Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked "r". To this rule there are two exceptions (Funding 4 per cent. and Consols 4 per cent.) on which yields are taken to earliest date and marked "e". (a) Net yields are calculated after allowing for tax at 9s. in £. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To latest redemption date. (f) Free of tax. (g) Yield basis 12%. (h) Plus tax free bonus 2½%.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To latest redemption date. (f) Free of tax. (g) Yield basis 12%. (h) Plus tax free bonus 2½%.

Statistical Summary

THE ECONOMIST, September 3, 1949

EXCHEQUER RETURNS

For the week ended August 27, 1949, total ordinary revenue was £70,539,000, against ordinary expenditure of £46,069,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £4,604,000, the surplus accrued since April 1st is £65,132,000 against £285,625,000 for the corresponding period a year ago.

ECONOMIST, September 3, 1949

SOUTHERN RHODESIA GOVERNMENT

VACANCY: STATISTICAL OFFICER

Applications are invited for the post of Junior Professional Officer to the Central African Statistical Office in Salisbury, Southern Rhodesia.

Applicants should possess a specialised degree in Commerce or Economics or Statistics normally involving a 4-year course at a University, or a specialised honours degree of a University involving 4 years' full-time post matriculation study and training.

Salary scale: £532 x £30 to £712 x £80 to £792 x £36 to £1,008 per annum. In addition to salary, a cost of living allowance at the rate of approximately 23½ per cent of salary, and a children's allowance at the rate of £30 per annum for the first dependent child under 15 years and £24 per annum for each other dependent child under 15 years, is payable at present. A marriage allowance at the rate of £60 per annum is payable to married officers in receipt of a salary of £712 or less (per annum).

The successful applicant will be required to obtain a satisfactory medical certificate at an examination by a medical officer appointed by the Southern Rhodesia Government.

Third-class rail fare will be paid from the place of recruitment in the United Kingdom to port of embarkation. A second-class passage on the boat for the recruit and half the cost of passages for the same class for his wife and dependent children under the age of 18 years will be paid by the Southern Rhodesia Government. From the port of disembarkation to Salisbury, first-class rail fare and subsistence allowance will be paid to the recruit, and half the cost of similar fares and allowances in respect of his wife and family. Applicants should state the earliest date on which they could assume duty.

Applications, stating age, nationality, marital status, School and University career and qualifications, and the names of two persons to whom reference may be made, together with copies of testimonials, should be sent to the Director of Census and Statistics, Box 63, Causeway, Salisbury, Southern Rhodesia, not later than September 30, 1949.

AUCKLAND UNIVERSITY COLLEGE

(UNIVERSITY OF NEW ZEALAND)

Applications are invited for the position of *Senior Lecturer in Accountancy*. Lectures conducted in the Accountancy Department include Book-keeping, Auditing and Cost Accounting, and Secretarial Law and Practice.

Salary: £775 per annum, rising to £850 per annum. Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. The closing date for the receipt of applications is September 30, 1949.

UNIVERSITY OF ADELAIDE

CHAIR OF ECONOMICS

The University invites applications for the Chair of Economics. The Professor will be Head of the School of Economics and will be responsible to the Council for its work.

The salary will be £41,400 a year, plus 10 per cent for superannuation. First-class fare to Adelaide will be provided for the successful candidate and, if he is married, for his wife also.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. The closing date for the receipt of applications is September 30, 1949.

SOUTH WESTERN ELECTRICITY BOARD

APPOINTMENT OF ASSISTANT ESTABLISHMENTS OFFICER

Applications are invited for the position of Assistant Establishments Officer at Area Board Headquarters, Bristol, from candidates who have had a wide experience in personnel management and labour relations, including negotiating machinery. Candidates will also be expected to have experience in initiating schemes for education and training of industrial and non-industrial employees.

The post, which will be pensionable, will carry a salary between £500 and £1,000 per annum, according to qualifications and experience. Applications, giving full details of qualifications and experience, should reach Assistant Secretary (Establishments), South Western Electricity Board, Electricity House, Colston Avenue, Bristol, 1, within ten days of publication of this advertisement.

NUFFIELD COLLEGE, OXFORD

It is proposed to elect a Gwilym Gibbon Research Fellow for one year, in the first instance, with the possibility of a further year. The Fellow will be required to devote his time to research into a problem of government. Preference will be given to candidates with experience in the public service and to serving officers whose employing Department or Authority may be willing to second them. Applications should reach the Warden by September 30th, and should give the proposed subject of research. Application forms and further particulars can be obtained from the Warden.

AMERICAN JOURNALIST IN USA

Broad experience, academic background in economic subjects, will be an asset. Correspondent for European trade groups, periodicals, etc. Intelligent, well written reports on US conditions.—Box 195.

MANUFACTURERS and distributors of very well known and profitable line of proprietary household chemicals are desirous to extend operations to exploit proven potential market. They offer half interest to similar firm (preferred) or gentleman able to invest £15,000 and in a position to introduce further substantial capital if warranted by future earnings. Capital is required solely for sales promotion, advertising, etc. Gross profit on actual sales last trading year exceed £10,000, but trading possibilities not yet touched. This is a first-class proposition and interested parties will be required to furnish financial reference in the first instance.—Box 999.

B.A. (Econ) Hons., 36, male, 17 years local government service, needs change requiring initiative and responsibility.—Box 191.

Prescriptions for Unity

THE dollar problem, despite the improvement in the situation over the last two years, is not on the way to solution. . . . This is not solely a European problem. It is a problem for the United States . . . and also for the whole free world." In these words, Baron Snoy and M. Marjolin last week presented to the Organisation of European Economic Co-operation their gloomy conclusion on the facts of European recovery. At the same time, the Assembly at Strasbourg was seeking in its economic report to state the same conclusion in more dramatic terms. "The Assembly warns the people of Europe that millions of us will soon go hungry and unemployed unless we act at once. . . ." Thus, on the eve of the talks between the United States, Britain and Canada in Washington, the spokesmen of Europe have come forward to declare that the dollar problem is not simply Britain's, but that it governs the whole relationship between the New World and the Old. The dollar sales of the Marshall group of countries have declined by 30 per cent in the last six months. Marshall Aid, invaluable though it is, covers no more than two-thirds of the nations' estimated "irreducible" requirements. If no fresh policies can be conceived, if the drift continues, the hunger and unemployment foreshadowed at Strasbourg will not wait until 1952.

For this reason, the European reaction to the crisis has in recent weeks come to show a growing awareness of its deeper political significance. What is at stake is not so much the nations' dollar balances or their gold reserves. It is the capacity of the whole free world to work and trade and prosper together. Since the war, in spite of the American loan, of Marshall Aid, of the Inter-European payments scheme, of the work of the OEEC, Europe has found it more and more difficult to trade freely and to gain the advantages of a proper division of labour either inside Europe or across the Atlantic; the barriers have grown higher and the worst of them take the form of inconvertible currencies and their accompaniment, bilateral trade. These facts are realised today more clearly than ever before. The difficulty lies in the total confusion of method which becomes apparent when generalities are left behind and concrete steps proposed.

In the first place, the western world is itself sharply subdivided. When statesmen speak of unity, it is not always certain of which area they speak. Do they mean western Europe alone? Do they include the sterling area and the British Commonwealth? Or should the United States and the dollar area also be thought of as part of "western unity"? The distinction is important, for to each concept is attached a different version of how best to achieve unity, underpin the west, bridge the dollar gap and save Europe. At the Assembly, a number of Continental delegates, backed energetically and competently by Mr Mackay, the British federalist, put all their insistence upon a purely European solution. They seek a complete Customs Union of the Marshall countries in order to bring into being a "single unified market," which by its greater flexibility and

productiveness, would, they maintain, soon restore the balance between Europe and the United States.

★

The debates showed, however, that the concept of a single unified European market, open to its members but presumably closed to the outside world, is not generally accepted as the cure of Europe's crisis. The British and the Scandinavian representatives in particular had their eye on the larger perspectives of European trade. Western Europe is not and cannot be an autarchic economy. It is heavily industrialised, its exports are mainly manufactures, its imports food and raw materials. Unity in isolation would spell lower living standards. "You do not," as one delegate pointed out, "increase markets simply by fusing them." If Europe is to prosper, it must trade freely and increasingly with non-European sources of supply. From this school of thought has come the suggestion, finally incorporated in the Assembly's Economic Report, that any unification of the European economy should be extended to include the overseas dependencies and, if possible, the Commonwealth. The Report asks the Committee of Ministers

to prepare a European economic union which shall retain the existing preferential system between European nations and overseas associated territories and to consider their progressive extension to other members of the union.

One group at Strasbourg, however, has shown itself to be suspicious not only of narrower schemes of European unity but of all attempts at this stage to commit the sterling area or the Commonwealth to schemes of economic co-operation in Europe. Throughout the Assembly, the British Labour delegates have taken part in the debates with marked reserve. The question has been asked whether their insistence that nothing should be said or discussed that might compromise the Washington talks, may not have reflected a lingering hope that a special Anglo-American arrangement could still be reached and that the "unity of the free world" might be based in the first place on Britain entering into special relationship with the United States, even perhaps into some form of dollar union.

★

These, then, are the three chief prescriptions for western unity—European autarchy, the fusion of the Marshall group with the sterling area and the Commonwealth, or an Anglo-American union. Given such varying interpretations of what "unity" might mean, western statesmen can hardly be surprised that a certain confusion of purpose reigns from Strasbourg to Washington. If any positive results are to be achieved from their debate and speculation, they must at some point pause and decide just what they mean by this "unity" which they are all pursuing.

Certainly, the nations of the Old World cannot, acting by themselves, bring into being the type of unity of which modern society is chiefly in need. The world of convertible currencies, of multilateral trade, of freely moving men and of rising prosperity and ever closer political unification, which is clearly the ideal form of western unity, can only be achieved on the initiative and with the active leadership of the United States. The European statesmen must take some positive steps towards correcting the imbalance between Europe and America, which at

BRITAIN
INDIA-PAKISTAN
YEARLY SUBSCRIPTION

Printed in Great Britain at 22, Roper Street

present cuts off all more ambitious plans for unity at the roots. They can extend their sales in America to some extent. For the rest, the deficit can only be met restrictively—by cutting American imports and by rationing dollars, both expedients which carry with them the stigma of discrimination and exchange control. Yet so long as the world's biggest producer sells abroad freely, but buys and lends little, and, moreover, protects its markets with high tariffs, unity in the sense of a single world economy, co-extensive with western society and based as firmly on the dollar as was the 19th century market on sterling—that dream of unity cannot come about.

This part of the problem is, as the Marjolin-Snoy Report has pointed out, primarily an American concern. If, as a result of the Washington talks, it became clear that the United States was prepared to make the dollar do the work of an international currency and to accept the obligation of extensive buying, extensive lending and lowered tariffs which the working of such a system entails, all lesser organisations of unity would be unnecessary and the work of political and economic unification could go forward on a scale adequate to meet the negative challenge of Communism and the positive challenge of building an "expanding international economy." But such a result is not certain and if the British Ministers and the other European statesmen who are conferring in Washington this month return convinced that, for the time being, the wider vision of unity cannot be realised, the time will have come to cease talking generally of unity in the west and to build up with all vigour and all speed the subsidiary forms of European co-operation which, even if they cannot fill the dollar gap, can at least mitigate its consequences.

★

From the British standpoint there can be no doubt that the creation of a narrow autarchic economic unit in western Europe would be economically the most unattractive alternative. The British Government's second choice, if the co-operation of the United States could not be secured, should be to link Europe and its overseas dependencies with the Commonwealth and the sterling area. The Strasbourg Assembly has already suggested a possible pattern in the creation of a low tariff area in western Europe to which such preferential systems as those enjoyed by the Commonwealth would be steadily extended. Within that area, as the Assembly has proposed, the convertibility of currencies would need to be restored as an essential preliminary to the resumption of multilateral trading. Domestic credit policies would need to be co-ordinated; fiscal policies would have to march in step; broad agreement on the practical limits of social improvement would have to be reached. None of these proposals is utopian. All are possible and practical. It is true that they would demand adjustments in the British economy and indeed in the whole sterling area where inflation still persists and where, as a result, sterling remains a soft currency. But these adjustments would be far less unsettling than the catastrophic changes which would be dictated by the disappearance of Britain's last reserves and the disorderly dissolution of the sterling area. Economic unification on the pattern proposed by the European Assembly cannot come about without Britain's advocacy and leadership. If the British choice were to be isolation, Europe would have no alternative but to follow suit. Then unbridled economic nationalism would undermine those measures of co-operation and reconstruction which have been achieved so far.

The Arab Opportunity

THIS week, the fifty members of Uno's Economic Survey Group on Arab refugee settlement have converged by air upon Lausanne. They assembled there Thursday. Tomorrow they are due in Beirut, which will be their headquarters. After this flying start, their schedule is not to be quite so breathless as rumour had forecast. They hope to produce a preliminary report by the beginning of November. Even this achievement will tax their mental and physical stamina. For they have to master at least four facets of their problem—the actual needs and nature of the refugees, the carrying capacity of the lands available, the engineering projects that might increase its irrigation and productivity, and the cost and financing of the schemes they advocate. They have, also, to cover at least four countries: Israel, Jordan, Syria and Iraq. (Egypt and Lebanon are virtually ruled out because the one is alarmingly overpopulated already and in the other there is virtually no uncultivated land that could be brought into cultivation). They will have their work cut out to cover the terrain in the time available.

Their terms of reference set two tasks. The first is to recommend a programme "to enable the governments concerned to further such measures and development programmes as are required" to straighten the economic tangle caused by the Palestine war; the principal feature of this tangle is, of course, the plight of the Arab refugees. The second objective is "generally to promote economic conditions conducive to peace in the middle east." Presumably the word "peace" implies not only peace between Israel and Arab, but also domestic, social peace within each country. If it does not, it ought to do so. For the first hangs upon the second and no scheme will work unless it takes into account the question of social contentment in each locality.

The start to the job is the purely technical one of measuring the possibilities and for this the prospects are good. The team of technicians, under Mr Gordon Clapp of the Tennessee Valley Authority, is highly expert, and a mass of ready-made surveys are at their disposal. These include, from Israel, an expensive "TVA for the Jordan" which is signed by James B. Hay, but is more often known as the "Lowdermilk scheme"; a scheme for the Jordan and Yarmuk rivers—which has as its basis the Ionides report of 1939 and which is now being revised by the British firm of Sir Murdoch Macdonald and Co.; from Syria, a work on the country's resources commissioned by the Syrian government

of 1947 and executed by a British firm of consulting engineers, Sir Alexander Gibb and Partners; from Lebanon, a similar Gibb report which became available only this year; and from Iraq the so-called Haigh report—a vast long-term irrigation project, already surveyed in far more detail than any of the others—which deals with the immense potentialities, given time, of irrigation on the Tigris and Euphrates. Here is a wealth of material. To master it, check it, and pick from it the projects that are worth putting up forthwith to the Assembly because they lend themselves to refugee settlement entails concentrated study. But it is a job that starts from fixed data and is therefore of manageable dimensions. The same cannot be said of the political or social aspects of the problem.

★

Suppose the technical survey finished. Suppose also that its cost can be kept to proportions that will not cause UN members to blench, and that can be met either out of voluntary contributions by states members, or by means of international guarantees to private lenders, or out of International Bank and other loans. Supposing, that is, that the plans and the money are to hand, what other ingredients are necessary for success? A second look at the wording of the Survey Group's terms of reference reveals that the operative verb in the text is not "to recommend" but "to further." Execution is the crux of the Group's work. They must, as they go ahead with their technical and financial planning, never lose sight of the political and social difficulties that stand in the way of action.

To anyone who has followed the Palestine problem either over the years or even during the past three frustrating months at Lausanne, the political difficulties are obvious enough. They include the vexed question of a frontier settlement in Palestine. They also include the disparity between Israeli and Arab estimates about the number of refugees who ought rightfully to return to their homes. The Israeli offer extends to 100,000; many Americans and all Arabs hoped it would be higher. That the technical knowledge afforded by the Clapp team could exacerbate instead of reducing this disagreement is shown by a glance at the Jordan valley schemes that it must study. For example, if it were to accept the Hayes plan for irrigating the vale of Esdraelon and the coastal plain of Israel, which demands for this purpose virtually the whole of the upper Jordan waters and half the

£1,000 ON RETIREMENT...

... at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12s. 6d. from age thirty. Only £4 18s. 4d. more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

The premiums for other sums assured, ages or terms of years will be quoted on application.

OUTSTANDING VALUE IN LIFE ASSURANCE

Yarmuk waters, it would turn into the equivalent of refugees quite half the present population of the land of Jordan. Any scheme which the Survey Group proposes for the Jordan waters must stem, therefore, from a political agreement about their fair division. Any such agreement ought to include not only Israel and Jordan but Lebanon and Syria also because the Hasbani and the Yarmuk, not to mention smaller flows draining into the Jordan basin, rise in these countries respectively.

Apart from the political legacies of the Palestine quarrel there are political snags ahead inside the Arab states concerned—particularly in the unstable parliamentary democracies of Syria and Iraq. In both these countries the governments, unsure of popular support, must perpetually angle for this by mouthing popular slogans: "Out with the foreigner!" "War on the Jew!" "No trust in Uno, which tricked us over Palestine." To recommend a policy

to the cabinet ministers of these countries is easy enough. Their natural politeness causes them to listen. Moreover, asking foreign experts for technical advice is one of their hobbies. The trouble is to get them to take it. Their drawers are crammed with reports from foreign advisers whom they hire or employ, but which they have—often with personal regret—tucked out of sight through distaste for taking the action entailed. Usually they have preferred to do nothing because they lack the political courage, which means the political backing, to announce measures which might carry the smack of foreign supervision. Both the International Bank and the American Export-Import Bank have encountered in their dealings with such governments a reluctance to borrow much-needed capital if a condition for such borrowing is any supervision by the foreign lender of the use to which the loan is put. A foreign scheme linked with aid to Israel will be doubly suspect.

But over and above these political difficulties there towers a social barrier to progress that is less widely recognised because it has received, so far, little publicity. In the lands envisaged for refugee settlement—the *wadis* east of Jordan, the Orontes marshes, the rain-fed Jezira, the remote banks of the Khabur and upper Euphrates—there lives a local peasantry. Ideally, if the refugee immigrant is to be adequately compensated for the loss of his home in Palestine's populous, accessible coastal belt, he ought to get not only a roof but enough land—leasehold or freehold—to give him a subsistence minimum. He also needs access to a co-operative pool of modern implements and the instruction that is necessary to arrest his age-long habit of despoiling the soil and lapsing into debt. But how can a newcomer be

endowed with these benefits when the existing inhabitants do not possess them? His very life will be in danger if he receives them over the head of local peasants none of whom own their land, who are usually share croppers working without incentive to improve their methods, and who are always in the toils of debt to absentee landlords who think of estates in terms of extracting money and not of ploughing it back. It is fully arguable that the £1,000,000 granted by Great Britain to Jordan this summer with refugee settlement in mind will do no more than provide a livelihood for the people already living in the district in which it is to be spent.

It follows that any resettlement schemes must, at least in Syria and Iraq, form part of wider schemes for agrarian reform generally, and of reform of land tenure in particular. In Jordan the position is rather different because absentee landlordism has always been negligible and because during the years of the British mandate a satisfactory system of land tenure was evolved on a basis of individual ownership. In the other two countries, any would-be reformer comes up against vested interests which are at their strongest in the landlord-politician class. For centuries the local admixture of fatalism, conservatism and improvidence has paralysed all desire to change the state of society. The landlord and the peasant have both accepted it. But minds are now on the move. The impetus towards change is not yet strong, but there are in all the towns, and even among the younger members of landed families, men who realise that the present maldistribution of wealth gives their country a faulty social structure, and that it must not last. A major task before the UN Survey Group—perhaps, even, its most important function—is to capture the imagination and to harness the social awareness and practical support of these people.

The task will not be easy. Most foreigners have failed at it. Its fulfilment will be baulked by plenty of plausible English-speaking landlords—good hosts and charming companions—who will aver that while believing, personally, in such ideas, it would be as much as their portfolios are worth to introduce them now. "Surely, Uno does not wish to overthrow my government."

That an easy way of evading action is going to be available is already plain from the Syrian and Iraqi press where professional xenophobes are writing of "America's way of trying to buy us" and as a "dangerous plot to deliver Israel from its crisis by inducing the Arab states to give it their economic collaboration." Even the social welfare experts collected this week at Beirut for a United Nations' Arab Social Welfare Assembly have taken a similar line. Yet for Arab as well as for western states the broad objective of agrarian reform ought now to be encouraged to take precedence over vested interests as well as over nationalist emotions. Unless this happens, no amount of competent engineering and financing by UN nominees can surmount the great wall of upper class Arab conservatism, of implacable resentment over Palestine, and of local mistrust of the foreigner. Yet these must be bypassed by anyone who perceives the chance afforded by refugee settlement to get at the heart of the matter. Even the peasant mind is beginning to move. Social change must follow. Is it to come tranquilly? If so, cannot the solution of the refugee problem be used to introduce it? Unless some such opportunity is taken, it will come violently. After a lapse of centuries, the tide is beginning to turn against the landlord-politician. Would he not do well to seize the chance and the funds afforded by refugee settlement to harness it, instead of slithering in his Packard to his doom?

Profile of American Recession

SOME Labour spokesmen have recently blamed "the chronic instability of American capitalism" for Britain's dollar difficulties. In the charts below, six basic factors in America's economic condition are compared, over a period of twenty years. "Chronic instability" would presumably imply a sweeping descent in output, employment, prices, wages, and the demand for imports. The charts show nothing of the kind. Some recession was obviously to be expected after the war and postwar booms had spent their main force. But it is astonishing how relatively slight, and how markedly restrained, the adjustments have been. The American gross national product in the second quarter of this year was running only 5 per cent below the all-time peak recorded in the closing months of 1948. Industrial production showed a further fall in July, but output is 62 per cent higher than for the five years 1935-39. Unemployment, too, has been rising gently, but so has total employment; Mr Henry Wallace's "Sixty Million Jobs" are still a reality. The trend of imports, particularly of crude materials and foodstuffs, of which a significant part comes from the sterling area, has certainly been more disconcerting. But even in the second quarter of this year such imports were still running at practically three times the prewar rate. Prices of food and farm products have been falling somewhat more rapidly than "other commodities"; thus the real value of weekly earnings in industry—now rather above \$53½ a week—has been enhanced. Such are the facts. It is impossible to hold that they illustrate anything more than a healthy pause for breath after a period of rapid expansion—a pause from which the United States economy is perhaps already deriving benefit.

Improving Justice

(By a Correspondent)

IN April, 1947, the Lord Chancellor appointed a committee to inquire into the practice and procedure of the Supreme Court. The work of this committee has been parallel to that of other committees, similarly appointed, which have examined county court procedure and the specific problems of the Divorce Court. As a result, the work of the majority of courts of first instance, and of the Court of Appeal, has been under review. The Supreme Court committee has now published an interim report*, to present its views on two urgent matters only; the extension of county court jurisdiction, and the problem of giving the litigant in the High Court as early as possible a fixed date for the hearing of his case.

The layman may still tend to think of the County Court as the "poor man's" court, dealing only with minor disputes and operating under a simple and easily understood procedure. He knows that, in the majority of cases, he takes his complaint to the court, issues a summons and a date is fixed forthwith for its hearing, usually some six weeks or so ahead. The High Court, he feels, is the place where the more complicated disputes are heard. There he issues a writ; then follows a maze of interlocking proceedings, which he probably does not understand; and, finally, weeks or months later, he is told by his lawyers that the case is in Mr Justice So-and-So's list and may be heard any day now. But the layman seldom draws any distinction between the quality of justice obtainable in either court.

The problem of fixing a date for trial in the High Court in advance is, as the Committee says, one of "exceptional and obstinate difficulty." It has been examined by Commissions and Committees from 1869 onwards and still no complete remedy has been found. The High Court has now reached the stage when a great many of the trials of actions in the King's Bench Division, and of witness actions in the Chancery Division, are fixed well in advance, but it is still impracticable to fix definite dates for actions set down to be heard at Assizes. Some of the difficulties are obvious enough. It is hard to say, in advance, how many hours the hearing of a complicated action may take. It is equally hard to foretell whether or not any particular action will be settled out of court at the last minute, or even at the doors of the court. High Court judges, and their attendant officials, are expensive machines to be allowed to run idle. Which is the more important: that there should always be a supply of cases ready and waiting for each judge to hear, or that there should be enough judges always at hand to hear every action set down for hearing on each particular day, even though that may mean, on occasion, that half the judges are sitting unemployed in their courts?

That question has never been answered decisively in this country, nor does this interim report propose any radical solution. It recommends that the number of judges should be increased by four, which should effect a considerable improvement to the speed of justice in London, though it leaves the problem of cases at Assizes untouched. The Committee can hardly be blamed for that, for, as the report rightly points out, the problem of Assizes contains many

other ingredients besides the element of the fixed date for hearing. None the less, the interim report does almost apologetically add this comment, that England seems to be about the only place in the world where some system of fixed dates for all hearings is not in force. As it says, "we find it difficult to believe that it is only in England that it is not in practice possible to do it."

The problem of the jurisdiction of the county court should not be so complex, but it is. As the original King's Court for England and Wales, the High Court, in theory and in practice, has universal jurisdiction, whether the suit be for 5s. or £50,000. The county court, as a statutory creation dating only from the last century, has always worked under a monetary ceiling for claims that may be brought in it, and certain actions, such as actions for defamation, are excluded from it altogether. The Interim Report recommends that the upper limit for claims in the county court should be raised from £200 to £300 and that no one suing for a small sum in the High Court shall be entitled to recover a greater sum by way of costs in that court than he would have recovered if he had brought his claim in the appropriate county court. These are sensible proposals in an interim report, but, again, they do not touch the real relationship between high court and county court as it exists today, or as it should exist henceforth.

Over the past fifty years, the one outstanding change in the English courts has been the increase in the status and authority of the county court. This may fairly be traced back to the Workmen's Compensation Acts, which gave the county courts exclusive jurisdiction over claims under these Acts. The complexity of those statutes soon established the fact that the calibre of the county courts and of their judges, was scarcely inferior to that of the High Court. The Rent Control Acts, from 1915 onwards, again gave the county courts exclusive jurisdiction in a field of law which became of equal complexity. But the greatest change in the importance of the County Courts has come since the late war, over matrimonial cases. Once it became clear that the existing High Court judges of the Divorce Division could not possibly handle the vast flood of matrimonial petitions in 1944 and 1945, the problem was solved in a practical way. In effect, county court judges were given the status of High Court judges, for the purposes of hearing matrimonial cases, but they tried these cases in county court buildings and with county court procedure. There can no longer be any real belief among laymen that the county court is an "inferior" court, in the popular sense of the word.

★

This report is an interim report and it should be judged as such. The action it recommends consists, in the main, of detailed and minor alterations in the practice of these courts and it would be difficult to quarrel with any of the proposals put forward. Yet there is, in the report, certain evidence of difficulties which the Committee will have to face in its larger task, and on these public opinion should begin to make itself felt. For instance, there is the possibility of severing civil from criminal business at Assizes, a proposal which found support from the Gorell Committee as

far back as 1908. Again, it is important that an accused man should be tried as near to his home as possible. On the other hand, there are strong arguments for grouping the locations of civil trials now taken at Assizes, and, as it were, decentralising the High Court, so that each region could have its own pattern of county courts and a sitting of a high court, without recourse to the machinery now centred in London. The Committee obviously sees some advantages in such a proposal, but it says "we found substantially no support for this idea, to which the Law Society were opposed."

That raises two questions. What are the sources of the evidence which is being presented to the Committee? What is the relative importance of the lay point of view and the point of view of the Law Society, the professional organisation of solicitors? The Committee itself includes a high proportion of lawyers. It is to be hoped that the organisations which can claim to represent the litigant are making certain that the litigant's point of view, particularly the point

of view of the provincial litigant, is laid before the Committee.

The problem becomes the more urgent now since the scheme of assisted litigation is about to come into effect. No one yet knows how many claims, how many actions, have been held up simply through lack of means; but the answer will soon be given. The courts may well be faced with an increased volume of work. But it would be a mistake to think that the assistance coming from the State will solve all financial problems. The litigant, poor or rich, has still to attend court; so have his witnesses. And the poorer litigant can afford to waste working time even less than the richer. The Committee, before its final report is written, has still the opportunity to match its mind and experience to these new problems. The county courts have won their place, in the mind of the public, as an effective local equivalent of the High Court. Given a greater opportunity, they could serve the community still more effectively.

NOTES OF THE WEEK

Washington and Bridlington

The preliminary conversations between the finance and foreign ministers of the United States, Canada and Great Britain began on Wednesday, but there is little in the guarded statements, which the ministers permitted themselves during the first day, to indicate their nature or their course. It was made obvious by Mr Abbott, the Canadian Finance Minister—indeed it has always been obvious—that the initiative for proposing a solution to the disequilibrium between the sterling and the dollar area must rest with Britain. Mr Snyder made it quite clear that a long term solution "of Britain's dollar earning problem in the light of adjustment to declining United States assistance" was what he was prepared to talk about. Sir Stafford Cripps's contribution to public enlightenment was to say that "We are prepared to cut production costs as much as we can" which reads, although it may not have sounded like it, as a gesture of grace to appease some idiosyncratic New World love of low cost production; and to issue a mild threat aimed, perhaps, at producer lobbies in Washington, that Britain would persist in its policy of import cuts.

It might have been supposed that the Prime Minister would use his address to the TUC on Wednesday as a means of explaining the gravity of the situation not only to trade unionists but also to the nation at large. He is the only important minister at the scene of action, and the TUC conference provides the only political sounding board, during the two and a-half months of the Parliamentary recess; but in the event he contributed nothing to the enlightenment of an anxious nation. His speech contained no hint of an adaptation of the Government's policy to meet the forbidding and intractable economic problems that are confronting the country. It is understandable that the Prime Minister, who takes very seriously the doctrine of cabinet responsibility, should not wish to jeopardise the course of negotiations in Washington by even hinting at possible solutions to be achieved there. But he has not made the position of Sir Stafford Cripps and Mr Bevin any easier by failing to give even a shadowy indication of what domestic action the Government intends to take; the rest of the world will interpret this as meaning that it intends to take no action. Equally that part of his speech which was purely reflective or hortatory carried none of the sense of urgency with which he might conceivably have convinced trade unionists, and not only trade unionists, of the danger in which Britain stands of losing all the advances of the past four years, and of being confronted with a new loss—the emergence of mass unemployment. Mr Attlee, like so many of his colleagues, has confounded the prescription for a nerve tonic with that of an opiate.

Loyalty and Ambiguity from the TUC

The first three days of debate at Bridlington have shown that the Communist virus has been checked, and that the trade union movement is as conscious as the political parties of the imminence of the General Election. The defeat of the Communists was overwhelming: the General Council's campaign against Communism in the unions was approved by 6,746,000 votes to 760,000, and its withdrawal from the World Federation of Trades Unions by only a slightly smaller majority. The denunciations of Communism made by Mr Deakin and Mr Tewson went virtually unanswered; apparently the Communist trade union leaders do not at the moment choose to indulge in open combat.

Mr James Griffiths made a perfectly open and sincere demand to the trade union movement to throw its weight and resources into achieving victory for the Labour Party at the election. This necessity of presenting a united front has of course made the position of the General Council much easier. For one thing most of the unions which had tabled resolutions critical of the Government's policy on wages and prices have been persuaded to withdraw them in favour of the vague resolution of the General Council itself. Even the National Union of Railwaymen which has done everything in its power to get around the policy of stabilisation, planted its tongue firmly in its cheek and agreed to support the General Council. The desire for compromise was obvious also in the withdrawal of the resolution in the name of the National Union of Journalists, the NUR and several smaller unions demanding the end of compulsory arbitration. The large general unions cast their influence for its retention since on the whole it has worked in favour of their lower paid workers, and the advocacy of the NUR and other recalcitrant unions was weakened by the unscrupulous tactics they have used to try and circumvent compulsory arbitration. The General Council has promised to review the machinery of arbitration but no one at Bridlington has been able to suggest any alternative procedure other than the continuous use of the strike weapon—a course that was roundly condemned by Sir William Lawther, the President, in his opening speech.

But if the conference has shown that it does not approve of Communism or irresponsible action that would embarrass the Government, trade unionists have given no indication of how they intend to preserve the economic *status quo* that is so clearly to their taste. Sir William Lawther in his presidential address (which brought off the unlikely double of misrepresenting *The Economist* and misquoting Christina Rossetti) made an intelligent and honest appeal to trade unionists to

* Interim Report of the Committee on Supreme Court Practice and Procedure. HMSO. One shilling.

live up to the responsibilities of their power. But, echoing the economic report of the General Council, he was prepared to shrug off Britain's present difficulties as "entirely beyond our control," and to ask his hearers to believe that full employment and the maintenance of the social services simply depend on whether or not Labour is returned to power at the election. How profoundly the Labour Government must wish that they did.

★ ★ ★

Optimism and Caution in the Air

At a time when the spirits of the British people are badly in need of a tonic, the signs that the British aircraft industry is really getting into stride have been welcomed with special enthusiasm. On Sunday the giant Brabazon I took to the air and throughout this week the annual display organised by the Society of British Aircraft Constructors at Farnborough has provided impressive evidence of the quality of British aeronautical engineering. That both the aircraft industry and the Government have been aware of the importance of providing this evidence of strength can be deduced not only from the neat timing of the completion of the Brabazon's first flight, but also from the fact that three of the most important smaller airliners and the new Canberra bomber have been completed in time for this week, while two of the new military fighters have been removed from the secret list in the nick of time.

Among the aircraft at Farnborough, the de Haviland Comet, a turbo-jet airliner which can cruise at 500 m.p.h. at a height of eight miles, has attracted the most attention. Its development cost has been small and although it has only been flying for six weeks there is no doubt that it is far ahead of anything even contemplated by any other country. (The other types shown at Farnborough are discussed in a Business Note on page 582.) By comparison with the aircraft on display at Farnborough, the Brabazon I, developed by the Bristol Aircraft Company under the auspices of the Ministry of Supply, seems a more dubious project. It has cost £12 million (which includes its hangar and runways) to complete it. It is solely an experimental aircraft and in due course it is planned to produce a Brabazon II as a commercial proposition for the London-New York route. By the time it is in service the work it is designed to do will have been performed for some years by Boeing Stratocruisers and other aircraft. It is true that the Brabazon would carry more passengers, but there are many commercial matters—airfield alterations, administrative costs, traffic density and insurance costs—to be worked out before it is certain that a larger aircraft is commercially more valuable. Undoubtedly the Brabazon will yield important technical results but given the American aptitude for building large aircraft and the obviously outstanding British lead in the construction of smaller and medium sized aeroplanes, it seems reasonable to ask why the old military principle of reinforcing success should not apply here. This seems to have been the opinion of BOAC who in their somewhat tepid telegram of congratulation to Bristol Aircraft seemed to suggest a fear that the Government might force the Brabazon II upon them without reference to its commercial feasibility.

★ ★ ★

First Days at Bonn

On Wednesday, the two Chambers of the Federal Republic of Germany came into being at Bonn. In the morning the Upper House, or Bundesrat, elected Herr Arnold, the leader of the left-wing of the Christian Democrats, as President, and in the afternoon the Bundestag, or Lower House, elected Dr Köhler, another Christian Democrat, who had been chairman of the former Economic Council of Frankfurt. So far, however, the Republic lacks a government, for Dr Adenauer, whose party, the Christian Democrats, obtained the greatest number of votes in the recent elections, has not been hurrying in the task of building his coalition. He is drawing upon the right-wing Liberal group, the Free Democratic Party, and to secure

a comfortable majority, he must also secure the support of one other group even further to the Right. It is generally expected that this group will be the German Party, which received 17 seats in the elections. The formation of the Government will not produce any striking change in the trend of German politics, since Conservative politics and Liberal economics have been the guiding lines of German official thought for the last eighteen months.

It is, nevertheless, a disappointment to some Germans, particularly to men of the constructive outlook and moderate temper of Herr Arnold, that the first free government of the new Federal Germany should not represent a coalition of its two most powerful parties, the Christian Democrats and the Social Democrats. However, events of the very first day at Bonn have shown that there is a considerable advantage to be gained from the existence of a strong constitutional opposition claiming to represent the rights and interests of organised labour. In the last few weeks tension has increased in the Ruhr as a result of the new efforts at dismantling, and recently a British official was manhandled and dismantling stopped by force by a crowd of workers at the Ruhr Chemie works at Oberhausen. An all-out attack upon dismantling could, therefore, be an admirable weapon for Communist use both against the new Government and against the Allies who support it. And, in fact, the Communists put down a motion on dismantling in the first hours of life of the new Bundestag. Their thunder has, however, been stolen by the Social Democrat's decision to put forward a motion on dismantling themselves. The Communists cannot, therefore, claim to be the only defenders of Germany's rights and livelihood, and since this type of issue is bound to recur, it is as well that parliamentary opposition is not confined to the extremist and anti-Democratic left.

Dr Boffa Goes Home

The long series of talks in London on the economic problems of Malta have at last come to an end. But Dr Boffa has had to return to Malta with very little to show for his pains. His request that Britain should continue its contributions to Malta's food subsidies was turned down. So was his request that Britain should try to obtain a share of Marshall Aid for the island. His attempt to obtain a reversal of the Admiralty's decision to dismiss 1,200 dockworkers succeeded only to the extent of securing a promise from the Admiralty to defer the dismissals for two months and to reduce them as much as possible, as well as an offer from the War Office to employ from 1,000 to 1,300 Maltese on works in Cyrenaica.

It is clear that Dr Boffa felt compelled to concentrate on this question of the dockworkers. It is the most burning political problem in Malta today, and in view of the explosive political situation which Dr Boffa's former colleague, Mr Mintoff, has been busily stirring up, it was only natural that the Maltese Prime Minister should make every effort to solve it. All the same his policy was unfortunate because, taking a short-term view, the Admiralty could say with some reason that it could not afford to go on employing people for whom there was no work. (On the long-term view one would think that the Admiralty might be wiser to indulge in a little extravagance in order to preserve good relations in one of the Empire's most important strategic bases, and certainly could find somewhere else to practise economy.) Moreover, even if no dockworkers at all were discharged the fundamental problem of Malta's unbalanced economy would remain.

Towards the solution of this problem the British Government has taken the cautious step of stating that if the Maltese Government invites an expert to examine ways of improving the Maltese economy, it will help to find such an expert. It is true that since the Maltese are jealous of their newly won independence in internal affairs, it is essential that the initiative for this survey should come from them. It is also true that they have not produced adequate figures about their

economic situation and that they cannot expect financial help from the British Government until they do. But although the details may be obscure, the main outlines of Malta's economic plight should be clear enough for the British Government to realise that it must be helped sooner or later. Malta must provide for its rapidly increasing population by the development of what secondary industries the island can support, and by finding financial assistance for the emigration of as many as can be found homes elsewhere. For these tasks Malta's own financial resources are inadequate, and it is therefore little short of disastrous that the British Government has somehow created the impression that it will grudge every penny which it is eventually persuaded to give Malta.

The analogy between Britain's relation to Malta and the United States' relation to Britain is obvious. One discrepancy should be pointed out—the Maltese Government regretfully decided that it could not afford to embark on its cherished health scheme just now. The analogy is, however, sufficiently close to make it not inappropriate to suggest that the Colonial Secretary should re-read the parable of the two debtors and ask himself with what credit Britain has emerged from so ungenerous and unimaginative a handling of this vital and loyal Mediterranean island.

The Englishman's Food

Although the Englishman is supposed to be no epicure, he seldom loses an opportunity to castigate the Ministry of Food for the plainness of the modern diet. But a trend towards a more uniform diet with the consequent loss of some of the best local traditions of food preparation has been evident for many years. As Dr K. G. Fenelon observed in a paper on Britain's Food Supplies to the British Association:

Wartime shortages and housekeeping difficulties have only accelerated a process which was well under way when William Cobbett thundered against the decay of home brewing. He did not suggest that increased potato and cereal consumption would necessarily be a permanent feature of the British

diet, but it was clear from his discussion of the changing pattern of British imports that many years are likely to pass before roast beef and steaks can freely be had. Britain is, in fact, eating more milk, fish, potatoes and grain products per head of population than before the war, and less meat, oils and fats, fruit, tea and sugar.

Despite the great expansion in British agriculture which has taken place since 1939 only 37 per cent of the calories consumed last year were home produced, compared with 31 per cent before the war. And because Britain is so dependent on overseas supplies of food, it has had to depart further than most European countries from its prewar pattern of diet, in order to bring its consumption of calories up to the prewar level. Britain's difficulties have been further exacerbated by the re-

orientation of world trade. The terms of trade have moved in favour of primary producers—though the Ministry of Food's system of long-term contracts is doing much to keep those terms unfavourable to Britain—while countries such as India which before the war were exporters of food are now importers.

These are difficulties of procurement. The next stage is to see that the available supply is distributed equitably so that no sections of the population should suffer malnutrition. Dr Fenelon was realistic in his discussion of "national averages." He pointed out that an average level of consumption gave no indication of the relative wellbeing of different social groups in the community. It only permitted comparison of the over all position between different periods. Hence in 1941 the Ministry of Food inaugurated a food survey of urban working-class households, from which data on food consumption and food expenditure are given in the accompanying table. The figures must be interpreted with caution since the survey takes the family as its unit of calculation and not the individual, and it takes no account of food consumed outside the home in schools, canteens or restaurants. But it can be seen that between 1942 and 1948 there has been an improvement in consumption of virtually all foods. The only exceptions have been cheese and potatoes: and the consumption of potatoes was well above the 1942 level in each of the subsequent years except 1948. The changes in expenditure are also interesting: the greatest increases occurred in fish, fruit and vegetables, sugar and preserves and cereals. More detailed figures, however, would reveal some illuminating facts about consumer preference in a rationed economy.

Food and Housing

Two eminent experts on the use of land have chosen opposite sides in the controversy over the claims of new and better industrial towns as against the conservation of agricultural land. Professor Dudley Stamp, speaking to the British Association, claimed that the low densities in the new towns, in which one acre is needed for every ten persons, are consuming an unwarranted quantity of good agricultural land. He warned his hearers that the nation is heading for "new towns to starve in." By contrast, Dr C. S. Orwin, speaking recently to a summer school, urged a sense of proportion in balancing "the claims of large numbers of industrial workers for better living conditions against the retention of a few thousand acres in agricultural production." Dr Orwin's case is that an industrial nation cannot deny to its workers proper breathing space, and that better farming practices can make good the loss of land which this policy entails.

Both speakers are good friends to the countryside though some of Dr Orwin's views on the reorganisation of agriculture have never gained wide acceptance. It may be true that some new towns are being designed with an unnecessary spaciousness. Holland provides an excellent example of how attractive towns can be developed at a high density of population. It is certainly true that owners of land generally have too little security from sudden predatory raids by the various Ministries, whose failure to discipline and co-ordinate their requirements or even to plan far ahead constitutes a severe indictment of a planning government. But it is not the case, as the revised decision over Bracknell witnesses, that agricultural interests are overlooked in planning decisions. On the contrary, planning schemes show a tenderness for the protection of good quality land which is in striking contrast to the damage inflicted by unregulated building. By virtue of the Town and Country Planning Act the agricultural community is much more resistant to the demands of urban development. It is not surprising, therefore, that its advent is opposed on every occasion and in every place, though such opposition is sometimes not very farsighted. A healthy rural economy needs alternative sources of employment to agriculture, particularly since there are few prospects of increasing the amount of rural industries.

MacArthur's Tribute to Japan

Few would deny General MacArthur the right to point with pride to the achievements of his administration in the difficult days since Japan's defeat. What few will accept is the General's periodic attempt to persuade the world that in four years the Japanese nation has been permanently converted to democratic ways. In a statement last week issued on the fourth anniversary of the surrender, General MacArthur reiterated his conviction that the Japanese are capable of running their own affairs and have now earned the right to a peace treaty. "Long hence," he added, "history will record of the Occupation that its greatest contribution to the progress of civilisation was to introduce into Japan the great concepts of personal liberty and individual dignity. . . . The great and noble effort toward the reorientation and reconstruction of the postwar Japan, beyond peradventure of doubt, will prove eminently successful."

American policy, as it is now shaping, may soon put the General's faith to the test. A peace treaty is a remote possibility because of the difficulty in obtaining Russian agreement to any reasonable terms. But the American authorities in Tokyo are moving speedily to give the Japanese more responsibility in order to establish what they call "Peace without a peace treaty." How will Japanese politicians react to this new license and how long can the democratic reforms instituted by SCAP be expected to last, once Allied supervision is loosened?

General MacArthur based his recent expression of confidence on four main points. "The threat of Communism as a major issue in Japanese life is past," he declared. This is a contention with which many would disagree after witnessing the violence that accompanied the Communist-organised protests in recent months against the government programme for retrenchment. For the benefit of those, on the other hand, who are disturbed at the eagerness the Yoshida Cabinet has shown to build up a large, government-controlled police force, the General asserted: "The danger that a police state will re-emerge is non-existent."

His third claim was that the Land Reform Act and Economic Deconcentration Programme (the breaking up of large industrial holdings) had created a middle class that would "reject with scorn any will-of-the-wisp economic Utopia." It is doubtful whether the middle class is sufficiently sturdy and well organised to resist for long the strength of the reactionary elements which the Occupation authorities have, for the moment, put out of office. A disquieting note on this topic was recently struck by an American businessman in charge of anti-monopoly action in Japan. After the Occupation ended, he told correspondents, the Japanese Government could wipe out all democratic legislation introduced by SCAP—"there is nothing to stop them—they are free to do what they like."

In the economic field MacArthur hailed the "firm and determined course based on sound fiscal policies now being pursued by the Japanese Government." This was a course charted entirely to the Occupation advisers and followed by the Japanese Government with the greatest reluctance and after the most urgent prodding.

Although SCAP has at all times been the object of widespread complaints and the recipient of critical advice from all sides, it must be credited in the main with having made the best of an extremely difficult assignment. The quarrel now is that the job is not yet finished.

* * *

Warning from Yunnan

After a weekend of confused and conflicting reports, it appears that for the time being the Nationalists have not after all lost control of the key province of Yunnan. Bordering on Szechwan and providing through Kunming one of western China's outlets to the world beyond, the province is of cardinal

importance if General Chiang Kai-shek is to maintain any sort of resistance from Chungking. It was, therefore, serious news for the Nationalists when reports reached them that General Lu Han, the Governor of Yunnan, had thrown overboard the central authority of the Nationalists and was setting up an autonomous regime of his own. In one sense, General Chiang Kai-shek was being paid in his own coin, for three years ago when the fighting was at its height between Communists and Nationalists in Manchuria, he persuaded the then Governor, General Lung Yun to send his troops north. Thereafter the Generalissimo despatched his own forces to take control of Kunming, exiled the General and put in his own nominee as

Governor. However, it now seems that the local forces of General Lu Han were not strong enough to carry through their *coup d'état*. The Nationalist troops in Yunnan have been numerous and loyal enough to foil the attempt, and now the affair seems to be on the way to being patched up. General Lu Han has flown to Chungking, and presumably the two forces, however distrustful of each other, will now co-operate against the Communists, who are also active in various parts of the province.

Even if the Yunnan affair has not led to a successful *coup d'état*, it nevertheless throws light upon the situation in China. For the supporters of the Nationalists, it is a warning of how precarious is the control exercised by Chungking. For the Communists, it is a warning of the strength of the old traditions of land-lordism and banditry. In fact, there are some observers who believe that the Communists' worst troubles will only begin when the war with the Nationalists is to all intents and purposes over.

* * *

Intervention on Kashmir

In the middle of last month the United Nations Commission on Kashmir reviewed the tedious and abortive negotiations of the previous few months, in the light of a fresh deadlock which for the moment still seems complete. The Commission states that the fundamental views of the two governments remain unshakeable and concluded that the possibilities of reaching agreement were at present remote. The Commission, however, has by no means given up, and it is understood that at the end of August fresh proposals were being drafted for referring the dispute to some new form of arbitration.

It is at this delicate and difficult stage that both Mr Attlee and President Truman have entered the lists with letters to Pandit Nehru and Liaquat Ali Khan, urging them to accept the arbitration proposals in the interests of world peace. Mr Truman's action seems to have taken Delhi, at least, by surprise, and it is not yet certain what result it will have. The

essence of the matter, however, is that it would probably be easier for India to make a conciliatory gesture at this juncture than it would be for Pakistan, since, quite apart from the facts of the case as presented by both sides, India is potentially the bigger power and should have less fear of losing face by practising generosity. The hopeful aspect of the Anglo-American intervention lies in the degree to which Delhi is likely to listen to any American prompting.

India's relations with the United States have lately grown closer than at any previous period. Pandit Nehru's expected visit to Washington next month has aroused considerable anticipation on both sides. Delhi has lately received a loan from the World Bank, and is expected to receive two further instalments; India figures prominently in American projects for helping underdeveloped economies, and stands to gain considerably thereby. All this gives weight to the President's appeal, and since the dangers to peace inherent in the Kashmir situation increase with each delay, it is to be hoped that the United States will—with all the tact necessary—keep up the pressure.

Sense from the Treasury

There appears to be some prospect that in matters concerning civil service manpower the Treasury will in future be able to look at the wood instead of being confounded by the trees. The Treasury has recently redefined its own powers and those of the individual departments in matters of staff with a view to giving the larger Ministries a greater measure of responsibility and independence, and of relieving itself of much of the detailed business of control over numbers, grading and day to day personnel management. Two good consequences should flow from this decision: on the one hand the Treasury should be freer to concentrate on the larger questions of civil service manpower and management which are at present frequently submerged by routine business. On the other, departments will be encouraged to take more initiative themselves rather than blaming things "on the Treasury."

In many departments this is outwardly merely an extension of wartime practice. But for peacetime it is a very significant decision. Constitutionally the power and financial responsibility of the Treasury remains unaffected: the circular embodying the new rules lays down a number of safeguards and stipulates that the Treasury should balance its delegation of powers by a more effective system of investigation than it now employs. But for all this the objective is to make Heads of Departments and Establishment Officers more masters in their own houses, and to raise the status of staff management in departments. If the results are to improve establishment (staff) work in departments and to give the Treasury the opportunity to consider what the 700,000 people in government employ are really up to, the new rules will be worth while.

*

The quarterly statement prepared by the Treasury on civil service staffs shows that some slight effort is being made to reduce the number of non-industrial civil servants. Excluding the Post Office and the Defence Departments, the figures for

July 1st show a net decrease over April 1st of 7,860. This reduces the figure from 347,587 to 339,727 or by 2.3 per cent. The department responsible for the largest reduction is the Ministry of Food which has reduced its staff by 4,450 or more than 10 per cent. From the point of the taxpayer this is cause for satisfaction particularly if the returns show a continuing reduction. From the point of the economy the gain may be small since it may be presumed, a presumption partially reflected in the returns of the Ministry of Labour's appointments service, that those who have been released are those least employable, by reason of age or competence, in other callings.

* * *

Unrighteous Asparagus and Righteous Peach

The distinction between the permissible and the *streng verboten* in the matter of restaurant meals has reached an almost Talmudic height of refinement. Last week a restaurateur was heavily fined for serving asparagus to two Ministry of Food officials, not as a vegetable but as a separate course, on a separate plate (this subject is dealt with in a letter on page 552.) This week it is announced as a generous concession that the illegal fourth course may be legal if it consists entirely of fresh fruit. (Would fruit salad count?) This supposed innovation was, in fact, allowed last year at the same season; under the five-shilling maximum rule it merely gives the restaurateur the option of ignoring it or of cutting the quantity or quality of his main dishes. It is something, no doubt, to have that option, just as it is something to be able to ease the strait-jacket of the maximum price by dexterous wriggling among the complexities of house charge, band charge, authorised surcharge and fancy prices for drinks, coffee and oysters. A really enthusiastic collaboration between an ingenious management and a co-operative client can extract from the latter's pocket, quite legally, as much as he can conveniently disgorge. The Ministry knows this, and must know, too, that the client most likely to be baffled, infuriated and effectively discouraged from a return visit is the much prized foreign visitor. It is high time that the whole cat's cradle of sumptuary regulation was sent to join the blackout rules of the era to which it was appropriate.

Apartheid in the Universities

It is clearly too late for an appeal to reason, good faith or liberal principles to have any effect on Dr Malan. Speaking at the Transvaal National Congress last Tuesday, he announced his government's intention of stopping African students from mingling with European students at the Witwatersrand and Cape Town universities. He also repeated his intention to enforce a registration scheme, under which all men and women in South Africa will have to carry identity cards classifying the holders according to race, and to abolish the Cape franchise.

The proposed action against the universities is a new detail in the policy of *apartheid*. For very many years it has been one of the few saving graces in South African life that those African students who were able to pass the matriculation examinations were allowed to attend the Witwatersrand or Cape Town universities on an almost equal footing with European students. They attended the same lectures, the same debating, literary and scientific societies, and were forbidden only from joining Europeans in games and social entertainments. Their numbers were always small—about 150 students at each university in any one term—but they were one of the chief hopes that eventually some form of common life for African and European would emerge in South Africa.

Such a possibility is obviously anathema to Dr Malan and his followers who regard any form of education of the African as a threat to their security. In spite of the lesson of prac-

tically every other country in the world, they have failed to understand the elementary principle of government—that oppression breeds revolt more readily than any other policy. More, they are undermining the very policy which they profess to sponsor. Only if the negro has full opportunity for every type of education and for advancement in any kind of work or profession will he acquire the self respect in which a natural social separation between white and black communities becomes a matter of course.

* * *

France and the Fezzan

Is there never to be an end to Franco-British misunderstanding about the Arab world? It seems to be simmering once again, this time over Libya. The position there is that France, with the tranquility of its North African dependencies in mind, would like to retain trusteeship over the Fezzan—that is, over the western part of the inland Libyan desert which borders on no less than four French African territories. It would also, to ward off the westward march of Arab independence, be glad to see some companion trustee, preferably Italy, established in Tripolitania. The British are more sensitive to the climate of United Nations opinion. Having tried, and failed in the Bevin-Sforza plan, to assuage Italian dignity, they are now sponsoring independence for Libya within a measurable term of years. The matter was discussed by Mr Bevin and M. Schuman when the former was on his way to Evian. It will

come up for decision at the Assembly. Meantime, wounds seem to have re-opened, and the belief to have been revived that, as in 1944-45 in the Middle East, so now also in Libya, the aim of British policy is to weaken France overseas.

Anglo-French relations are critically important. Is it not possible to propose that France should retain the Fezzan? Economically speaking, the plan has virtues. The area consists of four relatively fertile valleys, growing dates and grain, in what is otherwise a wilderness of sandy deserts and rocky ridges. A reasonable standard of living for its 45,000 inhabitants can be maintained only if it is well policed, so that tribal raiding is controlled, and if it enjoys some tourist traffic as a source of revenue. It is on the way from nowhere to nowhere except from the northern parts of French West Africa and French Equatorial Africa to the Mediterranean. In the hope of retaining it, the French have, in the years since General Leclerc reconquered it from Mussolini, spent a good deal upon its economy. They have endowed its one time semi-slaves with small holdings; they have set them up with tax exemptions and seed loans; they have dug for the water table, found it at 180 feet, and sunk 18 artesian wells to it; they have set up some 40 motor pumps to distribute the water so secured. They have

as a natural development of their policy tended to divert trade from the roads to Misurata and Tripoli to those into Tunisia and Algeria. In no other hands would the Fezzan be better off.

*

Why then should the British be proposing Libyan independence to the United Nations? In the first place, they know that with the growth of Arab nationalism, the days of African annexations are over. The chill wind of xenophobia has reached the Fezzan and is causing discontent. Encouraged, say French sources, by the British-sponsored Tripolitarians, and by the Emir of the Senussi, Moslem fanatics set upon the garrison at Sebha on June 17th, and killed two Frenchmen before they were repulsed.

The British are also anxious to relinquish the onus of running the rest of Italy's ex-empire. The chief clue to present British policy is therefore the realisation that no solution other than independence in five years' time for the whole of Libya has a chance of securing the necessary majority at the forthcoming Assembly.

Caribbean Cross-fire

The cynical Communist attitude to peace has been expressed again this week in yet another "Peace Congress." This one, in direct line of succession to Breslau, New York, and Paris last spring, has been taking place in Mexico City. Moscow radio says that it "voices the will to peace of the peoples of the American continent, from Alaska to Tierra del Fuego." The tactics of these conferences at which Russia appeals for peace—Soviet version—and condemns as a war-monger anyone who opposes what happens to be a purely national Soviet interest are familiar enough. The interest of this latest exhibition of militant "pacifism" is that it should take place on the southern doorstep of the United States.

The Caribbean area is of high strategic importance to the Americans. On its south side lie the oilfields of Venezuela, second only to the United States itself in output and still greater even than the Middle East. To the south west lies the narrow isthmus connecting two continents through which the Panama Canal cuts a narrow seaway worth an extra fleet to the American Navy. For some months a so-called National Liberation Movement has been at work in the Caribbean, carefully praised and fostered by Moscow radio, and reported to be centred on Guatemala—a country which its neighbour, the Dominican Republic, has thought fit to brand "the most dangerous Soviet nest in America." And there can be little doubt that the Communists would like to make this vital area a liability rather than an asset to the western powers.

It is against this background that nearby Mexico, with its revolutionary trade union tradition, has been chosen for a Communist-inspired "peace" congress. It is, however, also against this background that during the past month Washington has organised a special session of the Inter-American Peace Committee, set up by the conference of hemisphere foreign ministers at Havana in 1940. This special commission has enlisted the aid of twenty-one American republics in investigating possible threats to security—among which is the so-called Caribbean Legion, a group of discontented exiles from various countries in the region. No responsible leaders in North or South America can afford at this point to neglect Washington's lead. They must take the offensive against growing pressure from left-wing malcontents who, with a mixture of motives, seek to bring Moscow's brand of "peace" to the American continent.

* * *

Turkey and Syria

Turkish public opinion which is so intensely preoccupied with Turkish home politics that it gives scarcely a thought to the Arab world at its back door, was jolted into momentary

alarm by the violent end of the Zaim dictatorship in Syria. Zaim had been, with some reason, regarded as a would-be Atatürk. Though the Turks of 1950 officially deplore dictatorial regimes, he was obviously keen to copy them and to be their ally. They had shown some reserve when he first perpetrated his coup in the early spring, but his overtures were disarming. They accepted them when he issued a statement that Syria no longer had any ambition to the Hatay (formerly the Syrian Sanjak of Alexandretta), and when he applied for a Turkish military expert to train the Syrian army, General Kazim Orbay, formerly Chief of the Turkish general staff, was dispatched to Damascus. Simultaneously, arrangements proceeded for the sale of 100,000 tons of Syria's wheat surplus to Turkey.

A stable regime in Syria is important to the Turks not only for reasons of international security, but because, on a long frontier which lends itself freely to contraband, imperfect Syrian policing can impair the Turkish revenue. On several counts, therefore, the disappearance of Zaim threw Ankara into a flutter. General Orbay was told to stay where he was until the confusion in Damascus had cleared; as early as August 18th the Turkish Minister in Damascus called on the new Syrian Government; a few days later the Syrian chargé d'affaires in Ankara held a press conference to announce that relations were unimpaired. But by the 25th General Orbay was back in Ankara stating that although as far as he knew the new Government was friendly, he had unexplainedly "finished his task."

It is probable that some purely personal issue caused his return, for it is plain that both governments would like to maintain friendly relations. Turks see no harm in the fact that whereas the Zaim Government's alignment was with France and Egypt, his successor's is with Iraq and Jordan. Good Turkish relations with a stable Syrian Government are as important to Turkey's western allies as to Ankara. The doubtful factor in the equation is whether Syria's present regime can be called stable.

Peace, Retrenchment and Reform

It is a pleasant thing to have no news from the continent. We have been so long stunned, day after day, with a succession of astounding events, each one more exciting and alarming than the other, and each one after exhaling much light and heat, and filling the world with dust and smoke, only to end in the dull stagnant pool of military despotism from which it arose, that a little quietness is quite a relief. . . . We get time to breathe, and look calmly at our own condition. We are beginning to lose our apprehensions of commerce being interrupted, and our merchants becoming insolvent. . . .

We confess to some alarm lest the coming prosperity and the want of excitement for the idle should give birth to numerous unsatisfactory schemes. There is some danger lest all the energy that has been carried off in the last eighteen months by giving advice to the French, by guiding the Italians, instructing the Germans, and helping the Hungarians, should all now be directed, first and foremost, to improving our own condition, and lest we should be overwhelmed by a perfect avalanche of reforming energy. Already, our great contemporary, who, vulture like, smells from afar every prey, has broken ground, with the help of Mr Gurney's pickaxe, in favour of economy and the payment of the National Debt. We presume that it is only one of many schemes to which leisure will give birth. . . . One consolation . . . is, that each of the very busy knot of social improvers whose private affairs allow them to occupy themselves with amending the public, will so press forward his own favourite plan, and be so little tolerant of others, that they will keep each other in check. If they were all to work in harmony, we should have no resource but in flight or prayer.

The Economist

September 8, 1949

the fable of the lady and the frog

A certain Romantic Maiden, who was reckoned extremely beautiful in a rather old-fashioned way, once found a large Frog in her path, and dropped it a curtsy. "What's that in aid of?" asked the Frog. "Aren't you a prince in disguise?" she enquired, nettled. "No, Ma'am," said he, "I'm a Frog—in a hurry." And he hopped away, muttering under his breath.

Even in this age of hard work and few illusions, there are people who hope for a magical solution to their problems. TI, for their part, are planning increased production — of intricate precision tubes . . . of special paints and finishes . . . electrical appliances, fittings, cables . . . bicycles and bicycle components . . . traffic signs . . . fabricated aluminium alloys . . . parts of motor-cars, aircraft, locomotives . . . everything in short, which TI make and Britain can sell.

SPENCE CHEMICALS IN THE MANUFACTURE OF PAPER

ALUMINIUM SULPHATE, used in the sizing of paper during manufacture, is available as "Aluminoferic" (Commercial quality) with Al_2O_3 contents of 14%, 16%, 17% and 22%. For special grades of paper, the Iron-free quality, containing 14%, 17% and 22% Al_2O_3 is used.

ALUM, the purest form of aluminous compound, is used in the manufacture of the finest quality papers, e.g., parchment and hand-made papers.

UNEMUL-WAX EMULSION, used wherever a water resistant paper finish is required, is insoluble in acid or alkali and is unaffected by bacteria or fungi. These qualities, with its high degree of purity, make it eminently suitable for all types of food wrappings and paper containers.

Letters to the Editor

The Dollar Shortage

SIR,—Your leading article of August 13th "Britain in the Pillory" has created a great deal of discussion. To your conclusion that it is unfair to blame Europe's present financial difficulties on the policy of Great Britain more than on the other Western Powers, I think almost everyone would agree. On the other hand many have found that your attitude in this article towards the Government's policy of planning, control and socialisation, is not fully in accordance with the strong criticism which you have on various occasions expressed.

Political conditions and economic policies in Great Britain and Norway are very much the same, but it would certainly not be correct to say here, that these policies would not "have been substantially differently applied if another party had been in power."

Without going further into this question, which undoubtedly would to a great extent depend on the definition given to the term Socialism, will you permit me to make a few remarks on the statistical material used in your article.

(1) It is certainly correct as you say that the volume of industrial production in the United Kingdom of 131 per cent as compared with 1938 shows up well in comparison with the other Western countries in Europe. Britain has also at the same time a little more than maintained her agricultural production. But not so most of the other West European countries. As we know there was already before the war a tendency for labour to flow from agriculture to industry, and this tendency has been strongly increased by the economic policy pursued after the war. This accounts for the fact that while industrial production has increased as compared with 1938, agricultural production in Europe is on the whole now considerably less than before. In Norway the "National Budget" (which is the counterpart of the British "Economic Survey") says "we still have a long way to travel before agricultural production reaches the level of 1938." In 1948 it was 78 per cent of 1938 while industrial production was 130 per cent. The "less" in agricultural production has to be imported—and to a great extent from dollar areas—and one might therefore even say that the increase in industrial production obtained at the expense of agricultural production renders the question of international payments more difficult. Especially so as this increased industrial output is often the result of restrictionism in import policy; distortion in the demand due to "directed" economy and of autarkic tendencies generally. The cost of it is mostly too high to compete on the international market—if not it would be able to procure dollars, which obviously it is not.

(2) It is true, as your second table shows, that English exports have increased, and imports decreased as compared with 1938. But the British gap to be covered is still very much larger both for the dollar area and for the world as a total than for any other country. It may not be fair, but under these conditions it is probably natural that, as you say, "so great a barrage of criticism" should be concentrated on Britain.—Yours faithfully,
THOMAS SCHLYTER
Slependen by Oslo

The Greek War

SIR,—You may be in an embarrassing position, but why put me in one? In consequence of your recent charges against the Greeks, who are fighting our battle, you have been led into equating Mr Pallas and me with Messrs Athanassoglou and Doganis, and even to sandwiching me between them. I do not mind being thought meaty, but such bread is not to my taste. It is stale and rancid; and some hands at the bakery might be cleaner. When, however, in the same correspondence column I find you assailed for your just comments on Germany

by the familiar Richard Merton on the authority of the late Lord Ponsonby I feel that I should desist from reproach and resort to condolence on these strange absorptions of your precious space.—Yours truly,
DENHAM PLACE, DENHAM, BUCKS.
VANSITTART

SIR,—Mr Doganis is being a little obscure when he says that he has been deprived of his Greek citizenship because of his "politics." He is an old and faithful supporter of the Greek Communist Party, which is at the present moment in armed rebellion against the Greek State. He is that Party's principal spokesman and propagandist in this country, and he openly gives first loyalty to the "Provisional Democratic Government." By his own free choice, therefore, he is a subject of that "Government." He may know its present whereabouts—I don't, except that it is not in Greece. So I really fail to see why he is complaining because the Greek State has no particular desire to regard him as one of its subjects.—Yours faithfully,
S. L. HOURMOUZIOS
Greek Government Department of Information,
34 Hyde Park Square, W.2

The Repellent Germans

SIR,—It seems remarkable how often in the last hundred years the peaceful Germans have been forced to fight their neighbours; the Danes in 1864, the Austrians in 1866, the French in 1870, besides the two world wars; especially as in every case the initial stages of those wars seemed to be so perfectly planned by the Germans and never by their war-mongering opponents.—Yours faithfully,
G. S. PHILLIPOTS
Oakfield, Foxrock, Co. Dublin

BBC and the Unions

SIR,—Your eminently fair note on "The BBC and The Unions" contained the phrase: "the Governors of the BBC have felt that, having set up a Staff Association . . ."

As this may give the impression that the BBC has done something more than accord recognition to the Staff Association, may I point out that the association was formed, on the sole initiative of staff, at a general meeting held on May 3, 1940. The meeting was called by members of staff after the BBC had announced its inability, due to the outbreak of war, to continue discussions on agreed negotiating machinery.

The Staff (Wartime) Association then formed merged in 1945 with the Association of BBC Engineers to become the present BBC Staff Association, a registered trade union wholly maintained by the subscriptions of its 5,400 members.—Yours faithfully,
G. T. RHYS, Assistant General Secretary
BBC Staff Association

The Yugoslav Oil Refinery

SIR,—In your Note of September 3rd on Soviet "Peace" Campaigning you mention the blowing up of the "only Yugoslav oil refinery at Fiume." Having just returned from Yugoslavia I should like to assure you that the oil refinery at Rijeka (Fiume) is in full operation and none the worse for having been "blown up" by a Trieste reporter a week ago.

The actual damage caused by a small fire—an accident rather than an act of sabotage—was restricted to a small quantity of refinery waste. The combustion of such material usually produces a great pall of smoke and a pungent smell which to the lay observer may suggest an enormous fire. In this connection our wartime experience of enthusiastic reports of bombing damage to enemy oil targets may well serve as a useful warning. No amount of smoke, however, can conceal the fact

that Yugoslavia possesses several more refineries besides the one at Rijeka, and consequently, even the knocking out of the latter would hardly represent "a most serious blow to the country's economy."

As my business takes me to Yugoslavia at regular and frequent intervals, may I be allowed to say that there is absolutely no evidence there of any panic or even undue nervousness caused by the Soviet "Peace" campaign.

Press reports on Yugoslavia emanating from Trieste should be checked with particular care, as strangely enough, that city is now one of the main launching bases for anti-Yugoslav propaganda rockets.—Yours faithfully,

JOSEPH A. KRONSTEN

77 Eaton Place, S.W.1

West Indian Sugar

SIR,—Your article "New Regime for Sugar" states—"any project for large expansion (of Sugar production in the Colonies) would raise social problems which could not be solved merely by international agreements assuming price stability." But no other solution is offered.

In the meantime our urgent problem is to find employment for rapidly increasing populations. Unlike the Irish, Italian and Polish emigrants of the nineteenth and early twentieth centuries, West Indians are, on colour grounds and through the development of national barriers against immigration, largely debarred from seeking work overseas. Thus we must rapidly provide a great number of additional jobs. And failing the discovery of new major sources of employment, this involves expansion of production of our main staple product, sugar, by far more than the 100,000 tons per annum which you appear to consider adequate.

You mention the position of Cuba—a country, incidentally, at whose hands British investors have received scant consideration. As you say, Cuba is a special interest of the United States which has accorded that island substantial tariff and other trading concessions. The Government of the United Kingdom, on the other hand, has a definite responsibility for the economic and social advancement of the British colonies.

As to the possibly unfavourable reaction of the United States Government to long-term contracts, on reasonable terms, for British Colonial produce, I wonder if it is realised that the produce of the American colonies, Hawaii and Puerto Rico, etc., enters the United States free of duty. In other words, the chief advocates of the abolition of British colonial preferences themselves grant 100 per cent tariff preference to their own colonies.—Yours faithfully,

R. L. M. KIRKWOOD

Legislative Council, Jamaica

SIR,—British West Indian sugar producers will have no quarrel with the article in your issue of August 20th entitled "New Regime for Sugar" in so far as it is an objective survey

of the present world position, but will not agree with it on the following points:—

1. There is implicit in the recent Government communiqué an assurance of its intention, under long-term arrangements for the purchase of Commonwealth sugar, to pay prices fixed by negotiation with producers which will be reasonably remunerative to them. Commonwealth sugar prices will accordingly in future be divorced from the so-called "Cuban world price." Contrary to what the article says this must involve, in my view, separate marketing arrangements or at least differential price arrangements for Commonwealth as opposed to foreign sugars within the present bulk buying system, or something like it.

2. Colonial sugar producers appreciate what the USA has done for Cuban sugar by quotas and preferred prices and contrary to your correspondent's views, are certain that similar treatment by the Commonwealth for its own producers along the lines envisaged in the communiqué would give them the stability they need. They think this has a prior claim over considerations of what is to happen to Cuba's surplus sugar.

3. They will not appreciate the statement that large expansion would raise social problems which could not be solved merely by international agreements assuring price stability. That may be true but this they know that without assured markets at reasonably remunerative prices leading to expansion of production in the British West Indies there will arise social and economic problems the consequences of which they shudder to contemplate.

Finally, the nature of the solution proposed in the article is so nebulous as to be completely incomprehensible to me, or to any of my colleagues with whom I have discussed it. We would welcome more concrete proposals.—Yours faithfully,

R. GAVIN, Secretary

The West India Committee, 40, Norfolk Street, W.C.2

[The article did not suggest that differential prices for Commonwealth and foreign sugars could not exist; in fact it stated that a system of differential prices could be incorporated into an international marketing scheme. Britain is no longer in the position to take unilateral action in developing Commonwealth sugar production without considering its effects on Cuba and the United States. Hence a purely Commonwealth marketing scheme as such is ruled out. Finally, if Commonwealth production is to be developed to the point of self-sufficiency, the necessary expansion would be so large that unless it were conceived as a sociological instead of an economic project, long-term stability to the producing areas could not be assured.]

Unrighteous Asparagus

SIR,—The imposition of a £20 fine upon a West End restaurant for serving two enforcement officers with asparagus as a separate dish, instead of with the chicken, emphasises afresh the absurdity of the regulations which harass British restaurants and hotels.

The three-course rule permits only one main dish to be served, but though fresh herrings, sole and uncooked oysters do not constitute a "main" dish, kippers, snock and cooked oysters do. The 5s. limit is so unworkable that the Ministry has had to permit all manner of additional charges, e.g. house

charge, band and service charges, etc. The figure of 5s. was, in fact, fixed many years ago, and before Catering Wage Board regulations had augmented the costs as well as the complexity of hotel-keeping.

The Government recognises the urgent need for increasing the national income by encouraging the tourist traffic. At the same time Government restrictions make it increasingly difficult for the hotel industry to satisfy its customers, and for those who direct it to make both ends meet. The "paid holiday" movement increases the demand for accommodation, while regulations tend to diminish the supply. The continuance of rationing tempts, if it does not drive, people to take their meals away from home; but the restaurateur is increasingly forced either to disappoint his clients or to break the law. The need to avoid wasteful Government expenditure is nowhere denied, yet enforcement officers can earn a livelihood by eating their way (at the taxpayer's expense) through restaurants which break the law not by the size of the meal which they offer but

Colonial Problems from Three Standpoints

"Empire and After." By Rita Hinden. Essential Books Limited. 193 pages. 12s. 6d.

IN "Empire and After," Miss Rita Hinden presents an interesting history of the philosophy of British colonialism, but shows the present generation to be no nearer to a cut-and-dried solution than its forebears. Using the past history of their mental approach to the facts of colonial aggrandisement to "whet the appetite," she examines future policy from the standpoint of one who, in common with the two major political parties in the country, accepts self-government within the Empire as the ultimate, or at any rate the next, objective. In what she describes as the "declining years"—surely, if that objective is attained, the "crowning years"—would be more apposite—of British imperialism, she finds two main problems still to be solved. One is to evolve the right relationship between the dominant power and the subject races, the second is to retain the latter, once manumitted, within the Commonwealth.

In the first instance she believes that what was achieved in the case of the white colonies in the last century, and the Asiatic in this, can be repeated now in Africa, the Caribbean and elsewhere. It is a matter of appreciating the psychology of dependent peoples and of developing a technique of co-operation between races. Although she believes that "the problem has only to be stated clearly, for the outline of the answer to emerge," she does not really give us any very practical suggestions about how this shall be brought about. The difficulties of eliciting co-operation from a nationalist minority while it is still subject to alien domination are, as is well known, formidable, principally because the more level-headed leaders who appreciate its necessity are quickly denounced by extremists as "imperialist agents." In fact, the history of trade union leadership in the dock strike is a very good parallel to what happens when colonial political leaders associate themselves with government.

Nor are we given much guidance on the attainment of an equitable solution in "plural" societies, that is, in colonies where several races, black, brown and white, have a stake. Indeed Miss Hinden seems at times to be unduly hard on the white settlers, who, whatever their motives, have carried most of Equatorial Africa on their shoulders. As for the retention of the colonies within the Commonwealth, Miss Hinden ends on a note which leaves her readers in doubt as to whether she considers it possible or even desirable. This choice has been more succinctly stated by Dr Awolowo, in his "Path to Nigerian Freedom."

by the intervals at which they serve its component parts.—Yours faithfully,

A. H. JONES,
Managing Director

Grosvenor House, Park Lane, London, W.1

GKW and GOK

SIR,—Your note headed "Oh Bring Back My Bottle to Me, to Me" was a most refreshing oasis to a traveller through your arid desert of economic facts and theories. Your suggestion that all those half-empty bottles of medicines we all accumulate should be concentrated into one large jar labelled "GKW"—signifying God Knows What—solved a problem which has been worrying me for some weeks. A month or so ago, one of my staff sent a Medical Certificate to the effect that she was unable to carry on her normal employment because she was suffering from a disease which her doctor diagnosed as "GOK." At last I know what he meant.—Yours faithfully,

S. J. B. CULL

Kingston Hill, Surrey

Nigerians prefer to remain within the Empire simply because they realise that it is more sensible to choose the least of many evils. . . . No nation can stand absolutely independent. . . . And if there is truth in the saying that old friends are better than new, then there is wisdom in staying where we are. We must not allow personal grievances to blind us to the virtues of the Empire."

The main portion of the book contains a selection of quotations from British statesmen and writers on colonial relations since the mid-eighteenth century, and is, as the author warns us, "an essay in self-criticism." Even so, if read as an anthology, the sum total affords an impressive record of the creative imagination which has gone to building-up the empire, and this impression survives the assiduity with which Miss Hinden hauls to the surface instances of smugness, hypocrisy and meanness when she finds them. Two strands of thought are pursued through these pages. One is the ever-recurring materialist query: "Does the possession of the Colonies bring us profit?" Discussion of it would arouse more contemporary interest if something was said of the place of the colonies in maintaining the trade equilibrium between Europe and the western Hemisphere over the last four decades, but of this there is no mention.

The second is concerned with the different moral interpretation that succeeding generations have put upon colonising activities—the *Pax Britannica*, sense of mission, paternalism, trusteeship and partnership. Again, no very clear answer emerges, and the list would have gained by the addition of a quotation from one non-British lover of Africans, Dr Albert Schweitzer, who has observed that the impact of world trade on primitive peoples was a fact which neither they nor we could prevent. The function of the state, on his argument, in colonising was to minimise the evils of this impact and eventually to develop among the colonial peoples themselves a new social and political order. Certain it is that until this latter function is performed no final judgment on British imperialism can be passed.

"The Sociology of Colonies." By René Maunier. Edited and translated by E. O. Lorimer. London, Routledge and Kegan Paul. 2 Vols. 767 pages. £3 3s.

THE book is a translation of what is regarded in France as a standard work on "colonial sociology." Its three parts were originally published in 1932, 1936 and 1942, which explains why recent changes in colonial affairs receive no mention. Ostensibly Professor Maunier's aim is to deduce general principles applicable to the colonial experience of all colonising nations from the ancient Greeks to the modern Russians. In fact, he draws mainly on French history and experience.

The occasional examples adduced from classical antiquity and from Dutch or "English" (sic) colonial history are often wrong in matters of fact (as the translator points out in her editorial footnotes) or biased in interpretation. Indeed, careful documentation of matters of fact, even where French colonial history is cited, is markedly lacking. For, in spite of his protestations of objectivity, what Professor Maunier is to expound is a system of concepts and ideas designed to interpret French colonial experience.

Yet there is much of importance to be learnt from this book. Professor Maunier shows that colonisation has always tended to take the same course, to display similar features and to meet with the same problems in the dependent territories of all European Powers. He argues that the process of establishing, maintaining and developing colonies is a complex activity involving the whole of the metropolitan civilisation. Granted the primacy of economic (capitalistic) motives ever since the Spanish colonial era, it is nevertheless important to recognise that the course of colonial development is fundamentally influenced by political ideologies, religious movements and cultural changes in the home country. This is clearly seen, for example, in colonial "autonomism"—i.e., nationalism—which emerges inevitably and with a strength proportional to the spread of western institutions and ideas in the colonies.

The critical feature of colonisation, says Professor Maunier, is "the contact of peoples" in which "two differing civilisations are pitted against one another." This contact has many forms, such as harsh conquest, emigration, domination, etc.; but when, as during the last 100 years, the stage is reached of bestowing security and prosperity on the—often recalcitrant—native peoples, the way is open for "partnership," an ideal rooted in western social democracy. Finally, there ensues some form of "emancipation." Economic and political contact involves cultural contact, both collective and individual, and often marred by hostility, prejudice and ignorance on both sides. To make constructive association possible the native peoples must be brought into the orbit of European law. The ideal way to achieve this is by education; but force, ending often enough in brutal wars of extermination, has sometimes been necessary. Resisting at first, the natives later imitate and learn from their rulers, taking over technical, juridical and theological institutions and customs. Fusion by legal or illegal miscegenation is one of the problems that arises, and in this connection Professor Maunier has some pungent remarks about race and colour prejudice among the French.

Professor Maunier then discusses what he calls the "mental forces" which have directed colonial evolution. This is mainly an historical analysis, in general terms, of the doctrines and ideologies of colonial expansion as expressed by representative statesmen, administrators, missionaries, etc. What is striking is the frequent parallels between British, Dutch and French thought on colonial problems over the past two centuries.

The last part of the book, which takes up the whole of volume 2, is devoted to the progress of law. This, in Professor Maunier's view, is the crux of the colonial problem. The Law

is the State, and the fundamental problem of contact is the conflict between the secular, impersonal State with its codified legal system based on the concept of public order and individual responsibility, and the Tribe with its oral, personal law based on kinship, common cult and group responsibility. Drastic measures may be required to transform tribal-society into state-society, but in the long run compromise and education succeed better. Here Professor Maunier is in his element, and his analysis of the expansion of the State in colonial conditions is brilliantly done.

"The Concept of Colonisation." By Herbert Frankel. Clarendon Press. 24 pages. 2s.

THE words "colonial economic affairs" suggest groundnuts, sugar, over-population, sterling-dollar problems, Malayan banditry, and the like: the political background against which these are considered is apt to be equally impermanent. The Inaugural Lecture on "The Concept of Colonisation," delivered by Professor Herbert Frankel, the first incumbent of the Chair of Colonial Economic Affairs, at Oxford last June, is the more worthy of attention as an essay in the philosophy of colonisation in that it recalls attention from short run to timeless problems. The process of colonisation, whether through settlement, administration or economic development, is seen as a special instance of the basic process of social and economic growth and diversification. Economic adaptation and social mobility are the key factors. The regrouping of individuals to form "a new pattern, a new cell, a new colony of economic activity," is as apparent in the launching of a new industry in home territory as in the clearance of a jungle; the psychology of innovation, of free-lance or co-operative pioneering, is the same; and every such "colony" is necessarily integrated, by the necessities of a world-wide division of labour, into the general stream of economic endeavour.

The conspicuous facts about colonisation in the everyday sense—the elements of distance and climate, the formation of constitutional entities, the clash of race, nationality, culture—mask this essential likeness and the relationship of the metropolitan authority to the nascent or developing colony has a deceptively one-way look, very encouraging to the builders of supposedly permanent ring-fences, to the more self-satisfied type of planner, and to the un-historically minded generally. "In the long history of colonisation," says Dr Frankel, "there has been but little comparative analysis of the factors which made possible, or prevented, the successful integration of metropolitan societies within the larger economies to which they gave birth." It is time that this lack was remedied. The more purposive the direction of colonial—or other—economic affairs, the more essential it is that that purpose should be framed in the light of something more enduring than the current structure of commodity prices or the comparative nuisance value of competing grievance-bearers.

University Text Books

The shortage of text books is less acute than it was, but there are still not enough to go round. Students and others requiring books for the new university term should, therefore, place their orders **now**, when stocks are at their highest and before the beginning-of-term rush.

We specialise not only in economics, but also in the social sciences, history, and allied subjects.

THE ECONOMISTS' BOOKSHOP,

Two French Economists

"A Short Treatise on Money and Monetary Systems." By Bertrand Nogaro. Staples. 214 pages. 17s. 6d.

THIS book is rather an oddity. Written with practised competence in the best French academic tradition, embodying the fruits of a lifetime of study (the list of Professor Nogaro's published works begins, with a volume on money in international trade, in 1904) it deliberately excludes all consideration of credit and (in the author's own words) "of monetary problems considered in the context of the economy as a whole"—that is, of those very aspects of "money and monetary systems" which most occupy the minds of present-day economists. Professor Nogaro's approach is inductive and historical, and anyone wishing to know how bimetalism functioned, and how informed public opinion was gradually weaned from the notion that money is essentially a commodity, will find the necessary information presented here with admirable clarity. There is also to be found some suggestive discussion of the causative sequences of price change, and an independently evolved version of the Keynes Plan for international exchange stabilisation. (This is the only connection in which Keynes' name is mentioned.) On the whole, however, the whole book is of archaeological rather than contemporary interest.

"Esquisse d'une Théorie Générale de l'Equilibre Economique." By Claude Gruson. Presses Universitaires de France. 324 pages.

THIS is uncompromisingly a professional economist's book, closely reasoned, highly abstract, making no concession (beyond a meticulous avoidance of undefined technical terms) to the lay reader. M. Gruson's aim in writing it appears to have been twofold: to present Keynesian theory to his qualified compatriots, and to cast that theory into a more rigorous, indeed an almost Euclidean, series of definitions, propositions and logically developed demonstrations. It is possible to hold

Collective Security provided by Chubb Safe Deposits

PRESTIGE and profit are two results of the installation of a Safe Deposit for the use of customers or of the public in general. Facts about the demand for this type of service, and the most effective means of meeting it, are contained in the attractive and informative brochure "Collective Security." Among the many illustrations are photographs from various aspects of modern Chubb Safe Deposits and a plan of a typical installation. Write for a copy now.

CHUBB & SON'S LOCK & SAFE CO. LTD.
Makers to the Bank of England

40-42 OXFORD STREET, LONDON, W.1

that the second aim is better achieved than the first. The General Theory is indeed implicit in the "Esquisse d'une Théorie Générale," and its inspiration is explicitly underlined in M. Gruson's introduction; but at no stage does he pause to say, "This is Keynes' concept; here is mine; they are exactly equivalent or diverge in such-and-such a respect." Nor is there any mention of other economists—English, American, Austrian, Scandinavian—who have at various times anticipated, enlarged upon, or criticised Keynesian theory. This work, in fact, exemplifies to a striking degree not only the beautiful cutting edge of the French analytical mind, but the isolation of French economic thought.

Shorter Notices

"Employment and Equilibrium." By A. C. Pigou. Macmillan. 277 pages. 18s.

THIS work, dealing on an abstract and frequently mathematical plane with the necessary conditions of economic stability and the influences disturbing these, was first published in 1941 and has now been revised in the light of intervening criticism. It is unequivocally for the well-equipped professional economist.

★

"The Viking Lands." By Gordon Young. Evans Brothers, Limited. 154 pages with plates. 9s. 6d.

THIS is a pleasant enough book, superficial and stereotyped, but accurate in the main and describing in stock phrases the stock reactions to the life and landscape of Norway, Sweden and Denmark. The author is handicapped by his attempt to cover too much ground, so that the work smacks rather of the guide book. This feeling is reinforced by the many unfamiliar proper names, sometimes spelt in an unfamiliar (though strictly accurate) way—Karl XII for the redoubtable Charles XII of Sweden or von Linné for the great Linnaeus.

BANK-INSURANCE UNITS

THE investor in Bank-Insurance Units secures a freely marketable investment spread over 50 high-grade equities, the Trust Fund being made up as follows:

Insurance companies	..	38%
Dominion, Colonial & Overseas banks	..	27%
Home banks	..	23%
Discount companies	..	7%
& Trustee securities	..	5%

In recent years there has been a steady upward trend in the distributions paid on Bank-Insurance Units, and the Managers consider that the distributions for the coming year will be maintained.

Offer price, 6th Sept. 20/4½d. Yield (conservatively calculated on net cost which includes commission and 2% Gov't Stamp Duty), £3-11/11%, subject to reduced rate of tax allowing for D.I.T. relief.

Units can be freely bought and sold at quoted net prices (and information obtained) through any Stockbroker or Bank.

AMERICAN SURVEY

Puzzle of Plenty

(From Our American Staff)

THIS year, as last year, Congress is being pressed to enact a farm programme before adjournment and once again the Senate is trying to make the long-term readjustment in agricultural policy which the House of Representatives, passing a frankly interim measure, has preferred to postpone. Last year the House, putting the hope in the Hope-Aiken Agricultural Act, continued the high wartime price supports until the end of 1949, when a new system was to come into force under which price supports would fluctuate in inverse ratio to supplies. This scheme, for which Senator Aiken was responsible, also modernised the parity formula which relates the prices farmers receive to those they pay for what they have to buy, and on which the support prices are based. This Act would mean an unpleasant fall in price supports next year—election year, when the outcome will probably depend on the farm vote. The House, deciding that it would be politic to put off the evil day until 1951, repealed the Aiken section of the Act a few weeks ago and continued the temporary, but at least rosy, Hope section for another year.

The Administration had already produced the so-called Brannan plan as an answer to the rigours of the Aiken Act, but the House repudiated this, by 239 votes to 170, and the Senate is not even expected to consider it. But the Senate is no more likely to swallow the Hope proposals whole this year than last. It is almost certain that, when the two Houses go into conference on an Agricultural Act, the Senate's version will be the Bill prepared by Senator Clinton Anderson, of New Mexico, the former Secretary of Agriculture; this has been approved by the Senate Agriculture Committee with reservations and the Administration is prepared to accept it. The Anderson proposal is closely akin to the Aiken Act; it is another example of the tendency of the Eighty-first Congress to continue the measures of its predecessor, after changing the names of their sponsors. By introducing a system of flexible price supports, it attempts to allow prices to serve as a means of allocating the use of agricultural resources, while at the same time protecting the farmer from price fluctuations so wide as to be ruinous.

The Anderson Bill is a witness to the power of the American Farm Bureau Federation, whose national president, Mr Allan Kline, had seventeen state presidents on hand to endorse his testimony before the Senate subcommittee which drafted it. The Bill contains a few provisions which the AFBF does not like, but also a number of refinements on the Aiken provisions which the Bureau proposed as the result of a conference in which compromises were worked out between its own sectional interests. The most troublesome internal disagreement has been between the cotton farmers of the South and the grain farmers of the Middle West. The basic reasoning behind last year's Bill remains: it is desirable to have floors under farm prices; to have resources allocated by the price mechanism above those floors, thereby leaving farmers freedom of choice and encouraging agricultural output to change as demand changes; and to provide standby methods of controlling

production, over and above the price mechanism, to be used if and when that mechanism proves inadequate.

This emphasis on the use of price as a regulating factor is in sharp contrast to the Brannan proposal, which would let prices seek their market level, while raising farmers' incomes to a given standard by government payments, voted annually by Congress. Adherents of the Anderson-Aiken approach insist that the rewards offered by the Brannan programme are so high that production is bound to rise to a level that would require permanent acreage and marketing controls; in that case the government would set both the volume of production and the level of income to be derived from it. Yet there is room to wonder whether the new Senate Bill, like the Hope Bill, is not essentially an interim programme, which would mitigate the immediate agricultural difficulty, but prove insufficient to solve the long-term puzzle set by the American farmer's phenomenal capacity to produce.

*

A good deal of readjustment in the agricultural situation has already taken place. Prices received by farmers for oil-bearing crops, feed grains, meat animals and dairy products are all sharply down from a year ago, to or near the support level, with the averages for livestock and products down 22 per cent and for all crops 13 per cent. Yet, after this readjustment, the ratio between prices received and paid by farmers still stands at 101 of parity, and the prospect of continued strong demand for farm products is improving as the recent recession recedes in its turn. The latest estimate of this year's harvest puts it only slightly below last year's record. Apart from a few further downward adjustments, 1950 is therefore expected to be a good year for the farmer. But 1950 will also probably bring an accumulation of agricultural surpluses. What then?

The attempts made in the Senate to dispose of these surpluses through the Economic Co-operation Administration show that the farmer's eye is already wandering to exports. The International Wheat Agreement may take care of part of one crop. Talk of a two-price system, of export subsidies and so forth, is likely to be increasingly frequent. But it is recognised that the farmer's major market is at home and, along with general concern for the maintenance of domestic purchasing power, there is interest in methods of directing output so that full and uncontrolled production can be allowed.

All present plans resort, in the end, to acreage limitations

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

and marketing quotas. Yet experience since the first world war, and particularly since 1933, has raised doubts whether such measures are effective. In practice, output has been stepped up continually in spite of acreage restrictions, since farmers have kept their most productive land in use and have cultivated it more intensively, with more fertiliser and mechanical aids, and better quality seeds. To the extent that genuine means for reducing production are as yet undiscovered, all farm programmes are designs for moving one season's crop out of the market to make room for the next, while protecting the farmer from the financial effects of expanding supply beyond effective demand.

Three of the six basic crops, tobacco, peanuts and cotton, seem to be more or less amenable to production controls, partly because of the relatively smaller acreages on which they are grown, compared with grains. But these three together occupied less than 28 million acres in 1948, while maize and the grains traditionally used for feed were grown on 145 million acres and wheat, soybeans, flaxseed, all of which are increasingly used for feed, covered another 87 million. These are substantial totals to administer under controls; since their production is highly mechanised, fixed costs cut into farm income if volume is reduced, and a small profit per unit sold can mean a good sized income. The problem of grain stocks, however, can be solved if there is a steady and growing market for livestock. According to a Michigan State Agricultural College study, two per cent more livestock in the country during the years 1930-48 would have cleared up the wheat surplus; five per cent more would have absorbed the surplus of all feed grains.

In this light, city purchasing power appears to be the farmer's best farm programme. More meat would certainly have political appeal in city areas. But there are other farm products of which consumption is persistently declining, and these have already demonstrated how programmes for supporting prices and controlling output may prove so costly and so ineffective as to bring on a taxpayers' revolt. In the case of potatoes, that stage has been reached. The cost of the potato support programme last year ran to some \$225 million. Marketing restrictions have cut this year's crop to an estimated 362 million bushels, in contrast to 446 million last year. But it will still cost an estimated \$50 million to take unwanted potatoes off the market, and big growers are being paid as much as one hundred thousand dollars each by the government. The Brannan scheme has at least the advantage that under it the city dweller does not pay twice over for his food, once in taxes, once in high prices.

Academic Freedom

[FROM A SPECIAL CORRESPONDENT]

ACADEMIC freedom has been a far from academic subject in the United States this summer. Both light and heat have been generated by the problem, which periodically vexes America, of how to maintain freedom of inquiry without offering opportunities for subversive activity. Much of the light has been supplied by the report of the Educational Policies Commission of the National Education Association. The convention of the NEA subsequently voted that, while members of the Communist Party should not be permitted to teach in the nation's schools, neither should teachers be required to take oaths of loyalty.

The heat surrounding the subject has been supplied by the Un-American Activities Committee of the House of

Representatives, and its smaller-scale imitators in a number of states. The former, stimulated by a complaint from the Sons of the American Revolution, requested representative schools and colleges to furnish it with a bibliography of the textbooks and supplementary reading used in social science courses. Its booklet, "100 Things You Should Know About Communism and Education," claims that "Communists have always found the teaching group the easiest touch of all the professional classes for actual Party zealots and fellow travellers. . . . Sometimes this is due to frustration. . . . Sometimes it is greed or love of power. Sometimes it is misplaced idealism."

State investigators have held public hearings on Communism in the teaching bodies of public and private institutions. The Broyles Committee in Illinois, and similar bodies in the states of Washington and California, are conspicuous examples of activity on the state level. Both Maryland and New York have passed laws requiring school authorities to investigate the loyalty of individual teachers and, after granting hearings, discharge those found disaffected. In New York, the state educational authorities are to prepare a list of "subversive organisations"; membership in such organisations will be ground for dismissal of teachers. Twenty-seven states now require loyalty oaths from teachers in the public (i.e. state) school system.

These measures, and the arguments they have inspired, underline the age-old difficulties inherent in combating an idea. In the present controversy, the desire to safeguard freedom of inquiry as the fundamental basis of new knowledge, mistrust of intelligence, and assorted ulterior motives, are all playing their traditional parts. This time, however, two new factors are apparent. There is general agreement that a member of the Communist Party is not a free man,

A Banking Link between Britain and the U.S.

THE CHASE NATIONAL BANK OF THE CITY OF NEW YORK

A United States Corporation with Limited Liability

LONDON — 6 Lombard Street

51 Berkeley Square Bush House, Aldwych

but a person who has sacrificed his capacity for individual judgment and serves his superiors with often fanatic devotion; to him, freedom of inquiry is a weapon which can be turned against those he wishes to destroy. The existence of atomic bomb secrets also introduces new complications. In June, Mr Frank Oppenheimer, a nuclear physicist and younger brother of the wartime director of the ultra-secret Los Alamos laboratory, admitted that he and his wife had been members of the Communist Party for three and a half years, shortly before he worked on the atomic bomb project. Mr Oppenheimer refused to name any of his Communist associates, though the Un-American Activities Committee is on their track; he insists they were "decent, well-meaning people," and that he and they maintained "complete loyalty to this country and its government." The probers recall, however, that it was naive idealism which started Dr Alan Nunn May down a road leading finally to a crime against his country.

Dr James B. Conant, the president of Harvard University and wartime director of nuclear developments, recently told the sponsors of the new Harvard Foundation for Advanced Study and Research:

In this period of a cold war, I do not believe the usual rules as to political parties apply to the Communist Party. I am convinced that conspiracy and calculated deceit have been, and are, the characteristic pattern of behaviour of regular Communists all over the world. For these reasons, as far as I am concerned, card holding members of the Communist Party are out of bounds as members of the teaching profession. . . . But with this single exception which is the unique product of our century, I maintain that a professor's political views, social philosophy or religion are of no concern to the University, nor are his activities within the law as a private citizen. . . .

As long as I am President of the University, I can assure you there will be no policy of inquiry into the political views of the members of the staff and no watching over their activities as private citizens. Any suggestion that we should employ here procedure comparable to that required by the necessities of secret government work and investigate the loyalty of our staff is utterly repugnant to my concept of a university. On this point I am sure you will all agree. You will likewise join with me in condemning the careless, incorrect and unjust use of such words as "Red" and "Communist" to attack teachers and other persons who in point of fact are not Communists but who merely have views different from those of their accusers.

A few other administrators have taken stands similar to that of Mr Conant, and more have applauded him. But in many state universities and small colleges, the typical attitude is that of the president of a western Illinois State College, who was asked by a member of the legislative committee investigating seditious activities: "If anyone in your university was giving emphasis to some foreign ideas, you would not permit him to remain?" and who loyally answered: "Certainly not. I think you know that, Mr Thompson."

★

Today's investigators, however, are for the most part more adult than their predecessors of a generation ago. During the first world war, alarmed legislators thought patriotism required a ban on the teaching of the German language and culture. In the Red scare that followed, teaching about Socialism, Communism and Russia was often suspect. Nowadays Russian studies are booming. Before 1940, the teaching of Russian was almost unknown; today, there are some 5,000 students of the language in colleges and universities. There are many more in private classes or teaching themselves with the aid of gramophone records or specially devised manuals.

"Area studies" which combine the language, history, geography, economics and culture of a region—usually Russia—are the latest academic style. Teaching about Russia, Communism and Socialism is now found in social science courses for children as young as 10 or 12. Russian language textbooks and school and university books about Russia now in use do include some rosily pro-Soviet ones; but these more often represent an undue respect for the pro-Russian foreign policy of the period in which they were written than any subversive intent. Local communities, moreover, are demonstrating their ability to winnow with good sense.

This year's scare also reflects a different attitude towards teachers. Back in the days when most American businessmen and political leaders were self-made men with little education, the usual charge against teachers was that they were idealists in ivory towers. Nowadays this view is seldom heard. The present drive against subversive influences in the schools is based on the opposite assumption, that teachers wield a very powerful formative influence. This is all the greater now that most Americans do not leave school until they are 17, and the authority of the home and church have been weakened. Former professors are frequently encountered, and often successful, in both government and business. This new recognition may be some compensation to bodies like the NEA, the American Association of University Professors, and Phi Beta Kappa (the honorary scholastic society) when they are driven to call on their members "to withstand the emotional pressure, from whatever quarters, to substitute dogma for critical analysis."

American Notes

New York at the Starting Post

The Democrats have put forward two strong and experienced entries for the important election races which take place in New York in November. The city's 8,000,000 voters are to elect a Mayor, and other officials, for the next four years; New York State must elect a Senator to fill out Senator Wagner's term, which expires in 1950. Mr O'Dwyer, the present Mayor, after renouncing further political ambitions in the spring, and allowing the machine to discover for itself that he was indispensable, has gracefully acceded to the "draft" supported by city labour unions and, it is believed, by Mr Truman.

Control of the city, which has a population larger than many States, and a budget second only to that of the federal government, is a stake in which the national party is naturally concerned. Mr O'Dwyer, although a Democrat in a city where the cry of reform has long been a Republican monopoly, has a number of solid achievements, particularly in welfare, to his credit; and he has begun his battle by turning on Tammany, the notorious and now almost toothless Democratic machine in Manhattan. With one hand, he has rejected the support of its "sinister elements" and, with the other, engineered a palace revolution in its leadership.

Last week Mr Herbert Lehman rounded out the Democratic ticket by agreeing to run for the Senatorial post to which Mr Dewey recently appointed Mr John Foster Dulles on a temporary basis. A political slate in New York must give consideration to the claims and prejudices of both Catholics and Jews; Mr Lehman, now 71, can count on Jewish support, but he has other assets: a humanitarian record, four terms as Governor of the State, proved administrative ability, and an appeal to voters of all groups. When this appeared to be jeopardised by Cardinal Spellman's attack on Mrs Roosevelt, which brought Mr Lehman to her support, Mr O'Dwyer made energetic and successful efforts to heal the breach.

Mr Lehman has lost only one election, and even then, in the Republican landslide three years ago, he ran 400,000 votes ahead of other Democratic candidates. He should derive some help this year from the mayoralty race (which brings out a heavy vote in Democratic New York City) while he, in turn, introduces larger issues into the whole campaign. His candidacy has encouraged the Republicans to put great pressure on Mr Dulles to run for the seat he now holds in the Senate. Mr Dulles has just announced that he will gladly accept the Republican nomination. Party loyalty, and a taste of the joys, as well as the aggravations, of shaping foreign policy from the inside have evidently overcome the doubts which led him to insist, in the past, that he could not be a candidate.

Neither Mr Lehman or Mr O'Dwyer will have—or would care to have—the support of the American Labour Party, which has moved so far to the left that its endorsement is a liability. It is nominating Mr Marcantonio for Mayor. Mr Lehman has, however, been endorsed by the Liberals, who decided in 1943 that they could no longer accompany the fellow-travellers of the ALP. In the city elections, the Liberals have joined hands with the Republicans to support Mr Newbold Morris, who served with Mr La Guardia; not all Mr O'Dwyer's crusading fervour has convinced them that under his shining new Fair Deal armour there are not to be detected the same old Tammany stripes.

★ ★ ★

Higher Floor for Wages

Another of Mr Truman's election pledges was redeemed last week when the Senate, after only two days' debate, and in a hurry to depart on a six-day holiday, voted to raise the national minimum wage from 40 to 75 cents an hour. As was the case with low-cost housing, however, the Administration was forced to call in the Republicans from industrial states to compensate for defections in its own ranks. Without their aid it would not have been possible to repel the attempts of Democrats from the lower-wage South (where, to be fair, the new minimum will be felt more widely than in the North) to reduce the figure to 65 cents or even less.

Broadly, the Fair Labour Standards Act applies to workers in inter-state commerce, not to those who produce goods and services sold in the same state. In the House, which has already approved the Bill, the 75 cent minimum was passed only at the price of exempting over a million workers, or rather their employers, from the requirement to pay it. In the main, these would include the unorganised clerks, stenographers, and employees in retail trade, who stand in most need of protection but who can be excluded by a rigid definition of what constitutes inter-state commerce. In the Senate the Administration, which several months ago abandoned its hopes for extending the coverage of the Act, was able to keep new exemptions down to 200,000 or less, including some 2,000 home sewers of baseball covers in Tennessee for whom Senator McKellar gallantly went to bat.

If the Senate conferees are able to convince the House that the number of workers covered should remain substantially unchanged at about 22.6 million (out of a total labour force of about 64 million), it is calculated that about 1,300,000 will have their pay-packets increased. Although they are not exactly comparable, hourly earnings ranging from \$1.11 in retail trade to \$1.38 in manufacturing and \$1.95 in building explain why Congress did not balk at a statutory 75 cents an hour. The official net to break the fall of the artists on the high-wage trapeze has been raised from the meaningless 40 cents an hour accepted when the Act was passed in 1938, but the descent from present levels would have to be very steep to test its strength. With new unemployment declining, there are no signs of this, despite the bravado of the shipping employers, who have "insulted" the longshoremen by suggesting a wage cut, and similar proposals to typographers employed by four newspapers in the national capital. More immediately effective than the Wage-Hour standards are the minimum

wages for firms accepting government contracts which are being set by the Secretary of Labour at levels close to those prevailing. Any increase in government purchasing or building to offset a recession, for example, would widen an impact which most employers are likely to feel at least indirectly.

On the other extreme, a Supreme Court decision on overtime pay for stevedores, which would have sent some wages soaring through the industrial roof, has been set aside by Congress and the Bill signed by the President. The Court ruled that premium rates of pay for work done at night and on holidays must be allowed for in calculating the regular wage rates which are the basis for computing pay for work in excess of 40 hours a week. This decision made stevedoring firms liable to claims for back pay amounting to millions of dollars. The new Act, which had the backing of both employers and labour unions, removes this liability, both in the past and for the future, and applies to all workers covered by the Wage-Hour Law.

★ ★ ★

Death of a Wizard

Dr Samuel Green, who died in August, had just been raised to the rank of Imperial Wizard in the Georgia Ku Klux Klan in recognition of his five years' reconstruction of that discredited organisation in his own state and elsewhere, especially in Alabama, Tennessee, South Carolina and Florida. His death seems to have split his empire; a Mr Lycurgus Spinks has been crowned Imperial Emperor of the Knights of the KKK, but is regarded as a pretender by other branches of the Klan. Its present membership is over 100,000 but Dr Green's success seems very limited when compared with the influence achieved by this anti-Negro, anti-Catholic secret society after the first world war. Then hundreds of thousands joined it, even if they did not all parade in the traditional sheet and pillow-case to burn fiery crosses, to flog and even to

TRAVEL CAREFREE

BANK of AMERICA
TRAVELERS CHEQUES

Protect your funds against loss or theft

kill. Then aspiring politicians in the South found it expedient to come to terms with the Klan; now it is only in Georgia, Dr Green's home ground, that politicians do not repudiate its support.

Even in Georgia, where the State Legislature has refused to outlaw masked organisations, local communities have done so, and across the border in Alabama an aroused public opinion has been dealing drastically with the latest outbreaks of the "hooded violence" that has been increasing ominously in the South. The victims nowadays are usually white and their alleged crimes moral or social. Klan leaders indignantly deny that their society approves these outrages or is anything more than a patriotic organisation. They have ordered their followers to cease wearing the masks which give opportunities to criminals and others to turn the awesome reputation of the Klan to their personal ends. In Alabama not only has the wearing of masks been banned by law, except at carnivals, but a grand jury has also returned indictments against a number of participants in the recent incidents, including a police chief and a deputy sheriff, and has imprisoned the Grand Dragon of the Alabama Klan for refusing to give access to his membership lists. However, a second grand jury, which took over after the first was exhausted, adjourned in confusion when one of its members was found to be himself a Klansman.

This commendable energy, inspired in part by the certainty that Washington would interfere if nothing were done locally, will only be effective if the accused can be convicted and punished. It is the difficulty of obtaining local enforcement that has led to the demand for federal protection of civil rights: for instance, no one has been punished for any of the 26 lynchings that have taken place in Georgia since 1930. The only three lynchings since January, 1948, have been in Georgia, a state where the Klan has much of its present strength and where rural educational standards are extremely low and the rural influence is dominant. All of this is very strong evidence on the side of those who argue that education is the only effective answer to the prejudice and terrorism that are epitomised by the Klan. But the powers of the Wizards are already weakened when, as has happened at recent Klan-claves, Negro children dare to prance behind the procession draped in their mothers' bed-sheets.

Beveridge—Pacific Style

Americans have no need to cross the Atlantic to study the welfare state in practice: they have two on their own continent. The states of Washington and California are both deep in experiments which, with the Pacific coast's well-known inability to do anything by halves, are already out-Beveridging Beveridge.

Under its Citizens' Security Act, Washington embarked last January upon a complete "cradle-to-grave" programme for its needy, which provides free care for mother and child before, during and after birth and \$100 towards funeral expenses. During the lifetime between, relief allowances for rent, food and clothing are so generous that an unemployed man with a wife and three children can draw benefits of \$292

a month, while his earnings as, say, a teamster would amount to only \$275. In addition, while he is out of work, he and his family are entitled to free medical care, which includes dental and hospital treatment, hearing aids, spectacles, massage, and so on. There are similar plans for dependent children, for the blind and for all needy old persons in the state. The latter are paid at least \$60 a month after they are 65; 36 per cent of persons of that age, 68,000 people, are drawing such old-age pensions, which average \$67 a month.

In California last November, the voters, amongst whom there is a higher proportion of old people than in any other state, raised the maximum pension from \$65 a month to \$75, lowered the age-limit from 65 to 63, and practically abolished any means test. This scheme does not yet go as far as either the Townsend or the "Ham-and-eggs" programmes of the nineteen-thirties, but it has at least become law, which neither of them did, and its political influence may prove as strong as was that of its predecessors. The new protector of California's aged is Mr George McLain, a personable and far from aged demagogue, who is already rallying the state's biggest pressure group against the attempt to amend the pension scheme which is to be made at a special election next November.

The State Legislature has no control over the scheme, the details of which were written into the Constitution by popular initiative, yet it must find the \$100 million a year which the new pensions are already said to be costing the state, largely because the federal contribution to old-age pensions does not begin until the beneficiaries are 65. In six months the number of pensioners has risen from 198,000 to 245,000, and the additional coins in the pot of gold at the foot of California's already very attractive rainbow are likely to draw many more of the country's "senior citizens" to the state. Washington faces a similar problem. Not only does it have its local examples of the Indian seamen who get their false teeth in Liverpool and the Frenchman who came to Dover for his operation, but also of the doctors who want higher pay and the dentists who refuse to co-operate. More serious, the State Legislature has so far refused to impose the additional taxes needed to cover the cost of the welfare state, now running, oddly enough here too, at \$100 million a year.

Shorter Notes

On September 1st one million non-operating employees of the American railroads, clerks, dining-car attendants, signalmen, maintenance workers, changed from a six-day, 48-hour week to a five-day, 40-hour one, and received a wage increase of 7 cents an hour. This will mean that many smaller stations will be closed on Saturdays and Sundays, so that freight shipments and deliveries will be delayed; passengers will, however, be able to buy tickets on the train. The railroads will have to engage some additional employees, but they hope that this enforced review of their working habits may lead both to economy and greater efficiency.

*

The Fellows in American Letters of the Library of Congress recently gave a prize of \$1,000 to the American poet, Mr Ezra Pound, now in an insane asylum, for a poem written while he was held in an American prisoner-of-war camp in Italy on charges of having committed treason by broadcasting for Mussolini during the war. Congress has now recommended, and the librarian has agreed, that in future no prizes shall be awarded by the Library.

THE WORLD OVERSEAS

Belgian Steel and Coal

(From Our Brussels Correspondent)

THE installation of M. Eyskens' new Catholic-Liberal Government was in itself satisfactory. Ostensibly, the Socialists have left the Government, for the first time in fourteen years, through their inability to agree with the other parties on how to tackle the vexed problem of King Leopold's return. Ostensibly, too, the Government parties are divided on the same issue, and may at any time be blown apart by Private Members' Bills already tabled to deal with it. There is an element of paradox in the Socialists' refusal to participate in a non-existent agreement; and their real motives for going into the wilderness must clearly lie deeper than their hostility to King Leopold. The probable answer is that the Socialists foresee economic troubles for Belgium, and are glad of the chance to make working-class propaganda. Equally probably, the Catholics foresee similar troubles, and are relying on their short-term, and somewhat inflationary, policy to induce a transient sense of prosperity. Upon their success may depend their willingness to allow the issue to be forced on the Royal question, entailing a new General Election about the end of the year. The crux of the problem is that unemployment, which grew steadily through 1948, has settled down at something over one-tenth of the insured population and, without positive measures, will grow worse during the winter. In defiance of earlier attempts to blame the growth on a shortage of exports, unemployment has continued in spite of an export surplus of frs. 1,611 million in the first half of this year. This figure compares with an habitual deficit of frs. 8,342 million in the corresponding months of 1948, and of frs. 5,054 million in the second half of the year.

The improvement in exports, of course, owes much to drawing rights under the Intra-European Payments Scheme. During the first half of 1949, Belgium had a surplus with Marshall countries of frs. 6,396 million. For the ERP year, 1949-50, the surplus with these countries has been estimated as at \$440 million—about frs. 19,400 million—and the dollar deficit at \$200 million.

Doubts About the Dollar Deficit

As things stand, there are two doubts. First, the Belgian dollar deficit now looks more likely to approach the American estimate of \$311 million than the \$200 million which was taken into account. Secondly, the prospective export surplus may not after all find its market in the Marshall countries. The main trouble is steel, which has borne much of the brunt of the export expansion. The iron and steel group accounted for 30 per cent of the Belgo-Luxembourg exports in the first half of this year; but the United States market for it, into which Belgium made its first important inroads last autumn and which was worth some \$13 million in the first quarter of 1949, earned only about \$1½ million in the second quarter. There has been a similar drying-up of the Argentine market and a serious decrease in the Swiss. Only the enormous growth in the tonnage saleable (and sold) in the British market has kept the industry continuously busy.

In so far as the dollar deficit exceeds \$200 million, there will be a corresponding fall in the supply of "free" dollars which Belgium will get from the Intra-European Payments Scheme or—if "free" dollars are not legally available—in the dollars which it may appropriate, in accordance with a recent suggestion, for capital equipment for the Congo. If exports to Marshall countries fall short of their target, the possibility might even emerge of receipts failing to cover the dollar

deficit, and in any case there would be a diminished prop for the Belgian franc in its relations with the Swiss. Whatever might happen in the international sphere, the effect on employment and prosperity in Belgium might well be catastrophic.

As soon as the Washington talks are finished and the allocation of Marshall aid defined, the Trade Agreements for 1949-50 (already overdue) will have to be re-negotiated. The danger for Belgium may be that its bargaining position will have been weakened by the fact that the world hunger for steel has notably diminished and the supplies increased so that Belgian steel, which is high-priced and therefore marginal, will be less in demand. Things seldom work out as badly as the worst fears, but, first, a diminished demand for Belgian steel would cause a direct fall in employment, especially around Liège and Charleroi where opposition to the Government is strongest, and second, other nations might wish to curtail their buying of less-essential Belgian goods, the purchase of which was formerly associated with securing the promise of sufficient steel. The key to the matter lies in the lowering of the price of coal. There are in Belgium a number of well-placed, well-developed and well-equipped collieries, but their activities are hampered by the cumbrous system of subsidies and inter-colliery compensation developed during the postwar shortages, which made it necessary to work a number of the less economic pits. The situation is also complicated by the apparent reluctance of the postwar Belgian to work underground, with the result that little over a third of the hewers and less than half the other underground workers are of Belgian nationality, despite a Belgian preponderance at the surface.

Lower Output of Miners

The combination of these factors, and a growth of absenteeism, has resulted in a much lower output per man than before the war. The daily output per face-worker is now a little over 4½ metric tons, as compared with 5.65 tons in 1939; and the average output for all workers has fallen from 774 to about 640 kg. Despite a labour force increased by about a quarter, output is still less than in 1939; and, throughout the postwar period, the industry has been working at a loss which has precluded the raising of capital to modernise the workings or to get full benefit from the amalgamations proposed. Against this background the mines have had to meet demands for higher wages; at present the average wages of a face-worker are the equivalent of about 30s. 9d. per day, and surface workers 17s. 6d., plus social security advantages. The average production cost is about frs. 690 per ton, and the average price at pit-head about frs. 660 (about 75s.).

Before the war Belgium was a net exporter of coal, but it is now a net importer. Moreover, the high price of Belgian coal has lately caused the loss of some export markets. Italy has preferred American coal to Belgian, which it could, nevertheless, claim under the Treaty by which Italians helped to staff the mines, and Switzerland prefers British coal to dispensing with British tourists. French and Dutch takings, though slightly larger last year than in 1947, and Swedish purchases, are all far below the prewar figures; and bunker sales have been affected by the Durham supplies offered from the coaling station at Zeebrugge, Belgium's only port of consequence which is actually on the sea. Coupled with the loss of exports, there has been an increase in imports from Germany, offsetting the reduced supplies from America; this may be increased still further under the operative protocol to the Trade Agree-

ment. In addition, Poland is being allowed to pay in coal as compensation for the nationalising of Belgian-owned property, and for the purchase of certain mining equipment.

The result is that Belgium, already faced with the threat that the steel industry may need less coal, had increased supplies entering the country. There has in consequence been a growth of pit-head stocks which, at about 3,000,000 tons, compare with a monthly output of 2,000,000-2,250,000 tons. Colliery companies, already financially straitened, and finding it difficult to discharge their foreign labour or to discriminate against their Belgian workers, are faced with a major problem. Short-time working has been tried, but it raises awkward questions regarding eligibility to unemployment benefit.

Under the Spaak Government, and during the interregnum, the coal problem baffled the ingenuity of the Socialist Minister, M. de Greote. Its solution is not wholly within the Belgian Government's competence, since a part of it results from Luxemburg industrialists being anxious, and now able, to take coke and coking coal from their own establishments in Germany. The accumulation of coke at the Belgian coke-ovens, however, is also attributable to the small purchases from France which is turning increasingly to Germany. Indeed, the very great saving on coke bought from Germany is strengthening the Franco-German economic rapprochement which, largely operating through the Saar territory, is regarded in Belgium as one of the chief long-term dangers.

The coal problem is now in the hands of M. Duvieusart, the Catholic Minister for Economic Affairs, who appears to envisage an ultimate solution through "normalisation." This evidently involves a temporary phase in which subsidies will disappear, the home market will be protected by quota restrictions on imports and prices will be allowed to find their own level though without prejudice to the miner's standard of life. The ultimate objective is to concentrate output into the more efficient pits, but at the cost of an autarkic period contrary to Belgium's avowed policy towards the outside world. This solution is nothing if not controversial, and it may, therefore, furnish the background for one more Government crisis.

Tibet's New Role

CHINA's plight is always Tibet's opportunity. When the original Chinese Revolution broke out in 1911 the Tibetans took their chance of rising in revolt against the loosely organised Chinese rule and expelling the Chinese garrison from Lhasa. Since then Tibet proper—though by no means all of the territory which is ethnically Tibetan—has been free from direct Chinese control, but the last few years have seen a certain restoration of Chinese influence due to the repercussions of events elsewhere. From 1911 to about 1940 British Indian policy in the Himalayan borderland was to support Tibetan independence without denial of Chinese "sovereignty"; the basic reason for this was that China was incapable of organising an effective authority in this wild country and it had been found by experience that the only guarantee for peaceful and orderly conditions along the Himalayan frontier of India lay in a firm understanding with the Dalai Lama's Government in Lhasa. But during the Pacific war the British Government's desire not to embarrass China in any way caused a tendency to yield to China's pretensions to complete sovereignty over Tibet, and this withdrawal from support for Tibetan independence was intensified as the time drew near for the "quitting" of India and remote frontier problems lost their interest for the caretakers in Delhi.

The new Government of independent India started out with too many urgent tasks nearer home to have time for looking beyond the Himalayas. So the Lhasa regime was isolated and began to slip gradually more and more under the influence of its relatively powerful eastern neighbour. The Chinese Republic had never abated its claim to inherit all the lands of the Manchu empire, including Tibet, and it retained effective control of the eastern fringe of Tibet, from which it created the two new provinces of Sikang and Chinghai. The

western boundaries of these provinces were drawn far to the west on Chinese maps, taking in a large part of Tibet, though their actual extent depended on the range of Chinese military control at any particular time—which in turn depended more on communications than fighting, for the Tibetans with their primitive equipment were usually unable to stand up to the Chinese in battle, but Chinese army units were liable to perish of starvation in the vast mountain wilderness which intervenes between Lhasa and the Szechwan plain. The Chinese have never managed to reoccupy Lhasa since 1912, but they have made considerable encroachments on the sphere of the Dalai Lama's rule and have been able up to a few months ago to exert a strong pressure on the policy of the Lhasa authorities.

Buffer Against Communism

But recently the situation has radically changed. In the first place the Chinese Nationalist Government has been too much weakened by its defeats at the hands of the Communists to be able any longer to intimidate the Tibetans. Secondly, the

Chinese Communists, who aspire to take over all the territorial claims of Kuomintang China, are anathema to the archaic regime of priests and nobles who govern Tibet and are well aware of what happened to their kind in Outer Mongolia. Thirdly, interest in what goes on in Tibet is reawakening in Delhi, and there is no enthusiasm there for the idea of Chinese Communism (or of Russian Communism infiltrating south through Sinkiang) established on the Himalayan passes. Tibet by itself is the most harmless and inoffensive of neighbours, and India's interests require its maintenance as a friendly, independent buffer state on India's northern frontier.

Taking advantage of these political trends, the Dalai Lama's Government has expelled from Tibet the Chinese Mission which performed the functions of a Residency in a territory over which China claims to be paramount. The pretext was that certain members of the Mission had been carrying on Communist propaganda. The Nationalist Government, vigorously asserting China's sovereign rights even while it is fleeing from capital to capital, has rejected this charge, saying that its representatives were very carefully selected and could not have been Communists. But in view of the large number of Kuomintang soldiers and officials who have recently passed over to the Communist camp, it would not be surprising if one or two of the younger members of the Mission had been

indulging in some "anti-feudal" talk in old-world Lhasa. In any case, the Tibetans have sent them out of the country.

The only counter-move the Chinese have been able to make to the new Tibetan declaration of independence has been to revive the old feud between the two highest spiritual dignitaries of Tibet, the Dalai Lama, who has his seat in the great Potala palace-monastery outside Lhasa, and the Tashi or Panchen Lama, who formerly resided at Shigatse to the west of Lhasa. In strict Buddhist hierarchy the Panchen Lama can claim even higher dignity than the Dalai Lama, but secular authority over Tibet has long been vested in the latter, and the conflict has arisen over the Panchen's attempt to poach on this mundane preserve. The last Panchen Lama died in exile in China, and a new incarnation, a fourteen-year-old boy, has now been installed under Chinese auspices in Chinghai to make trouble for Lhasa. But the Moslem general, Ma Pu-fang, who has promoted this diversion, is hardly a man to appeal to pious Buddhists, and if the Communists arrive in Chinghai, they will be even harder put to it to make a convincing show of zeal for Lamas and their gods.

The Buddhist Vatican, indeed, though its range of authority is relatively small, may be expected to put up a stiff fight against a Communist China. The India which was the birth-place of Buddhism, and which reveres Mahatma Gandhi, is definitely more to its liking. But the Lamas are reluctant to have any foreigners whatever in their holy land if they can possibly avoid it. Except for an Indian diplomatic representative, it has been ruled after consultation with an oracle that no foreigner may enter Tibet before 1951, and the ban has been applied to the British Alpine Club, which was planning a new assault on the unconquered Mount Everest.

Swedes Without Dollars

[FROM OUR STOCKHOLM CORRESPONDENT]

SWEDEN is facing well known difficulties in its trade with the dollar area. During the first half of 1949 Swedish exports to the United States decreased, in value, by more than 50 per cent, as against the same period last year, prices having meanwhile gone down about 4 per cent. This means that during the first half of 1949 less than 45 per cent of the very low imports from the United States were covered by exports. Although Swedish pulp prices have been cut to the Canadian level, very little pulp has been sold to the Western Hemisphere this season. The buyers seem to be waiting for some new development.

Thus America's former middle way favourite is flagging somewhat. But the dollar crisis of this country is in no way equal to that of Britain. Undamaged by two world wars and to some extent protected by particular measures of taxation against excesses of taxation as a whole, the Swedish industry

Laws and Orders

Other people's laws may prevent the execution of export orders. Before planning production for export, the currencies, quotas, and licensing systems of export markets must be studied. Fact and opinion on these and kindred subjects may be obtained from:

The Economist Intelligence Unit,

22 RYDER STREET, ST. JAMES'S, S.W.1.

Whitehall 1511, ext. 34.

can boast of a consolidated economy and modern equipment. Moreover, Sweden produces 80 per cent of its food, and its export industries are still based mainly on domestic raw materials. It is, however, true that wood and wood products cannot cover as big a proportion of the country's exports as before the war, and it may be that the speed of its economic expansion will remain lower than in recent periods of Swedish industrial history.

Immediately after the war Germany was unable to play its traditional part as Sweden's main supplier, and Swedish dollars were exhausted in buying American goods instead. But it is now generally believed that Germany is coming back again on the market. During the first half of 1949, imports from Bizonia were three times as large in value as during the same period last year—imports from Great Britain being still three times larger than those from Bizonia. At the same time imports from the United States are now cut to about 10 per cent of the grand total. Although these reductions are likely to cause some extra costs in production, they have not brought any real austerity to this country.

The export drive as a whole does not seem too ambitious in the light of the present situation. The Swedish target for the Marshall era, according to the long term programme of October, 1948, is to increase exports by 25 per cent of the small volume of 1947. As has been stressed before, some manufacturing industries are likely to meet difficulties. The engineering industry, for example, would have to send abroad 40 per cent more in 1952-53 than in 1947. But in the revised programme which was presented to OEEC some months later, the Government was already able to report that a considerable part of the four years target had been reached during 1948. The figures for the first half of 1949 confirm this picture. Although the volume of Swedish exports is still below the prewar level there was an increase by 12 per cent, as against the same period last year. Like Great Britain, Sweden has now reached an over-all balance of payments. This has been possible, mainly through severe restrictions on imports, but there are some signs that the actual need for foreign goods is much lower now than two years ago.

The dollar-gap, of course, is the weak point. Few people here believe that the targets of the long term programme will be reached by the appointed date, although they were only too modest—an increase in exports to America of from 13 to 14 per cent of the grand total of Swedish exports in 1947. It might, however, be necessary to write off 50 per cent of the planned pulp exports. The figures for the first half of 1949 indicate that the Swedish exports are facing difficulties in other hard-currency markets as well, and this must be taken as a proof of too high costs.

Question of Devaluation

There is little doubt now that the appreciation of the crown in July, 1946, was a mistake, and, as is often the case in politics, the mistake has been thought too painful to be rectified. Since last autumn Professor Ohlin, the leader of the liberal *Folkparti*, has been arguing for devaluation—an argument which he recently repeated at Strasbourg for all Europe. So far the Government has denied any plan for a Swedish devaluation, stating that the exchange rates ought not to be altered by one-sided and separate action. Industrialists have been in an undecided mood, some of them waiting for the sort of "automatic readjustment" which follows a recession. Some independent economists stress the importance of not coming too late on the market with competitive prices. They think that Sweden had better depreciate immediately by 14 per cent—which would take the crown down to the pre-1946 level—and then be prepared to follow other European countries with a further cut of about 20 per cent. They believe that the first move would, theoretically, raise the cost of living by about 2 per cent but, as import prices are now going down, this trend would not be felt as a deterioration. Further, the second move would only affect the costs of American imports, which are a small part of the Swedish market. This ought to

set the Government at rest, as one of its main reasons for not devaluing has been the fear of upsetting the stability of prices and wages.

As a whole the policy of stabilisation has had a good effect in checking inflation. The stabilisation of wages, together with a cut in investments and the pressure of indirect taxation, have worked to reduce demand, and, although industrial production has been falling slightly in recent months, it has nevertheless, according to a report from the Business Research Institute, turned out more favourably than the administration expected at the beginning of this year. Absenteeism is declining, labour and equipment are more effectively used. At the same time savings are increasing and the fear of recession has reduced expenditure. Because of the restored internal balance there will be some relaxation of the building restrictions and some slight reductions of taxes, unless the wage-earners come in first to swallow in higher wages the part of the national product which is now released for consumption. If this economic climate could be preserved prospects for the export drive would not look too bad.

Socialist Troubles in New Zealand

[FROM OUR NEW ZEALAND CORRESPONDENT]

THE Budget which the New Zealand Minister of Finance, Mr Nash, presented on August 18th took no apparent note of the election that is due in November. To that extent it confounded the confident prophecy of the Leader of the National Party Opposition, Mr Holland, that it would offer an election bait. The scale of social security benefits was increased by five shillings to 50s. a week at an estimated cost of £1,800,000, and war pension rates were increased by 5s. a week at an estimated cost of £500,000. Both increases are generally regarded as justified by the general movement in income and price levels.

For the taxpayer there was nothing except the renewal of the general rebate of £10 given last year. Mr Nash could easily afford this gesture, for his income tax receipts for the year were £49 million or nearly £9,000,000 more than he had estimated, and he is budgeting for £49 million again this year.

The keynote of Government policy was sounded in this flat declaration in the Budget: "There is no way of reducing taxation very substantially unless by cutting social services and reducing the number of civil servants. The Government will do neither." To this Mr Holland has retorted that it is possible to make economics without reducing social security or wages. He has accused the Government of taking more from the people than is necessary. He has also charged Mr Nash with masking the real surplus last year. Mr Nash showed it at £2,600,000; Mr Holland claimed it really exceeded £11 million but that there had been deft manipulations whereby sums had been transferred to other accounts to conceal the actual position.

Search for American Loans

Mr Nash also gave a hint of dollar borrowing. He said the Government had instituted inquiries "as to the availability on reasonable terms and conditions of loans from Canada and the United States." This is a radical departure from the Labour policy of borrowing at home while reducing overseas indebtedness. It is assumed that such loans would be used to finance essential imports, particularly for capital works, and America is the only source for much of the plant, machinery and materials which New Zealand requires for its development.

New Zealand's deficit with the United States last year was £6,549,000 and with Canada £3,907,000, the total dollar area deficit being £10,456,000. The 25 per cent cut, which was enjoined by the Commonwealth conference in London in July, would thus amount to about £2,500,000.

FLOUR MILLING

The design and equipment of flour mills, on which hundreds of millions of people depend for their daily bread, is a highly specialised industry in which Britain holds a commanding lead. Henry Simon Ltd., with factories in England, Europe and Australia, are the world's largest milling engineering firm, to whom progressive millers at home and abroad look for the latest developments in milling science. Exports of Simon milling machinery to some forty countries, including North and South America and other important currency areas, contribute substantially to Britain's export drive, besides helping to improve and cheapen the production of one of the staple foods of civilised communities.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

SANDHOLME IRON CO LTD

At the moment of writing, a week after the delivery of the Budget, Mr Nash has not expanded his sketchy references to the dollar loan proposals. It is being pointed out in the press, however, that New Zealand can still do considerably more to earn dollars. The best way, obviously, is to divert to America exports of New Zealand's main primary products. An exceptional season should make possible the shipment of some butter to the United States without affecting the British ration. But New Zealand is also rationing its own butter at home and this policy is being currently condemned in some quarters so that the export of butter to America might be awkward politically. But wool and meat offer better prospects. An early announcement on the whole dollar question is expected.

Although the Budget gave few concessions it was framed with considerable political astuteness. As the debate on it has developed in Parliament Labour speakers have challenged the Opposition to declare whether they would cut social security or dismiss civil servants. The social security bill is reaching a size that is perturbing. Expenditure from the fund in the current year is estimated at £46,224,000. Toward this the social security charge of 1s. 6d. in the pound on all incomes will produce only £31,600,000, so it is proposed to transfer to it £12 million from the consolidated fund and to meet the balance from cash carried forward in the fund last year.

The Opposition are not advocating social security cuts, but there is much talk in its ranks that it is a bad thing for the country to have so many people retiring on pensions at 60 when the call for increased production is so insistent and when labour is in such keen demand. The civil servants constitute just as sticky a problem as the social beneficiaries, especially when heads are being counted in an election year. The Labour Government has had to face much criticism from the civil service in the past year over wage demands, and at one stage the Opposition was somewhat startled and embarrassed when its assistance was invited in pressing the claims of the public servants. It did step somewhat nervously into the breach, but the point was never very much in doubt that the public servants were simply using every form of pressure available to them and that there was no prospect of the predominantly Labour vote in the civil service being transferred to the National Party.

But the National Party, very conscious of its "near miss" at the 1946 election (38 seats to Labour's 42), is naturally not anxious to alienate any section on the eve of another election. Indeed, it has been encouraged in its election hopes by a crack or two in the Labour façade in the last month. But only professional party organisers are yet attempting to forecast the result of the general election. The Prime Minister, Mr Fraser, is very conscious of the fact that his present majority of four depends on the four Maori seats which are all Labour. So, although he has a Maori member in his Cabinet, Mr Fraser is the Minister of Maori Affairs, and throughout his tenure of that office he has been indefatigable in visiting Maori communities, even at weekends in the current Parliamentary session.

The coming election is probably a more crucial test of the leadership of Mr Holland in the National Party than of Mr Fraser in the Labour Party. Mr Holland came to office in 1940 after the leadership problem had troubled the party for several years. The appeal of a comparative newcomer with no depression policy taint to his reputation gained seats in 1943 and more in 1946, when the 76 European seats were evenly split. But if Labour should not be ousted this year Mr Holland will be greatly disheartened and the party itself may feel tempted to seek a new leader. In the meantime, though, there is no serious challenge to the leadership of Mr Holland. Now 55, he works hard, delegates duties intelligently, is never out of humour and speaks briskly and clearly with just the right note of aggressiveness on appropriate occasions. But Mr Fraser carries more guns—longer political experience, a greater tactical sense and a "boots-and-all" ruthlessness when he feels thoroughly certain of his ground. Nonetheless, that ruthlessness is also developing into a form of dictatorship which the recent conscription referendum showed was apt to stray outside his own party room.

Communist Youth at Budapest

[FROM A STUDENT OBSERVER]

FOR two weeks Budapest has been the willing and hospitable host to ten thousand young people attending the World Festival of Youth and Students. Organised jointly by the Communist World Federation of Democratic Youth and the International Union of Students, its expressed purpose, conveniently ignoring the far from peaceful threat against Belgrade, was to give "a mighty demonstration of the unity and determination of youth to add their strength to the mounting peace forces throughout the world." It associated itself completely with the Paris Defenders of Peace and the Moscow Peace Conference and, to this end, brought together people from 81 countries in every part of the globe, with the notable exception of Yugoslavia. Of no small significance was the presence of 700 delegates of the *Freie Deutsche Jugend*, the German Communist youth organisation recruited mainly from the Soviet Zone, by which Germany was represented in Eastern Europe for the first time since the war. The myriad flags and banners and the precise marching order of these German youths in the parades suggested that they had not forgotten their earlier training.

The fortnight was packed with cultural and sports performances and contests by all the national delegations. The finest were inevitably the Russians, who brought over a large contingent headed by the ballet of the Moscow Bolshoi Theatre. Most of the delegations had spent large sums of money on their own contributions, the Hungarian government alone spending twelve million forints (about £300,000). However, the cultural aspect was merely a veneer, for the political approach was introduced everywhere.

The outstanding exception was the World University Summer Games, which owed their non-political nature to the firm stand taken by the British National Union of Students. The true tone of the "Festival" was set by the opening procession, with its glorification of the Soviet Union in general and the *Comsomol* movement in particular, together with banners attacking the "monarcho-fascist imperialism" of the West, for, as M. Guy de Boisson, the President of the WFDY, declared: "The youth of the world are everywhere fully recognising the leading role of the Soviet Union in the preservation of world peace and in the construction of a society free of exploitation." The point was pressed home still further by a magnificent exhibition and by the interminable blaring out of the "Soviet Fatherland Song," the "International" and other hymns so dearly beloved by the extreme Left.

A significant feature was the special attention paid to the several hundred colonial students present, the term "colonial" being used in its widest sense, embracing not only Africans but Indians, Burmese and Indonesians too. Many "scholarships" were provided by Eastern European Countries to help them get to Budapest and they were obviously regarded as the vanguards of the new thought in their territories, though they included non-Communists.

The gathering was officially described as "mainly characterised by a militant stand for peace." To the more dispassionate observer the militance seemed stronger than the desire for peace—unless that peace was of the Soviet Union's making. Watching the uniformed youth marching in the streets, listening to the chanting of their monotonous slogans, talking with them, left no doubt that the overwhelming majority unquestioningly accepted Communism as the only true political creed. Of the few "deviationists" and "reactionaries" most were to be found among the six hundred British; such as there were from Eastern Europe felt it wiser to hide their true beliefs. This was a mammoth gathering of the clans and a mutual admiration society of the comrades, but, coming as they did from so many different countries, these young peoples' enthusiastic acceptance of the familiar so liberally handed out gives a warning for the future that should not be ignored.

Industrial Development in Brazil

[FROM OUR RIO DE JANEIRO CORRESPONDENT]

BRAZIL is embarking on a major hydro-electric undertaking calculated to hasten progress in its north-eastern States. The plan has been likened to the TVA scheme, a comparison which by no means exaggerates its importance but is technically incorrect. Irrigation plays a minor part and flood-control none at all in the Brazilian programme. The intention is to harness the Paulo Afonso falls on the Sao Francisco river, so that cheap and eventually abundant electricity may be distributed to cities where current has always been a scarce commodity, and to smaller communities where it is virtually unknown. The much-needed power is to be carried as far as

Recife and Salvador, two of Brazil's earliest cities, and now its third and fourth largest, with a combined population of 800,000 and some large industries. From the hub of Paulo Afonso, transmission lines will eventually radiate across a region as long and as broad as France. In population and area it falls little short of Sao Paulo, Brazil's most progressive State, but in economic development there is no comparison. Yet if hydro-electricity is available to give for transport and industry a fraction of what it has long contributed to the growth of Sao Paulo, then the dream of reviving Brazil's north-east will undoubtedly become practical politics—at least for the five States below the bulge which can be served from Paulo Afonso.

Power is certainly their greatest want, and so long as nothing is done to explore the possibilities of Bahia's petroleum deposits in the south, hydro-electricity seems the obvious answer. Though nature has been prodigal in many ways, the region has no coal, and firewood from the *sertões*, Brazil's arid "backlands," is still the chief source of fuel; in fact, firewood is estimated to supply 84 per cent of all the natural energy utilised in Brazil. In the north-east, its constant use by the few existing railways has driven them ever farther afield in search of timber, and today imported fuel oil is a cheaper proposition because of the long timber haul from the interior. Only water power could provide the means for eventual electrification.

Long-Term Plans

It is therefore significant that the Brazilian authorities have set themselves an ultimate target of 900,000 kilowatts of power from the Paulo Afonso falls—ten times the amount now available in the region and half of the whole country's installed capacity. Visiting experts believe this target could be attained, and say that although it might not be reached for 20 years the possibilities of the 80-metre cataract would not even then be exhausted. The transition wrought by a scheme of this kind is thus likely to span a generation. But it is important to note that it has begun. The first stage is in hand, and might be finished in 1953 with the installation of equipment to generate 120,000 kilowatts and the completion of the main transmission lines to the coast. Difficult terrain may delay progress, but the obstacles are not insurmountable. Overhead cables will have to be slung for hundreds of miles across barren territory where roads are few, far between and very bad. They are to be strengthened to carry units of equipment weighing upwards of 100 tons and too heavy for the railway which covers more than half of the 280 miles from Recife to the falls. At the falls themselves 2,000 workers have already begun to build a dam, and French contractors have been engaged to build the only bridge over the river. Meanwhile, the authorities in Rio are studying tenders for the generating equipment—a contract worth £3,000,000. They were submitted last month by 23 makers in Britain, Europe, the United States and Canada.

Finance appears to be assured. Local construction is being paid for, and the whole scheme managed, by the *Companhia Hidro-Eletrica do Sao Francisco*, created by the Brazilian Government for the purpose. Its capital of 400 million cruzeiros (about £5,300,000) has been fully subscribed, most of it by Federal, State and Municipal authorities and 26.4 million cruzeiros of it by the Brazilian public. The initial 5-year stage was allotted 600 million cruzeiros under the *Salté* Plan, and although the *Salté* Plan itself still shows no sign of emerging from the Senate, developments show that President Dutra is determined to push ahead with one of its farthest-reaching proposals.

Loans from the International Bank

His visit to Washington in May no doubt fortified this intention. The chief consulting engineer of the International Bank recently inspected the works at Paulo Afonso, and discussed them with the Brazilian authorities. In the Chamber of Deputies it has been claimed that he found them "a model of what public works should be," and the best project of their kind for which the International Bank had ever been asked to lend money. That it will do so is now taken for granted here, and President Dutra has just asked Congress to authorise the Government to guarantee an International Bank loan of \$15 million. This would meet foreign disbursements on the works to be completed in 1953, and since the Bank's engineer is understood to be satisfied that these will cut present electricity rates in Recife and Salvador—perhaps by as much as two-thirds—the risk seems reasonable.

The new loan will leave the borrowers free to buy their equipment where they think fit, but if there is any good reason to buy British it is not immediately apparent in the comparative list of tenders for turbines, generators and transformers just issued in Rio to those who bid for the Paulo Afonso contract. British makers have evidently been unable to match, in either price or deliveries, the quotations of many competitors on both sides of the Atlantic. Leaving out a Swiss and an Italian firm who make an even poorer showing in these respects, British and Swedish prices are roughly comparable, but about a third higher than the cheapest American quotation, and considerably above those of a Canadian and other European makers. The only German bidder has managed to undercut British prices and to quote much shorter deliveries. Where the contract will be placed remains to be seen. It is at least clear that its award will mark the opening of a new phase in Brazilian development.

Robinson Crusoe did it. ..but you can't!

FEW people can set up a private little world and finish the story with the classic "...and they lived happily ever after."

Today, whether we work with our hands or our brains, we depend on our neighbors, and all of us must remember our actual, physical kinship with the earth.

The base of the social pyramid rests where it has always rested, upon the land, and International Harvester has never forgotten this fact. For well over a century it has built an ever-increasing variety of

machines to help in the production and conservation of food and raw materials ... for transportation of such articles ... for development and construction of projects that change the face of the earth and harness the forces of nature.

Built by International Harvester, these are machines that provide for national development and public welfare. They will help all of us live better lives when basic indus-

tries are able to purchase equipment that will increase capacity as well as maintain and replace present units whenever necessary. Accordingly, it is to the interest of every nation to facilitate the supply of such priority items in order to make this essential equipment available to its producers. THE BUSINESS WORLD

British Transport's First Year

IT is the general duty of the British Transport Commission to provide an efficient, adequate, economical and properly integrated system of public inland transport. All the business conducted by the Commission is to form "one undertaking," and that undertaking must be run so that the Commission earns enough to meet its proper revenue charges "taking one year with another." That is the broad framework which Parliament has laid down, and all the acts of the Commission must eventually satisfy these tests. It was not to be expected that the Commission would be able to satisfy them within the first year in which it assumed its enormous tasks. Its first report for 1948 must be read as an account of the first steps which the Commission has taken to acquire and to integrate the various forms of inland transport for which the Transport Act of 1947 made it responsible. The only fair criterion by which this first report can be judged is not to be found in its account of the complicated processes of taking over its constituent undertakings, nor in their financial results for the first year of operation under the Commission. It is to be sought in the Commission's suggestions about future policy, and in clear evidence that it is tackling its great tasks in a promising way.

The first thing that can be said about the report is that, as a descriptive story of 1948, it is admirable. Its 175 pages are supported by more than 200 pages of financial statements and operating schedules. Not a fact goes unrecorded. Every asset is accounted for, down to the solitary oil-lit passenger coach; the movement of a billion passengers and 21½ billion ton-miles of freight traffic is analysed in detail; the financial results are all brought together in consolidated accounts, in accordance with the precept that the Commission's activities are to form one undertaking. It is an accounting *tour de force*, which repays close examination. The danger, however, is that some readers may confuse this clear and detailed presentation of facts with the real job of the Commission, which is so to shape the inland transport of this country that an adequate service is provided at smaller real cost to the community. On that question—which is really the fundamental argument for bringing the Commission into existence at all—far less is said, and what is said is open to critical comment on several grounds.

Results in 1948

The Commission's revenue deficit in 1948 amounted to no more than £1.7 million—a result surprising to most unofficial estimates, which had based themselves on the gap of £27 million between expectation and achievement in railway gross receipts last year. In fact, the result is at once too good, and not good enough. It is too good, first, because as a result of change in depreciation policy (referred to later) the revenue account has been relieved of about £8,500,000 which would otherwise have had to be provided, and secondly, because the Commission is paying in interest to former railway stockholders some £13 million less than they were receiving during the period of wartime control. It is not good enough, first, because it leaves the Commission with no surplus from

which it can put aside any contribution towards the replacement of assets at enhanced costs or towards the creation of a general reserve fund, and secondly, because the trend of receipts and expenditure in 1949 shows that "a further marked deterioration" is inevitable this year. The Commission is undoubtedly right in its ambition to make a beginning of internal saving at a rapid rate in its early years, for it has no equity capital, and its financial needs are as great as its revenue earning capacity is vulnerable to falling traffics and rising costs. But last year it could do nothing in this direction, and when it is in a position to do so, it will have to meet income tax and profits tax first. Already, the Commission is caught in a situation where there is no hope of better results in the immediate future "at any rate with the existing levels of fares and charges." Before caps are thrown into the air about the relatively favourable outcome of 1948, it should be realised that railway receipts for the first thirty-two weeks of 1949 are over £4 million lower than in 1948, while London Transport's takings are down by £300,000. And costs are still rising.

Last year's results can be summarised—at the expense of a great amount of detail which the report provides—in the following table:

CONSOLIDATED REVENUE ACCOUNT, 1948
(£ Million)

	Gross Receipts	Working Expenses	Operating Ratio	Net Receipts	Per Cent of Total
CARRYING ACTIVITIES:—					
Railways:—					
Passenger and freight	337.3	311.1	92	26.2	72
Collection and delivery	8.7	12.6	146	Dr. 3.9	Dr. 11
Road haulage	14.3	13.2	92	1.1	3
Road passenger services	32.5	28.3	87	4.2	12
London Transport:—					
Road	42.8	38.5	90	4.3	12
Rail	15.1	13.5	90	1.6	4
Marine services	10.3	7.4	72	2.9	8
Canals	0.5	0.6	113	Dr. 0.1	...
Total Traffic	461.8	425.2	92	36.4	100
Docks, canal tolls, hotels and catering, advertising and rents	30.2	28.0	...	2.1	
Minority interests and profits before acquisition				Dr. 2.4	
Other income, rents and interest				9.1	
Total net revenue				45.2	
Central administration expenses				0.7	
Interest on transport stock, etc.				42.3	
Freight rebates funds				3.9	
Deficit for year				Dr. 1.7	
Provision for capital redemption				2.5	
Initial expenses, etc.				0.5	
Deficit on net revenue account, Dec. 31, 1948				Dr. 4.7	

The railways produced £26.2 million net, compared with £35 million which had been hoped for. If a fair but necessarily rough apportionment of the Commission's interest charges is debited to the railways, and their collection and delivery losses are also deducted from the results of railway operation, it appears that they showed a true net revenue loss last year of the order of £7,000,000. Here lies the serious weakness in the Commission's earning capacity. It is also worth noting that the Commission's road passenger services

outside London (that is, the Tilling and Scottish Motor Traction interests) made a contribution to net revenue equal to that of London Transport road services, with a noticeably more favourable operating ratio. A significant part of these earnings arose before acquisition, and has been written off the capital costs of the interests acquired.

Depreciation and Refunding

The Transport Act charges the Commission with the duty of making proper provision for depreciation or renewal of assets and proper provision for redemption of capital. The point that this responsibility involves a double burden on the Commission has been made on several occasions in these columns. Particular interest, therefore, attaches to the way in which the responsibility has been interpreted by the Commission. There is nothing in the report which comments on this double obligation—from which it may be inferred that the Commission accepts it as a statutory obligation and is presumably not out of sympathy with it in principle. The point, put simply, is this: If the Commission maintains its physical capital in good operating order, its financial capital will always be represented by assets of equivalent value. If, in addition to maintaining its physical assets, it also sets aside a fund to redeem its financial capital, it will ultimately be in a position to which no industrial undertaking and certainly no Government undertaking has ever aspired—it will be in first-rate physical shape, and will have not a penny of debt or of any other form of externally provided capital. It follows that, in order to carry out this intention (for such it is) of making a present of the nation's transport undertaking to the happy generation of 2038 (since the Minister of Transport has ruled that the Commission's Transport Stock should be redeemed in 90 years), the next two or three generations of transport users will have to pay correspondingly more for the Commission's services. Either the physical assets should be scrupulously maintained, or the Commission's debt should be redeemed; it is a task of supererogation to attempt both.

The application of these twin requirements, however, cuts across the results of 1948 in a distinctly confusing way. In the first place, the Commission has departed from the old principles of providing for renewals which were observed by the railway companies. The companies made their provisions against capital assets on a "renewal basis"—that is, they charged against revenue each year at sum based on current costs to provide funds for capital replacement when the lives of the various assets expired. The Commission has abandoned this principle so far as wasting assets are concerned by adopting the so-called "commercial basis" for depreciation. Under this system, revenue is charged with annual instalments to write off the original cost of the asset when acquired. In other words, it is a system based on historical cost, unlike the former system which was based on replacement cost. Several considerations have impelled the Commission to make this change. It is regarded as essential in order to provide a common basis for accounting; much is made of the desirability of basing depreciation on "the firm fact" of the actual cost of the assets; and the pronouncements of accountancy bodies in favour of historical cost are brought in aid of the argument, without any mention of the fact that these pronouncements are themselves matters of acute controversy. The permanent assets, such as way and works, continue to be treated on a renewals basis.

This change has involved a re-assessment of the book values of rolling stock, ships and other wasting assets, and a corresponding raising of the accrued depreciation based on their expired lives. In the upshot, the net book value of these

wasting assets has been brought into the Commission's books at a figure £46 million higher than they stood in the books of the vested companies. This sum, and other credits arising from differences on the substitution of Transport Stock for the stocks of the vested undertakings, the revaluation of subsidiary interests, and the reserves of the companies taken over, total £296 million. Out of this sum, £107 million has been provided to make good an actuarial deficiency on the superannuation funds which the Commission has taken over, and £165½ million has been deducted from the book value of buildings, permanent way, docks and canals. These complicated book entries have the effect of adjusting the book values of the "permanent" assets in anticipation of the displacement which is to be expected when the physical apparatus of the transport system is contracted.

These transactions, however, are of a capital character rather than a revenue character. So far as revenue is concerned, the change in the method of depreciation to a "commercial basis" has the effect of reducing the charge for depreciation in 1948 to £19½ million, or about £8½ million less than would have been required under the "renewals" system formerly employed by the railway companies. This is the measure of the year's shortfall which would have to be made good to replace the assets which are involved. The Commission recognises the desirability of making further allocations, when profits are available, to a replacement reserve to meet the increased cost of replacement as compared with the gross book values on which the depreciation provision is computed. This admission surely destroys much of the force of the argument that "asset accounts maintained on a 'commercial basis' reflect more accurately the changes in the capital position, and the extent to which the assets have been written down out of revenue."

To some extent, this deficiency—for so it must be reckoned—is offset by the provision of £2½ million for redemption of Transport Stock. But even in combination, the two bites at what is really the same cherry are not enough. At a time when many leading industrial concerns are setting aside extra sums out of taxed profits in order to make up the deficiencies of depreciation provisions calculated on a "commercial basis," it must seriously be asked whether the Commission is discharging its full duty in pursuing a method which, on its own admission, does not provide sufficient funds from current revenue to meet depreciation. It is a question of some urgency, for, as the balance sheet shows, the Commission is using up its cash resources at a rapid rate. They amounted to about £290 million net at the end of 1948, but a great part of them are earmarked for deferred maintenance—there is £129 million to be absorbed on this account, and £16½ million for war damage. Since £50 million of liquid assets were used up in 1948, it is obvious that there will be no very large free balance available for the general development of the Commission's undertakings.

Efficiency Factors Examined

The financial results for 1948 are not in themselves very adequate measures of the Commission's achievement in its first year. It would claim, however, that the results were as good as they were—despite the fact that standard charges on the railways were only 55 per cent higher than before the war (30 per cent higher for London Transport and unchanged for the provincial and Scottish omnibuses) and despite the more than doubled cost level for wages and prices—because of the "favourable trend" of certain important efficiency factors. More freight was moved in 1948 than in 1947 on the railways, but the most favourable comparison is with 1938—25 per cent more work at the cost of only 3

per cent more freight train miles. But this improvement is largely attributable, it would seem, to the taking over of private wagons and the consequent reduction of empty wagon movements. On the passenger side, there was a fall of 7½ per cent in passenger miles in 1948, compared with 1947, but an increase in train mileage of 3.8 per cent. Compared with 1938, the railways recorded one-ninth more passenger-miles, but reduced their passenger train mileage by one-fifth. The same story is true of London Transport; on the railways, passenger miles are 60 per cent up and car miles only 30 per cent up, while on the buses the corresponding figures are 40 per cent for passenger miles and no more than 6 per cent for car miles.

The report takes some pride in these efficiency factors. But they can hardly have derived from the Commission's work in 1948. Perhaps there were some gains in operating efficiency, but the examples given show a dramatic contrast with 1938, not with 1947. To argue that efficiency is counted by a rise in bus miles by only 6 per cent compared with a rise of 40 per cent for passenger miles is to overlook in this particular context (though it is freely discussed elsewhere in the report) the shortage of buses and to make no allowance for inconvenience and overcrowding suffered by the travelling public. The adverse change in the efficiency factors on the railway passenger services in 1948 suggests that, in the first postwar year in which the railways really tried to attract public support for improved services, they had to make an appreciable concession in terms of operating efficiency. Certainly it would be wise to await the results of more normal postwar years before assuming that the changes which have occurred during the last decade in the travelling habits of the public and in their willingness to travel in more crowded trains are permanent. It would be a mistake to belittle the importance of such improvements as the rise in ton-miles moved per engine-hour from 461 in 1938 to 516 in 1947 and 542 in 1948, or the continued though slight increase in average wagon loads. These and other operating factors have gone a good way towards offsetting the rise in wage costs and coal; but there is still room for further radical improvements in railway operating methods before the full economies of an integrated railway system can be won.

Co-ordination and Charges

These operating trends set their own question mark about the future. But there are other more fundamental issues of policy which are briefly and tantalisingly referred to in the report which are of much greater importance. The Commission has got off to an indifferent financial start. But what progress has it been able to make towards its real function of integrating and co-ordinating the various forms of transport so that they can be made to work as an efficient and economical whole? The most urgent issue, which arises directly from the lagging earning power of the railways and the adequate earning power of the road services, is the extent to which the Commission might seek to assist the one out of the profits of the other. The point is covered in a somewhat perplexing passage in the report:

The degree to which one form of transport or one service can and should be called upon to support another will vary from time to time, but, within reasonable limits, bold application of the principle may be essential to any adequate system of facilities for the country as a whole.

There are, of course, some particular transport services which are necessary for the public interest which cannot be made to pay. There are ancillary services which bring in traffic, but do not cover their own costs. There is the classic case of internal subsidy in using profits from London's buses

to pay for the underground railways, which were incapable of paying for themselves. There is, as the Commission claims, nothing new in the acceptance of the principle. But what would be new would be the application of a principle devised to cover the difficulties of particular and subsidiary means of transport, or the unremunerative character of certain specific services, to balance the deficit of one means of national transport out of the surpluses of other means of national transport. Put bluntly, would it be within "reasonable limits" to use profits from road services to bolster the deficiencies of railway earnings? The Commission obviously sets great store by the proposition which is enshrined in the Transport Act that its transport businesses are declared to form "one undertaking." But as the chairman has emphasised on an earlier occasion, it could not acquiesce in the proposition that the railways can never be made to pay their way. The question of what are "reasonable limits" therefore hangs on what progress can be made towards a rapid reduction of railway operating costs. The report shows only too clearly that wage costs and fuel and stores are still rising, and the discussion above suggests that some of the favourable efficiency factors to which the report draws attention may not necessarily be permanent. Thus, until more far-reaching efforts have been made to improve railway operating efficiency and to reduce unit costs of service, the issue of what subsidy is appropriate for the railways must be left open. It follows that there would be no justification for precipitate action in increasing road charges in order to produce a bigger surplus for the assistance of the railways. Road fares outside London remain roughly at prewar levels, because the improvement in operating factors has offset the rise in costs of wages and supplies. The public is entitled to the benefit of this improvement, unless convincing proof is shown to the contrary.

The report lays down the principle that "charges policy will be a key to effective integration" of all forms of transport. That indeed is so, but the process of reformulating transport charges is a long and detailed one. Already the two years allowed for this purpose in the Act have expired, and it is doubtful whether the task will be completed in the further two years which have recently been allowed. Committees are sitting; much progress has been made with the formulation of the "preliminary principles" which are involved. As time goes on, the Commission intends to take traders into its confidence, so that a common measure of agreement can be reached before the charges are submitted. But in the public mind, at present, there is a lively apprehension that the Commission may seek the approval of the Minister for alterations in charges designed less with the idea of "effective integration" than with the aim of balancing the books. The report states quite openly that, given the present volume of traffic and the present level of charges, the Commission cannot meet its costs. And the implications of this meticulously phrased passage are clear enough:

So long as the trends of traffic did not unmistakably declare themselves, and so long as the unexpected increases in costs did not add too heavily to their burdens, the Commission have been reluctant to avail themselves of these special powers and to make or apply for increases in charges in those many directions in which increases could be made without detrimental effect upon their revenue. A general increase in railway charges, indiscriminately applied, might not benefit railway traffics and revenues and would tend to increase the cost of production. But it is not possible that any undertaking which is to pay its way should submit to constant increases in the cost of the services and commodities which it needs and yet refrain indefinitely from raising its prices to its customers.

subsequently from the budget surplus and Marshall aid) were applied to achieve a substantial further cancellation of TDRs. The total dipped momentarily to only £1,003 million early this year, and on the eve of the latest move stood at £1,258 million, with the ratio of clearing bank holdings to deposits at under 20 per cent.

The Treasury has now resumed the switching process which was virtually stopped after the end of 1947. Since July the weekly offering of bills has been raised successively from £170 million to £230 million (the amount offered yesterday), so that by the end of next week the total of tender bills will be £2,490 million and the TDR issue is already down to about £1,075 million. It is generally assumed that the weekly bill offer will be raised still further, but that it may be more susceptible to variation than in the past. Even if it were to settle down at an average level no higher than £200-220 million a week (compared with the current flow of maturities of £170 million a week), this would mean an aggregate increase in the total supply by from £390 to £650 million, with a corresponding reduction of the TDR issue below whatever amount would otherwise have been necessary. Evidently this switch will be comparable in magnitude to the major movement of 1945-46. If it could be assumed that the Treasury will not need to increase its total borrowings on floating debt, the prospective level of the TDR issue might not be much more than half the total at which it stood before the present reduction began.

★

It will be apparent that this time the switch cannot have been dictated by the considerations which necessitated it four years ago. For some time now the supply of money

market assets to the banking system has been at least as large, in proportion to deposits, as it was in the prewar quinquennium, and there has been no sign that the banks were in real need of further supplies. This has led to suggestions that the reduction in the TDR issue is merely an instance of *reculer pour mieux sauter*; that the authorities are envisaging the possibility that conditions next February may not enable them to re-finance, by a new bond issue, the £787 million of Exchequer bonds which mature then; and that the repayment may therefore involve them in large borrowings from the banking system. In that case, a large part, and perhaps the whole, of this year's reduction in the TDR issue might be reversed next year—apart from the large decline to be expected in the tax-gathering season.

Such a sequence of events might well arise, but it would probably be wrong to regard this as a sufficient explanation of the switching process. Although the banks now have no pressing need for additional liquidity, there is no doubt that monetary trends are likely to require more rather than less banking flexibility in future. The further the economic system moves from the wartime pattern of direct controls and rationing and the greater the scope for the functioning of the price mechanism—whether in home or external trade, or both—the more desirable will parallel changes in the monetary structure become. If the way out of Britain's crisis lies by way of retrenchment, devaluation and eventual relaxation of restrictions on international trade, the consequential changes in the industrial structure will inevitably have an important impact upon the banks—notably through their effects on the gilt-edged market, the new issue market, and the composition of bank advances. The precise incidence of such changes is not predictable even for the banking

system considered as a whole; still less is it predictable for individual banks. For that very reason, it is desirable that each bank should feel itself to have greater scope for manoeuvre. Within the framework of overriding monetary policy, it should feel free to make its own choice in the distribution of those of its assets which are not, like gilt-edged portfolios and advances, inevitably inflexible. Those of its assets which provide floating finance for the Government can all be flexible, and at least the greater part of them should be so.

By reducing the proportion of TDRs, the authorities have evidently perceived the wisdom of enlarging the area of flexibility. By so doing they will facilitate not only the func-

tioning of the commercial banking system in a phase of economic change, but also their own task as central bankers. The further the authorities move from the habit of borrowing direct from the banks by what is virtually a weekly edict, and the more they finance themselves by open bill tender instead of TDR quota, the more surely will they be able to feel the pulse of the monetary system and to frame their overriding policy accordingly. It is for such reasons as these, it seems, that the drift is away from TDRs. They are unlikely, however, to be wholly abandoned in the foreseeable future. The TDR, relatively new though it is, has shown itself to be too valuable a weapon of discipline in the central bank armoury to be allowed to grow rusty.

Business Notes

Mr Snyder on the Dollar Talks

The Ministerial talks in Washington have opened this week with the preface of yet another public refusal by Sir Stafford Cripps to contemplate even the possibility of a devaluation of sterling. Apart from this, the Chancellor was reticent in his eve-of-conference remarks. Not so Mr John Snyder, Secretary of the US Treasury, who is presiding at the talks. In a speech before a war veterans' organisation last week-end, he devoted the bulk of his introductory remarks to the problem of encouraging the investment of American capital overseas and particularly in under-developed areas. The choice of this subject seems to be a fairly clear hint of what, in the eyes of official America, appears to be the most promising channel through which the present dearth of dollars in the world outside the United States might be corrected. Mr Snyder laid down three conditions for foreign governments wishing to receive assistance under President Truman's "Point 4" programme for encouraging investment in under-developed areas. First, there must be reasonable terms for the investor. Secondly, there must be an assurance of convertibility into dollars of the profits yielded by the investment. Thirdly, there is need for assurance of adequate compensation if the property in question were nationalised. Enlarging on these prerequisites, Mr Snyder pointed out that "foreign governments must recognise that the right to do business in their countries on reasonable terms is considered of paramount importance by our potential investors." This seems to imply a fourth condition—that there shall be no discrimination against US goods in the countries to which the United States is exporting capital.

Mr Snyder was also able to suggest ways in which the United States itself might and would encourage the export of capital. He pointed out that legislation now before Congress would authorise the Export-Import Bank to guarantee US private capital invested abroad against three risks peculiar to foreign investment. The first was inability

to convert earnings into dollars, the second expropriation of property without adequate compensation, and the third, destruction of property in war. To these helpful suggestions Mr Snyder might have added yet another, namely that the United States, having eased the dollar shortage by exporting capital, having done its full duty in raising production and the standard of well-being in under-developed countries, should then complete the logical sequence of its constructive initiative by being prepared to provide an adequate market for the additional goods it had helped to bring into being. Only on that condition can the capital in question earn its dollar keep. Only on that condition will the guarantees for which legislative power is now being taken remain unused.

France Invites Dollar Capital

Following the hints from the United States that the encouragement of the export of capital ranks high in the official list of short-term measures to ease the present balance of payments difficulties, the French Government has hastened to announce measures to attract the hard currency investor into France and its overseas territories. The gist of this plan is a promise that capital invested in the franc monetary area after August 31, 1949, will be effectively convertible into the currency of the country from which it came. Certain conditions, however, must be fulfilled. The first of these is that the investments are made by persons or companies resident in countries which allow transfers to the franc area on terms as favourable as those granted by France. The second is that the investments have been duly authorised by the French authorities. Such investment may take the form of purchases of existing French securities, subscriptions to new issues, purchases of land or commercial property, or loans to persons or companies domiciled in the franc monetary area.

The measure is not to be retroactive and will not allow foreign holders of French securities acquired before August 31,

For Export

At the quay-side, the import-export procedure is reaching its final stages, but the earlier steps were equally important. Markets had to be found, references exchanged, restrictions completed. At each of these steps the services of the Westminster Bank can usefully be employed. To help those who are engaged in foreign trade, the Bank has issued a booklet which may be obtained without charge at any branch. Ask for *The Foreign Business Service of the Westminster Bank*.

1949, to realise their assets and convert the proceeds into their own currency. Steps have been taken to prevent abuse of the regulation through sales of property already held by non-residents to new foreign investors, a device which would in fact have secured convertibility of pre-August 31 holdings. This is to be guarded against by restricting sales of securities or properties to those held by residents of the franc zone. It will be seen that the terms offered by the French authorities for the attraction of capital from the United States, Belgium and Switzerland—the only three countries which satisfy the conditions laid down by the French Government—go considerably further than Mr Snyder's points. Mr Snyder merely asked for convertibility of the profits earned on American capital invested abroad. The French Government has in fact offered complete convertibility of the capital itself.

Re-entry to the Fund

Among the many measures which have been propounded as an immediate means of easing the dollar pressure, and which could be implemented without reference to US Congress, is the readmission of Britain and the other countries participating in the European Recovery Programme to the facilities of the International Monetary Fund. It will be recalled that in April, 1948, despite the opposition of prominent member countries, the Fund decided to cease sales of dollars to all countries which were recipients of Marshall aid. The reasoning put forward by the Fund was that the essential dollar needs of these countries were being satisfied by ECA and that the Fund's resources should be reserved for the period that would follow the end of the Marshall Plan when, on all available evidence, there would still be a considerable dollar shortage over most of the world. If the Fund could be induced to go back on this decision, an immediate source of additional dollars would become available and some highly interesting incidental developments would follow.

At the end of June, 1949, the Fund's holding of dollars amounted to \$1,340 million compared with the \$2,062 million which it originally derived from that part of the United States quota which was paid in US currency. In little more than two years, therefore, the Fund's holding of dollars has fallen by 35 per cent, and this despite the embargo on purchases of dollars during the past year by member countries in the ERP group—members with the keenest appetite for dollars. If these members were re-admitted to full participation in the facilities of the Fund, the resulting diminution in the Fund's holding of dollars would be very long—and for the first time—bring into effect the "scarce currency" provisions in the Articles of Agreement of the Fund. There is a dignified orderliness about the steps envisaged in that agreement to deal with the scarcity of a member's currency. First, if the Fund finds that such a scarcity is developing it may so inform members, may issue a report setting out the causes of the scarcity and may then make recommendations to bring it to an end. If this does not avail, the Fund may take action to replenish its holdings of the scarce currency. This it can do either by inducing the member in question to lend its own currency to the Fund, or by buying that currency itself with gold. Finally, if the scarcity still continues, the Fund may then make a formal declaration that such currency is scarce. Such a declaration would have the effect of authorising the other members to impose limitations on the freedom of exchange operations in the scarce currency. This means that, if the dollar were formally declared to be in scarce supply, the other countries of the world would be free to discriminate against the United States without the limitations imposed by clauses in loan agreements or by any other international obligations. It will thus be seen that the re-admission of ERP countries to the full facilities of the Fund might kill two birds with one stone. First, it would make available urgently needed dollars. Secondly, it might before long cut through all the difficulties which now arise from the various obligations under which European countries have undertaken not to discriminate against dollar goods.

No Desinflation for Australia

Judgment upon the Commonwealth budget for 1949-50 presented by Mr Chifley on Wednesday must perhaps be tempered by the reflection that it is a pre-election budget. But it is still regrettable that Australia should this year be complacently envisaging a deficit after two years of surpluses—and of increasingly inflationary conditions. In the twelve months to mid-1950 net governmental expenditure, at £A567 million, is expected to exceed revenue by £A35 million, after allowing for the substantial tax relief announced earlier this year and the further slight relief disclosed in the budget. The deficit is to be met from the loan fund. Evidently the authorities are more impressed by the possible internal repercussions of the incipient fall in export prices than by the need for trimming the whole economy to a prospectively less favourable export situation. Doubts about the wisdom of this policy are strengthened by the review of the past year contained in the annual report of the Commonwealth Bank which became available in London this week. Like the Prime Minister, the Commonwealth Bank emphasises that in the last quarter of 1948-49 prices began to fall. Thus the export price index was 4 per cent lower last June than in June, 1948. But for the whole of 1948-49 it was still a full 17 per cent above the 1947-48 average. Meanwhile, signs of over-expansion have become apparent in certain secondary industries, notably in light engineering. Total factory employment is 50 per cent higher than in 1939, and in the metal and engineering industries it is 80 per cent higher.

The current inflationary pressure in Australia has been partly caused by the persistent influx of money, much of it "hot," from Britain. During 1948-49 the international currency reserves of all Australian banks rose from £A273 million to £A452 million after repatriating some £12 million of government and semi-government sterling loans. Yet only a moderate part of this increase resulted from Australia's favourable balance of current payments. In 1948-49 exports worth £A547 million exceeded imports by £A133 million, but an adverse invisible balance reduced the surplus to £A51 million. Roughly £A130 million of the increase in Australia's sterling assets thus seems to have been attributable to capital transactions—a movement which almost bears comparison with South Africa's absorption of capital in 1946-47. The Commonwealth Bank suggests two explanations for this accumulation of sterling resources. The first is that speculation on a revaluation of the Australian pound in terms of the pound sterling has been causing Australian importers to delay payments and exporters to Australia to accelerate them. Secondly, there has been a large inflow of capital from Britain, much of it for permanent industrial investment. The Bank regards part of this movement, however, as "hot" money "transferred to Australia for temporary refuge or for speculative purposes" and considers this to be "a source of considerable instability to Australia's international reserves." According to the Bank, up to £A100 million might be withdrawn at short notice. While Britain itself still shrinks from domestic retrenchment as a means of correcting external disequilibrium, and also continues to benefit from Australia's willingness to hold ever rising funds in London—to be reduced once again by a gift of a further £A10 million—it is hard to be too critical of Australia's policies. But it is disappointing to learn from Mr Chifley himself that the full expected cut of 25 per cent in dollar imports will not prove possible in 1949-50. In any case, budget deficits and import cuts do not make good bedfellows.

Finance and Investment

Intra-European Payments

The new Intra-European Payments Scheme covering the year to June 30, 1950, was signed in Paris on Wednesday. The drawing rights recommended for the year are shown in detail in the first of the accompanying tables. The second table (on page 578) shows the effect, as between the individual

ERP recipients, of the consequent subtraction or addition of this intra-European mutual aid upon the provisional gross net allocations of Marshall aid for 1949-50. It also shows the very significant changes compared with last year, which have taken place in the distribution—still provisional—of the available dollars between the participants.

It is at first sight a little surprising that the signature of this intra-European payment agreement, with its apparently firm and irrevocable commitments, should have preceded the final Congress vote on Marshall aid appropriation for 1949-50. Unless there are some hidden reservations to the IEPS, the countries which signed the agreement this week would appear to be beating the gun. They might have to retreat later if something goes wrong with the final Congressional vote on ECA appropriation. The details of the scheme are also subject to the distribution of the \$150 million pool to which reference is made in next column.

Quite apart from the question of the total aid allocation, a few other points inherited from the first Intra-European Payments Scheme have yet to be finally settled. It has not been decided, for example, what is to be done with the drawing rights which were left unutilised on June 30, 1949. They are not being carried forward, but remain in suspense as an existing asset of the countries to which they were granted. They are not assets to which any very specific value can be given, but there is no question of paying back any of these dollars to ECA, although they were received in 1948-49 on the assumption that they would later be designated as "conditional grants" against drawing rights granted to other participating countries. A joint committee of OEEC and ECA has been set up to look into this and other problems raised by the Intra-European Payments Agreement.

The final allocation of available Marshall aid, it should be emphasised, is still subject to the ultimate distribution of a \$150 million pool which the Economic Co-operation

Administration has seen fit to earmark out of the available funds. This will be used for special purposes of which ECA itself will be the judge, and its distribution will not, therefore, be left to OEEC. The earmarking of this pool has caused some surprise in Paris and also some confusion—the latter because the \$150 million in question has been quite erroneously

(a) Norway-Bizone.—It is recommended that the drawing rights should be fixed at \$12.6 million and that the two Governments should discuss the possibility of consolidating the repayment of Norway's debt of \$8 million to the Bizone. If after these discussions it should appear that more than \$2.6 million must be paid during 1949-50 on account of repayment of this debt, this would provide a *prima facie* case for the revision of the Norwegian drawing right.

(b) Drawing Rights include \$87.5 million of Belgian credits in favour of France, Netherlands and the United Kingdom.

confused with a similar figure which was provided for the loan portion of the Marshall aid appropriation for 1949-50 as authorised by the Senate. For the year 1948-49, it will be recalled, the American legislation laid down that 75 per cent of the amount made available to OEEC countries should be given in grants and 25 per cent in loans. Those proportions

The Market Place, Peterborough

Local markets give an accurate picture of the produce and the needs of the agricultural areas they serve. These may differ very widely with the district, and it is the task of the banker to ensure that he is fully acquainted with the special conditions affecting farming in his area. The varying needs of the farming community are particularly well served by Barclays Bank, who have developed a unique system of Local Head Offices covering England and Wales. The Local Directors of these Offices are men with an intimate knowledge of the districts they serve. Thus they are in a position to deal quickly and effectively with all the varied problems on which farmers may wish for information and assistance.

BARCLAYS BANK LIMITED

As a market for British manufactures and as a source of food and raw materials, Australia plays an important part in Britain's economy. Whether your interest is in imports or exports, the services of the Commonwealth Bank of Australia can be of considerable assistance. With over 400 Branches in the Commonwealth and New Guinea, and guaranteed by the Australian Government, the Bank can provide the British trader with up-to-date, authoritative information on every aspect of Australian commerce.

COMMONWEALTH BANK OF AUSTRALIA

Also at Australia House, Strand, W.C.2

have disappeared in the new legislation, which provides that the whole of the aid except for this amount of \$150 million shall be given in the form of grants.

The ECA pool is something quite apart from the \$150 million loan. It is set aside for three purposes which have been described by ECA in the vaguest of terms only. The first is Colonial development. The second is the financing of the "liberalisation of trade in Europe" (whatever this vague formula may mean). The third is the establishment of a reserve to finance "planned European projects"; this, at least, is familiar ECA phraseology. The amount which has been allocated by OEEC includes the \$150 million which is to be made available on loan terms and also the \$150 million to be set aside for the ECA dollar pool. In viewing the figures set out in the accompanying tables it should be realised,

DIRECT AID AND I.E.P.S. CONTRIBUTIONS IN MILLIONS OF DOLLARS					
Country	Proposed Direct Dollar Aid	Proposed I.E.P.S. Con- tributions (+) or Receipts (-)	Net Aid Proposed	Per Cent of Total	Per Cent Allotted in 1948-49

TOTALS	3,716.5	...	3,776.5	...	...

therefore, that the provisional allocations announced by OEEC may have to be revised as a result of the ECA decisions on the use of the dollar pool.

Argentina Speculates in Sterling

Irritation has been rising fast in the past week or so at the continuing delay in the issue of Argentine import licences for purchases from Britain, and at the absence of the expected release of funds to discharge the arrears of financial and commercial remittances due to British investors and others. Thus, although Argentine exports are now moving towards Britain, further doubts have been raised about the future of the hard-won Anglo-Argentine trade agreement. On this occasion, the delays do not seem to be due to the customary casual—or purposeful—dilatoriness on the part of Argentine officialdom, but rather to a deliberate speculation on the future value of sterling. Paradoxically, this hold-up arises from the possibility of sterling devaluation. While all the world is going short of sterling it suits Argentina at the moment to accumulate sterling.

The explanation is that the value of the Argentine sterling balances is safeguarded by exchange guarantees. If the pound is devalued in terms of dollars, then, irrespective of what happens to the peso, the Argentine sterling balances will be increased sufficiently to maintain their dollar equivalent at the same amount as before devaluation. This guarantee must now be giving much comfort to Argentina's financial experts. Not content with what they already have standing to their credit in London, they are using every device to enlarge these sterling balances. For Argentina this is a riskless speculation. If there is no devaluation, nothing will have been lost except time in making purchases. If devaluation takes place, Argentina's purchasing power for sterling goods will have been almost correspondingly increased. The British Ambassador in Buenos Aires is reported to have protested to the authorities there about the financial and trade delays; if this explanation is correct,

the Argentine delaying tactics will be excused and explained in various ways, but will continue—until devaluation uncertainties are removed.

The Fate of Ultramar

The promise held out for Ultramar when the ros. stock units of the company stood in the market at over £4 only fifteen months ago has dwindled to the point at which the future existence of the company is in jeopardy. The critical position now revealed in the 1948 report has caused a slump in the shares this week to around par. Indeed, the price might well have fallen further but for the announcement appended to the report that negotiations for the provision of new finance had been resumed since the document was printed. Negotiations with four mining houses to provide substantial funds necessary to continue the enterprise had broken down earlier this year. The terms demanded for advancing new money were that it should rank before the existing prior charges and that a readjustment should be made in the interest and redemption dates of these charges. Apparently no agreement could be reached with the Finance Corporation for Industry, from which a loan of £1,750,000 at 3½ per cent repayable by September 30, 1952, is outstanding, or with holders of the £3,500,000 4½ per cent Unsecured Loan stock 1949-57. The notice that negotiations have been resumed for the provision of new capital does not reveal the principals.

The extent of Ultramar's requirements of liquid funds is not confined to the ultimate needs of continuing its interests in Caracas Petroleum, through which, jointly with the Texas Company, it controls the Venezuelan producing company Mercedes. In the past year it has been unable to furnish its half share of the required advances to Mercedes through Caracas Petroleum. This money has been furnished by Texas Petroleum, a subsidiary of the Texas Company. In discharge of these payments Texas Petroleum has had the right to take as from July 1, 1949, 25 per cent of each oil cargo loaded until the debt is cleared. This drain on Ultramar's potential income is a serious factor in its present crisis since its commitment to Mercedes is a continuing one. But there is the possibly more onerous duty of the company to provide more money to Mercedes for further exploration, drilling and extending production. Here the disappointing results of the oilfields to date have called in question the wisdom of continuing the whole enterprise. Production in the twelve months to June, 1949, amounted to only 5,000,000 barrels compared with the estimate of 11 million barrels; as a result the revenue of Mercedes was \$12 million below expectations.

This poor performance "has called for a complete reassessment of the economic possibilities of the venture on the basis of present experience and such data as is (sic) available." In the meantime Mercedes has cut its drilling operations in order to keep revenue and expenditure in balance. So far \$70 million has been spent in bringing Mercedes to the present stage of operations, but for technical reasons the present operating wells are not producing sufficient oil to justify such a heavy capital outlay. It is the intention, if sufficient funds are forthcoming, to push on with a bigger programme of exploration and development despite the hazards involved, for it is the board's opinion that only by discovering more productive fields than those which are at present being exploited can the venture justify itself.

The Rise in Japanese Bonds

The rise in recent weeks in the prices of Japanese sterling bonds quoted in London is not the first speculative movement in these issues since the war, but it is certainly the sharpest. As a peace treaty with Japan comes nearer, it is doubtless justifiable to place a higher valuation on Japan's foreign debt. Various pronouncements, admittedly encouraging, on the status of this debt have emanated from Japanese sources, from

RED LEAD OVER THE HOOGHLY

Bridges, over the Hooghly or the Thames; river-boats in Burma, liners in Southampton—all are under the common threat of rust. Red Lead is their safeguard; in whatever climates it is used as a paint, it removes the menace of rust to steel. But that is not its only duty. Red Lead is an ingredient of good glass, sometimes up to the proportion of 75% of the whole. Red Lead mixed with White Lead, provides the finest priming paint for wood. Red Lead is used in the manufacture of the battery in your car. Associated Lead are expert in its manufacture, and will always co-operate with their customers and other friends in its diverse applications

INCENTIVE MEANS BETTER TYRES

This is the Drill... a first-class worker never forgets it
This man with the drill is clearing one of the vent-holes in a tyre mould. If these tiny holes (only three thirty-seconds of an inch across) were not kept clear, trapped air would ruin the tyres. Small, vital jobs of this kind can only be done unflinchingly by workers who concentrate the whole time.

INCENTIVES to increase output are easy to devise. Incentives that will improve quality are not so simple. To improve workmanship is the tyre-maker's essential problem. In spite of the newest machinery, tyres are largely put together by men and women using their hands and brains.

The Henley Co-operative Award Scheme gives higher pay for better work. Ratings are awarded according to quality of

work. As the rating rises, pay rises too.

Since the scheme began, men and women all out to improve their rating have raised the standards of workmanship till today the quality of Henley tyres is higher than ever before.

Extra incentive means finer workmanship. Finer workmanship makes Henley's better than the good tyres they have always been. Supplies are good now. Ask your dealer.

HENLEY TYRES
BUILT WITH INCENTIVE

General MacArthur's headquarters and from interested circles in New York ; but it is hard to feel that they justify so rapid an advance as that shown in the following table.

	Price, June 1, 1949	Price, Sept. 6, 1949	Increase Per Cent
Japan 4% 1899.....	21	28	33
" 4% 1910.....	21	28	33
" 5% 1912.....	25	35	40
" 6% 1924.....	24	35	46
" 5½% 1930.....	31	46	49

It is tempting to cite by comparison the valuation placed on German sterling bonds. But if pushed too far, such a comparison would be misleading. The German foreign debt is incomparably larger, and was in default before the war. Japan, on the other hand, serviced its foreign debt fully until 1941 ; in addition, large portions of it have been repatriated. In both cases, it seems that the chances of resumption of service will depend largely on the attitude of the American authorities without whose financial support the two countries could not contemplate financial transfers abroad for some time ahead. In this context, too, Japan is in the better position. The total of dollar bonds outstanding is relatively moderate. According to recent Japanese official estimates, only \$67,529,000 is still outstanding and not repatriated ; the latest prewar estimate was \$283 million.

The sterling debt is larger, as the table below shows but it is difficult to see how the dollar debt could be tackled without the sterling debt. The second column of the table gives Japanese official estimates of the amounts still held outside Japan. The estimated total of £61 million is almost certainly too high. Well-informed quarters in the City do not put the figure at more than £50 million. Interest arrears calculated on the larger figure would amount to £16,750,000. The

British authorities, no longer influenced by the indifference shown by Dr Dalton towards foreign bondholders, are believed to be anxious to arrive at a settlement. Japan, for its part, has set aside yen funds to meet its obligations. But proper valuation of the bonds must await more concrete proposals for action to convert the yen into sterling and dollars.

Trade and Commodities

Export Competition in Coal

It is early to speak of an immediate problem of selling British exports of coal ; the mining industry has not yet mastered the task of producing enough coal to meet urgent demands and keep Britain in the market as an exporter. But the representatives of the National Union of Mineworkers who, at the TUC this week, urged an international coal conference were anticipating a difficulty which will inevitably come. To anticipate difficulties, is however, one thing, and

to approach them in the right spirit is another ; the spokesmen of the NUM demonstrated this. Mr Ernest Jones pointed out that, while coal with high coking properties, gas coal and dry steam coal still found a ready market, the lower qualities were increasingly hard to sell abroad. Although the present export target (which, he might have added, Britain will indeed be fortunate to attain unless output improves quickly) was less than half of the 1937 export of 52 million tons, the reconstruction programme for the coalfields suggested a future export figure in the region of 55 or 60 million tons. He was concerned as to how these exports were to be sold in view of the "grave threat" from Poland. He pointed out that the Polish mines employed 25,000 women on the surface and 18,000 German prisoners of war below ground ; if British trade union morality were to permit such practices, British coal output could be expanded by 14 million tons a year, but that was undesirable. Polish miners worked longer, and the average wage in the Polish mines was about £3 a week.

No one would defend the employment of prisoners in the Polish mines ; but it would be silly to pretend that the Polish effort in the production and export of coal since the war has primarily been obtained by such practices or is likely to cease when they cease. There remain the employment of women above ground, the longer hours, the lower wages. The remedy proposed for these was that "the coal-producing countries

should get together to examine the situation." Mr A. Moffat, who seconded the proposal for an inter-Governmental conference to formulate an international plan for the production, export, and price of coal, mentioned the threat of competition from the Ruhr.

The moral seems to have been to find some way of "getting international understanding to avoid cut-throat competition in coal." But when is competition "cut-throat" ? The National Coal Board is still charging substantially higher prices for export for most qualities than it is charging at home. Its prices at home are themselves so high as to be an unreasonable burden on the British economy, and the widespread feeling of the importing countries of Europe against the high prices they have to pay for their coal is well known. British coal can still—with the exception of certain qualities—be sold readily enough abroad, but this is because of the persistent general shortage in European coal output, which can only be made up by marginal American exports which have to bear the heavy transatlantic freights. The accompanying table, taken from the last annual report of the National Coal Board, shows how far this deficiency had been restored up to the end of 1948. It shows how rapidly Polish and Ruhr coal exports expanded when British coal exports were kept to a miserably low level by the deficiencies of output and the exigencies of home consumption. From it the cause of the present high prices—namely, a deficiency in European supplies—can be deduced. So far as Britain is concerned, the deficiency has not been made up. Is this the moment to talk of international arrangements to maintain prices and restrict exports ?

Keeping down the Cost of Living

HOOVER LIMITED AND A STABLE NATIONAL ECONOMY

TODAY, as Government appeals are constantly stressing, the need to keep down prices is of paramount importance. National policy and Hoover policy, therefore, are very much in line. For, since the War, Hoover prices have been kept as close as possible to the pre-war level and, in fact, Model 612, the latest Hoover Cleaner, sells at the same figure as its corresponding pre-war model (plus, of course, purchase tax).

Indeed, until 1946 *all* Hoover prices were pre-war, and although eventually the prices of some models were forced up slightly, the overall increase today is still only 10% above 1939 price levels.

Further evidence of the Hoover Policy of keeping down costs is shown by the introduction of the Hoover Electric Washing Machine at only £25 (plus tax), and by the very moderate prices of Hoover F.H.P. motors.

The highest possible quality at the lowest possible price still remains the Hoover policy.

We help to make colours brighter

WE CLAIM the credit for the bright colours of such things as lacquer and linoleum, plastics and printing inks. That's because we make lithopone.

Lithopone is a most widely used white pigment, and white pigments are the most important of all pigments. For they're the base, the 'body' that makes white paint white and opaque, and makes brilliant colours possible in paints and many other materials.

Our illustration shows an early stage in the production of ORR'S ZINC WHITE LITHOPONE at our Widnes works—the roasting of one of the raw materials in a revolving furnace.

Besides lithopone and other zinc pigments, our products include zinc metal and alloys, zinc dust, cadmium, metallic arsenic, sulphuric acid, catalysts, fungicides and fluorides: all basic materials for Britain's home and export trade.

IMPERIAL SMELTING CORPORATION (SALES) LTD. 37 DOVER STREET LONDON W1

Russia to Send Coarse Grain

The Russian grain contract is to go forward at last, and the first shipments are expected to arrive in Britain soon. The Ministry of Food agreed some months ago to buy 1,000,000 metric tons of coarse grain from the Soviet Union—500,000 tons of barley, 400,000 tons of maize and 100,000 tons of oats. But after the contract was signed the Russian authorities wanted it to be incorporated in a general trade agreement. The discussions for the general agreement have been taking their usual protracted course, and are still proceeding in London. Evidently the Soviet grain export corporation appears to have realised that Britain might buy substantial quantities of American maize with ECA funds—the American crop, though slightly smaller than last year's, is again of bumper proportions—and came round to the British idea of implementing the grain contract separately. There may, of course, have been another motive in deciding this on the eve of the Washington talks, especially as the United States will have a large export surplus of coarse grains this season.

The agreed prices have not been officially announced. In December, 1947, when 750,000 metric tons of coarse grain were purchased from Russia (450,000 tons of barley, 200,000 tons of maize and 100,000 tons of oats), prices were fixed at the level (a postwar peak) then ruling in the Chicago market. By the time the last shipment was received, American prices had fallen by 40 per cent. It will be interesting to see if the new prices are also determined by reference to the American market. Maize is now \$1.22 a bushel, against \$2.69 twenty months ago. Even if Russia has accepted current prices, it may well find the sale profitable before final shipment takes place.

The main advantage for Britain is that farmers will now be assured of adequate feed supplies. In 1948 Britain imported 780,000 tons of barley, 294,000 tons of oats and 1,330,000 tons of maize. For the first seven months of this year imports of barley totalled 184,000 tons, oats 49,000 tons and maize 620,000 tons. But Britain is to get between 1,000,000 and 1,250,000 tons of Argentine maize and smaller quantities of other coarse grains, so that with the coarse grain from Russia, imports this year should be at least as great as in 1948, and possibly greater. The amount of maize available, however, would still be only half the prewar quantity, though supplies (including home-produced supplies) of barley and oats should equal, if not exceed, the prewar level.

* * *

Stability for Rubber

The rubber market has improved in the past three weeks. The spot price in London is now 11½d. a lb., compared with less than 10½d. at the beginning of August. Though world consumption of natural rubber in July declined by 12,500 tons to 107,500 tons and world production increased by 5,000 tons to 120,000 tons, stocks at the end of the month were unchanged; they were, in fact, 90,000 tons less than at the beginning of the year. Sir Eric Macfadyen, chairman of Golden Hope Rubber Estate, Limited, said in his statement circulated with the annual report that "in normal circumstances" the stock position pointed to a rise in prices. But circumstances in rubber were not normal; owing to the existence of the American synthetic rubber industry the United States "can at will turn shortage into surplus." Synthetic rubber has clearly come to stay, and Sir Eric suggested that there is room for both the natural and the synthetic product, just as in textiles there is room for both rayon and natural fibres. The main thing is to allow the two types of rubber, which in some fields are complementary and in other competitive, to settle down together to find their own levels on their merits. But such a process is only deferred by discriminatory measures such as have been imposed in the United States in favour of synthetic production.

Sir Eric Macfadyen's advice was sound; perhaps it will be listened to in the United States during the Washington talks.

But synthetic rubber production is only half of the story. The other half is American purchases of natural rubber for the strategic stockpile. The favourable stock position at the present time is, of course, almost entirely due to these purchases. World production of natural rubber totalled 817,500 tons in the first seven months of the year; consumption was 840,000 tons. The difference of 22,500 tons came from stocks, but reported stocks declined by 90,000 tons during the period. The discrepancy of 67,500 tons represents in the main purchases for the strategic stockpile, and, but for these purchases, the rubber market would be looking much less healthy than it is. Long-term stability in the rubber industry can be assured, therefore, only if natural and synthetic rubber can freely compete with each other, and also if the demand for each type bears a more direct relation to consumption. If both these conditions obtained, rubber producers might stand to gain.

Industry

The New British Aircraft

With the tenth exhibition of the Society of British Aircraft Constructors at Farnborough this week, the gas turbine has entered the field of civil aviation. The general significance of the advance made is discussed in a note on page 582. The rate of development of British aircraft may create some difficult questions for the operators. Among the piston-engined aircraft which BEA and BOAC have been buying are the Airspeed Ambassador (British) and the Boeing Stratocruiser (American). Much was expected of these two aircraft, but for various reasons neither has yet been delivered to the British corporations. Of the five gas-turbine aircraft demonstrated this week, two, the de Havilland turbo-jet Comet and the Vickers turbo-prop Viscount, are to be built for BEA and BOAC. The Viscount was actually shown with BEA markings, and will be used by BEA for European routes. BOAC are buying 14 Comets for their long-distance Empire routes and negotiating for Viscounts for the British West Indies routes. Two other turbo-prop aircraft shown, the medium-range Armstrong-Whitworth Apollo and the much larger Hermes V of Handley Page, are so far being built only for the Ministry of Supply, but it would be surprising if neither was to be ordered by the British corporation. But delivery of the new piston-engined types is long overdue, and these may not have completed more than a small part of their economic life before the corporations are asked to take delivery of the new gas-turbine aircraft which will replace them.

Devices for assisted take-off are beginning to be of interest for civil aviation. It is clear that because the cruising power of turbo-jet engines and their maximum power are not far apart, difficulties may be met under certain conditions in the take-off of a fully laden turbo-jet aircraft. The De Havilland Company exhibited a "cold" rocket—a rocket which does not use combustion—designed to provide the Comet with the extra thrust needed in those circumstances. An alternative method—"re-heat"—was demonstrated on two fighters. Fuel is added to the exhaust gases before they leave the jet pipe; the effect is somewhat like that of a supercharger. This device is still in too crude a form for civil applications, but refinements to it might prove worth while.

Gas-turbine civil aircraft hardly exist on even the drawing boards of manufacturers in any other country. Representatives of most of the world's airlines have been to Farnborough to see them flying and the manufacturers are prepared to discuss estimates, delivery dates and guaranteed performances with them. In particular, Dutch and North and South American airlines are talking as if they meant business. But, surprisingly enough, there is a feeling among business. But, manufacturers that the talk is unlikely to lead to contracts. Aviation industries tend to be protected by considerations of prestige and strategy, and it remains to be seen whether the world-wide American companies will find it possible to adopt some of the new British aircraft for their international routes.

This may not prove true of the American internal services. What is certain is that by 1952 the British international air lines will be operating with gas-turbine liners. The passenger will experience such an improvement in comfort through the absence of vibration that he may well be reluctant to face piston-engine travel again.

Tankers for Haifa

The attempts that are being made to get the Haifa refinery working again are to be welcomed; there has lately been no more flagrant example of economic waste arising from political ill-feeling than the continued idleness of this plant. Some recent press reports have been so confused that it is perhaps useful to explain what the position is. It is true that two tankers are approaching Haifa from the Dutch West Indies with cargoes of Venezuelan crude oil; they are due to arrive about September 18th, and will (together with a third tanker which is under orders to make the same voyage) deliver about 30,000 tons of crude. It is not true that (as was reported) they are to pass through the Suez Canal, either to "test" the willingness of the Egyptian Government to let them through, or for any other reason; a glance at the map would show how absurd and costly such a proceeding would be. They are taking the direct route from Curaçao to Haifa—across the Atlantic and through the Mediterranean.

Even this is an expensive way of supplying oil to Haifa, but it will be worth while if it helps to break the deadlock. Its contribution in bulk will be small—less than three days' throughput if the refinery were working to its full capacity of 4,000,000 tons a year. But it will permit work to be started when the decision to start work is taken, and it may assist the Iraqi Government to realise the folly of keeping the pipeline from Kirkuk indefinitely closed.

In normal times, although the pipeline was its largest single source, the Haifa refinery drew some of its supplies from the Persian Gulf by tankers which passed through the Suez Canal. The question of resuming shipments via Suez to Haifa is, therefore, bound to arise. It has not formally arisen yet; no oil has been despatched to Haifa through the Canal since the Israeli-Arab war. The Egyptian Government has not stated formally that it would refuse to permit such shipments; there is merely a presumption that shipments might arouse Egyptian feelings and might, therefore, meet with difficulty. Perhaps too much weight has been given to these presumed Egyptian feelings. Egypt as well as Iraq is losing revenue through the present position, and, once it is demonstrated to either country that the refinery can in any case be operated, it is reasonable to suppose that their objections might be overcome.

* * *

Textile Machinery Prices and Re-equipment

A revision of the prices of British textile machinery was probably overdue, since with the passage of time the costs of producing various types of machinery have changed in different degrees, while the price structure has remained static since 1946. During that time two influences have been at work on production costs; the makers of textile machinery have made improvements in their methods and organisation of work, and their employees have gained increases in pay. The wage increases (the last was an increase of 5 per cent in engineers' wages last autumn) have not yet been reflected in higher prices for machinery, but neither have the economies gained through the reorganised methods of work. The Textile Machinery Makers' group has now notified the cotton spinners of a revised price list which makes a number of the changes that might have been regarded as logical; certain machines are raised in price, and others are reduced, but the net effect is estimated by the cotton spinners to be an average increase of 7½ per cent.

This has aroused some unfavourable comment, and Sir Frank Platt, managing director of the Lancashire Cotton Corporation (the biggest customer for new spinning machinery), is reported to have said this week that the changes "are taking away the advantages of the subsidy." It is true that an increase of 7½ per cent in machinery prices takes a big slice out of the subsidy of 25 per cent of the cost of re-equipment, which is provided under the Cotton Spinning (Re-equipment) Act. It may in some cases call in question the calculations on which schemes of re-equipment were worked out. No doubt the impact of the new prices will vary in accordance with the individual requirements of firms. It is unfortunate that the changes should be announced at the moment when the first payments of the re-equipment subsidy have begun to be made. The committee of the Federation of Master Cotton Spinners' Associations has expressed some concern, and is to meet the Textile Machinery Makers' group to discuss the new price list.

Shorter Notes

Dealings started on Wednesday in the new W. H. Smith shares for which 30,000 applications representing approximately £33 million were received last week. The "A" 4s. ordinary shares opened at 2s. 1½d. premium on the issue price of 40s., but reacted to 2s. 6d. early on Thursday before recovering to 3s. premium. The "B" 4s. ordinary shares issued at 8s. were at first 1s. premium, but have shed 4½d. The opening premium of the 4½ £1 preference shares was 7½d. on the issue price of par. This issue subsequently improved to 1s. 6d. and later fell to 1s. 1½d. premium.

*

The Cement Makers' Federation has announced that cement prices in the United Kingdom are to be reduced, on average, by 2s. a ton. The chief reason for the change is a decline in the price of the Kraft paper used for cement bags, but there have also been economies in costs arising from the industry's current volume of production. The price changes will not be uniform; in some areas changes in costs and freights will offset, wholly or in part, the general price reductions.

*

The agenda for the general meeting of Companhia Hispano-Americana de Electricidad (CHADE), which is in liquidation, called by a Spanish judge for September 27th in Madrid, is held by the liquidators to disregard the decisions taken at the general meeting held at Luxembourg in January this year. The liquidators further consider that the decision by the judge that deposits of shares to be made in respect of the forthcoming meeting will be accepted only in Spain, contravenes the bye-laws of the company. In these circumstances the liquidators state that the meeting cannot validly deliberate on the company's affairs.

*

Coal output last week was 4,201,300 tons. This is 434,700 tons more than in the preceding week; the improvement is attributed to the simultaneous ending of the holidays and settlement of the windingmen's strike. Output for the first 35 weeks of the year is now 141,766,600 tons. In this period over 1,000,000 tons of coal have been lost by strikes compared with just over 700,000 tons in the same period last year.

*

Switzerland was the only European country to which gold was transferred from the United Kingdom during August, receiving £3,226,000. Settlements with countries in the Intra-European Payments Scheme for July and August will be held in abeyance pending signature of the payments agreements for 1949-50.

Food in Pubs

It is the aim of the brewing industry to encourage the serving of food in public houses by providing facilities for catering wherever it is practicable to do so. The licensee is, however, obliged to secure a permit from the food authorities before he can serve even sandwiches made with lettuces and tomatoes from his own garden, and to do this he must produce evidence of genuine consumer need.

Where consumer need has been proved "the trade" can point to evidence of remarkable progress. For example, one brewing firm recently announced that an average of more than 141,000 main meals were served weekly in its houses. Again, to quote an independent

observer (Mr. Maurice Gorham in his new book "Back to the Local"): "Before the war it could be claimed that London pubs provided as good food of its kind as you could get in England . . . Food is a problem now for the pubs as for everybody else, but the machinery remains the same. You can still find everything varying from the separate restaurant to the dish of sandwiches on the bar."

SHORT OF ROOM? SHORT OF EQUIPMENT? SHORT OF PERSONAL ASSISTANTS?

Keep this Self-Contained
"Secretary" Always on Your Desk

It Splits up Your Work—
Acts as a Diary—
Reminds You of Routine Jobs—
and a hundred and one other things.

Here is the self-contained "secretarial" unit . . .
It is especially for business men who have to keep their papers filed neatly—on their desk or side-table.
It also helps where space and staff shortages are problems.
The Unit contains either the famous flat-topped Shannograph files or the Shannoblic adjustably-tabbed files.
Which you have depends on your needs. The flat-topped type permit fuller designations (plus address, phone number, etc.). They can also be signalled for action and "progressed" daily and otherwise. The tabbed type are probably more widely used for general correspondence.
There are many uses for these units: you can arrange 31 files for days in the month, with 12 files behind for months in the year. This acts as a fine reminder work diary. Or you can have them alphabetically, numerically or geographically.
Sales Managers may file by product, salesman or area; Advertising Managers by papers used; Export Executives by order number—and so on. Every type of busy Executive can utilize one or two of these Units.

Below is a list of applications. Tick the one in which you are interested, attached to your letter-heading and full details will be sent you by return.

NOTE.—You may also be interested in the Personal Portable File for transporting private papers between office and home—or for systematizing your domestic affairs. Tick this also if you are interested. This file is in the form of a handsome crackle-steel case, complete with lock and keys and necessary files and labels, adjustable tabs, etc.

COMPANY MEETINGS

GEORGE NEWNES LIMITED

ANOTHER PROGRESSIVE YEAR

SIR FRANK NEWNES'S REVIEW

The fifty-second annual general meeting was held on September 1st at the company's office.

The following is the statement circulated with the accounts:—

The year's results again reflect a progressive and healthy state of affairs.

The combined profits of the organisation, now comprising twelve publishing companies, amount to £968,443 as against £712,052 last year. After providing for taxation of £442,351, the net profit amounts to £526,092, as compared with £396,064 last year. The increase is largely due to our acquisition of a substantial interest in Temple Press, Limited, the benefits from which first show in the figures now under review.

Of the above total net profit of £526,092, the amount attributable to the parent company, George Newnes, Limited, is £205,096, the balance of £320,996 remaining in the accounts of the subsidiaries. It is interesting to note how the overall profit figure of £526,092 is deployed. Dividends, paid and proposed, take £168,966; general and capital reserves, £98,747; development and reconstruction reserves, £70,000; staff sick and pension funds, £23,500, and supplementary pension accounts, £135,000, leaving a residue of £29,879 to be added to the undistributed profits of the various companies, making that figure £269,319. It will thus be seen that the amounts distributed by way of dividends are of a modest order having regard to the total net earnings. A larger dividend on the Newnes ordinary shares would have been amply justified, but in conformity with the generally accepted practice of dividend limitation the distribution remains as last year. Two of our companies—C. Arthur Pearson, Limited, and Country Life, Limited—both of which issue balance sheets to their preference shareholders, have paid higher ordinary dividends to Newnes, but this is purely a question of internal policy, as Newnes own the whole of the ordinary shares of both companies.

NEWNES' BALANCE SHEET

As already indicated, the net profits of George Newnes, Limited, the parent company, amount to £205,096 against £199,831 last year. With the amount of £65,896 brought forward from the previous year, and after deducting dividends on the preference shares and the interim dividend of 5 per cent. on the ordinary shares there is an available balance of £204,719. The directors propose that a final dividend of 10 per cent. be paid on the ordinary shares together with a bonus of 5 per cent., making with the interim dividend a total of 20 per cent. as for last year. This will absorb £75,000, and after transferring £6,500 to employees' sick and pension fund, £50,000 to supplementary pensions account, and £15,000 to general reserve, there remains a balance of £58,219 to be carried forward to next year's accounts.

Certain items in the balance sheet show marked changes. "Shares in subsidiaries" is increased by approximately £300,000, this mainly representing Newnes' proportion of the group's investment in Temple Press. For similar reasons the items "cash" and "tax reserve certificates" together show a reduction of approximately £260,000. "Freehold premises" has increased by £42,000 due to additional purchases to meet the needs of the business. The increase in "trade investments" by £30,000 represents an interest acquired in another large organisation with

whom in the ordinary course of business we have large and regular dealings. "Stocks and work in progress" has risen by over £90,000, this being largely due to actual printing production having now commenced on *Chambers's Encyclopædia*—an important new enterprise to which further reference is made later.

GROUP'S FINANCIAL STRENGTH

The consolidated balance sheet, setting out the financial affairs of the group as a whole, discloses a position of great strength and solidarity. The various reserves, including £249,799 capital reserves and £494,146 for development and reconstruction, amount to no less than £1,516,211, in addition to which a sum of £387,289 is provided as reserves against future taxation liability. Undistributed profits held by the various companies amount to £269,319. The combined cash resources stand at £986,771, in addition to which an amount of £443,400 is held in tax reserve certificates.

PAPER POSITION

During the year under review the permitted paper consumption for periodicals was 45 per cent. of prewar. Recently the percentage has been raised to 70 per cent.—a very welcome increase, although bringing in its wake new problems on the production side owing to shortage of skilled printing labour. But because the step is welcome it must not be thought that more paper necessarily means more profit. Better quality paper, better production and better reading values, long held back by rationing and restrictions, must be the natural outcome as larger paper supplies are made available; and costs must increase accordingly. On the other hand the price of paper should be substantially reduced, notwithstanding that a modest reduction took effect on July 1st last. The price today is still roughly between three and four times what it was prewar, a state of affairs that helps to frustrate or discourage a publishing house from taking the steps it feels to be desirable in the long-term interests of its publications. As a matter of national interest British publications should be further helped to discard their remaining wartime austerities and one of the ways the Government can do that is to cut down the excessive cost of paper by passing on to the publisher the benefit of price reductions in raw materials as soon as they take effect. Not only do British publications play an important part in the home life of this country, but large quantities go to countries overseas where they have to compete with productions produced under more favourable conditions, and where they are called upon to play an important part in helping to show the British way of life.

HEALTHY STATE OF PUBLICATIONS

As to the publications owned and published by the group—now more than fifty in all—it is not possible to refer to each individually. Suffice it to say that we have a variety of healthy properties widely spread in their appeal, many of them in their respective fields holding a leading place both with reader and advertiser. *Woman's Own*, our colour gravure women's weekly, has recently enjoyed a further notable success in passing the "million a week" circulation mark with a very handsome margin.

CHAMBERS'S ENCYCLOPÆDIA

Over the past five years reference has been made from time to time to the great publishing enterprise upon which the company has been engaged in producing an entirely new edition of the world famous *Chambers's Encyclopædia* by arrangement with W. and R. Chambers, Limited, of Edinburgh. As a work of the first order of importance, unimpeachable in authority and scholarship, it brings together the most up-to-date knowledge in every field of human endeavour, contributed by foremost authorities under the guidance and collaboration of fifty-two associate editors. With the immense amount of editorial work all but completed, printing production is now actively proceeding and plans are being made to launch the new edition in the spring of next year. The company expects to reap a rich and long-continuing reward from these efforts, not only in the home market but also in all countries overseas. Necessarily, a large initial expenditure has been involved in this undertaking, and following the usual conservative policy of the company, very considerable sums have been charged against the company's accounts year by year during the period of preparation. The benefits from this policy will, of course, accrue to the company in the years ahead.

TEMPLE PRESS, LIMITED

As was mentioned briefly last year, we have acquired a substantial interest in Temple Press, Limited, proprietors, publishers and printers of fourteen technical and specialised journals. The group, which includes such well-known journals as *The Motor*, *The Aeroplane*, *The Commercial Motor* and *The Motor Ship*, ranges from *Cycling*, founded in 1891, to a new periodical, *British Farm Mechanization*, first published this year. It is of particular interest to note that Temple Press prints and produces all its publications in a modern building designed specially for the purpose and completed in 1939. The management of Temple Press remains in the same hands as before, with Mr. Roland E. Dangerfield as chairman and managing director. He is the son of the founder, and has been a member of the board of Temple Press, Limited, for over thirty years.

PENSION FUNDS

Last year reference was made to the necessity of inaugurating Pension Funds for our various companies on a more comprehensive basis than hitherto. The existing non-contributory sick and pension funds, although admirable in their purpose and to which, since they were founded many years ago, over £400,000 has been contributed by the various companies, do not, in the opinion of the board, meet the changed economic conditions of recent years, particularly in the case of the higher grades of wage-earning and salaried personnel. Further, it was stated that to institute a suitable scheme a considerable initial sum would be required; and as a beginning a total sum of £200,000 was allocated last year from the profits and reserve funds of the various companies. It is proposed this year to allocate a further £135,000, bringing the total amount, including a sum previously provided, to £365,000. This is still insufficient for the initial needs, but subject to the trading results for the current year being reasonably maintained we should be able at the time of our next balance sheet to have the required amount available to bring a suitable scheme into operation. If this can be done, as we sincerely hope it can, it will, we feel sure, give every satisfaction to all concerned—staff, directors and shareholders.

In conclusion, the board again pays high tribute to the staffs of our various companies for another year of able, energetic and loyal service.

The report and accounts were adopted.

THE MERCANTILE AND GENERAL REINSURANCE COMPANY, LIMITED

CONTINUED EXPANSION IN ALL BRANCHES

MR H. K. GOSCHEN ON ECONOMIC DIFFICULTIES

The annual general meeting of The Mercantile and General Reinsurance Company, Limited, will be held on September 27, 1949, at the company's chief office, 25-31, Moorgate, London, E.C.2.

The following is the statement by the chairman, Mr Hugh Kenneth Goschen, which has been circulated with the report and accounts for the year ended December 31, 1948. This year I am circulating the usual chairman's statement with the directors' report and accounts and propose, with your permission, to take this statement as read at the annual general meeting. That meeting will therefore be confined to purely formal business. I trust that this procedure, which conforms with the practice now adopted by most companies, will commend itself to you.

THE LATE CHAIRMAN

It is with great regret that I have to record the death of our late chairman, Mr Richard Sidney Guinness, on January 14th last. Mr Guinness was virtually the founder of our company and presided over it for 33 years; from modest beginnings he brought it to the eminent position it now holds in the reinsurance world, and up to the day of his death watched over its fortunes with a fatherly interest. By his death the company has lost a great chairman and his colleagues and the staff a good friend and a great leader.

Your directors honoured me by electing me chairman of the board on January 31, 1949.

I have also to record the sad loss which the company has sustained by the death of Mr Henry Pattison Hewitt, an alternate director, on May 16, 1949. Mr Hewitt had rendered inestimable services as secretary of the company, a post which he occupied for nearly 30 years. He will be much missed.

To the regret of his colleagues, Mr Edward Douglas Guinness, C.B.E., resigned his seat on the board. Mr Ian Watson Wardlaw Shepherd (previously an alternate director) has been appointed a director in his place. Mr Shepherd brings to the board a specialised knowledge of investments, an aspect of our business which becomes more and more important as we grow in stature.

You will be aware that, where it is proposed to re-elect a director who has attained the age of 70, special action is now called for under the Companies Act of 1948. The requisite special notice of a resolution concerning Mr C. M. Woodbridge has been received. We value the wide experience and wise counsels of this elder statesman.

A vote of thanks to the staff will be proposed at the meeting. This is no formal matter, but a sincere tribute to the untiring efforts in the company's interests of Mr Calburn, our general manager, of the managers and of the whole staff.

THE ACCOUNTS

The accounts for 1948, now submitted for your approval, show a continued expansion in every branch.

This applies particularly to the fire department in which the premium income has increased at a high rate, due not only to a very satisfactory acquisition of new business, but also to the general adjustment of insured values which has brought them more nearly into line with new price levels. Notwithstanding the heavy charge for additional premium reserves and a number of serious losses, the working of this department has closed with a profit.

In the accident department the motor and general liability business still give cause for some anxiety; the rates have not yet caught up with postwar experience and awards for damages in the Courts are continually in-

creasing. Aviation has shown a small loss. The remainder of the accident account has given satisfactory results.

The marine accounts for 1945 and 1946 can now be closed; together they show a profit, after deduction of tax, of £34,305. The business has, however, expanded considerably during the year, and it has therefore been considered prudent to leave these profits in the fund, which now stands at 103 per cent. of the premiums.

During the year the life department completed 8,940 new life reassurances, the net sums assured retained being £4,837,507. This represents an increase in our new business figures not far short of the average of the previous three years of conspicuous advance. Between 1944 and 1948 the total of net sums assured in force has almost doubled and has been accompanied by a constant increase in the number of our connections both at home and abroad, testifying to a widening appreciation of the expert services which we afford in this highly specialised department. It will be easier to assess the progress after the quinquennial valuation to be carried out as at December 31, 1949, but in the meantime it can be stated that the department's mortality experience continues to be favourable.

HEALTHY POSITION

From the foregoing it will be seen that the position of the company itself is healthy. The income continues to expand in all branches, and with expansion comes an ever-greater spread of risks and a more balanced business. Competition is growing, but the technical services which we are able to provide to our ceding companies, and ventures such as the pool for diabetic lives in the life department, continue to bring us new friends.

We must not, however, be too optimistic about the next few years. The economic difficulties with which the country is now faced, particularly the rapid exhaustion of the gold and dollar reserves, overshadow the whole business world. Our company has active business relations with ceding companies in 36 different countries and a net premium income of over three and a half million pounds. Transferability of currency over a wider area is, therefore, essential to our business. While it must be the aim of the country's financial policy to maintain and expand the use of sterling as the most generally accepted medium of international exchange, the deterioration in the country's balance of payments will almost certainly delay this progress.

We might be more optimistic if we felt that steps were being taken to deal with the balance of payments position in the right way. The measures to rectify the position which have been announced so far are concerned almost entirely with further restriction of imports, which can only mean the balancing of the account on an ever-decreasing volume of trade. Meanwhile, our exporters meet ever-growing sales resistance in overseas markets, their difficulties are not lessened by the heavy burden of taxation at home and the Government schemes for social services which, desirable as they are in themselves, cannot but increase the costs of production and so make their products less competitive in world markets.

NATIONALISATION: EFFECT UPON OVERSEAS BUSINESS

It is hardly credible that the Labour Party has chosen this time to issue a manifesto, which presumably will become their programme for the next election, containing proposals which can only be interpreted as a

threat to nationalise the insurance industry. The manifesto refers only, it is true, to the nationalisation of industrial assurance, but the proposals for implementing this policy speak of the taking over, wholesale, of companies who not only transact industrial assurance, but are responsible for probably one-third of the overseas life business of the London insurance market as well as substantial overseas business in fire, accident and marine. When our managers travel abroad, the first questions they are invariably asked are about this threat of nationalisation. Our many friends abroad are seriously worried at this prospect.

A TRAGIC POSITION

The London market has a reputation for the prompt payment of claims, even ones which may not be strictly enforceable in law, and for a healthy competition within itself which enables foreign insurers to obtain the finest rates. Our friends abroad cannot believe that these advantages would remain if the London market were to become largely a State monopoly.

They will inevitably seek other markets and the valuable foreign exchange earnings, largely in hard currencies, will dwindle. It is tragic that at a time when the country is fighting for every dollar this threat should be hanging over the industry. Happily there are signs that these fears are being heeded; we can only hope that the wiser counsels will prevail and that the real interests of the country will not be sacrificed to purely doctrinaire socialism.

I ask our many friends abroad to believe, as I do, that these troubles are temporary ones, the troubles of a nation trying to raise the standard of living of its people at a time when, impoverished by a great war, it cannot really afford to do so. We will overcome these troubles as surely as we have conquered our other difficulties in the past.

LISBON ELECTRIC TRAMWAYS, LIMITED

INCREASE IN PASSENGERS CARRIED

The fifty-first ordinary general meeting of the Lisbon Electric Tramways, Limited, will be held on September 28th in London.

The following is an extract from the circulated statement by the chairman, Sir Alexander Roger, K.C.I.E.:—

The profit and loss account shows an increase in operating revenue of £99,532 and an increase in expenses amounting to £105,261. The operating surplus thus shows a decrease of £5,729 compared with 1947.

The number of passengers carried again shows an increase. Passengers carried on the tramcars and elevator were 262,658,741, which is practically the same number as in 1947; the motor-buses carried 14,307,070, an increase of over 9 million compared with 1947.

The mileage run by trams increased by 404,803 miles or 2.48 per cent. and buses by 1,181,250 miles or 155.03 per cent. These statistics of passengers and mileage indicate that the Companhia Carris de Ferro de Lisboa's efforts to relieve over-crowding on trams are at last bearing fruit and I am happy to feel that with co-operation between that company and the authorities, which is indispensable, we are now in a position to offer greatly improved travelling facilities to the public of Lisbon.

The delivery of buses, which had been held up in 1947 owing to various causes, improved in 1948. In addition nine new tramcars have been put into service during the year. In consultation with the authorities 12 new bus routes have already been installed and many districts which previously had no public transport service are now linked up by an efficient bus service. In addition to these normal weekday services, a new Sunday and Holiday route from Marques do Pombal to Alges was inaugurated.

LINTAFELT, LIMITED

DOWNWARD TREND OF PROFIT MARGINS

INCREASED FACTORY EFFICIENCY

MR B. M. LINDSAY FYNN'S STATEMENT

The annual general meeting of Lintafelt, Limited, will be held on September 28th in London, when the following statement will be made by the chairman, Mr B. M. Lindsay Fynn, F.C.A.:

My circular letter to shareholders, dated August 8, 1949, will already have acquainted you of the decision of your directors to change the accounting period of the company to bring it into line with the planning period of those Government Departments responsible for the allocation of import licences covering the main raw materials used by the company. The effect of this decision is that the accounts now presented to you cover a trading period of 15 months to June 30, 1949, as against the previous accounting period of 12 months ended March 31, 1948. The comparative figures given in the balance-sheets and profit and loss accounts are, however, in respect of a twelvemonth period only.

INCREASED SALES

To achieve a similar annual rate of net profit it has been necessary for the company to increase its sales by approximately 38 per cent. During the period reductions aggregating approximately 6 per cent. have been made in the selling price of Lintafelt, the main product of the company. This indicates that the company is experiencing the general downward trend of profit margins as a return is made to the buyers' market. To a certain extent these reductions have been offset by an increase in factory efficiency.

From January 1st of this year the Government allowed the importation of cotton liners to return to limited private trading subject to the user industries accepting the stocks then held by the Government. The prices at which the trade was required to accept these stocks were well in advance of the then current world market prices, and since these stocks represented the accumulated residue of a number of years' bulk purchases, the quality was well below the normal standard. In so far as your company is concerned, the proportion of these high valued stocks which were allocated to us have been accepted and used, and any loss taken during the period covered by the accounts now presented to you, and in this respect we therefore face this new financial year with well bought stocks only and our forward purchases represent current market values and quality.

The return to private trading has also necessitated the provision of large additional sums for the finance of forward purchases and for payments in advance against shipping documents, a position which is also reflected in the higher stock figure at June 30, 1949.

CONSOLIDATED ACCOUNTS

From the consolidated accounts it will be noted that the value of the fixed assets has increased over the period by £62,508 after allowances for obsolescence and depreciation of £25,690 have been made. This figure compares with an amount of £10,579 provided for in the accounts to March 31, 1948. Your directors have decided for administrative reasons to change slightly the method of calculating the depreciation on the fixed assets. In future the depreciation will therefore be calculated on the valuation figures at March 31, 1947, or on the costs of additions since that date, at an annual rate which will eliminate the fixed assets on the following basis:—

Freehold land and buildings ...	50 years
Machinery, plant, fixtures and fittings and furniture ...	10 "
Motor vehicles ...	5 "

These rates have been adopted for the accounts to June 30, 1949, and applied retrospectively to the accounts for the year ended March 31, 1948. In comparing the figures calculated on the old and the new basis for depreciation a decrease of £1,685 is revealed in respect of the current period, and this together with an over provision of £1,000 in respect of the accounts to March 31, 1948, has been adjusted in the accounts to June 30, 1949. Despite that our total charge for the 15 months for depreciation and obsolescence in the group amounted to £25,690—a substantial provision.

DIVIDEND RECOMMENDATION

In considering the recommendation for the payment on our ordinary share capital of a final dividend of 35 per cent., making a total of 50 per cent. for the 15 months, or 40 per cent. per annum as against 50 per cent. per annum for the year to March 31, 1948, your directors have been influenced by several factors. Firstly, the higher provision necessary for taxation in accordance with the following comparative figures:—

	1949	1948
	£	£
Income tax	27,866	18,247
Profits tax	12,820	11,000
	40,686	29,247

Secondly, the larger capital involved in the financing of our stock forward purchases and debtors, the latter being partly due to the rather longer credit taken by customers. Thirdly, the increasingly uncertain economic position as the company relies to a large extent on imports for its raw material requirements. While up to the present the priority accorded its products has resulted in sufficient supplies being made available to meet its needs, we cannot but view the position which faces the Government in meeting the country's economic difficulties as one which may result in overall reductions in imports with the consequent effect upon your company's trading prospects. I must, however, state that those responsible for finding the company's raw materials are using every endeavour both to locate alternative materials and to develop new materials which are available either at home or in the sterling area.

DEVELOPMENT PROGRESS

During the 15 months under review the company has continued to develop along the lines previously indicated to shareholders and has at York successfully converted redundant Air Ministry buildings into an up-to-date and profit-contributing fillings plant. The planned alterations of premises and additions to plant at Loudwater have been completed and this factory is now among the finest of its type in the world.

Our Ulster venture has not been without its vicissitudes and the accounts before you include the cost of moving the original plant of Lintafelt (Ireland), Limited, from the Corporation Street, Belfast, premises and consolidating with the Unity Manufacturing

Company, Limited, in premises leased by them at Whiteabbey, near Belfast. This latter company, a small spring making business, was acquired by your directors early in the present financial period. These changes should result in a profit contribution from these two Ulster subsidiary companies during the current trading year.

NEW MANUFACTURES

The products of your company still continue to enjoy recognition as the foremost of their kind in the many industries served and I am looking forward with pleasure to the introduction of new manufactures resulting both from research carried out internally by our own organisation and from further research resulting from visits to the U.S.A. and elsewhere abroad by members of the company's staff. During the past few weeks your company has acquired the whole of the issued share capital of Unicorn Latex Industries, Limited, which it is proposed to use as a pilot plant from which to develop an interest for your company in the many and varied industrial and other applications for the use of foam latex.

I am sorry to have to record the loss which the company suffered during the year by the death in January of Mr A. C. Nash, who since the inception of the company has been its auditor and latterly joint auditor, and whose guidance and help are reflected in the strong position of the company today.

Our thanks and grateful appreciation are due to our managing director, Mr Harold Turnbull, Mr Hynds, our sales director, and to our excellent and hard-working executives and staff for the part they have played in the successful results of the 15 months. They are all keen to keep Lintafelt in the forefront of upholstery interiors.

SEAGER, EVANS AND COMPANY, LIMITED

CRUSHING BURDEN OF TAXATION

The fifty-first annual general meeting of Seager, Evans and Company, Limited, was held on September 1st, in London, Lieut. Colonel the Hon. Michael T. Henderson (chairman and managing director) presiding.

The following is an extract from his circulated statement for the year to March 31, 1949.

The profits of the parent company amount to £146,498 as compared with £170,783 for the preceding year. We have left undistributed in the accounts of subsidiary companies profits of £8,117 as compared with only £84 in the preceding year, so that the fall in profits is approximately £16,000. The directors propose that the total dividend for the year be 17½ per cent. with a bonus of 5 per cent. The revenue reserves and undistributed profits total over a million pounds.

With the reduction in the spending power of the public, the full impact of the crushing burden of Customs and Excise duties is now being felt. The distilling trade, especially Scotch whisky distilling, is of national importance and it is to be hoped that the Chancellor will not allow it to be crippled under the burden of taxation.

We are pleased to report that since the close of the financial year we have been able to reintroduce to the market our well-known Egg Flip; this was always popular with the public and that which we are now making is of the same high standard of quality as our prewar product. Stockholders can materially assist the company by asking for our products when ordering wines and spirits.

Our subsidiary companies enjoyed a good year's trading. Licences to distil whisky were granted on a scale nearly equal to prewar. Licences for 1949-50 are on a similar scale. The report was adopted.

JAMES HOWDEN AND COMPANY, LIMITED

INCREASED PROFITS

MR CRAWFORD W. HUME'S REVIEW

The forty-third annual general meeting of James Howden and Company, Limited, was held on September 7th at 195, Scotland Street, Glasgow, Mr. Crawford W. Hume, M.I.N.A. (the chairman) presiding.

The secretary (Mr. James S. Niven) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to April 30, 1949:

The accounts this year are drawn up on the lines we have followed for a number of years and are, of course, in accordance with the provisions of the Companies Act, 1948. In dealing with this year's profit of £278,822 which exceeds last year's by £18,677, the directors have further consolidated and increased the reserves and recommend a final dividend of 22½ per cent. keeping the total dividend for the year at the previous rate of 30 per cent., which requires £45,045 net.

APPROPRIATIONS

In the appropriations made by the directors you will have observed that £65,000 has been transferred to the general reserve account, increasing this reserve to £310,000, which, as will be seen from the balance-sheet, is now somewhat greater than the issued capital of the company. £15,000 has been utilised to write down goodwill and £5,000 to write down patents, and the amount carried forward has been increased by £5,919 to £42,780. Under revenue reserves, the amount set aside for income-tax, £217,000, covers the taxes due till January 1, 1951, while the balance of taxation up to April 5, 1949, and the profits tax on profits for the year ended April 30, 1949, together amounting to £41,600, are shown under current liabilities.

On the assets side it will be noticed that the stock in hand and work in progress has increased considerably. This is a direct and necessary result of the growing order book and increasing capacity and output of the company's works. For, as you may remember was said last year, the company is benefiting from the demand for its special equipment for power stations and ships, not only in this country where the programme for new stations is as extensive as ever, but also overseas, where there is a substantial demand for its products.

EVER-GROWING DEMAND FOR POWER

The growing consciousness throughout the world that in order to maintain a reasonable standard of living each man will require to produce more goods is making it clearer to us all that in order to produce more each man needs more power not only to, but at, his elbow. The result is an ever-increasing demand in industrial centres and also in the agricultural areas for more and yet more power.

The buildings and plant have been well maintained, additional plant has been installed and new research buildings with appropriate equipment to ensure the highest quality and efficiency of the company's products are being constructed. The new factory premises acquired last year, covering 120,000 square feet, have now been equipped and are in production. There the lighter products and certain parts which are required in large quantities are now being turned out.

During the year senior executives have travelled to Europe, South Africa, the Far East, India and Australia to extend and consolidate the company's market in these parts, and visits here have been made by the company's Canadian and South African and South American representatives. The results

of these strenuous journeys have been most satisfactory from the company's point of view.

FREEDOM FROM INDUSTRIAL DISPUTES

For more than 27 years the company has been free from serious industrial disputes, and it is gratifying again this year to record that the company continues to enjoy the loyal support of the administrative and executive staff and the workpeople. On your behalf I should like to take this opportunity of thanking all the employees for their faithful and friendly service.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, Mr. P. H. N. Ulander, M.I.Mech.E., F.Inst.F., and Mr. Henry L. Paul, M.B.E., were re-elected and the remuneration of the auditors, Messrs. William Hart, Jnr., and Wilson, was fixed.

WM. CORY AND SON, LIMITED

IMPROVED COAL EXPORTS

The Rt. Hon. Lord Leathers, P.C., C.H., chairman of the company, presided on 6th September at the 53rd annual general meeting of Wm. Cory and Son, Limited, held at Cory Buildings, Fenchurch Street, London, E.C.3.

The following is an extract from his statement circulated with the report and accounts: The net profit for the year is £630,758 as compared with £679,207 for the previous year.

During the year the volume of coal distributed in this country by your company has fallen below that of the preceding year, which was a peak tonnage, and we are back to our normal tonnage of war and prewar years. Quantities of coal discharged at our river stations and carried by our lighterage departments were correspondingly lower.

Our fleet of coasting colliers was employed to the full throughout the year.

The export of coal has shown a considerable improvement, in which your company has appropriately shared. However, if further progress is to be made, or indeed the present markets maintained, prices will have to be reviewed, before other coal-producing countries make inroads into business which should remain with this country. The National Coal Board is fully alive to the price trends.

OIL TRADE MAINTAINED

The company's oil trade, of which I recorded a new high level for last year, has been more than maintained. Supplies are ample, and since December last fuel oil prices and subsequently diesel oil prices have been substantially reduced.

One of the Cory Group's subsidiaries in South Africa, has entered into a long-term contract with the South African Iron and Steel Corporation to comply with which important extensions will be required.

In the year 1948 the output of our Natal collieries was appreciably lower by reason of shortage of railway wagons, but our output is now satisfactory, and there is a demand for all we can produce.

The coal available for shipment at Lourenco Marques from the Transvaal Coal Owners' Association, for whom we have long acted as exclusive shipping representatives, was greatly reduced by wagon shortage. The position is substantially restored and shipments proceeding normally, the demand for export coal remaining in excess of supply.

We acquired one half interest in the share capital of John Kelly, Limited, of Belfast. The results of their trading for the year 1948 have been well maintained.

The report and accounts were unanimously adopted.

TATA IRON AND STEEL

MR J. R. D. TATA ON THE POSITION

At the annual general meeting of the Tata Iron and Steel Company, Limited, held at Bombay on August 25, Mr. J. R. D. Tata, the chairman, said that while the second year of India's Independence had brought calmer political conditions, the economic sphere was still gloomy.

ECONOMIC POSITION

There had been complete stagnation of the investment market. It was practically impossible for any industrial concern to raise money for any purpose.

The company's production of saleable steel had increased from 664,000 tons in the previous year to 671,000 tons—a negligible increase.

The Government had awarded an average price increase of Rs. 18 per ton, to be effective for two years from May, 1949. A substantial part of this had already been utilised, and there was no margin for further increase in costs or more concessions to labour.

LABOUR SITUATION

The labour situation, while slightly better, still caused anxiety. The authority of the workers' union, which had secured valuable benefits for labour, had recently been challenged by radical groups. Both the industry and the workers might be harmed by a struggle for power between rival groups.

The average labour cost per ton of finished steel had gone up from Rs. 31.54 in 1939-40 to Rs. 92.80 in 1948-49, and the average output per employee had declined from 24.36 tons in 1939-40 to 16.30 tons in 1948-49. The number of men employed, several times the number required for the same output in America and Europe, far exceeded those required even under Indian conditions. The output per man in the company's structural shops was ½ ton per month, whereas the average in similar shops in the U.S.A. was five tons.

PROVISION OF AMENITIES

Indian labour was no longer cheap. Apart from wages, dearness allowances, etc., which had greatly increased, the company was asked to provide amenities, such as housing, roads, sanitation, water supply, education, hospitalisation, etc., the costs of which had all risen.

FINANCIAL PROBLEMS

One of the principal recommendations of the Tariff Board, accepted by the Government, was that the company should convert the deferred shares into ordinary shares. A minority of deferred shareholders had blocked this scheme. The directors were willing to take steps to put through a conversion scheme if there were enough evidence that the scheme would go through. If not, they would have to inform Government that they were unable to carry out their directive, leaving further action to Government themselves.

GOVERNMENT REQUEST

At Government's request, a programme for expanding the output by about 200,000 tons at an estimated cost of Rs. 15 crores had been submitted.

It had been made clear to Government that such a project could only be implemented if they advanced a substantial part of the cost.

Even assuming that the expansion scheme were dropped, a little over half the cost mentioned represented necessary replacements and, in addition, a little over Rs. 1 crore would be required each year for routine renewals.

It appeared that the company would need to raise additional capital of the order of Rs. 3 to Rs. 5 crores. Whether such amount should be raised as share capital, debentures or borrowings, was a matter still to be decided by the directors.

The report was adopted.

LAND SECURITIES INVESTMENT TRUST

PROGRESS CONTINUING

The eighteenth annual general meeting of this company was held on September 7, in London, Mr. Harold. Samuel, F.R.I.C.S., F.A.I., chairman and managing director, presiding.

The following is an extract from his circulated statement.

The value of properties at cost to the group, after providing for amortisation to date, stands at £2,391,908, as compared with a figure of £1,604,324 for the previous year. This substantial increase has been brought about by the acquisition of additional office properties in the West End of London and in the City of London, and by the inclusion of the properties owned by the United City Property Trust Limited.

Current assets amount to £324,729, including cash at bank of £240,898, and compare with a total of current liabilities amounting to £201,944. The bank overdraft, which last year amounted to £98,655, has been repaid during the year under review, and the current liquid position of the group is considerably more satisfactory than at the date of the previous accounts.

THE RECENT ISSUE

During the year a further 10,000 ordinary shares of 10s. each were issued, at £5 per share, such issue being made to existing shareholders on a "rights" basis. The share premiums arising on this issue total £45,000, and partly as a result of this, and partly as a result of profits, which it is proposed to retain within the group, the total figure for share capital and reserves now stands at £268,632, as against £192,665.

The item "Minority interests in two subsidiary companies" has increased to the substantial figure of £765,144, and relates to the Preference share capital of Lansdowne

House (Berkeley Square) Limited, and the preference and ordinary share capital of the United City Property Trust Limited to the extent that these are not held within the Land Securities Group.

The profit arising on sale of properties is £50,955, as against £38,089 last year, and the rents receivable less expenses have increased from £89,902 to £214,319, such rents including the rental income of United City Property Trust Limited for a period of nine months only.

INCREASED NET PROFIT

The net profit for the year attributable to the parent company, after allowing for all charges, and after providing the sum of £97,810 for taxation as compared with £44,039 for the previous year, and after deducting the sum of £17,494, being the proportion of the profits attributable to minority interests, amounts to £57,042, compared with £31,014 for the previous year. The amount brought forward is £11,925, making a total of £68,967 available for dividend.

An interim dividend of 32 per cent., less income tax, has been paid on a share capital of 140,000 shares of 10s. each. In accordance with the policy that your directors have followed for several years of maintaining the ratio of the interim to the final dividends of 1:1½, they now recommend the payment of a final dividend of 48 per cent., less income tax, on the existing issued share capital of 150,000 ordinary shares of 10s. each.

It should be gratifying to shareholders that after the payment of a dividend of 80 per cent. the company is in a position to increase the carry-forward by approximately £25,000. Since the end of the financial year under review the affairs of the group have progressed satisfactorily, and your directors hope that the accounts for the current year will in due course disclose a further expansion in the net revenue.

The report was adopted.

NOTICES

UNIVERSITY OF SYDNEY

Applications are invited for the position of Senior Lecturer in Economics. The salary range is £750 (Aust.) per annum rising by annual increments of £50 to £1,000 (Aust.) per annum and is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to qualifications and experience. The successful applicant will be required to take up duties as early as practicable in 1950. Applications, supported by testimonials and giving the names of three referees, should be forwarded to the Registrar, University of Sydney, New South Wales, Australia, not later than October 14, 1949.

Further particulars and information as to the method of application, may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

CHARTERED Accountants with experience of Financial Control and Standard Costing are invited to submit an application for a responsible appointment with an industrial firm of national repute. The successful candidate will be required to take energetic action and will be given the fullest support. The position calls for a man of first-class technical quality and personality. Scale of remuneration up to £2,000 per annum. Applicants should be between 30 and 40 years of age, and a University Degree is desirable although not essential. Please send full particulars, in confidence, to Box 196.

WRITER, full time, with first-class style, age 25-30, wanted for distinctive type of overseas trade review published in London. University degree and interest in economic and financial affairs essential. Applicants must have adequate writing experience.—Box No. A.B.C., c/o 95, Bishopsgate, E.C.2.

FOR SALE Economist from December 1937 onwards, three dates missing.—Box 198.

SUDAN GOVERNMENT

The Finance Department requires Qualified Accountants, aged 30 to 45, for service in the Sudan. Candidates must be either Chartered or Incorporated Accountants or Associates of the Institute of Municipal Treasurers and Accountants or of the Certified and Corporate Accountants. Costing experience is an advantage.

Appointment will be on Long Term Contract on a salary scale of £E 600 to £E 925 with special post-service gratuity; or on Provident Fund Contract or Short Term Contract, at higher rates of pay and different post-service benefits.

Cost of Living Allowance varying between £E 180 and £E 290 per annum according to the number of dependents is at present payable, and, subject to certain limitations, an Outfit Allowance of £E 60 is payable on appointment. There is at present NO INCOME TAX in the Sudan. Free passage on appointment. Full particulars and application form may be obtained on application to: Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Accountant, F.S."

GOLDEN HOPE RUBBER ESTATE, LIMITED

The annual general meeting of The Golden Hope Rubber Estate, Limited, will be held on September 27th, in London.

The following is an abstract of the address of the chairman, Sir Eric Macfadyen, circulated with the report and accounts:—

The crop of rubber harvested was 5,815,507 lbs. yielding a profit of £34,608 after providing £37,405 for taxation in the United Kingdom and Malaya. From the balance we recommend the payment of a dividend of 7 per cent.

Up to a few years before the war I had kept in touch with the estates by regular visits. It was therefore very interesting to me to see something of them again during a visit to Malaya last winter.

We own some old rubber but no bad rubber and some that is very good. Of our total planted acreage of 9,622 acres the proportion of modern rubber is about one-third. Our costs are below average and I look to see them lower. I feel that the condition of our estates, in the difficult circumstances of the times, reflects great credit upon those who had the job of bringing them back into cultivation since the war. The Board mean to back up the men on the spot by continuing to pursue a progressive replanting policy within the limits of financial prudence; and replanting will to some extent—where the land is suitable—be in oil palms.

The subversive campaign of which I spoke last year now manifests itself in most parts of Malaya as undisguised banditry. On our estates some damage to property has occurred but I am thankful to say that no loss of life has been sustained.

SOCIAL SCIENCE RESEARCH IN THE COLONIES

A limited number of post-graduate studentships tenable at British Universities in preparation for field research in one of the social sciences in the Colonial Empire is now available. The purpose of these studentships, which will normally be tenable for a period not exceeding twelve months, is to provide potential research workers with an opportunity to study the sociological background of modern Colonial problems and techniques essential for modern field studies. It will be a condition of the award that the student undertakes, if so required, to carry out research in the field under a further grant from the Secretary of State for a period of not less than two years after the completion of training. The studentship will carry a personal allowance appropriate to the qualifications etc. of the holder. Fees will be paid and a grant made towards the purchase of recommended books. Applications should be made in writing, not later than the 1st December next, to the Under Secretary of State, Research Department, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1 giving an indication of the type of project which the applicant feels he is best qualified to undertake in the Colonies, together with details of career and academic qualifications.

£2,000 p.a. derived from one lease Shops, Garage, Flats and premises main road Sussex Town, Excellent covenant. £30,000 secured.—William Ridgway, Salisbury Square House, London, E.C.4.

STATISTICIAN for research organisation. Degree essential. Kindly state age, education, experience, present post, references and minimum salary required.—All applications in confidence, reply Box 184.

SUDAN GOVERNMENT

The Finance Department requires candidates aged 23 to 35 for service in the Sudan, to fill posts of Establishment Officers. Duties will be to act as Establishment Officers in certain Departments or in the Establishment Branch of the Finance Department. The duties will be administrative and executive, dealing with all aspects of Personnel Management. Candidates must have an Honours Degree.

Experience in Personnel Management or in an appointment with the Armed Forces dealing with personnel matters would be an advantage but is not essential.

Appointment will be on Long Term Contract on a salary scale of £E 600 to £E 925, with special post-service gratuity, or should the candidate prefer, on Provident Fund Contract or Short Term Contract at higher rates of pay and different post-service benefits.

Cost of Living Allowance varying between £E 180 and £E 290 per annum according to the number of dependents is at present payable, and, subject to certain limitations, an Outfit Allowance of £E 60 is payable on appointment. There is at present NO INCOME TAX in the Sudan. Free passage on appointment. Full particulars and application form may be obtained on application to: Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Establishment Officer, F.S. Dept."

Investment Statistics

Company Notes

Tate and Lyle (sugar refiners and distributors).—Insufficient proxies necessary for a quorum at the special meeting of Tate and Lyle, fixed for September 15th to approve the capital segregation scheme, have so far been received from ordinary and preference shareholders. The final date of receipt is September 13th.

Blackwood, Morton and Sons (carpet and rug manufacturers).—Consolidated net profit increased from £228,762 to £302,059 in the year to June 30, 1949. A final dividend of 35 per cent, plus a bonus of 10 per cent, is recommended, making a total distribution of 65 per cent for the year (same). A bonus issue is also contemplated.

Head Wrightson (plant and machinery).—Consolidated net profit increased from £110,800 to £134,800 in the year to April 30, 1949. A final dividend of 6 per cent is recommended, making 10 per cent for the year (same). It is also proposed to capitalise £118,125 of reserves by a bonus issue to holders of ordinary shares of one fully paid £1 ordinary share for every four existing shares held.

H. A. Saunders (motor distributors).—Group profit for the year to March 31, 1949, amounted to £67,225 (£64,360). The ordinary dividend of 25 per cent is repeated.

Ransome and Marles (ball-bearing manufacturers).—Net profit increased from £286,548 to £300,487 in the year to June 30, 1949, after deduction of depreciation £100,006 (£101,145) and taxation £309,000 (£345,000). A final dividend of 12½ per cent and bonus of 5 per cent is recommended, making the total distribution 25 per cent for the year (same).

Spiers and Pond (hotels and catering).—Consolidated trading profit declined from £298,148 to £189,543 in the year to March 31, 1949, and net profit from £104,676 to £32,926. The dividend has been reduced from 10 per cent to 7½ per cent. Net current assets are lower at £188,750 (£264,621) and bank overdraft up from £18,833 to £26,343.

George Cohen, Sons and Company.—Consolidated trading profit fell from £1,019,445 to £697,614 in the year to March 31, 1949. Net current assets have increased from £2,711,152 to £3,065,441.

Whitworth and Mitchell (makers of "Wemco" fabrics).—Group trading profit has increased from £275,580 to £324,109 in the year to June 30, 1949, and consolidated net profit from £124,791 to £182,353. General reserve has been allocated £70,000 (£50,000) and stock reserve £30,000 (£20,000). Stocks have risen to £912,895 (£667,768) and debtors to £337,200 (£239,497). Liquid funds are down from £314,019 to £124,675.

Ultramar (oil).—The consolidated deficit for 1948 was £157,395. Advances to the principal subsidiary Caracas Petroleum S.A. were increased by £1,241,683, while CP&A advanced £1,953,634 to Mercedes during the year. Net loss of Mercedes for the year was £2,958,128. Average daily production for the year to June, 1949, was 13,000 barrels, compared with the estimate of 30,000 barrels. Negotiations for the provision of further finance for Ultramar have been resumed.

Neepsend Steel and Tool Corporation.—Net revenue for the year to March 31, 1949, amounted to £118,814. A final dividend of 9d. is recommended on the 5s. units, making a total dividend of 1s. 6d. for the year, plus a bonus of 1s. per unit. A free bonus of 1,223,388 ordinary shares is to be issued to ordinary stockholders on a one for one basis to capitalise £305,847 of reserves.

Capital Issues

Associated Fisheries.—Shareholders are to receive 2,600,000 5s. ordinary shares in the proportion of two new shares for each share held. The issue will capitalise £650,000 of reserves.

Montague L. Meyer.—Shareholders' approval is to be sought for a 300 per cent bonus issue.

Hattersley (Ormskirk).—Shareholders are to receive, by way of a free bonus distribution, £250,000 5 per cent cumulative £1

preference shares in the proportion of one preference share for each four ordinary shares held.

Scottish Agricultural Industries.—The Capital Issue Committee has approved the placing of £750,000 4½ per cent £1 second preference shares, and an issue to ordinary shareholders of 453,200 £1 ordinary shares at a price to be determined later.

Tecalemit.—Shareholders are offered 500,000 5 per cent cumulative redeemable £1 preference shares at 21s. per share.

Lancashire Cotton.—Treasury approval has been obtained for an offer to 5 per cent non-cumulative preference shareholders and to ordinary shareholders of one new £1 ordinary share for each £3 of stock of either class held on August 18th.

Lintafelt (padding manufacturers).—Group net profit for the 15 months to June 30, 1949, was £71,840 (£59,074 for previous year). A dividend of 50 per cent or at an annual rate of 40 per cent is recommended for the period (50 per cent for 1947-48).

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'P'. To this rule there are two exceptions (Funding 4 per cent and Consols 4 per cent) on which yields are taken to earliest date and marked 'E'. (a) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To latest redemption date. 1 Free of tax. (s) Yield basis 12%. (p) Plus tax free bonus 24%.

Statistical Summary

EXCHEQUER RETURNS

For the week ended Sept. 3, 1949, total ordinary revenue was £58,883,000, against ordinary expenditure of £99,055,000 and issues to sinking funds £2,903,000. Thus, including sinking fund allocations of £7,507,000, the surplus accrued since April 1st is £20,057,000 against £250,384,000 for the corresponding period a year ago.

THE EASTERN BANK LIMITED

The Transfer Books and Register of Members will be CLOSED from September 15 to September 28, 1949, both days inclusive. By Order of the Board.

C. L. MANNING, Secretary.
 2 & 3, Crosby Square, London, E.C.3, August 31, 1949.

AN INTERESTING EDUCATIONAL APPOINTMENT IN INDUSTRY is about to be made by a large industrial concern near Chester which has established an educational and training organisation on a considerable scale.

A lady of good general education is now required to organise and conduct the training of typists, comptometer operators and junior office staff. Previous office and teaching experience would be an advantage.

Applicants should write sending full details of education and experience to Box 3023, c/o Charles Barker & Sons, Ltd., 31, Badge Row, London, E.C.4.

INCORPORATED ACCOUNTANTS THE SOCIETY OF INCORPORATED ACCOUNTANTS AND AUDITORS EXAMINATIONS

The next Examinations will be held at London, Manchester, Leeds, Birmingham, Cardiff, Glasgow, Dublin and Belfast as follows:—

Final Examination: November 15, 16 and 17, 1949.
 Intermediate Examination: November 16 and 17, 1949.
 Preliminary Examination: November 15 and 16, 1949.

Application forms may be obtained from the Hon. Secretary of the local Society of the District in which the candidate resides.

Completed forms should reach the Secretary, Incorporated Accountants Hall, Victoria Embankment, London, W.C.2, not later than Monday, September 19, 1949.

Candidates are requested to make their own arrangements for accommodation.

OFFICER (man) required by a public organisation to control various existing administrative activities and to develop and control a new one. Qualifications: good education (degree preferred); ability to gain confidence and co-operation of senior staff; at least 5 years' experience in an administrative post of senior responsibility including a period in industry or commerce. Temporary appointment (approximately 2 years). Starting salary £1,000 per annum. Apply, giving age and full particulars of education and career, to Box 180. Only those required for interview will be written to.

THE CHARTERED INSTITUTE OF SECRETARIES—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

THE position of Secretary-Accountant advertised under Box 168 has now been filled. The Research Association wishes to thank all those who applied for the position.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for research and working in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of a Volsey Hall tutor. Modern fees payable by instalments, if desired.

Prospectus from Dept. P17, WOLSEY HALL, OXFORD

Printed in Great Britain by ST. CLAYTONS PRESS, LTD., Portland St., Kingway, at 22, Ryder Street, St. James's, London, S.W.1. U.S. Representative: R. S. FOLEY, 111, Broadway, New York, 6. (Saturday, September 10, 1949.)

UNIVERSITY OF LONDON

DEPARTMENT OF EXTRA-MURAL STUDIES (UNIVERSITY EXTENSION COURSES)

The following evening courses are included in the University Extension programme for the session 1949-50, commencing in September, 1949.

Ancient Greek Drama
 English Folk Song
 Modern Drama
 Plant Science and Horticulture
 Pond Life
 The Cultural Pattern of the 20th Century
 The Honey Bee
 Youth in Society

Many other University Extension courses will be held at suitable centres in London and the Home Counties, some of them leading to University Extension Diplomas in the Humanities. Further information may be obtained from the Director, Department of Extra-Mural Studies, University of London, Senate House, W.C.1.

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Economics, with Special reference to Banking and Currency, tenable at the London School of Economics and Political Science (salary £1,950-£1,250-£1,450). Applications (10 copies) must be received not later than October 5, 1949, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY OF QUEENSLAND

Applications are invited for the post of Professor of Economics, Salary £A1,350-£A1,600 p.a., plus cost of living allowance (at present £A23 10s. p.a.). Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. The closing date for the receipt of applications is 15th October, 1949.

WOMAN Assistant (preferably aged 25-35) required for senior officer of a public organisation. Duties: secretarial and administrative in connection with organisation of training courses. Qualifications: University degree; shorthand and typing speeds 100-40; good secretarial-administrative experience. Salary £350, or more if exceptionally well qualified. Reply with details of age, education and career to Box 189.

PROGRESSIVE organisation should consider man bored by unenterprising present job. Is a Wrangler who specialised in statistics and has had considerable experience as manager of a market research department. He is 32, has held responsible position in Government department and has more than a nodding acquaintance with advertising. Considers he has analytical and constructive brain and is a potential bargain as congenial job more important than present £2,000 salary. Reply Box 190.

REQUIRED Immediately: Assistant to Managing Director of large industrial organisation in North West. Must be well educated, preferably with knowledge of at least two European languages. Salary according to age and experience—minimum £500 per annum.—Box 192.

COMPLETE SET OF THE ECONOMIST, October, 1947, to May, 1949 inclusive, for sale, together or in parts.—Box 185.

QUALIFIED Accountant, age 35-40, for Executive post requiring financial experience, especially in relation to company formation and taxation. Continental experience and knowledge of French desirable. Salary £1,500 per annum or according to qualifications, with good superannuation benefits. Reply to the Secretary, Aspro Limited, Slough, Bucks.

NORMAL OPEN COMPETITION FOR THE (1) ADMINISTRATIVE CLASS; (2) SENIOR BRANCH OF THE FOREIGN SERVICE; (3) SPECIAL DEPARTMENTAL CLASSES; (4) STATISTICIAN CLASS; (5) GOVERNMENT COMMUNICATIONS HEADQUARTERS; AND (6) THE UNIVERSITY GRADUATES COMPETITION FOR THE EXECUTIVE CLASS

The Civil Service Commissioners announce that as an exceptional measure applicable to the above-named Competitions in 1950 the upper age-limit will be raised to 26, i.e. candidates must be born on or after August 2, 1924, and on or before February 1, 1930; and the only persons above this age who will be admitted in 1950 will be (a) candidates for competitions (1), (2), (3) and (4) who have served or are serving in H.M. Forces on a regular or short service engagement, if their age after deduction of such service will be under 21 on August 1, 1950; and (b) certain candidates born on or after August 2, 1923, and on or before August 1, 1924, who traded civilian service otherwise than under the National Service Acts, who may be admitted to any of the six competitions at the Commissioners' discretion. After 1950 the normal age limits of 20 and 21 will be restored, i.e. candidates for these Competitions in 1951 must be born on or after August 2, 1927, and on or before February 1, 1931, subject to age deductions in the following cases: (a) for persons who have served in the Forces on a regular or short service engagement, for whom the age deduction will be the same as in 1950; (b) for civilian national service; the exact form which this will take is under consideration, but the Commissioners hope to announce the final decision in the Autumn.

Note. The closing date for the receipt of applications for some of the 1950 competitions is November 15, 1949.

M.A. (HONOURS) German, with subsidiary French. Age 21, desires position with prospects. Scholastic or commercial.—Box 181.

EX-OFFICER (20), B.Sc. (Econ.) Scandinavian languages, German and Italian, seeks progressive appointment.—Please write, RM 101H, W.C.1.

After Washington

LAST Monday, the financial talks in Washington—"perhaps the most momentous of all time" as Mr. Bevin described them when he left these shores—ended with the publication of a three-thousand word statement from the three Finance Ministers. The conclusions are in every way as satisfactory as the British delegation had any right to expect. There is scarcely an overtone of the harsh line of criticism of British economic policy which was widespread in the United States before the talks started. On many points which might have been expected to lead to difficulty, the statement is bland. Not a single suggestion in it comes within a mile of wounding British susceptibilities. If the occasion was momentous, the conclusions seem to consist largely of polished and well-balanced commonplaces.

It is this impression which has left the British public puzzled and sceptical. It seems, after all, not to have been so very difficult to bring "our reserves position into a manageable condition," which is Sir Stafford Cripps's estimate of the result of the consultations. But he also cited the agreement as an example of the determination and ability of the free democracies to deal with the cold war. And Mr. Bevin, echoing the same thought—which, after all, comes more appropriately from a Foreign Minister than from a Chancellor—declared that the dollar problem was not an isolated subject.

The reservations which exist in the public mind about the agreement do not stem from any doubts about such basic political issues. There was never any fear that the American and Canadian Ministers would abandon the role of constructive co-operation which they have assumed in their attempts to link the dollar and sterling worlds. But their viewpoints on the fundamentals of economic policy are so different from the premises on which British action is based that "success" in a conference of this kind could only mean a friendly accommodation, not identity, of views. It is the fact that the concessions in the agreement seem so largely to be a one-way traffic from North America to Britain that has caused mystification. It is one thing for British politicians to put out for home consumption the doctrine that the dollar crisis is "not our fault"; it is an act of considerable diplomacy to have succeeded, to all appearances, in implanting something of the same idea in the shrewd minds of Mr. Snyder and Mr. Abbott.

Yet, when the proposals for remedial action which the sterling area should undertake are examined, they give some support to this otherwise fanciful idea. Cuts in dollar imports by the sterling area are recognised to be temporary expedients, painful for all the countries concerned. More fundamental action, based on the assumption that Marshall Aid will end in the middle of 1952, is promised. If the sterling area is to pay its way in dollars by that time "appropriate incentives" must be created for exporters to the dollar area, and a "vigorous attack" made upon costs of production in the sterling area. This is good if familiar doctrine and its implications have long been clear—the end of inflation in the sterling area, the reduction of excessive public expenditure, and a limitation upon the ready-made

market in the sterling area on which British exporters are now largely content to rely. The prescription is familiar, but the patient has never screwed up sufficient courage to swallow it. The United States and Canada, for their part, accept the responsibility for reducing obstacles to the entry of goods and services from debtor countries. On every point in this analysis of a freer flow of competitive trade towards the dollar area, the conference has expressed broad views of principle. But principle has to be translated into action not only by the Governments whose representatives were meeting, but also by other sterling area countries not directly involved in the talks. The agreement poses the old problem of stiffening unexceptionable proposals by sanctions which will make them work.

But it has been widely asked since last Monday whether there is one implicit sanction in the agreement which is unmentioned—namely, the devaluation of the pound. As this article goes to press, the International Monetary Fund is still in session, and Sir Stafford Cripps is on his way home. It may be that the American viewpoint on devaluation has prevailed, not perhaps as a result of the formal discussions among Ministers, but in a tacit understanding on each side that the Chancellor of the Exchequer would no longer resist a demand which is heard not from America alone but increasingly from across the Channel. The views of the Fund and of Mr Eugene Black, the President of the International Bank, on devaluation and Government expenditure, could not have been more explicitly expressed this week, nor more plainly addressed to this country. They have created an impression throughout the world that if devaluation of the pound is not actually imminent, it cannot be delayed a moment longer than is required to save the Chancellor's face. Within a few hours, events may show whether devaluation is part and parcel of the Washington understanding. The decision, if taken, would amount to an acceptance of the argument that the measures outlined in the agreement cannot succeed, largely because costs in the sterling countries are now so much higher than those in dollar countries that even the greatest efforts of productivity and retrenchment are incapable of bringing the two cost levels together in one competitive world. If devaluation is, in fact, to be the next step, there would be no necessity for this country to take it tragically, for it is certain that other soft currencies will be devalued too. But equally there would be no justification whatever for regarding it, even in conjunction with the other measures of agreement reached in the Washington talks, as an easy means of economic salvation. The policies outlined in the agreement would still need to be firmly applied and more strictly defined. To produce any benefit, devaluation would still have to be accompanied by every form of retrenchment, every measure to cut costs and to resist further wage inflation that already underlie—or ought to underlie—the Washington decisions.

★

Of the ten topics on which special attention was focused, two promise some degree of immediate relief to protect the dwindling gold and dollar reserves of the sterling area. These include the use of Marshall dollars to pay for Canadian wheat, and some unspecified increases in purchases of reserve stocks of rubber and tin by the United States and Canada, together with "a substantial additional area of competition" for natural rubber in the United States which can be contrived by a change in the regulations governing the use of synthetic rubber. A deliberately optimistic estimate of these benefits, on page 629, suggests that they might contribute

£100 million towards the dollar gap. But these are, in fact, the only changes which promise to bring more dollars into the sterling area account, apart from those which it earns for itself. For this reason alone, "the assurance of a degree of stability" in the British balance of payments, of which Sir Stafford spoke last Monday, must be qualified either in assurance or degree. Not all readers will interpret this conclusion as carefully as Sir Stafford phrased it. The danger is that it will give rise to public complacency that a balance, lasting and adequate, has been achieved; if so, it will do great harm.

Thus no easy way out of the dollar crisis has been discovered. The immediate concessions may tide over immediate difficulties. But apart from these the British delegation brings nothing back which was not fairly self-evident from the beginning. The high-flown commodity schemes under which, it was hoped, the sterling area might find a guaranteed dollar market for raw materials have not been accepted. The offer of free entry of goods to the British market, limited to those countries with which Britain is not in deficit, is to be tried, though the American view remains quite clear that this wider area of competition will still discriminate against dollar trade. A review of customs procedure in the American and Canadian markets is promised. Even more important, it has been recorded that "high tariffs are clearly inconsistent with the position of creditor countries," though "there have already been significant substantial reductions in United States tariffs during the last fifteen years."

★

There remain, too, the problems which can be solved only by further and prolonged discussion. To establish the principle that a high level of productive investment by North America in under-developed countries could make an important contribution towards equilibrium between sterling and the dollar is one thing; but action clearly waits on the willingness of the debtor countries to provide the incentives and suitable environment to which the statement refers. The implications are quite clear. Dollar investment will not flow towards countries which seek to impede or limit the return in accordance with their own ideas of "fair" yield. The tests to be applied will be commercial tests; that will call for a radical change of attitude among the debtors, Britain not least among them, towards the conditions on which they have hitherto been disposed to accept American capital.

On the question of the sterling balances, the statement seems distinctly mild. No doubt, political factors have played an important part in these particular discussions. There is to be further study of the balances, but within a set of postulates which is clearly kind to the British point of view. The balances, it is agreed, "are an integral feature of the multilateral use of sterling for financing international trade." Although in principle they represent a charge on British output, and are in part being liquidated by unrequited exports which could otherwise be used to pay for imports, "a substantial proportion will continue to be held as reserves by the countries concerned," and the need to provide capital goods for the development of the sterling area countries (which must be largely financed out of the balances) is specifically mentioned. It is here that pressure might have been expected, for if the balances are "an integral feature" of sterling trade they are also the chief element which makes that trade exclusive, and the chief impediment to the extension of multilateral trade which is a primary aim of American economic policy.

Throughout the statement, one limiting rider is evident. The agreement is between Ministers acting for their Governments, but not empowered to commit them. It has been conceived in terms that Britain could publicly accept, and do not—so the Administration hopes—invite a clash with Congress. For this reason, the immediate reliefs do not go beyond a modest application of multilateral and competitive principles. The multilateral use of Marshall dollars for Canadian wheat may even yet cause trouble for the Administration in an America of surpluses. To reduce the required use of synthetic rubber to a new minimum level does not by itself guarantee that natural rubber will successfully compete, though it is offered a wider market.

On the British side, for the same political reasons, the undertakings are of a comfortable long-term character. It is easy to promise that the sterling area will pay its way by the middle of 1952, but the agreement gives no more convincing proof of how it will be done than could be found in the dozens of plans and forecasts which in the last year or two have been dumped on the statistical rubbish heap. None of the tough things that have to be done is mentioned. A "vigorous attack on costs of production" is a resounding cry, but it means nothing at all when it is construed in terms of recent British economic policy. The whole philosophy of that policy has been to stay put, to hope for gradual improvement, to exhort but never to compel, to regard the standard of living as untouchable, and the social services as one of the rights of man. A "vigorous attack" on costs means change, new and better ways of production, the pressure of unemployment and lower profits, a standard of living maintained only because it is earned, with the social

"Japanese Comeback"

POLICY in the Far East has been the subject of Anglo-American consultations in both Washington and Tokyo in the last week. Mr Malcolm MacDonald, the British High Commissioner for south-east Asia, has just returned from a visit to General MacArthur's headquarters, and in Washington, Mr Bevin and Mr Acheson have examined the Far Eastern situation in considerable detail. The need for the closest possible co-operation between the United States and the British Commonwealth is obvious enough. China is already lost to Communism; the whole of south-east Asia is unsettled by the Communist victory in China; and Japan itself could easily become the prey of extremism, given its vulnerable economy and the relentless pressure of its population.

It is, nevertheless, difficult to translate into concrete agreements on particular aspects of policy the general desire of the two nations to dam the flood of Communism and to create stability in the Far East. The fact is that on the two main heads of Far Eastern strategy—China and Japan—there is at the moment a marked difference of approach in London and Washington. Although British policy towards Communist China has not been formally defined, it is an open secret that British merchants would like to defend their large interests in China by working and trading with the Communists to the greatest extent that the Communists themselves are disposed to allow. In the United States, this view would probably not be found outside a corner of the State Department. Although official policy has not been determined—it is, indeed, at this moment being reconsidered by

services as part of that standard and not as a free extra. There is nothing of this in the agreement, but it is undoubtedly the condition of independence by 1952. To suggest anything less may be good electioneering, but it will be dishonest politics. To applaud the agreement, as the Chancellor has done, on the ground (which itself seems dubious) that the condition of the dollar reserves is now manageable, is a grotesque notion of economic policy. Is this the limit of British aims—to be able to survive from month to month, under constant economic pressure, with no resilience and no reserves, vulnerable to the slightest change in the economic breeze which still blows from across the Atlantic, and content with a dull regimen laid down by a body of exhausted and fearful Ministers? There is every reason to doubt whether the Government is capable of making the changes which independence by 1952 really demands. But that achievement itself—remote though it may well be—represents only the most limited economic aim.

The great merit of the agreement is that it gives the British Government and the British people no excuse for failing to take their place in a restored system of world trade. The contribution which the United States and Canada are prepared to make has been clearly set down. There will be no more easy dollars. But there is assurance, as firm as politics can make it, that the responsibilities of creditor status are accepted. Overseas investment and tariffs have been re-defined in terms which allow no real doubt of the sincerity of the dollar world to assist the sterling area towards a new equilibrium. But only if the sterling countries seize every chance of entering and remaining in the dollar markets can this equilibrium be found.

a special committee headed by Dr Philip Jessup—the tendency is to apply to China the kind of reservations and controls which at present hamper trade between western Europe and Russia and its satellites.

The disagreement over Japan is even more immediate. Ever since the beginning of the occupation, the American authorities in Japan have been faced with a dilemma. The Japanese record of aggression is such that a measure of control over future Japanese policy is vital. In particular, there is a strong case for controlling the use which Japan makes of its economic strength, and of preventing the development of its industry for purposes of war. On the other hand, it is equally necessary to permit Japan the utmost peaceable economic expansion, in order to offset the loss of its empire and the continual growth of its population. If Japan is to enjoy a standard of living no higher than that of 1930-1934, American estimates suggest that it will need to export 30 per cent more than it did in 1937, and to import 50 per cent more. To achieve this expansion of trade, the Japanese economy would itself have to be expanded considerably, with greater weight on industry. Such expansion would make nonsense of any attempt to curb future Japanese aggression by limiting the level of Japanese industry.

The threat of Communism has grown and so has the need to relieve the strain of the Japanese occupation on the American taxpayer; as a result, the aim of giving Japan a stable economy has come more and more to replace the aim of checking any future Japanese aggression. During the past

two years, a series of American missions—the Strike Mission, the Johnston Mission, the Dodge Mission, the Shoup Mission—has advised the American administration to remove all controls, domestic and external, on the Japanese economy, to restore Japan as a great trading nation, and to give it a political status in which it can enjoy “peace without a peace treaty.”

Accordingly, in recent months, almost all forms of control over prices and allocations have been removed from foodstuffs and vital commodities. Subsidies for industry are being withdrawn. The Deconcentration Review Board, which has been charged with the task of breaking up the big concentrations of Japanese wealth, the *Zaibatsu*, has completed its work with the suggestion that 11 out of the 325 industries which it examined should be divided up and eight others reorganised. At the same time, in the political field, the American Control Commission is to be drastically reduced by the end of the year. The 45 Civil Affairs teams which used to supervise the carrying out of General MacArthur's policy in the countryside are to be withdrawn, and only eight Regional Offices will remain.

Step by step with these domestic measures, new proposals have been made to restore Japan's international status. The decision to stop sending reparations abroad was taken some time ago. Now the Americans have given their full support to a Japanese proposal to set up trade offices in ten vital centres of trade—London, San Francisco, New York, Hong Kong, Singapore, Calcutta, Karachi, Surabaya, Johannesburg, and Buenos Aires—to re-establish consular links with foreign countries, and to secure admission to the specialised agencies of the United Nations. Should such a plan be carried through, the only remnant of allied control in Japan would be the presence there of General MacArthur and of a small army of occupation. And this, too, would have changed its character completely, for instead of being an instrument of control over the Japanese people, it would have become a safeguard against the risks of Russian aggression or of an internal Communist coup.

★

American policy in Japan is thus clear—the restoration of Japan to the status of a friendly nation, and the utmost expansion of Japanese industry and trade. The difficulty lies in the fact that, so far, none of America's colleagues in the Far Eastern Commission, which exercises nominal authority under General MacArthur, is prepared to accept the policy. For the moment, the Russian approach can be left aside. The Soviet Union seeks an early peace treaty with Japan; it hopes that Communist China would replace the Nationalists as one of the negotiating governments and that signature of the treaty would entail the early removal from Japan of the American army of occupation. The Russians believe, as do the Japanese Communists, that the withdrawal of American influence would be the signal for the transfer of Japan into the Soviet sphere of influence.

More disturbing opposition comes from America's colleagues. The nations in the near vicinity of Japan, with Australia and the Philippines at their head, still remember Japanese aggression too vividly to accept Japan as a peaceful neighbour. They are also extremely perturbed about the possibility of renewed Japanese emigration. Australia has refused point-blank to receive a trade mission, and would certainly seek the support of the Commonwealth in refusing to accept the new American political line. The British reaction is more difficult to assess.

On the one hand, British policy opposes the opening of Japanese consular offices and seems to be obstructing, for fear of Japanese competition, the aim of restoring Japan as a great trading nation. On the other, it is quite clear that Britain and the sterling area as a whole are most anxious to expand their trade with Japan. For a time, American insistence that Japanese trade should be conducted in dollars restricted trade with Britain but, for some time past, General MacArthur has realised that Japan cannot be tied to the dollar since its sales to America are strictly limited and its natural markets lie in South-east Asia and in the sterling area. In 1948, agreement was reached for the exchange of about \$240 million worth of goods between Japan and the sterling area and General MacArthur had powers to convert sterling into dollars if he was left with more sterling than he could “reasonably be expected” to spend in the sterling area. As a result of this agreement, the sterling area was, in fact, left with a deficit of some \$35 million. But new negotiations in Tokyo have been opened to increase trade in the coming year to a level of some \$350 million. These figures do not suggest a desire on Britain's part to restrict trade. Britain's political objections to the revival of Japan as a trading nation simply do not appear to square with its economic policy.

★

If the hesitations apparent in British policy are dictated by fear of Japanese competition—in spite of the evidence to the contrary provided by British readiness to trade—it must be said that, in the short run at least, such fears can be grossly exaggerated. Neither Communist China nor South-east Asia are “glutted.” On the contrary, the needs throughout the area of industrial development goods are unending and if Japan can supply them, China, Burma, Indonesia and Siam can, in return, produce the foodstuffs and raw materials which Japan needs and cannot, without indefinite dollar subsidies, continue to buy in the United States. The development of such trade, far from exacerbating the problems of European traders, could draw off “harmful Japanese competition” from European markets in Africa and South America. But even if the risk of competition could never be entirely eliminated, the British Commonwealth and western Europe can hardly refuse to agree to American policy since it is clear they have no alternative to offer. The United States cannot continue indefinitely to subsidise the Japanese economy to the tune of \$400 million a year; and when the subsidies cease, Japan must literally export or starve. America can reasonably be asked to modify its policy of trade with China so that both Britain and Japan can find there whatever trade is available. But in return the United States would be justified in asking Britain to bring its economic and its political reactions to Japan into harmony. At present the sterling area proposes a great increase in trade, but no political change in Japan's ex-enemy status. It is an illegal position and should be brought to an end.

American policy might be made more palatable to Britain and the Commonwealth if the new line were accompanied by a firm agreement on future security. The maintenance in Japan of an American and Commonwealth base and an allied garrison would give an assurance against the resurgence of Japanese militarism and would, at the same time, reassure the Japanese that the Allies have no intention of abandoning them to Communism. It would meet the legitimate fears of America's associates and it would permit them to join without reservation in the new American policy of restoring Japanese prosperity.

Landlord and Tenant

THE English rural landlords of the eighteenth century led the way in an agricultural revolution which became the pride of their country and the envy of the world. Their pioneer work ushered in the golden age of British agriculture, a period of rising production and increasing prosperity, which lasted until the influx of cheap food from the American continent depressed home farming in the 1870's. The landowner during this time played a threefold role. He provided the extensive capital on which agricultural expansion was founded; he led the way in improving standards of farming practice both by precept and advice; and he exercised the social leadership of the countryside. In the process he made the English countryside the most beautiful piece of landscape gardening in the world. The landowner without doubt got a good return for his efforts, as much in quality of living as in financial benefit; but at the expense of the last remnants of the English peasantry he laid solid foundations for farming prosperity.

Since about 1875 the fortunes of the English landowner have been in steady decline. In part, his troubles have flowed from the endemic depression from which British agriculture as a whole has suffered; but special factors have hastened the process. The most familiar of these is the toll which death duties have taken of the large estates. Exact statistics of this process are lacking. An indication is given by a survey of landownership in ten eastern counties*, based on the 1941 National Farm Survey, which suggested that the number of estates over 2,000 acres had fallen by a third since 1873; that the large estates remaining in private hands tended to be concentrated on the poorer soils such as the Norfolk Breck; and that their standard of equipment was worse than that of either owner-occupiers or the estates of public bodies. Owing largely, no doubt, to advantages in matters of taxation and the raising of capital, the estates of public and educational bodies were, by contrast, the best equipped in that region. Their rents were also appreciably higher than those levied by private owners, a fact indicative not only of superior equipment but of greater business acumen.

The financial plight of private landowners can be traced in the movement of farm rents. Average gross rentals were in 1946 no higher than they were 20 years ago and appreciably lower than 70 years ago; yet during each period the

value of money fell heavily, and both costs and taxation increased considerably. The prosperity which farmers have enjoyed since 1939 has not been shared with the landowner, whose position has grown worse owing to the extreme rigidity of rural rents. A survey carried out jointly by the Ministry of Agriculture and the Central Landowners' Association† shows that, between 1938 and 1946, gross rents increased by only 8 per cent, although owners' actual receipts rose by 13 per cent owing to the elimination of rent remissions. The increase in costs of maintenance was of a much higher order. In 1938 the owner was still receiving 38 per cent of his gross rent as profit, after allowing for maintenance, statutory charges, and improvements, but by 1946 his return had fallen to 20 per cent, despite a then reduced level of maintenance. At the same time the purchasing power of any net income he contrived to retain had fallen considerably.

It is, of course, reasonable to argue by analogy with industrial ownership that improvements represent fresh capital expenditure which should be raised by borrowing—although it is clearly desirable that there should be some profit available to plough back. Even so, a position has now been reached where maintenance alone, carried out on a prewar scale, absorbs perhaps 80 per cent of gross rents. After allowing for statutory charges, this leaves a negligible margin either for personal profit or reinvestment.

Impoverished financially and at times reviled politically, it is a wonder that the rural landowner survives at all.

Nevertheless, the rural economy of England is still broadly based, and necessarily so, on the relationship of landlord and tenant. After the First World War, a number of farms were bought by their occupiers, often at prices which brought mortification to the farmer at a later date. The same process is recurring on a smaller scale today. The National Farm Survey, however, pointed out that in 1941 two-thirds of the farms in this country were rented by tenants, while less than one-third of the cultivated area was owner-occupied. England is very far indeed from becoming a nation of peasant proprietors or even of owner farmers. Nor in the interests of efficient production should it become one.

Agriculture is unique among productive industries in that it is carried on by a large number of small family concerns. The average farmer is not in a position to take the financial risk of an adequate investment in his own holding. Hence the customary distinction between landlords' capital consisting of buildings, water supply, drainage, and other fixed equipment, and tenants' capital, consisting of stock, fertilisers and machinery, makes good economic sense, as long as the landlord is able to perform his part of the bargain. The increased prosperity of the last decade has put many tenants in a position to undertake more improvements on their own account and recent legislation has widened their right to do so. But British agriculture can only be re-equipped and modernised by means of an adequate flow of landlords' capital.

Its economic function apart, landownership has survived in this country for a variety of reasons. Although the pleasures of rural life are now much reduced, the ownership of land carries a social prestige and gives a kind of satisfaction greater than any other form of ownership. The picture of the landed gentry as an inbred aristocracy is a figment of popular mythology. The countryside has been invaded by self-made business men from the towns since the fifteenth century, and the desire to own land bears only a very tenuous relationship to its profitability.

Moreover, there are other special advantages accruing to the ownership of agricultural land, despite the low monetary return which it now yields. Its possession is thought to be a good safeguard against the risks of inflation. The rate of death duties, for all the havoc they have wrought with estates in single ownership, is preferentially low, being only about 55 per cent of the rate for most other types of property. Taxation reliefs in respect of farm maintenance and improvements have been made especially generous in recent years. Secondly, the existence of a rural refuge has obvious attractions to an age living under vague fears of atomic bombardment and widespread starvation. These are reasons enough to explain why the capital values of farmland have not followed landowners' returns on their steep downward path.

Landownership remains, then, an important institution, but its character has changed very considerably. The break-up of large private estates in single ownership signifies more than the crumbling of a social tradition, centred on the "great house," and fervently admired or abhorred according

to the beholder's viewpoint. It deprives the farming community of certain economic advantages which are dependent upon unitary ownership of a compact estate. By affording opportunity for the provision of common services, the rational allocation of tenancies, the improvement of farm layout, and the long-term planning of capital investment. The large estate should act as a source of economic continuity as well as of social stability. The fact that some large owners have failed to make good use of their advantages is little compensation for the disappearance of an efficient system.

The reduced rate of death duties on agricultural property is a recognition of its special character. Nevertheless, this official attempt at compromise must be counted a failure. The rate of estate duty rises steeply for the larger estates—still more steeply under the Chancellor's recent adjustments—so that their gradual dissolution becomes inevitable. To a limited extent, public authorities, educational bodies, and special agencies, such as the National Trust, are taking the place once filled by the large private landowner; over 10 per cent of the cultivated land of the country is now in their hands, and their purchases and acquisitions have been considerable in recent years.

Nevertheless, the eastern counties' survey found that a third of the farms had two or more owners—many of them had four or more owners—and that the region contained almost as many separate ownerships as it did separate farms. The survey "Country Planning," carried out by the Oxford Agricultural Economics Research Institute, concluded that the complex pattern of land ownership formed a serious bar to the improvement of farm layout and the rational investment of capital. It is on rich soils such as the Fens that multiplicity of ownership is especially prevalent, and sales of small lots of two or three acres occur frequently. Such a fragmentation of ownership destroys the basis of good estate management. Another result is that the personal relationship between landlord and tenant becomes much weakened. An owner of a single holding, or a part-owner of several farms, is ill-placed for making a successful partnership with his tenants.

The private landowner is today in a very different position from his grandfather. He is a very much poorer man—at least so far as his agricultural activities are concerned. His holding is likely to be a good deal smaller and more fragmentary. His personal relationship with his tenants is weaker and his tenants' statutory rights are stronger. If he is a large owner, he is continuously worried by the impact of death duties. Nevertheless, he still occupies a vital economic position in agriculture. As part of it, he is now called upon to participate in the realisation of a large-scale plan of agricultural expansion. He is asked to overcome the ravages of seventy years' neglect, to improve his holding, and to invest large amounts of fresh capital. Is he capable of meeting these demands? Can the private landowner operate successfully under strange new conditions, or is his gradual extinction inevitable? A subsequent article will examine these questions.

(To be concluded)

Europe in Council

THOSE who went to Strasbourg and watched the Council of Europe's Consultative Assembly at work came away certain that something important was achieved. Yet it is far from easy to describe and define what that achievement was, and to explain it to those who did not choose to spend most of August and part of September in almost continuous and sometimes arduous debate, committee work, corridor consultation and friendly post-prandial conspiracy. No clear pattern of the Council's future or of the Assembly's role has emerged; there is rather a mosaic of incomplete designs from which only the historian will be able to trace what was really significant in this unique, yet undramatic, meeting of a hundred European politicians.

There was the clarifying of common aspirations and ambitions among men with very diverse education, experience and national viewpoints. There was the knitting of new friendships and contacts between personalities who were talking together out of hearing of the party whips. There were intellectual and political revelations for the more parochial delegates, who discovered that it is useful to have a Swede saying publicly things about Europe's economic situation which British delegates hardly dared say; that many Catholics are progressive; that not all Socialists are anti-clerical; that the gulf between planners and non-planners is as deep but not nearly as wide as was thought; that no considerable body of opinion really wants federalism in the accepted sense of the word; and that enthusiasts in committee can work as well as cautious and cynical realists. Also useful was the first effort to simplify and popularise Europe's economic and other problems, in forms which different wings of opinion could accept and pass on to their national parliaments and electorates. Most useful of all was the creation of a new loyalty and *esprit de corps* in the Assembly itself, which will now make themselves felt wherever politicians discuss the problems of Europe.

What answer can be given to those who think little of the intangibles, who regard the aspirations of Strasbourg as a new form of "sublime mysticism and nonsense" and ask what specific results were achieved? In the first place, the Assembly has made to its masters, the Committee of Foreign Ministers, recommendations which should ensure that it will be something more than an annual meeting of European MPs. It proposes to keep in being a small, representative and powerful steering committee which, at its quarterly meetings, will maintain continuity, give point and cohesion to ideas and proposals, and presumably represent the Assembly in dealings with the Committee of Ministers. If the Assembly is to become an organised opposition to the Committee of Ministers—which is both likely and desirable—the steering committee could play something like the role of a front bench. Here is a proposal for something clear-cut, promising and new in Europe which the Ministers can hardly reject; for its existence should make their relations with the Assembly more orderly if not easier.

Secondly, there is the proposal that, by April next, a committee of the Assembly should report on the "changes in Europe's political structure" which are necessary to promote closer unity. Here again is something the Committee of Ministers should welcome. They themselves signally failed

during last winter to find out what they meant by "unity" (translated in the French version of the Council's Statute as "union"); and their permanent officials have since looked askance at the crucial word. If a representative group of European parliamentarians can produce a set of really original and workable proposals, bringing lawyers and scholars in to help, not hesitating to consult American and Commonwealth experience, never forgetting that it is not they, but national governments that will have to sell their plans to the electorates—then the Foreign Ministers will find themselves obliged before next summer's session of the Assembly to bring both courage and precision into their European policies. M. Spaak, on whose skill and vigour as president of the Assembly so much has depended, has given his warning, with all the authority of a former Foreign Minister and joint creator of much that is new in Europe:

In order to unite Europe, everyone, nations and individuals alike, must be prepared to make sacrifices of pride and—what is still more difficult—material sacrifices also.

Next in importance was the work of the committee on economic questions, the debate which it provoked and the recommendations that emerged. In committee, the planners and the non-planners—or, to be more accurate, the British Labour members and their Continental sympathisers on the one hand, and their Conservative-Liberal critics on the other—appear to have got at one another's throats. It was, therefore, much to their credit that they were able to produce an agreed document, even though it provoked a heated debate in the Assembly and a subtly impertinent—but effective—suggestion from Dr Dalton that they should not discuss the crucial dollar and sterling problems, then *sub judice* in Washington. The report was not comparable in authority or documentation to the work of OEEC, and it covered much battle-scarred ground. But it did attempt to provide an answer to the question "Why must Europe unite?" The first indisputable and urgent reason for European unity—the need for a common strategy against Communist imperialism—could not be used, because that would have meant challenging the Ministers' decision that defence should not be discussed. Therefore, the problem of the dollar deficit and of the joint measures by which member nations could contribute to its solution had to be raised to first place. The exercise was valuable, despite the somewhat strident warning against unemployment and hunger, and the virtual ignoring of warnings from Mr Boothby, Mr Mackay and Dr Ohlin of Sweden that Europe could not immediately meet its dollar deficit save by increasing threefold its exports to the United States.

The economic recommendations that will, in fact, reach the Ministers are less clear and less immediately practicable than might have been hoped. The chief issues they raise were discussed in a leading article last week, and there is nothing fresh to say save this: that if the Washington conference has not brought any closer the vision of an "expanding international economy" for the free world, then the western governments—the British and the French in particular—cannot postpone any longer the task of building up subsidiary forms of co-operation within western Europe and its overseas dependencies. These, though they cannot close

the dollar gap, can at least mitigate its effects on their social and economic policies. In other words the Strasbourg discussions have removed from quarantine under OEEC control in Paris issues and ideas which have sooner or later to be explained and justified to voters. Europe's economic problems may not be made more easily soluble by being placed before the public in the simplified and general forms which can alone get the approval of men of diverse parties. But hardly any of the proposed solutions can be undertaken unless voters are prepared to understand their effects. The process of popular education has begun, and it is to be hoped that the Ministers will accept the Assembly's suggestion that its proposals should be debated in the national parliaments.

*

In November, the Committee of Ministers will meet to survey the results of Strasbourg. In the next six weeks, therefore, Mr Bevin and his fellow Ministers have to be briefed on what to think and say and do about the activities of the Assembly, which has developed such lusty lungs and limbs in the swaddling clothes they had designed for it. What needs to be done in London stands out conspicuously. First the Labour Ministers must recapture some of their old international spirit and stifle those tendencies towards national socialism (not Nazism) in deed and thought that have been growing in the last eighteen months. They should attempt to ensure that British policy on European unity can become bi-partisan. They must drop their jealousy of Mr Churchill's European Movement and realise that it has now broken the back of its task. Indeed, it may now decline in importance, unless it has the wisdom to turn from propaganda among the black coats and white collars to education in the factories

and the fields. The leadership in Europe which Mr Bevin tentatively offered in 1948 is now thrust upon Britain, and the responsibility can be sidestepped only by evasions and rebuffs that would demoralise western Europe and prepare it for eventual German—or Soviet—hegemony.

Second, there must be a thorough examination of the possibility of getting the sterling area or the Commonwealth to contribute to schemes of economic co-operation in Europe. The basic difficulties and advantages of such a policy have not been fully studied and discussed; until they are, powerful sections of American opinion will remain convinced that western Europe is not seeking its own salvation and that British isolationism is the chief obstacle to greater unity.

Most important of all is the need to bring Germany as soon as possible into the Council. There may be genuine practical difficulties about giving full membership to a government that is not master of its own foreign policy; and it is clear that the French want to steal a march on the Germans by getting the Saar Territory into the Council before questions are asked in Bonn. These are difficulties that can and must be overcome. The next nine months will be a formative time for the Council and the Assembly; political and economic proposals will be debated and taken which no German Government—particularly a coalition government—can be asked to accept some time next year as *faits accomplis*. Moreover, the sooner German politicians are brought into intimate contact with their western colleagues, the sooner will there be formed in the new German parliament a body of men who can draw moral and political strength from experiences and achievements outside their own country. Had there been twenty-five years ago a Council of Europe to which Stresemann could have been invited, the subsequent history of Europe might have been very different.

NOTES OF THE WEEK

The National Interest Prevails

On Wednesday of last week, Mr J. B. Figgins, the secretary of the National Union of Railwaymen, argued before the TUC conference in favour of abolishing compulsory arbitration, but ended by withdrawing his motion. On Thursday he voted in favour of the General Council's policy of wage stabilisation, and that very evening his good faith was put to the test by the publication of the report of a Board of Conciliation set up to review the claims of the railwaymen, which rejected the NUR's main claims. The history of this claim goes back to January, 1947, when the NUR put forward a claim for an increase in wages of 20s. for all their members. This was referred to a court of inquiry, which awarded an increase of 7s. 6d. The award was accepted and went into force on June 30, 1947. A year later the NUR decided to press for the remaining 12s. 6d., which was rejected by the relevant tribunals. In May of this year the NUR decided it was time to start pressing again, and put forward a claim for a flat increase of 10s. and for payment of time and a quarter for work after Saturday noon. After long and involved arguments between the Railway Executive, the NUR and the smaller railway unions (who were interested in other projects than a flat rate increase, and who were dismayed by the prospect of a general evening-up of railway wages), the Ministry of Labour eventually succeeded, in order to avert a railway strike, in getting the Railway Executive and all the railway unions to agree to abide by the decision of a Board of Conciliation.

The Board sorted out all the various claims of the railway unions into nine minor and two major issues. On six out of the nine the employers and the unions succeeded in coming to an agreement, which will raise the Railway Executive's wages bill by £850,000 a year. Of the two main issues, the claim for a flat rate increase of 10s. affected only the NUR, and was based on the assertion that rates of the lowest paid workers are now insufficient for human needs; that railway rates of pay have lagged behind other industries; that "earnings" should not be considered in assessing the adequacy of basic "rates"; and, finally, that existing rates are not high enough to enable the Railway Executive to retain old and recruit new staff.

The Board examined these claims with scrupulous care, and did not accept them. It did not regard the argument from human needs as proven, since it refused to accept the NUR's argument that it was the basic rate rather than the size of the wage packet that must be considered. Although there might be an undesirable amount of overtime on the railways, in fact, the average weekly earnings of the lowest grade of railway workers on a basic rate of 92s. 10d. was 112s. 7d. Nor did it accept the fact that railway earnings in the lowest grades had fallen behind other industries, and it pointed out that to grant an increase in railway basic rates would mean in the end setting a new basic minimum wage for unskilled manual labour.

*

The claim for increased Saturday overtime was presented by the NUR and the Associated Society of Locomotive Engineers and Firemen. The concession would cost the Railway Executive £15½ million, and the NUR put forward some ingenious suggestions as to how these might be met—by the restriction of "C" licences to force freight on to the railways, by using the road earnings of the Transport Commission to finance this additional cost to the railways, or by making the Transport Commission's interest charges on its stock chargeable to the Revenue. Very properly the Board refused to entertain these manifestations of naked self-interest, and concluded that it was not possible for the Commission to meet this additional cost.

Railwaymen's Dilemma

The rejection of their claim was a severe shock to the NUR, whose leaders had argued that the Conciliation Board could not very well award less than the 3s. 6d. for their lower paid workers offered by the Railway Executive on a previous occasion. By promptly accepting the award, and giving effect to the agreements reached on the minor points, the Railway Executive have ruled out the likelihood of a renewal of their offer, and the terms of the award would seem to preclude it.

So Mr Figgins and the executive of the NUR have arrived at an impasse. They are morally if not legally bound to accept the decision of the Conciliation Board, but to do so means abandoning the cherished aims for which the union has fought so devotedly and so tenaciously for two years past. At the moment the leaders of the NUR are adopting a policy of wait and see while various local branches make up their mind whether to continue the struggle by the use of "go slow" tactics. Mr Figgins and the union leaders have it in their power to tell their members unequivocally that to flout the arbitration award will lose the railwaymen the respect of the public, alienate the support of the rest of the trade union movement, destroy the earning prospects of their own industry and embarrass their Government. It is only too probable, however, that they will permit resentment among their branches to go unchecked and unguided, and then declare the pressure of resentment too strong for them to resist.

* * *

A Word of Wisdom

The relations between the NUR and the Railway Executive, and the failure of the former to carry with it the full support of ASLEF and the other railway unions (who by and large had their sights set on longer-term objectives than pay increases—such as pensions and reorganisation of the antiquated wage structure) underline the only really important speech made at the TUC conference. Speaking towards the end of a week which had produced only negative ideas, Mr Bryn Roberts of the National Union of Public Employees moved an amendment to the General Council's motion on wages and profits demanding that it should tackle the problem of increasing productivity and thus eventually make wage restraint unnecessary. The present policy would end by damaging the structure of collective bargaining. "The struggle now will be not only between worker and employer but between the trade unionist and his own executive committee." It would create divisions within unions and between unions. "It provides glorious opportunities for disruptive elements to exploit."

This is a very accurate analysis. There is no general union whose inner cohesion has not been weakened in the past two years; as the railway dispute, among others, has shown, the general unions and the craft unions are becoming increasingly estranged. In a sense national arbitration is bringing the trade union movement back to where it originally started—the Typographical Association has decided to abandon national bargaining in favour of local deals between employers and workpeople. It is true that this is an aspect of over-full employment—and that the unions will be very glad to return to national collective bargaining if employment becomes more difficult. But a mere standstill on wages is undoubtedly corrupting the trade union movement, and Mr Bryn Roberts is entirely right to remind his fellow trade unionists of the importance of working for a return to a healthier economic state which will make the policy of wage restraint unnecessary. As *The Economist* has often pointed out, the difficulty of the British

Modern methods sometimes make almost incredible savings in production time and cost. An example: a well-known firm wished to cut a block of steel 51 inches thick to an intricate pattern. Estimated time for machining was 300 hours—more than a normal working month! By a BOC process—Heavy Cutting—the job took only six hours. One more instance which underlines the extreme importance of BOC processes in industry today.

The British Oxygen Co Ltd
London and Branches

"I'm a pioneer
in modern dress!"

Some people don't think that tradition counts for much, but I know better. Take the example of B.O.A.C. . . . Its 150,000 miles of world-wide routes to five continents and forty-two countries didn't just happen! There was always a 'first time' for every route. Because B.O.A.C. has the imagination and the determination to be a leader, it always looks and plans ahead. That's why it's not surprising that B.O.A.C. pioneered so many air routes. Nor is it surprising that B.O.A.C.'s 30-year-old tradition of Speedbird service and experience is reflected by all its personnel!

B.O.A.C. TAKES GOOD CARE OF YOU

FLY "B.O.A.C."

BRITISH OVERSEAS AIRWAYS CORPORATION WITH QANTAS EMPIRE AIRWAYS LTD., SOUTH AFRICAN AIRWAYS, TASMAN EMPIRE AIRWAYS LTD.

economy is not that individuals are paid too high a wage, but that the cost of labour entering into production is too high. If the British trade unions could bring themselves to recognise the difference between labour costs and wages, many of Britain's economic problems would be solved. The tepid reception accorded to Mr Bryn Roberts's speech shows that that recognition still lies a long way off.

* * *

M. Queuille Begins Another Year

M. Queuille's administration has lasted a year. The feat puts the Prime Minister in a small group of French statesmen who probably do not number more than sixteen. If he achieves a second birthday, he will be equalled only by M. Clemenceau and M. Poincaré.

At the moment, his chances of surviving another full year seem slight. In spite of the degree of recovery and stability achieved in 1949—French production has risen 30 per cent above prewar and the franc has recovered one third of its value—the situation is precarious. A great mass of the workers are not much above the subsistence level (their conditions are described in an article on page 617) and any deterioration in general economic conditions could lead to new social unrest. The farmers, discontented by the fall in food prices which relative abundance has brought with it, are hostile to the Government and have threatened a "farmers' strike" if the policy of increasing food imports to maintain low prices is adopted. The parties in the coalition, sensitive to these undercurrents of discontent, and relieved for the time being of the more acute pressure of Gaullists and Communists, may cast around for means of evading responsibility—in which case the coalition could break up.

M. Queuille's chief difficulties are not, however, domestic. France, with thirty to forty per cent of its imports still covered by Marshall Aid, has not yet recovered equilibrium. Above all, the outlook in the western trading area, of which France is a vulnerable partner, is much more uncertain than it was in the first months of the year. Collapse of foreign trade is the chief menace to France's precarious recovery—as it is to that of every other trading nation in western Europe. The Washington talks and the increased flexibility in the use of ECA dollars have postponed an acute crisis, but in Paris as in London, the sense of it is as apparent as the first tang of autumn in the morning air.

* * *

Germany's New Start

Until the middle-aged and the young of western Germany have found the faith and the energy to make their mark in and around the political life of the new Federal Republic, the old men must set the tone of its public life and lay the foundations of its institutions. It is a tremendous task for Professor Theodor Heuss, the 65-year-old President, a liberal and a Protestant and for Dr Adenauer, the 73-year-old Chancellor, a conservative and a Catholic. Their roots lie in the prosperous, self-confident, Prussian-dominated Germany of forty years ago. The roots of the middle-aged lie in the period of Weimar inflation, resurgent nationalism and spiritual anarchy. The roots of the young lie in the period of economic crisis and the rise and triumph of Hitler. Their greatest common experience was disastrous war and the effort of the last three years to recover prosperity and a zest for life amid the ruins. Those who have worked most closely for and with the Germans hesitate to prophesy what can be built out of all this.

The office of President, to which Professor Heuss was elected this week, in face of an unexpected and ill-considered challenge from Dr Schumacher, leader of the Social Democrats, offers few powers but great possibilities. Professor Heuss will represent the Republic in its limited relations with the outside world; he can be an arbitrator between the two main parties,

the leaders of which—incredible though it may seem—met for political discussion this week for the first time for three years. He can establish precedents and practices which will give the President powers not provided for in the constitution.

Professor Heuss has the advantage of having played a major part in creating that constitution, of coming from the liberal and tolerant atmosphere of Stuttgart, of having wit as well as intelligence, of having written on politics in the *Frankfurter Zeitung* when it was dangerous to do so, and of having had his books burnt by Goebbels's orders. He is the kind of man who has the courage to take an orthodox patriotic line against dismantlement of German factories while condemning mob violence as a method of frustrating Allied policy. Socialists and fellow professors may describe his views on economics as old-fashioned; but they are very like the views fashionable among the men who will direct the German economy in consultation with the American High Commissioner, Mr McCloy.

*

By next week the political picture in Germany will be transformed. The *Bundestag*, or federal lower house, will meet; a Chancellor will be elected, a Cabinet chosen. The authority of Military Government will be transferred to the Bonn Government (presumably it will not move to Frankfurt); internal affairs will—broadly speaking—come under German control and external affairs remain under control of the new Allied High Commission. The Government will have to work within the limits of the Occupation Statute, and it remains to be seen whether the Chancellor will call on Sir Brian Robertson and his colleagues to receive it or whether they will call on him. Some quite crucial things will happen in the next few months around the new President and Chancellor. It is to be hoped that the personalities and activities of the new Government will be more fully reported in the British press than has so far been considered necessary.

* * *

Bullies In The Balkans

The most ominous move so far in the Soviet campaign of menace against Tito has been the speech made by Marshal Bulganin in Sofia at the fifth anniversary celebration of the entry of the Red Army into that city in 1944. Marshal Bulganin is a member of the Soviet Communist Party Politburo, and was until recently Minister of the Armed Forces; his visit to Sofia was a sequel to a similar visit of Marshal Voroshilov three weeks ago to Bucharest for the commemoration of the corresponding anniversary for Rumania. Marshal Bulganin was accompanied to Sofia by Mr Lavrentiev, the former Soviet Ambassador in Belgrade, who was recently recalled thence, without being replaced, and appointed a Soviet Deputy Foreign Minister. Addressing his Bulgarian audience, Marshal Bulganin furiously denounced "Judas Tito," and added: "Whatever will be the test which the Bulgarian people have to face, they may always be sure to find in the Soviet Union and Stalin faithful and disinterested friends ready to support them with all their forces."

Such words have to be taken in the context of Balkan politics, in which Bulgaria is divided from Yugoslavia not only by the current ideological schism between two brands of Communism, but also by the older national feud over the possession of Macedonia, for which Bulgaria has already engaged in three wars within forty years. Now, with a raging propaganda from all the Cominform capitals to incite them against their ancient enemy, and the protection of the mighty Soviet Union assured by a Soviet representative of the highest rank, the Bulgarians must be sorely tempted to make still one more bid to win their national irredenta. Since the Cominform-Tito conflict emerged a few weeks ago from the condition of being a quarrel among Communist parties and became a matter of Notes officially exchanged between states, it has

become possible for the Balkan enemies of Yugoslavia to envisage not merely a purge of the Yugoslav Communist Party, but a new break-up of the Yugoslav state and redivision of its territory. Russia is unleashing the dormant, but unassuaged, traditional national hatreds of the Balkans. It is a dangerous game, which should be exposed and checked by a full discussion when the United Nations meets next week.

The Yugoslav leaders appear to be well aware of the possibility that Russia, wary of charges of "imperialism" in dealing with small Communist countries, will refrain from direct attack on Yugoslavia, but will stir up Yugoslavia's neighbours to provoke incidents which will provide Russia with a pretext for intervention as an interested third party. It is, however, Albania rather than Bulgaria which they anticipate will be used in the first instance to launch against Yugoslavia charges of disturbing peace in the Balkans. Mr Pijade, of the Yugoslav Communist Politburo, has alleged in a full-page article in *Borba* that the Cominform plans to use a crisis in Albania as an excuse for action against Yugoslavia, accusing Yugoslavia of causing the disorder. Economic conditions in Albania are indeed so bad (as was shown in *The Economist* of September 3rd) that internal trouble is likely to break out there at any moment, and a pro-Tito faction certainly exists there; on the other hand, the Cominform is inciting the ruling Communist clique in Albania against Yugoslavia by spreading reports that Tito has made a pact with Greece for a partition of Albania. The Balkan pot does not seem far off the boil now.

* * *

Colonial Investment

The first point of the agreement reached at Washington on ways of encouraging private American investment in the sterling area will call for early examination of the prospects of investment in the colonial empire. Sir Stafford Cripps has long supported in principle the idea of dollar investment in the colonies, and the Secretary of State for the Colonies, in the annual colonial report presented to Parliament last July, underlined the same point.

Unless the sterling area as a whole succeeds in restoring the balance of its external payments at a high level, the United Kingdom itself will be unable to provide the overseas capital investment upon which the colonial territories must rely if their development is to be accelerated.

No exact figures exist for the amount of existing dollar investment in the colonies. American aluminium interests have extensive holdings in bauxite development in British Guiana, and there is American capital in timber and manganese interests in West Africa and in other enterprises in Malaya and Southern Rhodesia. But the private American investor who has money to put into the colonies certainly has to face a formidable series of obstacles before he can do so. Some of these arise directly from the dollar problem itself. He can take out his dividends, but his capital will fall under the usual ban on the withdrawal of dollar capital. New enterprises will also have to pass the test of being either dollar earning or dollar saving. These are tests which would arise also in the United Kingdom; but in the case of a colony he must in addition secure the approval of the colonial government, which is charged with the responsibility of securing the welfare of the people of the colony on the wider social and political aspects of the proposed scheme.

The Colonial Loans Act passed some months ago enables colonial governments to borrow from the International Bank, and the Colonial Development Corporation has led the way here by borrowing \$10 million to cover essential dollar needs incurred by their existing projects. But the Bank's rate of interest is a good deal higher than a colonial government is likely to have to pay on the London money market—a factor which is likely to be a formidable deterrent for some time.

Meanwhile the new Anglo-American Economic Council, in its investigations into colonial investment, will be able to refer

to the list of projected colonial development projects which the British Government has recently submitted to OEEC in Paris. These total some £400 million, and contain a number of schemes earmarked as specially suitable for dollar investment. Other information available from the colonial report points out that in 1948 the amount of capital investment projected for the colonies totalled £188 million, of which about £122 million represented the cost of imported capital equipment, the remainder the cost of local labour and materials. The report also points out that about one-third of all colonial investment for the year was devoted to transport facilities. Behind this last fact may well lie the biggest obstacle to any immediate large flow of private dollar capital to the colonies—the fact that the kind of capital developments most urgently needed in the colonies are those on which any quick or substantial rewards are unlikely. The most urgent need of a great part of the colonial empire is capital for roads, railways and harbours, without which other development cannot proceed—as the Overseas Food Corporation has discovered to its cost. Yet this is the type of investment on which returns are likely to be slow and unspectacular—and indeed which is regarded as being primarily, if not exclusively, the province of colonial governments rather than of private enterprise.

More About Murder

It is becoming increasingly clear that the Royal Commission on Capital Punishment is chasing a hare which was never really worth starting. They are prevented by their terms of reference from discussing the merits of abolishing capital punishment, and they have been left to settle only the comparatively minor questions of whether or not to set up more than one degree of murder and whether or not the present system of pronouncing and carrying out the sentence of death could be improved. All the evidence so far produced before them points to the fact that, with the possible exception of the laws and rules relating to insanity, the present practice of the courts coupled with the exercise of the royal prerogative is sufficiently flexible to ensure that justice is done and needs few, if any, changes.

Indeed, as Sir Theobald Mathew, the Director of Public Prosecutions, said in his evidence last week, the proposal to set up different degrees of murder is in fact an attempt to make the crime fit the punishment. It would mean that the police in charging a man for homicide and magistrates in indicting him would have to consider not only whether there was a *prima facie* case against him for the killing but also whether the killing was of such a nature as to warrant punishment by death—which would be murder in the first degree—or punishment by imprisonment—which would be murder in a lesser degree or manslaughter. The probable punishment, not the crime, would become the deciding factor, and it is obviously undesirable that this should be the concern of the police. A way out of the difficulty would be, as Sir Theobald suggested, to charge a man with "unlawful killing" and to leave the precise charge against him until a later stage in the proceedings. But the legal complexities of such a practice seem hardly worth the small gain, if any, which might ensue.

* * *

National Assistance

The report of the Assistance Board for 1948 reviews its work during the first six months of the social security scheme. It has two main functions, both directed towards the same purpose of preventing anyone's income from falling below a fixed minimum: to supplement insurance benefits where these, together with a person's other resources, are insufficient for his needs; and to provide entirely for his needs, up to the minimum, if he has no resources and does not qualify for insurance benefits. For the unemployed, old age pensioners,

and widow pensioners with children, the Assistance Board had been undertaking these functions for some years before July 5, 1948. On that date it took over from the local authorities the duty of relieving all the other cases previously helped under the poor law—for instance, the sick, the disabled and the deserted—the blind, previously helped under the Blind Persons Acts, and the tuberculous, previously helped under a special wartime system of treatment allowances.

When the transfer took place the Board was paying about 30,000 unemployment assistance allowances and about 512,000 supplementary pensions. The local authorities were paying more than 200,000 outdoor relief allowances under the poor law, about 40,000 allowances to the blind and nearly 20,000 treatment allowances to the tuberculous. Thus the Board began its new duties with 802,000 cases on its books. By the end of the year they had grown to just over a million. About 20,000 of the increase may be accounted for by assistance payments to old people in local authorities' homes and hostels who are now required, under the National Assistance Act, to pay a minimum charge for their accommodation. There were also nearly 4,000 more blind people and over 2,000 more tuberculous people receiving assistance from the Board than were receiving grants from local authorities.

A rise in assistance payments was, in fact, expected. For one thing, the Board's definition of the minimum income necessary to prevent want is, with a few exceptions, more generous than that adopted by local authorities under the poor law; the extent to which it can disregard an applicant's resources in determining his needs is also greater—of those in receipt of assistance at the end of the year, 174,260 owned capital, excluding owner-occupied house property, totalling £19,500,000, of which about half was completely disregarded because it was war savings and the rest only taken into account to a limited extent. For another thing, experience with supplementary pensions had shown that people are far more willing to ask for assistance from the Board than relief from

local authorities. Even if there is no big increase in unemployment, therefore, a steady rise in the cost of assistance can be expected.

* * *

A Language is Made

The desire to abolish all traces of the old poor law has been carried so far that a new vocabulary has arisen to take the place of the old terms that in some cases were as old as the poor law itself. Sturdy vagabonds, tramps, vagrants, casuals—these plain, downright words have been displaced now that, under the National Assistance Act, the ladies and gentlemen concerned have been made the Assistance Board's responsibility, by the circuitous phrase "persons without a settled way of living." They no longer tramp from casual ward to casual ward but proceed from reception centre to reception centre. Similarly, the workhouse (poorhouse in Scotland) *alias* the house, *alias* the union, *alias*, in the mealy mouthed language of the twentieth century, the public assistance institution, is acquiring yet another designation. Accommodation for the deserving and aged poor and shelter for the destitute now has to be provided by local authorities according to the conditions laid down in Part III of the same Act. Therefore the workhouse is now known by the term "Part III accommodation"—surely more dreary than the old workhouse itself. The relieving officer has gone with the old poor law, but his functions in respect of lunatics at large have been transferred to a person called a "duly authorised officer"—there is even some talk about whether an Association of Duly Authorised Officers should be formed. The old phrase "pauper lunatic" disappeared, of course, some years ago and was replaced by "rate-aided person of unsound mind." In this respect, the only change made by the new social service legislation was one that was well in keeping with this egalitarian age—throughout the Lunacy Acts, the word "rate-aided" is now omitted.

It is not only in the old poor law world that a new vocabulary is growing up. When the new social security scheme came into force, there was some speculation whether people receiving benefit would "go on Beveridge" as, a generation earlier, they had "gone on Lloyd George." They do not. Nor do they receive a sickness benefit or retirement pension. Going straight to the heart of the matter, they declare quite simply that they are "getting their twenty-six."

* * *

A New Foreign Ministers' Meeting?

The deputies of the four Foreign Ministers struggled for two months to produce an agreed draft treaty for Austria by September 1st. They discussed twenty-two articles and settled thirteen of them. Nine are still outstanding, and on one of them—Article 35—disagreement proved intractable enough to defeat the deadline, put an end to discussion and leave the western deputies wondering how and when the discussions could be taken up again.

The offending article concerned the disposal of the Danubian Shipping Company, of Austrian rolling stock and of the country's oil assets. Agreement could not be reached on any of the three, and the disagreement on oil is clearly serious since the Soviet manner of handling the question suggests bad faith. The Foreign Ministers agreed that, although two-thirds of the property rights in promising oil lands should be left to the Russians, the Austrian share should be equitable. The western Powers now feel that Russia, by its manipulation of the lands in question, may be claiming two-thirds in terms of area but practically a hundred per cent in terms of likely deposits of oil.

The talks have therefore ceased for the time being, but the western Powers are ready to reopen them on September 22nd in the United States under the respectable shadow of the United Nations. There is some speculation whether the issue might not in fact be referred back to the Foreign Ministers

themselves. It is true that geographically they will be assembled in or near New York, but at their last meeting in Paris they did not make any definite arrangement to hold an autumn session. They only agreed to discuss the possibility of arranging a further meeting at some future date.

Amber Light for Mr Clapp

Before leaving Lausanne for the Middle East last week, an American member of the UN Survey Group for Arab Refugee Settlement, of which Mr Gordon Clapp, of the TVA, is president, asked: "Why must we go? I have two tons of documents and blue prints with me here, and could make my recommendations immediately in Lausanne."

Almost simultaneously, in Beirut, another Uno servant, Sir Raphael Cilento, while acting as chairman of a United Nations Arab Social Welfare Assembly, was grappling with the Arab cry: "Why must they come?" At the closing meeting of that Assembly on September 3rd, Sir Raphael addressed an audience consisting of all the most humanitarian and progressive elements in the Arab states. Speaking from a purely social and economic angle, he said, he must assure them that it was now in their own interests to set politics aside and to accept great power aid with refugee settlement. But he spoke to deaf ears. He was voted down by an audience that would hear of nothing but limitless return to Palestine. The two incidents, juxtaposed, reveal a fundamental flaw in most

American, and indeed United Nations, thinking about Middle Eastern development and welfare. This flaw is the belief that the money and the know-how are all that is necessary to produce progress. In the Arab states this is not so.

British observers know it from experience, but are hardly in a position to run down Uno's methods on grounds of superior knowledge. A man who has tackled a problem, failed at it, and handed it to another to solve is ill-placed for criticising the way that other goes about it. Yet the Clapp team, as it masters the political and the temperamental snags in the way of using its blue prints, would do well to keep consulting its British colleagues about their experiences.

For these were gleaned not only from the long hard years in Palestine. Experience of trying to settle refugee strangers in Arab lands was also gained during the years as mandatory in Iraq. A Special Report to the League of Nations on the progress of that mandate, made just before it ended in 1932, tells of the difficulties they encountered in settling the Assyrian refugees in northern Iraq. The story is one of refugees embittered and truculent as a result of their experiences, demoralised by months of assistance and therefore unfitted to settle as taxpaying citizens, fastidious over sites that they thought less than their due, and ready to let political prejudice override all thoughts of social security in a settled home. It is true that the Assyrian problem was exacerbated by differences of race and religion, but it is a fallacy to think that these do not arise as between Palestinian and Syrian or Iraqi. One may

be a Christian, the other a Kurd. Moreover, even the Moslem inhabitants of a Mediterranean city such as Jaffa would regard as an alien soil and an uncongenial climate the highlands of north Syria or the flats of Mesopotamia. Lastly, it is well to remember that the united forces of the western world failed to solve the Assyrian tragedy which ended in massacre or in flight and a slower death.

* * *

Uneasy Syria

It is a matter for grave regret that the moment at which the United Nations' Economic Survey Group for Refugee Settlement is landing in Beirut should be one of such uncertainty in Syria. In a country which has passively suffered two army coups in five months, no civilian feels stable. Therefore the present Syrian Government, which was carried to power on the epaulettes of Marshal Zaim's executioner, Colonel Sami Hinnawi, is in no position to take firm decisions or to introduce United Nations' schemes to a people long fed on anti-foreign slogans.

It now transpires that Colonel Hinnawi, despite his initial pose as a simple soldier, who was interested only in ridding his country of a tyrant, in fact went back to barracks only—as it were—for a wash and a meal. He now heads a supreme war council which meets almost as often as does the cabinet. Ministers cannot well gainsay it; it therefore severely handicaps a team of men of integrity and repute. Further, one or two of the better men who were said to have entered it—notably the ex-Mayor of Aleppo—have not felt Hashem Atassi's leadership to be sufficiently stimulating or reliable to warrant leaving their jobs in private life.

Meantime, Hinnawi's conduct of army affairs suggests that he is less capable, even, than was Zaim of reconciling opponents and administering a country. Whereas Zaim, at least for some months, kept the army at one and at his back, it is now at sixes and sevens. Its officers make no secret of their quarrels and some have ostentatiously quitted Damascus with a group of supporters. These dissidents are finding plenty of support outside the capital because the Government—arguing that illiterate nomads can have nothing of value to say on national politics and should be content with their tribal councils—is proceeding with Zaim's policy of disenfranchising the bedouin. Tribes whose members used to have the vote were accustomed to vote as their sheikhs directed; naturally all sheikhs are incensed at the prospective loss of power to people whom they regard as town-bred mongrels. To alienate the bedouin is disastrous because they have it in their power to make or mar the security of cross-country travel.

The various units of the Syrian population have therefore only one point in common—nationalist antipathy to the foreigner and to Israel. On all other points they are divided. Some are royalists—particularly among the tribes; they would enthrone a Hashemite king tomorrow if any scion of the Hashemite house were popular. Other groups can think of nothing more constructive to propose than ousting the present Government; others again find relief in reviling Egypt for "coming to terms with Israel." (The Egyptians have this month broadmindedly accepted the presence of an Israeli representative at an international health conference in Alexandria.) Most of the criticisms advanced are alarmingly unconstructive. In a word, Syria presents, in microcosm, all the discussion, uncertainty and waste of breath upon negative criticism that has been the undoing of the Arab League.

Finnish Strikes Fade Out

The Finnish strikes are as good as over. Their collapse represents the most resounding of the many defeats the Finnish Communists have so far suffered. All that their manoeuvres have achieved is to show still more conclusively that the Finnish people reject their policies, their methods and their claims to speak on its behalf. Tribute is due to the remarkable morale of the Finns and the evident determina-

Can Taxes be Increased?

One of the most discreditable things done of late years, has been increasing the National Debt by the amount of £12,000,000, since 1846 [to £797,793,000] . . . for the relief of the Irish famine, and . . . to make good a deficiency caused, in a great measure, by the same fact. . . . We will not even question the policy of the expenditure in Ireland. Public opinion demanded it. Parliament, without any opposition, voted it. Had we taxed ourselves for our humanity no blame could have attached to our acts. But it was surely a discreditable act of the age to hand our contributions down as a burden to posterity; to increase the debt in times of peace. . . .

But the excuse for thrusting these burdens on posterity, and the excuse for not reducing the National Debt in the time of peace, is the same as it has ever been. "It is with difficulty the current expenditure is provided for. The country is taxed to the utmost possible point, and no greater pressure of taxes could be borne." Judging from the comparative condition of the country, from the enormously increased expenditure on articles of taste and luxury—from the quadrupled numbers of expensive and elegant equipages—from the increase of the highest order of dwellings in all our chief cities—from the thronged watering places, from the pleasure-travelling at home and abroad, from the enormous increase of charitable institutions and voluntary contributions for objects of every conceivable kind, and from all that marks in such striking contrast the habits and expenditure of the country now, compared with past times, and in every grade of life, we are bound to say that there never was a period in English history when there were so many proofs of the ease with which taxation is borne, or when it would have been so practicable to reduce the amount of the National Debt.

The Economist

September 15, 1849

tion with which, unlike some other peoples to whom the doctrine and practice of Communism are no less repugnant, they are prepared, under the able leadership of their Government, to stand up for their beliefs. For, if circumstantial reports from Sweden are true, the Communists at the beginning of this month were within an ace of attempting a *putsch*. They never did so because they realised that the opposition was too solid and too large; and their only action was to make a typically hypocritical complaint about the "wave of terror" directed against the "democratic forces" and "provocative" breaches of the Finnish Peace Treaty by the Fagerholm Government.

The strike offensive failed, then, in its aim of replacing the Social Democrat Government by one in which the Communists would hold office. It has, nevertheless, had a serious effect in both political and economic fields; and its repercussions could become graver in the next few weeks. The direct cost of the strikes is reckoned at at least 2,000 million Finnmarks—over £3,000,000. If the work lost on vital reparations goods—mainly ships and steel tubes—is not made good when the current reparation year ends, fines may be imposed to the total value of all the goods in the categories affected, irrespective of the fact that the bulk of them have already been delivered. Such fines would amount to more than the above sum. Failure to deliver reparations goods promptly could also lay Finland open to dangerous political pressure from Russia.

In home politics, the immediate result of the strikes has been to split the trade union movement along the now familiar division of Communist and non-Communist unions, although the rebel unions may come to heel to avoid showing openly how few of their members are ready to follow their Communist executives. A probable secondary result is a vote of no confidence in the Social Democrats. Such a move was thought to be imminent when the Diet met a fortnight ago. That it has not been made implies that the Communists have been unable to find adequate support from other opposition parties. This would mean that the Agrarian leaders in particular have realised that this is not an opportune time for pressing sectional interests. If so, many people outside Finland will applaud the decision.

* * *

The War in Indo-China

The discussions between Mr Bevin and Mr Acheson in Washington are stated to have covered particularly the current problems of the Far East, and among these no doubt the continuing war in Indo-China, which involves the military potential of France, as well as the general security of South-east Asia, was not overlooked. The public, not only in this country and America, but even in France itself, tends to forget about this war because of the lack of large-scale actions or dramatic events in its unending course, but it remains a very important fact in world affairs. It has never, like the Dutch "police actions" in Indonesia, been subjected to the jurisdiction of the Security Council, nor has there ever been any mediation by a third power; but France has not so far been able to achieve any military result that can be described as a "pacification" of the territory. Some progress has been made by the French in recent months in recovery of key areas from the Viet Minh forces and the principal towns—Hanoi, Haiphong, Hue, Saigon—are firmly held. But approximately half of the total area of Vietnam—the other two parts of Indo-China, Cambodia and Laos, being little disturbed—is wholly in the hands of the Viet Minh, and even where the French have eliminated open opposition, guerilla raids, assassinations and acts of sabotage are of frequent occurrence.

According to figures recently published by *Figaro* the total number of men under arms on the French side in Indo-China is now 230,000, of whom 44,000 are French, 66,000 French African and Foreign Legion troops, and 120,000 Indo-Chinese. The number of French effectives is stated to have

been reduced to its present figure from 72,000 at the beginning of 1947. The direct strain on French manpower has thus diminished, but the part played by the Foreign Legion in the Indo-China war appears to have increased, and France has been charged with recruiting for this force not only numerous displaced Poles, Yugoslavs and Hungarians, but also Germans from the French Occupation Zone who go through a form of becoming Displaced Persons before being enlisted. The war has certainly been unpopular among French conscripts, who have frequently been kept in Indo-China far beyond their proper terms of service, and the Communist propaganda against *la sale guerre* has made the French Government reluctant to commit French troops to it beyond an indispensable minimum—a policy which is also in conformity with the needs of defence in Europe.

For the time being the forces engaged under French command seem to be sufficient to hold their own and make small local advances. But no end of the war is in sight, and the situation might become critical for the French if the Chinese Communists were to complete the conquest of southern China, including the provinces of Kwangsi and Yunnan, and give large-scale aid to the Viet Minh, who have their main stronghold in the mountains just south of the frontier.

* * *

Truth and Professor Bernal

One does not seek figs from thistles, nor a concern with objective truth from Communists. "Right," said Hitler's tame jurists, "is what is useful to the race," and the maxim is equally congenial to all adherents of totalitarianism. It is not therefore really surprising that Professor Bernal should, at the Moscow Conference for Peace, have told the countrymen of Lysenko and Vavilov (not to mention Kapitza) that in the west "the scientist has no freedom" and that "the direction of science is in the hands of those whose only aim is to destroy and torture people so that their own profits may be secured for some years longer."

What is a little surprising is that he should have expected these propositions to command assent, even the assent of silence, from his fellow scientists in the British Association. They, after all, know what freedom they possess or lack. They know that they will not disappear from the ken of their fellows should their researches lead them to some conclusion unwelcome to the academic or official powers. They know that they are not forbidden to leave the country or to correspond with their foreign opposite numbers. If they are not allowed to impart information about armaments to aliens, particularly to aliens holding that war between their respective regimes is inevitable, the last persons to complain should be the Russians, who punish with anything up to the death penalty the disclosure of economic data which the secretive and tyrannous capitalist governments blazon in their official statistics. Not only do British scientists know these things, but they know, and everyone else knows, that Professor Bernal knows them too. He cannot plead ignorance, as might his fellow speaker Wanda Wasilevska, who told her hearers, among other things, that in America the publication of books about the war is prohibited lest the horror of revived memory hamper the warmongers' propaganda.

He knows, too, and they know, how well-founded is his assertion that under capitalism "science can never be employed usefully." He cannot believe, whatever may be the Russian orthodoxy, that the discovery and production of penicillin or antrycide are merely steps in biological warfare, that the sole use of radar or the gas turbine is better bombers, or, for that matter, that the whole cumulative process of technical improvement in industry has come to a halt or is resulting merely in unemployment or lower wages. "Freedom," says the unhappy hero of Mr George Orwell's "Nineteen Eighty-Four," "is the right to say that two and two make four. All the rest follows." It is an abomination that anyone should be deprived of that right. That a scientist should of his own free will abjure it is nauseating self-degradation.

How to give Canada all you've got!

T.C.A. TO CANADA can mean more business for you—and more dollars for Britain!

Yes! Nowadays, in important markets such as Canada, it's the man on the spot who captures valuable export orders for Britain. That's where T.C.A. come in—they offer the most frequent direct service to Canada. Two fast services daily, one from London and one from Prestwick, link Britain with 32 important cities throughout Canada and the U.S.A., and there are connections with every major U.S. airline. What is more, U.K.

passengers save dollars by booking T.C.A. right through to their final destination. Traveling in the comfort of T.C.A.'s famous pressurised North Star Skyliners, business men can be sure that they will be on the spot—and on time!

AUSTRALIA AND NEW ZEALAND via CANADA!
Book via T.C.A. to Australia and New Zealand. Connections with Canadian Pacific Air Lines or British Commonwealth Pacific Airlines at Vancouver. Then on to Australia and New Zealand via sunny Hawaii! No dollars required—T.C.A. pay your transit expenses.

Letters to the Editor

Currency Unions

SIR,—May I suggest that in some respects the analysis made in your well-timed leader on currency unions is misleading? In practice there might be very little difference between the economic effects of an Anglo-American currency union on the lines sketched in your article, and a return by this country to a conventional gold standard. In either case, the problem involved would be that of protecting the country's ultimate monetary reserves, whether of gold or of US dollars. In other words, we should be thrown back on the well-known disciplines of the gold standard.

In your view, the immediate effect of a currency union with the United States would be a violent internal deflation. This thesis appears tenable only on the assumption that the basis of the new union would be the present sterling/dollar exchange rate. If, however, the union were carried out at some such rate as \$2.75 to the £ sterling, and if similarly realistic rates were applied to the other sterling area countries, the deflation would in effect be over and done with before the union was many hours old. It would be painful only in so far as it entailed cuts in the standard of living not already enforced by circumstances preceding the union. In this respect the immediate effects would be no different from those which would be experienced if the currency of this country and the sterling area were devalued.

As your article indeed points out in another connection, governments cannot create gold and silver out of thin air. On a gold standard, however, they are equally prohibited from creating either currency notes or bank deposits at their own sweet will for they are obliged to protect their central reserves. This, however, in no way reacts unfavourably on the government securities of the country concerned, for redemption is in no important sense ultimately guaranteed by the power to print paper notes or expand credit. It would appear, therefore, that the disciplines which a currency union with the United States would impose on this country, far from threatening the status of British Government securities, as you suggest, would in fact enhance that status materially both at home and abroad.

Amongst the obstacles to a currency union you rightly stress the difficulty of achieving full employment at a time when some other part of such a union (and particularly so important an area as America) is on a deflationary tack. This is the old gold standard discipline again, a discipline which it is now fashionable to side-step by successive devaluations. In the case of ourselves and the United States, there might be a further and immediate threat to full employment from the fact that British wages would then be expressed in dollars and thus be easily comparable with wages in America. The dis-

crepancy would be startling, and might well give rise to such violent and prolonged industrial unrest in this country as would go far towards wrecking the union.

Finally, one must agree with your thesis that under a currency union there would be painful results if long-term equilibrium were not achieved in the balance of payments between the former sterling and dollar areas. But would the results of permanent disequilibrium be so much less painful under any other conditions? And would not the union itself make a substantial contribution towards equilibrium, not only by re-introducing the money techniques designed to make nations cut their coats automatically according to their cloth, but also by throwing the British Commonwealth open to United States investment and American tourists in a way which could not be achieved by a return to even the prewar gold standard?—Yours faithfully,

J. RUSHBROOKE CUTHBERTSON

11 Old Broad Street, London, E.C.2

SIR,—The article on "Currency Unions" in your issue of August 20th goes to the point. Currency union between two countries involves complete economic union, which certainly is impossible without complete political union—as long as we are talking of currencies which can be increased in volume at the will of governments.

What puzzles me is why you do not mention that there is a method of establishing currency union without this sacrifice of the liberty of sovereign nations. Few people seem to remember the condition, but, prior to 1914, Britain, the United States and most other countries did use a common currency. It was a metal known as gold. Since the supply of this metal was limited, and could not be increased by the will of politicians, or in accordance with the theories of economists, the acceptance of gold as a common currency applied adequate discipline to various countries, in connection with their internal budgets.

In attempts to escape from this discipline, the world abandoned the use of gold as a common currency. It might be well worth considering the re-establishment of the gold standard, or the adoption of some similar supernational discipline, as the obvious solution of present difficulties.—Yours faithfully,
P. C. ARMSTRONG
Montreal

SIR,—In your article on "Currency Unions," published in *The Economist* of August 20th, you examined the question of a British-American currency union, but without considering the simultaneous establishment of a customs union between these countries. You did not contemplate the creation of an entirely new currency replacing both the pound and the

dollar. Nor did you suggest that the internal and external public debts of these countries should be merged, and that a large degree of uniformity should be brought about between their systems of taxation and between their customs towards the rest of the world.

You were apprehensive lest Great Britain might become, within this large union, a sort of depressed area, and asserted that "the southern states of the American Union receive large hidden subventions through the ordinary means of paying less taxes and receiving more benefits of one kind or another." It would be interesting to have fuller details about these subventions, of which nobody seems to have heard. I myself was stationed in Washington as a diplomat, but was never aware of their existence. In any case, federal taxation is uniform throughout the United States. In the American Union the standard of living of any citizen entirely depends on merit and exertion. This would and should equally apply to every British citizen within the British-American union.

The creation of a British-American customs and monetary union might become the precursor of a universal customs union and of a single world currency. Whereas to turn the entire world into one trade and currency area is at this stage no more than a pious hope, the British-American free trade union is a practical possibility. Its impact, both upon the countries comprising it and upon international trade between all countries, would be of inestimable benefit.—Yours faithfully,
PAUL DE HEVESY

[Average per capita income in the South is substantially lower than elsewhere in the United States; therefore, under a uniform federal income tax, less is collected from the South than from the non-South. Yet, since agriculture is responsible for a far higher proportion of total income payments in the South than in the non-South, the South obtains more benefits than the rest of the country under the Federal Government's farm price support programme. The same is true, to a smaller degree, of other types of federal assistance to the states.—EDITOR.]

Mandrils or Mechanical Brain?

Amid the mountainous sea of words which the world's presses commit to paper a man might be forgiven for wondering whether a colony of typewriting mandrils was not busily at work somewhere on the banks of the Zambesi or the Limpopo. Or—to leap to the other end of the evolutionary chain—perhaps a giant Mechanical Brain has been set in motion in order to improve upon the works of William Shakespeare. Yet good books are still written. To discover them is the special purpose of *The Times Literary Supplement*. Informed and experienced, discerning in its critical standards, it has never yet wasted a thinking man's time.

Problems in Rubber

SIR,—It would be interesting to know the arguments on which you base the statement in your issue of August 13th that "Under present conditions a shilling a pound for rubber could only be maintained artificially, and certainly not for any length of time." From the general tenor of your article it might be thought that the consternation of producers at the present price was unfounded and that their desire to see free competition for natural rubber in the United States would lead to a still lower price.

A shilling a pound for natural rubber would not satisfy some producers but it would enable the efficient ones in Malaya to make ends meet and would, I submit, result if the following principal factors making up "present conditions" were brought to an end.

1. American policy requires the use of a prescribed proportion of subsidised synthetic in the fabrication of small passenger tyres and prohibits the import into America of tyres made to any other specification. It does not prohibit the export of such tyres made from natural rubber only. Can it be that, despite the confident assertions of the Americans that their synthetic product is competitive with natural, they are aware that consumers in countries where a free choice obtains prefer tyres made wholly of natural because they are better tyres? Substance is given to this suggestion by the recognition even in America that synthetic is not suitable for the manufacture of heavy-duty tyres.

I should certainly not deny that for certain purposes synthetic rubber is superior to natural, but the consequences which flow from the refusal of the Americans to permit free competition between the two in the large field of small passenger tyres is the biggest factor in keeping down the consumption and, therefore, the price of natural rubber.

2. The insistence of the Indonesian authorities that half the rubber produced on estates and a large part of the smallholders' production must be sold to America, Canada or Japan for dollars, whatever the price, means that the American manufacturer

is assured of a substantial supply at almost any price he cares to offer

3. The premium over the fixed rate of exchange which the dollar commands on the free market in many countries leads to a seepage of rubber through traders in countries such as Siam where exporters are permitted to retain 80 per cent of the dollar proceeds of their sales. This enables them to buy rubber at one price, sell it somewhat cheaper to America and still make a profit.

If, as the producer maintains and as the Americans apparently realise, natural rubber is a superior product from which to make tyres, it might be expected that natural should command some small premium over synthetic. The RFC's recently published operating statement gives the estimated cost of synthetic, based on a production of 458,000 tons for the year to June 30th last, as 19.2 cents, or 11.43 pence per lb., allowing a "profit" on the funds invested in the active plants of 1½ per cent or no profit if the stand-by costs of the inactive plants are taken into account. If, therefore, synthetic were sold at its true cost of production and if free competition were permitted it does not seem unrealistic to suggest that the proper price for natural rubber in America is a shilling a pound.

You rightly stress the importance of stockpile purchases on the statistical position and on the rubber market, but it should not be forgotten that, without stockpile purchasing, manufacturers in America would prudently have to carry larger stocks than they do at present when the policy of the US Government is to turn over the stockpile by selling "spot" and buying "forward."—Yours faithfully,

K. M. G. ANDERSON

52-54, Gracchurch Street, London, E.C.3

[If, as the letter suggests in point (2), an American manufacturer can buy natural rubber at any price "he cares to offer" and if according to point (1) he knows that people would prefer tyres made wholly from natural rubber, why then is the consumption of synthetic rubber in the United States still well above the minimum quantity enforced by law? Secondly, the average cost of production of synthetic rubber given as 19.2 cents a lb includes the cost of butyl (special purpose) which is nearer 30 cents a lb. General purpose synthetic costs 18.1 cents a lb to produce, i.e., 10½d. a lb, and this will tend to set the upper limit to price of natural rubber even in a free market.—EDITOR.]

Ethiopia and Eritrea

SIR,—In an article on Ethiopia, published in your issue of August 26th, your correspondent begins by stating that the Assembly of the United Nations awarded the whole of Eritrea to Ethiopia. In fact, however, the resolution begins as follows:—

"That Eritrea, except for the western province, be incorporated into Ethiopia. . . ."

This is a fundamental difference; for it is the western part of Eritrea in which the majority of the Mahomedan popu-

lation lives, and the part awarded to Ethiopia would contain at least two-thirds majority in favour of union with Ethiopia. The vote on this resolution was not thirty-seven for, eleven against, with two abstentions, as your correspondent states; there were ten abstentions (*cide* the official verbatim report).

Your correspondent greatly exaggerates the financial difficulties of the Ethiopian Government, which are due to the growth of revenue not keeping pace with a growing expenditure, especially on education, whilst earnings of the state gold mines have fallen off, partly on account of a regulation by the International Monetary Fund. He rightly says that Eritrea is a financial liability to any owner; but on his own showing the charge on the British taxpayer has only averaged about £84,000 a year. He does not mention that Ethiopia is due to receive £6,250,000 as reparations from Italy over the next five years. This would help to cover the loss in Eritrea during the period that salaries of foreign advisers and administrators have still to be paid. After five years the country will be governed by Eritreans, with perhaps a few Ethiopians, and revenues will be developed by economic unity with Ethiopia, so that the new territory should cease to be a financial liability.—Yours faithfully,

H. STANLEY JEVONS

Abyssinia (Ethiopia) Association,

Industrial Sickness

SIR,—Your comment in your article "The Nation's Ill-Health" that morale is the determining factor in sickness absenteeism is, I know, fully confirmed by the experience of many good firms which have sick pay schemes for their workers similar, and often more generous, than that of the Royal Ordnance Factories. But your article fails to draw attention to the fact that a good sick pay scheme is an integral part of that morale and not just a rather tiresome adjunct of the Welfare State, which scrimshankers will abuse.

A sick pay scheme which guarantees to all employees if they fall sick the difference between their national insurance and their basic wages for a period of several weeks or months has the following advantages:

1. Employees are enabled to:

- do their work whole-heartedly without having to worry about what will happen to them if they fall ill;
- afford, when ill, the necessary medicines and comforts which will help them to get well quickly;
- stay away from work till fully fit.

The equal treatment of all employees, staff, office and works, helps to create a good team spirit.—Yours faithfully,

R. A. C. RADCLIFFE

A Doubtful Prognosis

"Can Parliament Survive?" By Christopher Hollis, M.P. Hollis and Carter. 148 pages. 9s.

MR CHRISTOPHER HOLLIS is a civilised man with a strong sense of history, an ingrained dislike of cant, a courageous imagination, a command of sinewy and pungent prose style, and a few bees in his bonnet. He views with the deepest pessimism the prospects of survival of Parliament as at present constituted—in his opinion an inept, rigidly regimented, desperately over-worked, and intellectually exhausted agglomeration of lobby-fodder, going through the motions of lawmaking under the scornful gaze of a public well aware that power now resides outside the parliamentary system. He takes an equally poor view of the Cabinet system, which, unless dominated by a single strong character, becomes merely a forum of departmental rivalries; and he attributes the plight of both in part to the tightening, over the last sixty years, of the machinery and discipline of party organisation, in part to the spread (inevitable as he sees it) of legislative control over virtually the whole of the economic field, in part to the ensuing ossification of Parliamentary procedure itself. Much of his book is accordingly concerned with tracing the evolution of the party system and the transition from the comparatively self-regulating, truly competitive economy, to the economy of the large, and of necessity imperfectly competitive, productive unit, requiring public control in one form or another. This latter process is irreversible, and poses two major problems; one technical and economic—how harmonise the claims and needs of the economic Leviathans of today?; one psychological and moral—how provide, in a system of enormous impersonal organisations, for that sense of solidarity, personal responsibility and pride of function which comes naturally to the normal member of a small working team? Socialism and its panacea, nationalisation, provide no solution at all; they merely give new names to the factors of the problems and leave the problems themselves in a mess rather worse than before; and there is no way back to a competitive era now seen to be essentially transitional.

Mr Hollis's solution for the whole complex of dilemmas—the sickness of Parliament, the disharmony of rival industries, the sense of frustration of the workers—is, in a word, corporatism. He would hive off the functions of economic control from those of government in general and vest them in a "House of Industry" whose relations with Parliament would be analogous to those of the Church Assembly. This House, with a membership elected on an occupational basis (directly, not by Trade Unions and employers' associations) would constitute the uppermost level of a whole system of industrial self-government, with smaller organisations from Works Councils upwards filling a role corresponding to that of the local authorities in the political system. Debating matters in which its membership was expert, dividing on lines of genuine opinion rather than irrelevant party or class affiliation, the House of Industry could effectively handle such major questions as relative wage levels in sheltered and unsheltered, or over- and under-manned, industries, or the allocation of capital and of raw materials and such minor problems as the day-to-day shortcomings of rationalised or other utilities; while Parliament itself, relieved of a burden which it is not fitted to carry, could get on with its proper job and regain the dignity and power which it has lost.

The idea is, of course, an attractive one. Quite apart from its appeal to Fascists, Nazis and Communists, it has been in one form or another supported by the Webbs, and Mr Winston Churchill, by Mr Amery and Mr Harold MacMillan—a sufficiently wide scatter of political opinion. But the case against it is formidable. To remove from the competence of the House of Commons—except for a right of veto which, if

exercised, would make for a frightful intestinal discord in the body of government—matters which most vitally affect economic life, is to make nonsense of parliamentary democracy. To elevate the present divisions between the sectors of industry to the dignity of constituency frontiers is to open up a truly disturbing prospect of politico-economic gerrymandering for the future. To encourage still further the producer, as against the consumer, interest is to sanctify sectionalism. The case against corporatism does not rest on its historical association with ethically detestable regimes, but on its own inherent weakness.

None the less, the present plight of Parliament is no subject for complacency. Keynes paid tribute in his General Theory to "the noble army of economic heretics" who insisted, against all the certainties of the orthodox, on the essential instability of the economic system. At the lowest reckoning, Mr Hollis's exposure of the sickness of Parliamentary democracy in its present form has earned a similar tribute from the future architect—if any—of its rehabilitation.

Art or Science?

"Public Opinion and Propaganda." By Leonard W. Doob. Cresset Press. 600 pages. 25s.

IF the lip-service paid to the importance of public opinion and propaganda is considered, it is astonishing how little academic attention these subjects have attracted. The gathering of data about them has been slow and the techniques of measurement and analysis have been surprisingly neglected—especially in this country. Little attempt has been made to formulate any general principles about the determination of public opinion or the efficacy of propaganda. For this the basic dilemma of social science is responsible. If social science is to confine itself to the discovery of verifiable and universal principles—like the physical sciences—it must, because of the diversity of humanity and the impossibility of rigidly controlled and repeatable experiments, limit its scope to an absurd degree. If it is to shed any extensive light on a vast and important area of human ignorance it must abandon the pretence of being scientific. The shadow of this dilemma lies heavily across Professor Doob's book.

Professor Doob systematically discusses the formation of public opinion, its measurement and its social importance and then turns to the nature of propaganda, its processes and the media through which it is disseminated. On the factual side he is at his best. He describes the techniques and examines the validity of public opinion polling with an objectivity which, on that subject, is all too rare. He explains clearly the problems of newspaper content-analysis. He has much that is of interest to say about the American press, radio and cinema. But, when he turns away from the practical side and from allusions to his own experience as a propagandist in the US Office of War Information, he becomes less convincing. He very fairly and modestly points out how tentative any general conclusions must be when drawn from data so dependent on the human element; indeed, when the reader has unravelled the exasperating jargon of the social psychologist, he will find all too often that the theories which Professor Doob offers reveal only "a blinding glimpse of the obvious." Few will set down this book with any greatly increased understanding of the general principles of propaganda or public opinion. Most of what Professor Doob writes is unobjectionable—and unenlightening.

This is the first comprehensive text-book on public opinion that has been published for ten years and as such it must be welcomed, especially for the bibliography and for those parts devoted to the actual techniques of measurement and analysis. But the 557 pages of text—which show clearly the impress of the American lecture-room, the padding and the weary campus

jokes—are, for the most part, prolix, innocuous and uninspiring. Professor Doob vigorously justifies the attempt to analyse public opinion and propaganda and he is certainly right in saying that it is a legitimate field for academic inquiry. But his endeavours show how difficult it is to arrive at general principles about so vast and diverse a subject; he displays a science as yet lacking any substantial structure of accepted theory, a science devoid of adequate systems of measurement or even an agreed terminology, a science attempting to cope with the infinite number of variables presented by human behaviour. Professor Doob has demonstrated the present limitations of his branch of social science more clearly perhaps than he intended.

The Secrets of Advertising

"Advertising Explained." By Dennis Caton. George Allen and Unwin, Limited. 112 pages. 7s. 6d.

It has been said that everybody knows how to do two jobs: his own and advertising. Mr Caton's little book attempts to explain to the beginner the elements of advertising practice, and is not concerned with propounding new theories of advertising or demolishing old ones. The section on the various advertising media—the press, posters, films, wireless, etc.—explains the advantages and disadvantages of each in such tactful terms that few will disagree with the descriptions. The technique of buying space in the press is dealt with in some detail and such curious terms as "a half double," "a semi-solus" and "ear spaces" should no longer perplex the beginner. The chapter on how a modern advertising agency operates should dispel many misconceptions that still linger in the minds not only of the public but also even of advertisers. The functions of an advertising agency have been growing for many years: the old-fashioned agency was little more than a space-buying office, whereas the elaborate modern agency provides so many services that it has become a closely integrated and irreplaceable part of its client's sales organisation. No part of its client's relations with the public falls

outside the agency's function; it will design his notepaper, arrange his displays at exhibitions, or introduce his product into a pantomime scene; and the so-called public relations department will provide the press with "news stories" about the client and his product in the hope that those stories may appear in the editorial columns of the paper. Mr Caton's chapter on "The Mechanics of Advertising" is an ingenious essay in compression of information. Within the compass of some thirty pages he manages to inform the beginner about the various printing processes used in modern advertising. Accompanying his descriptions are a number of useful diagrams and charts.

In some parts of the book, however, Mr Caton does not observe the golden rule when writing for beginners: always explain a technical term or piece of professional jargon on the first occasion that you use it. He is also guilty of rather loose use of words in a book where precision is essential. If these imperfections were eradicated the book could become an introduction to advertising that should be read both by advertisers and by those intending to enter the profession.

Shorter Notice

"Some Problems of Anthropological Research in Kenya Colony." By I. Schapera. International African Institute, Memorandum XXIII. Oxford University Press. 43 pages. 2s. 6d. net.

THIS is a report submitted to the Colonial Office Research Department by Professor Schapera after a visit to Kenya. The reviewer would have wished to know what it has cost; for reading it immediately suggests the questions: Was it really necessary? And what is the point of it? Over a third (17 pages) consists of a comprehensive, but indiscriminate bibliography on "first-hand sources of information on the ethnography of Kenya." The bulk of the 300 odd references are to publications which a good research assistant could have tracked down in the libraries of London. The fifty odd references to unpublished memoranda in Kenya government files must surely be a sop to the local administration. Nothing is said of their value, but many of them are obviously valueless.

AMERICAN SURVEY

Pattern in Steel

(From Our American Staff)

AFTER 17 days of listening to 750,000 words of testimony, the fact-finding commission appointed by the President has made public its recommendations for a settlement of labour's claims against the steel industry. It is a triumph for the board that they are only mildly disagreeable to both sides, though the initial enthusiasm of the companies has been somewhat tempered by second thoughts on the inflexible long-term costs involved in setting up pension and insurance schemes. The employers are relieved, however, that the board, which they at first suspected to be merely a device to force them to accept the union's wage claims, recommends no increase in wages.

The union, on the other hand, which has already announced that it accepts the board's findings as a basis for negotiation, is gratified by the recommendation that a social insurance programme should be put into effect immediately, and that by March, 1950, a plan of company-financed pensions should be drawn up for inclusion in the next contract. These two proposals would give the union, in the end, only about 10 cents of its 30 cents an hour demand, but they would open the social security door at which the unions have been hammering with growing determination.

Mr Murray, for the steel workers, has agreed to an 11-day extension of the strike truce. The negotiations may be stormy and the US Steel Corporation, objecting to bearing the whole cost of pension and insurance programmes, has refused to be bound by the report when the discussions are resumed. However, the industry as a whole is aware that any prolonged stoppage might put a painful crimp in the curve of economic recovery which has gladdened businessmen's hearts in the last six weeks.

The fact-finding board recommended insurance schemes costing (including any present outlays) about \$80 a year for each worker, and calculated that the recommended pension at the age of 65, which would provide each worker with \$100 a month when added to the Government pension, would cost the companies about \$120 a year. The first works out at 4 cents, the latter at 6 cents, an hour for each employee when the mills work full time.

The recommendations, and Mr Murray's willingness to forgo an immediate wage increase, are already having their effect outside the steel industry, and on the queue of unions which have been waiting to follow the leader. The Ford Company proposes to use the report as a basis for negotiation with the automobile workers, though Mr Reuther, whose control of his union is less complete than that of Mr Murray, may have more difficulty in persuading it to give up hopes of an immediate increase in wages. The rubber workers now on strike are expected to follow the steel pattern. The diversion of union energies from increasing the weekly pay-package to an expansion of social security raises a number of difficult questions, such as the extent of union participation in control of the schemes, which will have to be threshed out in the months ahead.

Even more important, in the long run, are the assumptions

on which the new agreements will be based. Lacking the insatiable consumer demand which in recent years has positively invited collusion between employers and workers, both parties arguing their case before the board appealed for justification to economic theory. There is no question that recent steel operations have been profitable, though the companies, emphasising the "prince or pauper" record of their industry, were reluctant to assume a continuing high level of operations.

The controversy is over the division of the profits. The union, emphasising the theory of under-consumption developed during the lean nineteen-thirties, argued that only high wages, coupled with adequate pensions and benefits for those unemployed, disabled, or retired, could assure a demand high enough to sustain full production. Therefore, it insisted, it would be to the employer's interest to use the lion's share of profits to increase wages, pensions, and insurance schemes.

The companies, on the other hand, urged that both the stockholder and the whole economy will suffer if the wage and security bill rises too far. When wages are fixed in long-term contracts, the larger they bulk in total costs the greater is the possibility that a decline in the volume of business may wipe out all profits. And it is to their own profits that the major companies have become accustomed to turn for the funds to replace and expand existing facilities, and to take advantage of the new techniques and equipment developed by research.

*

The board, in urging the union to withdraw its wage claim, pointed to the recent decline in the cost of living, and underlined the need, at the present time, for stabilising wages and prices. It thus rejected the union theory, characterised by one member as "an unorthodox version of Keynesian economics," that a wage increase would avert, or reverse, a recession. It also pointed out that present profits, while substantial when compared with those in 1939, must be deflated for the lower value of money, and noted that a large proportion of the industry's recent profits had been devoted to the modernisation and expansion programme which labour considers so urgent. The board concluded, however, that this very modernisation, given no drastic decline in demand, should both allow for lower prices for steel, and help to finance the insurance and pension schemes which it believes should be considered a part of normal business costs, similar to depreciation and insurance charges for machinery.

But if there is still some room to increase the worker's share in profits, many Americans, looking at Britain, feel there is a point beyond which such an increase is dangerous. It may revive the demand for protection against the competition of cheap foreign labour. It may impoverish the professional classes and those living on fixed incomes. A third consequence may be a long and persistent decline in the

THE BARCLAYS GROUP OF BANKS

value placed upon business enterprise when compared with reproduction or book value.

But profits, as a business incentive, are subject to a curious kind of moral discount even in the United States. Labour is as opposed as capital to government operation of the economy; yet the conviction that profits are the wages of sin is general and persistent. The industrialist, with one eye on the tax collector and the other on the union president, admits his profits somewhat shamefacedly when caught with the goods, but enters a prompt disclaimer to the effect that they will not occur again.

The trade unionists are not the only Americans who, wanting only security untroubled by risk for themselves, nevertheless demand periodically an increased share of the yields of the risk-takers. But today the labour unions have over 15 million organised members, compared with less than five when the steel workers, at the end of the first German war, struck unsuccessfully for the right to organise. Some 69 per cent of the wage earners in manufacturing work today under union agreements. The labour vote has been a major factor in keeping the Democrats in power for 20 years. Moreover, this support, given, or withheld, in the past, union by union, is becoming, and will become, even more effective and united if the Congress of Industrial Organisations succeeds in expelling its already lagging fellow-travellers this autumn.

This political climate, while unfriendly to government operation of the economy, is by no means hostile to government fact-finding boards or government intervention in the dispute over the division of profits and the proper basis of capital formation. It will not be surprising if Mr Truman, having found his way round the Taft-Hartley Act in steel, has recourse to the same device in other controversies, such as that in the automobile industry.

California's Century

HISTORY, as lavish as nature in the Golden West, has given California three centennials to celebrate in three successive years, an opportunity for prodigality which the State is now taking with its usual zest. In 1848, Mexico ceded California to the United States; in 1850 it was admitted to the Union as a full-blown State; during the year between, the Gold Rush, begun in 1848, became a stampede. This was the first and most romantic of the migrations which during the century have increased California's white population from

7,000 to nearly 11 million, so that now it is vying with Pennsylvania for the position of the second most populous State in the country. Nearly half of that 11 million came in the last migration of the century, the flood of job-hunters which began with the growth of war industry in 1940 and has been augmented since 1945 by the veterans who saw, and were conquered by, California on their way to the Pacific fronts.

After the covered wagons, the railroads brought the immigrants to the northern half of the State, where the gold had been found and where the abundant crops, grown in the fertile Central Valley, could be distributed to the world through the great natural harbour of San Francisco, which soon became also the centre of much of the nation's Far Eastern trade. But after the yellow gold came the black gold, the oil that was found at Bakersfield and Long Beach and at many other places, nearly all in the southern half of the State. And after the railroads came the automobiles and in them the tourists, to enjoy the fantastic beauties of a State bounded by half the Pacific coastline of the United States, from which it is so cut off by the mountains and desert that it seems almost like another country—a State which, in European terms, stretches from the North Sea to the Mediterranean, with all, and more, of the diversity of climate and scenery which this involves. To the young this breeding-ground of athletes offered unsurpassed opportunities for sport, while their grandparents could sit in the sun all the year round, with the certainty of a cool breeze at night.

Until the second world war, California's far from negligible industry was almost entirely concerned with processing the State's mineral and agricultural products, apart from the films and the aircraft which the sun had brought to Los Angeles. The State has specialised in the growing of luxury crops for the whole country and in this the arid south, thanks to the irrigation which is so much more easily controlled than rain, has rivalled the north. More than half of the 26 richest agricultural counties in the United States are in California and Los Angeles county, nearly as large as the whole state of Connecticut, is the richest of all. But today it is also the fifth most important manufacturing area in the United States—San Francisco is the tenth—and accounts for more than half the industrial production in California. During the war the city was industrialised almost overnight. It was not a question of converting existing facilities to war production, but of constructing new ones. The same was true of the State as a whole; it obtained over 1,000 new plants under government contracts during the war. Much of this expansion was in shipbuilding and aircraft manufacture, which had little importance once the war was over. But California also gained chemical and light metal facilities, nowadays almost as good a foundation for an industrial system as the coal and iron which the State lacks. Best of all, the war brought the steel industry which California had long desired and, last but far from least, a highly-skilled labour force.

Since the war, secondary industries, such as steel fabricating plants and plastic factories, have grown up round these

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

new basic industries. This explains at least in part why continued and even accelerated industrial expansion has confounded those who prophesied catastrophe once peace was restored. More important, during the war California's economy grew to a size and diversity which creates its own needs and generates its own industrial expansion. The State is now a self-supporting unit, an adequate local market for large-scale production. It now, for example, makes its own factory equipment instead of importing it from across the Rocky Mountains, and national corporations have found it worth while to open branch factories in California; Chevrolet is only one of the companies which now assemble its cars in Los Angeles as well as in Detroit. Some foot-loose corporations, Carnation Milk for one, have moved their national headquarters to Los Angeles, attracted amongst other things by the low heating costs and the outdoor storage which the Southern Californian climate makes possible.

Industrial expansion has spoiled the holiday-makers' paradise; the oceans are polluted, the whole coastline from Santa Barbara to San Diego is one long ribbon of development, the

Los Angeles sun is almost permanently obscured by a nauseous "smog," far more unpleasant than San Francisco's recurrent fogs; luckily the talkies drove the films indoors long ago. Natural gas is already being imported from Texas, but, so far, sufficient electric power has been available, except in time of drought. This lack of water, already becoming a serious problem, seems the only long-term check on continued industrial expansion and here attention is turning to what seems a typically Californian fantasy, the use of atomic heat to distil sea-water. But where the atom is concerned, fantasy has a habit of becoming fact.

This year's recession followed last winter's disastrous frosts and a localised depression in the film industry; for these and other reasons, it hit California harder than it hit other States. In the spring the percentage of unemployed was twice the national average; the seasonal demand for agricultural labour has reversed this trend, but not neces-

sarily permanently. Wartime dreams of postwar prosperity for California envisaged an ever-expanding market in China and the Far East, and one of the most remarkable things about the State's steady industrial growth since the war is that it has happened in spite of a virtually complete collapse of Far Eastern trade. The European Recovery Programme, notwithstanding the pressure of the State's dried fruit producers, has done little for California and now the need for exports is becoming pressing. It is not, therefore, surprising that Senator Knowland of California leads China's charity appeal in Congress. California's internationally-minded business men will certainly take an interest in any governmental plans for other underdeveloped areas.

But even if Californian capital and trade is forced to stay at home, there is no reason to suppose that the long-postponed economic collapse is just over the horizon. Industrial expansion continues in spite of the recession. San Francisco has, for the first time in years, real hope of prolonged labour peace on the waterfront. Housing, roads, utilities, service industries, have all still to catch up with the State's industrial and human expansion. There is an abundance of potential and necessary public works available in the State and a Governor, Mr Earl Warren, at Sacramento, who will not hesitate to put them in train if necessary. The Golden State is starting its second century with much of the gilt off its gingerbread, but even in California centenarians may be well advised to try a plainer diet.

American Notes

Peril Points

This year's battle over American tariff policy opened just as the Administration was assuring Sir Stafford Cripps and Mr Bevin that the United States would pursue policies appropriate to a great creditor nation, and would do everything in its power to make it possible for Britain to pay her dollar way in 1952. The vote on the extension of the 15-year-old Reciprocal Trade Agreements Act will inevitably be taken as the first test of the Administration's ability to persuade Congress to fulfil its promises.

A stop-gap extension, for a year, of the Act which expired in June might have been had for the asking. But the Administration wants the Act to run until June, 1951, and is determined to have none of the "peril point" provision which the Republicans exacted as their pound of flesh in 1948 when they were in control of Congress. The House passed the Administration measure seven months ago, but Senator Milliken, unable to comprehend why any safeguard for the American producer should be sacrificed while foreign nations are "strangling our farm exports" with quotas and bilateral treaties, has sponsored a new peril point amendment. It has the aggressive support of Senator Taft, and Senator Vandenberg is puzzled to understand why there should be any objections. The amendment requires that, before any concessions are made, the Tariff Commission set peril points beyond which reductions are likely to injure American producers. There are few concessions which cause pain to no one. If the President decides, nevertheless, to drive past these red lights, he must justify himself to Congress. Obviously only a heroic or foolhardy President would regularly challenge the Tariff Commission before a Congress which delegated the tariff-making power with some reluctance and sometimes hankers after the log-rolling of the good old days.

The place of the Act on Senator Lucas's "must list" is due not only to Britain's dollar gap, but also to the fact that without it the Ancey agreements cannot be ratified. But the rumour that at Ancey the American negotiators in some instances disregarded the peril points set last year has stiffened those

who suspect the State Department of making the American producer a mere "diplomatic pawn." The first suggestions of the hoped-for economic upturn have taken some of the chill from the atmosphere of the Senate debate, but even so the vote on peril points is expected to be close. The Republican ranks are almost united; and they have good hopes of support from Democrats representing oil- and coal-producing States which attribute their unemployment to foreign imports. The watch and fur industries are on their annual warpath against foreign monopolies. It will not be easy for the Administration to convince the Senate that, as the *New York Times* puts it, "the real peril point for the United States lies in stubborn allegiance to this outdated protectionist thinking."

* * *

Receding Recession

The pendulum of the recession, so long on the downswing, oscillated sharply upwards in August for the first time in many months. This encouraging movement displayed itself in two monthly reports, that of the Federal Reserve Board on industrial production and that of the Census Bureau on the labour force. The FRB's industrial index rose for the first time since October, 1948, and recovered all of the seven points it had lost in July, a loss which had been largely due to the "spreading practice of plant-wide vacations." Unemployment, after reaching the highest figure for seven years in July, went down by over 400,000 to 3,689,000, the first important decline this year. Non-farm employment reached 51,414,000, more than it had been since last December; the rise of 1,368,000 during the month was over three times that achieved during the comparable period last year and one of the largest monthly increases for a long time. Farm employment, however, declined by over 1,000,000, as was to be expected during the summer slack period, so that total employment rose by only 227,000. Over 2,000,000 persons were working part-time from necessity rather than choice, about double the number a year ago, but this figure had not changed appreciably since May.

Both new and continuing claims for unemployment compensation have been decreasing during the current month, and business loans by banks have been rising; while personal incomes are declining, they still seem to compare favourably with their level last year, and retail sales are said to have been surprisingly well maintained. The chief impetus behind the present upswing was restocking by manufacturers and retailers of their badly depleted inventories; this is partly a seasonal movement and partly due to the recent tendency of prices to rise. For the next six weeks or so, preparations for the Christmas trade should ensure a fairly high level of manufacturing activity in consumer goods. Whether the upturn continues beyond that time, and whether Christmas trade proves less disappointing this year than last, will probably depend on how soon retail prices come into line; so far they have fallen only 2 per cent, while wholesale prices have dropped 10 per cent. July, however, brought a decline of over a point in the cost-of-living index, which had hardly fallen since February.

The autumn upswing in trade does not habitually affect the durable goods industries, the automobiles, machinery and so on, and it is these which are likely to decide the direction of the pendulum once Christmas is over. Preparations for possible strikes, which if they materialise could halt the normal seasonal trend, explain much of the recent improvement in the demand for steel and the record output of cars and lorries in August, when the 1929 peak was exceeded. But sooner or later the automobile manufacturers, already drawing in advance on future sales, and producers of other heavy goods, will have to deal with the problem of the saturated market which most manufacturers have already faced. At this point the pendulum of recession is likely to swing down again, until the process of disinflation is completed, as Dr Nourse, the President's economic adviser, warns that it must still be.

Entering the 1950 Lists

On Labour Day President Truman mounted his campaign charger and prepared personally to lead his Democratic knights into the tilt-yard where the Congressional tournaments will be fought in 1950. His chivalry had already been purged of the traitors who turned openly against him in 1948: the Democratic National Committee has thrown into Dixiecrat darkness its five members who supported the States Rights' presidential candidate last November. But in the Democratic ranks there are still many who, when jousting in Congress, habitually desert to the Republican side and who thus turn the President's official majority into a practical minority. Mr Truman does not yet want to expel these dastards permanently, but he intends to see that in 1950 sufficient trustworthy Democrats are elected to give him a safe lead over any reactionary coalition.

Speaking at Pittsburgh and Des Moines, the citadels of labour and agriculture, Mr Truman made it clear that he is relying on the united votes of these two basic groups to award him the victor's crown in 1950 as they did in 1948. He made it clear too that he intends to follow the same bold tactics next year as he did last, to appeal straight to the people in down-to-earth speeches and to attack his opponents relentlessly. But last year those attacks could be concentrated on the Republican Eightieth Congress; now Congress is, nominally at least, on the Democratic side. Mr Truman therefore set himself to turn this liability into an asset by polishing the Congressional armour to Fair Deal brightness.

He pointed out that this armour, about which he has been far from enthusiastic in the past, is not as tarnished as has sometimes been suggested and that there will be another chance to burnish it during next year's session. Congress's record already includes not only such international measures as the Atlantic Pact and the Wheat Agreement, but a Housing Act and a Minimum Wage Bill; before Congress adjourns, stop-gap farm price legislation is to be passed as well as the Military Assistance Programme, on which debate is to begin in the Senate before the end of the month. Mr Truman did not, however, attempt to gloss over the stain of the failure to repeal the Taft-Hartley Labour Act.

*

The father of this Act, Senator Taft, also chose Labour Day to enter the lists for 1950, when he must again seek the favours of the voters of Ohio. He has begun a three-months' speaking campaign, which will take him into every county in the state and will keep him from all but the most urgent business in Washington. This early girding for battle draws attention to the national importance of this local tournament. The voters in Ohio are the trade unionists and the farmers who, if they can be won permanently to the Democratic side, will make the party invincible and the Republican champion is the able leader of the party's isolationist and conservative wing. If he is defeated next year that wing may be broken for ever; if he wins, he is likely to be the party's standard bearer in the Presidential tourney of 1952. General Eisenhower, speaking to the American Bar Association, also on Labour Day, led many to believe that he would not be unwilling to consider taking up the Republican lance that year, should the party prefer to be led down the middle of the road. Mr Truman is also beginning to show signs of readiness to let the Democrats fight under his banner again in 1952.

* * *

Seducing the Veterans

The Grand Army of the Republic, the Union survivors of the Civil War, now dwindled to a mere sixteen, all over 100, has held its last encampment; its members are too old to attend any more meetings. It was the first veterans' pressure group. Today, the 19 million living veterans of the last two wars have four organisations to choose from, though only

5,000,000 have joined up. But their political importance is attested by President Truman's recent flight which enabled him to speak at three of their conventions. The Legion has over 3,000,000 members, the Veterans of Foreign Wars 1,500,000. The two which accept only men who fought in the last war are relatively small, but proud; they have always looked down their noses at the older groups, as dominated by the disillusioned and reactionary veterans of 1918, and condemned them as seeking to advance only the selfish interests of their members. The American Veterans of World War II has 140,000 members, the American Veterans Committee a mere 40,000, but efforts to bring about a merger have failed, partly because of the latter's left-wing reputation.

With time, however, the younger men have come to the top in the older organisations; this year both the Legion and the VFW are headed by veterans of Hitler's war. The Legion's vote this year against liberalising the law admitting displaced persons has, however, sorely disappointed those who had counted on youth to bring about a speedy reversal of policy. The distinction between old and new has been further blurred by a decision, taken at the Amvets convention, which three former commanders deplore as destroying much of the reason for its separate existence. This was to demand a bonus for every man who wore uniform for 60 days or more in the last war. The value of a day's service in the United States is put at \$3; abroad, at \$4, with a maximum of \$4,500.

When Mr Rankin proposed, and the House passed, a Bill for a general service pension for all veterans at the age of 65, Amvets and the AVC opposed it as an indefensible raid on the Treasury. Its appeal was plainly to the veterans of the first world war, whose average age is 56. It had been hoped that the GI Bill, passed in 1944, would silence the demand for bonuses and pensions by providing the young veteran with free education, assistance in on-the-job training in farms and industry, and unemployment benefits of \$20 a week for a

maximum of 52 weeks. About a third of the eligible veterans have taken advantage of the educational and training schemes, which are still in force; over half have drawn some unemployment benefit. But the latter has come to an end just as the need has begun to mount. Mr Rankin dealt it a death blow, terming it "rocking-chair money" and proposed, in its place, the bonus scheme which has seduced Amvets from its original ideals.

Shorter Notes

Each man, woman and child in the United States paid on an average \$372 last year in Federal, State and local taxes, according to the Commerce Department. \$40.5 billion of the year's record tax total of \$54.5 billion was taken by the Federal tax collector, but this is less than in the peak year of 1945. The rise in the total amount is due to increases in State and local collections.

*

Nearly half, 46 per cent, of the total capital assets of American manufacturing corporations were in 1947 controlled by 113 firms; each of them had assets of over \$100 million, amounting to over \$16 billion worth of property, plant and equipment, according to a report by the Federal Trade Commission.

*

Terrified by the genii it may conjure out of the bottle of its weather-making experiments near Schenectady, New York, the General Electric Corporation, with the support of the anxious Navy on whose behalf the research is being conducted, has appealed to Congress for protection against claims for damage caused by hail or tornadoes produced as a result of its efforts. But Congress has little time this session and Senator Kilgore at least is afraid that the company may learn how to control the weather and then proceed to patent the process.

THE WORLD OVERSEAS

Wages and Prices in France

(From Our Paris Correspondent)

AUTUMN, the traditional campaigning season of the trade unions, is at hand and the French press is full of the problems of wages and prices which face the Government. The Government itself is without its Minister of Finance, M. Maurice Petsche who is keeping an eye on the tripartite talks in Washington; the National Assembly is in recess until mid-October. M. Queuille, who celebrated (quietly) the first Prime Ministerial anniversary of the Fourth Republic last Saturday, has therefore some weeks of preliminary probing in front of him.

The labour front was last in motion at the end of July when the unions pressed for a holiday bonus of £5 per worker and M. Daniel Mayer, Minister of Labour, gravely embarrassed the Government by himself conceding the principle. Now that the *congés payés* are over, this claim is being reiterated in the form of a demand for a return-from-holiday bonus supported by the three big unions (CGT, the Christians and *Force Ouvrière*) which has occasioned several token strikes. During the last few weeks, moreover, there has been an appreciable rise (perhaps 3 per cent) in the cost of living, which is partly attributable to the exceptional drought. This disappointing increase is a contrast to the considerable fall in the price of foodstuffs between January and June of this year, which was from 1,740 to 1,548 or about 11 per cent on a base of 100 in 1938. (On the other hand, there is no

reason to believe that the substantial general drop in prices, estimated on the retail index, from 1,940 to 1,720 between January and June is seriously threatened by the recent rise to 1,750 in August.) The Government has, however, now decided to increase the price of milk to more than the usual winter price and to withdraw the subsidy on butter, which will, therefore, also become dearer. Nor are household goods and clothing exactly cheap. Nor is the housing programme—admittedly a less vital element in French working-class psychology—advancing very fast. There are more new houses built in Great Britain every month than in a whole year in France.

If this picture is nothing like as black as the outlook in the autumns of 1947 and 1948, it nevertheless suggests that France's working population is far from attaining prosperity. M. Pierre Drouin in a remarkable series of articles entitled "*Où sont les damnés de la terre?*" which has appeared in *Le Monde* has drawn attention to some less well-known facts of the postwar situation. In spite of the many statutory improvements since the liberation (minimum wage-rates, social security, equal pay for men and women, special remuneration for dirty jobs, the new regime for miners and dockers), the standard of living is still definitely and sometimes desperately low. There are many workers in obscurer trades whose wages are little above the vital minimum. Every-

one hears of the miners and dockers and metallurgical workers, nearly all of whom through bonuses and facilities manage to get wages above the statutory minimum for their grade. Less is heard about the cutlers, the chairmenders, the people who make cardboard boxes and fishing nets. France has many of these artisans and workers in small enterprises who are often faced with the alternatives of minimal wages or unemployment. Nor are these elements much helped by union action. M. Drouin remarks: "The strongest claims come generally from the least poverty-stricken." France's industrial population proper amounts to about 7,000,000. Unemployment, although increasing slightly, stands no higher than some 40,000, of which figure two-thirds is represented by Paris and one or two big towns. (In 1938 about 300,000 were receiving unemployment relief.) On the other hand, about 300,000 workers are now under employed; that is, paid for less than 40 hours a week, and a large proportion of these can find work only for 32 hours a week. Nevertheless, France has something like full employment. But the threat of unemployment exists, and the real wages of many do not provide a reasonable purchasing power. Moreover, beyond these concrete elements there is the psychological factor of social jealousy. The French working-class feels that it has not had its just share in the gains in prosperity made during the last year. It is tantalised by the sight of a renascent bourgeoisie which, it must be said, is—even after all France's vicissitudes—singularly lacking in the social graces.

Rival Claims of Right and Left

In face of this moderate discontent the "neutral" Government will try to steer its habitual middle course. While it is certain to reject out of hand the CGT's claim for a 40-hour week at 48-hour wage rates, and is unlikely to accept a return to collective bargaining (at present the Ministry of Labour itself operates a national wages policy), it is doubtful whether the coalition parties will readily find agreement on how to walk the economic tightrope this autumn.

On the side of the producers, there is a serious discrepancy between agricultural and industrial prices. The maintenance of agricultural prices is, in the "Peasants' Republic," essential for the success of M. Pflimlin's plan for the development of agriculture, which his department is carrying through in liaison with the American officials of ECA. But to raise the price of foodstuffs adds to the intractability of labour. Moreover, the current conversations in Washington will also influence French policy. For, if the franc were devalued, a further deterioration in purchasing power within France would result at least temporarily.

The evidence indicates that the attitude of the employers will be stiffer than at any time since the war. The philosophy of the *patronat* appears to be that the national power of the CGT was irreparably broken by the failure of the miners' strike last November; that the members of the other unions, should the Communists attempt to call a general strike this year, will decline to follow a political lead; that the same heads in the movement will realise that, in a relatively depressed economy such as France's, an unsuccessful strike cannot but react unfavourably on the prosperity of the workers. The Government will, therefore, be under pressure from its Moderate and Right elements to hold firmly to its wages policy.

At present Communist propaganda is plugging international issues, notably the campaign for "peace" against the Atlantic Pact and Tito's treachery to the working-class. But there is little doubt that should local opportunity present itself, and if the Kremlin sees fit, the French Communist Party, which has certainly retained its strongholds in the industrial population, will again take the offensive. The pity of it is that, during their seasons of hibernation, there is no imaginative person or group capable of wresting the initiative from them. Meanwhile, year in, year out, French social disunity continues to the righteous indignation of foreigners and to the experienced indifference of the inhabitants.

In Memory of Jinnah

[BY A CORRESPONDENT]

IN a recent poll the Germans voted Bismarck the greatest man of all time. On any standards they were wrong, for even in the same genre Qaid-e-Azam Mohamed Ali Jinnah stands higher. It took Bismarck the same seven years, from the Schleswig-Holstein war to the treaty of Frankfurt, to create the German Empire as it took Jinnah from the Lahore Resolution of 1940 to Independence Day, to make Pakistan. But Bismarck started with all the advantages: a hundred-year old nationalism, the Prussian Army and Civil Service, the Ruhr, 15 years of experience of high office and youth enough still to have 20 years as Chancellor before him in 1870. Jinnah began with nothing but his own ability and the disgruntlement of a religious minority in which he was only an unobservant member of the most heretic sect, at an age so great that he only survived his creation by one year and without any experience of public office until he nominated himself Governor-General.

Jinnah had not begun his career as a member of the Muslim League; instead he had been contented to follow the wheel of Congress and his reputation was made in defending Tilak, first of the great Congress Extremists. So far from his mind was then the idea of Pakistan that, when a friend of the late Mrs Naidu prophesied in his horoscope that he would be a great leader of men, greater than any leader of history, he joined Mrs Naidu in merriment over what seemed a good joke. And so at the end of the twenties, having earned a great deal of money at the Indian Bar and seeing no future scope for himself as a Congress leader, Jinnah sailed for England, settled in a Hampstead house and practised at the Privy Council Bar. Then one day some charitable "friend" repeated to him that Nehru, whom he despised and hated, had imprudently said at a private dinner party that "Jinnah was finished." Outraged, Mr Jinnah packed up and sailed back to India at once just to "show Nehru."

Back in India he became affiliated to a withering organisation called the Muslim League. The Muslims, as a minority community with a traditional respect for existing authority, had been inclined, since the Mutiny, to be supporters of the Government. Stirred into opposition only once, in the early twenties, by the non-Indian issue of the Caliphate, they had relapsed immediately into the position of suppliants for more jobs, more reservations and a larger share of power. Their leaders were correspondingly the pillars of the *status quo*, the big Bombay merchants like Sir Suleman Cassum Mitha, the big UP or Punjab landowners like Sir Sikander Hyat Khan or the Rajah of Mahmudabad. These men had too much at stake. The landowners among them were too ignorant and too corrupt to provide leadership for a revolution.

Revolution in Need of a Name

Yet it was a revolution that was needed. The Muslim was in speech, dress, habit and interests deeply different from the Hindu, so that Jinnah had only to provide him with the name for him to talk of his separate nationhood. The thought of a single democratic state in which the Hindu would necessarily have a majority of three to one was anathema to him. So Muslim thought floundered, until Jinnah cut the Gordian knot by demanding a separate state where the Muslims would be in a majority and the whole tone of life Islamic. The idea was accepted at once by the League leaders, whose minds could see only the bargaining weapon it gave them against Congress in their fight for more seats and more privileges.

Jinnah alone had understood the Muslim subconscious, the aggressive sense of superiority to the Hindu ("One Muslim equals ten Hindus"), combined with a growing feeling that Hindu cleverness—which the Muslim called cunning—had made them better adjusted to the modern world, better businessmen, lawyers and, above all, politicians. For both feelings Jinnah offered a psychiatrist's cure. The theory of a separate nation freed the Muslim from the necessity to identify

himself with the Hindu he despised, and it gave him somewhere where his majority would enable him to see that he held the contracts and the posts.

Campaign Against Congress

The more the Muslims accepted the idea of Pakistan, the more indispensable Jinnah became to them. Only Jinnah could conduct a long distance campaign, only Jinnah could be trusted to outsmart both the Congress and the British, for he alone had learnt from Congress the technique of using concessions not as a basis for permanent compromise, but as a stepping stone towards the attainment of a fixed and unwavering goal. As an old Congress hand he knew exactly how to make them repeat all the mistake into which they had previously forced the British. In a country where almost all the great lawyers were Hindus, he alone among Muslims had made a steady £20,000 a year at the Bombay Bar; in a community whose leaders could always be bought or distracted, he alone was incorruptible. Even Gandhi's offer to make him Prime Minister of a United India did not move him.

Jinnah's blitz campaign was conducted with great cleverness, and, unlike Congress, he made no mistakes. All means were good for his end. Like Bismarck in the Ems Telegram, he used the paper *Dawn* to let slip in 1946—when he saw that Congress would accept the Cabinet Mission scheme, thus depriving him of Pakistan in name if not in effect—that Congress was not prepared to nominate a Congress Muslim among their quota of the Cabinet. This made it impossible for Congress, not to insist on their right to nominate whom they liked, and thus the danger was averted.

Master of Tactics

Jinnah, who had been in his youth a sham actor, had an imperturbable self-control and could be cool or rabid at will, always a closed book to his interlocutor. Tall, ascetic, his aquiline nose emphasised by his small bony face, white hair and piercing eyes, he looked like a fanatic burnt up by his passion. Yet never did this perfect poker player overbid his hand; he always waited for his opponents to make a mistake, and then he would coolly raise demands one up on the last bid. Pakistan was eventually a historical necessity, but first it was a feat of autosuggestion turned into mass hypnotism. Jinnah's faith in Pakistan was so great that he was enabled to perform such miracles as getting an overwhelming percentage of the Muslim vote even in what is now India; though the Muslims should have known in the minority provinces that the creation of Pakistan would turn them from a pampered and powerful minority into a tolerated and distrusted one. So great was Jinnah's hold that he made no pretence, but told those who protested, quite frankly, that their lives were a small price to pay for a land where Muslims would be free.

Jinnah was often accused, and rightly, of rudeness; he would hang up the telephone on India's modern sacred cow—the journalist—or call Gandhi "Hindu poison." He was accused, equally rightly, of inaccessibility and superiority; he went on tour only on the most important occasions, as when there was trouble in the Frontier and over the accession of Kalat. Usually he was content to let the mountains come to Mahomet. He would talk in English to a background audience in which perhaps only three could understand him, for he knew little Urdu or Arabic, and did not even bother to learn. He was again and again accused of being irreligious; for did he not eat pork, drink whisky and wear Western clothes? Had not his wife been a Parsee, and was he not ignorant of the commandments of his own religion? Once, when he went with Sir Tej Bahadur Sapru to visit the Pyramids, the guide took Sapru for the Muslim, for he could repeat the first verses of the Koran while Jinnah could not. And yet he was indispensable; for what the Muslims needed was neither a good man nor a good Muslim, but a good politician, and they had no one of Jinnah's political incorruptibility and political genius.

The Hold of a Prophet

Jinnah was no dictator, but deeply constitutional. He was once asked whether the editor of *Dawn* took his orders from him, and he answered: "No, Altaf just thinks as I do," and it was true. Once Jinnah's clarity had spoken everyone in the League was convinced. His hold was that of a prophet, for he had no sanctions to apply: the League had not won enough seats in the 1937 elections for him to have offices to offer, and the police were in his opponents' hands. Yet men who had sold their souls for knighthoods gave them up without question at his behest, and he never had to face a break-away like that of Subhas Chandra Bose from the Congress. So constitutional indeed was Jinnah that, as Governor-General of Pakistan, he refused to meet the Duke of Gloucester at the airport; for in Karachi he was the King, the Duke only the King's brother; and his officials would complain that he was more interested in the constitution than in the administration of Pakistan.

Jinnah was also a man of inflexible courage. He cut off his only child, when by marrying a Christian she threatened the Islamic ideal; yet in his last days, with Pakistan achieved, there was nothing he liked better than to hear of his grandchildren. He defied even the Pathans, Pakistan's *enfants terribles*. When asked to tea by the Pir of Manki Sharif, who had done more than any man to bring in the Frontier, he refused to go unless his sister went too—in a land where women are never seen. It was the Pir who gave way.

Today his tomb is the centre of Pakistan; it still offers only a headstone and a corporal's guard for visitors to see, but it is a place of pilgrimage second only to Mecca. It is there as much as in Parliament that the major pronouncements of state policy are made. To Cleopatra's nose as a factor in history one should perhaps add Jinnah's pride.

Another Round in Egypt

[FROM OUR CAIRO CORRESPONDENT]

THE fundamental pattern of Egyptian politics has not altered in the last 25 years. Changing international conditions have had their repercussions on the internal situation. But the basic political struggle remains—that between the Wafd and the Palace. Another round is beginning, but nowadays there is no third party to hold the coats. What are the prospects?

For the last five years King Farouk, having dismissed the Wafdist Government formed so dramatically in February, 1942, has ruled Egypt through a series of governments composed mainly of members of the Saadist and Liberal Constitutional Parties, but in reality gradually becoming entirely subservient to the royal wishes. They were backed by a Chamber of Deputies resulting from general elections held in January, 1945, which were boycotted by the Wafd. Impelled more by realisation of the growth of Communism than by the necessity to have a "neutral" Cabinet to supervise the forthcoming elections, the King somewhat summarily dismissed Abdel Hadi Pasha's Cabinet at the end of July and summoned Hussein Sirry Pasha, an independent in character as well as politics, to form a coalition government. Presumably he felt that the only way to check the general increase of discontent which was driving frustrated young men into the arms of the Communists was to encourage a spirit of national unity and urgency and, at the same time, to associate the disgruntled Wafdist, embittered by five years in the political wilderness, with the Government.

Revival of the Wafd

It is no secret that the King intended that a coalition government should continue in office after the elections, which, by various means—allocation of some seats, redistribution of constituencies, a little pressure here, a little "arranging" there—would result in the return of the main parties in the proportion

they hold in the present Cabinet. But things are not working out quite as expected. When Nahas Pasha allowed four members of his party to take office he was half-way to power, for the result of Wafdist participation in the Government has been immediate and overwhelming. From all over the country come reports of an immense Wafdist revival, and it is now fully possible that free elections would confirm the Wafdist contention that they have at least 80 per cent of the country behind them. This is not really surprising to anyone who knows Egypt. Its leader, Nahas Pasha, still commands a big personal following, and he has some lieutenants of ability. Further, the Wafd is the only political party with anything like an effective party organisation.

There is the further development that Nahas Pasha, whose personal plans are still somewhat misty, has played his cards well. He has himself remained discreetly in the background and left the nominal leadership of his party to his first lieutenant, Fuad Sirrag el Din Pasha, who is far more acceptable to the Palace than Nahas. And in a squabbling and antagonistic Cabinet it is the Wafdist members who are all sweet reasonableness and staunch supporters of Sirry Pasha and the King. The trouble comes from the out-manoeuvred and poorly organised Saadists and Liberals, whose threats of resignation become louder and longer and must surely before long become operative. They find themselves on the horns of a dilemma. The volume of popular support for the Wafd now suggests that in free elections they would be submerged; on the other hand, it would be difficult—martial law or no martial law—not to have free elections.

The King and a United Front

Sirry Pasha's public-spirited acceptance of the leadership of so ill-assorted and unmanageable a team is highly commendable. Should he fail to hold them together and have to resign it seems likely that the King will call upon another independent leader—Hafez Afifi Pasha's name is most frequently mentioned—to form a genuinely neutral caretaker Cabinet to supervise the elections. The alternative, of selecting another government from the present Saadist-Liberal Chamber, could only defeat the reasons that inspired the recent change.

A point to be considered is the King's ultimate objective. Is he prepared to accept a Wafdist administration or does he still hold to his desire for an all-party coalition? So far as Wafdist prospects are concerned, the answer might depend upon Nahas Pasha's willingness to be "pushed upstairs" to the only available position—President of the Chamber—and to leave the premiership to Sirrag el Din or another Wafdist leader. Could Nahas Pasha do this while retaining the leadership of the party and the power? Were he to do so, he would show qualities of statesmanship and renunciation not commonly associated with him. Yet he is an elderly man and a sick one; if it were a choice between a Wafd government without Nahas at its head or no Wafd government, he might conceivably abdicate, provided he could continue to hold, as he at present holds, the party purse strings.

New Negotiations with Britain?

The basic reason for the King's insistence upon a coalition government is thought to be his desire to re-open Anglo-Egyptian negotiations and settle once and for all the outstanding questions between the two countries. It is obvious that after past experiences the British Government would be reluctant to negotiate with anything but a fully representative Egyptian government. Responsible Egyptians now take this to mean either a United Front such as negotiated the 1936 Treaty, or the Wafd, but not a Saadist-Liberal combination totally lacking in public support. It is probably realised in Palace circles that Egypt cannot hope to obtain all its demands—sovereignty over the Sudan and the complete evacuation of British troops from their base in the Canal Zone. There is

some grasp of the need for compromise and even a little covert appreciation of why British defence chiefs remain adamant regarding the imperative need of a base in Egypt. But such plans will not be widely acceptable to an Egypt fed, for the past few years, on promises that all its "national aspirations" will be achieved. Therefore if, for the sake of general security, internal as well as external, the Palace is prepared to accept a compromise, it will need a government of strength, sufficient to persuade the man-in-the-street to accept less than he has been led to expect. Here again all points to a united front, with a Wafdist Cabinet as the only possible alternative.

The virtue of a united front, which would obviously be the ideal choice for the purpose of negotiations, would be nullified by its unworkableness once the negotiations were over, when, internally at least, the country would face the same problem as it does now. The only reassuring feature of the moment is that both the Wafd and the King have recently displayed such a striking advance in statesmanship that the outlook is brighter than at any time since the end of the war.

Austerity in Norway

[FROM OUR OSLO CORRESPONDENT]

WHEN Norway came out of the war it had lost 5,800 million kroner of its national capital. The merchant navy had been reduced by more than half, and only a few new ships had been built during the war. Finnmark and northern Troms, with a population of some 65,000 people, had been completely devastated and all over Norway towns had suffered from bombing and other war damage. The railways were worn out, the machinery in the factories suffered from wear and tear, the fishing fleet was seriously depleted, and Norway's trade with its overseas markets had been almost entirely cut off for more than five years. Furthermore the recruits in industry and various crafts had learnt, not to work, but to go slow—a lesson they had learnt in order to deny to a hated occupying Power the benefits of their production. In addition, the schooling of the new generation had suffered heavily. Thus Norway had to face several serious problems when it started to work on its own again. The German account with the Bank of Norway stood at kr. 8,107 million—money printed and used by the Germans and still partly in circulation. Germany was out of the picture as a producer and as a consumer. Finally, London was for the time being no longer in its traditional position as Norway's able clearing house and Bank of Europe, where all kinds of foreign currency could be changed to serve Norwegian demands.

A foreign currency reform was carried through, but it was very mild and its effect was hardly visible. To avoid strikes and unrest the government decided to stabilise prices and wages. All basic foods are subsidised and, as prices have gone up on the international markets, Kr. 600,700 million have had to be paid annually. The government also planned to rebuild the country in five years and to create a new economic balance. Such optimism showed itself in the import figures for 1946 and 1947. But in the meantime prices on the international markets had developed very much to Norway's disadvantage. Something had to be done. The control of imports, exports and wages already existed, but it was a shock to most leading politicians when they finally discovered (in 1947) that Norway's resources of foreign currency were rapidly coming to an end, and that, through the shortage of raw materials, they might in a short while face unemployment. Marshall aid saved the situation. But it became very clear that for a long time it would be necessary to keep Norway's consumption down and to invest as much as possible, if a balance was to be attained in 1952-53. The aim is to give Norway's population—which has increased by 13 per cent since 1938—the same standard of living in 1953 as it had in 1938.

Ambitious Investment Programmes

If this is to be achieved, Norway must produce and sell Kr. 1,000 millions' worth of goods more than in 1938. The expansion must be brought about by the quick rebuilding of the merchant navy, the expansion of the electro-chemical and electro-metallurgical industries, the rebuilding of the fishing fleet and the expansion of the fishing industries, especially the herring-oil industry. As part of the industrial expansion new water power plants have to be built. The present increase in hydro-electric capacity is about 150,000 kwh a year.

All this requires money. The net investments from May, 1945, to January 1, 1949, were a little over Kr. 5,000 million, of which amount Kr. 2,000 million were reserves of foreign currency, Kr. 1,000 million loans, Kr. 200,000 help from ERP not paid for, and Kr. 2,000 million capital accumulated from Norwegian production.

For the next four years a gross investment of Kr. 16,800 million is planned as follows:

	Million Kroner
Agriculture	1,200
Forestry	108
Fisheries	585
Whaling	240
Industry and handicraft	3,000
Electricity supplies	684
Shipping	3,700
Other transport	2,689
Stores	500
New houses	2,250
Various	1,860
TOTAL	16,816

The corresponding net investment is about Kr. 9,000 million, or over Kr. 2,250 million a year. In 1948 the net investment was a little more than Kr. 1,500 million. It is estimated that half of this Kr. 9,000 million can be obtained from savings during the next four years.

Lower Efficiency of Labour

The obvious corollary of this investment programme is the restriction of private consumption. On the other hand, to increase the efficiency of labour and attract savings some increase in the supply of consumer goods is desirable. It has been said that the investment programme is too big and in the last few months there have been signs that the government intends to reduce it. But the part of it which concerns the expansion of export industries will certainly not be reduced.

As for the more immediate future, the national budget for 1949 plans to use the National Product as follows:

	Million Kroner
Net national production	9,872
Imported goods and services	4,988
Goods and services at disposal	14,860
Export of goods and services	3,955
Official net investments (civilian 417; military 95)	512
Official consumption (civilian 1,123; military 360)	1,383
Private net investments	1,519
Private consumption	7,491
TOTAL	14,860

The above mentioned quantities of food and so forth are bigger than in 1948 and 1947 but still represent a much lower proportionate increase than that of wages for workers in industry and handicrafts. The average pay for a male worker here is 3.13 kroner per hour which means that, allowing for the increased cost of living and increased taxes, he has 18 per cent more than his prewar pay. Female workers have 26 per cent more. Moreover, three weeks' summer holiday with pay has been introduced since the war. Another factor which has also to be considered is that the efficiency of labour is lower than in 1939. It was about 80 per cent at

the end of 1945 and since then has improved to about 85 per cent; but, according to scientific research, it has become stabilised at that low level. That means that today it takes 335,000 workers to do the job done by 275,000 in 1939. The reasons are to be found in worn out machinery and unsteady supplies of raw material, but still more in the fact that since food is subsidised the workers need not work so hard to get the necessities of life. Moreover, taxation which takes more and more of their pay also acts as a deterrent. The present taxation system in fact has not changed since before the war—and at the present level of prices and wages it takes a very high percentage of the few thousand kroner a man can make by overtime work.

A brighter side to the picture, however, is the fact that a study of imports, exports and production during the first five months of 1949 shows a development which corresponds very well with that planned in the National Budget for 1949. Production in agriculture, forestry, whaling and industry is higher than estimated. Fisheries are a little less, shipping likewise, whereas building and construction are higher than estimated. Seen as a whole the increase in production is higher than estimated, and improvements have been made exactly where they were most vitally necessary. But whether it will be possible for Norway to attain economic balance in 1952-53 will still for a long time be an open question. Some experts believe it is necessary to alter the taxation system to stimulate production, to stop subsidising food in the present way and to increase the differences in the remuneration of skilled and unskilled labour. Private interest must be used for the benefit of society, not regarded as its enemy. But a Socialist government is unlikely to make these changes.

Re-settlement in South America

[FROM OUR RIO DE JANEIRO CORRESPONDENT]

In providing re-settlement areas for European displaced persons South America has proved less responsive than was at first hoped at Geneva. Among the reasons for this are administrative problems arising partly from lack of funds; political opposition, which has been aggravated by nationalistic sentiment and Communist propaganda; and—the weightiest problem of all—living conditions whose scant appeal to immigrants has sometimes meant their rejection by the field officers of the International Refugee Organisation (IRO).

Despite these setbacks, as IRO enters on its final year the interest of some South American governments in its task has quickened. In round numbers South America has absorbed some 70,000 DPs since IRO's work began, and if programmes now under consideration are carried through this figure may be doubled before IRO ceases to operate next June.

The broad picture is that Argentina, although a late starter, has already received 28,000 DPs—many more than any other South American country—and now plans to take 25,000 more. In Brazil, which has re-settled 19,000, the further outlook has been clouded by the inability of several government departments to pull together in handling immigration schemes, but Congress has ratified Brazil's membership of IRO, and behind the administrative smokescreen some State Governments are working hard to find a way of encouraging a flow of DPs into their undeveloped regions. Emigration to Venezuela, which already has some 17,000 DPs, was interrupted by a change of government, but has been reopened by a Venezuelan selection team which went to Europe last month. Paraguay recently offered to re-settle 20,000 Europeans, and has already selected 270 of the 600 stateless persons from Shanghai to whom it has offered a home. Chile, which has received only 1,500 of the 10,000 DPs for whom it was planning, also reopened immigration last month. Uruguay

has asked for a small group of specialists, and in Colombia, where immigration has so far been negligible, an IRO agent has been appointed at the Government's request. Peru, where 2,000 DPs have settled, and Bolivia, which has taken several hundred, have announced no definite proposals for the future.

Pioneers for the Land

The success of these programmes will no doubt vary from country to country. Virtually everywhere, however, primitive living conditions are a fundamental problem, and not only for re-settlement workers. Even in the most advanced republics rural living standards are far below those in the big cities, and the general policy of South American governments has been to rely on immigrants to open up frontiers and to make good the steady drain of agricultural labour to the towns. It is estimated, for instance, that in the sixties of last century only a sixth of Argentina's immigrant flood settled on the land. In the nineteen-thirties the door was closed to mass immigration. It seems unlikely to be reopened, and it is easy to understand why, in the restricted and selective schemes which took the place of mass immigration, agricultural labour has had high priority.

The reasons are even clearer today, when industry is vigorously competing with agriculture for both capital and labour. Farm production is notoriously lagging behind the needs of growing urban communities; in Brazil it is said to be actually declining. Staple exports are also suffering from this agrarian anaemia in countries that till only a small fraction of their arable land and—except for Argentina and Uruguay—are badly fed even by present European standards. Demonstrably, their industrial ambitions call for the expansion of trade staples in order to pay for imports of capital equipment, and it is significant that in Brazil and Argentina, the two most industrially-minded countries in South America, labour has been officially exhorted to go back to the land.

Lagging Food Production

These trends are illustrated in a report presented at the recent Havana meeting of the UN Economic Council for Latin America (ECLA), and in statistics of the Food and Agriculture Organisation (FAO). Although Latin America's total population increased by 23 per cent during the decade 1937-47, says the Havana report, food output rose by only 20 per cent and total exports by 16 per cent. FAO statistics show that while the average Argentine enjoyed 3,162 calories a day in 1947, Brazilians lived on only 2,299, and Peruvians on 1,891; only the Argentine figure had risen appreciably since 1937. According to the same source, Latin America's total production of three principal staple foods showed the following barely perceptible growth:

	(in tons) average 1934-38	1947
Wheat	8,616,000	9,212,000
Maize	17,636,000	17,600,000
Meat	5,515,000	6,158,000

(Of the 1947 figures, Argentina accounted for two-thirds of the wheat, over a third of the maize and almost half the meat.)

It seems improbable that any other South American country will ever rival Argentina as a food producer. Resources differ, and the problems of exploiting them are distinct. But more tolerable living standards are a common goal, and until more indigenous food is available little progress seems likely for the overwhelming majority of Latin America's 150 million people who still earn a living from the land. In Argentina itself, political change has dislocated the continent's biggest export economy, and, by common admission, has reduced production. Argentines eat more than before the war, but export less. (Although meat consumption rose from 218 lb. a head in 1937 to 299 lb. in 1947, the average working-class diet is not so well balanced as in Britain.) In Brazil new and promising lands might be opened to cultivation, but much

that is already produced in a country larger than western Europe is unmarketable because of woefully inadequate transport. The Andean republics contain the hard core of South America's backward areas. Their coca-ridden Indian labour—a third of Peru's population and half of Bolivia's—is a formidable barrier to efficient production.

There is no magic formula for speedy development. Almost everywhere, however, primitive husbandry is a greater barrier than any dearth of productive land. This is the lesson that Mr Nelson Rockefeller's International Basic Economy Corporation (IBEC) has set out to teach in Brazil and Venezuela, where its modern techniques of farming and distribution have made a modest beginning in the work of destroying ignorance and ancient prejudice. The possibility that, where such capital has ventured, more might follow has been brought nearer by Mr Truman's "Fourth Point" programme for backward areas. Under present conditions immigration alone is no panacea, just as blood transfusions cannot remove the cause of anaemia. Yet in an earlier age immigration and investment went hand in glove, and if US capital is to be encouraged—as South Americans hope—to undertake in several areas what British capital has already done to open up others, notably the River Plate countries, then it seems likely that immigration will again play a part.

Italian Workers and US Loans

That South American governments have this prospect in mind is shown by their interest in loans for the re-settlement of immigrants. The Brazilian Government has already indicated its readiness to take substantially more DPs if money could be found to finance their re-settlement, and several South American countries are known to be interested in a more recent Italian suggestion to establish Italian farm colonies with the aid of an American loan of \$32 million to be sought by Italy from ECA. As present plans go, IRO is to be wound up next June, but there is much to be said for the view of Mr Hallam Tuck, its former Director-General, that its liquidation then would be a mistake. Its field work has laid bare the re-settlement problems to be faced in South America, and therefore equipped it to help the flow of immigration that would complement capital investment in backward areas. Its experience might also prove invaluable in assessing the merits of South American claims to loans not only for immigration but also for development works such as communications and power schemes. So far, the financing of re-settlement has not been part of IRO's purpose, and South American governments have tended to regard it as merely a means of shifting from British and American shoulders the burden of maintaining DPs in Europe. If foreign loans are now to finance larger re-settlement programmes as an aid to South America's own development, it is difficult to think of any instrument that could serve so well as IRO the best interests of all concerned.

Canada's Defence Problems

[FROM OUR OTTAWA CORRESPONDENT]

WHEN the Atlantic treaty powers meet in Washington this month to set up the necessary organs for common defence planning, the Canadian Government will also face a domestic debate about its defence policy.

Criticism has been stirred by a small-scale exercise, named Exercise Eagle, which was held this summer on the route of the Alaska Highway. One battalion which had recently completed its airborne training was to try to recapture the airfield of Fort St John (an important link in the staging route to Alaska) supposed to have been taken by an enemy force. The exercise established, according to all observers, the efficiency of the battalion. But it also revealed that Canada had nothing like enough modern aircraft either to transport

the battalion, which was carried in DC3's from the last war, or to give it fighter protection; and it showed that Canada was short of certain other items such as parachutes. The critics, headed by old war correspondents who attended the exercise, say it showed all too plainly that Canada is completely exposed to airborne attack by Russia across Alaska and the Yukon.

The only answer the Government can make to this is the honest one that (a) they do not believe Russia will launch any attack on the western powers in the next few years; and (b) that if it did the only force it could, or would want to, land in northern Canada would be a small raiding party, destined to be sacrificed, and intended to create temporary alarm among the Canadian and American people.

The Canadian defence authorities are persuaded that they know how much—or rather how little—the Russian air force is capable of delivering in the northern part of this continent within the next few years. They are persuaded that the only object of the "threat to the North" is to make Canada and the United States hold back for passive defence troops and resources which ought to be used in an active sector of battle outside this continent. The only sensible way to deal with such a threat, they think, is to have a small, highly mobile "force-in-being" ready to clear up any airborne invader in quick time.

For this purpose they are training three battalions in airborne warfare, of which the one recently exercised is the first to complete its training. This is the limit of what the Canadian Army now proposes to devote to the territorial defence of the North. Unquestionably it would like to have up-to-date troop-carrying planes. The paratroopers in training practise with a dummy model of a US Fairchild Packet. But even by the time the other two battalions have completed their training—which will be something like another two years—the Royal Canadian Air Force will still, according to present plans, not have enough new transports to carry them.

Priority for Fighter Aircraft

This in itself is a very good indication of how priorities are distributed between the North and the European theatre. Top of the RCAF's priority list are modern fighters, and too US F86's (Sabres) are to be built under licence by the Canadair Company at Montreal (builders of the DC4M airliner which BOAC uses under the name "Argonaut" and Trans-Canada Airlines and Canadian Pacific Airlines use under the name "North Star"). In addition, Avro Canada of Toronto are developing a new twin-engined, two-seater, all-weather jet fighter of Canadian design which is specially adapted for northern conditions. In its early tests it is expected to use a British jet engine, but an all-Canadian jet named the Orenda is also being developed by Avro Canada.

Second on the RCAF's list are improved anti-submarine aircraft. The new troop carrier comes in about third. Emphasis on the Atlantic supply route is underlined in the naval planning. For the Canadian Navy protection of the shipping routes is the first priority and anti-submarine vessels of a new design are now being built in Canadian shipyards.

The Army conforms to the same pattern. Its main concern is to create a nucleus of highly trained specialists in both permanent and reserve units which could rapidly assimilate and train the large number of recruits which would appear on the outbreak of war. To the criticism that the main Canadian forces should be ready for instant action the authorities reply that experience has shown that they have some time before shipping is available to carry any large numbers of troops overseas.

All the Canadian defence services are grouped in one ministry. Unification has actually been achieved faster and carried further than by any of the other western powers. The Minister of National Defence, Mr Brooke Claxton, presides over a single department with a single civilian deputy minister

(or permanent under-secretary). The chiefs of staff committee reports through him to the defence committee of the Cabinet. The Chiefs of Staff, incidentally, number four, not three. The head of the Defence Research Council, Dr O. M. Solandt, is the fourth chief of staff sitting on an equal footing with the Army, Navy and Air Force.

Difficulties of Atlantic Co-operation

Since these authorities believe that the Northland cannot, in any period for which it is reasonable to plan, be any more than a sideshow, and since Canadian concern about the Pacific is conspicuous only by its absence, the problems of the North Atlantic treaty powers rate very high in Canadian defence planning. Canada should be a good partner for the Atlantic alliance.

But this is where the difficulties start. The Canadian armed forces grew from the British services. They were modelled on them and they have the closest affiliations with them. It took many difficult passages before they evolved a pattern which combined practical co-ordination with unquestioned independence. Now they are setting about the business of establishing a similar relationship with the United States. It is as though, having accomplished the difficult enough task of "bringing up father," they now had to start on godfather too. In some ways it's a weary business, but it has got to be done in the military as in the political sphere.

Few people realise even in Canada what Canadian engineers went through in the last war adapting British designs to North American engineering standards so that they could be manufactured here. Every single blueprint had to be redrawn; every single component re-engineered. It is to avoid these wasteful labours that all the efforts are being made towards standardisation. But standardisation is a gradual and depressingly long-term process. In the meantime Canada's industrial resources are already geared to the North American pattern.

The second great production worry of the last war was dependence on Britain for parts, which were liable therefore to delay not only by enemy bombers but also by enemy submarines. Never again, say the Canadian defence chiefs. It will be to Britain's interests as well as their own, they believe, if they insist that their production shall not be dependent on the long transatlantic pipeline.

Need for US Materials

The other consideration which makes North American co-ordination essential is that Canada cannot produce any heavy manufactured goods, including arms, without a considerable US content. Much of the steel and most of the coal must come from the United States. Nor does Canada itself require quantities of any item to justify tooling for each separate component. The only sensible and economic way for Canada to produce arms is the way it did it in the last war; to concentrate on certain types and produce them for all the allied nations. Only 30 per cent of Canadian war production was for the use of its own forces.

Given United States co-operation Canada can again become an important supplier for the Atlantic nations. But without that co-operation its capacity is most strictly limited. It cannot produce arms without spending US dollars, which it has not got, on raw materials as well as on parts. The famous Hyde Park agreement of the last war enabled it to supply certain items to the United States and acquire in return its own requirements of other items. Only if it is allowed to earn US dollars in this way can it again become an important supplier to the allies. Although in the recent Military Aid Bill the US Congress allowed "off-shore" purchases of arms for Europe in Canada, it has not changed the previous law which requires that arms for the US forces must be acquired within the United States. Until the Congress changes this law the Canadian contribution to the Pact nations will not be what Canada would like it to be, nor what the other countries have a right to expect.

“What will they think of next!”

The date of our picture is 1909 when there were 86,419 motor vehicles on our roads (or one between every five hundred people!). Immense developments in our motor industry were obviously needed to multiply that figure to to-day's total of nearly three million. Have you ever thought of the corresponding expansion and change in the steel industry? Steel has had to be made not only for the motor vehicles themselves, but also for the machine tools used in their production and for the refineries which supplied them with petrol and oil. Then there was also all the steel needed for railway trains and bridges, for ships and docks, for aircraft, for mines and skyscrapers, for a thousand and one things large and small, from power stations to safety pins.

TO-DAY. An output of over 15½ million tons is confidently looked for this year, evidence of the steel industry's great efforts to meet the constantly increasing demands of exporting industries of which the motor industry is only one.

LOOKING FORWARD. To raise capacity to 18 million tons by 1952, the industry, on its own initiative, started to plan before the end of the war and secured Government approval three years ago for expansion and development that will cost £240 million. That plan now is half completed.

In short, for the second half of this century no less than in the first, the industry has prepared to anticipate and foster every demand for steel from all branches of industry.

STEEL

is serving you well

BRITISH IRON AND STEEL FEDERATION

HOW MUCH STEEL IN THE AVERAGE CAR?
Many different kinds of steel are made for the motor industry — for crankshafts, valves, gear wheels, ball bearings, transmission, frame, road wheels, body panels, and accessories. The average car requires in all about a ton of steel.

Sulphuric Acid

Sulphuric acid is one of the most important of all the “heavy” chemicals. It is of such fundamental importance that its consumption can be regarded as the barometer of a nation's industrial capacity. It is essential for hundreds of products — artificial silk, dyes, electric accumulators, explosives, fertilizers, paper, plastics and weedkillers, to mention but a few. It is also used extensively in several branches of the metal industry. A Birmingham doctor, John Roebuck, developed the first commercial method of manufacture in 1746, and 85 years later, Peregrine Phillips, a vinegar manufacturer of Bristol, patented a Contact Process. By this method, which today is responsible for half the output of this vital chemical, sulphur dioxide — obtained by burning sulphur, iron pyrites, zinc blende, or other substances rich in sulphur — is made to combine at high temperature with oxygen. The combination takes place in the presence of certain metal “Catalysts” which have the remarkable effect of speeding up the reaction without themselves taking part in it. The combination of sulphur dioxide and oxygen yields sulphur trioxide, which combines with water to form sulphuric acid.

Britain's achievement in respect of Sulphuric Acid is a double one. Not only were the two principal processes of manufacture invented by Englishmen, but the raising of production to present levels — about 1,600,000 tons yearly — is a triumph of British chemical engineering.

THE BUSINESS WORLD

Fund's Plea for Devaluation

THE annual reports of the International Monetary Fund have hitherto had a happy knack of sounding a keynote appropriate to the contemporary economic situation. There is no mistaking the main theme which runs through the report published last Tuesday at the opening of the meeting of IMF governors in Washington. It is “currency revaluation,” or, another euphemism for devaluation, “exchange adjustments.” To see this IMF theme in perspective, it is well to recall the Fund's first report, issued in October, 1946, in which the executive directors were pleading the case for accepting from their members what was then acknowledged to be a largely artificial structure of official exchange parities. In the exceptional circumstances of 1946 there was much to be said in favour of overvaluing the currencies of most countries in terms of the US dollar. Those exceptional circumstances, including the shortages of the immediate post-war period, the promise of a sellers' market for some time to come, and the inevitable dependence of most of the world on imports from dollar countries, have now passed. But the overvaluation of currencies has not passed. On the contrary, with the downturn in the dollar price level, the phenomenon of maladjustments of prices and costs between the dollar and non-dollar world has increased. In its latest report, the IMF fastens upon this phenomenon and then credits it with the major responsibility for the perpetuation of a state of disequilibrium in international balances of payments.

“The world is now tending to divide into high-priced markets of countries dealing mainly in inconvertible currencies and low-priced markets of countries dealing mainly in convertible currencies. The dollar payments problem will persist at least as long as these price differences continue. Prolonged dependence on restriction and discrimination would be likely to divide the world economy into economic blocs, each with its own price structure, each tending increasingly to insulate itself from the rest of the world by the necessity of protecting its own inconvertible currency system by trade restrictions and exchange controls.”

This is not to say that the IMF absolves the creditor countries from all blame for the prevailing disequilibrium or from all responsibility for initiating remedial measures. The report points out that “surplus countries should keep their economies operating at a high level and minimise the trade barriers that restrain imports.” This general observation is then brought into specific focus in the remark that “the decline in the level of business activity in the United States from its extremely high postwar peak has added a new element to the payments problem.” But, informed with the knowledge that derives from the IMF's close physical proximity to US Congress, the report also points out that “the process of tariff reduction is always slow and it will not be realistic to count on it as a solution to the immediate dollar problem.”

The IMF therefore places on the deficit countries themselves the primary responsibility for restoring the international payments position. In this respect the report has

some very wise observations to make on matters other than exchange adjustments. The prevailing disequilibrium, it points out, arises not only from the excessive need for imports and the insufficient capacity to pay for them, but also from the disparity between overall demand and productive capacity within the deficit countries. “Until their domestic economies are adjusted to make more of their output available for export, so as to reduce their dependence on an excess of imports, their payments difficulties will continue.”

From this point the argument proceeds inexorably to the problem of inflation, emphasising that the existence of inflationary conditions is incompatible with a satisfactory international balance of payments. But, when all relevant facts and probabilities have been taken into account, the IMF concludes that the discrepancy between dollar and non-dollar prices is too great to be remedied merely by appropriate contraction of costs and prices in the deficit countries and within the context of existing exchange parities. It is pointed out that, while the US wholesale price index for manufactures was about 175 in May, 1949 (1937 = 100), the index of export prices in dollars of the principal western European countries exporting manufactured goods ranged around 210. That is too big a gap to be closed by deflation “which would encounter formidable resistance.” Therefore, “where a price reduction of the magnitude indicated above is necessary to expand exports, it would, in many cases, seem possible only through an adjustment in the exchange rate.”

★

Having suggested that “countries with dollar difficulties are faced with the question whether an exchange rate adjustment can help to solve their problems,” the report enumerates the conditions in which devaluation could be made within a safe and constructive framework. It points out that for exchange adjustment to be successful it is essential that the expected benefits should not be dissipated by an offsetting rise in local prices and costs. Moreover, “unless home demand is restrained, the expansion of exports which alone can justify an exchange adjustment will not be achieved.” If, however, the necessary measures are taken to arrest inflation in the deficit countries, the IMF is confident that “every country with a payments problem has a direct interest in the establishment of exchange rates that will encourage a pattern of trade conducive to a better balance in international payments.” This leads to the final conclusion that “in their own interests they [the deficit countries] cannot afford to forgo any suitable instrument, including any necessary exchange adjustment, that could expand their dollar exports.”

This is very plain speaking indeed. It is for the most part couched in general terms; it mentions no names save for the occasional inescapable reference to the United States as the ultimate creditor country; but the names suggest themselves. If a general realignment of exchanges can be long delayed after this flag has been so ostentatiously nailed

to the IMF mast, the world will have to rate even higher its high assessment of the forensic powers of Sir Stafford Cripps.

The annual report of the International Bank for Reconstruction and Development inevitably deals with somewhat more humdrum fare than that of its sister institution. For the most part the Bank's report is a careful documentation of its activities in what has been an active and satisfactory year. Eight loans were made by the Bank, totalling \$191.6 million, and a large number of projects are in process of investigation and negotiation. The latter include loans to the Colonial Development Corporation and to the Overseas Food Corporation.

On the marketing side of its activities, the Bank developed during the year new means of adding to its resources. This it did by selling securities held in its own portfolio to institutional investors in the United States. Such sales amounted to \$19.9 million and consisted of securities representing loans made by the Bank to the Netherlands and Belgium; these securities were sold with the guarantee of the Bank. This procedure opens up a most promising avenue through which to increase the lendable resources of the Bank. The scope for placing such guaranteed securities and for marketing the direct obligations of the Bank has also been expanded by recent legislation in the United States authorising national banks and State banks which are members of the Federal Reserve System to deal in and underwrite obligations issued or guaranteed by the International Bank. This, together with a widening volume of State legislation authorising institutional investment in the Bank's securities in individual states, should create a wider and freer market for the Bank's securities in the United States—the main provider of the currencies needed by the Bank's borrowers.

This satisfactory groundwork in developing the market for the Bank's securities will yield increasing returns as the Bank gets into fuller stride in the role of financing the economic development of under-developed countries. A considerable part of the report is devoted to a discussion of the role the Bank can play in this "Point IV" programme. Its comments on this subject—a subject which is all too often wrapped up in emotional phrases and thinking—is refreshingly realistic. Drawing on its own experience, the Bank points out that it has learned "how limited is the capacity of the under-developed countries to absorb capital quickly for really productive purposes." The real obstacles to rapid economic development in these countries is not lack of finance but "low levels of education and health, lack of skilled and vigorous manpower, political factors such as frequent changes in government with resultant economic insecurity and the temptation to put more emphasis on short run objectives than on long run development of the country." On this showing, there can be no complaint that the International Bank itself is failing to become educated.

The report sets out three criteria by which the Bank is guided in its loan policy. First, it must be convinced, on the one hand, that the loan cannot be obtained privately on reasonable terms; and, on the other, that there are reasonable prospects for repayment. Secondly, the loan must be for sound and productive purposes. Finally, since the capacity of most countries to service additional foreign debt is at present limited, the Bank must satisfy itself that the object of the loan is of sufficient importance to the economy of the country concerned to warrant its incurring a foreign exchange obligation to finance it. These criteria involve a recognition that the Bank is prepared to accept greater risks than the private investor is willing or able to assume. But the risk

is a calculated one; and if the conditions enumerated in the report are duly satisfied, there should be no excessive danger of bad debts for the Bank.

The report is reticent upon questions of exchange rates and other matters which do not lie directly within the province of the Bank; but this reticence was thrown to the four winds by its President, Mr Eugene Black, in the speech which he made at the opening session of the Fund and Bank meeting on Tuesday. Mr Black sided bluntly with the devaluation school, pleading for "a system of exchange rates which will assist the dollar deficit countries to compete effectively in world markets," adding that only this would provide an adequate incentive to exporters to increase their sales to the dollar area and for importers from the dollar countries

to buy from abroad. He failed to see how such an adjustment could be avoided. Mr Black next attacked the "wilderness of bilateral arrangements, special currency controls, quotas and similar restrictions" which he said have grown up to protect inefficient production and trade practices. Finally, as if to make sure of treading on every sensitive corn, he flung some good advice to countries now running ambitious programmes of social services beyond their means. Even from the platform of the Bank, therefore, the theme of devaluation has been heard loud and clear in Washington this week. The opposition, or anti-devaluation faction, has been described by one of the correspondents reporting the proceedings as "taking on the appearance of a thin red line."

The Canadian Market

IN view of the governmental exhortations to British manufacturers to increase their exports to Canada, it is surprising how little material is available for any comparative study of prices in that market. Comparison between separate lines in the same trade is always odious, chiefly because objective measures of quality are difficult to find. But there is some virtue in making an attempt. This article is the outcome of private research, undertaken in Toronto, by the Canadian correspondent of *The Economist*. The conclusions drawn are rough and ready. The classes of goods compared cannot be fully homogeneous in quality. Complications are introduced by the Canadian import quotas, by the retailer's practice of accepting a smaller margin on goods which he finds difficult to sell, and by the fact that the prices examined refer to goods on public sale in Toronto only. A strict comparison is hardly possible. The comparison which follows is based on an eyewitness report and not on a statistical analysis.

Nevertheless, certain salient points emerge. In general, the British consumer goods which have had most success in Canada have been high-quality or medium-quality lines. Very little attempt has been made to meet North American competition in the mass-produced popular ranges. It is, therefore, the more unfortunate that British prices are now so extremely high that several luxury products have priced themselves out of their own markets. Bone china dinner services at between \$125 and \$250 for 56-piece sets are one example; sea island cotton shirts, lately on sale at about \$9 each, but recently quoted much dearer—so that the new retail price would be nearly \$15 if retailers would agree to stock them—are another. Medium-quality goods are now meeting keen Canadian, rather than United States, competition. Men's shoes are an example. British-made shoes (between \$15 and \$25 a pair) are seriously threatened by Canadian shoes (between \$12.50 and \$23.50) which are little inferior in quality. In the same way British and Canadian semi-porcelain dinner sets in the \$20-\$90 price range are fully competitive with one another, while Japanese producers are now entering the same market in spite of a tariff of 27½ per cent against them. Competition between British and Canadian products is also intense in some branches of the hardware trade. Confectionery seems to be the exception. British biscuits (average price 70 cents a lb.) are accepted as more palatable than Canadian biscuits at prices between 29 cents and 40 cents a lb. There is a good demand for British products in humbler lines of the confectionery trade, where one might have expected that low price would have been a more potent market factor than high quality. Boiled sweets (British type 50 cents to \$1 a lb., Canadian type

39 cents to 60 cents a lb.) and liquorice sweets (British type 49 cents a lb., Canadian type 39 cents a lb.) are examples. With consumer goods of this kind, however, United States competition may be only temporarily kept out of the market by tariff or quota restrictions.

Textiles deserve special mention, though they form no exception to the general depressing pattern. British woollens, worsteds and lighter suitings are generally admitted to be without rival, but the increase in prices is driving importers to cheaper lines; the higher-priced lines are becoming unsaleable. One example quoted was that of a worsted tricotine, retailed at \$7.95 in 1946, which rose to \$10.50 by the end of 1948; at this price demand was too small to justify stocking the material. But buyers were offered the material in England last spring at a still higher price. In cotton and rayon goods North American competition is keener and the situation is correspondingly worse. British-made cotton shirts on sale in Toronto cost between \$8.50 and \$12.50; shirts of British cloth made-up in Canada cost between \$6 and \$10; those made in Canada of American cloth between \$4 and \$6 (despite a 10 per cent tariff differential). The superiority in quality needs to be very great to offset this disadvantage in price, and it is, therefore, particularly disquieting to find that complaints are common about flaws and inconsistent colouring in the medium price ranges of British cotton shirtings. The number of flaws has increased markedly (the Canadians say) and the colour of the shipment does not always match the colour of the samples. As for rayon fabrics, it seems clear that there would be virtually no British exports at all to the Canadian market if quotas on imports from the United States were removed. American rayon goods are consistently cheaper than British rayon goods of comparable quality, and quotations for flat and printed crepe at half the British levels seemed to be representative.

The division of the market for capital goods is the reverse of that for consumer goods. British makers offer the simple, straightforward and on the whole cheaper product; the United States supplies the more complete equipments with the "frills" which the British models lack. Yet the favourable price margin on British machinery is often no greater than is to be accounted for by the British tariff advantage over American products (which amounts to 15 per cent of the price on equipment of a kind which is made in Canada, and 10 per cent on other equipment). A turret lathe of 3½-inch bar capacity from Britain was priced at \$12,500 in Toronto; an American model with pre-selective speed changing and other gadgets not on the British model cost \$16,000. Similarly, a British radial

● Money is required for the export programme—to keep men and machines working and so ensure the ceaseless flow of British goods to markets overseas. All this vital activity is sustained by the facilities which a Bank alone can provide.

drill of 6-foot capacity with 18 speeds and 9 different feed rates cost \$13,000; an American model with 24 speeds and 18 feed rates cost \$17,000. A British surface grinding machine (6 by 18 inches) was found to cost 25 per cent more than the American model despite the tariff advantage. For steam turbines it is true that British firms have landed some important dollar orders, but these have usually been for machines custom-built to individual specifications. On a job which standard American machines will serve (and any firm which uses the services of an American consulting engineer for a manufacturing project will probably arrive at a layout which enables the standard types to be used) Britain is not offering a competitive price, nor, indeed, a competitive service of spare parts and maintenance. In this field, the coming competition in tenders for equipment for the new Toronto subway will be worth watching; the contract for building the subway itself went to an American firm.

Cars can be regarded as a special class of capital goods. Most Canadians regard British cars as "second strings" or as models to be used where the driving is predominantly urban. Within this very limited market British cars are competitive. An Austin A40 4-door saloon delivered in Toronto, with heater, licence and tank full of petrol costs \$1,699. The cheapest Canadian-built Ford with the same accessories costs \$1,910, and the Plymouth Club Coupé and Chevrolet 4-door de luxe cost slightly more than this. But since most Canadians use their cars for long trips and travel a good deal on bad country roads, it is only in the larger ranges that mass sales can be made. Here the picture is not encouraging. Despite the 30 per cent tariff on completed cars made in the United States, and despite the dollar quota which limits the numbers and variety of American cars on the market, the cheapest available Packard (\$3,211) is still lower than the Humber Hawk (\$3,271).

★

Quite apart from these questions of price, it is fairly evident, from inquiries made, that British goods are not being suitably designed and prepared for the Canadian market. The product of the British motor industry, with its narrow tracks, small luggage space, and reputed inability to stand up to bad roads, has been criticised to the point of monotony, but the same incompatibility between British practice and Canadian requirements is evident in many other trades; and in some there is less excuse for neglecting to make the small changes which are needed. The Canadians have repeatedly asked that British china should be packed in cartons so that it can be sent out from the shop to the customer without repacking—but it continues to arrive in straw-filled barrels. They believe that no attempt has been made to style women's shoes and underwear to North American tastes. They have

become accustomed to the American width for cotton piece goods, and the British standard widths of 32 inches for shirtings and 36 inches for dress materials are narrower; this, they complain, is inconvenient and uneconomical for the Canadian maker-up. In their eyes the final laundering and packing of British textiles are incredibly bad; "The Canadian finish will make an article sit up and smile out of its box instead of looking like a faded bouquet." It appears that British dress crêpes of better quality and equal price are being oversold by United States competitors by wide advertising of brand names. Confectionary seems to be almost the one trade in which Canadian importers find the British manufacturers fully co-operative in preparing goods for market.

Four other British disadvantages came to light. First, despite the talk in Britain of an "export drive" to hard-currency countries, some British goods for which there is a ready sale are not supplied in large enough quantities to meet the demand. Medium-quality china and high-quality hardware are examples. Orders of British-made hand tools (which could probably be sold if they were there to sell) "come dribbling through over a number of years." Good British cutlery is hardly ever seen. Secondly, delivery of some classes of goods—particularly of capital equipment—is still far too slow. Thirdly, United States manufacturers are much more flexible in their price policies than British exporters. Price-cutting is still the common American reaction to competition. British traders (perhaps because of the alternative soft-currency markets that are open to them) do not behave in the same way. Finally, Canadians will not accept the general level of British prices without question. Instead, they are disposed to criticise British Government policies; they argue that centralised purchase of cotton and other raw materials, the persistent reliance on bilateral trade, and the blind eye to restrictive trade union attitudes have driven up costs unnecessarily. There is a tendency to believe that prices can easily be brought down once these policies are dropped. Whether this belief is true or not (and there is, in fact, some evidence to support it) its existence is important; it makes the buyer critical and tends to hold him back from immediate purchases.

No soothing conclusions can be drawn from this survey. The Canadian market offers no rosy prospects of easy profit, and some British exporters, observing the facts for themselves, have drawn the conclusion that they would do better to turn their attention elsewhere. The only alternative is a more resolute selling effort, backed by more flexible production policies, than British industry and British exporters have achieved since the war. In certain high classes of consumer goods—and particularly in some high-grade textiles—Britain has in the past enjoyed, and might now recapture,

a position approaching monopoly; but these opportunities are too frequently thrown away by prices so high as to scare customers out of the market altogether. British products of medium quality have to meet keen Canadian competition, and it is necessary that exporters should be more aware of this and better prepared for it. The mass popular market is quite out of reach of British prices. British sales of consumer goods in Canada are small enough in all conscience; without the preferential tariff, and without the quota restrictions on imports from the United States, they would be smaller still. In the market for capital goods the same considerations apply, and their effect has been largely to limit the British share in the machinery trade to "tailor-made" equipments.

But while the progress that can be made is severely limited by the high level of British prices, there is evidence also

Business Notes

Britain's "Manageable" Deficit

To judge from the behaviour of stock markets this week, the general body of investors is showing a scepticism about the achievements of the Washington Conference hardly less marked than that of the City's most vocal commentators. On comparable occasions in the past, the markets have generally been disposed to read bullishly any news which promised postponement of unpalatable remedies. By this test, it might have been expected that the Washington communique would have been "good" for markets, for, as the City was quick to point out, it contains no hint that Britain is any the more ready than it seemed a few weeks ago to tackle the really fundamental problems of the excessive level of costs. As it is, the easier trend of gilt-edged prices is clear evidence of the City's refusal to regard the communique through any such rose-coloured spectacles as the Chancellor himself has donned. The accompanying firmness of equity share prices, significantly combined with strength in gold shares, is evidently indicative, not of any relief or satisfaction with the Tripartite achievements, but of the possibility that the problem of devaluation, though carefully excluded from the three-power announcement, might yet be resolved after the Fund and Bank meetings.

The City, in short, though welcoming the many signs that the United States is, in principle, acknowledging the responsibilities of its creditor status, still finds it impossible to see how even the eventual outcome of these discussions can provide any workable solution of the dollar problem. Still less can it comprehend how the measures upon which agreement has already been reached will suffice, even in the relatively short run, to stop the drain on Britain's gold and dollar reserves or, as Sir Stafford Cripps put it, "to bring our reserves position into a manageable condition." By indulging in some highly optimistic flights of conjecture, it is indeed possible to produce a prospective balance sheet showing a temporary equilibrium at some time during the ERP phase—provided each of the several measures produces its maximum of aid and provided the projected cuts are fully and promptly implemented.

Such a balance sheet, the construction of which is explained in subsequent Notes, would read approximately as follows:—

	£ mn.
Net dollar deficit (annual rate as stated by Sir S. Cripps in July)	600
ECA Grants and Loans	200
Dollar Import Cuts (U.K.)	100
Dollar Import Cuts (Sterling Area)	100
Stock-piling, etc., of Rubber and Tin	50
Release of ECA funds for Canadian Wheat	50
Dollar purchases from IMF	80
World Bank Loans to Sterling Area	20
	600

that a closer attention by manufacturers to the tastes, habits and requirements of the dollar markets would yield results. High prices are asked not only because of the high level of British costs of production, but also because alternative markets exist where currencies are softer and higher prices are still readily paid. In the same way, manufacturers who are already selling successfully to a wide range of overseas markets may feel that it would not pay them to modify their products to suit Canadian (or, for that matter, American) requirements. In this they may be right, by their own calculations, and while they are selling the whole of their output it is difficult to prove them wrong. It is not the individual trader's misfortune, but the misfortune of the national economy, that the markets where selling is easy do not yield the currency that the British economy most urgently needs.

★ ★ ★

Relief through Stockpiling

The most immediate relief which Britain and the sterling area can expect from the Washington talks is an increase in dollar earnings from the sale of tin and rubber. The communique was by no means explicit on this point:

The Canadian representatives stated that the Canadian Government is prepared to take steps to increase reserve stocks of tin and rubber in Canada.

The United States representatives reported that the United States Government was prepared to open to natural rubber a substantial additional area of competition including a modification of the Government order relating to the consumption of synthetic rubber. The United States would review its stockpiling programme with particular reference to rubber and tin.

It is difficult to assess in terms of dollars what this really means. Canadian consumption of tin and of rubber is relatively small. Last year tin amounted to 4,000 tons and rubber to 20,000 tons. If "increasing reserve stocks" were to imply the purchase of an additional year's supply of each during the next nine or twelve months, the sterling area would gain some \$16 million—provided these quantities were purchased from the sterling area.

The American stockpile purchases are more complicated. In the first place the amount of funds available to the Munitions Board is very limited; secondly, the Board stated

only recently that the current year's purchases must ensure a better balance in the quantities of materials held. This was taken to mean that most of its dollar funds would be used to buy those commodities which until recently have been in short supply. Tin and rubber were expected to benefit little. Presumably the overriding consideration of a balanced stockpile is to be waived, and rubber and tin will be bought with dollars instead of with the sterling counterpart fund. Last year American purchases of tin for the stockpile were estimated at 25,000 tons. If a similar quantity were bought before the end of next June—and all of it from the sterling area—Britain's dollar pool would get some \$56 million. Last year, too, approximately 100,000 tons of natural rubber went to the American stockpile. Since June, a little over 20,000 tons have been purchased against the sterling counterpart fund. If, therefore, the remaining 80,000 tons are bought from the sterling area within the next nine months, a further \$36 million will be earned. The price of natural rubber has been taken as a little under 1s. a lb. Thus, on these rather optimistic assumptions, the sterling area could get only about \$110 million from stockpile purchases (American and Canadian), and this would appear to be a maximum rather than a minimum figure.

* * *

Larger American Rubber Consumption?

The main gain to the sterling area could come from the increased commercial use of natural rubber in the United States. But such an increase is by no means a certainty. Still less is it certain that the additional rubber would necessarily come from Malaya. Under the present American law, the minimum synthetic rubber consumption must be one third of the total available capacity—that is, it must not be less than 200,000 tons a year for general purpose synthetic (GR-S) and 22,000 tons for special purpose synthetic. Actual consumption is about double that level, so that there is scope for an increase in the consumption of natural rubber of the order of 200,000 tons, if Congress is not to be asked to amend the law. The phrase "to open to natural rubber a substantial additional area of competition" would at best mean that the American Government will modify "R1"—the regulation which lays down specific minimum percentages of GR-S which must be used in the manufacture of tyres and inner tubes—so as to reduce synthetic consumption to the minimum specified in the Act. So far, American manufacturers have been freely using synthetic rubber in greater quantity than that laid down in R1. It may be that a drastic revision of this regulation will alter the buying policies of American manufacturers.

A more decisive influence, however, is likely to be exerted by the relationship between the prices of the natural and synthetic products. If, owing to larger stockpile purchases, the price of natural rubber stays at around 1s. a lb., the chances of increased commercial consumption in the United States would appear, on past experience, to be limited. If, however, the American Government increased the price of GR-S in the United States from its present level of 18½ cents a lb., a high rate of consumption of natural rubber would no doubt be assured. But such a move is likely to arouse serious opposition in America, as the latest accounts show the production costs of GR-S to be 18.1 cents a lb. Nor are American manufacturers likely to accept meekly any significant rise in price of either rubber or tin through any benevolent act of their Government. Perhaps these additional purchases will be incorporated in the framework of an international agreement for each commodity providing both an upper and lower price limit. Nevertheless, if it is assumed that commercial consumption of natural rubber in the United States will expand by 200,000 tons a year, then the sterling area will earn an additional \$90 million.

One very encouraging feature has been the rise in American industrial activity last month—the first rise since last October. If this rise continues (and at the moment it cannot be counted upon) American consumption of rubber, tin and other sterling area products will also rise, with a corresponding increase in dollar earnings of the sterling area. Failing that, the most—

perhaps the very most—Britain can expect to get from the increased sales of tin and rubber projected in Washington is \$200 million.

* * *

More Flexible Marshall Aid

The second line of action to give short-term relief to the central dollar reserve is the proposed extension of the range of goods which may be purchased with ECA funds. But such relief is likely to be less immediate in its effect than the increased stockpile purchasing. The real point at issue is the question of "off-shore" purchases, particularly of Canadian wheat and flour which until last March formed Britain's largest single item of procurement under ECA, absorbing a little over \$300 million a year. When ECA prohibited the use of its funds for the purchase of wheat outside the United States, Britain was placed in an awkward position. Its dollar purchases had already been pruned drastically, so that the scope for switching the ECA funds released from wheat to items still being purchased from earned dollars (thus releasing dollars to pay for the wheat) was in any case limited. Moreover, many of the items which Britain might have transferred to the ECA programme had not been included in the overall plan, and were therefore ineligible for ECA aid. To use up the \$70 million of ECA funds which had previously been earmarked to meet the outstanding claims of the Canadian wheat contract, Britain had to buy such goods as frozen pork, canned beef, wheat and flour, lard, canned fish and egg products, all from the United States. As it turned out, the meat purchases were timely in bridging the gap in Argentine supplies caused by the protracted negotiations. But ordinarily these goods would not have been bought at all—not, at least, for dollars—and they therefore represented a net dollar loss.

The expected announcement by Mr Paul Hoffman, the Economic Co-operation Administrator, on the details of the agreed extension of eligibility of goods for ECA procurement had not been received by the time of going to press; drafting difficulties had apparently delayed it twice. The main question is what goods will now be eligible and from what date. If it is assumed that Canadian wheat becomes eligible as from the fourth quarter of this year, then Britain will have a saving of some \$225 million earned dollars (calculated at \$75 million for each of the three quarters), provided that the new arrangement does not involve a mere reversal of the recent switching. If the items which were switched a few months ago from dollar purchase to the ECA programme were all essential, and must therefore now be purchased once more with earned dollars, the new concession would bring no dollar saving. But, judging from the figures published for the second quarter's procurements, most of the goods substituted were not of this category. The main substitutes were the products listed above, and these amounted to \$68 million in the April-June period; thus for nine months the saving on these less essential goods would amount to \$204 million. This again represents the maximum saving likely to be achieved, and it implies that a further reduction in imports will have to take place. If some of these less essential goods have already been replaced by essential goods, the net dollar saving would be correspondingly reduced.

Trade and Commodities

Trade Deficit Widens Again

No reassurance is to be found in the provisional figures for Britain's foreign trade last month. The value of exports fell by £4,500,000 to £137 million, the lowest total since last September. It is true that exports are usually small in August because of the holidays, and it is true that, while the daily rate this year was only 3 per cent less than in July, twelve months ago the corresponding decline was 3½ per cent.

COMPLETE WORLD-WIDE BANKING SERVICE

With the immense strength of its combined resources and experience, the Three Banks Group is exceptionally well-equipped to fulfil the many varied functions of a modern Banking Service. Although the Group serves the interests of many large and important concerns, it is careful to preserve the personal touch that has been a tradition of each of its members during two centuries.

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners—there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

With over 80 Branches at the leading centres of Industry and Commerce in India, Pakistan, Malaya and Burma, The United Commercial Bank is well equipped to serve Banks, Commercial Institutions and individuals carrying on business with India or intending to open connections with that country.

B. T. THAKUR, General Manager.

But there is an important difference to take into consideration. In 1948 exports reached their seasonal peak in July. This year the seasonal peak was attained in June; the July figure was diminished by the dock strike. Thus the reduction in last month's figure represents in reality a more serious decline than a year ago. Apart from holidays, the main cause has been the closing of the South African market. Shipments to the Union in August totalled just under £5,500,000 compared with £14 million in July and £19½ million in June; the figures for those two months were exceptionally high because of the rush to forestall the new import restrictions. Exports to the United States fell, but were still as high as their monthly average for the second quarter of the year, whereas exports to Canada fell to well below the average level of the second quarter.

Imports increased in August by over £13½ million to £200 million—only £1,700,000 less than the record figure of June. It is possible that the dock strike delayed the unloading of some supplies which reached the ports in July, and that these were therefore recorded as August imports. In previous years imports reached a seasonal peak in July. The average of imports in July and August was slightly below the monthly average in the second quarter.

On the basis of these figures the visible adverse balance of trade (imports valued c.i.f. and exports f.o.b.) rose by £18 million to £59 million—the highest monthly figure for two years. The cumulative balance, however, was still below last year's level; for the first eight months of 1949 it totalled £295 million against £321 million a year ago. But this was due to the small adverse balance during the first quarter. If present trends continue, the trade deficit this year will be significantly larger than in 1948.

* * *

Export Licensing for Wool

Last year the sterling area lost some \$10 million through the sale of dominion wool to the United States by countries outside the sterling area. To stop this leak Australia tightened up its licensing system, and this year, at any rate, the loss of dollars from this source has been negligible. But this was probably due more to the slump in the American wool textile industry than to the new licensing system. The Board of Trade is now to introduce export licensing for raw wool from Britain, starting next Monday.

Arbitrage in commodities between currency areas is clearly only a reflection of a more fundamental dislocation which the system of fixed exchange rates can only accentuate. To attempt to stop it by a licensing system is like trying to cure pneumonia with aspirins. Nor is that all. The amount of dominion wool re-exported from Britain to the United States is in any case small, and the disadvantages of interfering with a smoothly-running market may well outweigh any advantage gained. Admittedly, the saving of even one million dollars would be important. But how far would a licensing system help? It could ensure that wool sold to, say, the Netherlands is in fact shipped to that country. But without the ready co-operation of the buying countries—and particularly of the United States—it would be impossible, even if it were desirable, to prevent subsequent transshipment in the course of legitimate trade.

Wool brokers can be expected to co-operate with the Board of Trade to reduce the dollar leak, but an effective licensing system would restrict the operation of a free market. The idea that the seller of a commodity may determine its use—that the buyer in acquiring the goods does not acquire the right of free disposal—is itself a disquieting one. If systems of conditional sale were to spread to certain other commodities, the whole concept of a free market would be undermined.

Egyptian Cotton as a Substitute

Orders issued by the Board of Trade this week permit manufacturers to use Egyptian-type cotton yarns in certain utility cloths for which American-type yarn has previously been specified. For cloths in which Egyptian yarn has thus been substituted for either warp or weft, converters are allowed to raise their maximum selling prices by 5 per cent. Where Egyptian yarn is used for both warp and weft, the maximum selling price is raised by 10 per cent. The reasons for these new specifications are not hard to seek, though they may be hard to justify. The Chancellor of the Exchequer announced in July that imports of American cotton would be cut, though he did not contemplate any reduction in output in Lancashire. Part of the cut could, no doubt, be made at the expense of stocks. But since cotton production in Brazil, the main alternative source of supply, is declining, it was clear that in the long run output in Lancashire could, in these circumstances, be maintained only by substituting Egyptian for American cotton.

Egyptian cotton was used as a substitute for American at a critical time two years ago. The result was that stocks of Egyptian cotton in this country were nearly exhausted, and the "panic" buying which took place in the following February helped to bring about the sharp rise in the Alexandrian market. The lesson has, no doubt, been learnt, and an exact repetition is unlikely. But the implications for British cloth prices are still sinister. With Egyptian cotton nearly double the price of American cotton (admittedly the qualities are different), substitution will raise costs and prices. It offers, therefore, a clear example of the painful choice between dollar expenditure and higher costs. Higher prices will, in turn, further restrict exports to the dollar markets, whether or not expedients are found to keep these more costly products saleable at home and in the soft-currency markets overseas.

If the area planted to cotton is any guide to output, Egypt should have a large crop this year. The first official estimate shows an acreage 16 per cent greater than in 1948-49. There have been the usual reports about worm infestation, particularly in certain districts of Lower Egypt. Weather has not been favourable, and last year's high yield is unlikely to be maintained. If the damage done by worm should prove serious, the total crop may not be very much larger than a year ago. In that case, with the world-wide shortage of dollars tending to inflate the demand for non-dollar cotton, the Egyptian and American price levels might well be pushed still further apart in the coming season. Even without this handicap, productivity in Lancashire needs to be increased quickly if British cotton textiles are to stand up to competition. How can production costs absorb this additional disadvantage?

* * *

Prospects for Base Metals

The Ministry of Supply chose its time well to institute its new policy of keeping its selling prices in line with those ruling in the American market. The policy came into force on July 12th and the prices of copper and lead rose on the following day. Since then the Ministry has benefited from the recovery in base metal prices in the United States. Copper has been more stable than the other two metals. Its price fell to a low point of 16 cents a lb. in the middle of June, compared with 23½ cents two months earlier. It recovered to 17½ cents (£99 a ton) and has since remained at that level. On July 12th the British selling price for copper was reduced from £117 10s. a ton to £104, and the next day it rose to £107 10s.; it has so far remained at that level. The price for lead in New York was 12 cents a lb. in June, compared with 21½ cents three months earlier; it has since crept back to 15½ cents (£84 a ton). Zinc, which was 17½ cents a lb. in March, fell to 9 cents in June, but afterwards recovered first to 10 cents a lb. and more recently to 10½ cents (£58 10s. a ton). This latter rise, however, was not held and within a week zinc was back

to 10 cents a lb. (£55 10s. a ton). The British prices for lead and zinc have followed the American market at a close interval: lead is now £87 5s. a ton and zinc, which rose to £66 5s. a ton a fortnight ago, was reduced last week to £63 10s. a ton.

The future trend of base metal prices will be influenced to some extent by the freeing of the American tin market. Zinc

is still dearer, relatively to copper, than before the war. This may be due to the increased uses for zinc castings, which can be expected to persist. But it has also been due, in part at any rate, to the high price of tin. If, as is generally expected, the price of tin falls when the American exchange re-opens, the price of zinc may ease in sympathy. Lead is still in relatively short supply in the world, and its use continues to be restricted in many countries. For this reason alone it is likely to be dearer (compared with before the war) than either of the other base metals, though last March showed clearly what can happen if

American demand for storage batteries should decline. Copper output has expanded more rapidly than the production of either lead or zinc; so, too, has its consumption. But because of its importance in the electronic era, its recent stability of price might be due to more fundamental factors than the mere organisation of the American copper market.

The level of activity in the United States is still, however, of overriding importance, while purchases for the stockpile must also be taken into consideration. Commercial stocks of all three metals were at a high level in America at the beginning of the year, and once a weakness in the market became evident purchases declined rapidly. Domestic deliveries of copper in the United States in June were between a half and one-third of those during the first quarter of the year. Deliveries of lead slumped by almost as much, and deliveries of zinc fell to about half their level in the first quarter. The initial recovery in prices was due to renewed purchases for the stockpile, but commercial stocks are also being replenished. American manufacturers, however, are still cautious and are apparently buying only for working needs.

Finance and Investment

Gold at the IMF Meeting

South Africa has played the most vocal part, at least in the public sessions, in advancing controversial subjects at the International Monetary Fund meeting. Mr Havenga, the South African Finance Minister, made a general plea for IMF action in writing up the currency price of gold by all member countries. He also put forward a formal motion asking for IMF authorisation to gold-producing countries to sell up to 50 per cent of their output in the various premium markets of the world. The first plea was rejected by Mr Snyder, US Secretary to the Treasury, who stated that he saw no reason

BANKING AMALGAMATION

Subject to the approval of the Court of Session,
the business of

THE CLYDESDALE BANK LIMITED

and the

NORTH OF SCOTLAND BANK LIMITED

will be amalgamated as from January 1, 1950

under the title

**CLYDESDALE AND NORTH OF SCOTLAND
BANK LIMITED.**

The combined Bank will conduct business at 360 branches in Scotland, besides operating through its established offices in London. It will be represented, as hitherto, by the Midland Bank throughout England and Wales and by correspondents in all important trading centres overseas.

why he should propose a higher price for gold to his government. The reasons for this refusal are very concisely put forward in the annual report of the International Monetary Fund. This points out that under present conditions the predictable effect of a general upward movement in the currency price for gold on the United States would merely be increased exports in exchange for further additions to its gold supply, which is already about two-thirds of the world's reserves. The report of the IMF adds:

In so far as the United States is prepared to maintain a large export surplus to facilitate world recovery, it can do this more effectively through its foreign aid programme than through an increase in exports to gold-producing and gold-holding countries. A rise in the dollar price of gold could have no positive effect in correcting the maldistribution of gold unless and until the present payments difficulties have been met.

The IMF report also attacks any proposal for a uniform rise in the price of gold, on the ground that it might be regarded as a substitute "for the measures in the sphere of exchange and payments policy" which have to be taken if international balance is to be restored.

The refusal of the United States delegate to consider any such suggestion has ruled this proposal out of court. The South African motion regarding the sale of gold at a premium was referred to a special committee of the IMF. The day following this move, however, South Africa surprised all concerned by withdrawing the gold price motion before this committee. Announcing this decision, Monsieur Gutt, managing director of the Fund, said that the South African Finance Minister had acted on the ground that the motion was "too narrow." Perhaps Mr Havenga realised soon after his motion had been tabled that the issue would soon become one of comparatively academic interest and that South Africa's desire for a higher gold price, at least in terms of its own currency, might be satisfied by some other means.

The New IEPS

Final details are now available of the new Intra-European Payments Scheme which comes into operation in October and covers the period to June 30, 1950. The contributions and drawing rights exchanged under the scheme were set out in *The Economist* last week. These are definitive figures and the wording of the new scheme appears to make no provision for adjustment to a cut in the total Marshall aid appropriation by Congress, an appropriation on which the final vote has yet to be taken. The main outlines of the new scheme have been known for some time past and were given in *The Economist* of July 9th. In contrast to the first version of the scheme, there is a certain element of transferability of drawing rights in the new version, but this has been kept down to 25 per cent of the drawing rights established and announced last week. The introduction of an element of transferability into this year's scheme necessitates the setting up of a dollar "pool" to cover multilateral drawing rights. It is in the detailed provisions applying to this pool that the full text of the new scheme is most informative.

The pool is to be created by crediting to it dollars equal to one-quarter of the drawing rights established under the IEPS. In the case of Belgium the amount to be credited to the pool will be one-quarter of the amount allotted to the Belgo-Luxemburg Union to cover its Western Hemisphere deficit, together with the whole of the \$112½ million which has been set aside to cover that part of the excess of Belgium's surplus with OEEC countries over its deficit with the Western Hemisphere which is to be made available to Belgium in dollars from ECA funds. The monthly compensation of intra-European debts will continue to be handled, as hitherto, by the Bank for International Settlements. The deficits which remain after the first compensation are to be financed wherever possible by the utilisation of the bilateral drawing rights. When these are exhausted the deficits will be financed by any available multilateral drawing rights. When-

ever the BIS uses multilateral drawing rights it will inform ECA of this fact and ECA will then make a firm allotment to the creditor concerned of conditional aid from the dollar pool. This is the machinery by which the conditional Marshall dollars will in fact be made to follow the expenditure of the multilateral part of the drawing rights.

The new IEPS agreement incorporates provisions for review and rules for commercial policy designed to safeguard the position of both debtor and creditor nations under the scheme. These rules provide for appeals to OEEC when the revised scheme, which has as its principal object the stimulation of competitive trade in Europe, appears to be abused by any participant.

Peso Loses Its Gold Backing

By authorising removal of the 25 per cent gold backing of the Argentine peso, the Peron Government has been forced to acknowledge in yet another way the pressures resulting from its economic policies of recent years. In the early postwar phases it was easy enough for the Argentine Central Bank to satisfy the obligation to back the peso by gold or gold guaranteed foreign exchange to the extent of at least 25 per cent. But despite the bank's substantial sterling holdings—all of which carry the necessary guarantees—the statutory gold backing has been declining rapidly over the last two years. By last August the backing amounted to only 27 per cent of the note issue as compared with 64 per cent at the end of 1947. Although it is generally believed that the 25 per cent minimum had been infringed some time before the new law was introduced, it is just possible that the Argentine Government's delaying tactics in granting import licences for British goods may have been partially prompted by a last attempt to defend the minimum reserve. This would have been in addition to other motives such as the Argentine bull position in sterling, discussed here last week.

(a) Commercial banking deposits held on behalf of Central Bank.

(b) Ratios as published by Central Bank.

Meanwhile the boom in ordinary shares on the Buenos Aires stock exchange and the rise in the local price of gold suggest that local observers believe that devaluation of the peso cannot be long delayed. If this judgment is correct it becomes all the more important that Britain should insist that the financial remittances overdue to British nationals should be guaranteed at the exchange rate for financial transfers in force at the time of signing the Anglo-Argentine trade pact.

Incentive for Dutch Dollar Exporters

The long-awaited scheme to give Dutch exporters to the United States and Canada a dollar bonus has been operating for the past week—and already the first results are visible. Under the scheme, Dutch exporters to the dollar area are allowed to retain in dollars ten per cent of the proceeds of their exports, and virtually no restrictions are put on the disposal of these funds. In effect, of course, this is equivalent to a

partial devaluation of the guilder in terms of dollars, and since it is unlikely that the Dutch authorities would at this particular moment be willing to defy the International Monetary Fund, it must be assumed that the Fund's earlier objections to the scheme have been overcome. The Netherlands Bank can well maintain that it is acting according to the precepts of no less an authority than Mr Paul Hoffman, who on his recent tour to Europe repeatedly urged that exporters to the dollar area must be provided with a differential monetary incentive to earn hard currencies.

Broadly speaking, Dutch exporters will be able to put their 10 per cent in dollars to three different uses. They can build up a dollar nest egg, always a strong attraction for any Continental business man. Alternatively, exporters anxious to maximise their guilder earnings can repurchase guilders by acquiring notes or securities standing at a substantial discount in New York and reselling these at parity in Holland. The third alternative is to buy American goods for importation into Holland, where nylon stockings or American motor cars, for instance, command a substantial premium over the dollar price calculated at the official parity. The first result has been that Dutch banknotes and securities, probably in anticipation of the scheme rather than on the strength of actual purchases, have already appreciated in New York.

Scottish Bank Merger

A merger between British banks occurs so rarely nowadays that any amalgamation, even between joint affiliates of the same bank, is of particular interest. It was announced this week that, subject to the approval of the Scottish Court of Session, the Clydesdale Bank and the North of Scotland Bank will be merged with effect from January 1st next, and thereafter will operate as the Clydesdale and North of Scotland Bank, Ltd. The requisite Treasury approval has

already been obtained. Since the capital of both institutions is owned by the Midland Bank, no outside shareholders' interests are involved; moreover, the whole of the present staffs will be retained in the service of the combined bank. As measured by the extent of deposits shown in the latest available balance sheets, the North of Scotland Bank, which dates from 1836, is the smallest of the eight Scottish banks (with deposits of £59 million), while the Clydesdale Bank, founded in 1838, ranks third in the list (with £102 million). After the merger, the new institution will thus become the largest banking unit in Scotland; the Royal Bank, which last October had £133 million of deposits, will rank second.

Since both the Clydesdale and the North of Scotland banks have been affiliates of the Midland Bank for the past 29 and 25 years respectively, and since their spheres of business are largely complementary, the merger is a logical step. That it has not been taken sooner may perhaps be attributed to the need to acclimatise sturdy local opinion to a departure from tradition, and in particular to the disappearance, as a separate unit, of the only bank which, for the past 30 years, has had its head office in Aberdeen. Recently, no doubt, the growing pressure of costs—aggravated in all banks by the familiar "bulge" in the age-distribution of staff—and the difficulties which small entities like the North of Scotland Bank must encounter in these days in finding specially qualified staff to deal with the intricacies of foreign and other business, must have combined to make the spreading of overheads and other economies of integration increasingly desirable. Considerations of this sort, of course, are common to all small banks, but the geographical location of the North of Scotland Bank, which probably finds few outlets for its advances other than farming and fishing, always presented a rather special problem. In all the circumstances, therefore, the new combined bank should be able to give a strengthened service to its customers without losing any of the special characteristics of its two constituents.

Bankers at Oxford

For the past two weeks bankers from some forty different countries have been assembled at Christ Church, Oxford, attending the second International Summer School of the Institute of Bankers. Most of the lectures at this year's assembly have been concerned with the technical and financial apparatus which has been built up since the war to aid—or hinder—the development of foreign trade. The British system of Payments Agreements, the technique of Exchange Control, the Intra-European Payments Scheme, the ITO Charter and the law relating to Documentary Credits have been among the subjects discussed. At least three lecturers were invited to take more ambitious sweeps into major problems of current controversy. Sir Hubert Henderson discussed the problems raised by the continuance of inflation in Britain, which he said had “ceased nearly everywhere else, at any rate outside the sterling area.” His prescription was a retrenchment of public expenditure at home and an attempt to combine controls (including long-term contracts and bilateral agreements) with appropriate price relations abroad. Professor R. G. Hawtrey expounded his theory that inflation must continue until the value of the currency falls far enough for the flow of money to catch up with the enlarged stock of money. He believed that this stage may have been reached in America, but that in Britain there was some £2,000 million of “redundant money” still left. Finally, Mr Leslie Gamage attacked some facets of Britain's “hurriedly produced” export policy, likening an economy subject to rigid Treasury control to “a big business directed by the cashier.”

This year's session of the School, like the first gathering last year, will be valued by all associated with it, especially for its active exchange of views quite outside the more formal programme. It must also have served as a welcome reminder to the overseas visitors that, despite the fall of sterling from sovereign power, Britain is still the natural centre for informed discussion on the wider issues which lie behind the deceptively humdrum business of international banking.

* * *

Mr Butlin Takes Over

The holiday atmosphere appears for the moment to have departed from the Butlin camp. Mr Ian Anderson, chairman of Butlin's, Limited, since January, 1947, has now resigned. He retains his chairmanship of Butlin Properties and his directorship of Butlin's Bahamas. But there has evidently been a sharp difference of opinion about the conduct of Butlin's, Limited, between Mr Anderson and Mr W. E. Butlin, who has now succeeded him as chairman, which appears to stem

from a disagreement about the appointment of a new director to the board. Mr Anderson apparently wanted a director with considerable experience in financial matters, whereas Mr Butlin preferred a man who would identify himself with the life of the camps themselves, as he has been wont to do since they were started. If that were all, the public interest in the matter would not be particularly important. But there have also been suggestions, first, that a certain financial group has been attempting to gain control and so change the company's policy against the wishes of Mr Butlin, and, second, that Butlin's, Limited is in urgent need of further finance.

The first of these suggestions has been openly affirmed by Mr Butlin, who has expressed his determination not to let any outside financial interests interfere with his running of the camps. His natural desire is to carry on the development of the company along his own lines. But it is evident that the financial aspect is far from rosy. Last week's cut in the interim dividend of Butlin's, Limited, from 50 per cent to 10 per cent, though paraded as an act of enlightened policy, suggests real uneasiness about the course of profits. Moreover, the group balance sheet at December 31, 1948, shows net current liabilities of £348,000 and cash at £67,708. Mr Butlin last week offered no comment about the current year's trading, but declared that there was no intention of raising further capital in the near future. Any new approach to shareholders would be for extensions to camps and not for existing camps. Mr Butlin is entitled to take credit for the fact that so far he has obtained all the money required for his ventures from shareholders. He is the founder and largest shareholder, and his intention to remain independent of “financial interests” is at least understandable. But he has wider responsibilities as chairman of this public company, and he ought not to dismiss from his mind the fact that the shares of Butlin's, which once reached 24s., now stand at 5s. 3d.

Moody's Anticipation Factor Index

A new attempt to isolate the factors which control long-term movements in share prices has been undertaken by Moody's Services, Ltd. Their research has covered movements of ordinary share prices on the London Stock Exchange back to 1925 and has resulted in the production of an index of what is called the “anticipation factor.” Starting with the Moody's monthly index of ordinary share prices, the compilers have removed from the index the influence of changes in dividends and money rates. This is done by the use of the formula—

$$\frac{\text{Share Index} \times 100 \times 100}{\text{Dividend Index} \times \text{Consols Index}}$$

The residual index from this calculation, it is suggested, reflects the real state of confidence in the share market and will provide a more reliable pointer to the earning power of industry in general. The index will henceforth be calculated monthly.

The anticipation index appears to break new ground in investment research and is an interesting addition to investment statistics. The trend of the index over the past twenty-five years, plotted against the course of the other three Moody's indices, is reproduced in the chart on page 636. The fact that no precise time relationship can be established between the new index and the other three indices is evident at once. This may dispose some critics to dismiss it as a useful medium for measuring “the view that the market takes of the future”—the more so because it is traditional to regard the current level of ordinary share prices as measuring just that view, and traditions die hard in investment circles. It is also evident that although the index has been purified of the factual elements of current dividends and money rates, the anticipation element of future dividends and money rates remains. Nor is it perhaps justified to regard current dividends and existing money rates as the only two current influences affecting the level of share prices, though they may be the only factors which are readily measurable. For instance in these days, if not at all times, political factors appear to exercise an equally potent influence whose effect is not by any means confined to discounting the future. Within these and other limits—particularly the mathematical limits which, as Moody's point out in their circular about the new index, partly account for its unusual course—investors will welcome this addition to their equipment.

* * *

Tunnel Cement and Nationalisation

Like Tate and Lyle whose scheme for “hiving off” investments has been sanctioned by stockholders this week, Tunnel Portland Cement is trying to ensure that a new Labour

Government, should it emerge from the next general election, will not be able to proceed to the next stage of nationalisation. Cement, sugar, water supply and industrial insurance are specifically named in this programme. The board of Tunnel Portland Cement has under consideration a scheme to segregate the overseas assets of the group. The present idea is to form a new company—Tunnel Cement Investments Ltd.—to acquire these assets. Shares in the new company would be distributed to preference and ordinary shareholders of Tunnel Portland Cement, whose share capital and share premium accounts would be correspondingly reduced. The project is still in the formative stage and Court sanction would have to be obtained, but proposals will be put before shareholders in due course.

The extent of the overseas interests of Tunnel Portland Cement is not precisely known. In the consolidated balance sheet at March 31, 1949, trade investments appear at £1,530,591 at cost out of total group assets of £8,883,346, while shares in subsidiary companies are valued in the parent company's balance sheet of the same date at £946,212, also at cost. Hence, ignoring the possibility that the intrinsic value of the assets represented by these interests exceeds their book value at cost, Tunnel Portland Cement's investments in subsidiaries and associated companies amount to approximately £2,500,000. Not all these investments are in overseas countries. For instance, Tunnel Portland Cement has a controlling interest in the Tunnel Asbestos Cement group whose total consolidated assets at March 31, 1949, alone had a book value of £720,310. None the less, on a rough estimate, it is conceivable that the new company might take over overseas assets worth possibly between £1,000,000 and £2,000,000 at their present values in the books of Tunnel Portland Cement. These would include interests in the National Portland Cement Company in the United States, the expanding Egyptian company Helwan Cement, whose capital is being increased from £900,000 to £1,000,000, a smaller enterprise in the Sudan which has now

3 DAYS' MACHINING SAVED

Production up . . . costs down

Accuracy consistently maintained

A better job because of BAKELITE

You, too, may have a tricky production operation which you would like to simplify, speed up, reduce in cost. If so, we offer our co-operation. The Reavell hydraulic valve, as illustrated, is but one of many instances where the use of mouldings in BAKELITE materials instead of metal castings has eliminated machining and ensured an unvarying accuracy that facilitates assembly and the interchangeability of parts. For every known application a special BAKELITE material has been developed and can be delivered quickly. That is why BAKELITE materials are successfully solving so many manufacturing and material supply problems in every branch of industry. A note to the address below or a phone call to Sloane 9911 will bring you any advice or information you may desire.

BAKELITE LIMITED · 18 GROSVENOR GARDENS · LONDON S.W.1 · PHONE SLOANE 9911

commenced operations and a new venture in Jamaica. In addition the transfer would presumably embrace the group's assets in Eire and Denmark, but not in Burma, where the company's interests have already been nationalised.

Although it is not so far covered by any official declaration on nationalisation by the Labour Party, International Combustion is also planning to "hive off" its interests outside this country. The first step was taken on September 9th by the registration of a new company, IXC Ltd.—with an authorised capital of £1,500,000 in £1 shares. This is apparently to be a holding company formed to acquire the main undertaking of International Combustion in this country, the South African, Indian and Australian subsidiaries, and the Aberdaire cables interests in South Africa. Details of an exchange of shares from the old company into the new are to be submitted for shareholders' approval at a future date. A similar plan was evolved in June by Union Cold Storage whereby the existing cold storage business in this country would be transferred to a wholly owned subsidiary and the name of the parent company changed to the Union International Company.

Industry

Anglo-American Cotton Trade Talks ?

Reports from New York indicated this week that the principal organisations in the United States cotton textile industry have agreed to renew the collective discussion of matters of common interest with the Lancashire textile industry. An Anglo-American cotton textile conference was held in England in April last year, and arrived at some tentative general conclusions about the division of the world trade in cotton textiles, together with a suggestion that Japanese spinning capacity might be limited to 3½ million spindles. Later events have shown even those tentative conclusions to have been abortive, and little has since been heard of the proposed limitation of Japanese spindleage. Sir Raymond Streat, the chairman of the Cotton Board, described this particular proposal last spring as having been "justifiable as a first public move taken to provoke thinking and evoke counter-proposals if other parties felt it was open to objection." These words themselves suggested that Sir Raymond, when he visited the United States early this year, had not found any universal readiness among American manufacturers to take common action about Japanese competition.

In fact, the United States industry is not nearly so closely organised as the Lancashire industry for common action of the kind suggested. The primary purpose of Sir Raymond Streat's visit early this year was to promote the idea of a joint Anglo-American industrial mission to Japan, which in turn was intended to lead to a common policy on Japanese matters which the two industries would press on their Governments. On his return, Sir Raymond expressed the hope that the idea would be approved. Things have not gone as far as that yet. The American cotton trade organisations have at length, however, agreed to another conference with the representatives of the Lancashire industry, to be held (if the British agree) in the United States. Mr William Pilanz, chairman of the American Textile Industries Committee on Foreign Trade, said in announcing this decision that the discussions were not expected to be limited to the question of a joint mission to Japan; they would "embrace a wide range of problems connected with world trade in textiles."

It is apparent that the Americans, though they too would not relish a return of full-scale Japanese competition on the prewar price-cutting lines, do not fully share the preoccupation of the Lancashire firms with the Japanese "menace." They have lost a great deal of foreign trade in the past two years—in spite of the severe reduction of their own prices—largely because of the closing of so many of the world's

markets to dollar manufactures. Their main concern must be to reopen the channels of world trade.

Engineers' Initiative

An initiative taken by the British Engineers' Association is designed to put into effect a proposal of the engineering mission, led by Sir Harry Gilpin, which visited Canada last year. The mission suggested that sections of the British engineering industry should maintain specialist representatives in Canada to seek out opportunities there of expanding engineering imports from Britain. These representatives would have a number of specific duties—"to obtain early news of important projects and to ensure that purchasing specifications give a fair chance to British firms and to recommend the appointment of effective agents"—and general tasks hardly less important, such as "to remedy the widespread ignorance in Canada of United Kingdom technical achievements."

In the year that has gone by since the Gilpin Mission made its visit, nothing has come to light to call in question the good sense of this suggestion. Canada is an exceptionally large importer of capital goods. Last year the Dominion imported from the United States machinery (including electrical machinery and apparatus, but excluding vehicles) to the value of £111.4 million, and from Britain machinery to the value of only £5.1 million. This is the more absurd since British-made machinery enjoys a tariff preference.

The British Engineers' Association, which represents the bulk of the mechanical engineering industry in Britain through its federated trade associations, has now passed on to its members a set of detailed proposals, worked out with the Government, to bring about the kind of technical representation in Canada which the Gilpin Mission recommended. Each of the associations in the engineering trade is asked to consider the appointment of a representative for its branch of the trade. The Treasury has offered to bear up to 75 per cent of the cost (which would be between £5,500 and £6,000 a year for each representative) and proposes to recover its expenditure by a levy on the additional business obtained by subscribers. A company will be formed to co-ordinate the operation. It now remains for the trade associations, and for individual firms, to determine what support they will give. Firms which have not found it economic to maintain their separate representation in Canada may well find that joint representation is worth while. One addition needs, perhaps, to be made to the representatives' list of duties; if the scheme is to work, they will need to devote time to remedying the "widespread ignorance" in Britain of the special requirements of the Canadian market.

The Cost of Coal

The average cost of coal mined in Great Britain reached the highest quarterly figure so far recorded—45s. 11.4d. a ton—in the fourth quarter of 1948. The National Coal Board, in its report for 1948, was able to point out that the curve of ascending costs was then flattening and had since begun to fall. The first quarter of this year accordingly showed a decline to 44s. 6.8d. a ton. The decline was not maintained in the second quarter of the year, when (as the second quarterly statistical statement for 1949, published this week, shows) cost per ton rose to 45s. 2.2d. This is explained largely by the, paid holidays at Easter and Whitsuntide, which fell in the second quarter. These would by themselves account for rather more than the net decline in total output (from 47 to 45.5 million tons) which was in fact recorded. It would not reduce the wages bill proportionately, and the wages cost per ton rose by nearly 4d. Roof supports and repairs tend to cost more, instead of less, at holiday times, since much of the repair work is done then. The increase in steel prices in June also added to the cost of roofing. "Other costs," which include depreciation, persist for the most part whether coal output is

interrupted or not. Continuing expenditures of this kind therefore add to the cost per ton. Their effect in any period of slackening production is clearly illustrated by the figures for the north-western division, where the strike over concessionary coal in Lancashire and Cheshire caused the cost per ton to rise by 2s. 3d. This adverse influence is incorporated into the general figures. If these things are taken into account, there is colour for the view that the Coal Board is still managing to keep labour costs in check.

The revenue position of the board was reasonably well maintained in the second quarter; instead of a surplus of £3,832,650 it showed a surplus of £2,491,883—after making a new provision of £650,000 for profits tax, which has not previously appeared in its accounts. Less cheerful is the prospect of what will have happened in the third quarter, which includes seven paid holidays and (as the meagre weekly coal output of the past two months has shown) a prolonged period in which production is upset by the holiday spirit.

Clouds on the Shipbuilding Horizon

Figures published in the *Monthly Digest of Statistics* show that merchant ships under construction in the United Kingdom at the end of July totalled 1,874,000 tons gross; this is the lowest figure recorded for two years. The fall of 61,000 tons since the end of June means that about 130,000 tons were completed during July and only about 70,000 tons were laid down. The turnover of the shipyards in the first seven months of this year, however, compares favourably with that for the same period of 1948. The tonnage completed in the seven months was 780,000 tons and the tonnage laid down 661,000 tons; these figures compare with 628,000 tons and 642,000 tons in the same months of last year. The tonnage of ships under construction for export has declined to 629,000 tons from the peak of 701,000 tons which was reached in January. Tanker tonnage under construction has increased since January from 619,000 tons to 690,000 tons, and of this total 333,000 tons are for export.

What the statistics do not show is the serious decline in the number of new contracts being placed either by British or foreign owners with British shipyards. Hardly any new contracts have been announced in recent weeks; the loss to a Belgian shipyard of an order of at least £2,000,000 for a Portuguese company has been almost the only piece of news. The reason is not hard to find. British shipowners in speeches at recent launches have gone out of their way to stress that high prices are holding up new contracts. Foreign owners have gone further, placing their orders with foreign yards. Representatives of several types of shipping have recently given figures which show the extent to which building costs have risen in the past three years. The new P & O passenger liner *Himalaya*, for example, was estimated when she was ordered to cost about £2,400,000. Her final cost has worked out at about £3,500,000. On 31 cargo liners delivered since the end of the war, Ellerman Lines have had to pay £1,600,000 more than was anticipated. This is not an extreme case. The *Athel Line*, when it ordered 11 tankers to replace war losses, expected to have to pay £6,000,000, but now finds itself liable for £7,250,000. A tramp company which is now beginning to take delivery of five vessels ordered in 1946 finds that they have taken nine months longer to build and cost £275,000 more than was anticipated. These figures, striking though they are, do not impress themselves so readily on the industry or on its suppliers as will the sight of empty berths and order books which must inevitably follow unless steps are taken to bring costs down. The shipowners seem to feel that little can be done without the co-operation of labour. This will not necessarily mean reducing wages, but it will mean removing restrictive practices and, if necessary, working longer hours. Dearer coal, steel, transport and power, as well as taxation, have had their inevitable effect on ship-

building prices, but labour costs still account for a good three-quarters of the price of a ship, and in an international industry the customer cannot always be forced to bear the burden.

International Comparisons of Labour Costs

The study of relative changes in labour costs which has been made by the secretariat of the United Nations Economic Commission for Europe is a brave effort, but its effect has been little more than to demonstrate the fallibility of statistical exercises when these are conceived in a too ambitious way. The new study opens with a retraction of calculations made in the *Economic Survey of Europe in 1948*, which the Commission published in May. Those calculations attempted to show the movements in European industrial wages and labour costs in relation to corresponding changes in the United States. They need not be recapitulated, since the Commission now admits that "an important error has arisen in them" because "movements in the hourly earnings in industry have been compared with the movements in output per man without any allowance being made for changes in the number of working hours." Since the number of hours worked per man in the United States rose by 13 per cent between 1939 and 1948, and remained in general unchanged in Europe, this is an error indeed. The general statement, made in the *Survey*, that output per worker in American industry rose by some 30 per cent between 1938 and 1947 has therefore had to be qualified; the new study says that American productivity "on a man-hour basis" rose by only 10 per cent between 1935-38 and 1948. It also purports to demonstrate that labour costs, measured in dollars, have risen considerably less in Britain than in the United States. The accompanying table gives extracts from the new calculations.

RELATIVE CHANGES OF LABOUR COSTS IN INDUSTRY Indices of Output, Earnings and Costs in 1948. Average 1935-38=100						
	France	Germany (Western Zones) (b)	Italy	Sweden	UK	US
Average output per man-year in industry	94	62	80	121	115	120
Average weekly earnings (national currencies)	1,235a	134	5,645	225	228	249
Annual wages adjusted for employers' contributions to social services (national currencies)	1,457a	135	6,910	230	231	249
Labour costs in industry per unit of output (national currencies)	1,550a	218	8,630	190	201	208
Labour costs in industry per unit of output (US dollars)	196a	232	241	209	165	208
(a) 1937-38 = 100. (b) Second half of 1948. Indices prepared by Economic Commission for Europe.						

Before this pleasant line of thought is carried any further, it is necessary to note that the new study is marked by flaws of a hardly less vital character than those which invalidated the first attempt. Principal among these is the fact that the comparisons of prewar and postwar production are based on a calculation using prewar weights. This can only mean that (other things also being equal) the comparison would be valid if the structure of industrial activity in the countries compared had remained static since 1935. But obviously they have not remained static. The fact that the American industrial economy has changed more rapidly than any other (using, for example, the shift of sources of power from coal to petroleum and the innumerable new technological opportunities which have followed from that shift) is perhaps decisive among all the economic advantages which the United States has enjoyed since the war. As the study itself observes, "the alternative index number using postwar weights would give a lower output for the United Kingdom and correspondingly higher labour costs for 1948." The fact seems to be that the material for a fully comparative study of this kind does not yet exist.

TUNNEL PORTLAND CEMENT COMPANY

SUBSTANTIAL INCREASE IN EXPORT TRADE

AN EFFICIENT AND WELL ORGANISED INDUSTRY

LABOUR'S NATIONALISATION PLANS THREAT TO PRIVATE ENTERPRISE

MR. N. M. JENSEN'S REVIEW

The thirty-eighth annual general meeting of The Tunnel Portland Cement Company, Limited, will be held on October 3rd, at 105, Piccadilly, London, W.

The following is the review of the chairman and managing director, Mr N. M. Jensen, which has been circulated with the report and accounts for the year to March 31, 1949:

The accounts before you are set out in practically the same form as last year, but we have given comparative figures and we have also—for the purpose of clarity—set out the notes to the accounts separately.

PROFIT AND LOSS ACCOUNT

The profit on trading, together with dividends and interest, amounts in all to £1,043,045, as compared with £911,385 for the previous year. There has been a substantial increase in the export trade, in which the high prices have been maintained, and there has also been a substantial increase in the dividends we have received on our trade investments. Provision for income tax and profits tax corresponds to the profits for the year, but, as explained in the notes, we have taken into account reliefs amounting in all to £81,800 in respect of initial allowances on capital expenditure. The net profit for the year, after taxation, works out at £565,811. After setting aside a further sum of £90,000 to a special depreciation reserve, and providing for the dividends on the Preference shares and the interim dividend and the proposed final dividend on the "A" Ordinary shares and "B" Ordinary stock, there remains a balance to be carried forward of £875,160, which is an increase of £274,259 on the previous year's balance.

BALANCE SHEET

The issued capital and capital reserve are unchanged. The investment reserve is increased by £546,115. Of this £409,470 is the amount we have realised on the sale of our stock of Alpha Cement, Limited, over the book value adopted when we acquired this stock in 1938, and £129,802 is the final distribution from a subsidiary company which was in the course of liquidation on March 31, 1948. Special depreciation reserve has increased by a further £90,000 out of this year's profits. Property, plant and equipment has increased by net additions during the year amounting to £1,024,514, mainly expenditure on our new works in North Wales, and on the new kiln and grinding plant at West Thurrock. Notwithstanding the sale of our Alpha stock, trade investments have increased from £2,188,029 to £2,386,336. This is mainly due to our taking up our share of increases in capital by the Helwan Portland Cement Company and Ribblesdale Cement, Limited. During the year we have disposed of our British Government securities and there has been a consequent increase in cash at bankers and in hand, and tax reserve certificates.

DEMAND FOR CEMENT

During the year under review, the total deliveries and the export of British cement were greater than ever before. Export is still to-day a sellers' market, but there are indications that the demand is slackening, which

may result in lower prices and reduced deliveries. Any such decreases may be expected to be offset by an increase in the home deliveries as more labour becomes available for building and civil engineering work.

EXTENSION OF PRODUCTIVE CAPACITY

At West Thurrock our new cement kiln is now in full operation and more grinding equipment and packing plant are being installed. Our new works at Padeswood, I am sorry to say, is not yet working, but we are expecting the first unit to be started in October, and the second unit soon after. This means that we shall have been more than four years in building this new works, in spite of all the preparations made beforehand. Prior to the war, we could comfortably have built a similar works in less than eighteen months. The delay is, to some extent, due to the lack of steel and the consequent long delivery of machinery, but a main reason is the numerous consents and licences required and the failure of the authorities to co-ordinate and time the grant of these so that work could proceed smoothly. We have had the goodwill of the local authorities, as well as of the various Government departments, and we have met with every courtesy throughout, but the fact remains that the machinery of Government planning and control has become so involved and cumbersome that it slows down all operations and almost kills the urge for development.

As you are aware, we increased our capital in January, 1946, for the purpose of financing our programme of expansion. This capital has not yet earned any money, and you will realise what a tremendous burden the extra delay has been on your company. Had we been able to complete our extensions in normal time, we should have saved in interest alone a matter of some £150,000 and the country would have been able to export a further £3,000,000 worth of cement.

In January last we received permission to go ahead with the extension of our Pitstone works after it had been held up for nearly four years. This works was originally laid out so that it could be readily expanded, and it is one of the lowest cost works in the country. Had we been able to follow our own desires in this matter we should have saved the very substantial amount of money representing the difference between the cost then and what the extension will now cost us, and we should have been able to make still further quantities available for the export market.

OVERSEAS INTERESTS

I am happy to report that the Helwan Portland Cement Company in Egypt has had another successful year. The demand for cement in that country has grown continuously and it has recently been decided to expand the works still further. In order to finance this, the capital is being increased from £900,000 to £1,100,000. We have received the Bank of England's consent to subscribe our share of the new capital.

Last year I referred to the building of a small works in the Sudan. This has now commenced operation, and your company has arranged to subscribe 50 per cent. of the capital. The remainder of the capital is to be subscribed partly by the Helwan Company

and partly by other Egyptian interests, but we are hoping that it will be possible for Sudanese interests to be represented also.

Your company has taken a small interest in a new venture. The Caribbean Cement Company, which is building a works in Jamaica. This is particularly interesting because it is a joint American and British venture with a fair share of the capital raised locally.

The National Portland Cement Company in the U.S.A. has had a fairly successful year during 1948, and there are signs that we shall soon again see a satisfactory return on this investment.

ALPHA CEMENT, LIMITED

From 1938 until early this year, your company held 26 per cent. of the Ordinary capital of Alpha Cement, Limited, and the Associated Portland Cement Manufacturers, Limited, held the remaining 74 per cent. This joint interest worked satisfactorily on partnership lines until last year when it became clear that the Associated Company proposed to exercise fully its majority powers, with little regard to the views of your company, and to cease co-operation on the previous lines. Your Board decided that, in this situation, it would be better to bring this joint interest to an end, although our share in the productive resources of Alpha has been a useful supplement to your company's own production. Eventually it was agreed that Associated would purchase your company's holding of Alpha stock, and, at the same time, they undertook to dispose of the stock in your company which was issued to them when the Alpha stock was acquired. These transactions were duly carried out in the earlier part of this year.

TOWN AND COUNTRY PLANNING

In my review last year, I mentioned that the provisions of the Town and Country Planning Act, 1947, about development charge were causing grave concern in the cement industry and other industries which win and work minerals to provide their raw materials. It then appeared that we might receive out of the fund of £300,000,000 inadequate compensation only for the loss of our development rights, while a substantial development charge would be added to our costs of production. This was pointed out during the passage of the Bill and the Minister gave a pledge that a scheme would be introduced under which mineral undertakings would be granted full compensation, but only on a limited proportion of their resources.

Through the Minerals Committee of the Federation of British Industries, on which we were represented, the extractive industries have pressed the Central Land Board that the differing circumstances of individual firms in each industry should be considered and full compensation paid. A recent announcement by the Chancellor of the Exchequer shows that the Government has accepted this view. The claims of each individual firm for loss of development rights in its own minerals will now be looked at separately and settled in full.

This announcement, coupled with statements by the Central Land Board about the practice they propose to follow in assessing development charges, suggests that the amount of compensation for loss of development rights in our quarries will be approximately equivalent to the development charge we shall have to pay. On this basis the company will not suffer the grave hardship which was feared.

LONG SERVICE BONUS

For some years your company has had a profit-sharing bonus scheme under which nearly all our workpeople received a dividend on a notional amount of shares. In the case of some of the older employees this has amounted to as much as £12 10s. per annum. Your directors came to the conclusion last

year that it would be better to substitute a long service bonus for this arrangement, and a scheme was therefore introduced before Christmas under which, subject to certain conditions, all our workpeople receive an annual long service bonus at the rate of £1 for each full year they have been in our employ. I need hardly tell you that this decision was accepted with gratitude by all our workpeople.

NATIONALISATION THREATS

As you are undoubtedly all aware, the Labour Party has decided to put the nationalisation of the cement industry, the sugar industry, water supply and some industrial insurance on its programme for the next election. One wonders why a relatively small industry like cement should have been singled out for this purpose. The cement industry in its efficiency compares favourably with that in any other country including the U.S.A., and in the matter of sale prices it is ahead of any other country in the world to-day, in all of which prices are higher than at home. It is in relatively new hands and is well organised, but the floride Committee, which was appointed by the present Government, made it abundantly clear that the cement industry had not abused its position.

This company's initiative and urge to develop has not suffered by its co-operation with the other companies in the industry. May I just remind you that 20 years ago your company's capital consisted of only £100,000 Ordinary shares with a loan capital of £142,500 six-and-a-half per cent. debentures? The output of your works was a mere fraction of what it is today, and, in addition, your company now has substantial sums invested in overseas cement works and other undertakings. During the war years we have, of course, not been able to expand, and in the years after the war we have met with the difficulties I have mentioned; but, at the moment, your own company and other companies in which we hold an interest of 50 per cent. or more, are involved in an expenditure of about £3,800,000, mainly for the purpose of expansion.

At the Blackpool Conference in June last, the Lord President made the following statement:—

"Private enterprise can no longer be allowed to go its own sweet way. In the present state, all business, socialised and private, is the nation's business. The only proper justification for private enterprise is that it shall be efficient, economical, really enterprising and working for the common good. If it meets those requirements it will deserve well of the country, and receive the praise of Socialist Ministers. If it indulges in anti-social conduct it will be pulled up short and sharp."

I appreciate that this statement was made to excuse to his supporters the continued existence of private enterprise, and to threaten any private industry which failed to receive the praise of Socialist Ministers. It has, however, been thought to indicate that industries that were efficient, economical and enterprising and working for the common good might regard themselves as free from the threat of nationalisation. The selection of the cement industry proves how little regard in this respect can be paid to Mr Morrison's statement. If the findings of the various Committees appointed by the present Government are anything to go by, the cement industry has deserved well of the country. It has even received the praise of the present Minister of Works when he wrote some time ago:—

"I recognise that the industry has attained a high standard of efficiency and that its record of production at a time when replacement of plant has been virtually impossible, reflects credit on all concerned."

It is clear, therefore, no industry can in future feel itself safe against nationalisation as long as there is a Labour administration in

power—no matter how admirably such industry may be conducted.

If the Labour Party really believe in Britain and want Britain to believe in them, one would have thought they would have wanted to digest some of the immense amount of legislation that has been passed in recent years, and endeavour to prove to the country by results that their policy was right. Perhaps insufficient time has yet elapsed to prove anything, but, so far, there is no evidence to show that the country is better off with the nationalisation that has taken place. It was undoubtedly expected by well-wishers of Labour that the nationalisation of certain industries would improve conditions of and, at the same time, act as an incentive to the labour employed in such industries, but the country is still looking for evidence of this. Is there, in fact, anything to show that the State is a better or more considerate employer than well-run private enterprise?

The supply of cement is doubtless of national importance, but does anyone of intelligence and unbiased judgment in these matters believe that a nationalised cement industry will make more or better or cheaper cement than the present industry is able to do? Can anyone conceive that any organisation set up to conduct a nationalised cement industry could find and satisfy buyers in export markets as effectively as the present industry can, bearing in mind that export will not always be a sellers' market?

WE WORK OR WANT

The Government has placarded our hoardings with the slogan: "We work or want"; the Chancellor of the Exchequer has repeatedly offered the plainest of warnings to the same effect; we hear constantly the cry for more production. The plain fact is that as a country we are not working hard enough.

Ten years of total war in a span of one generation have undoubtedly taken their toll and affected us all in our desire, or rather lack of desire, to work harder and new incentives are, therefore, required to get the wheels moving at a satisfactory speed once again.

In relation to its output, the cement industry is not nowadays a large employer, since it requires only 2½ to 3½ man hours to manufacture a ton of cement, while 100 to 150 horse-power hours are used. Few other industries are mechanised to such an extent and they are, therefore, more adversely affected than the cement industry by any lack of human effort. This shows itself when, for instance, your company has to pay 200 per cent. more for its coal than it did in pre-war days and only receives 65 per cent. more for the cement sold in the home market.

The country is in a bad way and what is the remedy? Mere exhortations will not do. Shorter working hours and longer holidays may help to spread employment over a greater number of people, but they will not increase production. Social security should lead to happier living conditions, but unless it is accompanied by greater effort, there is obviously a danger that the country cannot afford the present schemes which will themselves become insecure.

Must we go through a period of lower standards of living and all the hardship and strife that this would involve before things can really be put right?

It has fallen to my lot to work in several countries and I have, for some years, had close contact with industries in other countries and, therefore, I have perhaps more opportunity than most to make comparisons. May I just make these comments? Most people nowadays do not quarrel with the principle of giving an equal opportunity to all, but are we not in this country going further than this? When an equal opportunity has been given, should there be no distinction made between those who have taken advantage of such opportunity and those who have not, or have even misused it? Is it not time

that we rewarded skill and hard work more than they are being rewarded to-day? Trade unions have done good work in bettering the lot of the working man, but, generally speaking, they have been opposed to payment by result, presumably from fear of exploitation and unemployment. Is it not possible for industry and trade unions to get together and evolve some scheme whereby the less fortunate worker is reasonably safeguarded and, at the same time, full scope and additional reward are given to the more hard working and skilled men? I believe this is the only real way in which production can be increased, but such incentive would be of no avail unless it was accompanied by a reduction in taxation.

STEPS TO SAFEGUARD SHAREHOLDERS' INTERESTS

Your Board has, for some time, been engaged on the question of how they could best safeguard your interests in the event of nationalisation being proceeded with. They are considering a proposal which would, broadly speaking, involve disposing of the overseas assets to a new company, in process of formation, to be called "Tunnel Cement Investments, Limited." The shares of this new company will subsequently be distributed among the holders of the Preference and Ordinary capital of your company by a reduction of the share capital and of the share premium account to which the consent of the Court will be necessary. Detailed proposals will be placed before all classes of shareholders in due course, and they will, in the opinion of the directors, safeguard the relative interests of the holders of both Preference and Ordinary capital.

May I, in conclusion, pay a tribute to our staff and our workpeople? I would particularly like to thank our staff for the steadfastness and loyalty they are showing us in spite of the unsettlement caused by the clouds of nationalisation hanging over us.

PEERLESS AND ERICSSON, LIMITED

MARKED PROGRESS

The twenty-first annual general meeting of Peerless and Ericsson, Limited, was held on September 14th in London, Mr Hugh Wylie, C.A. (chairman of the company), presiding.

The following is an extract from the chairman's circulated address:

The net profits before tax, of £217,229, represent a considerable increase over the previous year's figure of £104,308.

The year 1948 has been one in which marked progress has been made by the company in welding together the diverse adjuncts acquired in 1946 into one active producing entity. The results of these efforts are extremely gratifying, and are such that opportunity has been given to recommend an increased dividend and a bonus on Ordinary stock to compensate for the fact that in respect of the initial period of the trading operations of the group the Ordinary stockholders received no dividend.

In the export field the company has taken active steps to promote overseas sales of its machines, and to that end subsidiary companies have been incorporated, firstly in Belgium to deal with continental requirements, secondly, in Australia to cope with the demand for its products in Australasia, thirdly, in Eire, and it is at present on the point of incorporating a distributing organisation in Canada in respect of which the Treasury have granted the required permission for transference into hard currency of the amount deemed necessary for working capital.

The order book of the company continues to be satisfactory.

The report was adopted.

TATE & LYLE, LIMITED

THE FIGHT AGAINST NATIONALISATION

LORD LYLE'S VIEWS

At an extraordinary general meeting of Tate & Lyle, Limited, held on September 15th in London, the board's proposals for the segregation of certain assets based on the belief that nothing but harm to workers, consumers and stockholders alike could spring from the nationalisation of the sugar-refining industry, were approved and subsequently confirmed at separate class meetings of holders of Preference, Ordinary and Debenture stock.

The Rt. Hon. Lord Lyle, of Westbourne (the president), in the course of his speech, said:—

Nationalisation as a general policy is, of course, a matter for party politics. My politics are well known and I am opposed to nationalisation as a general policy. But that does not prevent me from being able to weigh the pros and cons of the nationalisation of one particular industry, as indeed those who favour nationalisation as a general policy should also be able to do. Unfortunately, the constitution and methods employed by the Socialist Party make every detail of the draft programme of its executive a political issue. The party bosses seek to make the nationalisation of sugar refining a question of party loyalty. Sections of the Socialist Party who have more practical experience than those who hurriedly included sugar refining in their programme are discouraged from making their views known. It is not our job to be engaged in political controversy. I deplore the diversion of effort which has resulted from the suggestion of a small body of men to nationalise sugar refining.

ANSWERS TO ALLEGATIONS

In the circumstances that have been created, we have no other course open to us but to argue our case in public. I intend, therefore, to demonstrate to you that there is no foundation for the reasons that have been given for the nationalisation of sugar refining. I shall do my best to treat the issue objectively.

"Labour Believes in Britain" said that sugar refining is controlled by a state-protected private monopoly which has enabled large profits to be made for private shareholders. It also said that one concern dominates the sugar industry. The party's spokesman said at Blackpool that the time had come to end a private monopoly which had been state protected and supported for many years.

NO MONOPOLY

These statements charge your company with being a monopoly, with being subsidised and by inference of pursuing a dividend policy which is against the interest of consumers. What are the facts?

It is true that sugar refining, insofar as very elaborate and expensive machinery and equipment are necessary for maximum efficiency, is better conducted by large, rather than small firms. Nevertheless, there are still seven companies which refine sugar in this country. The largest, your company, supplies 53 per cent of consumption. The second largest, the British Sugar Corporation, supplies 23 per cent. The remainder is accounted for by the other five companies and by sugar consumed, but not refined, in this country. There is no price ring. It was only because the refiners kept prices low and quality high that sugar was not imported from abroad, that new refining concerns were not started, nor refining processes installed by manufacturing users.

How can the charge of monopoly be substantiated in the face of these facts? Let me turn to the charge that we are state protected and supported.

Sugar refiners receive no subsidy. They never have received a subsidy nor can I

foresee circumstances under which they would require a subsidy. We are not disputing that in 1928 the duty scale was varied to discourage dumping of heavily subsidised foreign refined sugar, but it is a gross extravagance to charge us with being State protected. It must not be forgotten that a continuance of foreign dumping would have involved the Treasury in large increases in the beet subsidy.

PROFITS A MEASURE OF EFFICIENCY

Let us turn to the charge that Tate & Lyle has made large profits for private shareholders. We are not ashamed of making good profits. They are a measure of our efficiency. But to imply that these profits have been made for private shareholders by exploiting the consumer is a travesty of the truth.

For every £100 distributed as dividends last year, nearly £200 of profits were retained in the business. This process has been continuing for years. These sums have been used to expand the business and should be regarded as stockholders' savings. Are stockholders not entitled to a fair rate of interest on their savings? One cannot help comparing dividends which have been virtually the same for 14 years with wages which have increased by 63 per cent. during the same period.

Last year net dividends were only .7 per cent. of turnover. This was equivalent to one-twenty-eighth of a penny per lb. of sugar sold. The average consumption of sugar per person is 85 lb. a year whether bought from grocers or eaten in cakes, biscuits, jam, golden syrup or the like. So that the average person contributes only about 3d. per annum to the owners of the capital equipment used in the refining of the sugar which was consumed by him. I make no apologies for forecasting that under bureaucratic control the increase of cost of production would far exceed this.

STOCKHOLDERS' RIGHT

Finally, let me turn to the stockholders. It is your savings that have gone to build up this business. Many of you have invested your money in the company because you saw that it was well run, pursued a conservative policy in the distribution of profits, maintained its assets and was slowly expanding. You have had every right to expect to see the day when the distribution of profits could be increased. You have had every right to expect a share in the gradual increase in the prosperity of the company. This right is to be taken away from you by the nationalisers.

In the war all those who loved their country joined together and stood shoulder to shoulder in the cause of Britain. Today the commercial greatness of Britain is again threatened and with it the country's whole financial position. Surely party politics should be cast aside and only decisions taken which will stimulate and strengthen British Industry and Enterprise. The actions of the nationalisers are calculated to divide the country at a time when the Government is rightly exhorting free enterprise to greater efforts. The effect of these opposing voices is to hamstring initiative and enterprise in every industry, whether it is directly threatened or not. It is our duty to see that the public knows the facts and that the nationalisers are diverted from their purpose.

FINANCIAL ARRANGEMENTS

Mr G. Vernon Tate (chairman of the company) said: When you have passed the resolutions and subject to the consent of the courts, the ordinary stockholders will in due course have shares in three companies instead of at present one. These companies will be: Tate & Lyle, Limited; Tate & Lyle

Investments, Limited; and Silvertown Services, Limited.

Tate & Lyle will be divested of its subsidiary companies which have not in the past, owing to our policy of ploughing back profits, contributed greatly to the profits of Tate & Lyle. The board hopes, therefore, that the distribution of profits of Tate & Lyle will not be affected by the hiving off of the subsidiaries. After the transfer of the assets of these subsidiary companies, the nominal value of Tate & Lyle shares will be 15s., but providing the gross dividend distribution remains the same there should not be a corresponding reduction in market value.

The reorganisation has the general effect of segregating the assets of Tate & Lyle, Limited, which are not essential to the carrying out of their business as sugar refiners. It is a step which might eventually have come in any event. The timing, however, was decided by the threat of nationalisation. The reorganisation will not, of itself, stave off nationalisation. It will, however, I hope, protect and improve the rights of shareholders in the event of our refining assets being seized.

The President, in a subsequent speech, said: I would like to spend a short time in telling you what we have done so far in our fight against nationalisation. I would like also to consult you on our future plans. In preparing our plans we must try to read the minds of those who are advocating a state monopoly in sugar refining.

I do not believe that the excuses put forward publicly by the nationalisers for seizing our business represent their true reasons. There are other well-worn arguments which one would have expected these men to have trotted out to justify state ownership. Among them is the improvement of efficiency and labour relations. These things have been conveniently forgotten.

EFFICIENCY NOT ATTACKED

The nationalisers have not dared to attack our efficiency. We have the finance, technical ability and the research organisation to maintain our world-wide reputation.

The distribution organisation which has been developed over a long period by co-operation between refiners, manufacturers and the distributive trades is, I think, unique. The cost of getting sugar to the grocers' shops is extremely low and the delivery service available to the retailer quite exceptional.

The nationalisers have not dared to disparage our labour relations. What other company of our size can claim our long service record? About 50 per cent. of all our men have had 15 years' service and 20 per cent. more than 30 years. Relations with the unions are excellent. Wages are high and no one has less than a fortnight's paid holiday. Pensions and sick pay are on an unusually generous scale. How long will these last under nationalisation? According to Mr Herbert Morrison's recent statement to the Trades Union Congress—not for very long. Extra pay is given for long service and there are marriage dowries for girls. Good meals at prices which are subsidised out of our profits to the extent of over £1,000 per week are part of the general conditions of employment. These conditions have only been made possible by high output per man. This in its turn has been achieved by the skill of the management and by the willingness and loyalty given so naturally by the workpeople in a free enterprise firm, but conspicuous by its absence under state monopoly.

With your agreement, we will carry on our business of sugar refining in defiance of the present threats, in the belief that we will remain our own masters. We have large projects in mind for all our refineries. These projects are planned to increase still further our reputation as the leading sugar refiners of the world. We will proceed with them all. We will not allow threats, from whatever direction they may come, to frighten us into becoming bad sugar refiners.

FURNESS WITHY AND COMPANY, LIMITED

GROSS INCOME WELL MAINTAINED

The fifty-eighth annual general meeting of Furness Withy and Company Limited will be held at the registered office of the company, Furness House, Leadenhall Street, London, E.C., on Friday, October 7.

The following is an extract from the statement by the chairman, Sir Ernest H. Murrant, K.C.M.G., M.B.E., circulated with the report and accounts.

The gross income of the parent company was very well maintained with the exception of our American branch offices, which suffered a setback in several sections of their business.

In the final analysis we have a surplus of £506,726 to deal with in the parent company's accounts, compared with £497,054, and this surplus your directors recommend should be utilised by transferring £200,000 to fleet replacement reserve. The Preference share dividend has absorbed £41,250, and the proposed dividend of 8 per cent., less tax, on the Ordinary stock will take a further £264,000. There is then £246,001 to be carried forward to the current year, against £244,525 brought in.

A TROUBLESOME YEAR

On the whole, the past year has been a troublesome one with few signs of any improvement in general trading conditions, and some signs of deterioration. Such increases as there have been in our shipping profits have been due to new tonnage coming into commission and, in particular, to the inclusion in the current accounts of two and a half months' trading of the Queen of Bermuda, which vessel, after undergoing 21 months' reconditioning at a cost considerably in excess of her original construction cost, re-entered the New York-Bermuda service under contract arrangements with the Bermuda Trade Development Board.

Engaged as we are in the shipping business in practically every part of the world, it is not surprising that we have encountered a great many of the difficulties which arise in the ordinary course of international commerce. The outstanding features of the past year have been those which are associated directly and indirectly with exchange problems; with continually increasing costs (with the exception of oil fuel), with labour unrest, and, recently, a decline in the general level of freight markets.

INCREASING COSTS

The subject of increasing costs—both capital and operating costs—has become so hackneyed that it seems almost useless to reiterate the seriousness of figures which either appear to be disregarded because explanations can be found for them, or ignored because it is thought that they are inevitable in existing circumstances. Ultimately, however, the facts will compel attention when the serious consequences cannot any longer be evaded. In the meantime stockholders should not be left in ignorance of the facts. Within our own group of shipping companies we had 13 ships under construction at the end of our financial year on April 30th, and in respect of those ships, the actual and estimated increase in cost (due to increases in wages, in the cost of steel, in the cost of sub-contractors' items, and loss of time) compared with the contract basic prices amounts to no less than £825,986, and the end is not yet.

Obviously this unproductive item takes close upon a million pounds out of our resources and equally obviously, so far from the ships being able to earn a single penny more because of this increase in costs, they must carry an annual charge for depreciation and

interest far in excess of what was contemplated at the time the contracts were placed.

ALLOWANCE FOR DEPRECIATION

Reference was made a year ago to the burdensome nature of taxation and its unfair incidence so far as shipping is concerned in that it prevented shipowners from accumulating sufficient reserves to take care of the cost of replacing its capital assets. Our arguments were placed fully before the Chancellor of the Exchequer, who probably found himself slightly deafened by the general clamour of industry for some relief from the burden it is asked to carry. However, amidst the deafening clamour some part of our representations must have reached the Chancellor's ear and touched his heart, as in the 1949 Budget he has advanced the initial allowance for depreciation in the case of newly constructed ships to 40 per cent. This undoubtedly is a very useful concession, but it should be appreciated that in reality it is a financial concession rather than a tax concession inasmuch as while it gives shipowners the earlier use of the capital represented by wear and tear allowances, it does not in any way increase those allowances, and what is gained in the first year of a ship's life will have to be made good at a later date, so far as the liability for taxation is concerned. The shipping industry has reason to be satisfied that the very difficult problem of financing the replacement of tonnage at current high costs has to some extent been appreciated and that an attempt has been made to meet it.

A LONG AND TORTUOUS ROAD

It will be recalled that British shipping has travelled a fairly long and tortuous road in the past ten years, commencing with the complete requisition of all tonnage for war-time operations and subsequently subject to a variety of restrictions and controls upon the use of tonnage and upon freight rates. The past year has seen the removal of the last of those operational controls and there only now remains one major control in respect of deep-sea shipping—namely, the Transfer Restriction Act. The last of the controls on freight rates was removed by agreement with the industry in December last, since which date owners have been free to employ their ships as they wished and freight rates have been subject to negotiation in something approaching more normal market conditions. I use the word "normal" with some reluctance because of the great difficulty in defining what is normal, and because it cannot be said with accuracy that markets which remain under the influence of bulk buying and tonnage chartering by Government Departments have returned to normal conditions. The Minister of Transport has gone as far as he could reasonably be expected to go towards freeing shipping, and he did so at the earliest practicable moment.

That his policy has been fully justified is shown by events, and I suggest that the Minister's role has now changed direction. Hitherto his main task has been to ensure that British tonnage was employed to the best advantage in the national interest, a task which was not made unduly difficult owing to the full and willing co-operation of the industry. Now his task seems to be changing in the direction of ensuring that his responsibility for the welfare of the industry—which at some future date he may again require to find in a full state of adequacy and efficiency—is not made more difficult by other Departments of the Government which control a powerful volume of shipping business.

MUREX LIMITED

CAPITALISATION OF RESERVES

The thirtieth annual meeting of Murex, Limited, was held on September 12th in London, Mr George P. Josepa (chairman) presiding.

The following is an extract from the chairman's statement circulated with the report and accounts for the year ended April 30, 1949:—

The improvement in the availability of materials and labour has enabled more progress to be made with the expansion programme and capital expenditure on physical assets at the parent company's works and the works of Murex Welding Processes, Limited, amounted to £133,000.

Your company's interest in Hard Metals, Limited, Johannesburg, was unchanged at the year-end. The erection programme on the site purchased at Springs, Transvaal, is well advanced and interim production has already started; the erection of the carbide plant is scheduled for completion towards the end of 1949, and it is anticipated that the entire plant will be in production early next year.

The consolidated trading profits of the parent company and its subsidiaries are £874,268, an increase of £178,440 compared with the previous ten months' period; the consolidated net profits again represent 5 per cent. on the sales turnover.

Since the issued ordinary capital was increased in 1937 to £1,000,000 the company has set aside out of profits to reserves £1,297,000. At April 30th last total revenue reserves in the parent company's books were £1,531,016, and in the consolidated accounts £1,923,348.

Consent having been given by H. M. Treasury, your directors feel it desirable to bring the issued ordinary capital into closer relationship with the total funds employed in the business, and have decided to submit resolutions to this meeting to capitalise £1,000,000 of the company's reserves and to issue one fully paid ordinary share of £1 (to be converted into stock) for each £1 unit held by ordinary stockholders.

The overall demand for the products of the parent company has continued at a satisfactory level. The turnover for the year showed an increase over the annual rate for the previous period and there was an increase in the volume of output for the year.

The volume of export sales of the products of the parent company for the year is at the annual rate for the previous period.

The research departments at Rainham and Waltham Cross have been actively engaged on investigations directed either towards the improvement of the quality of our existing products and production methods or to the development of new products and manufacturing techniques.

The opening months of the new financial year have not shown any material change in the general level of demand for the parent company's products in the home market. Demands in the European export market, which has always provided the major part of our export business, are at a lower level due to the international situation and to currency difficulties.

The improvement in steel supplies in recent months has enabled U.K. electrode manufacturers to make good the acute deficiency which existed in the home market, and it is likely that the home requirements of electrodes are now being met by U.K. manufacturers; provided the present supply position is maintained we should be able to increase our deliveries in the export market.

The report was adopted and resolutions were passed increasing the capital of the company from £1,650,000 to £2,650,000 by the creation of 1,000,000 new ordinary shares of £1 each and capitalising £1,000,000 of the company's reserves for distribution as fully-paid shares to the ordinary stockholders.

INTERNATIONAL TEA STORES

RECORD TURNOVER

The annual general meeting of the International Tea Company's Stores, Limited, will be held on October 3rd, in London.

The following is an extract from the annual review by the chairman, Mr. Frank Wilson, circulated with the report and accounts:

The turnover from all sections was a record in the history of the company and registrations throughout the period showed a considerable increase. Since the close of the financial year, however, there has been a complete re-registration. The total figures to date do not indicate any great change, and we are confident that the final totals comprising the whole of the group will show an improvement.

Turnover continues to increase, and as we pride ourselves on the service we give in our branches, we are satisfied that our customers will not only retain their registrations with us, but that their commendations and our excellent staff will attract new registrations. The factor which is disturbing is the currency problem which must reduce to almost negligible quantities the many and varied items of food imported from hard currency countries. On the other hand, certain commodities are available from other sources in slightly increased quantities, and they tend to offset any decline in trade resulting from the shortage of commodities from the hard currency areas.

STRONG POSITION

The liquid position, both of the parent company and of the group, is very strong. The accounts, in my opinion, are very sound, and this accords with our continued efforts to strengthen our balance-sheet, which has been the first principle in all our considerations.

In coming to the profit at £1,303,350 it is approximately £24,000 less than last year. I must, however, point out that for the parent company, this year's figures relate to a 52 weeks' trading period against 53 weeks last year, so that on a yearly basis we are approximately level. In the consolidated accounts the drop is about £125,000, but there are special features accounting for this decline.

In the first place there were, in last year's accounts, certain profits attributable to the upward trend in the selling prices of commodities. We then decided to set aside £100,000 as a reserve to meet possible future depreciation in stock values. We have not used that sum, or any part of it, but the upward trend during the year now under review has not been so noticeable.

The continued rise in all expenses of running the business, especially in wages, which have shown further increase, and the reduction in many of the profit margins tend, in spite of increased turnover, to reduce the percentages of both gross and net profits. Again, while a number of our international branches, and practically the whole of the branches of certain subsidiary companies, were compelled to meet competition by way of price reductions for some months of the financial year, which is reflected in the final results of the branches concerned, we are satisfied with the year's trading in those cases, bearing in mind the difficulties under which they traded.

I feel sure you will consider the results satisfactory when read in conjunction with the above explanations. The proposed dividend to ordinary stockholders is on the same basis as last year. I will not attempt to express any opinion as to the future. May it be left in this way—the financial structure of your company is sound, and it is so managed that it is well fitted to cope with whatever position may arise.

JOHN MACKINTOSH AND SONS

CAPITALISATION OF RESERVES

LORD MACKINTOSH'S SPEECH

At the extra-ordinary general meetings of John Mackintosh and Sons, Limited, held in London on September 8, the resolutions modifying the rights attached to the preferred ordinary stock, increasing the capital of the company, altering certain articles of association and sanctioning the capitalisation of £100,000 in favour of the preferred stockholders and £150,000 in favour of the deferred stockholders were all duly passed unanimously.

The chairman, Lord Mackintosh of Halifax, D.L., LL.D., J.P., in the course of his address dealing with the proposals, said:

Profit as calculated by conventional accounting principles and as computed for taxation is a very different thing from profit as it was known in 1914.

Then it meant the amount available for the shareholders to take in dividends or apply to expansion of the business, subject only to a deduction of less than 6 per cent. as a contribution to the costs of government.

INCREASED TAXATION BURDEN

For each £100 paid in dividends the Government took £6 3s. 9d.; today the least it takes is £142 8s. 6d., and where dividends are kept down, a much higher ratio. In 1943 this company paid £582 in direct taxes for each £100 paid to shareholders.

In 1914, and for many years before that, changes in cost were small and often downwards. Today the cost of new machinery is three times the cost of 1939 and we have to find new capital for the additional cost, since we are only allowed depreciation on the original cost of the equipment used up.

We have also to find capital for the artificial price of our raw materials, which have been charged to this industry after the Minister of Food has made a profit of some millions of pounds. He in turn has had to buy cocoa from the West African Cocoa Board which, in its turn, has made a still greater profit.

SHAREHOLDERS AND INDUSTRIAL PROFITS

I mention these matters to draw your attention, and I hope the attention of others, to the fact that industrial profits are no longer solely the concern and property of shareholders, and indeed we are junior partners in the rewards and senior partners in responsibility. We paid shareholders almost exactly 10 per cent. of last year's profits, and we have paid the rest in taxes, equipment and increased price of stocks.

This year we are making these conventional profits at the same rate as in 1948; we have paid no more in dividends yet we had to borrow £100,000 to pay for the increased stocks of raw materials during the period when sweets were unrationed.

There are several conclusions which may safely be drawn from these changes in the nature and ownership of industrial profits.

NATIONAL SAVINGS OR SOCIAL REVENUE

The first is that conventional profits are not profits at all in the old sense of that word.

To our fathers, and indeed to many of us who are over 50, profit was "what you could pay your private bills with," or something very close to that. Now, profit is primarily the measure of the amount we have collected for government uses, secondly, the fund on which we must draw to keep our equipment from deteriorating, and if we are lucky to improve it, thirdly, to pay for the higher costs of raw materials and manufacture, and, finally a small residuum for dividends.

We need a new word to describe this fund, a large part of which is social or communal revenue, and only a small part shareholders' profit, though we hope that our proportion will increase somewhat when prices fall. More than half of industrial profits are national savings, even if they are afterwards spent on social services and national security.

LIMITATION OF CASH DIVIDENDS

Our second conclusion is that for the present at any rate, very little of this so-called profit (which is largely a social income) is available for cash dividends to shareholders. Quite apart from the Chancellor's request, both the national position after a destructive war, and our own financial position demand that we conserve cash, and do not make it available for consumption.

It is not, however, sufficient to limit cash dividends, we must do our best to maintain these conventional profits at a level high enough to meet the inevitable demands on them. It would be much easier for us to make smaller profits, and we would still have enough for the small cash dividends we pay, but during this time of limited output and reduced competition at home, we have worked incessantly to improve every process of manufacture and to exploit export markets.

THE DIRECTORS' TASK

To keep up the pressure for higher efficiency is today one of the greatest, perhaps the greatest task of directors. The difficulties and frustrations of fluctuating raw material supplies, the many coupons, permits, controls and high taxes, tend to produce managerial fatigue. This must be fought in our trade associations, on our boards of directors, quite as much as among department heads and in our factories.

Direct monetary reward for successful effort is weakened by progressive taxation, and though within limits it is still useful we must rely more on a sense of achievement. To maintain a steady flow of goods from the point of origin of our raw materials to the consumer of the finished article, without friction or waste is the proper aim of management. That we have done this with some measure of success is shown by the fact that the price of our leading line is now 3s. 6d. per pound, as against 2s. before the war, although we have had to pay five times the prewar price for cocoa beans and over three times the price for sugar, our two main ingredients.

Your directors believe that in the present circumstances of the country and this industry we must try to maintain our conventional profits at a fairly high level and keep down cash dividends to a low level.

ACCUMULATED RESERVES

Over a period of 25 years we have accumulated £800,000 of reserves after paying taxes at varying rates, and the net dividends paid are a lot less than when I first became chairman nearly 30 years ago.

There is some talk of lowering prices at the expense of profits. Half of any such reduction would have to come from Government expenditures or be levied elsewhere.

More important, the lower prices would leave more money to be spent on other things, and total consumption would tend to rise without any greater product, which would merely raise prices elsewhere, and we would be back where we started. The purpose of the Chancellor's request for a standstill on wages and dividends cannot be met by financial jugglery. It means a standstill on real wages and real dividends—that is, a standstill on total consumption except as it can be raised by increased production.

At the final meeting the proceedings terminated with a vote of thanks to the chairman and his co-directors.

INDIAN COPPER CORPORATION

A PROSPEROUS YEAR

The twenty-fifth annual general meeting of the Indian Copper Corporation Limited, was held on 14 September, in London, Sir Geoffrey Fell, K.C.I.E., C.S.I., O.B.E., chairman and managing director, presiding.

The following is an extract from the chairman's circulated statement:

The profit for the year amounted to £744,931, compared with £653,427 in the previous year. After allowing for the proposed dividend of 12½ per cent., the carry forward will be £34,865.

Ore treated in the mill was nearly 4,000 tons more than last year. The output of rolled brass was slightly less than for the previous year, the change in rolling a 40 oz. average grade to a 35 oz. gauge adversely affecting production. Coal supplies were again irregular, and production was suspended for nine days in October owing to lack of coal.

The year under review has been the most prosperous in the corporation's history. Members may therefore consider that the circumstances justify a recommendation that the dividend should be increased. We have decided that it would be inadvisable to adopt this course. The considerations which principally influenced this decision were that the enhanced profits were solely due to the abnormally high world price of copper. The labour situation, which was relatively easy during 1948, has deteriorated to a considerable extent since the close of the year.

NOTICES

UNIVERSITY OF MALAYA

The University of Malaya invites applications for a Lectureship in History at Raffles College, Singapore, one of its constituent Colleges.

The Lecturer will be required to assist in giving lectures and conducting tutorial classes in the Modern History of the West.

Salary is on the scale £630 p.a. rising by annual increments of £42 to £1,260 p.a. plus expatriation allowance for persons recruited from overseas of £126 p.a. on salary below £700 p.a. and £210 p.a. above. In addition there is a cost of living allowance of, at present, 10 per cent. of basic salary, subject to a maximum of £210 p.a. for unmarried persons, £423 for married persons and £525 for married persons with dependent children. There is an additional Singapore allowance of 10 per cent. of basic salary subject to a maximum of £70 p.a. (A Straits Dollar=2s. 4d.)

Free passages for person appointed, wife and children under 10 years of age. Quarters (if available) with heavy furniture are provided at a rent of 6 per cent. of salary. Provident Fund Scheme set on a 10 per cent. contributory basis.

The appointment is for 3 years in the first instance, renewable thereafter by mutual consent to retiring age. Applications (6 copies), giving the names of three referees and full particulars of qualifications, should be addressed to the Secretary, Inter-University Council for Higher Education in the Colonies, 1, Gordon Square, London, W.C.1, from whom further information may be obtained. Closing date October 31, 1949.

UNIVERSITY OF SYDNEY

Applications are invited for the position of Senior Lecturer in Economics. The salary range is £750 (Aust.) per annum rising by annual increments of £60 to £1,000 (Aust.) per annum and is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to qualifications and experience. The successful applicant will be required to take up duties as early as practicable in 1950. Applications, supported by testimonials and giving the names of three referees, should be forwarded to the Registrar, University of Sydney, New South Wales, Australia, not later than October 14, 1949.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

AN INTERESTING EDUCATIONAL APPOINTMENT IN AN INDUSTRY is about to be made by a large industrial concern near Chester which has established an educational and training organisation on a considerable scale.

A lady of good general education is now required to organise and conduct the training of typists, computer operators and junior office staff. Previous office and teaching experience would be an advantage.

Applicants should write sending full details of education and experience to Box 3023, c/o Charles Barker & Sons, Ltd., 31, Budge Row, London, E.C.4.

PROGRESSIVE organisation should consider man bored by unenterprising present job. Is a Wanderer who specialised in statistics and has had considerable experience as manager of a market research department. He is 32, has held responsible position in Government department and has more than a nodding acquaintance with advertising. Considers he has analytical and constructive brain and is a potential bargain as individual job more important than present £2,000 salary. Reply Box 199.

Finally, we are still confronted with the necessity to spend large sums on capital works.

On all these grounds we feel that it is essential to conserve our financial resources. The report was adopted.

BOULDER PERSEVERANCE, LIMITED

HANDICAPS ON INDUSTRY

The twenty-fifth annual general meeting of Boulder Perseverance, Limited, was held on September 15th, at Winchester House, London, E.C.

Dr K. B. Edwards, B.Sc., Ph.D. (London), F.R.I.C., chairman and managing director of the company, presided.

The following is an extract from his statement, which had been circulated with the report and accounts for the year ended December 31, 1948:—

The standard of efficiency at the mine is extremely high, a fact wholly supported by the Federal Government investigators. In all directions, increases of cost are taking place and progressive depreciation of purchasing power of the currency makes the spiral an endless one. To the gold-producing industry the all-important economic fact is that the price paid for our gold remains unchanged at A.£10 15s. 3d.

The Federal attitude towards gold remains unchanged and arbitrary, but Commonwealth Treasury assistance to keep the mines going has been promised and the promise implemented. This assistance which is subject to many qualifications, is limited to a payment in cash equal to the deficiency between the

results of the year's operations and a 6 per cent. return on issued capital.

The tremendous incidence of British taxation on Boulder Perseverance has restricted both net dividends and the ploughing back of profits into the mine. Any subsidy given on the basis of issued capital is obviously based on the complete misconception of the operations of gold mining companies, and is grossly unfair.

During 1948, 137,298 long tons of 5.11 dwt. ore were treated, and the total profit after deduction of all charges is £41,523. Kalgoorlie Enterprise Mines treated 53,105 long tons of ore of 6.545 dwts.

With regard to the future, the present position both in Great Britain and in Australia is only too well known. The continuous piling on of burdens in taxation, social services charges and increased wages, irrespective of improved output per man-hour, goes on apace and, while gold reserves are now the keystone of all economic discussion and most countries are striving at all costs to acquire gold, the British and Australian Governments demand gold from the producers at a price yielding a loss to many or on a mere survival basis. As long as this condition endures, which in the opinion of most economists is now comparatively limited, only high-grade mines can hope to pay their way, with the resultant steady reduction in the production of the now admittedly indispensable substance, gold, and the infliction of arbitrary impoverishment on companies who treat gold production as an industry. If and when economic sanity returns, your company is in the position to take advantage of any improvement.

The report and accounts were adopted.

A BANKING CAREER IN THE EAST

THE EASTERN BANK LIMITED has a few vacancies for suitable men as trainees in London for executive positions in the East. Applicants should be between 20 and 24 years of age and unmarried. For particulars regarding salary and conditions of service during training, and on appointment to the Eastern Staff, apply to the Secretary, The Eastern Bank Limited, 2-3 Crosby Square, Bishopsgate, London, E.C.3.

WORKS MANAGER (ASSISTANT).—Responsibilities involve sound knowledge labour utilisation and methods, rate fixing, production management, stores control and relationship with costing organisation. Painters' Brushes and other brushware and component parts. Experience light industry desirable but not necessarily in Brush Trade. Adequate remuneration. Reply in confidence, letters only, stating age, scope of capabilities, experience, etc.—The Secretary, Christopher Long & Sons Ltd., Hazewell Brush Works, Birmingham 30.

B.COM. 25, mobile, ex-R.A.F., seeks permanent career with prospects. Willing to train for executive, research or representative posts.—EM/DNLG, W.C.1.

ROBSON, MORROW & CO. require the services of an outstanding man, Chartered or Incorporated Accountant, with wide industrial experience. Age not over 37. The successful candidate will be trained as a specialist in the installation of accounting schemes for management control. Four figure commencing salary and good prospects. Send full particulars of age, education, qualifications, experience and present salary to Robson, Morrow & Co., 58, New Cavendish Street, London, W.1, marking envelope "Application."

VACANCIES for Male Trainees for executive positions exist in the Market Research Department of a large Company. This is one of the largest Market Research Departments operated by a manufacturer in this country and its activities include most aspects of modern research technique. Applicants should be between 22 and 30 and should have a very genuine interest in this type of work. A good knowledge of statistics and mathematics is required, although a degree in these subjects is not essential. The successful applicants will be required to live in the North of England and to spend approximately 1 to 2 years on fieldwork of various types. Commencing salary and prospects are good.—Please write giving very full details of education, Services' record and business experience, if any, to Box 206.

EDITOR-JOURNALIST has two-to-three days weekly available for publicity or editorial work. Science degree, wide knowledge of industry. Not stunt artist or high-pressure salesman but writer of established ability and reputation. Propositions to "Editor," Rank & Apsimon, 43, St. Martin's Lane, W.C.2.

BACHELOR OF COMMERCE (Honours), incorporated accountant (41), with first class professional and commercial experience as company secretary and chief accountant, requires post carrying responsibilities commensurate with a salary of £1,500.—Box 206.

OXFORD GRADUATE offers London evening tuition in Economics, Statistics, some Moral Philosophy, Politics.—Box 199.

FOR SALE: *The Economist*, 1943-1949 inclusive, complete with supplements and *Records and Statistics*; fine condition in 14 Eastland volumes. Offers.—Box 197.

Investment Statistics

Company Notes

International Tea Company's Stores.—Consolidated trading profit declined from £1,901,133 (for 53 weeks) to £1,776,379 in the year to April 30, 1949. Group net profit was £616,863 (£621,303). Net current assets at April 30, 1949, were £3,631,935 (£3,665,869). The value of stocks increased from £3,150,473 to £3,527,898 and fixed assets from £4,283,470 to £4,653,938.

Tunnel Portland Cement.—Group trading profit increased from £917,749 to £1,029,502 in the year to March 31, 1949. Group net profit amounted to £565,811 (£390,575). Net current assets at the year end were £2,871,717 (£3,140,373). Net additions of £1,024,514 were made to property, plant and equipment. Investment reserve has been increased by £546,115, largely from the proceeds of the sale of Alpha Cement stock and a final distribution from a liquidated subsidiary.

Briton Ferry Steel.—Consolidated trading profit (including profit of London Works (Barlows), Ltd., for 11 months) amounted to £558,577 in the year ended April 2, 1948. Group net profit was £168,244. A dividend of 15 per cent has been recommended for the year (same). Net current assets were £1,507,905 at April 2, 1949. Group reserves amount to £931,144.

Coast Lines.—Total consolidated profit increased from £1,280,889 to £1,469,532 in 1948. Net profit of the group declined from £380,384 to £317,734. Depreciation was £608,223 (£416,671) and taxation £547,146 (£548,210). Total book value of fleet (including payments on account of vessels under construction) was £5,509,388 (£4,719,770) at the year-end. Short-term borrowing of £1,175,045 (£851,700) is outstanding.

Kelsall and Kemp (cotton textiles).—The balance on consolidated trading account increased from £341,636 to £402,401 in the year to June 30, 1949. Group net profit was £153,709 (£133,448) and appropriation to general reserve £90,000 (£50,000). Net current assets at June 30, 1949, were £1,099,335 (£967,813) and stocks £638,762 (£434,727). The dividend of 10 per cent, plus 5 per cent bonus, is unchanged.

British Overseas Stores.—Consolidated net profit amounted to £61,661 (£56,913) in the year to June 30, 1949. Profit for 1948-49 includes £14,000 provisions written back by subsidiaries. A dividend of 10 per cent (same) is recommended for the year. The net United Kingdom rate of income tax applicable to the dividend has not yet been agreed.

Anning, Chadwick and Kiver (hides and skins, etc., brokers).—Consolidated net profit declined from £48,435 to £41,424 in the year to June 30, 1949. A final dividend of 15 per cent and bonus of 5 per cent has been recommended, making a total of 35 per cent for the year.

Kay and Company (engineers).—Consolidated profit amounted to £77,218 in the year to May 31, 1949. A dividend of 20 per cent has been recommended (same).

Smith, Patterson and Co. (engineering).—Profit before taxation increased from £110,897 to £128,989 in the year to June 30, 1949. Taxation amounted to £66,437 (£60,000). A dividend of 25 per cent is recommended (same).

Wiggins Teape.—Treasury consent has been obtained for a 100 per cent bonus issue. The issue will capitalise £1,952,181 of reserves.

Vereeniging Estates.—Stockholders are to be offered 637,338 new ordinary shares in the ratio of two new shares for each five shares held. A further 19,315 new shares will be taken up by African and European Investment Company. The issue will raise some £2,500,000 of additional capital.

South African Pulp and Paper.—Shareholders are offered one new ordinary share for every ten shares held at 25s. per share.

Beecham Food Products.—Permission to deal is being sought in 500,000 4½ per cent cumulative £1 preference shares. Capital consists of £1,150,000, of which £500,000 is in the above preference issue and £650,000 in £1 ordinary shares. Profit of Beecham Food Products and its subsidiaries, subject to taxation, only for years ended March 31: 1948, £455,994; 1949, £311,174.

Capital Issues

Harding, Tilton and Hartley.—A proposed bonus distribution of one 5s. share for each share held will capitalise £116,625 of reserves.

Ault and Wiborg.—Shareholders are to receive one new 5s. ordinary share for each 10s. of ordinary stock held on October 17th.

Murex.—Shareholders have approved the creation of 1,000,000 new £1 ordinary shares to be issued by way of a 100 per cent bonus distribution.

Banister Walton.—By the creation of 1,400,000 5s. ordinary shares the authorised capital is to be increased to £500,000. Shareholders are to receive 490,548 5s. shares by way of a 100 per cent capital bonus.

Tarmac.—Shareholders are to receive one new £1 ordinary share for each two £1 shares held.

Purnell.—Shareholders are to receive 200,000 5s. ordinary shares in the proportion of one new share for each six shares held.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there are two exceptions (rounding 4 per cent and Consols 4 per cent) on which yields are taken to earliest date and marked 'e'. (n) Net yields are calculated after allowing for tax at 9% in £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To latest redemption date. † Free of tax. (g) Yield basis 12%. (p) Plus tax free bonus 2½%.

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 10, 1949, total ordinary revenue was £48,290,000, against ordinary expenditure of £38,809,000 and issues to sinking funds £340,000. Thus, including sinking fund allocations of £7,847,000, the surplus accrued since April 1st is £29,198,000 against £252,139,000 for the corresponding period a year ago.

DO YOU WANT TO KNOW ABOUT BUSINESS IN CANADA?

If you're thinking of going to Canada, or doing business there, consult this Bank first. Through our branches across Canada we can help you get established or supply you with helpful information on business conditions.

THE BANK OF NOVA SCOTIA 108 OLD BROAD ST., LONDON, E.C.2

Over 350 Branches across Canada, in Jamaica, Cuba, Puerto Rico, Dominican Republic, and London, England; an Agency in New York and Correspondents throughout the world.

Established in Canada in 1832 with Limited Liability.

REFUGE ASSURANCE COMPANY, LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £18,000,000
ASSETS EXCEED £107,000,000
CLAIMS PAID EXCEED £198,000,000
(1948 Accounts)

CROWN AGENTS FOR THE COLONIES

ASSISTANT ESTABLISHMENT OFFICER required by the Government of Nigeria for the Railway Department for one tour of 18-24 months with prospect of permanency. Salary according to qualifications and experience in scale £90 to £970 a year including gratuity pay. Outfit allowance £60. Free passages and liberal leave on full salary. Candidates not over 35 must be educated to matriculation standard and have had experience in dealing with staff work in a large undertaking. Preference will be given to candidates who hold a B.Com. or B.Sc. (Econ.) degree or who have followed a course of study on personnel management or secretarial practice. Apply at once by letter, stating age, whether married or single, and full particulars of qualifications and experience, and mentioning this paper, to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M/212/93/3C on both letter and envelope. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

APPOINTMENTS REGISTER

Employers seeking the services of Certified Accountants are asked to write to the Secretary of the Association, 22 Bedford Square, London, W.C.1. (Telephone: Museum 5163.)

INSTITUTE OF INDUSTRIAL ADMINISTRATION

The London Centre announces the following series of lectures on MODERN MANAGEMENT TECHNIQUES at the London School of Hygiene (University of London), Keppel Street, W.C.1. Meetings commence at 7 p.m., and non-members are invited to apply for tickets to the Hon. Secretary, 44 Horn Park Lane, S.E.12:—

September 21st: "Establishing the Objective."
October 20th: "Providing the Conditions of Efficiency."
November 16th: "Detection and Elimination of Waste."
December 11th: "Watching the Money."

BRITAIN'S LEADING MONTHLY ON ASIAN AFFAIRS

EASTERN WORLD

INDIA—PAKISTAN—S.E. ASIA—FAR EAST—PACIFIC

YEARLY SUBSCRIPTION £1 (post free). SINGLE COPIES 1s. 6d.

Write for Sample Copies to:—45, Dorset Street, London, W.1

HOSTEL OF ST. LUKE, 14 Fitzroy Square, W.1. A Nursing Home for Anglican Clergy and families. Majority of patients treated free. Not under Ministry of Health. Dependent on voluntary contributions. Expenses heavy. Please help by subscription, donation, legacy, to the Secretary.

TWO INDUSTRIALISTS.—Experienced executive, aged 41, educated public school, Cambridge and Glasgow Universities (chemistry and chemical engineering) is disposed to consider re-entering executive field at managerial level. Wide knowledge of marketing conditions and particularly of committee and Trade Association work. Only firms of consequence and standing considered, when fullest details of experience will be given to an accredited representative or principal.—Box 202.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894). Moderate fees payable by instalments, if desired.

Prospectus from Dept. P.17, WOLSEY HALL, OXFORD

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22, Ryder Street, St. James's, London, S.W.1. U.S. Representative: R. S. Farley, 111, Broadway, New York, 6.—Saturday, September 17, 1949.

UNIVERSITY OF LONDON

DEPARTMENT OF EXTRA-MURAL STUDIES (UNIVERSITY EXTENSION COURSES)

The following evening courses are included in the University Extension programme for the session 1949-50, commencing in September, 1949.

Ancient Greek Drama
English Folk Song
Modern Drama
Plant Science and Horticulture
Pond Life
The Cultural Pattern of the 20th Century
The Honey Bee
Youth in Society

Many other University Extension courses will be held at suitable centres in London and the Home Counties, some of them leading to University Extension Diplomas in the Humanities. Further information may be obtained from the Director, Department of Extra-Mural Studies, University of London, Senate House, W.C.1.

ASHRIDGE.—Principal: General Sir Bernard Paget. Course 42, Sept. 23rd to 26th. The Sea. Subjects: The Sea in Britain's History; Lincolne Kennedy; Sea Power and the Royal Navy; Admiral Sir William Tennant; The Fishing Industry; P. D. H. Brown; The Merchant Navy; A. S. Wightman. Course 47, Oct. 14th to 17th. Design in Britain Today. Subjects: Fashions in Design; H. S. Goodhart-Rendel; Herd Taste; Miss Margharita Laski; The Buyer's Influence on Design; Mrs. Grace Lovat Fraser; British Characteristics in Design; Dr. Nikolaus Pevsner. Inclusive fee, £3 10s. per Course.—Applications to Sec., Ashridge, Berkhamsted, Herts. Tel.: Little Gaddesden 3191.

BRITISH CAST IRON RESEARCH ASSOCIATION invites applications from a wide field for three or four posts in a team to visit, examine and advise ironfoundries on efficient production. Leader experienced in management, executive control and costing; a fourth post might cover working conditions; metallurgist; importance of choosing the right men, no salary ranges or limits are stipulated. Applications, marked "Confidential," to Director, Alvechurch, Birmingham, by October 14, 1949.

ANNUITIES

The safest and best investment. Sample quotations % p.a., payable half-yearly. (M = Male; F = Female.) (i) SINGLE whole-life. M aged 60, £8 10s. 4d.; 65, £10 0s. 1d.; F aged 60, £7 7s. 10d.; 65, £8 11s. 5d. (ii) LAST SURVIVOR (payable till 2nd death). M 60 and F 55, £5 19s. 8d.; M 65 and F 60, £6 13s. 10d. (iii) "CAPITAL PROTECTED" (payable for life, but for 15 years in any event, and assessable for tax on interest content only during those 15 years). M 65, £7 2s. 8d.; F 65, £6 13s. 10d. Terms for other kinds (reversionary, capital redemption, etc.) and ages 45 to 85 from Box 201, Economist, 22 Ryder Street, London, S.W.1.

REQUIRED Immediately: Assistant to Managing Director of large industrial organisation in North West. Must be well educated, preferably with knowledge of at least two European languages. Salary according to age and experience—minimum £500 per annum.—Box 192.

ECONOMIC RESEARCH Assistant required for Information Department in London office Iron and Steel Manufacturers. Experience essential in collation, and analysis of facts relating to economic matters generally, and the preparation of written reports. Academic background desirable. Apply in writing to Chief Education Officer, Messrs. Richard Thomas and Baldwins Limited, 47 Park Street, London, W.1.

SECRETARY-ACCOUNTANT, F.C.I.S. (35), seeks appointment with progressive company, London or S.E. Essex. First-class practical experience in accountancy, final accounts, taxation, costing, administration and secretarial practice. Commencing salary about £1,000 p.a.—Box 205.

NATURAL Brit., German industr. lawyer-economist; administrative, social, export, information, library, literary experience. French; knowledge Russian, Spanish; typist; 1st class testimonials; seeks wider scope for his ability.—Box 203.

M.A. (HONOURS) German, with subsidiary French. Age 23. Desires position with prospects. Scholastic or commercial.—Box 181.

Defeat or Opportunity?

IN and by itself, the devaluation of the pound sterling so artlessly announced by Sir Stafford Cripps on Sunday evening is no more than a confession of defeat by the Government. To the outside world, it has long seemed natural and proper that the pound should be adjusted to a level more in accordance with what the markets of the world are unconstrainedly prepared to offer for it. The majority of sober judges of affairs in this country have long felt that it was only a question of time before the decision to devalue was taken, and to many of them it had become apparent months ago that the time had come—indeed, was in danger of going by. But Ministers and the majority of their official advisers have been uncommonly stubborn in their refusal to face facts. Socialist politicians believe as an article of faith that water can be made to run uphill by administrative action; and the technicians of the Treasury and the Bank of England love so dearly the fabulous intricacies of their exchange control system (which, as they so proudly explain, no one but themselves can understand) that they have come to believe themselves capable of damming up any economic flow for any length of time. Between them, they have founded the economic policy of the British nation on the nonsensical doctrine that water does not, sooner or later, find its own level.

They have no reason to complain of the treatment they have had from those who distrusted their policy, either in this country or abroad. There has been no pressure from the United States Government. At home, there has been no campaign for devaluation. All the more responsible organs of the British press scrupulously observed, for as long as they could, the tradition that nothing should be printed that would be likely to undermine confidence in the national currency. There can be no question of a "ramp" either by bankers or by anyone else. It is the inexorable force of facts alone that has defeated the British Government, the Treasury and the Bank of England and has made Sir Stafford Cripps eat so many of his past words. Of the two—the politicians and the experts—it is the inability of the experts to foresee what was coming that is the more disturbing. Once again, as in the convertibility crisis of 1947, they have been shown up as being too expert to have any common sense. It is not a pleasant spectacle for a country that is accustomed to expect the highest degree of technical skill and judgment in its financial managers. They seem, for the present, to have lost that primary qualification of a good banker, the ability to accept the verdict of the facts, even when it is unpleasant.

The devaluation should have been undertaken months ago. Indeed, as soon as the world made up its mind that it was inevitable, every further day's delay merely meant further loss of reserves. But now that the decision has been taken, Sir Stafford is being criticised—at home and abroad—for going too far. This is unjust, and on this point at least the Chancellor deserves support. It is true that to reduce the value of one of the world's leading currencies overnight by as much as 30½ per cent must necessarily impart a severe shock to trading relationships the world over. But the blame for that attaches to

the dimensions of the maladjustment that had been allowed to grow up, not to the size of the remedial action taken. It is also true that the Government would have been far wiser to have fixed no new parity at all for the time being, but to have allowed the pound first to find its own level. This may, in fact, turn out to be Sir Stafford's greatest mistake. Nobody can confidently assert that any rate is "correct" in the present confused and distorted state of the world economy—let alone one that will still be appropriate when it has had time to settle down. If, as Sir Stafford says, the present exchange control would be unworkable with fluctuating rates, then so much the worse for the present exchange control—that is, if the reason is valid at all, for it sounds very much like the sort of excuse that is emitted when a technician retreats into his shell. But if there must be a new fixed rate, then obviously it must be low enough to be capable of defence in all foreseeable circumstances. It must make allowance, not only for the certainty of some rises in sterling costs of production (if only because of the higher costs of dollar materials), but also for the possibility of falls in costs of production in competing countries. Judged by this test, the new rate of \$2.80 = £1 appears to be realistic. Whether it will continue to be so, of course, depends on what happens hereafter.

And what can be expected to happen hereafter? Is the British economic crisis now solved, or clearly on the road to solution? To believe that would be to imply that the only thing wrong with the British economy last week was the rate of exchange between the pound and the dollar. Exchange rates are, indeed, potent factors and changes in them often have results far exceeding anything for which a visible causation can be traced; it would be unwise to underrate the probable effects of the devaluation of sterling. But nobody can seriously hold (though Sir Stafford, in his broadcast, seemed to be trying to) that changes in exchange rates are as potent as all that. There are far too many other things that are visibly wrong with the British economy. Distorted by the war, it has been held by main force in the distorted position, and the healthy natural processes that would help to restore a stable equilibrium are everywhere weakened and obstructed. And though many of these distortions derive from changes in external circumstances, they are added to and in some cases further distorted by purely domestic policies. (For example, at a time when it is more difficult for Britain to buy food from abroad, domestic policy encourages an increase in the demand for food.) It is impossible to believe that a change in the exchange rate with the dollar can miraculously correct these distortions or counter-balance their effects.

Yet Sir Stafford was at pains in his broadcast and in his press conference to make it clear that nothing else in the Government's policies was to be changed. With so many conflicting rigidities, something was bound to give way, and it has proved to be the exchange rate. But no attempt is to be made to re-examine the stability of the structure as a whole. A new girder, of different length but of equal rigidity to the old, is to be fitted in place of the one that has buckled, and everything else is to go on as before. Moreover, to listen to Sir Stafford, one would believe that the change, though of most fundamental importance, will make no difference to anybody at home, and certainly will hurt nobody. Yet in economic surgery, as in human, there is no such thing as an operation that is both effective and painless. How Sir Stafford or anybody else can believe that devaluation can revolutionise the external position of the country without altering any of its internal relationships is past understanding.

Nevertheless, it appears to be the Government's intention that devaluation should stand alone. The present state of the British economy, in which the only thing that is allowed to move is labour costs—and they only move upwards—is to continue. The basic distortion—which arises from the fact that the British people have voted themselves, in cash and in kind, larger incomes than they earn—is not to be removed. If so, then it can be predicted with the utmost confidence that the rate of \$2.80 will turn out to be too high, not too low. Average British wage rates and average British costs or production (as most relevantly measured by the price level of British exports) have been rising, with scarcely any interruption, ever since the beginning of the war. They are still rising, and the number of wage claims already proffered (as set out in another article) make it clear that they will go on rising. Until this process can be stopped, no fixed exchange rate will give the British economy any elbow room for more than a limited period.

It cannot be said too often or too emphatically that, however necessary and inevitable the depreciation of sterling may be, it cannot provide a solution to the British economic problem. There are no easy short cuts to the solution, which can only be found through a sharp increase in the economic efficiency of the whole national machine. What the British people need to do is not to take less for a pound sterling but to give more for it. Exchange depreciation will be of lasting value only if it proves to be the crack that breaks the log jam, sets other things in motion and breaks up the whole system of rigidities. If everything else is held tight, then the causes that produced this summer's crisis will produce others.

It is very important indeed, at the present juncture of party politics, that the exact degree of change in policy that is needed should be made quite clear. Retreats from what has been stubbornly upheld are, indeed, called for. But there is no necessity for a complete rout and reversal of everything that the Labour Party stands for. To proclaim now that a Labour victory at the impending general election would mean ruin and that a Conservative victory is the only hope would be to ensure, whatever happened, that the nation would be bitterly divided on essentials. There is nothing in what is required (on a minimum assessment at least) that should be more difficult for a Labour Government to accept than the devaluation that it has already swallowed. There is no need to abandon the ambition to exercise purposive direction over economic developments, but only to restrict the planning effort to the basic essentials that really matter. There is no need to abandon all economic controls, provided that enough free play of economic forces is left, operating through price changes in open markets, to bring about necessary adjustments. There is no need to abandon the welfare state, but only to base it on realism, both in respect of what can be afforded and of the way in which human beings act when offered something for nothing. There is no need to abandon the objective of greater social equality, provided it does not deprive the economy of its mainspring of incentive. There is no need to abandon the doctrine of public ownership, provided that the nationalised industries are turned into efficient economic instruments and not regarded as social welfare institutions for their employees. Basically what is needed is not that the Labour Party should abandon any of its aims, but that it should submit its methods to the test of economic efficiency.

This is not too much to ask, in a national crisis, of a responsible party. Some Socialists, even of Ministerial rank, have

been saying, in private, in recent weeks, that they admit the necessity for some fall in the standard of living of the British people. This should perhaps be welcomed as the dawn of realism. But it should rather be condemned as the intellectual pride that would impose poverty on the people rather than admit to error. It is not the aims of Labour policy that are so much at fault as the lack of realism in its methods, and if they could make the moral sacrifice of changing their minds,

Devaluation in Europe

THE devaluation of sterling has been the signal for a realignment of currencies throughout the Marshall countries. Only Switzerland and Italy have decided not to devalue their currencies in relation to the dollar, and it is doubtful whether the lira can in fact be maintained. In Western Germany, Dr Adenauer has done no more than announce his new government's decision to devalue; the new rate has yet to be chosen. The French have used the occasion to abolish the system of multiple rates established by M. René Mayer over a year ago, whereby importers and exporters enjoyed a rate of 272 francs to the dollar, while the official "free" rate ran at about 330 francs to the dollar. Now one rate will prevail—350 francs to the dollar—while the franc-sterling rate has been reduced from 1,096 francs to the pound sterling to 980 francs.

The French Government has declared its dissatisfaction with both the method and the scale of the British devaluation. The new rate, declares M. Petsche, the French Finance Minister, is a "trade-war rate." France could have safely maintained its old free quotation of 330 francs to the dollar had not the British offered—without prior consultation—this new competitive threat. This French criticism reflects the irritation with British policies that has been an undercurrent to most of the activities of the Organisation for European Economic Co-operation this year. Edge has been added to it by French memories of Sir Stafford Cripps's protests to the French Government when the Mayer devaluation took place early in 1948. But M. Queuille and M. Petsche have undoubtedly voiced a feeling of frustration that is general in Europe. The Organisation for European Economic Co-operation exists, a European Council of Ministers exists, a European Assembly has just spent a month discussing methods of European economic co-operation. Yet the British can introduce a radical change into every economy in Europe by a step taken in consultation only with the United States and the British Dominions. If this is the first fruit of the

Ministers would not need to call on the British people for any more material sacrifices.

Last Sunday the Labour Government had to admit that on one cardinal point of policy they had been wrong. Will they not, for the nation's sake, open their minds to the possibility that they may have other mistakes to correct? Or do they have a positive preference for the indignity of being coerced by events?

new forms of European consultation and co-operation, it has a bitter taste on the Continent.

It must be admitted that the British Government's handling of the European aspect of devaluation has been clumsy. It would surely have been possible without grave financial risk to have informed the European Governments chiefly interested at least a short time before the decision was sprung on the International Monetary Fund in the morning and Sir Stafford got into his aeroplane in the afternoon. The forms of consultation should have been observed at least to the extent to which the French observed them on the occasion of their devaluation, during which the British Government was kept closely informed.

The criticism of British manners and methods thus seems justified. The critics are on weaker ground when they attack the scale of British devaluation. For one thing, M. Petsche, who has campaigned against an "overvalued pound sterling" to some effect in recent months, cannot complain too sharply if his campaign at last succeeds. For another, if the pound sterling is ever to become convertible into dollars—and such an outcome is very much in the interests of western Europe, whose prewar system of international payments rested on converting favourable sterling balances into dollars—the rate between dollar and pound must be one the British Government can reasonably expect to maintain. But the chief justification for the British action is simply that it recognises a reality which other European countries are also obliged to face. The devastation of the war, followed by four years of strong inflation, has in almost every case reduced the real purchasing power of European currencies. One of the chief difficulties in the way of genuine recovery in the last eighteen months was the fact that exchange rates had ceased to reflect the realities of purchasing power and still sought to mask

£1,000 ON RETIREMENT...

... at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12s. 6d. from age thirty. Only £4 18s. 4d. more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

The premiums for other sums assured, ages or terms of years will be quoted on application.

OUTSTANDING VALUE IN LIFE ASSURANCE

the facts of the postwar inflation. In fixing the new rate for sterling and thus compelling other nations to follow suit, the British have not created a new situation. They have simply forced a recognition of the realities of the old.

For this reason, the devaluations in Europe can provide the springboard for a new attack upon the problem of freeing and intensifying inter-European trade. All attempts made in the last eighteen months to break away from the pattern of bilateral trading—of which the two Intra-European Payments Schemes have been the most ambitious—have at some point been brought to a standstill by the emergence of persistent debtor-creditor relationships. In their dealings with other European nations, Belgium and Switzerland have remained obstinate creditors and the fear of having to settle with them in dollars or gold has prevented other nations, with Britain at their head, from accepting the risk of full multilateral trading within the Marshall group. Today, the Belgian devaluation is small in comparison with that of Britain—12 per cent to Britain's 30 per cent—and Switzerland has not devalued at all. It is therefore possible that this more realistic pattern of exchange rates will mitigate the old difficulties created by the Swiss and Belgian creditor position and will pave the way to a general return to freer European trade.

This tendency could be very greatly strengthened if the new opportunity offered by the devaluations were followed immediately by a general easing of import controls. Since midsummer, the Marshall countries have been discussing the British proposal that European trade might be eased by the introduction of open general import licences and by the freeing of certain commodities from the system of quotas. France, Italy and Western Germany have taken one or two small steps in that direction, and the British are reported to be on the verge of making bold and far-reaching proposals. Decisions may, however, be postponed, since the first task for the OEEC is undoubtedly to redraft the Intra-European Payments Scheme in the light of the new exchange rates. But at the first opportunity the British should present to their European colleagues a really impressive list of the goods they are ready to free from import control. Devaluation has removed many of the risks inherent in such a policy of liberalisation and the sooner the scale of Britain's intentions are made known, the readier the other partners in the Marshall Plan will be to widen their approach.

This is the opportunity. It is a genuine and important one, since for the first time since the war exchange rates bear some relation to economic reality. But there is no automatic guarantee inherent in devaluation that the opportunity will be grasped. The new position has to be consolidated by vigorous policy and many of the necessary steps are difficult and unpopular. In the first place, all gain from devaluation will be wiped out if the governments do not keep a firm check on reascent inflation. The line against inflation in Europe is being held with very narrow reserves. It would not require much to undermine the present precarious stability and, unhappily, the mere fact of devaluation exposes a country to new inflationary risks. Some rise in the cost of living must follow the increased price of dollar imports. These prices may, in some countries, be offset to some extent by the lowering of sterling commodity prices, but these again depend upon firm measures against inflation throughout the sterling area. If the rise in living costs precipitates a new round of wage increases, the inflationary spiral can be in motion again within a few months.

The position in France in particular is unstable. Before devaluation, there were already signs of rising food prices and urban discontent. Devaluation will aggravate the trend.

The French farmers' confidence in the franc, which had shown some signs of recovery in the course of the year, will have received a fresh shock and the temptation to hoard may return. Optimistic estimates put the likely rise in the cost of living in France at no higher than 5 per cent, but even such an increase is enough for playing politics. Gaullists and Communists alike see in devaluation their first real political opportunity in 1949. They are ready to exploit every sign of discontent. And can a coalition in which the Socialists are an essential partner maintain the draconian control over wages and prices which the new situation demands?

* * *

It is, however, in Britain that the decisive battle must be fought against reflation. The train of devaluations in Europe and throughout the world which the British decision has set in motion is a reminder of the immense role which sterling—in spite of its weakness—still plays as an international currency. If, after this devaluation, sterling sags again, if after six months it is discovered that rising costs and unchanged productivity have once again undermined the real purchasing power of sterling, then the non-dollar world will be back in precisely the same uncompetitive posture it was in before devaluation. While the fight against inflation is the first duty of each European government, the British effort will be decisive.

European stability will not depend only on the nations' ability to check inflation. Devaluation as such is no answer to what is still Europe's most urgent problem—the dollar gap. The new price levels remove one great obstacle to effective competition in the American market, but other measures will be necessary to ensure that Europe's exporters join aggressively in the struggle for dollars. A European strategy for dollar sales and for economies in dollar imports has become more not less urgent as a result of devaluation. The task of capturing about one per cent more of America's domestic market—the target of some \$3 billions—has been eased for Europe only by the new competitiveness of European prices. It has been made more difficult by the increased sales necessary to maintain even the existing level of dollar earnings.

Nor is a blind drive for dollar sales enough for Europe's salvation. The new exchange rates will inevitably lay bare a problem which until this year has been decently shrouded by the high demands of the sellers' markets. The various industrial economies of western Europe are competitive. The goods which Britain, Belgium and Western Germany will seek to sell in the United States are largely the same. When M. Petsche talks of Britain's "trade war rate" for sterling, he has in mind that part of the French export business that is directly competitive with Britain. The temptation in these circumstances to indulge in competitive devaluation may, as the fight for American markets develops, prove dangerously strong, particularly if European co-operation fails to recover from the jolt it has received and each trading nation proceeds to solve its trading problems without regard for the international consequences.

It would therefore be well if, at this moment of uncertainty and irritation, the British Government could take the initiative in calling together an immediate meeting of the Council of the OEEC. Britain's devaluation has proved beyond any possibility of doubt the dependence of Europe upon sterling and the impossibility of Britain's pursuing its economic policies in isolation. Any attempt to do so may unleash in Europe new forces of inflation in the domestic market and cut-throat devaluations in foreign trade. The need for the Marshall countries to support each other in all

measures to stabilise their internal economies and widen their markets in Europe and overseas has never been more urgent than it is today and the decisive influence must be that of Britain. At present, it is difficult to read the Government's mind. Ministers do not give the impression of having thought out the consequences of devaluation for their trading

The English Landowner—II

A Last Chance

THERE are two economic functions which attach to the ownership of agricultural land, whether it is held by a private individual, a limited company, or a public body. The landowner is (or should be) the main source of fresh capital for the agricultural industry, and he performs (or should perform) the duties of estate management, which are complementary to those of practical farming. It is rightly said that a farmer is often his own worst landlord. The care and improvement of the land's fixed equipment requires greater resources and a longer and broader viewpoint than are within the compass of the average family farmer. This, in fact, constitutes the economic justification of the landlord-tenant system, a system which if it works properly is of great value to agriculture.

Unfortunately the system has not worked very well over the last half-century. Private landowners have been unable to find the fresh capital which the land has needed, while the decimation of the larger private estates, together with frequent changes in the ownership of land, has struck at the roots of good estate management. Landownership has been unable to perform properly its economic functions. It is ironical that it should fall to a Labour Government, acting under pressure of dire necessity, to make some attempt to patch up the system through its favourite method of mixed assistance and compulsion. The Government cannot be suspected of any solicitude for the welfare of the private landowner as such, whose personal income and capital have been raided by the Exchequer with increasing severity. But it has recognised that agricultural efficiency is dependent on a successful partnership between the three groups of landowners, farmers, and farm workers, each of whom has a vital contribution to make to the expansion programme.

This partnership finds practical expression on the agricultural executive committees and the agricultural land tribunals, on which all three groups work together. It has received legislative expression in the Agriculture Act, 1947, which establishes a system of guaranteed prices that are meant to provide for an adequate return on landlord's capital. In fact, however, the landowner, as a previous article illustrated, gets today a return which is very far indeed from being adequate, and which is seriously out of line with the costs of management and replacement. This is largely so because traditional valuations, which exercise a strong grip on the countryman's mind, have not kept pace with economic conditions, while owners are often as reluctant as their tenants to refer the rent to official arbitration.

The success of the agricultural expansion programme depends on a thoroughgoing modernisation of the land's fixed equipment. The Government's mixture of vague threats and concrete inducements is intended to produce quick results. During the period 1949-52, landowners in the United Kingdom have been asked to spend £86 million on farm buildings, £12 million on farm roads, £8,000,000 on water supplies, £3,000,000 on tile draining.

partners in Europe, or even perhaps of caring much what those effects will be. This is the impression which needs at all costs to be countered, and there should be no delay in inviting the Marshall countries to meet Britain round the table for a thorough examination of the next phase in Europe's economic strategy.

The Agriculture Act created new powers of compulsion. The owner who fails to maintain satisfactory standards of estate management is liable to be put under supervision and, ultimately, to be dispossessed in the same way as an inefficient farmer. So far, little use has been made of these powers; but following the official survey of ownership which is now being carried out, county committees may very well be urged to enforce better standards on the worst owners. It is especially significant that owners, whether under supervision or not, can be directed to undertake reasonable improvements which are necessary for the efficient farming of the land. The Government, in other words, can force private individuals to invest capital, even if doing so involves them in a loss; and it has refused to vary the use of this power to accord with the owners' financial circumstances.

However, these unusual powers of compulsion have been matched with strong financial incentives. Capital subsidies, amounting to 50 per cent or more of the cost, are available for works of land drainage and water supply and for the building of farm cottages. Further, under the 1945 Finance Act, the landowner can recover taxation over a ten-year period on the full amount of his outlay on improvements (which is even taken to include any sum he has received by way of housing subsidy). Finally, the erection of farm cottages is the only form of house building exempt from development charge. Whatever his grievance about the current level of rents, the landowner at least has every inducement to invest fresh capital—especially if he is paying taxation at a high rate. Indeed, in exceptional cases, it is paying landowners to charge their tenants no more than one or two per cent of the value of their improvements.

On one point only is taxation policy out of line with the Government's general aim. The penal rates of death duties on the larger estates run contrary to all sound principles of estate management. A remission of death duties, however, would only be of value if it could be stipulated that the estate should continue to be managed as a whole and that the heir should have had experience of estate management. But a reform of death duties is unlikely to be undertaken by any government in the near future.

*

It would be misleading to picture private landowners and the Government as entering upon a new period of harmonious co-operation. The harmony is more seeming than real. The landowner's legal position has been revolutionised. Not only can he now be told how to manage his land, and how to use his capital, but he is denied the right, save in exceptional circumstances, to recover possession from his tenants. Such a degree of state interference—even if much of it is waived in practice—is a severe infringement of the rights of ownership as traditionally understood in English law.

The Exchequer has still greater reason to grumble. The

co-operation between the Government and the landowner is directed towards an immediate objective in the pursuit of which questions of cost have been largely ignored. The state is paying out very large sums of money, either directly by way of subsidy or indirectly by way of tax remission, which may go to appreciate the capital values of private owners. The preferential treatment accorded to agricultural property acts as a magnet to businessmen seeking ways to reduce their tax commitments. Agriculture as a whole benefits from the fresh infusions of capital which the Exchequer partly encourages and partly provides; and for the time being this is justification enough in the Government's eyes. But the cost to public funds is too heavy to be continued indefinitely.

Moreover, to subsidise private owners on such a scale strengthens the case of those who advocate the nationalisation of the land. Why, it can be argued, should the state not reap the benefit of the assets which it is doing so much to create, especially since the task of re-equipping the land seems to be well beyond the means of its present owners? Those who advocate nationalisation can also point, in theory at any rate, to the advantages of management which would result if the whole land were under a single ownership instead of being parcelled out in small private lots.

In point of fact, there are still stronger arguments against transferring the land to public ownership, at least in a single operation or over a short period of time. In addition to the extreme nature of such an expedient, which would need a very great deal to justify it, there are several sufficient reasons against embarking on it at the present time. In the first place, it would cause a degree of social and economic disruption which would do grave harm to the agricultural effort, and it would be highly unpopular in the countryside. In the second place, state management in other fields has not been so strikingly successful to date as to justify its application to an industry whose problems are peculiarly complex and where even the usual stock of initial goodwill would be lacking. In the third place, the state would have to pay an extremely high purchase price for the land; and quite

apart from the magnitude of the financial operation, the interest charges which it involved might even exceed the present total of agricultural rents—thus causing an increase, instead of a decrease, in the costs of production. In brief, it is certain that land nationalisation would be unpopular and there is no evidence that it would either aid agricultural efficiency or lower farm costs.

To say this is not to deny the grave drawbacks of the present system. The idea of a new partnership in agriculture, so dear to the heart of the Minister of Agriculture, will not work if one partner is reduced to a condition of complete dependence. If both the rights and the responsibilities of land ownership continue to be whittled away; if the state comes gradually both to supervise the management of the land and to provide it with capital, then public ownership will eventually appear as no more than the logical termination of a superfluous institution.

There is only one certain way of avoiding this outcome. If British agriculture can be revitalised into a much increased efficiency, then it will cease to be so dependent on state aid or so liable to state control. Such a transformation is in any case devoutly to be desired; although unfortunately present government policy will do little to achieve it. But its achievement is of especial importance to the landowner, who has his existence as well as his prosperity at stake.

Above all, this is no time for the English landowner to take up a negative or defeatist attitude. He may feel sceptical about the outcome of the new deal for agriculture; he may dislike the controls imposed upon him; but at least he has an opportunity to repair some part of seventy years' neglect, and to play a notable part in the re-equipment of British agriculture. To do this calls for a bold and skilful programme of investment, and where this policy is handicapped by unduly low rentals, it is reasonable to take steps to have them raised. The landowner must make the most of his present opportunities; for one thing is certain—they will not recur. The challenge to British agriculture gives the landowner his last chance.

Wage Chaos

THE Chancellor's announcement of devaluation has come as a shock to the leaders of the trade union movement. Faced with the likelihood of a rise in the cost of living which cannot be matched by wage increases, the leaders of the TUC have so far abdicated their responsibility, and in a statement issued on Tuesday bluntly refused to pass judgment on the necessity for devaluation. The body of men most anxious to be heard whenever the Chancellor has any concessions to make has collapsed into silence when faced with an unpleasant situation. The men who claim to be industrial statesmen have no guidance to give their followers when there are hard truths to be told.

The grounds of their dismay are obvious enough. Devaluation marks the end of the comfortable assumption that the British economy, upheld by American aid, could become viable in 1952 by advancing in productivity and economic efficiency at a pace agreeable to organised labour. Devaluation has destroyed that jog-trot progression since, if it is to succeed in its object, it demands a furious economic activity and a strict attention to the economic cost of production. David Low's carthorse must break into a gallop, a pace for which its contours and past habits have not suited it.

The second cause of trade union anxiety arises from the

effect of devaluation upon the cost of living. The whole energies of the General Council of the TUC have lately been concentrated upon demonstrating that wage increases would merely add to inflation without raising the level of real wages. But that thesis was based upon a cost of living index which had latterly remained fairly stable. What has now to be reconciled is the Chancellor's demand—essential if devaluation is to create any benefit—that any rises in the cost of living shall not be reflected in higher personal incomes “whether from wages, salaries, profits or any other source,” with the existence of a number of outstanding wage claims. How will it be possible, runs the argument, to withstand an overwhelming succession of demands if the cost of living rises—as eventually it may—by four to six per cent?

There is already a considerable list of outstanding demands for increases in wages or salaries, occasioned by the present level of the cost of living. There is the demand formulated last week by the Confederation of Shipbuilding and Engineering Unions for an all-round increase of £1 per week, which would cost the industries concerned up to £130 million a year. There is the demand rejected a fortnight ago by a Board of Conciliation for a flat rate increase of 10s. a week for the railwaymen, and for payment of time-and-a-

quarter for work after Saturday noon. Despite the award, certain constituent units of the National Union of Railwaymen seem determined to use coercive action in the shape of “work to rule” in an effort to get the claim accepted. The prospect of a rise in the cost of living consequent on devaluation provided a heaven-sent opportunity on Monday to the Communist element among the London railwaymen to demand coercive action—a campaign which in the event seems to have fallen flat. Mr Figgins, the Secretary of the NUR, has shown himself readier to be borne up by pressure from below than to exercise control and guidance of his union from above.

There are a number of minor claims concerned with the cost of living. There is an outstanding claim from the Civil Service Clerical Association to increase the salary of clerks by 15 per cent to enable them to meet the higher cost of living. The Building Trade Operatives are presenting a claim for higher pay for the same reason. There is a claim for a 20 per cent increase in the wages of prison staffs. On a different level, the British Medical Association are demanding that an additional £16½ million be paid by the Exchequer into the pool from which capitation fees are paid to general practitioners; it contends that, in fulfilling the Spens Committee's recommendations, the Ministry of Health ought to have allowed for more than 20 per cent. to offset the rise in the cost of living since 1938.

In addition, there are about a million and a half workers in iron and steel, boot and shoe manufacture, hosiery and building whose wage rates are linked directly to the new cost of living index. There are a number of industries, of which mining is the most important, which are pressing for a revision of their cost of living allowances which have not changed with the movements of the new retail price index.

Finally, there is a great resentment among the workers in nationalised industries, which found expression at the Bridlington Congress, occasioned by the Government's refusal to permit these industries to consider pension schemes while their economic health remains precarious.

*

It is hard to say how large a part the desire to maintain full employment played in the decision to devalue the pound, but certainly it cannot have been absent, for political as well as for economic reasons, from the minds of the Cabinet. From the emphasis which Sir Stafford Cripps placed upon it in his broadcast last Sunday it is clear that he regards it as one of the chief ends of policy. In other words—since it has become clear that full employment in practice means fixed employment—the structure of British industry, which bears only a remote relationship to the needs of the international markets, is to remain petrified in the form from which it emerged from the war. There is to be no attempt to create an economic climate in which labour will move from inessential industries to those where it would give useful economic return, or which will permit of drastic revolution in the techniques or technology of production. Nor will there be any attempt to wring redundant labour out of industry. This, apparently, is the bargain that the Government will strike with the labour leaders in order to prevent them from overwhelming industry with demands for higher wages, but it is unlikely that even this dubious arrangement will be honoured.

Sir Stafford Cripps, at his press conference on Monday, gave the impression that while the Government would resist any attempts to allow wages generally to follow any upward movement of the cost of living which would result from

devaluation, it did not expect that all wage claims resulting from cases of hardship would be resisted. Before the nation becomes rent by arguments about what constitutes a hardship, it is essential that the Government and the unions make a fresh effort to think out a coherent wages policy. It is impossible to discuss in a few paragraphs the whole compass of such a policy, but there are three problems which must strike anyone who reflects upon the present position of wages.

In the first place, the wage is coming to be regarded not as a *quid pro quo* for a contribution to the economy, but as a species of welfare payment. The miners, the railway workers, and many others have rested their claims not on the fact that they are paid too little for what they do, but that they are not getting enough on which to keep a wife and family. This claim is as irrelevant to Socialist as it is to capitalist economic theory, both of which regard wages as a reward for economic services performed. This perversion of the true nature of wages means that they are coming to bear less and less relation to the economic value of the worker, to the value of the product, and therefore to the ability of the industry to pay. Industry is for the most part carrying as part of its labour, and therefore of its productive, costs a series of welfare charges which are properly the responsibility of the state. If it is difficult to contemplate a rise in the cost of the social services, it is even more dangerous to permit social service costs to enter into the cost of production. It should be clearly recognised that because a man cannot earn enough to keep his family in a particular job, it may be an argument for changing his employment rather than for raising the wage rate of his present job.

Secondly, the British trade unions have not begun to learn the distinction between high wages and high labour costs. Wages in Britain are low by American standards, and yet British labour costs were too high for the old value of the pound sterling to be maintained. If the British trade unions could bring themselves to recognise that they can have a continuously rising level of wages only if they actively co-operate in a more efficient use of labour and machinery, they would resolve many of the conflicts between their interests and those of the nation as a whole. But it is doubtful if the unions will learn this lesson for themselves since it conflicts directly with their interest. A swollen labour force in an industry means a higher membership, and therefore greater wealth and bargaining power for the unions in that industry. Only the Government, by deliberate policy as well as by propaganda and exhortation, could make plain the distinction between wages and labour costs, but a government which is at one and the same time determined to pursue overfull employment and *laissez faire* in labour relations is not well suited to undertake this task.

Finally, the Government—especially a Socialist Government—must bring itself to recognise that it can no longer maintain a bogus façade of neutrality in questions of wages and hours. If it is politically impossible for any contemporary British Government to lower wage rates, it must at least make up its mind in which industries and trades the economic situation demands or enables a rise in wages. Serious Socialist theory before 1945 contemplated that Government action would influence movements of labour and levels of production through control over wages. That aspect of Socialist policy has been forgotten since 1945, with the result that the wage structure of British industry is now in a state of chaos which makes nonsense of economic planning and free economic processes alike. If there are any Socialists who still believe in planning it is time they directed the attention of their party to the vital field of wages.

English for India

THE Indian Constituent Assembly's decision, after heated debate, to keep English as the official language for fifteen years before replacing it by Hindi is another sign of that readiness to face hard facts and to accept compromise of which Indian politicians have provided so many examples since independence. It is also—and this is perhaps even more important—the most notable instance yet of their capacity to cast aside nationalist passion and not to be deterred from making use of something which is British, merely because the British were once their rulers. Independence is not to mean revolution of destruction, but a rebuilding in which full use will be made of all that was of value in the institutions and the ways of the old regime.

The choice of the national language of India has involved a dilemma which was neatly stated by Pandit Nehru. English is today so important a language in the world that it is bound to remain a subject, and possibly a compulsory subject, in Indian schools. Yet it cannot be a universal language because its use creates between the English-knowing *élite* and the masses a gap which is politically intolerable.

English has, indeed, been to India what Latin once was to Europe—the great unifier and common medium of expression which has made the educated class not only physically but mentally at home in every part of their vast country. It was not just that English was the only language they all knew. It was even more that they were introduced through English literature to a set of new ideals which they could all share equally. Thus there has been created between the different parts of India, and also between India and the whole English-speaking world, that subtle mental bond which only a common language can give, and which even profound political divergence cannot altogether destroy, as is shown by the example of Spain and Mexico. So long as English remains a language in which every educated Indian is at home, England and India can never be foreign to one another.

Three generations of education in English have given Indians the freedom of the west and of its ways of thought in a way which is true of no other of the great countries of Asia. India alone has been enabled to see western civilisation from the inside and has thus been spared the strain and distortion which have been imposed on Japan, or even Russia, by the external limitation of a way of life whose material achievements they envied but whose spirit they failed to understand.

English is still the effective *lingua franca* of India, the language in which the clerk writes his letters, the student reads his textbooks, the journalist influences his audience. Many a husband and wife have no other common tongue. It is, moreover, often a very good English, as anyone who has heard Pandit Nehru or has read the *Hindu* can testify.

Hindi cannot quickly take its place without disruption. If Hindi were made universally compulsory tomorrow, half the university professors and senior civil servants in the country would have to be sent on leave, and many businessmen would have to close their businesses, while they learned the new language. Whole provinces would be unable to find more than a handful of candidates for the major professional and civil service examinations. Several of the High Courts would have to shut. Even the displacing of English as the language of intellectual conversation is not possible until Hindi has adopted an adequate scientific and mechanical vocabulary, probably by borrowing from English. English

should still have a future in India, even when Hindi does eventually become the national language. Every country must have some foreign language to provide it with a window on the outside world and just as for England this has long been French, so for India it is likely always to be English.

*

But the other horn of Pandit Nehru's dilemma remains. English cannot be the common language of the masses. Some other medium must be found through which people from all over the country can talk to each other with ease, if politicians and trade union leaders are to be able to grow to national stature, if an industrialising country is to obtain full mobility of labour and if Indians are to feel themselves at home everywhere in India. For this purpose, Hindi is the only possible choice. Including its dialect forms, it is the mother-tongue of over one-third of the population. No other language can claim even half so many speakers. The Devanagiri script is a beautifully adapted instrument which provides one letter for one sound and makes child's play of spelling. The Roman alphabet does not have enough letters. The Urdu alphabet, with its lovely complications, taxes the mind as much as shorthand.

Hitherto, however, the great advances since independence have been made by the regional languages, of which Hindi itself is, of course, the greatest, and not by Hindi in its role as a *lingua franca*. The ordinary conversation of home, field and factory, like teaching in the primary schools, local administration and local justice, has naturally always been conducted in the mother-tongue. Since 1947 the range of the local languages has been further extended into the secondary schools, provincial secretariats and the higher courts, and this process is bound to continue until the universities and the High Courts also use the language of the home.

Between English and the local languages it might, therefore, appear that Hindi will have a somewhat limited role to play. But this is not so. It is ideally fitted to be the language which everybody can *speak*. Already perhaps half the population can understand and make themselves understood in it, and at the level of simple conversation it is not a difficult language to learn. Wherever large bodies of men of mixed origin meet together, whether in the army, on a political platform, at a railway station or in a factory, Hindi provides the ideal language for them to talk to each other; and in a country which is being welded more closely together every day by a growing sense of nationhood, the opportunity and the need for such mixed gatherings are increasing rapidly. Using a common language, every such occasion will contribute something more to the building up of a national spirit. Without it, every regiment, every workshop, every trade union committee meeting would be a source of sectional division and provincial jealousy. Common loyalties must have a common language in which the hopes, the ideals and the fears to which they give birth can be expressed.

The particular compromise which the Constituent Assembly has chosen to adopt is thus of great future importance. The retention of English in the immediate present is a long step towards that stabilisation of India as a great liberal state which is so vital to Asia and to the whole world. The selection of Hindi for the future is one of the last steps in that process of creating a nation which has now been going on for so many years.

NOTES OF THE WEEK

Devaluation at Westminster

The Government has wisely agreed to the request of the Opposition for a short meeting of Parliament next week. A debate in the House of Commons is essential, not so much to discuss the wisdom of devaluation—which is irrevocable—as to hear what other policies the Government has in mind for the long-term solution of the balance of payments problem and on all decisions of the Washington talks. Sir Stafford will be wise to be very frank and detailed, not only about these, but also about the discussions in which they were formulated. For only in this way will he clear up the element of mystery which still baffles not only the Opposition but also many Labour backbenchers—the mystery of why the Chancellor of all people should have at this moment an air almost of elation about Britain's economic prospect. This optimism which he has radiated since his return is clearly grounded on something deeper than a show of bravado for electoral purposes, but in his press conference on Monday he failed to explain it or to impart it to his hearers.

If his optimism is well founded, then the country should be allowed to scrutinise its foundations more closely—and there is no better means for this than a meeting of Parliament. If Mr Morrison could call back both Houses last September to force the progress of the Parliament Bill, he can well afford to have them recalled to discuss one of the most important developments in Britain's postwar economic history.

The Government must also be frank on its plans for retrenchment. So far these take the shape of an instruction from the Prime Minister to all Ministers to prepare a cut of the order of 5 per cent in their administrative expenditure for the current year. This, if it could be carried out, would bring some saving, but against it must be set the prospect of further Supplementary Estimates, of which some £21 million have already been brought forward, in spite of the ban that the Chancellor imposed on them in his Budget speech. And there is every likelihood that the service departments, faced with increased expenditure in the Far East, will be asking for more. The scope of a genuine retrenchment programme has yet to be made clear.

But the recall of Parliament will not solve one further mystery—the date of the General Election. There is no evidence on this side of the Atlantic to indicate that a November election is likely. Indeed, the consternation into which Sir Stafford's broadcast flung the Labour Youth Rally at Butlin's Holiday Camp at Filey on Sunday night, destroying at one blow the happy atmosphere of beauty contests and community singing, is not an omen for an immediate rally at the polls.

* * *

The Acheson-Bevin Talks

For a week, Mr Acheson and Mr Bevin have discussed common problems of foreign policy. The talks have ranged over the Far East and the Middle East, and it is clear from the whole progress of the Washington conference that the need for the closest possible Anglo-American co-operation has never been more unreservedly felt by both Governments.

This strengthened desire for common policies does not, however, spring from a renewed fear of Russian aggression. It is clear, both from the atmosphere in Washington and from the quiet note struck by Mr Acheson in his opening speech to the United Nations Assembly, that the fears of war which have bedevilled the western world in the last eighteen months are receding. As Mr Acheson pointed out, the creation of the Atlantic Pact has put into practice the United Nations principle of collective security over a wide area, and this has undoubtedly

had a steadying effect. The war in Greece is a tragic exception to the general pacification of Europe, but some hope has been expressed in Lake Success that even here the Russians might now be ready to call off the long, futile and wasteful struggle.

The new challenge which Mr Bevin and Mr Acheson are anxious to meet jointly lies in another aspect of Russian foreign policy—the disintegrating effect of Communism upon backward peoples, whose nationalism has already been inflamed by a desire to be free of colonial status. If 1948 was the year of Berlin, 1949 is the year of China—perhaps of Hongkong. The two Foreign Secretaries have spent much of their time reviewing the situation in the Far East, the Middle East and in other areas where the spread of Communism could, without open war, withdraw large areas of the world from western influence. It is clear that one of the aims of Anglo-American policy is to establish local governments based upon independent nationalism, and then to give them all the backing that is economically feasible. Thus, both Britain and America are now apparently agreed on the need to give Japan a peace treaty, and thus stabilise its government.

In the Middle East, they are ready to pacify Arab nationalism by the creation of an independent Libya. A new emphasis is being put upon the economic pre-conditions of Arab resettlement and Middle Eastern development. It is also significant that American commentators have been paying particular attention to the role of India as a bulwark against the spread of Asiatic Communism. The suggestion is beginning to be widely made that the United States must reduce the strain on the sterling area by providing some of the economic assistance which India at present secures from its sterling balances.

Dr Adenauer States His Policy

In the new German Cabinet announced on Tuesday Dr Adenauer has given the key economic posts to members of his own Christian Democrat party. Professor Erhard will carry on his work of the last year as Minister for Economics, Dr Schaeffer is in charge of finance and Herr Storch is Minister of Labour. Free enterprise, "not applied dogmatically," and "based on social obligations," will be their watchword. His allies in the right-wing coalition get five posts, three of them likely to be storm centres: Vice-Chancellor and Minister for the European Recovery Programme, Housing and Reconstruction, and Refugees. To find the capital to build houses by private enterprise, to plan building and to spread the 8,000,000 refugees—increasing every month—more evenly over the *Laender* should keep ministers from the German Party and the Free Democrats too busy to have much time for inter-ministerial sniping.

The main tasks and techniques of a Christian Democrat economic policy have been clear for some time. What was still uncertain, until the Chancellor made his statement of policy, was the line to be taken about Germany's external relations—one can hardly speak of a foreign policy so long as they are under the control of the Allied Commissioners. Dr Adenauer obviously had to be obstinate about dismantling in order to forestall critics to the right and left; for the same reason he had to be conspicuously firm about the Oder-Neisse frontier. Much of the rest of what he said, in restrained language, was applauded by the Social Democrats of the Opposition. He was grateful to the Americans, nice about Mr Bevin and conciliatory to the French, and asked that Germany be accepted into "the European union" as soon as possible, tactfully not mentioning the Council of Europe by name.

Subsequent debates should show whether or not it will be

possible to work out in Bonn the makings of a bi-partisan foreign policy. To achieve this right at the start would be a sure way of quickly creating goodwill in western Europe; above all it could remove from Dr Schumacher the temptation to mobilise nationalist feeling behind Social Democrat opposition to the new government. Dr Adenauer has begun by striking a moderate note; it would be most unfortunate, and would certainly delay Germany's progress towards real independence, if the opposition were to try to achieve power by thumping the patriotic drum and so force Dr Adenauer to sharpen his tone.

★

It is a pity that military government has come to an end this week in a state of confusion about the validity of its laws, the permanence of the Allied Commissioners' staff, and their competences under the Occupation Statute, which was handed to Dr Adenauer on Friday. Nothing is clearer than that the Statute offers opportunities for the piecemeal nibbling away of Allied powers, by processes in which the British public will take no interest until something particularly flagrant occurs.

★ ★ ★

Step-by-Step Ulster

The oft-repeated slogan "Step-by-step with Britain" (writes a correspondent in Northern Ireland) has kept the workers of Northern Ireland aware of the fact that social services and working conditions owe much to Northern Ireland's status within the United Kingdom. This accounted for the annihilation of the Labour Party, which hedged about Partition at the recent general election, and it accounts for the strike of electricity workers who claim that their employers are out of step with Britain's nationalised electricity industry.

The strike is an unofficial one, since the Arbitration Tribunal rejected the 1½d. per hour wage increase demanded, and the unions were consequently bound to accept the decision. But the spokesmen of the strikers claim that the dispute is a vital one for all workers in Northern Ireland, since it concerns the honouring in Northern Ireland of wages agreements negotiated nationally in Great Britain and hitherto locally accepted. They reject the employers' case that the superannuation scheme in the industry should be considered and demand absolute wage equality with their fellows in Britain. This is "thinking imperially" with a vengeance. With the nationalisation of the shipbuilding industry, a distinct though perhaps distant possibility, the workers of Belfast are on the whole in sympathy with the claim for absolute equality of treatment with their English and Scots brethren.

Already the strikers have been supported by some thousands of shipyard workers and it is probable that the dockers will refuse to discharge coal for the power stations which are at present functioning with the help of the navy and army. Yet the most revealing aspect of this strike is not the solidarity of labour but the extent to which the workers in Northern Ireland, especially in Belfast, have become dominated by their shop stewards. As in Britain, the official trade union leaders seem impotent in the face of unofficial strike action engineered by over-zealous shop stewards.

This fact is a serious one. The most vital need for Northern Ireland is to diversify its industries. One factor, among many, that has induced British industrialists to set up factories in Northern Ireland, has been the quality and spirit of the workers here. If Northern Ireland becomes the scene of those unofficial strikes so prevalent in Britain, industry may well turn aside from Northern Ireland. The strikers are dimming the lights, but even dim lights can flash red.

Critics and the Masterman Report

The staff side of the Whitley Council for the Civil Services has been smouldering for two months over the Government's

acceptance of the Masterman report on the "Political Activities of Civil Servants" [Cmd. 7718] which was commented upon in *The Economist* of July 2nd. The unions had the opportunity for fanning their grievance into flames at the Trades Union Congress, and succeeded in carrying their objections against the wishes of the platform. The Congress is thereby committed to supporting the civil service unions in their demands for fuller civic freedom, and in this they have been joined by the Liberal party.

The sense of grievance arises from two causes. On the one hand the Government accepted the recommendations of the Masterman report on the day the report was published, and without first consulting with the Civil Service staff side. The staff side are therefore suffering from a strong sense of injured dignity. As the staff side played an important part in the setting up of the Committee, the Treasury's handling of the situation appears to have been lacking in tact and even in common prudence.

The real bone of contention is, however, the alleged restriction on the political activities of 300,000 members of the clerical and typing grades of the civil service. The Masterman report advocated complete political freedom for some 600,000 industrial and manipulative civil servants and post office workers. Above these it drew a line and virtually debarred from political activity the administrative, professional and technical staff and all the clerical and typing grades which serve them. Its justification for merging the clerical and typing grades with the higher grades was that their work was so entwined with that of their superiors that to allow political freedom to the one and not to the other would produce a host of anomalies.

Freedom is very sweet to Englishmen and in protesting against the Masterman report, the civil service unions have grasped a thread that runs continuously through English history. But common sense logic no less firmly equates the incorruptibility of the civil service with its freedom from politics. It would seem that the Masterman Committee has drawn the line too rigidly, including a great many card index filers and pen pushers above its line of demarcation. The straight line might have been intelligently indented, without infringing the central principle that executive and administrative civil servants have chosen their profession in the knowledge that it debars them from full participation in the political life of the community.

Barter by Any Other Name

Mr Harold Wilson's speech on international trade agreements, delivered last Friday to the Summer School of the Institute of Bankers, afforded a striking example of the chaos of distinctions without difference into which the desire to justify postwar trading practices can lead an honest man. His theme was the distinction between genuine bilateralism, barter exchange between pairs of countries (which is black), and the type of trade envisaged and encouraged by the thirty-odd agreements concluded by Britain in the last two years (which is white). True, the arrangements envisaged in every case "a rough equivalence of payments in the two directions," and in some agreements "there were understandings or undertakings about the supply of scarce commodities in both directions; but trade followed the usual channels, no "direct exchange" took place, and, above all, each deal was calculated and concluded in terms of money.

It would be pedantic to argue that any international deal involving a pair of inconvertible currencies, each of which, by reason of its inconvertibility, constitutes merely a right to acquire the produce of one of the contracting parties, must properly be classed as barter. These agreements, however, are of a particular kind. They are very largely deals in goods on which an *ad hoc* price has been set—compare the various prices ruling at one and the same time for wheat and coarse grains, or for cocoa, or for coal, in different markets covered by different

negotiations—and they are riddled with the kind of conditional sale on which Mr Wilson, in his capacity of controller of the home market, imposes condign penalties. (Sir Stafford Cripps, in his interview with the Canadian Press Association last February, was a good deal franker on this subject.)

It may seem unreasonable to make so much fuss about nomenclature, and there is undeniable force in Mr Wilson's plea that, but for these agreements, call them barter or not, the British standard of living, the level of world trade, and the recovery of Europe, would alike have suffered. They offered the only immediate remedy for a desperate situation. But it is equally undeniable that the artificial prices assigned to the goods concerned have powerfully contributed to maintaining and aggravating the discrepancy between costs in dollar and non-dollar countries.

Greek Dilemma Over Albania

The sorely-tried Athens Government has had one more piece of dynamite thrust into its hands. The victory on Mount Grammos has faced it with the immediate decision whether or not to throw caution to the winds and invade Albania in pursuit of rebels who have slipped over the frontier. The Greeks have so far held their hand, but have issued a warning the terms of which, however justifiable in principle, have sent shivers down the spine of responsible observers. They have said in effect that, if the rebels come back over the border to renew their attacks, the Greek army will next time carry the campaign into Albanian territory.

There are two aspects to this declaration. First, it is quite understandable that Greek public opinion should demand and receive from its own Government assurances that nothing will be left undone to end the civil war once and for all. But retaliation on Albania is a more dangerous project than it was some months ago, when the idea was first discussed. Moreover, it is one thing to threaten drastic action and leave the enemy guessing about its nature, and quite another thing to commit a government in advance to an act of war. Although other statements with just as grave implications have been made by other governments as part of the cold war, this declaration from Athens is disturbing. The Greeks would be well advised, at this juncture in Balkan affairs, to say little and do nothing until their case has again been dealt with by the United Nations General Assembly—from whose agenda the Russians have failed to remove it. Otherwise they risk losing all that they have so desperately gained.

An attack on Albania could set up a chain reaction which at best might bring down Marshal Tito, and at worst could bring East-West relations to a crisis. Tito's eclipse would mean a serious weakening of the effort to stand fast against Soviet megalomania, to which neither British nor American foreign policy—to say nothing of the United Nations—could remain indifferent. It is safe to assume that a localised brawl in the Balkans, in which Tito would be tempted to hit at the Cominform through Albania, would suit Moscow's book. Every effort is being made there and in the satellite capitals to build up a case for intervention in Yugoslavia. The Greeks should beware of providing a pretext.

★ ★ ★

Show Trial for Mr Rajk

Now we know all about Mr Rajk. Just as six out of the seven members of the Soviet Communist Politburo at the death of Lenin were, in fact, revealed as enemies of the party and the revolution, so Mr Rajk has been for twenty years a spy in the Communist ranks, either for the police of Admiral Horthy or for the Gestapo or for the American Intelligence Service. Also implicated in his foul treachery are, of course, Marshal Tito and the other Yugoslav Communist leaders, with whom he recently plotted to carry out a *putsch* in Hungary and who

were already working for Britain and America against Russia during the war. If we doubt these things we are contradicting Mr Rajk himself, who has included himself in all the accusations he makes.

Everything connected with the trial has been in accordance with the set pattern of such performances: the preliminary official announcements of the accused man's guilt over a wide range of crimes; the stereotyped resolutions of workers' meetings demanding punishment for the guilty man before he is tried; the fluent confession in open court, with all the political definitions up to date by the latest Communist text-books; the providential suitability of the confessions to the current propaganda line of the Cominform, and the miraculous conformity of events a dozen years ago to the situation which has existed since Tito's break with Moscow eighteen months ago. The only difference—if it can be called that—is that the language of the prosecution has reached a new level of violent beastliness.

Mr Rajk has no doubt made himself in some way obnoxious to the leader of the Hungarian Communist Party, Mr Rakosi, or to the Kremlin. But to eliminate and discredit Mr Rajk is clearly only a part, and a subsidiary part, of the purpose of this latest of Communist show trials. Just as the confessing Old Bolsheviks in Moscow in 1936-38 accused themselves, but above all Trotsky, who was beyond the reach of the Soviet police, so Mr Rajk has given first place in dishonour to Tito, whom the Cominform cannot so far put in the prisoner's dock. Tito's reputation as a sincere Communist is torn to shreds; he appears as a double-faced adventurer who never wanted to destroy capitalism in Yugoslavia—which will be good news to all the Yugoslav bourgeois who have been expropriated—and whose policies were dictated during the war years by the British and American military missions. The growing idea in Eastern Europe that heresy in the Party is possible without treachery has to be killed.

It is not only Tito who is now in disgrace; so also is Mr Zilliacus, who has appeared to espouse Tito's cause. *Pravda* has now declared that his stand has "aroused the indignation of the democratic people of the entire world." The confessions of Mr Rajk, and of the Yugoslav exile Mr Brankov in the same trial, must have put Mr Zilliacus in an awkward position, for he has previously given the impression of considering the confessions made in Communist show trials as worthy of credence. He must now admit either that he was all wrong about Tito or else that Communist confessionneering is the dirty business most non-Communists think it to be.

★ ★ ★

Who Shall Internationalise Jerusalem?

The delegates at the current Assembly of Uno have a hard decision to make about Jerusalem. Are they to uphold a vote which they gave as lately as last December, to internationalise the city and its environs as far south as Bethlehem? Or are they to bow to the result of a war, accept the divisions hewn out since then by the local Israeli and Jordanian military commanders, and establish an international frontier line through the very streets of the world's most sacred city?

Obedient to the instructions they gave last December, their Conciliation Commissioners have evolved a plan for international management on what is virtually a cantonal basis, with a neutral judiciary. This, like so many past plans for Palestine as a whole, is neat as a pin on paper, and eminently workable, given a will to work it in Jerusalem. But this will, now as in the past, is non-existent. King Abdullah, speaking from Spain, which he has been visiting, has declared that he cannot cede a yard of Arab sovereignty. The comment of Mr Sharet, before leaving Israel for Flushing Meadows, was even more categorical. The modern or Jewish part of Jerusalem, he said, was an integral part of the state of Israel. Had it not been so it would never have survived the siege. Surrounded as it is

on three sides by Arab-held territory, it must remain Jewish and retain the right to organise its self-defence.

Is it, in these conditions, possible to organise the "effective United Nations control" which the Commissioners' plan so optimistically prescribes? Its suggestions for administration begin with a division of the area into a Jewish and an Arab zone, each under its own responsible municipal authority. To these two authorities, it suggests delegating all matters except those reserved in the plan to the United Nations. The principal rights denied to these authorities are that to

admit immigrants in such a way as to upset the present demographic balance; that to convert their police, of which they may run 500 each, into para-military organisations, and that to supervise access to the Holy Places. These matters are to be the charge of a United Nations Commissioner appointed by the Assembly and making annual reports to it. He may enrol guards to protect the Holy Places and his own security, and for him and these the United Nations will pay. He is to be assisted by a General Council of fourteen, of whom ten are to be selected by the zonal authorities and four by himself. The Judiciary is to be international and to consist of judges of foreign nationality, elected by the United Nations, as are those of the International Court of Justice.

Whether such a scheme would ever have worked is doubtful. Its maintenance would depend on force and forces which Uno lacks, for unless it were protected by a military regime far more stringent than that once run by the British, terrorists would wreck its proper running. Certainly it is inapplicable now. The best course for the Assembly, therefore, is to cut its losses and save its breath for the internationalisation of the Holy Places, to which both Israel and Jordan would agree.

The Health Service in Practice

The many Americans who, on arrival in this country, want to know how the health service is working in practice can hardly do better than to buy a copy of the special number of *The Practitioner* which is devoted entirely to the subject. Articles have been contributed by practitioners in every major branch of the service (a big and unfortunate omission is any account of the mental health services); there is an article by that often neglected person, the patient—in this case a former private patient; and other articles deal with administration, the working of the health service in Scotland, and cost.

In view of the hostility of a large section of the medical and dental professions before the service was introduced, it is surprising that the opinions expressed by the practitioners are, on the whole, not unfriendly. Very occasionally, political bias peeps out; but criticism is in the main constructive, and there seems a general desire to make the best of a service that, in one form or another, has obviously come to stay. Severe criticism is expressed of the division of responsibility for the maternity service, which may, in the opinion of the writer of the article, be reflected in a check to the fall in infant and

maternal mortality. Otherwise there is little dissatisfaction with the machinery of administration—the regional boards for hospitals, the local executive councils for the general medical services, and the local health authorities for the preventive and after-care services.

What is striking, however, is that the criticisms of the working of the service as a whole are very similar in all the articles. There is general agreement that it was introduced too quickly, before facilities could be expanded to anything like the amount necessary. The article on dentists, for instance, which is in the main supported by the report of the working party on the "chairside times" of dental treatment, also published this week*, emphasises the almost intolerable burden of work placed on a profession that tends to be abused simply because, in trying to fulfil a huge public need, it is also making a great deal of money. There is also agreement that private practice, in the specialist service, is being unduly penalised by the regulations on charges for private beds and operations in hospitals. Most of the practitioners deplore the growth of committee work and form-filling, and many of them refer to the abuse of the service by a small minority of the population.

The trouble is that, although some economies could be made by cutting out extravagance, the only way to make real improvements in the service is to expand its facilities and thereby increase its cost. Yet a rise in its cost is out of the question, or ought to be, for some time, and a more immediate question is to decide how can expenditure on the present services be prevented from rising. Here, again, there is almost general agreement throughout the practitioners' articles that the patient should make a token payment when he uses the service's facilities. This step would not be an easy one for any political party to take. But what is the alternative? Arbitrary reductions in fees and salaries cannot be carried out indefinitely without serious repercussions on the standard of treatment; in any case they are an unfair way of compensating for the Government's gross underestimate of the public's demand for the health service. Since the people want the service they must pay for it, and a token charge may be the best way of making them realise that the service's success or failure depends on their recognition and acceptance of this fact.

School or School-Factory

A recent tour of old and new school buildings confirms a very pertinent remark of an inspector, quoted in the 1948 Annual Report of the Ministry of Education. The newest school buildings, he said, are so indistinguishable from "social centres or territorial drill halls or new factories for light industry" that they fail to command that respect and attention that a school building ought to inspire.

This criticism touches something deeper than the question of prefabrication or of the decision (now reversed) to build only single-storey schools in order to economise in steel and timber. It is a criticism of the attitude of mind which produces schools as stereotyped shells, excellent as far as window space and lavatory accommodation go, but so lacking in character that a child moving from one identical playground or classroom to another can only with difficulty appreciate that he has made a change of environment.

To say this is not to deny the advantages of the new schools over the dark and debased Gothic of the earlier school building. But the effect of the 1944 Education Act, which made the county council the education authority, has undoubtedly been to reproduce the county architect's blue print fifty times over. Nor is the prefabrication method to be blamed for the dreariness of postwar school building. It permits a new flexibility in the planning of schools with certain economies in cost.

What is at fault is the failure to recognise that a school by its very nature is a very individual organism and that to stereo-

* HMSO. 1s. 6d.

type school building is in a sense to frustrate the whole purpose of education. But the defect goes deeper than school building and is a reflection of the harm that has been caused to the whole concept of building by too great an emphasis on its utilitarian functions. A recent article in *The Nineteenth Century*, by Professor C. A. Mace, in discussing industrial morale says of the building industry:

How much less efficient the industry is now than it was before no one can say, and so far as it may be less efficient no one can say to what extent this is due to factors over which no one has control. As for morale, how could any industry expect to display a healthy self-confidence when it is being scolded by so many critics? What the industry needed most at the end of the war was a moral tonic—the chance to earn merited praise. Instead of being asked to build so many temporary houses with substitute materials, it might have been asked to include within its programme a couple of cathedrals, or better still, a town of a thousand homes to house the families of a thousand heroes—houses to stand a thousand years and to bear comparison with anything to be seen in, say, Oxford or Cambridge. No one can be sure that the builders would have "fallen down on the job."

A Split Among the Swiss

The Swiss are in the middle of a constitutional crisis which is of interest in itself and not without bearing upon everyone's problems. For many years the Federal Government has used emergency powers to deal with economic difficulties *ad hoc*. During the last war this practice was extended and the federal budget was balanced only by levying a direct federal tax, which the Constitution of 1874 does not sanction. In spite of Switzerland's great prosperity and a good deal of discussion of financial reforms which might bring the fiscal system into harmony with the constitution, no reform has yet been achieved.

better than anything"

She's a Lady

Sometimes you just don't want to use all the zip this car's got. Today you're feeling lazy. Of course you could whip through the gears and jump to 60 in 22½ seconds and stream along the straight at well over 75, and you could... But today it's different—you feel like crawling... You light a cigarette and drift silently along. Yes, you notice things about this car—how the curved windscreen lets in so much more of the landscape—how practically the bonnet tapers away to give you a close-up view of the road. And the back seat passengers enjoy wide visibility and relax in complete comfort. Your seat comfy? Want to be nearer the wheel? There's no need to stop. Just wind the handle and take the seat forward a bit. That's better. Forward a bit more. That's perfect. You relax and admire the way she takes the curves—the disdainful way she treats the hills. This is the time to find out the gentle ways of this car. The slightest tiptoe for the clutch and brakes. And that 50 B.H.P. engine just waits for you to tell it what to do—and it does it. Try and see from how slowly she'll pick up on top gear. That's a test for a 1½ litre car. She does it smoothly from a mere traffic crawl. A big car flashes past. A whim seizes you. A touch on the throttle and—still in top—you could be... But no. Today you are in the mood to enjoy the Javelin's other qualities—calm and quiet and instantly responsive. Yes—this car's a lady. *Javelins came 1st and 3rd in the 1949 Monte Carlo Rally, 1½ litre class. 1st in 2 litre (touring class) a bit. That's better. Forward a Belgian 24 hour Grand Prix.

Can Unesco Come to Earth?

Without increased material means the United Nations Educational, Scientific and Cultural Organisation (Unesco) may become merely "a collection of symbols and a laboratory of illusions"—such was the warning given by Dr Torres Bodet, the Director General, at the opening meeting of the fourth general conference in Paris last week. This warning will carry much greater weight than it would have done a year ago, when there was a widespread feeling that Unesco in fact was already what Dr Torres Bodet has now warned that it may become.

Since he became Director General less than a year ago Dr Torres Bodet has tried to follow the golden rule which he himself sets forth in his report—"that it is better to keep to a small number of items than to cover a great number of fields to which only superficial attention must needs be given." He has also pointed out that the production of general studies on this and that will "only touch the imaginations and hearts of the peoples" if they result in practical action from which concrete benefits can be expected. And Unesco can now point to a number of practical contributions towards better international understanding. Such for instance is its "International Handbook of Fellowships, Scholarships and Educational Exchange," a unique publication containing information on over ten thousand awards in nearly thirty countries which should really promote increased international educational exchanges. Likewise Unesco's surveys of educational reconstruction needs in various war-devastated countries and its world-wide campaign to meet these needs, is an eminently worthwhile task.

★

Since Unesco is showing some signs of starting off down the right road, why is it still willing to be diverted down byways which can lead to little practical benefit to the rest of humanity? Ought Unesco, for example, to devote even a small part of its resources to an inquiry

to analyse and define the main connotations of liberty, democracy, law, equality, which have emerged in the history of political and legal philosophy; to determine their practical influence today; and to estimate their importance in current ideological controversies?

Surely this sort of inquiry could be safely left to private enterprise. It is shocking that, when Unesco itself reports children in many countries still lacking adequate education,

The Function of Government

Either the Legislature must undertake the regulation and management of the whole business of society, or it must not undertake to manage a part. Its proper function is to protect the people in carrying on their own business. By undertaking to look after their health, it is required to look after their milk and bread and beef, and make itself responsible for all. The people may suffer from improper or neglected cultivation, from an injudicious application of manufacturing strength—is there to be a Board of Agriculture to regulate the crops, and a Board of Manufacturers to apportion production and consumption? There is no part of society which may not be as much contaminated from feeding cows and manufacturing milk, as from forming a sewer; and if government is bound to prevent injury from the one, it is bound to prevent injury from the other. On the principle now in vogue, government is made responsible for the existence of evil in the world, and is held bound to eradicate it. A surer means could not be invented to bring governments into disrepute, and destroy them. They are really required to change creation, and must cause disappointment, must fail to fulfil the onerous duties required of them, and must fall beneath popular anger.

The Economist

September 22, 1849

nearly \$130,000 should be spent on such pompous nonsense while the Department of Reconstruction gets a bare \$417,000.

Again, the idea of establishing an order of priorities is excellent. But it is rather discouraging to find that the only projects which have been labelled as of secondary importance are the establishment of an "international computation centre," the promotion of the publication of a journal on philosophic and humanistic studies, and a volume of essays on the philosophical principles of human rights; and a report on what research "should be undertaken on native cultures in Africa in order to further the purposes of Unesco." All these projects might well have been scrapped altogether. Paradoxically, in fact, Unesco continues to be haunted and handicapped by the breadth and grandeur of the vision which dazzled those who drew up its constitution. It has also been slightly infected by the Teutonic tradition in American sociological research. Dr Torres Bodet cannot expect a response to his appeal for more funds until Unesco has given even more convincing evidence that its feet are planted firmly on the ground and that it can keep the professors on the leash.

★ ★ ★

Boomerang for Dr Dalton

At a Labour Party rally at Filey last week, Dr Dalton thrust his head out a little too far on the subject of Strasbourg and the Council of Europe. He is reported to have said, among other jeers at the Opposition, that Mr Churchill and his fellow Conservatives would propose measures for greater unity in western Europe which would not fit in with the kind of speeches they made at Strasbourg. This remark might prove a stunning boomerang—for two reasons. First, because many sound and ambitious things were said by Labour delegates in Strasbourg which the Labour Party would not dare to endorse in an election year; second, because if there was anyone who tried to blur the distinction between delegates as individuals (which they were) and delegates as representatives of governments in power (which they were not) it was Dr Dalton himself.

If there is to be argument about whether the Conservatives or Labour can best afford to preach unity in western Europe and its practical consequences to meetings in the constituencies, it can be said straight away that both will find it equally embarrassing and difficult. At a time when Labour Ministers have shown scant respect for European solidarity, with actions and omissions discussed in a leading article in this issue, Dr Dalton would have been wise not to have trailed his coat. In any case, it is surely the interest and the duty of both parties to try to make their policy in western Europe bipartisan. Who knows which will predominate at next year's Strasbourg meeting?

By propagating the legend of a great Conservative conspiracy at Strasbourg the Labour Party is making itself look rather silly; for there were only six Conservatives there against eleven members of the Labour Party. As it was Mr Bevin who launched the policy of Western Union and Mr Attlee who said that Europe must federate or perish, it looks as if Dr Dalton is rocking the party boat in his best bonhomous manner.

★ ★ ★

Why the Sea is Boiling Hot

It probably started with Mr Pollitt, who is, after all, a Lancastrian:

He laughed like anything to see
Such quantities of sand:
If only this were free for all,
He said, it would be grand.

So the Blackpool Communist Party moved on to the sands and carried the class war in among the deck chairs and the sand castles. After them stalked the Blackpool Corporation, with writ, interim injunction and formal undertaking. The Communist Party retreated. "It's getting as dark as it can,"

said the Secretary. "Why, we're under a pier! We're on private property!"

Oh, Marxists, come and walk with us!
The Town Clerk did beseech. . . .
The eldest Marxist winked his eye,
And shook his heavy head—
Meaning to say he did not choose
To leave the oyster-bed.

More soberly, this week the Chancery Court of the County Palatine of Lancaster has decided that the Communist Party of Blackpool may hold meetings on the borough sands, provided they hold them on private property. Blackpool beach belongs to Blackpool Corporation, save for three narrow strips under the three Blackpool piers. The freehold of these strips is vested in the companies that own the Blackpool piers. They are private property. It is not open to the Corporation to prohibit meetings there: that prerogative belongs to the Pier Companies alone and, so far, they have taken no exception to Communist meetings, provided they are held beneath their boards (in which decision they are, perhaps, a little forgetful of the lesson of November the Fifth?).

The law has triumphed again, in defence of the right of the individual to urge that the individual should have far fewer rights than he now has. But may not the Blackpool Communists' redness of cheek be due, in part, to the fact that they owe this right to advocate the abolition of private property to the fact that private property still exists?

Target for Cyclists

If bicycles could ring their own bells there would come from the luggage vans and cloakrooms of the main line railways such a tumultuous tinkle as would reach the ears even of the Railway Executive. Bicycles on holiday are barbarously treated, and form among the goods and luggage handled by the railways an under-privileged and much-abused class. Dogs, two-day chicks, prams, horses—even the insensitive pig—are

Letters to the Editor

Devaluation

SIR,—Unless the recent devaluation of the pound is a deliberate short-run attempt to win new dollar markets and to end the speculative "embargo" on sterling, the present government has in my opinion embarked on an apallingly hazardous policy.

For the 30 per cent devaluation of the pound necessitates a more than 40 per cent increase in export sales at current prices if present dollar earnings are to be merely maintained at their existing level. And, even assuming that a 40 per cent increase in exports can be achieved, it is quite improbable that present domestic prices (including wages) can be maintained in the face of the inflationary pressures generated by heightened activity in the export industries. At the same time, we must certainly recognise the deflationary effect of our increased exports to the American markets where an incipient recession, in spite of recent stabilisation, is still in evidence—and a falling dollar national income augurs ill for British exports regardless of exchange rates.

Only if such drastic devaluation brings sizeable and immediate dollar purchases of sterling, only if it leads to considerable and immediate increases in our dollar markets, and only if these reactions are followed within a fairly short period of time by appreciation of sterling to a more reasonable dollar price (say \$3.50) can it, I believe, lead to any amelioration of our current economic adversity.

As an American who has chosen to live in Britain for the next few years and as a person who considers the welfare of our world to be dependent in many respects upon the spiritual, political, and economic welfare of Britain, I fervently hope that:

treated with the utmost respect, but the bicycle with impatience and derision.

A passenger wishing to take his machine on holiday, say to Scotland, can choose between sending it in advance or taking it with him—that is to say among the luggage on his own train. Both methods are expensive and dangerous. The bicycle may leave London cleverly balanced between suitcases; by the time it has crossed the Border it will have disappeared behind milk churns; by the time that the Highland line has been passed it may be invisible and unattainable. If a kind porter tries to segregate the bicycles in a party together, they will probably be swayed and jolted into intricate embraces that cannot be broken during the few minutes that the train stops at Kingussie or Glenfinnan. Forwarded all on its own, the bicycle may take a week to cover five hundred miles or three days to cover fifty miles, whichever is the worse.

Bicycles, like passengers, demand individual treatment; they become untidy and obstreperous if they do not get it. On the Continent, when in the station, they stand in stalls like horses; when travelling, they hang, like meat, from the roof. They are clearly labelled and sorted; to get them out on arrival demands neither brute strength nor subterfuge nor *pourboires*.

This is a matter of business, not merely of sentiment, for British bicycles are tough and can take it. British Railways should take more thought for their owners. How many passengers might not be tempted on to the railways, away from the buses and the dangerous high roads, if they thought that they would receive some slight evidence of care: racks or hooks in the luggage vans, quick access for porter or owner, skilful handling at stations, and quick delivery when forwarded. It is said that two million cyclists travel yearly by train; this is an astoundingly low figure. British Railways should revise their targets and treat bicycles with at least as much care as kippers or racing pigeons.

- (1) the Government, as Sir Stafford Cripps has implied, is prepared to appreciate the pound within the near future, or
- (2) that I am mistaken in my views concerning the possible outcome of devaluation.—Yours faithfully,

ROBERT W. CLOWER

Aberdeen

Currency Unions

SIR,—Is not the first step for the U.S.A. and the British Commonwealth to agree that their respective citizens should not be regarded as "aliens"? Eire and Britain are now completely independent, but their citizens are not "aliens."

Is this not a useful precedent, and one likely to lead to closer unity?—Yours faithfully,

STANLEY UNWIN

40 Museum Street, London, W.C.1

The New British Aircraft

SIR,—Your comments on "The New British Aircraft" (September 10th) are discouraging. America is the only country in the world even capable of competing with our latest types, yet we are far ahead of America in our gas-turbine engine development.

On the other hand, the potential customers, the airline operators, are world-wide. "Prestige and strategy" may prevent us from selling to the Americans, but the Belgians, Dutch, Swiss, etc., want aircraft that will give them the lowest operating costs and maximum utilisation. Up to the present day the European airlines have been operating with converted

military transports—Dakotas and Skymasters and a few later modifications of these designs. In 1946, 290 aircraft out of 472 operated by the European airline companies (excluding British) were in this category; the remaining types were even less suitable for the job. Since then only the Americans have produced suitable replacement aircraft and British companies were not bound by prestige when ordering Constellations and Stratocruisers. The factors which governed their acquisition were financial not strategic. Similarly, the British Empire airlines have been forced to operate American types, but now that we have economic aircraft available this situation will change.

Therefore, on the showing at Farnborough, it is hard to believe that the dollar-starved European countries and the Empire alike will not be very good customers for our virile aircraft industry.—Yours faithfully, ROBERT SOWTER

87 Fox Lane, Palmers Green, N.13

[The Note on page 582 on September 10th made it clear that the British aircraft industry is far ahead of the industry of any other country in the development of gas-turbine aircraft for civil use. The operating economics of these aircraft have yet to be tested in practice. A world-wide export business in civil aircraft will need the American airlines as customers, and the Note drew attention to the difficulty which American airline companies may have in bringing themselves to recognise the superiority which the British product is likely to have in the next few years. It is to be hoped that they will overcome the difficulty and buy the British gas-turbine aircraft on a large scale; but this cannot yet be taken for granted.—EDITOR.]

Hard Work for the City

SIR,—Sir Stafford has drawn upon our final reserve leaving us with the stark reality that we have no choice but somehow to make our production costs competitive.

800,000 EXTRA READERS NO EXTRA CHARGE...

Since September 1947 the Daily Mirror's average daily sale has gone up from just under 3,700,000 to over 4½ millions—an increase of more than 21 per cent. Yet the cost of advertising space remains the same—£14.16.4d. per column inch.

The Daily Mirror tells your product story to more than 4½ million readers. They're the right sort of readers, too—young readers with long buying years ahead of them.

● From the recent changes in newspaper circulations and advertising rates one fact emerges irrefutably. The Daily Mirror's rate of .79d. per column inch per thousand remains lower than that of any other National Daily.

Daily Mirror

In the days before Whitehall controlled every section of our national life it was the City which set the lead for British business activity. Now, in our time of peril, let the City show the way to increased production by personal example. Let us see all the offices fully staffed every Saturday morning.

The Stock Exchange was one of the earliest industries to adopt a five-day week; a reversion to 5½ days would really prove the seriousness of our plight and provide a positive example of emergency action which would be followed throughout the land.—Yours faithfully, W. A. KINNEAR.

1c Park Avenue, Mossley Hill, Liverpool, 18

The Repellent Germans

SIR,—Your reference to the Germans as "a not very attractive people" might be dismissed as a lapse of taste. But it is worth noting that it coincides with a number of other utterances, similarly evoked by the German elections. While it was right that the sinister undercurrents made visible at the German elections should be criticised, and salutary that the Germans should know how shocked we were, it was rather sad that so few English publicists made any allowance for the irresponsibility of politicians at election time (of which we had experience in 1945 and are like to have again).

Now the full volume of these criticisms is reaching Germany, with additional matter. There was the foolish because inaccurate and ill-documented attack on Bishop Dibelius. Then on August 29th *Life* published a map illustrating possible western defence in the future, and showing in dramatic figure the explosion of three super atomic bombs carefully sited along the Rhine, the middle one appropriately at Bonn, the seat of the new government of the Second Republic! I think I can

understand the dismay and discouragement of responsible papers in Germany like *Sonntagsblatt*, Bishop Lilje's brilliant weekly. Would it not be more helpful if, instead of lecturing, or even patronising, the Germans indiscriminately we took rather more seriously our responsibility towards that minority (however tiny and however unattractive) who are honestly seeking to explain us to their fellow-countrymen?—Yours faithfully, E. G. RUPP

Richmond College, Surrey

SIR,—Mr Merton's apologia for Germany's part in the last three European wars misses the essential points. In order to judge guilt for the war of 1870 it is not important who the contemporaries thought guilty but who was actually responsible according to the documents. In so far Mr. Merton's quotation from *The Times* is irrelevant. He would do better to quote Bismarck himself who has expressed himself repeatedly with cynical frankness—particularly in his memoirs—about the way in which he alone brought about the war.

Guilt for the 1914-18 war was certainly not Germany's alone; nevertheless here too it remains a fact that the Kaiser's Government did little to hinder it. For the rest, Hitler's sole guilt for the 1939-45 war has manoeuvred Germany so much into the role of the eternal aggressor that the crime of 1939 completely overlays the neglect of 1914.

No service is done to Germany by the way in which constant attempts are made on our part to minimise our share in responsibility for the events of the last seventy years. On the contrary the way to re-establishing a common policy can only be prepared by clear and honest confession of what was wrong. Mr Merton's differentiation between the individual Hitler and the German people is completely unreal. In the life of states the citizens are liable for the deeds of their government to at least the same extent as shareholders for those of their board of managers and often as much as the partners in a company without limited liability. Would the German people have been ready in the event of victory to leave the fruits solely to the Nazi Party?—Yours faithfully, KURT GRAT BLUCHER

Baumgartenmühle, Germany

Ashridge

SIR,—As a former student of Ashridge I am writing to ask you to do all in your power to influence opinion to the ends that either—

1. The work of Ashridge shall continue uninterrupted, and on a strictly non-party basis, or
2. General Paget shall be persuaded to carry on the work he has been doing at Ashridge in some new establishment, and that funds be found for it.

Spotlighting Waste

Administrative costs rise imperceptibly, but steadily. Every unnecessary record, every needless clerical operation pushes costs up. Our new booklet "500 Unnecessary Miles" tells how we can help you to get them down. Why not write for a copy? Consultancy Division, Remington Rand Ltd., Dept. 3, Commonwealth House, 1-19 New Oxford Street, London, W.C.1.

I think that it is most unlikely that the first-mentioned alternative is now possible because (a) I doubt if anyone will now believe that Ashridge is, under the new arrangements, strictly non-party, (b) because the good results achieved by Ashridge in the last few years have been built up around the personality, character and ideals of General Paget, and (c) because I doubt if anyone will be able to achieve good results with the kind of work General Paget has been doing, so long as the governors insist on another activity under a separate head sharing the same buildings and services.—Yours faithfully, A PROFESSIONAL ENGINEER

The Corporate State

SIR,—I am very surprised that your reviewer, in trying to place Christopher Hollis's book *Can Parliament Survive?*, should have ignored the suggestions of an illustrious Victorian who not only proposed a corporate state, but tried to do something about it.

I refer to the Prince Consort's friend and associate, John Scott Russell: a marine engineer of distinction, and one of the nine purchasers of the Great Exhibition building which was transferred to Sydenham. It was from Sydenham that he launched his famous New Social Movement which was noticed by most of the newspapers and *The Economist* in 1871. Scott Russell's plan was to form a Council of Legislation and a Council of Workmen: which together would work for a seven point programme which was, in essence, socialistic. The interesting thing about John Scott Russell's scheme was that he secured the nominal adherence of the Earls of Lichfield and Carnarvon, the Marquis of Salisbury, Lords Henry Lennox and John Manners, Sir John Pakington, and Sir Stafford Northcote. Even more surprising was the support he received from the working class leaders like George Potter (editor of the *Beehive*) and Daniel Guile, secretary of the Ironfounders. Indeed, it was at the *Beehive* office that the preliminary negotiations were begun.

So much of a stir did the scheme cause, that Gladstone delivered a public speech to his constituents at Blackheath on November 28th, 1871, in order to devote some time to criticising it. The date is very significant: for the following year marked the assembly of the Trade Union Congress at Nottingham for the avowed purpose of putting pressure on Parliament in order to secure the items in their political programme. Scott Russell's plan was to capture the Trade Unions for the Conservatives. He certainly gave the Liberals a bad fright, and some of their language on the question uses the two significant words "socialism" and "communism."—Yours faithfully,

W. H. G. ARMYTAGE

Making of a Marshal

"Eastern Approaches." By Fitzroy Maclean. 532 pages. Jonathan Cape. 15s.

ONLY twelve years ago the Croat Josip Broz was purging the Yugoslav Communist Party of grave heresies then worrying the Comintern; his fondness for ordering people about earned him among his friends the nickname Tito. Now Marshal Tito is defying his old masters and neighbours and turning towards his old comrades, while political trials in Hungary are being staged to prove that the bold heretic of Belgrade is, and always has been, nothing but a Fascist and an enemy of the Soviet Union.

This then is a specially good moment for a book by the Englishman who knew Tito best in the two years when he became a European figure, who had no illusions about his Communist views or his political ambitions, and who helped Mr Churchill to decide—with his eyes wide open—that the Partisans must be supported on the battlefield whatever the political consequences might be. It is pleasing to think that the Tito who, after a party, revealed sufficient knowledge of English to recite "The Owl and the Pussy Cat," may read this book and chuckle, as he is reminded of Mr Churchill's advice when they met for the first time in Naples:

My friend Marshal Stalin told me the other day that his battle with the peasants had been a more formidable and perilous undertaking than the battle for Stalingrad. I hope that you, Marshal, will think twice before you join such a battle with your sturdy Serbian peasantry.

That was one flash of insight into the future. There was another when Brigadier Maclean was reproaching Tito for having slipped away from his British friends in the Dalmatian island-base of Vis in order to pay a surreptitious visit to Moscow, Tito replied—

Only recently Mr Churchill went to Quebec to see President Roosevelt and I only heard of the visit after he had returned. And I was not angry.

Through such anecdotes and in the occasional analyses of Yugoslav personalities and politics with which the story of the Partisan campaign is interrupted, the second half of this book makes an authoritative contribution to the history of the war in the Balkans and the postwar settlement; but it is made with modesty, even casually. The narrative is throughout highly personal, laconic where it might have been pompous, reserved where it might have been exuberant, full of the pleasures of life, and unsentimental both about the dangers that beset the author and his colleagues and about the qualities they showed in action.

The thread that runs through the book, stretching from Moscow in 1936 to Belgrade in 1945, is what Flecker's pilgrims to Samarkand called "the lust of knowing what should not be known." It drew Brigadier Maclean into spending his leaves

from the Moscow Embassy on unauthorised journeys to the Asiatic republics of the Soviet Union, to Bakhara and Samarkand, to the confines of Sinkiang and India, to Baku and Tiflis.

There is an excellent chapter, written with acuteness and distinction, on the amazing trial in Moscow of Bukharin, Yagoda and Rykov, respectively the leading theorist of the party, head of the NKVD and first successor to Lenin, which the author attended as an official observer in 1938. It gets to the root of the question why there can be such confessions, such humiliations, such self-accusations; and it is in the final speech made by Bukharin, despite all Vishinsky's efforts to bully him into silence, that the author finds the explanation. He is summarising what Bukharin said:

Why had he admitted his guilt? In prison he had had time to look back over his past and he had asked himself this question: If I die, what shall I be dying for? It was then that he had found himself looking into a black abyss, and had realised that, if he died unrepentant, there would be no cause left for him to die for. If, on the other hand, he were by some extraordinary chance to be spared, there would, without repentance, be nothing left to live for. . . . It was then that all the positive qualities of the Soviet Fatherland came back to him more forcibly than ever, and it had been this that in the end disarmed him completely and caused him to bow the knee before party and country.

For good measure Brigadier Maclean gives us, too, some of the best sketches of the work of the Long Range Desert Group in the Libyan Desert that have yet appeared. One of the outstanding impressions of this book is of the ease with which the author and his fellow-officers secured at the highest level the co-operation of aircraft, naval craft, technical branches, politicians and other specialists. Flying Fortresses would arrive at precisely 11.30 in the morning to annihilate a German transport park in a remote Yugoslav village; it was possible to talk to Mr Churchill on the transatlantic telephone at short notice; and junior officers were invested with political powers which would make a Foreign Office official shake in his shoes.

To foreigners who know no better these are all manifestations of the legendary British ability to run a vast secret service with persons who call themselves gentlemen. This enthralling book will fortify the legend and doubtless inspire young men of another generation to take the "golden road to Samarkand."

The Irish Puzzle

"Craigavon, Ulsterman." By St. John Ervine. Allen and Unwin. 676 pages. 35s.

THE interest of a new political biography may be twofold. It may describe a person of unusual or curious character. Alternatively, the subject may be a bore, but may be placed in a political situation of exceptional importance and complexity. No one could put Sir James Craig (to give him his more familiar name) into the former category, although the author gives an unexpected and pleasing picture of the charm which lay behind Craig's rigid refusal to compromise on essential matters. But the political circumstances in which the first Prime Minister of Northern Ireland worked, and the conditions which produced the gravest constitutional crisis in Britain since the Reform Bill of 1832, must be of profound interest to all modern historians. Unfortunately Mr St. John Ervine, who writes as an avowed and passionate Ulsterman, is not the man to illuminate the problem of Irish politics between 1912 and 1922.

Why was it that in Ireland during those years the rules of liberal democracy which had hitherto governed British politics fell into abeyance? According to these rules minorities accept majority decisions, force is outlawed as a political weapon, and the machinery of government is politically neutral. Ulster not only refused (understandably) to accept the majority verdict

in Ireland, but, though this was not a clear issue, almost certainly would also have refused an adverse majority verdict in Britain. The private armies later to be such a sinister feature of Europe between the wars emerged first in Ulster, later in the South, while after 1920 an open civil war developed in the South. Finally the conduct of Sir Henry Wilson at the War Office and the "mutiny of the Curragh" in 1914 showed that the political neutrality of the army was in doubt, and started a feud between the army and the Liberal party which was to have serious consequences in the First World War.

Englishmen persisted in regarding all these incidents merely as aspects of the peculiarly tiresome character of the Irish, as annoying aberrations from the normal course of British development. In fact, however, Ireland merely displayed in a relatively mild form those dark and bitter passions which are all too familiar on the frontier lands of Europe, in Alsace, in Poland, and above all in the lands of the Austro-Hungarian Empire where alien landlords, racial hatred and religious intolerance rendered meaningless the ordinary rules of political democracy. With no common agreement upon fundamentals political compromise is impossible, and no such agreement existed then or exists now in Ireland.

A discerning history of these years has yet to be written. Meanwhile Mr St. John Ervine's life of Craigavon along with the official lives of Carson and Redmond will be one of the indispensable factual sources for the future historian.

Market Economy and Soviet Economy

"Markt-Wirtschaft und Sowjet Wirtschaft." By Adolf Weber. Richard Pflaum Verlag, München. 463 pages.

Professor Adolf Weber, who is one of the oldest living German economists, presents a well written and amply documented descriptive analysis of the market economy in general and the totalitarian economies of Nazi Germany and Soviet Russia in particular. He explains the principles, methods and results of the two contrasting economic regimes to the Germans. The emphasis is on the analysis of the German market economy modified by voluntary co-operation of the individual effort in all parts of the economy, i.e. trade unions, employers' associations, consumer and productive co-operatives, cartels, concerns and syndicates, etc. Professor Adolf Weber then makes this comparison:—

The real contrast to the Market Economy is the direct (absolute) *Command Economy*, that is to say, the *Administrative Economy* under central and authoritarian control. The will of the State reigns supreme. The commands of the State regulate the relations of the individual activities according to a comprehensive and unified economic plan. Allocation and delivery as ordered by the State are substituted for buying and selling on the market. Private initiative is suppressed by official direction.

Only in Soviet Russia has the direct command economy been fully established. Nazi Germany's economy is described as an *indirect* command economy, in which by necessity and

against the original economic ideas of the Nazis, the political regime transformed the market economy, leaving, however, some market institutions formally intact. This may create the illusion that the market economy was not fundamentally changed, only regulated by State intervention which developed a regime known as "steered economy." The description of the Nazi-German and the Soviet Russian types of the command economy proves the inevitable decline in the productivity of labour and the interminable struggle for order in the bureaucratic chaos of the command economy. In short the economic experiment of the planned economy in Soviet Russia is shown to be a failure.

Professor Adolf Weber is convinced that Lenin and Stalin misunderstood the "historical materialism of Marx," that they over-estimated the importance of the machine-technique and believed it possible to replace the price as a regulating factor of the market economy by State orders and State regulation. The general aim of a continued increase in the standard of living could be achieved within a market economy, intelligently steered by a State administration conscious of the productivity that is implicit in freedom, where co-operatives, trade unions and other market organisations regulate and modify individual initiative and effort. In fact, Professor Adolf Weber concludes, the aim of Marxist Socialism could be achieved in a market economy.

France Beyond the Sea

"Les Richesses de la France d'Outre-Mer." By Charles Robequain. Payot, Paris. 221 pages. 480 frs.

M. CHARLES ROBEQUAIN, who is professor of geography at the Sorbonne, has presented a highly condensed description of the economic geography of the territories of the *Union Française*. The French Empire is something of a blank in the general knowledge of the average Englishman, so that M. Robequain's book provides a convenient compendium of the areas' more important economic problems. His treatment of the subject rests on the assumption that the *Union Française* is not, but must become, a viable whole; that France—like Europe's other metropolitan states, Britain, the Netherlands, Belgium and Portugal—should rejuvenate herself through a determined development of her overseas territories, especially in Africa. To achieve this end a co-ordinated attack on the economic deficiencies of the various territories is necessary, account being taken of the labour supply and of the characteristics of the inhabitants of each region. M. Robequain, who is a great traveller (he has already written a work on Malaya and the East Indies) pursues his analysis briefly and agreeably, making some interesting distinctions—for instance between small-scale individual colonisation, as in the Maghreb, and the colonisation of large capitalism, as in Algeria since the last war. The author's conclusion that foreign capital is indispensable to the development of the *Union Française* is in tune with the French Government's recent decision to permit American and Dutch/British oil companies to operate in Tunisia.

University Text Books

The shortage of text books is less acute than it was, but there are still not enough to go round. Students and others requiring books for the new university term should, therefore, place their orders now, when stocks are at their highest and before the beginning-of-term rush.

We specialise not only in economics, but also in the social sciences, history, and allied subjects.

AMERICAN SURVEY

Congress and the Gap

(From Our American Staff)

THE joint communique issued at the end of the Tripartite Ministers' Conference is a document which can mean anything or nothing. There was no doubt that the nine men who were there—Canadian, British and American all looked equally elated—thought that it meant, and intended that it should mean, a great deal. But much will depend on the ninety-six who were not there, more perhaps than Ministers coming from countries with less effective constitutional checks and fewer constitutional balances can realise, despite many examples of the ability of the Senate to dispose of what the Administration has proposed.

Much of the American and British satisfaction came, no doubt, from the report which the British delegates made, as their opening move, of the decisions taken by the Cabinet. Everyone in Washington had been bracing himself for a long and hard tussle over devaluation and the realisation that there was no need to preach to the converted, sent the talks off to a good start. But the greater part of the pleasure on all sides came from the rediscovery—which apparently needs making and should be made at regular intervals—that the members of the Truman Administration are not such confirmed supporters of *laissez-faire*, and the British Cabinet not such doctrinaire Marxists, as fancy suggests when they have not met for some months.

Of the achievements which could be announced, the first, and the easiest to implement, was the decision of the Economic Co-operation Administration to permit \$175 million of its funds to be used to finance British wheat purchases in Canada. The Administration is, presumably, satisfied as to the legality of doing this. There are many, however, who are inclined to agree with Senator Butler of Nebraska, who called it an "attempt to violate the intent of the laws we have passed"—even though, unlike Senator Butler, they may dislike the intent of the laws.

The value of the other short-term — and stopgap — measures mentioned will take some time to assess and will depend on the result of the American government's review of its stockpiling programme and the willingness of the rubber manufacturers to return to the use of a larger percentage of natural rubber in their products after some years of experience with synthetic. Not much can be done quickly to eliminate the anomalies of customs procedure, most of which, however absurd they may be, have achieved the status of law by administrative and court interpretation during the 25 years since the last statutory changes were made.

★

If devaluation and the sum of the contributions, individually small though they may be, from the United States and Canada, added to the measures already announced in the United Kingdom, can bridge the gap for three years there will be time for the real achievement of the meetings to take effect. What the *Christian Science Monitor* calls "the profound moral victory" of American-British-Canadian statesmanship may well seem remarkable in Washington where, only two or three weeks ago, the leeches appeared

to have sucked away so much of the blood of Anglo-American unity that its survival was doubtful. Thanks to the transfusion given by the President at Philadelphia, by the time the meetings began the colour had come back into the patient's cheeks, which, with the publication of the communique, developed a rosy flush.

This real achievement was that, for the first time, the bases were established from which attacks on the long-term economic problems could be made. Of first importance was the actual formulation of these problems, the recognition that, as Mr Douglas Abbott said at the beginning of the talks, "What we are faced with now is not so much a further effort at reconstruction, but rather adjustment to the new situation in world affairs." The British Loan was an attempt to give Britain the time and the resources to rebuild the world of 1938. When its inadequacy and the weakening of the British position became apparent, the Marshall Plan widened the sights to include the whole of Europe and the goal became the reconstruction of the world of 1913, a year in which the interdependence of the European economy, which was one of the expressed aims of the recovery programme, was a fact.

The devaluation of the pound, and most of the sterling area and other currencies, which, though only loosely allied with sterling are feeling the cold wind of the dollar shortage, is taken to be that adjustment which recognises the new situation in the world and marks the end of the postwar period of reconstruction. But though the Chancellor is congratulated everywhere on his courage—the figure of \$2.80 was greeted with an incredulous gasp—there are gloomy predictions of "industrial chaos and inflation" in England which, it is feared, will cancel out the advantages British goods should now have in dollar markets. The attitude of the TUC is being watched apprehensively by those who believe that if the wage line can be held, Britain will begin soon to pay her way.

★

One of the fundamental adjustments made by the United States was its recognition of the value of the sterling area. There had always before been a tendency to deplore its existence as a form of financial concentration camp; now the importance of its maintenance and development has been proclaimed. The communique, taken with the political conversations between Mr Bevin and Mr Acheson, suggests that the countries in the Indian Ocean area—and, in particular, those members of the Commonwealth who have become independent since the end of the war—are now to be built, thanks to a "flow of investment from the North American Continent," into ideological barriers to the spread of Communism from the east and dollar earners for the sterling area as a whole, rather than allowed to remain a drain on its dollar resources.

Another important adjustment from the American side was called, with proper delicacy, the recognition that "an essential element" in any campaign for increased exports to

the dollar area "was the creation of a feeling of confidence on the part of sterling area exporters," the feeling that "they will be afforded the opportunity to remain in the markets . . . in which they will have gained a place and that the minimum of difficulties will be placed in their way in entering those markets." After devaluation, it is too much to expect that many of the present obstacles are likely to be removed.

The affirmation of a principle by the Administration in 1949 does not imply its acceptance by Congress between now and 1952. The Senate at the moment seems to be some way behind the National Association of Manufacturers in its attitudes. The NAM has lately issued a report, containing the statement that "the necessity for developing an import surplus is inherent in our position as a creditor nation," which seems to have, as Mr Lowell Mellett remarked, caught "industry's political representatives somewhat unprepared."

Certainly such men as Senators Wherry and Malone, both of whom are assumed to come into that category and both of whom will still be in the Senate three years from now, have so far shown no sign of wavering. As soon as devaluation was announced, the former said that something would have to be done "to assure fair competition in the United States" and Senator Millikin—an important man as far as tariffs are concerned because he is the chairman of the Finance Committee when the Republicans control the Senate—feared that a flood of imports would "intensify the distress in which many of our producers already find themselves." During the debate on the Reciprocal Trade Agreements, Senator Malone spoke of Britain "forcing other countries to remain a member of the sterling area" and of the lengths to which it "will go to capture a large share of our markets abroad" and even Senator Aiken, one of the most liberal Republicans, was afraid that "no American business or the jobs of American working people can be considered safe from becoming pawns in the game of international politics."

★

When a party of visiting European journalists was in Washington Senator Vandenberg recounted to them the immense majorities by which foreign policy measures had passed the Senate and declared that "there is powerful consistency in these attitudes." He had only just left the Senate, where the votes on amendments to the Trade Agreements Act (the imposition of quotas on the import of furs and petroleum were only avoided by the Vice-President breaking a tie in each case) showed that an equally powerful consistency still exists on the part of Senate Republicans and a few Democrats with industries in their states which believe themselves to be in danger. The President's authority to negotiate further reciprocal tariff reductions was extended for two years without any restrictive amendments, "peril points" being discarded by a vote of 43-38. But one of the three Democrats who voted for the Republican amendment to keep the "peril point" provision, introduced by the Eightieth Congress, was Senator O'Mahoney, one of the Administration's most reliable supporters on foreign policy. His colleague, Senator Hunt, was also, though absent, paired in its favour, which suggests that the State of Wyoming is so apprehensive about the effect of Australian wool and Canadian cattle imports that both its Senators had to desert the Administration to save their political skins.

A real attempt to remove tariffs on an adequate scale, not merely to reduce them at the rate undertaken in the last fifteen years, and to do it at a time when European exporters are making a determined effort to make their goods and their prices more attractive, might easily bring cries of anguish from enough States to entail certain defeat, even with a

continuing Democratic majority in Congress. To be sure of success, the Administration must see that the cries are stifled. They can only be stifled by education. It remains to be seen whether it is possible to carry out such a vast job of education in the time left. It would be unwise for countries hoping to make an honest living in the near future to count too much on its success.

Enforcing Competition

[FROM A SPECIAL CORRESPONDENT]

THE revival of activity on the anti-monopoly front reveals a number of groups pressing in different, and too often conflicting, directions. One stimulant has been the recent victory of the Federal Trade Commission over its long-standing enemy, basing-point pricing. (This system ensured uniform delivered prices over a trading area through agreement on a basing-point, such as Pittsburgh, from which all freight charges to the consumer were calculated, whatever the location of the supplier.) The basing-point battle, however, was only part of a larger campaign: the extension of anti-trust activities from attacks on obviously collusive price-fixing or the dominance of an industry by a single company, to include less obvious things such as trade practices suspected of reducing unduly the pressure of competition, especially in fields dominated by three or four large concerns.

Consequently, there has been a great growth of commission-made and court-made case law on trade practices, with multiplying uncertainties as to whether a certain practice is or is not illegal for one industry after a similar practice—with some inevitable differences in the circumstances—has been put out of bounds for another. Interwoven with this new offensive is the traditional hostility toward the "concentration of economic power" involved in mere growth in size of business units. Last, but not least, the reaction against the growing power of the trade unions, which produced the Taft-Hartley Act, is leading to a renewed move to apply the anti-trust laws to organised labour, or to modify labour's present exemption from them.

On each issue there are at least two sides to be heard. But a majority of the contestants (though not all the members of the Federal Trade Commission) probably would agree on the need of clarifying the law. The agreement, unfortunately, does not extend to what should be clarified. Big business wants to be assured that its present practices are legal, while the anti-trust authorities want it made clear that they are illegal, or that power exists to declare them so if they are used in ways that impair competition. Small business, in the name of preserving competition, wants to be protected from many of its rigours.

Both Houses of Congress have passed similar Bills (with different qualifying amendments) legalising freight absorption, where it is not used monopolistically—whatever that may be construed to mean. Here the original initiative was taken by those who fear that recent decisions on delivered prices will lead to uniform prices at the mill (as they have

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

done in the steel industry) and prevent rivals from competing by selling in one another's territory. But on the floor of the House the initiative was seized by those who consider it more important to protect small business, against domination by a few large concerns, which might escape present legal definitions of monopoly. The court decision against the Atlantic and Pacific chain grocery stores and the present suit to break them up, reveal the same suspicions of bigness.

The problem of maintaining competition presents a series of dilemmas. The tendency of the anti-trust authorities is to construe any mitigation of the most extreme competitive pressures as coming within the ban of the law. But where competition is unmitigated, we have "sick industries"; and the government is called in, for example, to support agricultural prices, and protect resale margins under the "fair trade" laws. Before the war, price-floors were set for bituminous coal, and this may happen again.

The tendency to protect small business by treating size as an offence, in itself underlines the need for greater clarity as to the part it is desirable for small business to play. Some think that its most important service is to furnish effective rivals to the existing giants. In that case, freedom of growth, to really large size, should be encouraged. Others think the continued existence of many small concerns is itself important, as affording multiple opportunity for entrepreneurship. But when the point is reached at which further growth in mere size becomes legally dangerous—wherever that point is set—then the incentive to compete in securing more business is impaired, and the vigour of competition is weakened by the very measures taken to protect and maintain it.

There is similar confusion of thought concerning vertical integration, with its perplexing mixture of efficiency and sheer "bargaining" advantages. There seems to be an idea that combining two profits is wrong, but it is also held that passing one of them on to the buyer is unfair to the non-integrated competitor, for it involves using the profit derived from one stage of production to subsidise competition at another stage. There is also a latent conflict, which might become actual in the future, between the maintenance of competition and the private stabilisation of industrial investment foreshadowed by the President's Council of Economic Advisers. The CEA urges that private efforts must bear a major part of the load, instead of laying the whole burden on the government. If private stabilisation of investment is ever undertaken, it will have to make terms with the anti-trust laws.

What amounts to the framing of new regulations of trade practices is taking place under procedures adapted to the older concept of forbidding offences against existing and understood rules. This creates numerous difficulties. In addition, some strange legal doctrines are creeping into the civil procedures. These include placing the burden of proving his innocence on the defendant, and the doctrine that something one firm might legally do becomes constructively "collusive," if it is aware that another is acting in the same way. Does this mean that all uniform market behaviour is now constructively illegal? Moreover, the Federal Trade Commission's findings of "fact"—which make the law—are final if supported by evidence. These advantages for the prosecution have been built up to offset the advantages of economic power and expensive legal talent on the other side, and the former tendency of the courts to lean towards the defence of business interests. But this tendency seems

to have been reversed in the Supreme Court; and the weakening of the rights of the defence may come to be considered serious.

Finally, there are drawbacks in trying to "clarify" the law by changing the language, which has been at least partially construed in past cases, and introducing fresh language. This means the process of construction must, at least in part, be started all over again. The legal effect of the new language remains uncertain until it in turn has been construed. So "clarification" may itself breed fresh uncertainty.

These difficulties are the price that has to be paid for the determination not to allow American industry to be cartelised, or to be "rationalised" by the kind of planning business would introduce, if left wholly to its own devices. The results will be sadly imperfect and fumbling; in part perhaps even self-defeating. Rational theories will wage a difficult struggle with politics, in which private interests masquerade under theories of public welfare. But a democrat who agrees with the main objective may prefer to accept some decisions with which he does not agree, rather than see the general effort emasculated.

American Notes

"No Welfare, No Work"

The sunshine spread over the industrial scene by the welcome given the fact-finding report on steel wages has proved short-lived. Half a million miners came out on strike this week, varying their traditional war-cry from "no contract, no work," to "no welfare, no work." The steelworkers seemed likely to follow them this weekend until Mr Truman appealed for a six-day extension of the present truce. The companies, which have been daring the lightning to strike, have not

Herblock in the Washington Post

climbed down completely, but have agreed to give "earnest consideration" to the report and the public interest.

What Mr Lewis calls the "voluntary social convulsion" in the mines followed the refusal of some southern operators to continue paying the 20 cents a ton royalty into the miners' welfare fund until a new contract is signed. The old one expired on June 30th. The fund's trustees last week called a halt to all except emergency benefits, and Mr Lewis accused the operators of "bleeding the fund white" and warring against the sick, the old, and the dependent. But most of the fund's difficulties are due to Mr Lewis's own enforcement of a three-day week east of the Mississippi, and the consequent reduction in the number of tons of coal mined, and the size of royalty payments. His object was to cut the stocks of soft coal to increase his own bargaining power, but the miners have worked so well on the permitted days that soft coal above ground is adequate for at least a month. The same is not true of anthracite, which may be why Mr Lewis encouraged the hard coal miners to call a sympathetic strike. Their independent welfare fund is also calling a moratorium, though all contributions have been paid in, a fact which encourages the suspicion that benefits in both cases have been granted on too generous a scale. No doubt Mr Lewis hopes that the strike will produce a new contract with even larger royalty payments for welfare.

The steel industry, emerging from its daze of relief that no wage increases were recommended by the President's fact-finders, now feels it applauded too soon. After consideration, it has decided that the welfare and pension payments which the board urged should be financed entirely by the companies, represent an "entirely revolutionary principle" in American social security—and a costly one. This is a trifle ingenuous as the US Steel Company led the way, in 1946, in agreeing to Mr Lewis's demands for company financed benefits for workers in the mines it operates.

The steel companies insist that if workers do not contribute, they will be "stripped of responsibility for their own future security." The less advertised fear—and one which has some basis—is that the sky will be the limit for welfare plans toward which workers pay nothing. To the unions this attitude amounted to a refusal to regard the steel report as a "basis for negotiation" and indeed, the companies have stoutly maintained that they are not bound in any way by the report. They took part in the hearings only on the President's assurance that doing so committed them to nothing. Mr Truman, however, in seeking to avoid a strike, has put heavy pressure on the companies by announcing his fullest agreement with the board's recommendations on pensions and insurance.

Mr Truman's Supreme Court

Mr Truman could afford to lose no time in filling the vacancy on the Supreme Court caused by the death of Justice Rutledge, for the Court reconvenes on October 3rd, and with only eight Justices sitting instead of nine, there are likely to be many evenly divided opinions. His latest appointment, Judge Minton of Indiana, will please neither the Catholics nor the Republicans; since Justice Murphy's death the former are without a representative on the Court for the first time in three-quarters of a century, and Justice Burton, Mr Truman's first appointment, is, after 16 years of Democratic rule, the only Republican on a bench traditionally shared by both parties. The ill-health of yet another Justice, Mr Reed, who is eligible for retirement, may give Mr Truman an opportunity in the near future to correct this lopsidedness of the Court. Mr McGrath, a strong contender, but too recently appointed Attorney-General to be eligible, would satisfy the Catholics if not the Republicans.

Judge Minton is an old friend and former Senate colleague of Mr Truman, but in other respects the choice shows that

Mr Truman has not been wholly indifferent to the outcry which greeted the elevation of Mr Tom Clark to Justice Murphy's seat. Eight years on the US Circuit Court of Appeals has given Judge Minton time to acquire the judicial temperament the critics found lacking in Mr Clark. There has been a tendency recently to look outside the federal and state judiciary for new recruits to the Supreme Court and Mr Truman is to be congratulated on not following it this time. Apart from the benefit to the Court itself, the hope of advancement encourages men of ability to accept appointments to the lower courts.

Judge Minton also has a strong New Deal flavour, too strong for some who remember his support for Mr Roosevelt's plan to pack the Supreme Court. The deaths of Mr Murphy and Mr Rutledge threatened to leave Mr Truman with only two Justices who could be relied upon for a liberal construction of the Constitution and unfailing championship of the rights of the individual. Mr Clark is regarded as a radical only on the anti-trust issue, and his recent service as Attorney-General will prevent his participation in many such cases. The so-called "liberal" wing of Justices Douglas, Black, and Minton will now oppose the "conservatives," Justices Frankfurter, Burton and Jackson. In the centre, wooed by both, stand Chief Justice Vinson and Justices Reed and Clark, who are likely to follow his lead.

The prospect, therefore, is for more of the 5-4 decisions and dissenting opinions which have become characteristic of the Court. Mr Truman, who in many of his utterances is to the left of Mr Roosevelt, and who has had more opportunities than Mr Roosevelt enjoyed in his first four years of altering the judicial balance, has been remarkably reluctant to seize his opportunities to "pack the Court."

Rush-Hour in the Schools

American schools and universities opened their doors this month to 32 million students, more than have ever before been enrolled. The colleges, which were the first to feel the post-war educational boom, expect no serious increase; they already have a million more students than they had before the war, and the rush of veterans financed by a grateful government is beginning to ease off. The bulge is at the two extremes, in the graduate and professional schools to which the veterans, and others, are moving on, and in the elementary schools. It is at the foot of the school ladder that the crowding is most acute; the elementary schools are being swamped by the heavy crop of war babies which began to reach school age last year and which by 1956 will have added seven million children to the today's total of 20 million.

Overcrowding already condemns many children to sub-standard schooling; desperate boards of education, short of classrooms and teachers, are forced to employ the insufficiently qualified, increase the size of classes and resort to a shift system, and the use of such unsuitable premises as basements and Quonset huts. By 1956 it is estimated that another quarter of a million teachers will be needed; last year only 17,000 were graduated to meet a present replacement need of 125,000. The number of classrooms also needs to be increased by half in the next six years. The high schools are even less prepared for the tidal wave now making its way toward them.

American education may face its most critical year, as the Commissioner of Education believes, but Congress is still paralysed by the serpent of religious prejudice which it has discovered coiled inside the apple of Federal aid. Mr Lesinski has dissolved all the House Labour Sub-committees to end the obstruction, but the question of religious discrimination in Federal aid has become a full-fledged political issue in the New York elections, and many Congressmen may prefer not to be stung so near the end of the session.

Mr Lehman, the Democratic candidate for Senator, has redeemed himself with the Catholics by his support for the

Senate Bill, which would permit the States, if they wished, to use Federal funds to provide transportation and textbooks for the three million children in Catholic schools. His opponent, Mr Dulles, has ducked the religious controversy by opposing all Federal aid as part of the trend to "statism," which he deprecates, but in the mayoralty race aid to parochial schools is denounced by the Republican and upheld by the Democrat. New York is the centre of another political school storm over the Feinberg Act. This makes advocacy of overthrowing the Government ground for dismissal from the schools, rules that membership in a list of subversive organisations (not yet published) is *prima facie* evidence of disloyalty, and as interpreted in New York City, requires bureau heads to report on the loyalty of janitors, principals on that of teachers, and so on up the educational hierarchy. The Communist Party has brought a suit to test the constitutionality of the Act, and its many other critics have been encouraged by the decision (now being appealed) that Maryland's even most extensive application of the theory of "guilt by association" is unconstitutional.

Wines from the West

Last year Americans drank over 120 million gallons of wine, nearly twice as much as in 1938, and more than four-fifths of it came from California. Whisky distillers have been accused of trying to stunt the growth of their infant competitor, but in fact the wine industry's present discomfort seems to be due to its own growing pains. Success has gone to its young head and vintners have been producing more than they can sell, especially now that whisky, scarce and expensive during the war and post-war years, is becoming both plentiful and comparatively cheap.

The popular-priced American wines account for over 90 per cent of the country's total consumption and sell at 30 to 70 cents a bottle. They can be compared, even if not always favourably, to the continental *vin ordinaire*, but in California

these wines are mass-produced, with little regard for either the need for ageing or the variety of the grapes. Quality suffers even more from the raisin-growers' habit of dumping their surplus crops into the wine vats, a habit which the Federal Government is now trying to check by means of export and other subsidies for raisins. In an attempt to steady the price of the wine itself, the movement of this year's vintage is to be controlled by a Californian state marketing order, which limits the amount each vintner can sell.

Meanwhile, the Californian Wine Institute is trying, by means of an advertising campaign, to convince Americans that wine is not an expensive drink for special occasions only, but a pleasant accompaniment to any meal. The co-operation of hotels and restaurants is being sought, but just as important are training courses for wine waiters. These are particularly needed if the prejudice against American vintage wines is to be overcome.

Of the 378 wineries in California, about 20 produce what are called premium wines, which also come, on a small scale, from Ohio and New York. Production of fine wines was begun in California soon after the turn of the nineteenth century, by immigrants from Europe who, more recently, have been joined by refugees. They had experience of European methods of viniculture, pressing and ageing and, after experimenting with soil and climate, they have established vineyards from European stock which produce Californian wines of a quality equal to that of famous continental vineyards. Sales of these vintage wines reached 3 million gallons last year, about the same as those of imported wines, and vintners hope that the market which they established during the war will survive the resumption of European imports. The US Customs authorities are doing their best to protect this market, as will be remembered by those who read, in the *New Yorker* magazine, of the complications in which Mr James Thurber was involved by the attempt of a grateful recipient of a CARE parcel to reciprocate with a bottle of Cointreau.

THE WORLD OVERSEAS

The United Nations in Perspective

(By a Correspondent)

A SUMMARY of the work of the United Nations, with its immense complexity of organs and activities, must be hard on the eye, and generalisations about it must be dangerous. Some things, however, are common to all its parts. It is designed to keep the peace, and it is by its success in doing so that it must be judged. Besides this aim, all its other work—even when it is non-political activity, such as running down drug-smugglers or stopping epidemics—can only be successfully carried out in peaceful conditions. Conditions since the armistices have been far from peaceful; and so the United Nations now looks like the seashore at the bottom of a spring-tide—full of living beings, some of them active in pools, the rest still and closed, passively awaiting the return of the sea.

Last autumn, at the Paris Assembly, the sea retreated almost out of sight. The Great Powers in Berlin were conducting hostile operations only just short of war; ordinary diplomatic exchange between them was reduced to meaningless formality; the Foreign Ministers' Conference had broken down. The mood of the Assembly reflected the general deadlock. Not only did the Soviet Union and its satellites defy the Charter; the Czech delegate blandly asked why the Balkan states should not help Greek guerrillas, whether the western Powers would not do the same for their friends? Even a small nation like Israel refused to comply with the laws of war, or to accept any intervention by Uno except the ratifying of its victory. The appeal of Hyderabad was refused by India in terms recalling Goebbels's worst manner. Small wonder that delegates left Paris exhausted, frustrated and unwilling to gloss over the failure of a disastrous meeting.

The hopeful portents of the time were outside the United Nations. They were the progress of Marshall Aid and the success of the air-lift. It was to regional organisation that the western powers were turning, in tardy imitation of the Russians.

A Useful Meeting Place

The impotence of the United Nations is written into its Charter with the Great Power veto in the Security Council. This is consistently used by the Russians to get their way or to protect their supporters, in opposition to six-sevenths of the world. Normal Assembly voting has been 54 to 6, Security Council voting 9 to 2, the two being the Soviet Union and its puppet fellow-member. (In the first votes of the present Assembly it has been noticed that that Russian vote in the Assembly appears to have fallen to a regular five. The representatives of Yugoslavia are presumed to have regained their independence as a result of Marshal Tito's quarrel with Moscow.) This means that the United Nations is powerless both to enforce peace and to create the pre-conditions of peace. This year the atomic committee, the committee on other (or "conventional") armaments, and the Staff Committee charged with organising the international force provided for in the Charter have all reported deadlock. The points of disagreement are technical, sometimes almost trivial; but this does not matter, for if either side gave way on them—and the west has tried this—the Russians simply think up something else to cause trouble. The demand for an international force has now dwindled to Mr Lie's request for 300 guards and 2,000 "truce-keeping" volunteers, guards such as might have saved Bernadotte. The Russians refuse even these, and the point is coming up again in the present Assembly.

Uno, despite its toothless state, remains the centre where international disputes can be raised and where, in theory, they should be justly settled. During the past year, Uno has been dealing with the Berlin blockade, the fighting in Greece, Palestine, Kashmir, and Indonesia, and the future of the Italian colonies.

The Berlin conflict was raised in Paris by the western powers as a dispute, and kept alive by Mr Evatt, the Assembly's president, in an attempt to arrange neutral mediation. The Russians presented a blank refusal to both approaches. In fact, however, the west had won the siege of Berlin, and the May Assembly at Lake Success saw Mr Malik of Russia talking behind the scenes to Mr Jessup of the United States. From these talks flowed negotiations for the ending of the blockade, and the resumption of Four-Power talks on Germany. Thus Lake Success provided a useful meeting-place for disputing governments, and a milieu in which Russia could begin accepting the consequences of a defeat. But it was the Air-Lift and the Atlantic Pact that decided the issue in Berlin—not Uno.

Violation of the Charter

The Greek question was kept within the competence of Uno, in spite of the most vociferous propaganda by Mr Vyshinsky to discredit the United Nations observer commission. Again this year the commission reports that Albania and Bulgaria have helped the guerrillas. Yugoslavia has ceased meddling, but Rumania has taken its place. If the frontier war ceases it will not be due to Uno, but to the Greek army. All the same, the Greeks attach great importance to having impartial witnesses to the interference of the Balkan states; so that Uno may be said to have served the cause of law here.

Palestine offers the greatest example yet of violation of the Charter. Uno has been constantly engaged with a dispute for which it has a direct responsibility and in which it has neither prevented war nor obtained justice. The result was obtained by truce-violation, foreign gun-running, genocide—as that crime is defined in the convention of 1948. The merits of the case were set at naught by the partisanship of the United States in forcing a partition which rendered war inevitable. Even then, if they had chosen, the Great Powers could have prevented war and mass deportation. As it is, a number of men have given devoted work, some besides Bernadotte their lives, to permit the United Nations to affix the rubber stamp to successful aggression.

India and Pakistan have presumably too much sense to begin an all-out war. Hence the New Year's Day cease-fire in Kashmir. The Uno mission has since then offered five different solutions, ending with mediation and a truce supervised by Admiral Nimitz. This plan would seem to aim at recognition, according to the Charter, of the right of people to choose their rulers. It remains to be seen if pressure by Assembly opinion will induce India, the stronger state, to accept the plan already agreed to by Pakistan, and to allow a real plebiscite. This would mark a real success for Uno as mediator.

Truce in Indonesia

Indonesia, after bitter fighting with the Dutch, has come to conference at The Hague. The United Nations Committee of Good Offices certainly did a great service in keeping the ways

Action for the Blind

Braille cards. Embossed with values for use by blind players.

DEAL WITH TO-DAY'S CORRESPONDENCE

TO-DAY!

With a "Recordon" at your elbow, ever ready to take down your dictation, you can utilise every minute and always keep up-to-date. No longer need you suffer those irritating delays or be inconvenienced by absenteeism.

The "Recordon" pays for itself and pays you a profit—by saving hours of valuable time for executives and staff—by getting more work done faster, easier, far more economically—because of a combination of features unmatched by any other machine.

You record your messages on magnetic paper discs, which can be erased and used over again, for an indefinite number of times.

"Recordon" Discs can be folded and posted for play-back in almost any part of the world. Their use in place of long-distance telephone calls gives an immediate saving in costs and far superior reception.

Other outstanding "Recordon" features are:

- One machine for Recording and Play-back.
- Audible warning when approaching end of record.
- Easily carried. Weighs only 11½ lb.
- Visual "Record" and "Play-back" indicator.
- Easily manipulated switches.
- "Recordon's" exclusive feature—"Codic" Scrolls for confidential correspondence.

to truce open; but the United Nations did not stop the war, and it will have no part in the settlement.

The Italian colonies were the subject of a realistic though oddly written, report on the merits of the case, and especially on the views of the peoples of the colonies. They wanted a variety of things, among which the return of Italy was included only by the tiny minority of remaining Italian colonists. In the May Assembly a "compromise" offered Tripolitania to Italy, whereupon the people rioted. The plan failed to get the needed majority, because all the Asiatics backed the native peoples against the Great Powers, and the present Assembly must tackle this problem once more.

Working Without Russia

The lesson of these disputes seems to be that Uno can only make just settlements if all the Great Powers are united in putting their strength behind justice, an event as rare as daisies in December. But Lake Success does offer a meeting-place even when relations are strained, and it succeeds in tidying up the results of quarrels which have really been decided by force. This is far indeed from the purpose of the Charter, but it is also far from nothing.

This appears clearly when the technical work of the United Nations comes into view. Most of this, like security, should be world-wide with many local variations. Like security, it has had to be worked out without Russia, but unlike security it is still within the United Nations. Russia belongs only to the main Economic Council, and to the drug and transport committees. But it allows the satellites to remain members of bodies like the Economic Commission for Europe, the only economic body which bridges the East-West gap; to take part in the health organisation, in food and agriculture, in the relief fund for children. True it is that bodies which are Cominform-free, like the refugee organisation, are the more efficient because they do not have to waste their energy in unravelling the tangles tied by the Communists. But even the satellite governments take part in work of immense value. Poland is deeply interested in supporting measures against tuberculosis; Czechoslovakia in retaining as much as it is allowed of its trade with the West. For the western countries the use of the United Nations bodies is obvious. On some of them, even in their early stages, it is worth paying large sums if only for long-term benefits. Food and agriculture, for instance, is the obvious field for practical world planning, and though American particularism has wrecked Boyd Orr's vision, it is still worth sustaining for its information and its campaigns for improving the yield of crops and for preventing loss by pests.

Australia's Pre-Election Budget

[FROM OUR MELBOURNE CORRESPONDENT]

EVEN Mr Chifley's political opponents have not accused him of window-dressing in the Budget which he introduced into the Commonwealth Parliament on September 7th with an eye to the federal elections later in the year. There were neither spectacular tax concessions, nor any election baits or promises which might facilitate the return of Labour to office. The two opposition leaders, Mr Menzies and Mr Fadden, contented themselves with describing the Budget as "a dismal prospectus for the long-promised golden age."

Mr Chifley offered in his Budget no concessions in either individual or company taxation, but granted reductions in sales tax, entertainments tax, customs, excise and primage duties amounting to £9,650,000 a year. Taking into account reductions in direct taxation rates made earlier in the year, to operate from July 1st and costing £36½ million, the full cost to revenue of

tax concessions coming into operation in 1949-50 will be approximately £46 million.

For 1949-50, Mr Chifley is budgeting for a deficit of £35 million. The estimated expenditure of £567 million is a new high record and includes a grant of £10 million to the United Kingdom. The revenue for the year is estimated at £532 million, but Mr Chifley's recent budgets have usually under-estimated revenue. It would be by no means surprising, if business continues at the buoyancy of the last twelve months, to see the year end with the national accounts balanced—if not showing a surplus on operations.

The Federal Budget has been balanced for the second time since the war. The year 1948-49 ended with revenue and expenditure exactly balanced at £425 million, whereas Mr Chifley originally budgeted for a deficit of £17,700,000. The total revenue for the year, £535 million, was £42 million above the estimates, the main increases being £26 million from income tax and social services contributions, £11 million from customs and excise and £1,800,000 from pay-roll tax. There is, however, every reason to suspect that the last three financial years have ended much more favourably than the bare figures have indicated. One authority says that the reduction of the Commonwealth's short-term debt through the redemption of Treasury Bills suggests that the Government in effect achieved surpluses of about £70 million in both 1946-47 and 1947-8.

Great Postwar Improvement

There has in fact been a tremendous improvement in Australia's national finances since the war. In 1944-45, the last full financial year of the war period, revenue fell short of expenditure by £266 million, which had to be borrowed. The huge wartime gap between revenue and expenditure has now been closed, while at the same time five major tax reductions have been made since 1945, gifts totalling £35 million have been made to the United Kingdom, social services expenditure has risen from £39 million a year to £81 million, and £132 million has been paid in subsidies to keep down the cost of living.

The buoyancy of public finances has been directly brought about by a succession of good seasons and soaring prices for Australia's exports, because of the strong world demand for primary products, particularly wool, wheat and base metals. The national income rose in 1948-49 to a new record of £1,955 million which is nearly two and a half times the figure of 1938-39. Personal expenditure on consumption in 1948-49 was £1,418 million, having increased by £184 million, or 15 per cent, since 1947-48.

It seems clear that the Commonwealth Government is using the Budget to promote its economic and social policy rather than to attempt to gain an election advantage through tax concessions. It takes the view that its financial policy is amply justified by the economic position in which the Commonwealth finds itself today. Financial policy is directed toward the objective of full employment, which has been maintained since the

COMMONWEALTH BUDGETS SUMMARISED

	1946-47		1947-48		1948-49		1949-50
	Estimate	Actual	Estimate	Actual	Estimate	Actual	
Revenue	£ mn. 385.0	£ mn. 412.0	£ mn. 397.0	£ mn. 457.0	£ mn. 492.9	£ mn. 535.0	£ mn. 552.0
Expenditure	444.0	450.0	427.0	455.6	510.6	535.0	567.0
Surplus or Deficit ..	- 59.0	- 38.0	- 30.0	+ 1.4	- 17.7	...	- 35.0

war ended. As Mr Chifley points out, every available worker has had a job, every new worker has found a job, and the total of wage and salary earners in work has risen rapidly. In June this year it was 75,000 above June last year and 720,000 above June, 1939. Mr Chifley has said:

These basic facts—far more than anything else—explain why we have been able to throw off the burdens of war, reduce taxes, increase production, improve social services and find the way to our present strong financial position.

The government will go to the public in a similar frame of mind to that with which it faced the electors in 1946. Then Mr Chifley refused to meet offers of sweeping taxation reductions by Mr Menzies with counter offers on his own part. He merely said that taxation would be eased when practicable. Mr Chifley, whatever his basic political philosophy may be, is fundamentally a conservative in financial matters.

This has been well demonstrated in the postwar years when Budgets in many ways might more appropriately have been framed by a treasurer with a Conservative rather than a Socialist frame of mind.

The significant exception to Mr Chifley's conservatism in money matters is, of course, his obsession about private banking, which led to the government's decision in 1947 to nationalise the Australian trading banks. Last year, when the High Court declared invalid the government legislation to nationalise the private banks, this looked like being a major election issue; but now that the Privy Council has decided against the government, it is possible that issues less complicated and less legalistic will weigh more, with the electors.

Expansion of Secondary Industries

The government is able to go to the country pointing to a creditable achievement in financial matters. But Mr Chifley is fully aware of the effect on the Australian economy of any severe recession in prices of primary commodities on world markets. Lower prices for wool, wheat and metals will result in a fall in the Commonwealth's export income in the current year unless prices return to their recent peaks, which seems unlikely. It is for that reason that the Government regards sterling funds, which are now standing at something less than £A400 million against an average of £A34 million in 1939, as a buttress against a sudden fall in export income. In 1930, when primary produce markets collapsed overseas, Australia's capacity to import was crippled, and the domestic standard of living suffered greatly through inability to obtain vital goods from overseas. Today, with the Australian economy much more self-contained through the building up of secondary industries during and subsequent to the war, the Commonwealth is much better able to meet a world-wide depression than previously. The Labour Government naturally claims much credit for having achieved this position. It has actively encouraged the expansion of secondary industry and the inflow of British and American capital. It can point to the establishment of the Australian motor-car industry and the expansion of the steel industry, in addition to the establishment and expansion of many other industries in the heavy and chemical field.

Although the general elections are only about two months away, nothing more than pointers have yet been given of the lines which the government and the opposition will take. But if the two previous campaigns are any criterion, it can be taken that the Budget presented by Mr Chifley on September 7th will give the pattern of the government's election campaign. In essence, it will stand on its achievements rather than on any promises that it might offer for the future.

Employers and Workers in Japan

[FROM OUR TOKYO CORRESPONDENT]

WITH hoarse democratic shouts of "Down with Communism!" Japanese employers are rushing in to hold down working conditions and wage scales and to knock out the tottering Japanese trade union movement. They have been swift to scent advantages in the current labour retrenchment programme, imposed by the belated "austerity" orders of Mr Joseph M. Dodge, the Detroit banker whom Washington despatched to Tokyo to enforce the economic reforms which General MacArthur had been gently discussing and benevo-

lently postponing. Unemployment in Japan is expected to reach the four million mark as the public services and big industries shed their tens of thousands of surplus employees, and the government fumbles apologetically the task of unemployment relief and reabsorption. Without a doubt, the government services have been swollen by excess employees. The only abundant Japanese natural resource, as General MacArthur has observed, is manpower—largely unskilled, always underpaid. The present developments were inevitable and overdue.

But Japan, fundamentally an industrious nation, is not accustomed to unemployment. The current disinflation programme, with thousands of long-service workers out on the streets in stunned bewilderment, has been a much greater shock to the nation because it has been delayed. Had rigid retrenchment been ordered at the outset of the occupation, it would have been accepted as a matter of course. Today, after four years of the mildest military occupation of a defeated nation in history, it has surprised employer and worker alike. Recovering from their surprise, Saito-san and Suzuki-san, the new democratic industrialists, who have replaced or are "dummying" for the purged Mitsui and Mitsubishi operators, hope to seize this opportunity of stifling the first faint struggles of organised Japanese unionism, groping, immature, ill-led, but still confusedly dedicated to the strange proposition of higher wages, shorter hours and an improved standard of living.

Ineffective Strike Threats

The Communists have infiltrated the usual key unions—transport, communications, mining, teaching, heavy industry. They raised their voices loudly when the Prime Minister, Yoshida, introduced his "economic stabilisation" decrees. They threatened "a summer revolution," "an August labour offensive" (which has now been shifted to September, or it may be October) and a programme of strikes from one end of Japan to the other.

But only words were violent as the dismissal notices were issued. The age-old Japanese instinct of obedience to authority, like all Japanese instincts, has been unaffected—perhaps only strengthened—by four years of occupation. And then even the words lost their violence when an elderly, inoffensive railway executive, charged with the technical responsibility of sacking surplus railwaymen, was found, cut to pieces, on a Tokyo railway track. In the ensuing uproar, the Communists were naturally, and perhaps correctly, blamed for intimidatory murder. The public revulsion against the Communists in general, and dismissed railwaymen in particular, was bitter and spontaneous. That was seven weeks ago. There has been no arrest. The railwaymen, like other dismissed workers, wilted under horrified public opinion. Some railwaymen, before quitting their jobs, bowed and placed flowers on their superior officers' tables.

Now employers, in common with the government, are exploiting the situation with Oriental expedience and mock-humble opportunism. This week the Japanese League of Employers' Association, in a long report full of pious phrases and unashamed hypocrisy, has drawn up recommendations for nation-wide adoption by all employers who are hampered by the existence of unions, whether Communist-infiltrated or not. They said among other things:

It was for a time regarded as a legal issue whether or not an employer could dismiss his employees on the ground that they lacked the sincerity to co-operate with him. However, the latest mass discharge of railway employees has furnished a decisive precedent. We are authorised to dismiss all those who either have committed acts interfering with the normal management of enterprises or who have assisted others in the commission of such acts.

The implication is that "such acts" mean the murder of executives on railway lines or elsewhere, or the derailment or wrecking of trains. Actually, there can be no mistake that the smoothly lacquered words interpret "lack of sincerity" as

holding office in a union, insistence on contractual rights and even "carrying out political movements to overthrow the Yoshida Cabinet."

Breakaway Unions

One paragraph touches delicately on the democratic possibility of encouraging rival unions:

When a second union is organised for the purpose of improving the condition of the enterprise by means of adequate labour-management collaboration in harmony with the actual state of affairs, the employer should give priority to this second union, regardless of the number of its members.

Other useful suggestions are made for reducing retirement allowances "in view of the present social and economic condition of the nation," for revising labour contracts, for restricting union membership and for "otherwise democratising labour unions." The moral effect of including union officials among the first batch of discharged employees is gently referred to in passing, but, in all fairness, only a suspicious person could construe the passage as a deliberate incitement to employers to adopt this stratagem in order to discourage union aspirants. The observation is merely dropped, with an Oriental shrug, like the seed which sometimes fell on stony ground. Finally, the League pays warm tribute to the remarkable legislation, proposed by the Government, which will empower the police to arrest and punish equally all the leaders of any union of which an obscure member has committed a crime of violence.

If the western observer accepts the theoretical design of all this anti-union activity and intimidation as a prudent defence against Communist sabotage and machinations, he will naturally commend the democratic fervour of the Japanese industrialists. But if he gives a thought to the restoration of oligarchic control of Japanese industry and to the holding down of Japanese wages and living conditions to the old "rice-bowl" standards on world markets, he may well be excused a certain perplexity over the practical uses of the occupation.

The Future of British Business in China

[FROM OUR SPECIAL CORRESPONDENT IN HONGKONG]

By their official pronouncements and, even more, by their practice in the big cities of Tientsin and Shanghai, the Chinese Communists have made fairly clear what they propose to do about foreign business activities in China. These activities fall into three main categories. First, there are the foreign-owned factories and static enterprises, of which the most notable are probably the mines of the Sino-British Kailan Mining Administration in North China, the cigarette factories of the British-American Tobacco Company in Manchuria and various parts of China, and the British textile factories in Shanghai. These, it is clear, will be nationalised as soon as the Communists feel they have the technical competence to take them over. Some compensation will be paid but probably not on any great scale, for the Communists take the line that these foreign enterprises have made such high profits out of China in the past that nothing more is now due to them.

Need of Foreign Ships

In the second category are the importing and exporting firms. In this field more and more trade is being concentrated in the hands of monopolistic state trading concerns, and it is quite clear that trade with a Communist China in the future must be thought of as taking place on a government to government basis. There may be a place for a few of the larger British firms in the role of government agents; but experience in Tientsin suggests that the Communists are determined to try to do away with the foreign (and the Chinese) middleman. They have already made it virtually impossible for the smaller firms to carry on; and even the larger firms can only function on the basis of a strict official limitation of their profits.

The third category comprises certain subsidiary adjuncts of the first two categories, the most important being 'foreign shipping and banking.' Until the Communists have a merchant marine of their own—and this may not be for several years—they will perforce have to rely largely on foreign shipping. It is probable that in the early stages economic necessity will even oblige them to permit cabotage and navigation on the Yangtze, two things which the Nationalists banned after the war. The future of foreign banking is less promising, and it is doubtful if foreign banks can expect to do much more in a Communist China than they do today in the countries of eastern Europe.

China will continue to require two commodities from the west. First, it will require the products of the west, especially capital equipment and machinery of all kinds, if the Communists' plans for industrialising the country, which is the only way in which the standard of living can be raised, are to be realised. If it has to rely for these imports on Russia and the Soviet bloc, the programme of industrialisation will be slowed up indefinitely. Second, for a number of years to come, China will need to import a certain number of experts in all those technical fields in which the country is still so backward. It is, therefore, not the trade, but the way in which trade is conducted, which has changed.

End of the Merchant Era

We are witnessing the end of an era, the ending of one type of commercial relationship and the beginning of another. It is a painful and depressing experience. Many British merchants are probably going to be ruined. It is possible that we shall witness a drastic reduction in a general British economic stake which has been built up over the years by enterprise and courage and in which it is impossible not to take a certain pride. This reduction of our stake in China is occurring at a time when the problems presented by our export trade and the balance of payments are graver than ever before in our history. There is already much frustration amongst the British businessmen in China. There will soon be much bitterness, and it will be difficult not to let our views on the nature of the tremendous revolution which is taking place amongst a nation of 450 million people be coloured by what is happening to British interests in the port cities.

Nothing, however, is to be gained by blinking the facts. The Nationalist blockade, which the British merchants in Shanghai blame for many of their troubles, has undoubtedly accelerated the crisis, but the crisis would have come anyway sooner or later. Indeed it is arguable that it would have come under the Nationalists too if they had ever been sufficiently strong to establish a united and efficient Chinese government. The monopolies established in the early days of the Sino-Japanese war like the Central Trust and the China Tea Corporation; the restrictions on foreign shipping after the war; the various measures to enforce economic nationalism; all these things were symptomatic of the underlying trends. They were pointers to the future. They were abortive because of chronic governmental inefficiency and corruption.

There is now an administration in China which is sometimes inefficient because inexperienced, but which, by all accounts, is learning fast; which is determined to push through, albeit with certain modifications, the basic economic principles of the Marxist philosophy; and which so far has displayed not the slightest trace of governmental corruption as traditionally practised in China in the past.

Allied Powers in Germany

[BY A CORRESPONDENT]

LAST Wednesday the three allied High Commissioners handed to Dr Adenauer, the German Chancellor, the Occupation Statute which will regulate their relations with the German Federal Government, which was formed the previous day. The

statute affirms the desire of the occupying powers that the German people should enjoy the maximum possible degree of self-government consistent with the basic purposes of the occupation. (These basic purposes are not defined in the statute.) Therefore, it says:

the Federal State and the participating *Laender* shall have, subject only to the limitations of this instrument, full legislative, executive and judicial powers in accordance with the basic law and with their respective constitutions.

The fields of activity in which powers are specifically reserved to the occupying authorities are carefully, although sometimes rather vaguely, set out. First, and most important, are foreign affairs; foreign trade and exchange; disarmament and demilitarisation including scientific research, prohibitions and restrictions on industry and civil aviation; controls over the Ruhr; restitution of property, reparations, decartelisation, trade discrimination and foreign interests in Germany; displaced persons and the admission of refugees; "respect for the basic law and the *Land* constitutions"; "the protection, prestige and security of allied forces . . . the satisfaction of occupation costs and their other requirements." Over internal action control is reserved

only to the minimum extent necessary to ensure the use of funds, food and other supplies in such manner as to reduce to a minimum the need for external assistance to Germany.

The German Federal Government and the *Land* Governments may legislate in these reserved fields after having given due warning to the occupation authorities, who may impose a veto.

Right to Resume Control

The control over certain fields thus specifically given to the occupation authorities could be extended over the whole range of German activities. This is implied both by the right of the High Commissioners, under certain circumstances, to resume in whole or in part the exercise of full authority, and by their power to veto legislation. They can resume governmental authority if they "consider that to do so is essential to security or to preserve democratic government in Germany or in pursuance of the international obligations of their Governments." All federal and state legislation and amendments to *Land* constitutions will become effective twenty-one days after their official receipt by the occupation authorities, unless disapproved by them. The authorities undertake in turn not to disapprove of legislation unless, "in their opinion," it is inconsistent with the basic law, the *Land* constitutions, other German legislation or allied directives, "or unless it constitutes a grave threat to the basic purposes of the occupation." Any amendment of the basic law itself will require the express approval of the High Commissioners.

A mammoth task made necessary by the change in Germany's status is the sorting out of the mass of legislation made both by the three military Governments and by the *Land* Governments in accordance with allied directives. It is laid

down in the Occupation Statute that all this legislation is to remain in force until either repealed or amended by the occupation authorities in accordance with the following provisions:— (a) Legislation inconsistent with the Occupation Statute is to be either repealed or amended to make it consistent; (b) legislation based upon the reserved powers is to be codified; (c) all other legislation is to be repealed by the occupation authorities when requested by the appropriate German authorities. It has been agreed that the codification of legislation should be completed by December 1st.

It is obvious that the text of the Occupation Statute does not in fact reflect at all clearly the shape of things to come in western Germany. It is an attempt to reconcile fear of resurgent German nationalism with a desire to see democratic Germans play a full and useful part in the life of western Europe. It is therefore, perhaps, inevitable that it should raise almost as many questions as it settles. Will the Allied High Commissioners, for instance, rely on exercising control principally through their power of vetoing legislation or through some system of administrative controls? Will they control foreign trade through an organisation similar to the Joint Export-Import Agency or will the Germans be given almost a free hand, subject only to discreet supervision? To what extent will the Germans be allowed consular and other representation abroad?

Twelve Months' Trial

The announcement made last week that the Federal Government would be allowed to send its own delegation to the forthcoming International Labour Conference at Geneva specifically stated that this was not to be considered a precedent. Again the "protection, prestige and security" of allied personnel might involve almost nothing at all, or might if necessary be used to cover the introduction of a great deal of restrictive legislation.

Everything, in fact, will depend on the interpretation which the High Commissioners give to the statute, and that in turn must depend on the behaviour of the Germans. It is therefore hardly surprising that one of the principal German criticisms of the statute should be that it contains no provision for any arbitration court to which the Germans can appeal against the High Commission's decisions. To them the most encouraging clause is the last, which states that after twelve months, and in any case within eighteen months of the statute coming into force, the occupying Powers undertake to review its provisions "with a view to extending the jurisdiction of the German authorities in the legislative, executive and judicial fields."

Politics in Pakistan

[FROM OUR KARACHI CORRESPONDENT]

It is commonly said that politics in Pakistan are a matter of personalities. This is in the main true, for there is virtually

only one political party and only one policy; but there are certain strong undercurrents, and in the long run personal factors may prove to be mere froth in the surface of the stream, except where they meet these deeper currents.

The Pakistan Muslim League, which is the Government party, has nominally taken on a different character from the old All-India Muslim League. The latter used to claim to represent the entire Muslim nation of the sub-continent, whereas the new organisation is no more than a political party. There is a small parliamentary opposition, slightly more effective than its numbers warrant, consisting of the Hindu representatives from East Pakistan; and a splinter Muslim party has recently come into being, under the style of the Awami (People's) League. Apart from these, the Muslim League holds the field unchallenged. The only serious threat arose in the first half of 1948, when disgruntled elements—including the leaders of the Red Shirt movement, the Ahrars—and the Socialists formed an organisation called the All-Pakistan People's Party, with its headquarters in Peshawar. This was rapidly bludgeoned out of existence by the North-West Frontier Province Government, under Khan Abdul Qayyum Khan, who has shown himself anything but squeamish in his use of the Public Safety Act for suppressing opposition, and some of the organisers are still undergoing detention.

Lacking the stimulus of opposition, the Muslim League has lost much of its momentum and, though still supreme as a political force, has shown signs not so much of disintegration as of growing inertia and decay. These signs have been more visible in the provincial Muslim League councils than at the centre; in the West Punjab in particular, the provincial organisation has forfeited the respect of the public altogether (and the West Punjab has some claims to be regarded as the nerve centre of Pakistan). The Central Council has still considerable prestige as, though presided over by Choudhry Khaliquzzaman, an elder statesman, it is really controlled by Pakistan's wise and able Prime Minister, Mr Liaquat Ali Khan. His government is a Muslim League government and stands or falls with the League. Its stability is unchallenged, except by a few mice gnawing at the roots—these words are Liaquat's own—and, indeed, there can be no overt challenge until the new constitution has been framed and general elections are held under its provision.

“Islamic Social Justice”

The policy of the League is Islamic Socialism. Many observers would be glad to know exactly what this stands for. It does not connote Socialism as understood by the economists, and no reference to it was made in the “objectives resolution,” which embodies the main principles on which the constitution of Pakistan is to be based, or in the Prime Minister's speech introducing that resolution in the Constituent Assembly. Constant references were, however, made to “Islamic social justice,” which is perhaps the same thing. This was described as based upon fundamental laws and concepts which guarantee to man a life free from want and rich in freedom, a life wherein the principles of democracy, freedom, equality, tolerance and social justice as enunciated by Islam shall be fully observed, and adequate provision made for the minorities freely to profess and practice their religions and develop their cultures. Brave words indeed! In practice, stress is being laid on the principle of equal opportunity for all, and Islamic Socialism is taking practical shape in agrarian reforms.

Here we meet the first of the main undercurrents. Agrarian reforms are being played up by the Muslim League but, while many votes will be gained thereby, obstinate opposition must be expected from big landlords who dominate the Provincial legislative assemblies. East Pakistan has led the way with a Bill for the abolition of big *zamindaris*, which is likely to be passed before the year is out. In West Pakistan a committee appointed by the League has made drastic recommendations, including the abolition, without compensation, of hereditary *jagirdaris* (assignments of land revenue), limitation of proprietary holdings, and tenancy reform. The Muslim League has given the report its blessing, but has avoided too definite

a commitment on the main issue, the limitation of the size of holdings. In the North-West Frontier Province agrarian reforms have already led to the formation of the Awami League by recalcitrant *jagirdars*.

Mullahs versus Progressives

Even more important among the wider issues affecting the future of the state is the ideological clash between the *mullahs* and what might be called the progressives. Islam recognises no priesthood, and, therefore, it is claimed there can be no question of Pakistan becoming a theocracy; but it cannot be denied that the *mullahs* or *maulvis*, to whom the people look for religious guidance, have very great influence. They tend to take an obscurantist attitude towards modern ideas of progress, and to follow the letter rather than the spirit of the *shariat* in regard to such matters as seclusion of women. The progressives, on the other hand, are working for a modernist and go-ahead state, and deprecate any kind of fanaticism. “The ink of a wise man's pen is of more value than the blood of martyrs” is an Islamic text which might well be their motto. Part of the importance of this controversy is that therein lies a threat to the authority of Mr Liaquat Ali Khan, who is in the forefront of the progressive school of thought. The late Mr Jinnah would never have allowed the *mullahs* to gain the upper hand.

The third main undercurrent consists of the ill-concealed tussle between the provinces and the centre. Provincialism is rampant and has defied the efforts of broader patriotism to suppress it for the sake of the unity and discipline which Pakistan so badly needs. So far as East Pakistan is concerned, for geographical and ethnographical reasons it was inevitable that the province must be allowed to go its own way to some extent and to enjoy a considerable measure of autonomy. But the provinces of Western Pakistan could easily be amalgamated under a single administration, and most political thinkers feel that in the interests of unity, no less than of economical and efficient administration, this should be done. Mr Jinnah would have carried through amalgamation; but it is doubtful whether the present Central Government feels itself strong enough to overcome the opposition of provincial politicians in the Constituent Assembly. Sind is already showing signs of revolt, under the leadership of the ex-Premier, Mr Khuhro. This remarkable man continues as president of the Sind Provincial Muslim League Council, although disqualified from holding public office for three years, having been found guilty by a Special Court of Inquiry on no less than 62 charges, 34 of which constituted cases of gross misconduct. A typical Sindhi, he dominates the province like an old-time Tammany Hall boss, and is likely to prove himself a thorn in the side of the centre, especially as a champion of the big landlords.

A Champion of Civil Rights

Another personality who at present holds no public office, but is prominently in the public eye, is Mr H. S. Suhrawardy, a former Premier of undivided Bengal. He is a declared foe of the present Muslim League set-up, and, with his flare for politics and intellectual ability, is a force to be reckoned with. He stands for better relations with India, in the interests of the Muslim community in that Dominion, and has prominently associated himself with the cause of the refugees, who have not been made too welcome in the provinces of Pakistan. He also stands for repeal of repressive legislation, which gives him an opportunity to attract much attention as a champion of civil rights. The platform is, indeed, an admirable one for any opponent of the Government, for there is a widespread feeling that the various provincial Public Safety Acts have been abused. Mr Suhrawardy has at present no strong provincial affiliations, and this, together with the fact that he is a modernist by outlook and persuasion, may lead to his ultimately joining up with Mr Liaquat Ali Khan. This would be a good thing for Pakistan.

THE APHID MENACE

The grower whose crops are threatened by green fly need fear that menace no more. The new Phosphate Insecticides—HETP and TEPP—will destroy all species of Aphids, Red Spider, and many other insect pests. HETP and TEPP are safe on fruit and vegetables and remain efficient even at low temperatures.

THE BUSINESS WORLD

Devaluation and the Consequences

The dust and disturbance caused by devaluation will take some time to settle. Issues which for some months past had been in doubt have been decided ; but in turn new problems have been created by the alignment of currencies which themselves will have repercussions upon prices and trade throughout the world. To trace in detail the effect of the new exchange rates upon the potential course of trade and economic activity is at this stage scarcely possible, even in the case of countries like Britain and the United States which are most directly affected. The articles which follow contain little attempt at prophecy. They set down the alterations which have been made in the world's exchanges, and the immediate effects which may be expected to follow ; they examine the conditions which will now determine the success of British exporting on the dollar area, and the effects of devaluation upon British prices and costs ; important repercussions on the security markets are reviewed in the fourth section ; and, finally, oil economics are examined as a special case which may become in some respects less tangled as a result of devaluation than it was under a regime of artificial currency relationships.

The Exchange Adjustments

THE devaluation of the pound, which took effect immediately after the Chancellor's broadcast on Sunday, September 18th, has been followed by even more rapid and violent exchange adjustments throughout the world than occurred in the corresponding period of 1931. Many of these adjustments, which are described below, had been formally announced by the time the British banks and Stock Exchange reopened on Tuesday morning, after their enforced closure on the Monday. Others have followed in quick succession during the week, so that, by the time of going to press, most of the major countries had already declared their attitude and twenty separate devaluations (many of them also involving dependent currencies) had taken place. No definitive statements had been made by Argentina, Italy or western Germany.

The new official rate for sterling against the US dollar is \$2.79½-2.80½, compared with last Saturday's rate of \$4.02½-4.03½ ; it will be noted that the opportunity has been taken to reduce the dealing margin from ½c. to ¼c. This depreciation in terms of dollar value amounts to 30.5 per cent, and the arithmetical equivalent increase in US dollar prices in terms of sterling is 44 per cent. This, accordingly, is the increase which has been made in the sterling price of gold, which is now 248s. per fine ounce compared with 172s. 3d. last week.

* * *

Though the devaluation itself had been widely expected, the actual parity adopted took the world by surprise. Beyond the very small circle who actually made the decision, few anticipated that the new parity would be as low as \$2.80. The International Monetary Fund has approved the new rate—but that of itself does not dispose of the question whether so drastic a depreciation was justifiable.

There is known to have been a school of thought, both within and outside official circles, which would have preferred the rate to go free, or at least that some form of free market should have been devised, on the ground that it is

impossible now to determine the equilibrium rate. Sir Stafford Cripps, without specifying his reasons, has stated this week that no such system could have been worked. He may be right. The position of sterling as an international currency would certainly have made any such experiment more difficult to conduct successfully than the comparable system operated by countries such as France and Italy. A freeing of the rate might have deterred rather than helped the world-wide realignment of currencies which is following inexorably in the wake of sterling's devaluation. The definite cut in the sterling rate has at least provided a new basis by reference to which the other countries have been able to make their own decisions.

The new parity of \$2.80 appears low in terms of all available criteria. The free market rates for various categories of transferable sterling ranged before the devaluation from \$3.10 to \$3.20. The forward rate for sterling in the New York market on the eve of the decision indicated a discount of no more than 20 per cent on the then official parity. It was only in the largely artificial markets for pound notes, in which any appreciable turnover depended on the "double smuggle" and values were depressed accordingly, that rates approaching the new parity were to be found. Surprise at the extent of the devaluation of sterling has been greatest in some of the overseas countries which had pressed most assiduously for a break with the old parity. The Canadian Government, for example, whose experts have taken a leading part in the campaign for devaluation in the past few months, was genuinely surprised at the extent of the cut ; though the Canadian and US Governments were informed at the opening of the Tripartite talks that devaluation would take place, they were not told the exact rate until the last moment. The unexpectedly large devaluation by Britain was the main influence in determining Canada's decision to take this opportunity of restoring the discount of nearly 10 per cent on its dollar in terms of the US dollar. In France the decision of the British Government has been severely criticised not because the pound has been devalued but on the grounds that it has been devalued too much. The Minister of Finance,

M. Petsche, has publicly described the new sterling dollar rate as a "trade-war rate" and has suggested that Britain's initiative in this matter was unilateral and so constituted a breach of the intra-European collaboration to which the countries participating in the European Recovery Programme are committed.

The severe cut in the sterling parity has had the effect of abolishing at a stroke the free markets in which transferable and bilateral account sterling was dealt in at a discount below the official parity. The only market in which any activity of this kind has been reported this week, and where sterling has been quoted at a discount on the new parity, is that for Chinese sterling. It is easy to guess from what quarters the sales of Chinese sterling are coming at the moment. The officials who have control of this sterling and who are selling now that the Communists are hot on their trail are not likely to be guided by precise calculations of what may be the standing of sterling a few months hence. They are taking whatever price offers for a quick sale ; no wider significance need be attributed to the behaviour of this market.

With the sole exception of Pakistan, which has declared its adherence to the former dollar parity, the countries of the sterling area have come into line with Britain. The Pakistan incident may probably be regarded as a temporary aberration. As there appears to have been lack of co-ordination in informing Pakistan of the devaluation of sterling, the new Dominion is perhaps suffering from a sense of injured pride. There is also the fact that on balance Pakistan is a net earner of dollars. The opportunity of exhibiting superiority over India, which devalued the rupee in conformity with sterling, is also one which must have proved tempting. The decision leaves the Pakistan rupee at 2s. 2d., or at a premium of 44 per cent over the Indian rupee at 1s. 6d.; since the two currencies are virtually interchangeable and the frontier is wholly devoid of effective exchange control, a situation has been created which obviously cannot endure for more than a very short time. The agreement between Pakistan and India when they divided up the reserves of the formerly united country provided that the two currencies should be maintained at parity with each other. The lawyers on both sides will be able to argue to infinity as to which party broke this agreement.

The only real uncertainty about the reaction of sterling countries to Britain's devaluation was whether Australia would take this opportunity of bringing its pound back to parity with sterling and with the neighbouring New Zealand pound. This has not been done, and the Australian pound remains at the old discount of 20 per cent on sterling (i.e. a rate of £A125 per £100). The virtual unanimity and cohesion maintained by the sterling area in the devaluation move has provided one more testimonial to the strength of the links which bind the members of this club. After the revaluation of 1931, it may be recalled, South Africa enjoined upon itself fifteen months of abstinence. This time it has seized the higher gold price with both hands. Incidentally, on the eve of devaluation the Union Government unexpectedly called for repayment in sterling the remainder (£12½ million) of the £80 million gold loan—despite the general assumption that the gold value of this sterling was in effect guaranteed by the loan agreement. This action has given rise to the belief that a new financial arrangement between Britain and South Africa is now being hammered out.

Every western European currency, save the Swiss franc, has now made some response to the devaluation of sterling. The Scandinavian countries have gone the whole way with Britain. Sweden, it may be noted, has thus more than retracted the

misconceived appreciation of its currency which it made in 1946 ; though it is still, of course, dearer in terms of sterling than before that move was made. The Netherlands has also devalued by the full 30 per cent. This move immediately posed a difficult problem for Belgium, which had previously announced its intention of not changing the dollar parity of the Belgian franc. Second thoughts, stimulated (in the context of the Benelux Union) by the Dutch initiative and also by the

THE NEW PARITIES AND RATES

(1) Currencies in Step with Sterling (30½% Devaluation).

The following countries have devalued by 30.5 per cent against the dollar and thus have maintained parity with Sterling. Their new dollar values are as follows :—

	Old Dollar Value	New Dollar Value		Old Dollar Value	New Dollar Value
U.K.	4.03 to £	\$2.80 to £	Egypt	\$4.133 to £E	\$2.871 to £E
S. Africa ..	\$4.03 to £	\$2.80 to £	Israel	\$4 to £	\$2.80 to £
Australia ..	5.22 to £	\$2.24 to £	Holland ...	2.65 guilds to \$	3.86 guilds to \$
N. Zealand ..	\$4.03 to £	\$2.80 to £	Denmark ..	Kr 4.79901 to \$	Kr 6.90714 to \$
India	30.225 c. to Rupee	21 c. to Rupee	Finland ..	160 marks to \$	230 marks to \$
Ceylon ...	30.225 c. to Rupee	21 c. to Rupee	Norway ..	Kr 4.96278 to \$	Kr 7.14286 to \$
Burma ...	30.225 c. to Rupee	21 c. to Rupee	Sweden ...	3.60 crowns to \$	5.18 crowns to \$
Eire	\$4.03 to £	\$2.80 to £	Greece ...	No fixed value	15,000 drachma to \$
Iraq	\$4.03 to dinar	\$2.80 to dinar			

* Special rate for exports at \$3 to £1.

(2) Currencies Devalued by less than 30½%.*

The table shows the extent of the fall in dollar value in each case, and the residual effective depreciation of STERLING in terms of each currency.

	Old Dollar Value	New Dollar Value	Devaluation against Dollar	Old Sterling Value	New Sterling Value	Effective Depreciation of Sterling
Canada	par	\$1.10½ Can. to US \$	9.1	\$4.03 to £	\$3.08 to £	23.6
Belgium	43.83 frcs. to \$	50 frcs. to \$	12.3	176 frcs. to £	140 frcs. to £	20.4
France	330 frcs. to \$ (free rate)	350 frcs. to \$	5.6			
	272 frcs. to \$ (com. rate)		22.2	1097 frcs. to £	980 frcs. to £	10.7
Portugal	24.95 Esc. to \$	28.75 Esc. to \$	13.3	100.60 Esc. to £	80.50 Esc. to £	20.0

* Italy, while not making definitive change, has allowed the free rate for the US dollar to rise from 575 to 617 lire, representing a depreciation of the lira by 6.7 per cent.

(3) Currencies whose Dollar Value is to remain unchanged.

In each of these cases the dollar rates are unchanged, and the depreciation of sterling against the currencies concerned is the full 30.5 per cent. Accordingly, the table shows only the change which has occurred in their rates against sterling.

	Old Sterling Value	New Sterling Value		Old Sterling Value	New Sterling Value
Czechoslovakia	202 cr. to £	141 cr. to £	Persia	129 rials to £	90.20 rials to £
Pakistan	18d. per rupee	25.9d. per rupee	Poland	1612 zlotys to £	1120 zlotys to £
			Switzerland ...	17.35 frcs. to £	12.12 frcs. to £

extent of sterling's devaluation, induced the Belgian authorities to change their minds and devalue by about 12 per cent. The differential devaluation between the Belgian franc on the one hand and sterling and the Dutch guilder on the other should have a welcome effect in restoring equilibrium between Belgium and the two other countries.

France has taken the opportunity of the devaluation to

remove the final traces of the two-decker exchange rate structure which survived from the 1947 devaluation of the franc. It has abolished the old official rate of 214 francs to the dollar which until last week was used as one of the two factors in calculating the commercial rate for dollars and other currencies; that rate was the mean between the official rate and the free market rate. The free rate has now been made the sole determinant in fixing the commercial rate, and has been allowed to move from 330 francs to 350 francs to the dollar. At the new sterling-dollar cross-rate of \$2.80, this gives a sterling equivalent of 980 francs to the pound, compared with 1,097 francs. The new French franc parity has not yet been notified to the International Monetary Fund, but when it is it may be assumed that the dollar rate of 350 francs will be chosen. On the basis of the old commercial rate the effective devaluation of the franc against the dollar is 22 per cent, so that sterling's effective devaluation against the franc is reduced to 10.7 per cent.

Italy is maintaining the system by which the official rate for the lira is fixed each month on the basis of the average level of the free rate during the previous month. This gives Italy complete freedom of action and that freedom has been used this week in allowing the free rate to move from 575 to 617 lira to the dollar. The lira has thus been effectively devalued, though within the setting of the former free market mechanism, and so far only to the extent of 6.7 per cent.

The devaluation of sterling took place on the very day on which the new German government took over autonomy in currency matters, and thus provided an initial problem of some magnitude for the directors of the Bank Deutscher Laender. They are expected to devalue the western mark, but to go only part of the way in following the depreciation of sterling. Portugal has devalued the escudo by 13.3 per cent against the dollar, despite the "hardness" of its currency. Among European currencies, this leaves only the Swiss franc to stand in splendid isolation at its old gold parity. It may, however, be significant that the rate for financial dollars, which last week was quoted at 3.97 Swiss francs as against the official rate of 4.30 Swiss francs, has this week risen to the official level. In other words, there are people in Switzerland who are beginning to take the view that the Swiss franc may be devalued later and that US dollars at a discount are attractive.

The eastern European currencies have not followed the general devaluation movement. This is hardly surprising. Exchange rates are not a primary factor in the foreign trade of these countries. If Polish coal, for example, is in danger of being priced out of the European market as a result of devaluation elsewhere, the position can and, no doubt will, be restored by reducing the price of coal and not by reducing the rate of the zloty. The commercial arrangements between Britain and the eastern European currencies are established in sterling, and the devaluation of sterling should not, therefore, have any effect on them, at least so far as Britain is concerned.

★

In the Western Hemisphere by far the most important reaction to the devaluation of sterling was the decision of the Canadian authorities to restore the margin of roughly 10 per cent between the Canadian and US dollars. The appreciation of the Canadian currency decided upon in 1946 after the removal of price control in the United States has thus been nullified. The Canadian Finance Minister, announcing the move, said that, in view of the substantial devaluation of many currencies, Canadian exports would meet

increasing competition. It was in the light of that factor and in order to soften the impact of higher prices of Canadian goods on Great Britain that the decision to lower the value of the Canadian dollar was taken. Thanks to Canada's decision (which leaves the effective sterling devaluation at 23.6 per cent in terms of the Canadian dollar) the arithmetical increase in Canadian prices in terms of sterling is only just under 31 per cent, compared with the 44 per cent increase in US prices in terms of sterling.

In Latin America the attitude of Argentina is of greatest moment to Great Britain. The Argentine authorities have up to now maintained an attitude of studied indifference to the devaluation movement and have declared that there will be no change in the parity of the peso. They have further claimed their right to the revaluation of sterling in their accounts at the Bank of England in accordance with the gold or dollar-rate exchange guarantees given to them in the course of the recent financial and commercial negotiations. The Argentine authorities also claim that they hold a similar revaluation clause in respect of the sterling price in the meat contract; this matter is in dispute between the two governments and has been submitted to the Anglo-Argentine committee set up to interpret the recently negotiated agreement. The Argentine accounts are one of the three groups of known sterling accounts on which an exchange revaluation guarantee will now have to be implemented. The other two are the Portuguese account, in which about £70 million is estimated to be held, and the Iranian account, in which there is about £40 million. With an estimated £85 million in the Argentine accounts, this makes a total of about £195 million, on which the revaluation clauses will require a payment by Britain of about £86 million.

★

The devaluation of sterling was followed by a rise in the price of gold from £8 12s. 3d. to £12 8s. per ounce. The London price for essential silver was raised from 44½d. to 64d. this week to accord with the New York open market price parity, but later dropped below parity, to 62½d., owing to offerings of scrap silver to take advantage of the sterling profit.

The members of the International Monetary Fund whose currencies have been devalued will have to make good, by payments in their own currencies, the reduction in the gold value of their currencies held by the Fund. The statement of currency held by the Fund on April 30, 1949, showed a sterling holding of £336,926,000. To make good the devaluation of sterling this figure would have to be written up by nearly £150 million. This will have to be created as non-interest bearing debt of the British Government payable on demand to the Fund and held by the Fund depository in London, namely the Bank of England.

The wholesale devaluation of European currencies has inevitably caused a situation of indescribable confusion in the affairs of the new Intra-European Payments Agreement. The contributions and drawing rights laboriously worked out in the last few months and published a fortnight ago are expressed in dollars but were based on estimates of balances of payment worked out in terms of local currencies. When reconverted into local currencies at the new rates, the drawing rights expressed in dollars bear no relation whatever to the probable balances of payments for the coming year. The whole exercise will probably have to be done again, though this is a matter to which OEEC in its present confusion can have had no time yet to devote any attention.

Trade and the New Pound

EXPORTS sold at the same sterling price as before devaluation will now bring in 30 per cent fewer dollars per unit; such exports will have to be increased by 44 per cent in total volume to bring in the same dollar return as before. Exports sold at the same dollar price will now bring in 44 per cent more sterling. It is within these ranges that the advantage presented by devaluation lies. Whether these are permanent advantages rests largely on the interplay of devaluation upon costs and prices; to the extent that the sterling cost of British exports rises (as it assuredly will rise) the new incentive provided by devaluation will be reduced. The only convenient assumption, at present, is to assume that costs remain unchanged.

On that footing, a statement issued this week by the Board of Trade is intelligible, if not especially enlightening. If British exporters already hold an assured dollar market which cannot easily be expanded "it may well be appropriate for a number of exporters to raise their prices in terms of sterling so as to earn something like the same amount of dollars as previously." In other words, if American demand for their products is highly inelastic, they can exploit that fact and secure their 44 per cent sterling export bonus. Where the American demand is relatively elastic (which is likely to be more true for those British products which had previously priced themselves out of the American market) sterling prices will have to renounce part of the increase—some of them perhaps the whole potential 44 per cent—if they are to be re-established in the dollar markets.

This formal exercise in reciprocals, however, does not carry the matter very far. While the sterling price of raw material imports is bound to rise (not merely for dollar imports, but for raw materials from the sterling area too), so the dollar cost of raw materials from the sterling area which are used by American or Canadian manufacturers will fall. The advantage to be gained by, say, Malaya is a larger volume of exports of rubber to the United States at a price which is lower in dollars but higher in sterling. It follows that the sterling cost of rubber to British manufacturers will be higher. What the sterling area gains from sales of raw materials to the dollar markets will to some extent—perhaps to a material extent—be offset by a rise in sterling raw material costs to British manufacturers and exporters.

This factor (quite apart from any consequential rise in wages which may have to be conceded) will reduce the export bonus which British exporters may now enjoy. But this bonus will also be shared by exporters in other countries which have devalued their currencies in terms of the dollar. It is an advantage which the whole of the soft-currency world enjoys (and indeed, to some small extent, even parts of the hard currency world, including Belgium and Canada), not an exclusive advantage for Britain alone. It is not merely "a vast number of British exporters" which have been presented with an incentive to increase their exports to dollar markets. Indeed, it has yet to be discovered whether, over a considerable range of potential exports, the previous attractions of "soft option" trade within the sterling area have been completely broken down. A 30 per cent cut in the dollar price may obtain an entry for a given line of British goods in the American market which had previously been uncompetitive. But if the same goods can be sold at an unchanged sterling price in the

sterling area they are likely still to find their way there, particularly since producers of raw materials in the sterling area will have more sterling to spend.

For the great majority of potential exports, changes in merchandising methods, design and salesmanship remain as essential after devaluation as they were before. The one thing which may lure British exports from the sterling to the dollar markets is the prospect of a higher sterling return. The same return (in sterling) would be unavailing to persuade exporters to make the switch. A "higher return," moreover, has to be discounted by two other factors. First, there is the extra cost and trouble of attacking a new dollar market with all its risks and difficulties; many British traders have avoided this in the past, because they had no inducement to take the plunge, and some of them may ask if the inducement is sufficient now. Secondly, the profit incentive, in the minds of many traders, will be calculated at something less than half the gross profit, because of the incidence of Income Tax and Profits Tax.

These points in no way minimise the necessity for increasing dollar receipts, but they do suggest that devaluation is not the all-powerful single incentive which the Chancellor claims. The extent of the increase in dollar exports which would be required to fill the visible trade gap between Britain and the United States and Canada can be measured on the austere assumption (which is plainly worse than the truth) that the price level in sterling of all British exports to the dollar market remains unchanged. The following table shows the calculations:—

UK VISIBLE TRADE WITH DOLLAR AREA
(£ Million)

	Jan. to June 1949	After 25 per cent Import Cut (£—\$4.03)	At New Sterling Prices (£—\$2.80)
Imports.....	207	155	220 (say)
Exports.....	88	90	90
Visible deficit.....	121	65	130
Increase in exports to close visible gap, assuming sterling export prices un- changed.....	137%	72%	144%

These are broad figures, based on the experience of the first six months of this year. The effect of devaluation will be to increase the sterling cost of dollar imports above that of the first half of this year, even after taking the 25 per cent cut into account. If the arbitrary assumption is made that sterling export prices remain unchanged (they will to some extent rise, but by how much cannot be guessed) the required increase in physical exports to close the dollar gap in visible trade would be about 140 per cent—rather more than would have been required to close the gap in the first six months of this year. This exercise sets a high target which, it is to be hoped, will not have to be attempted until 1952-53, after Marshall aid has ceased.

Such an increase implies a considerable degree of elasticity in American demand (which it would be fairly reasonable to count upon), a successful resistance to cost inflation, and successful competition with other European countries for the new opportunities in the dollar market. The following table does no more than hint at some of the potential export

items which keener prices and more ambitious salesmanship should assist:—

BRITISH EXPORTS TO USA AND CANADA				
(£ Million)				
	Canada		United States	
	8 Months, 1948	8 Months, 1949	8 Months, 1948	8 Months, 1949
Spirits.....	1.2	1.1	6.1	6.2
Pottery, etc.....	3.1	3.6	1.2	1.3
Iron and steel manufactures.....	0.8	1.8	0.2	0.1
Non-ferrous metal manufactures.....	0.8	2.1	3.5	2.4
Machinery.....	3.3	3.2	2.5	1.9
Cotton textiles.....	4.2	3.8	2.0	1.1
Wool textiles.....	12.4	11.8	3.5	2.9
Silk and rayon.....	2.1	2.1	0.3	0.2
Other textiles.....	1.3	1.2	2.8	2.6
Apparel.....	1.7	1.4	0.9	0.9
Chemicals.....	1.0	1.0	2.0	1.1
Paper, cardboard, etc.....	0.2	0.2	0.5	1.3
Vehicles.....	5.9	11.7	6.8	3.4
Of which:—				
Motor cars.....	1.7	4.7	3.2	1.0
Agricultural tractors.....	0.2	0.2	0.2	1.5
Commercial vehicles.....	0.2	0.5	0.4	0.1
Miscellaneous.....	5.5	6.3	11.8	7.4
TOTAL.....	43.7	51.5	43.9	32.9

In terms of increased volume, textile exports, both to Canada and the United States, show real promise—but probably only at the sacrifice of a large slice of the export premium, for these are largely the categories in which local price competition is most acute. Spirits and pottery (both of which have held up quite well) should retain most of their export

premium, since the need for concessions in dollar prices should not be so pressing. Whether, in these particular cases, the incentive will evoke a large response in increased exports to dollar markets is perhaps more doubtful. Machinery should enjoy greater opportunities in Canada, and perhaps make some recovery in the American market. It would be optimistic to expect mass sales of British cars to the American market, even at new prices which fully reflected devaluation of the pound, but Canadian prospects may be more hopeful.

Success in dollar trade, however, would bring other problems in its train. In order to fill the gap (on the lines crudely indicated in the first table) any increase in sales to the dollar markets would have to be found from output which now finds its way to the sterling or home markets, unless total output can be increased. But if incomes at home remain unchanged (*a fortiori* if they are increased) and if the earnings of the rest of the sterling area rise (which seems probable since their dollar spending is rationed by agreement and their exports to dollar markets will bring in more sterling), there will be so much the less restraint on demands which have for many months past been comfortably competing for goods which might otherwise have found a market in the United States. This is particularly true of the large range of miscellaneous goods which defies individual classification. It is here that a new attempt must be made to capture some part of the American market. But it is here also that American ideas of packaging, and the American pleasure in novelty and “gadgetry” need to be satisfied.

The Course of Prices

IT was the signal advantage of devaluation in 1931—for Britain, though not for the rest of the world—that the fall of the pound caused an even greater fall in world prices. Evidently, the Government seems to cling to something of the same hope now, to judge from the Chancellor's attempts in his broadcast to minimise the effects of devaluation upon internal prices and the cost of living.

One pretension in his broadcast must be rejected immediately and vigorously. “We shall not tolerate” declared Sir Stafford Cripps in a passage clearly intended to suggest that apart from bread nothing else need go up in price “anyone taking advantage of the situation for their own profiteering.” This is politics—and empty politics too, because the machinery of price control is so creaky. But it is even emptier economics. When a merchant raises the price of an item which has cost him \$4.03 from 20s. to 28s. 9d., he is merely taking proper account of the fact that his future supplies will cost 28s. 9d. at the new rate of \$2.80 to the £. The Revenue will, in any event, take over half of the so-called “profit” of 8s. 9d. from him, but he is entitled to make every effort he can to maintain his capital intact, and not to scatter it to consumers in the form of falsely low prices. This lesson in elementary economics is never learned, or at least never accepted, by Chancellors. There has been enough consumption of capital during the wartime and post-war inflations to make it quite unnecessary for Sir Stafford to pray in aid a specious argument in the hope of persuading the public that prices need not rise because they can live on stocks.

Clearly, the argument that “we must wait and see what happens” to dollar prices is a very unsatisfactory point at which to leave the analysis of the effects of devaluation. There is no such thing as painless devaluation; it works through changes in prices, and it is just disingenuous to suggest that such changes in prices redound to the benefit of exporters, and

have no countervailing disadvantages for importers and consumers. The Ministry of Supply, with a fine disregard of these political sentimentalities, has raised the sterling price of the non-ferrous metals to the full extent of the devaluation. Given its policy of following the American metal market (whatever the merits and demerits of that policy may be) the Ministry was plainly right to take the step of adjusting its sterling prices and to ignore any charge that it was “profiteering.” The Raw Cotton Commission, whose selling prices have for some time been based on replacement costs, has also offended the Chancellor's canon, though not to the full extent, by raising its prices.

It is quite impossible, at this stage, to attempt any estimate of the prospective changes in the terms of trade which will follow devaluation. Much depends on the extent to which imports and exports are invoiced in terms of sterling, and the relative pressure which devaluation may exert on those terms for items which enter into sterling-dollar trade. Many food contracts specify sterling terms—though the Canadian wheat contract is an important exception. The Argentine meat contract (though it contains no formal reservations about devaluation) may also be a special case. A rough calculation covering six principal food imports (wheat and flour, bacon, meat, cheese, eggs and sugar) suggests that the eventual increase in personal expenditure on these items can be put at a minimum of 5 per cent, and may range as high as 7½ per cent. This result aligns closely with the short-cut calculation based on the official calculation that 16 per cent of the content of the cost of living index represents dollar imports. Since the sterling cost of such imports (assuming dollar prices remain unchanged) will increase by 44 per cent, the eventual rise in the index will be of the order of 7 per cent. This conclusion contrasts sharply with the calculation, based on the increase in the price of bread from 4½d. to 5½d., that the im-

mediate rise in the index will be little more than half a point.

This calculation of the eventual rise which may occur in the cost of living, however, makes no allowance for the rise in industrial costs which will occur through higher import prices of raw materials and which in due course will react upon the cost of living when it has percolated through into the cost of final output. A rough calculation of the effect of devaluation upon the cost of the principal imported raw materials (excluding oil) suggests that the average increase may be of the order of 10 per cent. This is a weighted average, which takes into account the division of supplies of eight leading raw materials (copper, lead, zinc, aluminium, cotton, softwood, hard timber, woodpulp and hides and skins) as between hard and soft currency sources, and reflects the pattern of imports and home production in 1948. It is an average, and particular sections of British industry may find that their raw material costs have increased by a much greater percentage—for example, those which use large quantities of non-ferrous metals or cotton. Moreover, if the prices of raw materials from the sterling area itself increase as a result of devaluation (which is highly probable) the average increase in the cost of raw material imports from all sources will be correspondingly larger.

★

The following table shows the movements in American and British prices of leading raw materials and commodities after devaluation. In New York, rubber and cocoa are both cheaper, though they have not fallen to the same extent as the fall in the value of the pound. Conversely, the London price of rubber has risen from 11½d. a pound at the end of last week to 12½d. after having touched 13d. For materials where the British price follows the dollar price, in particular the prices of non-ferrous metals, British prices have been raised to the full extent, or nearly so. The Ministry of Supply, which resumed sales of non-ferrous metals (except tin) on Thursday quoted copper at £140 a ton, against £107 10s.; lead at £122 against £87 5s.; zinc at £87 10s. against £63 10s.; and aluminium at £112 against £93.

The Raw Cotton Commission appears slightly to have modified its recently adopted practice of charging replacement values for cotton. It has decided, apparently because it holds stocks, to temper the rise in raw cotton. American

middling 15/16” has been raised from 23½d. to 28.15d. a pound. The American price, however, has fallen somewhat during the past week, from 31.14 cents to 30.91 cents.

MOVEMENTS IN AMERICAN AND BRITISH PRICES						
Commodity	American Prices			British Prices		
	Unit	Last Week	This Week	Unit	Last Week	This Week

* Nominal.

Tin remains unchanged, for the time being, both in London and New York. Devaluation finds the Ministry of Supply still unresolved on the question whether to allow the resumption of commercial dealing in tin, a matter which has been under discussion for many weeks and on which a decision is overdue. Clearly, a large adjustment of the sterling price is dictated now.

Such changes in prices as have occurred this week have been in conformity with the quite legitimate principle that consumers should pay replacement costs for their supplies. To that extent they make nonsense of the pretence that devaluation does not involve “profiteering” or that it will have no material effect on industry's costs. The hope that dollar prices may fall evidently lies at the back of these beliefs. But as this week's events have shown, dollar prices can fall at the same time that sterling prices rise. The question is rather whether dollar prices will fall more than in proportion to the cut in the value of the pound. If that were to happen there might be some satisfaction that sterling prices did not rise. But that could only be because demand for raw materials in the dollar market had itself collapsed—which in turn would mean that the problem of closing the gap had been rendered impossible by reason of an industrial slump in the United States. This week's price movements show that no such calamitous assumption is being made; but it is the only one which would justify the notion that the sterling prices of raw materials will not rise to some extent in conformity with the depreciation of the pound.

The Market's Response

FOR some time before devaluation, and in the day or two immediately after, investors were working by rule of thumb—devaluation would be good for gold shares, good for industrial shares with an important equity in dollar trade (shipping shares and insurance shares included), good for commodity shares, generally beneficial for industrial shares even if their activities were largely confined to the home market, and anathema to gilt-edged. That is the traditional pattern, and the market was content for a time to rest upon it. As a result, Monday (when the “House” was officially closed) produced the biggest street market for years, with a boom in gold shares, which flowed over into the commodity share markets. The volume of informal dealings in industrial shares was relatively small, though prices responded smartly. No dealings took place in gilt-edged stocks, but the caution of dealers was marked by an agreement to quote prices, when official dealings reopened on Tuesday, up to 1½ points

lower than closing quotations at the end of last week.

Second thoughts, however, have produced some very marked reassessments of the potential effects of devaluation upon security prices. When the market reopened on Tuesday, dealings were active indeed—some 13,686 bargains were marked—but the course of prices soon became confused. The prices agreed for gilt-edged stocks proved to be lower than was necessary, and the fall in the “longs” was limited to a point. Gold shares, active as ever, made no further headway—on Monday their rise caused a jump in the *Financial Times* index of gold shares from 109.52 to 129.63, but on Tuesday the index fell slightly, just below 129. Rubber shares further improved, while oil shares were, on balance, lower. Industrials, checked by fears of labour trouble and the possibility of an election, displayed no very consistent trend.

Then, on Wednesday, the unsubstantial foundations for

the boom were exposed. A rumour suggesting that the trade unions would insist on the reimposition of EPT and statutory limitation of dividends as part of a bargain for accepting devaluation threw the industrial market into confusion. The rumour appeared to lack foundation—if Dr Dalton could bring himself to dismiss EPT as a bad tax, it is hardly to be believed that Sir Stafford Cripps could bring himself to reimpose it. Business remained active, with well over 12,000 bargains marked, but even where turnover was highest—in gold shares—revised estimates of the outlook and profit-taking took their toll of prices. Gilt-edged stocks recovered the point or so which they had lost on Tuesday (compared with Friday's close)—as if nothing at all had happened over the week-end—but the *Financial Times* index of industrial ordinary shares suffered a setback of 2½ points, from 110.3 to 107.9 (actually lower than Friday's figure of 108.2) and the gold share index dropped by nearly 4½ points to 124.20.

This precipitate adjustment of prices suggests no lack of scepticism on the part of investors about the longer-run consequences of devaluation. Since all the evidence points to a complete lack of intention on the part of the Government to buttress "the change in the exchange rate" (which is the Chancellor's euphemism for the blunt word devaluation) by cuts in Government expenditure, stiffer interest rates, looser controls and a determined wage policy, there is good reason for such doubts. If interest rates are not to be allowed to rise and make their contribution to a policy of Government and private retrenchment, so much the better, in the short run at any rate, are the prospects for fixed-interest stocks. If, on the one hand the Government makes much of the incentive of profits now presented to exporters to dollar countries, and on the other hand is as prompt

as a private "profiteer" to raise the prices of the many raw materials which it buys in bulk, so much the

more doubtful does the estimate of export profits become. The reflex action that devaluation is "good for equities"—because it acknowledges the existence of inflation and allows inflation to exert its effect on prices—may in principle be sound enough; but how does this react upon wages and other costs in a period of full employment and high industrial activity? Not, in the market's judgment, in such a fashion that it produces an automatic increase in profits. And even where profits increase, more than half is mopped up in higher taxes, while, for the time being at any rate, the prospect of any general rise in dividends is remote.

If the honeymoon period has been brief, it has been for good reason. Quite apart from the larger issue whether devaluation will, by itself, do the trick of putting the dollar account in balance, the purely local adjustments under present-day conditions of costs, employment, and the temper of labour suggest no certain or lasting advantages for ordinary shares, save in those cases where they have a specific and assured interest in the dollar market. The revision of estimates of the effect of devaluation on gold shares is quite as necessary. The rise in the sterling price of gold will be of the greatest benefit to the low-grade mines; that was a foregone conclusion because a mine at the very margin of profitability should now be capable of quite satisfactory earnings. But three factors are being taken into account by the great majority of gold shareholders. First, there is the evidence of rising costs—further wage claims and higher prices for machinery and supplies. Secondly, there is fear, for which

past experience provides plenty of ground, that if devaluation produces larger profits for gold mining companies, the South African Government will not be slow to take a sizeable proportion of them in the form of increased taxes. In its conflict of mind between encouragement for the mining industry and the reinforcement of its own revenues, the Union Government has in the past tended to make relatively limited concessions to the industry. Its tax formula has indeed been framed to give assistance where it was most needed—for the low-grade properties on the verge of profitability. But even their restoration to comparatively satisfactory profits is not likely to go untouched by the tax collector in future.

The third factor—most imponderable of them all—is the revision of mining policy which may follow the higher gold price. Each property now has to take a decision whether to reduce its grade and prolong its working life or to continue mining the present grade of ore. That decision is complicated in each individual case by questions of the average value of ore, the extent of development already carried out, and the prospective balance of increased mining costs against the higher price of gold. Much time will elapse before these calculations can be made. But it would be surprising if there were not some tendency, for those mines which can contrive it, to mine a somewhat lower grade of ore than in the recent past, and thus modify the immediate expectation of higher profits by an extension of the prospective working life of their properties.

Oil—A Particular Case

IN a number of trades the devaluation of sterling will lead to a reassessment of trading prospects and a revision of industrial policies. The prospect for oil prices merits discussion in some detail. Measured by bulk or by value, oil is the most important commodity in international trade. Britain not only relies largely on oil as a source of energy and industrial materials for the British economy, but is also heavily engaged in the petroleum business as an international trader. It is not possible in the production and handling of petroleum to keep sterling and dollar expenditures entirely separate; nor has it so far been possible, in the marketing of the products, to prevent sterling and dollar price levels from reacting upon each other. It is true that, under the influence of the dollar shortage, a general distinction between sterling and dollar oil has come into being. But this distinction, unreal and incomplete in many ways though it is, has itself been at the root of one of the crucial American grievances against British trading and financial policy in the last eighteen months. The American grievance cannot be disregarded, if only because American help is needed for the British overseas oil development programmes. But the prolonged Anglo-American discussions in Washington on petroleum questions—discussions which began in the summer and have been resumed this month—have yet to bring matters any nearer solution.

It seems necessary to consider once more, in the light of the devaluation of sterling, what the American grievance is. Substantially it is the grievance against trade discrimination, against bilateralism, against the inconvertibility of currencies and the segregation of soft-currency trade. The American overseas trade in petroleum products has been going through a period of great difficulty in holding its markets in many parts of the world—and this in spite of the rapid expansion in world demand. Indeed, without ECA dollars—which have enabled the European importing countries to maintain

their customary purchases of dollar oil for the time being—the American companies would have lost trade heavily. The demand for oil that can be bought for sterling has, on the other hand, been greater than ever and has far outrun the supply.

The world oil shortage has, in fact, substantially come to an end and has turned into a shortage of currency to buy oil. An expansion of sterling oil production and refining can clearly help to remedy this shortage; but, carried beyond a certain point, it could lead to the ousting of dollar oil from many markets on grounds not of ordinary trading considerations, but of currency preference. The Americans have therefore shown an intelligible reluctance to go very fast in financing British overseas oil development with ECA dollars.

It is a simple step from this American attitude to the general American thesis—so powerfully pressed in the months which preceded devaluation—that the false parity of sterling was distorting (or aggravating the distortion of) the pattern of international trade. The over-valuation of sterling did not make sterling products difficult to sell; true, it made them difficult to sell in hard-currency markets, but in soft-currency markets they were irresistible. If this applied to high-priced British manufactures in general, it applied with special force to petroleum products, which were not over-priced in relation to dollar petroleum products. Sterling petroleum has therefore been (like high-grade coal and semi-

A COMPREHENSIVE BANKING SERVICE

In their capacity as private bankers, Glyn, Mills & Co. have always arranged that the service placed at the disposal of their customers should be truly comprehensive, covering all financial problems from those of the large public corporation to those of private individuals. They are equally well equipped to accept duties as Company Registrar, or to act as executor or trustee for large or small estates.

Next week's issue of

The Economist

will include the annual survey of

British Insurance

finished steel) one of the bargaining counters used on the British side in bilateral trade bargaining. The use of sterling oil in this way in the Argentine agreement last summer aroused American indignation conspicuously.

Whether this policy was profitable to Britain is, for the purpose, irrelevant. There is evidence for supposing that it was not. "Sterling oil" is a convenient term for the products of British oil companies (which for this purpose include the British-Dutch Shell group) except so far as these operated in North America itself. But the costs of "sterling oil" contain a large dollar element. Something was learned of the size of this dollar element in June, when the Australian Prime Minister, Mr Chifley, said that the total net dollar cost of oil to the sterling area was more than \$400 million a year. Out of this figure, which was probably a modest estimate, it was learned in London that \$160 million represented purchases of dollar oil (after deducting sales of sterling oil to dollar companies), and the remainder represented the dollar element in the costs of producing sterling oil. This consisted partly of British purchases of American equipment for oil-getting and oil-refining, and some of it was of a capital nature. But it also represented the operating expenses of sterling companies in hard-currency areas—such as, for example, Venezuela, Curaçao, and Iran. It follows that, over an unknown sector of their trade, the British companies were expending dollars in order to earn sterling. Since the sterling oil prices were based on a parity of \$4.03 to the £, and the real value of sterling is now seen to have been lower, it would not be unreasonable to question the real profitability of these transactions.

The conclusion that sterling oil prices now need to be raised to reflect the diminished value of sterling is hard to resist. The costs of American equipment, of oil getting in Venezuela, of oil refining in Curaçao, have been increased by 44 per cent at a stroke. The bolivar and the Curaçao guilder have not been devalued; nor has the Iranian rial. American tanker freights are automatically made more costly; and if some of this increase is reduced, as time goes on, by a decline in demand for American tonnage, the increased demand for sterling tanker tonnage will cause sterling freights to rise. The oil development and refinery programmes will in any case need revision in the light of higher cost (in sterling) of American equipment—which is still indispensable for any scheme in which early delivery plays a decisive part. It is clear that, if the prices of the products were to be kept unchanged while the costs of investment went up, the economic basis of some major schemes would become questionable. Indeed, if trade in the products were to be based permanently on artificial price conceptions, an economic basis for the capital development

plans would be impossible to find. Sterling oil prices could, in fact, be maintained at the old parity of \$4.03 to the £ only by subsidy in some form. There is no reason to suppose that a British Government would undertake such a policy of subsidy; and the United States would in any case not tolerate it.

The status of sterling oil in the world markets, and the extent to which it is to be forced to move in a separate monetary sphere from dollar oil or (alternatively) subjected to the strict laws of supply and demand on a realistic price basis, must now have a leading place in the discussions in Washington. American pressure for a new set of arrangements in the world oil trade has been persistent for some months past, and such new arrangements have virtually been made a condition of ECA support for the oil development programme. The British Government has enough to do to defend its reasonable trading interests in petroleum, and will presumably not attempt in addition to maintain an unrealistic price system on a world-wide scale. The more readily and the more unequivocally it accepts this, the better will be the chance that the Washington talks may succeed in removing the obstacles to a rational and energetic programme of oil development. In the world markets British oil prices will inevitably rise. What happens, then, to the official contention that price levels in the British economy itself can—with the exception of the household loaf—be kept where they are "for the present"?

No doubt the Government can, if it chooses, insist that petroleum stocks already in the country shall be sold off at the present prices. This will mean selling them at less than their real value and less than their replacement value, and will represent another concealed dissipation of capital; still, it could be done. But new supplies arrive continuously, partly in the form of crude oil but still mainly in ready-refined form. Are these, too, to be sold at the present prices? About a quarter of the petroleum products sold in Britain are still, unequivocally, dollar oil. How will the increased cost of this oil be met? Who will pay the increased element of dollar cost in the remainder? By what means will the level of prices in Britain be insulated from the world price levels of the same products? How could this be done without again creating artificially high demand in Britain, which would once more need to be restrained by artificial means?

Devices of this kind would not square with the aim of entering yet more vigorously into world trade on a competitive basis, on which the Chancellor of the Exchequer laid so much emphasis when he announced and explained devaluation. To talk of keeping oil prices after devaluation down to their former levels is, in the circumstances, nonsensical.

Business Notes

Fresh Heart in the Motor Industry

For the thirty-two British manufacturers exhibiting cars at the annual Motor Show which opens at Earls Court next week, the announcement of devaluation could not have come at a more opportune moment. The organisers of the show, the Society of Motor Manufacturers and Traders, have sent 8,000 invitations to overseas visitors, though in fact the show may not have a great deal that is new to attract them. The range of mass-produced cars will be substantially the same as last year, when the big manufacturers presented their first post-war models. A year's experience has caused them to introduce various refinements which in some cases are important, and in others are concerned with detail and finish. The only new models shown will be in the sports and luxury ranges, with the exception of a Triumph made by the Standard Motor Company and a single model introduced by the Rover Company to replace the two at present made.

The industry, which was in danger of growing resigned to price resistance in the dollar markets, has been greatly heartened by devaluation; but then, it does not yet know what devaluation will mean. Reports from the United States already tell of dealers reducing the prices of British cars by 20 per cent. But Lord Nuffield has said this week that American dealers hold stocks of British cars which they must "liquidate." The possible range of price reduction is limited by the freight, insurance and other charges which have to be paid in the United States, as well as by the American distributor's margin. Freight, in particular, was a burden at the old rate of exchange, and the Austin Motor Company decided not long ago to send an experimental shipment of cars to the Middle West via the Great Lakes instead of overland, to see if freight charges could not be reduced. It is appreciated that the potential market for British cars in the United States is limited, and that the prevailing British prices have been too high even for this market. Second thoughts have suggested to the industry that devaluation may go only part of the way to correct that position. The whole American market for cars has been showing signs of change, and while certain of the American 1950 models are dearer, there is a noticeable increase in the number of lower-priced models being built by American manufacturers. This change has much the same influence as a general price reduction.

Some British prices have come down in the past months, but they have been for luxury and speciality cars made by firms like Daimler, Healey and Allard. The big manufacturers hold that the under-employment of their plant, which they attribute to the lack of sufficient steel sheet, makes it impossible for them to reduce their costs.

In Canada, British car sales have received some stimulus in the past months through the Canadian shortage of US dollars. Much the same has been happening in soft-currency countries, but some of these have also found themselves short of sterling and have had to limit the cars they import from Britain as well. Except in South Africa, devaluation is unlikely to augment British sales in the soft-currency markets, though it may at first close the door more firmly than ever against American cars. The South African Government is due to review the question of car imports this month, and there are hopes that the new sterling price for gold will encourage it either to permit once more the entry of assembled British cars, or to allow British manufacturers to go ahead with their postponed plans for local assembly.

Film Earnings and Exchange Rates

The American film industry, as a large earner and an extremely large holder of miscellaneous foreign currencies,

has lost heavily through devaluation this week. A vice-president of Paramount, Mr Paul Raibourne, put the immediate loss at \$30 million; this may be an underestimate. Mr Fayette Allport, the European manager of the Motion Picture Association of America, said that the foreign earnings of the American industry would be cut by at least 30 per cent. The president of MPAA, Mr Eric Johnston, spoke more hopefully when he arrived in Paris during the week for a review of the new position in the European markets for his members' products. He thought earnings would recover before long, because the increase in the cost of living in Europe would cause admission charges at cinemas to rise. His estimate, based on an assumption that the new exchange values would be allowed freely to react on internal price levels, may be valid for the freer economies on the Continent, but the degree of its application to the British economy is more uncertain.

So far as the British trading position of the American companies is concerned, the permitted remittance to New York of \$17 million a year will clear off £6 million, instead of £4.2 million, of their annual earnings in the British market. This will leave them a smaller surplus to be spent in other ways. A recent statement by Mr. Johnston indicated that the American companies had succeeded in spending \$25 million of their frozen earnings in the first twelve months of the Anglo-American film agreement; but how that money was spent is not known with any completeness. There are indications that American film earnings in Britain during those twelve months were not much more than \$50 million, so the companies will have (on that calculation) only another \$8 or \$10 million to dispose of.

It seems certain, however, that the American companies will now need to reconsider the ways in which their "frozen" money is spent. If British film production costs can be prevented from rising sharply, it may become worth their while to spend more on film production in this country. A film made here may, in their hands, earn more dollars in the United States than a sum equal to its cost would yield if translated into dollars at the new rate.

It is natural, therefore, that the film producing industry in Britain should hope for an increased flow of American sterling to the studios. British companies, at the same time, are hoping for better returns from the showing of their products in North America and, indeed, in all countries which have not devalued their currencies to the full extent of the sterling devaluation. A warning is necessary before either of these hopes is pitched too high. The American film industry is as strong in its entrenched position as ever, and is accustomed to react vigorously to any threat of market losses. If the present state of unrelieved hostile relations with the British industry continues, the British producers can probably not expect much American co-operation.

* * *

Marshall Aid and Wheat

The Economic Co-operation Administration in Washington announced last week that it would allow Britain to purchase \$175 million of Canadian wheat with ECA funds. This is about 60 per cent of Britain's commitment for this last season of the Anglo-Canadian wheat contract. It had been hoped, however, that some three-quarters of this dollar expenditure might be taken over by ECA. Nevertheless, in addition, ECA funds will be made available for bunker fuel and port and harbour dues up to \$30 million. Thus the total agrees with the estimate (on page 630 of last week's issue) of relief from this source of \$200 million. As it turns out, however, not all this amount can be considered a net dollar relief. To get "off-shore" purchases of Canadian wheat reinstituted, Britain

has had to agree to purchase \$30 million of American wheat and \$10 million of other American agricultural commodities which are in surplus supply. Britain's total allocation of ECA funds will not be increased to cover these additional purchases, so that the net dollar gain to Britain is reduced to \$160 million. It has been reported, though not yet confirmed, that Canada, too, has had to agree to buy certain quantities of surplus agricultural products from the United States.

It is easy to criticise this giving with one hand and taking away with the other, but Mr Hoffman, the Economic Co-operation Administrator, was clearly in a predicament. The American Congress has not yet authorised ECA's appropriation, and the representatives of the farming states have been vociferous in their attacks on the use of ECA funds to buy goods from other countries when those same goods are in surplus supply in the United States.

Mr Brannan, the American Secretary of Agriculture, in his letter to Mr Hoffman granting permission to resume "off-shore" purchases of wheat, pointed out that the American farmer would gain by this move. Under the international wheat agreement, the United States has a guaranteed market for 168 million bushels each season. If Britain bought American wheat, other buyers who had previously bought from the United States would have to switch to Canada. Now Britain is buying not only Canadian wheat, but also American. It certainly looks as if Marshall Aid is making Britain buy up its season's quota under the international agreement before the price of wheat has a chance to fall.

* * *

Britain's Declining Exports

The sombre impressions of the preliminary trade figures for August, which were discussed on page 630 of last week's issue, were fully confirmed by a study of the detailed trade returns published this week. The total value of exports at £137 million were £4,500,000 less than in July, making a reduction of 3 per cent in the daily rate of export. The August figure was, however, £1,500,000 larger than in August, 1948, but the sharpness of the downward trend in exports in the past two months was ominous. It remains to be seen how quickly the devaluation of sterling will help to reverse this

decline, which, perhaps, in part can be explained by the incidence of holidays, the effect of the recent dock strike and the expectation of devaluation.

The accompanying table shows the value of exports last month for the main groups compared with July and the monthly rates for the three previous quarters. The targets for the end of the year have also been included to show how

far industry has gone in achieving them. These targets are now, of course, of only academic interest, since to earn the same amount of foreign currency as originally planned, British exports must expand much more sharply. The export of food, drink and tobacco has been declining since the first quarter of the year, while the shipment of raw materials which recovered in July declined once more last month. Among manufactured goods, exports of machinery and vehicles have to all intents and purposes been maintained at their target levels, though actual exports of each group last month fell below that level. Non-ferrous metal goods and steel manufactures are both within reach of their targets, but the other groups, especially textiles, have still some way to go.

The only groups which expanded their exports in August were cutlery and implements, electrical goods, apparel, chemicals and vehicles. The increase in the latter group was due mainly to an exceptionally high export value of ships to Argentina: exports of motor cars declined sharply on the month. Exports to South Africa were considerably reduced and those to both the United States and Canada were also smaller. But exports to Argentina continued their recovery which started in June and last month totalled £6,100,000 against £3,500,000 in July.

Imports in August amounted to £200 million which was only £1,700,000 below the June record. Larger quantities of meat and butter were received from New Zealand and of fresh fruit and vegetables from Italy. Among raw materials, the main increases in supply were raw wool from the southern dominions, timber from Finland and Yugoslavia and oilseeds from West Africa. There were also much heavier imports of jute piece-goods from India.

Intuitive Price Policy

The Board of Trade Orders to reduce the maximum retail prices of utility clothing, footwear, and household textiles come into force on Monday. Even before the devaluation of sterling it was impossible to regard this method of reducing the cost of living with anything but scepticism. *The Economist* pointed out at the time that costs in the industries supplying these goods were still tending to rise, and there was no evidence that any of the conditions for a real decline in the cost of living had been created. This was at a time when the Government was still holding to its intention not to devalue sterling. The President of the Board of Trade is reported to have told the retail traders, in the course of last month's wrangling over the implementation of the cuts, that his scheme was "intended to meet a situation in which a psychological hunch must take precedence over scientific data." This was all very well. But it is necessary to recall that this flash of intuitive vision was vouchsafed to the Government in July, before the Chancellor of the Exchequer took the cure in Switzerland. Sir Stafford Cripps told the press this week that he changed his mind about devaluation when he reviewed the position on his return from Switzerland.

Where is the "psychological hunch" now? It is only necessary to mention cotton to show that the hope of keeping textile prices down (not to mention reducing them) has become visibly illusory. In so far as they work at all, the arbitrary cuts in utility textile prices will widen the artificial price gap between goods which are officially "essential" and goods which are not. This can only tend to make the utility or "essential" goods more scarce and the other goods dearer still. By exacting from the industries concerned assurances that utility production will be fully maintained, the Government is trying to stave off these consequences; but this expedient (again, if it works) will restrict the supplies and inflate the costs of export trade.

Any consumers who may still be hoping for a real easing of their cost of living through the Government's intervention should note that on Monday, when the utility price cuts come

Rayon in your home

More and more in the modern home, you rely on rayon for beauty and comfort. Rayon by itself, or used with wool, cotton, or silk, provides a host of things to delight the house-proud. Rayon goes to make your sheets and pillowslips... your bedcovers and tablecloths... your curtains and carpets and chaircovers. The complete list is very long, and all the time it grows longer still, as increasingly the beauty of rayon becomes appreciated, and its versatility realised.

Courtaulds

THE GREATEST NAME IN RAYON

Courtaulds Limited, 16 St. Martins-le-Grand, London, E.C.1.

A contradiction in terms? Certainly not. Any woman, admiring the gleaming surfaces of a range which cooks for twenty guests, is likely to call it opulent, and realising how little fuel it uses, will certainly call it economical.

The Advance Cooker No. 1 provides sufficient hotplate and oven space to cater for twenty people—or even thirty with an auxiliary oven. It will burn night and day with the minimum of solid fuel, replenished only once in twenty-four hours—or twice when using coke. Here is a cooker to save time, work, health and temper—the Advance Cooker No. 1. Write for folder number 34 which tells you all about it.

into force, a number of other Orders also come into force—releasing from price control not only many non-utility textiles but also a wide range of goods of a kind which are outside the utility schemes. These include many household articles in common use. To remove the existing price controls as part of a programme for bringing about a more realistic cost-of-living structure—particularly if it had been done at a time when the state of trade was tending to bring prices down—would have been a useful thing. But it has, instead, been timed to coincide with the aggravation of the artificiality of prices in the utility sector. The President of the Board of Trade was reported this week to be “looking round” the field of household goods to see what further reductions (presumably in utility prices) could be made. In the light of what has gone before, this is not good news.

Shipping and European Payments

Only brief mention of the possibilities of increasing Britain's dollar-earning capacity through shipping services was made in the joint statement issued after the Washington talks. Perhaps it was considered that devaluation would provide the answer; but that remains to be seen. What is certain is that the Washington Administration has to use great tact in handling shipping problems, since strong pressure groups in Congress would like to see the United States support its mercantile marine to the limit that subsidies and flag discrimination will achieve.

The report of the Maritime Transport Committee of the Organisation for European Economic Co-operation (which was prepared at the end of last year, but has only recently been published) explains the importance of shipping, as an earner of foreign exchange, to the viability of the OEEC countries. Before the war the world looked to them for about 60 per cent of its tonnage, but in 1947 they showed a net deficit on shipping account of over \$300 million. This figure is arrived at presumably after taking into account the United Kingdom surplus of £24 million (for dry-cargo tonnage only) which was mentioned in the Government White Paper. The participating countries forecast that in 1952-53, although there will still be a small deficit with the dollar area, they will have an overall surplus on shipping account with non-participating countries as a whole of more than \$250 million. The devaluation of their currencies may help further.

The decline of European earnings from shipping was caused mainly by war losses. The participating countries lost over 22 million tons gross, and the British share of this was 11,800,000 tons. By the middle of 1948, with new building and purchases (for dollars) from the American surplus, passenger and dry-cargo vessels totalled 24.7 and tankers 7.4 million tons gross, compared with 32.8 and 6.9 million tons (including German ships) at the end of 1938. The British totals for mid-1948 were 12.5 and 3.5 million tons respectively, compared with 14.3 and 3.1 million tons at the outbreak of war. The report estimates that by mid-1952 the participating countries will have 28.5 million tons of passenger and dry-cargo vessels and 10.1 million tons gross of tankers at their disposal. Their large shipbuilding programme, though it has been criticised in America, will thus leave them with fewer dry-cargo vessels in 1952 than before the war, although there will be more tankers. Moreover, these estimates allow for the minimum possible loss through obsolescence and other causes, and already more than seven million tons are beyond the age at which they would normally be expected to give efficient service. Earning capacity depends on quality as well as quantity of tonnage. Nor does the availability of tonnage in itself ensure maximum earning capacity. As the Maritime Transport Committee points out, an essential condition is that the participating countries should be able to offer shipping services throughout the world, unimpeded by government obstruction or discrimination or other measures. This condition of things still appears distant.

Lord Lyle Fights Back

Lord Lyle's vigorous defence of private enterprise in the sugar industry was a refreshing reply to the Labour Party's proposals to nationalise sugar refining. It was clear, from the moment the challenge was made, that he would fight it and have no compromise with it, and last week's extraordinary general meeting of Tate & Lyle (which approved the resolutions to segregate the assets which are not concerned with sugar refining) was a lively and spirited affair.

Lord Lyle dealt in turn with three charges levelled at the company by the nationalists. First, the charge that the company is a monopoly is easy to disprove; it has not so far been put forward for investigation by the Monopoly Commission (which is the natural place where such allegations could be tested); and Lord Lyle stated that the company supplies no more than 53 per cent of the sugar consumed in the country. The remainder is provided as to 23 per cent by the British Sugar Corporation and as to 24 per cent by five other companies and by imports of refined sugar. Since the price of sugar had been kept low, new entrants to the industry had not been attracted, though there is nothing to stop them. The existence of a price ring in sugar was emphatically denied. On the charge that the company received a state subsidy, it was admitted that in 1928 the duty on sugar was adjusted to discourage subsidised imports of refined sugar, and that there was a subsidy to beet producers. But Lord Lyle maintained that the undertaking of the refiners to keep the price of sugar low has been scrupulously kept. If it had not been so, the remedy lay in the hands of the Chancellor of the Exchequer.

On the third issue of profits, Lord Lyle declared that the profits of the group might be largely in total, but that they measured its efficiency; he was not ashamed of them, and he hotly denied that they entailed any exploiting of the consumer. Net dividends in 1948-9 represented only 0.7 per cent of turnover or the equivalent of one-twenty-eighth of a penny per pound of sugar sold. The average consumption of sugar per head is 85 pounds a year, so that each consumer contributes about 3d. each year to the owners of the capital employed in the sugar refining industry. Lord Lyle is certainly entitled, on such figures, to his doubts whether sugar could be refined as cheaply if the industry were nationalised, though, as he recognised, inadequate compensation could be used to reduce the industry's capital charges below a fair and economic level.

Anti-Climax in Barcelona Traction

The application brought in the Vacation Court by minority holders of the Prior Lien bonds of Barcelona Traction for an interlocutory injunction to restrain the London Committee of Prior Lien bondholders, purporting to represent the whole of this class of bondholders in the bankruptcy proceedings against the company in Spain, has been dismissed by Mr Justice Devlin. The reasons for the judgment make it clear, first, that the minority bondholders may by other means still achieve their avowed object of setting aside the appointment of syndicos which duly took place this week. In fact Mr Justice Devlin was of the opinion that the plaintiffs' delay in taking steps to stop the intervention of the London Committee as representing the Prior Lien bondholders could be attributed to their awareness that it lay in the power of the receiver appointed in Canada to represent this and any other objection to the Spanish courts. Moreover, to grant the injunction would be tantamount to setting aside a judgment of the Spanish courts, an action which His Lordship held would be quite unprecedented. Further in his view there was a strong case for believing that individual creditors of the company could appear at the bankruptcy proceedings. On the other points brought up in the case the judgment points out that it would be difficult for the syndicos to sell the assets of Barcelona Traction at anything very substantially below their true value, and at any rate the proceeds should be sufficient to provide all the plaintiffs require

Above is based upon report in London "Evening News" 18/2/49.

Shortage of police man-power is likely to be a major problem for many years to come. It is unfortunate, therefore, that thousands of police must daily be employed on traffic control duties.

Anything which will assist in putting them back on the beat is playing its part in beating the present crime wave. ELECTRO-MATIC VEHICLE-ACTUATED SIGNALS are already doing this at thousands of busy (and not so busy) traffic intersections up and down the country.

Have you considered them in relation to the man-power problems in your area?

For a great new
British industry

With the opening of the new Shell Chemical Plant at Stanlow, a wide range of industrial solvents and other chemicals vital to industry can now be derived from petroleum from sterling sources. Immediately, supplies to British industry will be increased. Immediately, dollar expenditure on such products is saved. And the export of these products will help to earn further foreign exchange. For another milestone on Britain's road to recovery

thank Shell Chemicals

in damages. Mr Justice Devlin saw no danger in the interests of the Prior Lien bondholders being depleted.

The attempt of minority prior lien bondholders to set aside the bankruptcy and prevent the majority from obtaining control of the company now shifts to Spain. The recent case in London has merely brought into the open long harboured accusations against the majority of the Prior Lien bondholders, of whom Senor Juan March is the most prominent figure. But it would be less than just not to state that time was not found in the crammed programme of the Vacation Court for the defendants in the recent action to reply to the charges laid against them both in the affidavits and the evidence.

Furness Withy's Future Finance

Although he gives full recognition to the Government's action in decontrolling freight rates last December, Sir Ernest H. Murrant, chairman of Furness Withy, emphasises in his annual statement that a further measure of liberation is still needed. He declares that the continuance of bulk buying and the chartering of tonnage by Government departments are preventing the shipping industry from making its maximum contribution to the national benefit. There are, of course, other problems which confront the industry. Sir Ernest cited the familiar difficulties of delays in port and labour disputes as two examples. He calculated that whereas in the year 1938-39 the average time spent at sea by the fleet of the Furness Withy group was 195 days compared with 170 days in port, in the past twelve months the figures were 164 days at sea and 201 in port. Last year, 750 working days were lost—the equivalent of laying up two ships with full crews on board for 12 months.

No end appears to be in sight to the rise in building costs. Sir Ernest's statement shows that the cost of the thirteen ships under construction for the group at the end of April had then exceeded the contract prices by £825,986 and the increases were still going on. The provision of funds from the group's own resources to finance its building programme may soon be a problem—evidently it has already become a problem for one subsidiary during 1948-49. Although the group's net liquid funds amounted to approximately £11½ million at April 30, 1949, its net liquid assets had been reduced to £2,405,344. Capital expenditure was very heavy last year. After providing £2,112,100 for depreciation, the written-down value of the fleet plus payments on account for tonnage building was increased from £12,420,651 to £16,503,753 on the year. Future commitments appear to be equally heavy, since outstanding contracts for new vessels at April 30, 1949, amounted to £8,312,576.

Patently, the capacity of the group to meet this expenditure without recourse to outside finance depends primarily on the trend of earnings. Here the prospect seems to be deteriorating. Trading profit declined slightly from £4,341,761 to £4,236,563 in the past year. The group's trade—and the country's shipping earnings—have been particularly affected by the fall in traffic and the diversion of business to Canada as a result of the changed status of Newfoundland. Some compensation has been obtained from the earnings of new vessels commissioned during the year—the *Pacific Unity* among others—and 2½ months' profits from the reconditioned *Queen of Bermuda*. The flow of Marshall Aid supplies has also been a relieving factor but United States shipping has been the chief beneficiary in this trade. Furness Withy should however be well placed to participate in the increased traffic to the United States which should follow the devaluation of the pound.

SMT Preference Repayment

Holders of the 6½ per cent preference stock of Scottish Motor Traction have not been deterred by the effect of the recent House of Lords judgment in the Wilsons and Clyde Coal case nor by the weight of legal opinion against them in

pressing their claim for a repayment of their stock above par. Nor, despite the passing of resolutions by ordinary shareholders at an extraordinary meeting in Edinburgh on September 16th which *inter alia* approved the repayment, is the attempt yet at an end. They will have a final opportunity of opposing the repayment when it comes up for court sanction. But at any rate their attempt to prevent the meeting of ordinary shareholders by applying to the Court of Session for an interdict on the grounds they had not received proxies to attend the meeting came to nothing.

The repayment of the preference capital of SMT is part of the company's capital reorganisation scheme, details of which were given in the September 3rd issue of *The Economist*. This scheme was approved at the meeting on a card vote showing an overwhelming majority of shareholders in favour after it had failed to be passed on a show of hands. The Transport Commission did not exercise its right to vote on the four resolutions put forward. Scottish Motor Traction has now become a holding company. After the necessary court approval for the reduction of capital there will be a distribution of £8,047,836 3 per cent Transport Stock, 1968-73 (received in payment for the assets acquired by the Transport Commission), in the form of a payment of £4 (nominal) for every 5s. ordinary stock unit held. Thereafter the principal assets will consist of two operating companies—SMT Sales and Service, which has taken over the SMT department previously engaged in the selling and service of motor vehicles, and Scottish Midland Guarantee Trust, a hire-purchase concern. It was stated at the meeting that the profits of SMT Sales and Service for the period April 9, 1949, to September 30th were less than the profits of the department for the corresponding period of the previous year. It is estimated that in a full twelve months' trading period the combined profits of the two operating companies would amount to approximately £140,000. In addition the holding company will have a small return from sundry investments.

Shorter Notes

The valuation of an additional 160 gas stocks has been announced this week. Compensation will be in the form of 3 per cent Gas Stock 1990-95 issued at par—as for the securities already valued—but the date of conversion into Gas Stock in this instance has been postponed until a date after October 31st next still to be fixed. This is the first batch of previously "unvalued securities" under the Act for which the date of conversion has not yet synchronised with the date of valuation. Until conversion the securities will remain in the classification of "unvalued securities." Gas Stock is at present quoted at 90½.

The Mond Nickel Company Limited states that its prices for nickel are now, in the UK: £321 10s per ton delivered works; on the Continent: £325 per ton c.i.f. Continental port.

Coal output last week was 4,229,100 tons, 8,400 tons less than in the preceding week. It is estimated that the strike among Scottish miners has caused a loss of 31,300 tons of coal. Output for the first 37 weeks of the year was 150,243,600 tons, compared with 146,363,100 tons in the first 37 weeks of 1948.

Mr. A. L. F. Green is to retire from the position of general secretary of the Stock Exchange Council after twenty years' valuable service. His successor is to be Mr C. D. Morley, who has been assistant secretary of the Share and Loan Department since 1936. Mr Green was entertained at luncheon by the Council this week on his retirement.

FAMOUS FOR ALL CLASSES OF INSURANCE

THE BROKEN HILL CORPORATION LIMITED

EXCHANGE OF REDEEMABLE PREFERENCE STOCK IN THE BROKEN HILL CORPORATION LIMITED FOR PREFERENCE SHARES IN THE CONSOLIDATED ZINC CORPORATION LIMITED

Extracts from an Offer by The Consolidated Zinc Corporation Limited to Preference Stockholders of The Broken Hill Corporation Limited, and from an accompanying letter from the Secretary of The Consolidated Zinc Corporation Limited.

When in 1947 The Broken Hill Corporation Limited was formed as a subsidiary of The Zinc Corporation Limited, it was hoped that it would provide a satisfactory means of dealing with many of the problems of finance, control, and management which were outside the scope of the main business of The Zinc Corporation Limited, namely, the operation of its mining and treatment plants at Broken Hill. It was not, however, at that time expected that an opportunity would occur so soon to acquire the Ordinary Share Capital of Imperial Smelting Corporation Limited, and the Preference and Ordinary Share Capital of Sulphide Corporation Limited.

The acquisition of these interests with their widely divergent activities has emphasized the need for simplification in the control and management of The Zinc Corporation Limited, and its group of companies situated both in the United Kingdom and Australia. The Consolidated Zinc Corporation Limited was accordingly formed for the purpose of effecting a general scheme of consolidation of this group.

Pursuant to an Offer made on the 14th March, 1949, the Consolidated Zinc Corporation has acquired the whole of the issued stock and shares of The Zinc Corporation Limited, in exchange for shares in The Consolidated Zinc Corporation Limited credited as fully paid.

In the terms of a Prospectus dated 27th May, 1949, the Consolidated Zinc Corporation issued for cash 2,500,000 $\frac{4}{8}$ per cent. Cumulative Preference Shares of £1 each at par.

In completion of the scheme of consolidation outlined in the Offer dated 14th March, 1949, made to Members of The Zinc Corporation Limited, it has now been decided to proceed with the third and final stage, namely, the Exchange of the Preference Stock in the Broken Hill Corporation for Preference Shares in the Consolidated Zinc Corporation.

Accordingly, The Consolidated Zinc Corporation Limited is now offering one Preference Share of £1, together with a cash payment of 1s., in exchange for every £1 of Preference Stock in The Broken Hill Corporation Limited, such exchange being on the terms fully set out in the Offer.

Subject to this Offer becoming unconditional, the Directors of The Broken Hill Corporation Limited propose to pay on the 2nd January, 1950, to Preference Stockholders registered on the date the Offer becomes unconditional, the half-yearly dividend (less U.K. Income Tax) on the $\frac{4}{8}$ per cent. Redeemable Cumulative Preference Stock of the Broken Hill Corporation in respect of the period 1st July, 1949, to 31st December, 1949. The Preference Shares of the Consolidated Zinc Corporation to be issued in pursuance of this Offer will rank for dividend on the full nominal amount thereof as on and from 1st January, 1950.

It is proposed to apply to the Council of The Stock Exchange, London, and to the Stock Exchanges at Adelaide, Melbourne and Sydney for permission to deal in and for quotation for the Preference Shares of the Corporation to be allotted credited as fully paid in pursuance of this Offer upon such shares being so allotted.

Subject to the present Offer being accepted in full, the issued and paid-up capital of the Consolidated Zinc Corporation will be £11,024,573, divided into 4,476,626 $\frac{4}{8}$ per cent. Cumulative Preference Shares of £1 each and 6,547,947 Ordinary Shares of £1 each.

This Offer is conditional upon a 90-per-cent. acceptance or such lower percentage as The Consolidated Zinc Corporation Limited may accept as sufficient, and will, if accepted in full, make the Broken Hill Corporation a wholly-owned subsidiary of the Consolidated Zinc Corporation; the Directors have no intention of liquidating The Broken Hill Corporation Limited.

The dividend dates of both securities are identical, and gross income will be unaffected by the Exchange. The average annual profits for the last ten years of the Companies which now comprise the Consolidated Zinc Corporation group are sufficient to cover the Preference Dividend requirements of the Consolidated Zinc Corporation nearly 5 times, while the combined net assets of the group provide capital cover on the Preference Shares of approximately 2.4 times.

Copies of the full Offer and Appendix thereto can be obtained during usual business hours from Central Registration Limited, 8, Basinghall Street, London, E.C.2.

COMPANY MEETINGS

THE DISTILLERS COMPANY, LIMITED

FINANCIAL STRENGTH OF THE ORGANISATION

PROPOSED REORGANISATION OF CAPITAL STRUCTURE

SCOTCH WHISKY SUPREMACY THREATENED BY HEAVY DUTY

HOME DEMANDS AGAIN SUBORDINATED TO EXPORTS

MR H. J. ROSS'S REVIEW OF EXTENSIVE ACTIVITIES

The seventy-second annual general meeting of the company was held in the North British Station Hotel, Edinburgh, on Friday, September 16, 1949, when the chairman, Mr H. J. Ross, presided.

The chairman, in moving the adoption of the report and accounts, said:—

Once again I have to open my remarks to you on a sad note. It was only a year ago that Mr John Barr Cumming, managing director of John Walker and Sons, of Kilmarnock and London, was elevated to a seat on the board of the parent company, and not long afterwards he was stricken with a serious illness from which he succumbed, after a very gallant fight, in June of this year. His passing is a severe loss to the company.

Since our last annual meeting, Major Ball, D.S.O., M.C., has been appointed a member of the management committee, and his specialised knowledge of plastics, chemicals, etc., should prove, and indeed is proving, to be a distinct acquisition to the deliberations of the committee.

The addition of three new directors to the board also falls to be recorded. These are all full time executives who have grown up in the service of our subsidiary companies, and whose promotion is the reward of merit. They are Messrs S. H. Hastie, E. Stein, and W. Walker, whose designations are stated in the report, and whose appointments you will be asked to confirm later in the meeting.

YEAR'S RESULTS

From the statement of accounts you will have noted that, for the year to March 31, 1949, the manufacturing and trading profits of the company and its subsidiary companies, including an item of £149,756 for inter-company profits in the stock valuations of subsidiary companies released during the year, amounted to £10,361,857. To this is added (1) income from trade investments £324,956, (2) income from other investments, including British Government securities, £400,673, and (3) provisions for taxation made in previous years not required and released £291,094, making the total revenue £11,378,580.

Taxation, under the headings of income tax and profits tax, required £5,479,939, and after all provisions for depreciation, writings off, and allowance for interests of outside shareholders in subsidiary companies, the net profit attributable to the Group amounted to £4,756,623, as against a corresponding figure in the previous year of £5,303,510.

There was transferred to the general reserves of subsidiary companies amounts totalling £644,295, and the directors have agreed to appropriate £773,754 to general reserve, and £275,000 to superannuation and provident reserve, both in the books of the parent company. At the same time, the directors agreed to take from investment reserve a sum of £100,000, and to apply this in reducing the book values of certain investments in subsidiary companies.

At this stage, there was available £3,163,574, being sufficient for the dividends

distributed or recommended, and to increase the carry forwards from £3,425,083 to £4,243,398. The latter figure comprises £1,001,889 by the parent company, and £3,241,509 in the books of subsidiary companies.

THE DIVIDEND

The dividend on the ordinary stock in respect of the year to March 31, 1949, is 1s. 11/5d. per unit of 4s, the same as for the previous year. Apart altogether from the national policy of restriction of dividends, the board has had to have regard to the somewhat heavy contingent liabilities in respect of uncalled capital on investments, and for commitments for capital expenditure, all as mentioned in the notes attached to the accounts. The board deems it desirable to mention again that the costs of the expansion programme will, when completed, prove to be in excess of the estimates.

COMMENTS ON LEGAL BALANCE SHEET ITEMS

The company's legal balance sheet calls for the following comments:—

(1) The general capital reserve is now £1,324,098. The increase here is mainly attributable to the credit for profits on certain investments sold during the year.

(2) The revenue reserves, including undistributed profit, total £14,733,432.

(3) Investments in subsidiary companies increased during the year by £598,993. The main items contributing to this are as follows:—

(a) The subscription of additional capital to one of the subsidiary companies in the industrial group towards financing the costs of further development of that company.

(b) The acquisition of the firm of R. G. Abercrombie & Company, distillers' and brewers' engineers, Alloa, and the creation, in collaboration with other interests, of a subsidiary company with a capital of £25,000, of which 80 per cent. is held by The Distillers Company, Limited.

(c) The investment in Uni-Bé Bakers Supplies, Limited. Here, the capital is £50,000, of which 60 per cent. is held by The Distillers Company, Limited.

(4) There is a substantial reduction in the book value of quoted investments, under the heading of "current assets" in the balance sheet. Certain holdings of gilt-edged securities and equity shares of British companies have been sold, mainly to finance loans to subsidiary companies for the expansion programme. The market value of the remaining holdings was below book value at the date of balance, but, in the case of trade investments, there was a very substantial surplus over book values. Having regard to this, the board did not consider it necessary to write down the value of quoted investments.

CONSOLIDATED BALANCE SHEET ITEMS

Turning now to the consolidated balance sheet, it is interesting to note the increases in lands and buildings and in plant and

machinery, due to the expansion programme. The effects of the appropriations to reserves and the increases in carry forwards are reflected in the comparative figures showing increases for both capital and revenue reserves. The strength of the organisation is clearly shown with current assets of over £57,000,000 and current liabilities of under £9,800,000.

It is appropriate to mention that the liquidation of W. P. Lowrie & Company, Limited, and the transfer of its assets to James Buchanan & Company, Limited, has brought about a reduction of £983,729 in the group's revenue reserves, with a corresponding increase in the group's capital reserves.

During the year, the board received an actuarial report upon the group superannuation and provident scheme. After taking into account the income tax position which would be applicable if a separate Trust was established, the valuation has disclosed that the existing reserves, under this heading, are adequate—in fact there is a surplus. The board will shortly have under consideration the formation of such a Trust to administer certain provisions of the scheme.

RE-ORGANISATION OF CAPITAL STRUCTURE

In recent years, the stockholders have been informed that the board desired to reorganise the capital structure of the company, at least to some extent, so as to bring the issued capital more in line with the assets, and with the earnings. The proposal as announced—to capitalise £7,512,923 of the company's general revenue reserve, and to appropriate this to the ordinary stockholders on the register at September 30, 1949, by the allotment of one new ordinary share (afterwards to be converted into stock) for every £2 of ordinary stock held—has received the sanction of the Capital Issues Committee of the Treasury. Arrangements are being made to hold an extraordinary meeting on Thursday, November 3, 1949, to consider this proposal, as well as one to increase the capital of the company from £20,000,000 to £35,000,000.

The transfer of £7,512,923 from the general revenue reserve of the parent company leaves a substantial figure at credit thereof, and the board considers that this, in conjunction with the reserves of subsidiary companies, leaves the organisation strong and in a position to withstand such contingencies as may arise in the future.

WHISKY DISTILLING

In my statement last year I referred to the release of 250,000 tons of cereals to the industry for the period to April 30, 1949, and for which quantities, licences were issued to maintain continuity of operations at distilleries.

This release was followed in February of this year by an allocation of 300,000 tons, equal, you might say, to the full prewar rate of distilling, but to achieve this we were obliged to pledge ourselves to still further increase our exports of old whisky.

SCOTCH WHISKY SALES—HOME AND EXPORT

Reference was also made last year to the limited and indeed meagre allocation being made available to the home consumer. In the year now under review the position has not improved. In terms of the arrangement with the Ministry of Food which came into operation on May 1, 1948, releases for the home trade had to be confined to an overall figure for the trade of two million proof gallons, and, although the official figure of releases showed that total to have been considerably exceeded, our companies faithfully observed the arrangement.

At a meeting with the Ministry of Food in February, 1949, the necessity for increased

home trade supplies was submitted with the utmost emphasis. Once again, however, the interest of the home market had to be submerged in the national necessity for increased supplies to hard currency export markets, and for the twelve months ending April 30, 1950, home trade releases have again been pegged at two million proof gallons.

I need not reiterate the feelings of the board which I expressed to you last year, except to repeat that it is our aim and desire to have the position remedied at the earliest possible moment.

RESULT OF HEAVY DUTY ON TRADE

The rate of duty remains at the ridiculous figure of £10 10s. 10d. per proof gallon. Continuance of taxation at this penal rate—equal to 24s. 7d. per bottle—coupled with the restricted releases already referred to, can only result in the strangulation of our home trade interests. The representations to the Chancellor of the Exchequer made during the course of the year must be intensified, not only on our part, but by ancillary interests, including the consumer public.

To return to exports, as I think is generally well known, the USA and Canada are the most important hard currency markets upon which we are asked to concentrate our efforts. Whilst our group of companies will naturally carry out their share of the undertaking made between the Ministry of Food and The Scotch Whisky Association, it has been impressed on the Minister that consideration must now be given, not only to the long-suffering home consumer, but also to certain other soft currency markets which have been deprived of their full requirements for years.

What we must ever impress upon the Government of this country is that the Scotch whisky industry, and your company in particular, has been responsible for creating a world-wide trade in an article the quality of which is second to none. The undoubted supremacy of Scotch whisky is acknowledged everywhere, but continued shortages will assuredly open the door to substitutes of one kind or another, of which there are many in various countries of the world. Particularly has this been the case in the home market, due largely to the exorbitant rate of duty.

For economic reasons, certain countries, notably the South American Republics, have been closed to us as markets for our brands of Scotch whisky.

The arrangements we have made to endeavour to protect our valuable trade in South Africa appear to have excited comment in some quarters. As you will be aware, the South African Government, in the interests of their internal economy, recently prohibited the importation of a long list of luxuries, including whisky.

Our efforts to be allowed to export even a token quantity having met with no success, we were informed that the only possible way in which a resumption of trading might be achieved would be for us to agree to leave our money in South Africa to be invested in Union Government and Municipal securities, or other approved investments, for a period not yet known.

Naturally, the prospect of tying up our resources in such a manner over an indefinite period held no particular appeal, but, as the only alternative left to us was the probable loss of what has been for long years a most valuable market for Scotch whisky, we decided to give this blocked fund system trial. The matter was therefore remitted to the Bank of England Exchange Control, and the necessary permission granted.

GIN

I am glad to be able to record once more that the demand for the Group's gin brands

continues strong—particularly the leaders—Gordon's and Booths, which reflects the public's appreciation of the high standard of quality which it is our endeavour always to maintain.

In addition to the continuing efforts of our gin companies to expand exports to hard currency markets, we have in the U.S.A. our own rectifying plant, where our sales are running at a higher level than they have ever done and those of our directors and others who have recently been in America have nothing but praise for the condition and operation of our factory at Linden, New Jersey.

EAST

Production at the company's yeast factories was at a high level throughout the year, but costs have again tended to rise. It is satisfactory to record that the Ministry has given permission for the erection of the new factory at Bristol, and every effort will be made to have it in operation within a reasonable period.

The United Yeast Company, Limited and its associated companies, who are distributors of the company's yeast to every district of the United Kingdom, no matter how remote, as well as engaging in the important business of providing most materials used by bakers, have well maintained their progressive position with satisfactory results.

INDUSTRIAL SECTION

The past year has been a difficult one on the industrial side of the company's business, but, on the whole, our combined results have been satisfactory.

The demand for industrial alcohol and chemical products has been substantially maintained, and I am glad to say that, during the course of the first half of 1949, all Government controls, which have been in force in respect of most of our manufacturing and selling operations during and since the war, were removed.

The world price of one of our important raw materials, molasses, fell very sharply at the end of last year, so that, notwithstanding the necessary liquidation of high-priced stocks, the recent purchase at much lower prices has enabled us to make substantial reductions in selling prices of the materials derived therefrom, and thus bring them more into line with the increasingly competitive conditions following upon the disappearance of the sellers' market. The indications are that molasses is likely to remain in free supply at reasonable prices for some time to come, which will enable us to make further reductions as and when the old stocks are disposed of.

The new project at Grangemouth for producing chemicals from petroleum, which development you will recall is being financed equally between the Anglo-Iranian Oil Company, Limited, and ourselves, is making steady progress. Although the rising costs of constructional materials and long delivery dates still present serious problems, nevertheless, every effort is being made to adhere to the original completion date of January, 1951.

PENICILLIN

The penicillin factory at Speke has had a satisfactory year, and the entire output has been fully sold. Plans are now in course of execution for considerably increasing the existing capacity, having regard to what we believe will be the future demand for penicillin, and also to equip the company with the most economic basis of manufacture in order to meet increasingly competitive conditions in world markets. The programme also provides for the marketing of new materials in the course of next year.

PLASTICS

The plastics industry, as a whole, has suffered a sharp set-back during the past year, due, in no small measure, to the operation of the purchase tax as well as the high cost of essential raw materials. In recent months, however, the prices of some of these raw materials have eased, and there have been signs of an improvement in demand. In the meantime, our new factory at Barry is virtually complete, and the gradual transfer of manufacturing operations from existing plants to that centre is now in progress. This large and modern unit should enable us to achieve further economies in production cost, and also considerably to expand and broaden the present range of plastic materials. The Geon polyvinyl chloride plant at Barry enjoyed a substantial scale of production during the past year, despite the general contraction in demand for plastic materials, and the quality of the range of products now being marketed by the Geon Company has enabled us steadily to increase our sales both in the home market and for export.

Reference has been made previously to our investments in industrial undertakings overseas, particularly in South Africa and Australia. I am glad to say that our trading operations in these countries are showing very satisfactory results, and we have under constant review the broadening of our activities to enable our company to participate in the growing demand for industrial chemicals, which it is felt will arise from the general development of those countries.

Your company is still maintaining an extensive research programme, which stockholders will recognise is an essential background to the large-scale developments in which we are engaged.

FUTURE PROSPECTS

The company has not yet benefited from the anticipated reasonable return from expenditure on the major part of the expansion scheme, and it may be some time before it does; but it should be remembered that it will be necessary to continue, over an extended period, the board's established policy of ploughing back a substantial part of the profit earned therefrom. In announcing the proposal with regard to the alteration in the capital structure the board deemed it advisable, therefore, to issue a statement that it must not be assumed there would be an increase in the amount paid out by way of dividend.

It is satisfactory to note, however, that so far as the current year has progressed, the profits earned by the company are well up to the standard of the year to March 31, 1949.

STAFF

It is again a pleasure for me to be able to pay tribute to the services of our staff. Relations with both works and office staffs continue to be excellent, and the board's appreciation has again been translated into the form of a small monetary bonus, 7½ per cent. having been paid for the year to March 31, 1949, as against 5 per cent. for the previous year.

In intimating a repetition of the 7½ per cent. rate for the current year, it was made clear that this is not to be looked upon in any way as a permanent addition to either wage or salary. In other words, when times are good and conditions justify it, the board is only too glad to consider rewarding loyalty and devotion in some practical manner. If, on the other hand, we were to run into a depression, with a consequent drop in profits, I feel sure we could count on the same loyalty and devotion even though no additional monetary reward was possible.

The report was adopted.

UNITED DAIRIES, LIMITED

MULTIFARIOUS OPERATIONS OF THE GROUP

PROPOSED BONUS ISSUE

MR. LEONARD MAGGS'S STATEMENT

The thirty-fourth ordinary general meeting of United Dairies, Limited, was held on September 16th at the Connaught Rooms, Great Queen Street, London, W.C., Mr. Leonard Maggs (chairman and manager director) presiding.

The secretary (Mr. Allan Mair, C.A.) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended March 31, 1949, and was taken as read:—

I feel it will again be in the interests of the many members who are unable to attend the annual general meeting on September 16th if I circulate my remarks with the directors' report and accounts.

The accounts do not call for much comment, as the consolidated statements published give a clear picture of the financial position of the whole group.

It was previously our practice to bring only sufficient revenue from the subsidiary companies into the accounts of the parent company to meet the recommended distribution. We have now decided that it is desirable, after offsetting losses, to bring substantially the whole of the year's profits of the subsidiaries into the parent company.

This has no effect on the consolidated accounts, but increases the amount of profit to be dealt with by United Dairies, Limited. Last year £344,005 out of group profits of £771,763 was brought into the parent company's profit and loss account, leaving the remainder to be added to the balances carried forward in the subsidiary companies.

PROVISION FOR TAXATION

There being no material alteration in the basis or rates of taxation this year as compared with last, the increased provision—£1,401,159, compared with £1,012,056—appears out of relation to the increase in the profits after taxation. This is due to the £341,073 provision for deferred repairs having been provided out of taxed income.

RESERVES

The following are the reserves of the group at March 31, 1949: corresponding figures at March 31, 1948, are shown for comparison:—

	1949	1948
£	£	£
The share premium account	1,488,201	1,487,971
Capital reserves:		
Profits, less losses on realisation of:		
Properties	131,473	113,762
Investments in subsidiary companies	99,157	99,157
Excess profits tax post-war refund	3,967	—
Revenue reserves:		
General reserve ..	2,250,000	2,000,000
Insurance fund ..	100,000	100,000
Depreciation not required on properties sold	29,619	25,956
Future income tax ..	956,245	679,675
Profit and loss appropriation accounts	2,526,028	2,283,481
	£7,584,690	£6,790,002

It is apparent that the issued capital is out of line with the capital actually employed. Apart from visible reserves, the industrial freehold properties of the group have been depreciated since 1931 at 2½ per cent. per annum on cost: the book value of the freehold properties of the group at £2,926,410 at March 31, 1949, represents considerably less than present-day real value.

My predecessor in 1940—the silver jubilee year of the company—mentioned that but for the war consideration would have been given to some correction of the balance between issued capital and capital actually employed. Since then the position has continued to get more and more out of line, and your board considers that an attempt should now be made to correct it to some extent.

Application has therefore been made to the Capital Issues Committee for consent to utilise £1,478,400 out of the share premium account of £1,482,387 to make a bonus issue of one ordinary share of £1 for each £2 of ordinary stock held.

DEFERRED REPAIRS

A survey of the repairs necessary to buildings, plant and machinery, fixtures and fittings, to bring them up to the high standard which obtained before the war, has been carried out, and the amount estimated to be necessary to achieve this, taking account of present-day costs, is £1,132,203. The provision of £341,073 out of this year's profits brings the fund up to this figure.

Of the amounts placed to the credit of this fund £881,330 has been taken into account in providing for excess profits tax. Unless expended within the prescribed period this amount of the fund would become assessable for excess profits tax, but it must be assumed that there will be an extension of the period because of the national circumstances.

All the amounts set aside are out of income, after payment of Schedule "D" tax, and when expended they will be allowed as an expense for that tax.

The total amount of the fund is temporarily available as working capital.

DISPOSAL OF GROSS REVENUE

The following statement shows, in respect to the year ended March 31, 1949, how every pound sterling received by the group in respect to sales of milk, milk products and other products was absorbed: comparative figures for the two previous years are also shown:—

	1949	1948	1947
Cost of milk, goods for resale, and raw materials for production of other goods	14/8½	14/7½	14/7½
Salaries and wages ..	2/5	2/7½	2/5½
Other expenses, including containers, depreciation, rents, repairs, provision for deferred repairs, etc.	1/10½	1/10½	1/9½
Taxation	7/2½	6/6½	7/2½
Paid as dividends ..	2/2	2/2	2/2
Retained in business for development ..	2/2½	2/2½	3/4
	20/	20/	20/

This is the picture as regards the whole of the multifarious operations of the group. Taking only the milk side of the business, but including such inseparable subsidiary activities as goods purchased for resale in the shops, and (in Scotland) the bakeries, the results are not so satisfactory, the net retainable profit available for dividends and development being 1.057 per cent. of the turnover.

MARGINS ON MILK

I reported to you on the last occasion that the distributive industry was pressing the Ministry of Food to revise margins to cover increases in costs over which the trade had no control. The Minister awarded an increase of ½d. per gallon in the retail margin in London and of ¼d. per gallon in the provinces, effective from October 1, 1948.

This means that in London we still receive only just over 1½d. per pint bottle to cover processing, wastage, provision of bottles and bottling, delivery, collection and cleansing of empty bottles, booking up and giving of credit, which I am sure could not be considered by anyone to be an unduly high reward for the service. That it can be done for this figure demonstrates beyond all doubt the efficiency of the industry.

MILK SUPPLIES

During the winter and the early summer, supplies of milk increased at a gratifying rate, but recent events have served to steady the optimists who have been talking of an early relaxation of the control of milk sales.

Those of us concerned with day-to-day delivery know how fine is the margin of surplus on which we have to work, and I am reminded that, in prewar days, it was estimated that to ensure a full supply of milk for liquid consumption a surplus of 20 per cent. was necessary in the months of lowest production of milk.

The position of the manufacturer of milk products is difficult in existing circumstances because he has, at some periods, to run overloaded, and, very soon, is liable to find that he has no milk to manufacture.

This is, to some extent, the normal fate of the manufacturer, but during 1948 the differences were remarkable: in England and Wales 28 million gallons were manufactured in May and only 1½ million gallons in September. In the latter month the adult entitlement of liquid milk was 2½ pints weekly.

It appears from recent figures (England and Wales) that liquid consumption would reach a figure of 117 million gallons monthly without control. Last year's figures showed that production exceeded this total only in three months of the year.

MILK (SPECIAL DESIGNATIONS) ACT

The Milk (Special Designations) Act has now been passed into law. Power is conferred on the Ministry of Food to specify areas in which only designated milk can be sold. "Designated milk" includes tuberculin tested, pasteurised, sterilised and accredited milk.

Since your companies have been among the pioneers of pasteurisation, it is not anticipated that these new requirements will cause any difficulty.

TECHNICAL WORK

All aspects of our operations are under review continually and constant efforts are being made to improve the equipment which we use and sell, and to avoid all forms of wastage.

We are happy to think that the knowledge acquired is being put to practical use by our

engineering, transport and utensil subsidiary companies, the U.D. Engineering Company, Limited, Mickleover Transport, Limited, and Dairy Supply Company, Limited.

DEVELOPMENT

The Standard Yeast Company, Limited.—Since my last report to you the company has acquired the whole of the shareholding in this concern, with its subsidiary companies, the London Yeast Company, Limited, the Bakers' Economical Supply Service, Limited, and the Devondale Preserve Company, Limited.

This group manufactures and distributes yeast, and to a small extent preserves; they are also large distributors of the very many commodities required by bakers.

Their present yeast-producing factory at Chiswick is too small for their present needs, and it is planned to erect a modern yeast-producing factory at Harwich which, when in operation, is expected to produce yeast of better quality and more cheaply than under present conditions.

This investment is expected to add further to the earning capacity of the group in connection with activities other than milk.

AUSTRALIA AND NEW ZEALAND

Australia.—I reported to you last year our development scheme in Australia, and I am glad to say that a company has now been registered under the title "British United Dairies, Proprietary, Limited," and is already in the process of equipping two of the four factories for the reception of whole milk instead of farm-separated cream, and for the manufacture of milk powder in addition to butter. It is hoped that these factories will commence operations some time during the coming Australian season.

Plans are also in hand for the erection of a new factory, to be equipped to manufacture condensed milk, milk powder and butter.

New Zealand.—On the last occasion I reported to you that our New Zealand company, Dairy Products, Limited, had just started to operate a new factory at Kapuni, in the Taranaki district of the North Island. I am glad to say that this has proved an unqualified success, and the results of the first full year's working are most gratifying.

APPRECIATION OF THE STAFF

In conclusion, I should like to take this opportunity of expressing the thanks of the board, and I am sure I may include the shareholders, to the officers and staff of the company for their services during the past year.

The report and accounts were unanimously adopted and the final dividend on the ordinary stock at the rate of 10 per cent. actual, less tax, making 15 per cent. for the year, was approved.

The remuneration of the auditors, Messrs Peat, Marwick, Mitchell and Company, was fixed.

Special resolutions were also passed increasing the capital of the company to £9,000,000 by the creation of one million shares of £1 each, capitalising the sum of £1,478,400, part of the share premium account, and distributing the resultant ordinary shares of £1 each to the existing ordinary stockholders in the proportion of one share for every £2 stock held.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

BRITISH GLUES AND CHEMICALS, LIMITED

MR ROGER DUNCALFE'S QUIET CONFIDENCE

The twenty-ninth annual general meeting of British Glues and Chemicals, Limited, was held in London on September 21st. Opening his review, Mr Roger Duncalfe, remarked that in spite of more difficult trading conditions the results presented were not dissimilar to those of the preceding year.

Consolidated profit, after full taxation provision, was £106,418 (against £113,606). With amounts brought in, the total available for appropriation was £222,488 (£211,249). Appropriations were: £100,000 to contingency reserve (making it £200,000) and £30,000 on replacement reserve (making it £110,000), leaving £92,488 profit available for distribution. Net dividends of 10 per cent on the preference stock and 25 per cent on the ordinary stock absorbed £52,937, leaving £39,551 to be carried forward.

Reviewing the consolidated balance sheet, Mr Duncalfe pointed out that current assets, at £1,127,504, exceeded current liabilities by nearly half a million sterling. Revenue reserves and surplus, apart from reserve for future income tax, were about £500,000, as compared with £370,000 a year ago—a source of satisfaction at a time when more difficult trading conditions were expected.

PRODUCTION AND SALES

After referring to the more difficult trading conditions experienced by the Canadian subsidiaries, Mr Duncalfe continued:

Group turnover approximated closely to that of the previous year. We have borne in mind Government policy in regard to prices and personal incomes and have made price reductions where possible.

Our technical department has contributed notably to progress during the year. Our gelatine works has fully maintained its position as a leading supplier to the photographic, pharmaceutical and food industries. During the year we have made available to industrial users several new grades of specialised adhesives.

Our agricultural business continues to expand in that section which caters for the effective mineral nutrition of farm livestock.

During the year we have strengthened our export drive and our representatives have travelled far and wide, and had it not been for currency restrictions our export turnover would have been much higher.

PERSONNEL AND THE FUTURE

We have a most excellent team, who gain inspiration and power from the leadership of our managing director, Mr Harold J. Cotes. I express to them all sincere thanks for their unfailing support. On May 5, 1949, your board appointed Mr I. H. Chayen, who has given outstanding service as technical director, to be assistant managing director, and we look forward to a continuation of his able service over many years.

As to the future, I do not anticipate an easy year, but we have started it reasonably well; our group's increased manufacturing capacity is for essential goods needed both at home and in many lands overseas, and our stocks are comparatively low. The development of our full manufacturing potential must to some extent depend on the upward movement of world trade, which in turn is dependent upon the freeing of currency and trade and the restoration of confidence which greater political stability would bring. On the other hand, our sales development campaign, particularly for our new products, is meeting with an encouraging response. I have already spoken of the reserves we have built up to meet adverse circumstances should they arise. On the whole, I feel that, unless conditions throughout the world suffer too severe a setback, we can face the future with quiet confidence.

AMALGAMATED BANKET AREAS LIMITED

GOOD DEVELOPMENT RESULTS

The thirteenth annual general meeting of Amalgamated Banket Areas Limited, was held on September 16th in London, Major-General W. W. Richards, C.B., C.B.E., chairman of the company, presiding.

The chairman addressing the meeting, said:—

Members will shortly be asked to confirm terms of an amalgamation with Gold Coast Banket Areas, Limited, and South Banket Areas, Limited, and the acquisition of certain mining concessions from Banket Goldfields, Limited.

The following is an extract from the statement of the chairman:—It is my sad duty to record the death on August 16, 1949, of Mr H. G. Latilla, the chairman of the company. Mr Latilla was responsible for the formation of our company back in 1935, and he has been on the board of directors continually from that date.

Turning to the mining operations, it is pleasing to record that 404,813 tons of ore were treated in the mill. One month's milling having been lost (October, 1947) due to a strike of the African employees, this represents a monthly average of 36,801 tons, as compared with an average of 30,233 for the previous year.

Our ore reserves are reasonably strong and with a proved tonnage of 1,126,489 tons of 5.57 dwts ore underground and 2,613,639 tons of 2.08 dwts ore in the shallow Pope areas, we have over seven years' ore developed ahead of the mill at the current rate of production. During the year under review the good development results reported last year were continued.

The report was adopted.

A. C. COSSOR, LIMITED

NEW RANGE OF PRODUCTS

The eleventh annual meeting of A. C. Cossor Limited was held on September 22nd in London, Lord Burghley, K.C.M.G. (chairman) presiding.

The following are extracts from his circulated statement:

The bulk of the group's loss was due to the provision we have had to make against our investment in our valve-making subsidiary, Electronic Tubes Limited. We have since succeeded in disposing of our interests on satisfactory terms and beneficial arrangements have been made whereby we shall still draw our supplies from this company. By this transaction our main source of loss has been stopped.

Cossor Radar Limited's factory at Chaderton, which was proving so costly, has been closed and the work transferred to our Highbury factory, the benefits of which will be fully felt in the year now in progress.

It became apparent during the year that the slump in the radio industry was not passing away; we therefore took effective measures to move our stock by making substantial price reductions. In response to Government appeals we prepared a determined attack upon the export markets. Models were designed which were very well received when shown overseas and large orders placed, but every one of our principal markets was closed by Governments concerned.

For the home market we have designed and put into production a new range of radio and television models which we are confident will improve our position. Our marine radar equipment continues in the forefront and is being fitted in gratifying numbers.

I think that I am safe in saying that the worst is behind us. We have made careful plans for the current year, which are estimated to result in profit on trading.

The report was adopted.

WATNEY COMBE REID & COMPANY, LIMITED

HIGHEST QUALITY PRODUCTS

The ordinary general meeting of Watney Combe Reid & Co., Limited, was held on September 22nd in London.

The following is an extract from the circulated statement of Major A. C. Bonsor (chairman of the company):—

In my statement to the stockholders last year I referred to the growing signs of reluctance on the part of the public to pay the high price for beer necessitated by the then existing rate of duty.

During the year that has since elapsed that disinclination became increasingly pronounced to such an extent that in the Budget in April the Chancellor of the Exchequer reduced the price of beer by 1d. a pint.

The decline due to high price was thereby slightly alleviated, but this was very largely offset by the deterioration in the economic situation, with the result that the expected improvement in trade did not materialise. This continued falling off in trade has undoubtedly been more severe in the southern half of the country and has persisted despite the abnormally favourable weather which has been experienced for so long this year.

Whereas the reduction of 1d. a pint brought a small measure of relief to the consumer, it was imposed in such a way as to leave an additional burden of 3s. a barrel to be found by brewers, in addition to their loss represented by the higher duty paid on stocks in hand.

AN UNQUESTIONABLE DEMAND

I still think that much more will have to be done in the way of reduction of beer duty before there is a noticeable response by the consumer. There is unquestionably a demand for better and stronger beer at a price which the public, having regard to other factors in the economic situation, can afford, and that is not possible while duty stands at its present level.

Meanwhile, with the cost of materials still rising and working expenses proportionately higher owing to reduction in turnover, I foresee that the expectation of lower profits is inevitable.

Profit on trading at £1,253,928, a decrease of £406,949, shows the result of the conditions to which I have alluded above.

We are satisfied that the products we are able to offer are of the highest possible quality under the limitations imposed on us.

Grants of licences for repairs and decorations have been more easily obtainable, and considerable headway has been made in restoring our houses to their pre-war condition.

The report was adopted.

NOTICES

CENTRAL OFFICE OF INFORMATION

Applications are invited for the post of economic and political editor in London for newsfeature language weeklies published in Moscow and Warsaw. Good academic qualifications in economics, and an appreciation of the special considerations to be borne in mind in addressing the audience concerned, are required. Duties will include contacting and briefing economic and political writers of high calibre, advising London editors on these topics and selecting material from British publications for reproduction. The post is graded temporary Higher Executive Officer, salary: Male, £675 to £800; Female, £550 to £675.

Written applications giving date of birth, full details of qualifications and experience, including dates, should be addressed to London Appointments Officer, Ministry of Labour and National Service, 1-6, Tavistock Square, London, W.C.1, quoting reference K.T.488/CO.

Original references must not be forwarded. Only candidates selected for interview will be advised.

COURTAULDS LIMITED require an Assistant for their Tariffs and Quotas Section in London. Candidates should have preferably a first-class Honours degree. A high standard of ability and clarity on paper is essential, and a reading knowledge of languages useful. Age limit 22-27 years. Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds Limited, 36, St. Martin's-le-Grand, London, E.C.1, quoting the reference number A.49.

SCRIBBANS-KEMP, LIMITED

NARROWING PROFIT MARGINS

The twenty-second annual meeting of Scribbans-Kemp, Limited, was held on September 21st in London, Mr H. Oliver-King (chairman and managing director) presiding.

The following are extracts from the chairman's circulated statement:—

The aggregate profit shown by the consolidated profit and loss account is a satisfactory one, but this profit is the total of profits from a group of companies whose main concern includes such a variety of interests as retail stores, tea, transport and the manufacture of cakes and biscuits. It has been the policy of the board for some years to broaden the base of this business, and as far as possible we are taking care that your profits are drawn from a variety of interests, which should spread the commercial risk and tend towards stability. While in the aggregate the profits show an increase on last year, we are experiencing a general narrowing of the profit margins in all our companies, with the result that profits tend to be lower. There has, however, been no decrease in the turnover, nor has there been any lessening of the demand for our products. This state of affairs is likely to continue while there is the present shortage of raw materials.

As regards our own food manufacturing companies, their production is still limited by shortages in many materials. Group reserves total £3,446,284, which is a satisfactory position.

While I cannot, of course, forecast the future, subject to this restriction the "trade winds" appear to be set reasonably fair.

The report was adopted and the interim dividends, totalling 7 per cent., less tax, on the ordinary shares and 19 5/6 per cent. on the deferred shares, less tax, were confirmed.

BRITISH BORNEO TIMBER COMPANY, LIMITED

The twenty-ninth annual general meeting of the British Borneo Timber Company, Limited, was held on September 22nd in London, Mr H. W. Horner, A.C.A. (the chairman), presiding.

The following is an extract from his circulated address:—

The directors are glad to be able to present to you accounts which show results sufficiently satisfactory to warrant, in their opinion, the resumption of dividends, thus realising the hope expressed in my address to you last year, and we recommend a dividend at the rate of 8 per cent., less tax.

Despite the great progress made since the company recommenced business in 1946, we have not yet attained the volume of production which we achieved in the years prior to the Japanese invasion. No effort has been

spared to obtain the maximum production practicable, but circumstances beyond our control have impeded us. Our plans for rehabilitation and development continue and are likely to make heavy demands on our financial resources. These, fortunately, are now assuming substantial proportions and, as you will observe, are largely in the form of ready cash.

We are maintaining steady sales of timber in two of our most important markets, the United Kingdom and Australia, the results in the latter market having been particularly gratifying. The markets in Shanghai and, to a lesser extent, in Hongkong, have been adversely affected by recent political developments in China. The general demand for timber, however, remains strong, although margins of profit are trending downwards, and we have every reason to hope that results for the current year will be satisfactory.

The report and accounts were adopted.

HACKBRIDGE CABLE HOLDINGS

A SUCCESSFUL FIRST YEAR

The first annual general meeting of Hackbridge Cable Holdings, Limited, was held on September 21st, in London, Mr C. J. Steen, the deputy chairman, presiding in the absence through indisposition of the chairman and managing director, Mr C. W. Bloomfield.

The following is an extract from the chairman's statement, which had been circulated with the report and accounts for the period to March 31st, 1949:

In the particulars published in September, 1948, it was indicated that the current profit would not be less than that for the preceding year, and this has been achieved, as the trading profit for the year of £259,898 compares with a figure of £252,425 in the preceding year.

Taxation requires a provision of approximately £145,000, leaving a combined net group profit of £115,187. Of this sum, £50,889 is the proportion of the net profit for the year attributable to the period prior to our acquisition of the operating companies on September 8th, 1948, and accordingly we are left with a balance of £64,298 for appropriation in accordance with your board's recommendation in the directors' report. You will notice that of this balance, £25,464 has been retained in the accounts of the subsidiary companies.

With so many complex and uncertain factors surrounding the trade situation at present you will not expect me to indulge in prophecy. I can, however, assure you, from the results of the four months' trading of the current year and the orders in hand, and from the strong technical and financial position of your company, that we are entitled to take a confident view of the future.

The report and accounts were unanimously adopted.

EXCELLENT prospects exist in Pakistan for British business. English businessman resident therein, who possesses highest credentials and sound knowledge country's business economy and politics, offers services as personal representative to old-established British Company or group which is considering development in this Dominion. Arrangements can be finalised in London in November.—Write Box E.W.G., c/o 95 Bishopsgate, E.C.2.

WORKS MANAGER (ASSISTANT).—Responsibilities involve sound knowledge labour utilisation and methods, rate fixing, production management, stores control and relationship with costing organisation. Painters' Brushes and other brushware and component parts. Experience light industry desirable but not necessarily in Brush Trade. Adequate remuneration. Reply in confidence, letters only, stating age, scope of capabilities, experience, etc.—The Secretary, Christopher Leng & Sons Ltd., Hazelwell Brush Works, Birmingham 30.

OXFORD Economics graduate seeks post in Trade association or large enterprise. Has good Honours Degree and varied experience of applied economics in sphere of Government and professional research.—Box 206.

FOR Sale.—Economist from June 15, 1946 (5364) to July 30, 1949 (5527), complete except 5391, 5444, 5446, 5451 and 5458. Offers.—Box 207.

FEDERATION of Civil Engineering Contractors require qualified English Solicitor, age about 30, as Assistant Secretary. Commencing salary £800.—Apply Box 215.

Investment Statistics

Company Notes

Pye Limited.—A cross-licensing agreement has been signed between Pye Limited and the Radio Corporation of America covering patents television and radio equipment and accessories.

Furness Withy.—Consolidated trading profit declined from £4,341,761 to £4,236,563 in the year ended April 30, 1949. Other income is lower at £459,170 compared with £545,779 in the previous year. The written down value of shipping property and payments on account of new tonnage has been increased from £12,420,651 to £16,503,753. Net current assets are lower at £2,405,344 against £5,857,398.

Gestetner.—Consolidated trading profit has risen from £658,280 to £779,271 and net profit from £234,713 to £251,625 in the year to August 31, 1949. Export and home market sales have been at a record level.

Tootal Broadhurst Lee.—Consolidated trading profit increased from £1,765,745 to £1,969,189 in the year to June 30, 1949.

Trinidad Petroleum Development.—Net profit for the year to July 31, 1949, declined from £267,280 to £221,670. The dividend of 16½ per cent tax free is unchanged.

Powell Duffryn.—Consolidated net profit including £100,000 (£268,893) not arising from the year's trading has declined from £939,176 to £652,106 for the year to March 31, 1949. The latest figure excludes "interim income" for the three months to March 31, 1949. The dividend for the year is 8 per cent.

Peninsular and Oriental.—An interim dividend of 8 per cent has been declared on the deferred stock for the year to September 30, 1949. The increase from the interim of 4 per cent paid in 1948 is not to be regarded as foreshadowing an increase in the total distribution for the year.

Associated London Properties.—Consolidated net revenue for the year to June 24, 1949, amounted to £67,215 (£68,296). It is recommended that the dividend be increased from 4 per cent to 5½ per cent.

Qualcast.—Consolidated net profit for the year to June 30, 1949, before taxation

increased from £320,229 to £409,315. An increase in the dividend from 60 per cent to 65 per cent is recommended. It is proposed to capitalise £169,919 of the share premium account by way of an issue of 5s. ordinary shares on a one for one basis.

Zinc Corporation.—Consolidated trading profit increased from £1,690,076 to £2,628,823 in 1948. Consolidated profit after taxation amounted to £715,470 against £534,120.

Nchanga Consolidated Copper Mines.—The balance on operating account for the year to March 31, 1949, increased from £814,850 to £1,612,098. Production of blister copper expanded from 23,621 long tons to 32,876 long tons.

Tronoh Mines.—Sales of tin ore and stock at net sale price rose from £293,869 to £445,045 in 1948. Profit for the year amounted to £345,249 compared with £150,585 in the previous year.

Capital Issues

Consolidated Zinc Corporation.—Holders of the £750,000 4½ per cent redeemable preference stock of Broken Hill Corporation held by "outside" interests are offered an exchange into one Consolidated Zinc Corporation 4½ per cent £1 preference share plus 1s. cash for each £1 unit of Broken Hill Corporation preference. The offer will remain open until October 10, 1949 or any such later date as may be decided by C.Z.C., and is conditional on its acceptance by holders of not less than 90 per cent of the total preference capital of Broken Hill Corporation or such lower percentage as C.Z.C. may later decide as sufficient.

English Card Clothing.—It is proposed to capitalise £49,293 of reserves by the distribution of 197,972 fully paid 5s. ordinary shares on the basis of one new 5s. ordinary share for every £1 15s. ordinary stock held.

Automatic Telephone and Electric.—An offer of 315,621 £1 ordinary shares (the unissued balance of the company's capital) will be made to ordinary and deferred stockholders on the basis of three new shares for

each £10 of ordinary or deferred stock held on September 9th. The issue has been underwritten by the Telephone and General Trust.

Allen West.—Permission is being sought to capitalise £365,625 of reserves by way of a bonus distribution of three 5s. ordinary shares for every five 5s. units of ordinary stock held.

W. & J. Martin.—It is intended shortly to capitalise £50,000 of general reserves and apply it by paying up in full 200,000 5s. ordinary shares to be distributed to ordinary shareholders in the proportion of one new share for each two ordinary stock units held.

Mawchi Mines.—Applications are invited for subscription to an issue of £150,000 5 per cent five year secured registered convertible notes at par. The last day for receiving applications is October 3, 1949.

Henry Mason (Shipley).—It is proposed to capitalise £17,000 of reserves by way of an issue of 68,000 fully paid 5s. ordinary shares to ordinary shareholders in the proportion of one bonus share for every five held.

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 17, 1949, total ordinary revenue was £44,183,000, against ordinary expenditure of £75,410,000 and issues to sinking funds £350,000. Thus, including sinking fund allocations of £8,197,000, the deficit accrued since April 1st is £379,000 against a surplus of £215,955,000 for the corresponding period a year ago.

Chief Office: OXFORD STREET, MANCHESTER, 1
ANNUAL INCOME EXCEEDS £18,000,000
ASSETS EXCEED £107,000,000
CLAIMS PAID EXCEED £198,000,000
(1948 Accounts)

THE Civil Service Commissioners invite applications for permanent appointments as Assistant Experimental Officer to be filled by competitive interview during 1949. Interviews will be held shortly after the receipt of the completed application form and successful candidates may expect early appointments.

The posts are in various Government Departments and cover a wide variety of scientific (including engineering) qualifications. Places of work are spread throughout Great Britain.

Candidates must be at least 17½ years and under 26 years of age on August 1, 1949; time spent on a regular engagement in H.M. Forces may be deducted from actual age. Candidates must have obtained the Higher School Certificate with mathematics or a science subject as a principal subject, or an equivalent qualification. Higher qualifications will be regarded as an advantage to candidates over the age of 20.

The inclusive London salary scale (men) is £230-£490. Salaries for women and for posts in the provinces are somewhat lower. Superannuation provision is made under the Superannuation Act.

Further particulars and forms of application from the Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2522. Completed application forms should be returned as soon as possible.

AN INTERESTING EDUCATIONAL APPOINTMENT IN AN INDUSTRY is about to be made by a large industrial concern near Chester which has established an educational and training organisation on a considerable scale.

A lady of good general education is now required to organise and conduct the training of typists, computer operators and junior office staff. Previous office and teaching experience would be an advantage.

Applicants should write sending full details of education and experience to Box 3023, c/o Charles Barker & Sons, Ltd., 31, Budge Row, London, E.C.4

ROBSON, MORROW & CO. require the services of an outstanding man, Chartered or Incorporated Accountant, with wide industrial experience. Age not over 37. The successful candidate will be trained as a specialist in the installation of accounting schemes for management control. Four-figure commencing salary and good prospects. Send full particulars of age, education, qualifications, experience and present salary to Robson, Morrow & Co., 59, New Cavendish Street, London, W.1, marking envelope "Application."

EXPORT SALES MANAGER.—Responsibility for organisation and administration of Export Sales Department, and to share visits overseas markets regularly in turn with Assistants. High-grade Painters' Brushes and other brushware. Adequate remuneration and assistance. Reply letter only stating age, career and any linguistic capabilities, etc., in confidence to The Secretary, Christopher Leng & Son, Ltd., Hazelwell Brush Works, Birmingham, 30.

EDITOR-JOURNALIST has two-to-three days weekly available for publicity or editorial work. Science degree, wide knowledge of industry. Not stunt artist or high-pressure salesman but writer of established ability and reputation. Propositions to "Editor," Rang & ApSimon, 43, St. Martin's Lane, W.C.2.

FOR SALE: complete set bound volumes of *Economist*, 1932-45. —Offers Box 211.

ECONOMISTS, August, 1945, to July, 1949, complete with indexes (except Jan.-June, 1948). —Offers to Box 213.

ECONOMICS graduate (25), B.Com.Sc., knowl. of Spanish and Portuguese seeks interesting post or traineeship in commerce or industry. —Reply Box 204.

additional stimulus to inflation—as it undeniably does—and if, finally, inflation has become more dangerous than ever, then the logical conclusion can only be that there ought to be at the very least a stiff new dose of disinflation or more probably a whole new approach. Yet, with the election coming, Sir Stafford dare not do anything that looks like a further confession of error.

All that he can do is to point once again to the necessity for increased productivity, for doing nothing—“literally nothing”—to increase incomes, and for renouncing “that easy-going get-rich-quick attitude to life that in all levels of society has found its postwar devotees.” But if these things are so urgently necessary, why does not the Government adopt policies that will bring them about? Socialists, above all other people, believe that the national economy can be made to respond to governmental policies. Why do they refuse to admit the truth of their own doctrines in their most important application? Why do they cry havoc in tones of ever-rising urgency, and refuse to do anything about it? The answer, of course, is that remedial action would be unpleasant, and unpleasant actions cannot be undertaken on the eve of an election.

So they are compelled once again to fall back upon mere exhortation. But if words ever had the power to influence economic phenomena, they have lost it. Does Sir Stafford himself really believe that “literally nothing” will be done by the trade unions to increase wages? If so many unions were so determined to secure an increase before devaluation started the cost of living on an upward jump, is it really conceivable that they should be ready to be more docile now? Moreover, Sir Stafford should realise that—through circumstances that are only partly his fault—his own words have inevitably lost a great deal of whatever force they possessed. He has shown how easily they can be eaten. And, as if this were not enough, the one specific piece of policy that he did announce on Tuesday might have been deliberately chosen to destroy his credit with the other half of the nation just as fully as devaluation has undermined his credit with the unions. The increase in the rate of distributed profits tax from 25 per cent to 30 per cent is not, in itself, a large matter—particularly since the increase is subject to the deduction of income tax. But as a revelation of the Chan-

cellor's mental processes it is most significant. The profits tax is a thoroughly bad one by any canon of public finance—no one has more forcefully argued this than Dr Dalton in the days when he was an economist. The total of distributed profits is far too small to have any influence on inflation or deflation. There is no justice in further penalising one of the very few classes of income which, in real terms, is smaller than it was before the war. And there is no logic in choosing this moment to reduce still further the already slender incentives to success in business. Yet these considerations are nothing to a Labour Chancellor when he has to placate the unions. He will always be ready to take a blind, vindictive swipe at the other half of the nation—regardless of reason, justice or its probable effects—as a means of buying off Transport House for another week or two. How, if he does such things, can he expect to get results from moral appeals? And yet he has no other instrument for achieving those changes in the economic atmosphere that he knows to be urgently necessary. It is impossible to resist the conclusion that the atmosphere will not be changed and that unchanging policies will continue to produce unchanged results. That is to say that the progressive deterioration in the value of the pound which has been going on for a decade—now fast, now more slowly—will continue, probably rather faster than before, and that devaluation will prove to be merely another of those expedients which lead back to crisis as soon as they are exhausted.

From all this, one immediate conclusion emerges with startling clarity. The sooner the General Election is held, the better. It would take a major prophet to calculate which party would gain an advantage if the election were held this autumn rather than next spring, since the conditions of next spring are so very difficult to foresee. But though Mr. Churchill may be wrong in thinking that he would win an autumn election, he is certainly right—right beyond any possibility of denial—in saying that “it is high time for a new Parliament, and all our difficulties will have a better chance of being solved in a new House of Commons.”

The British nation cannot afford nine more months of paralysis of policy. Whoever wins the election, there will then be at least a chance of courage and realism. Dissolution is the patriotic course.

atomic system could doubtless be devised. The precondition of confidence exists. But Mr Vyshinsky has left the western world in no illusions about his Government's views. His speech before the General Assembly did not differ by one jot from a score of previous harangues in which the imperialism and the warmongering of the west were compared with the peaceful intentions of Russia. Nor have the western Powers changed their view. Mr Vyshinsky's provocative address called from Mr Bevin a sombre rejoinder in which was repeated, for the Assembly's benefit, the whole record of Russia's troublemaking since the end of the war.

This is the background of Mr Vyshinsky's proposals that the five great Powers should form a peace pact and that atomic weapons should be banned and “a rigid system of international control” introduced. The western Powers will naturally not reject any opening for a constructive settlement of the difficulties between east and west but, given the background of distrust, what in fact do the proposals amount to? A peace pact presumably involves the settlement of the outstanding issues which stand in the way of peaceful

conditions. Many of these are due to be discussed at the Assembly itself. One at least is already on the agenda for an informal meeting between the four Foreign Ministers. If, as a result of these public and private discussions, it becomes clear that the Russians are ready to end their satellites' intervention in Greece, to call off the war of nerves against Yugoslavia, to demand only a reasonable share of Austria's oil prospecting rights and to attempt a genuine restoration of trade and traffic in Germany—if all these particular points appeared upon Mr Vyshinsky's agenda, then indeed the first steps towards a “peace pact” would have been taken. But does anyone suppose that it is such solid, definable and ratifiable agreements that the Soviet Foreign Minister has in mind?

The same difficulty of translating propaganda speeches into practical propositions arises in relation to Mr Vyshinsky's proposals on atomic energy. What type of international control has he in mind? If it is to be effective, it must concede to an international body the right of supervision. So far, the only forms of supervision the Soviet Government has been ready to consider are those proposed by itself and dismissed as inadequate by a nine to two vote in the Atomic Energy Commission. Does Mr Vyshinsky's reference to “international control” presage a new flexibility in Russian policy? If so, then indeed the Atomic Energy Commission can usefully return to its work, which, it will be recalled broke down over a year ago precisely upon this issue of supervision. But if the Soviet Government is ready to do no more than repeat its demand that all stocks of bombs should be destroyed and their use banned without any adequate form of inspection, the deadlock is exactly where it was before. There is no confidence in the west—and possibly in the east too—that such an agreement would in fact be observed.

The conclusion is inescapable. To ensure atomic control, the problem of supervision must be overcome. To restore peaceful relations (with or without a comprehensive pact), concrete agreement on the various matters in dispute must be sought and achieved. If Mr Vyshinsky really proposes a new Soviet policy, the test of his peace pact will be not speeches directed at mass opinion, but concessions on such troublesome issues as Greece's northern frontier or Austria's reserves of oil. Similarly the test of his atomic proposals will be readiness to discuss genuine international supervision of atomic power. The western powers should take up his proposals in this light and attempt both in private discussion and by using the United Nations machinery to turn his generalities into concrete issues upon which agreement can be achieved. In particular, a new attempt to breathe life into the Atomic Energy Commission is certainly worth the effort. Yet it must be admitted that if Mr Vyshinsky does in fact intend a startling change of front, no evidence for it has been placed before the Assembly.

★

Is the world, then, condemned to look on at as grisly a spectacle as has ever faced mankind? Russia has the bomb. Is the outcome to be an atomic armament race in which enough explosive to destroy the planet is stored up and finally released? It cannot, of course, be absolutely proved that the fatalities of the past will not be repeated, but arms races are not automatic. They depend upon the decision of governments and there are at least some grounds for believing that the two governments chiefly concerned in the potential race may not follow the pattern set by Germany before each of the two world wars. The United States would certainly arm only defensively. In spite of all the evidence of Russian military strength, the rearmament of the United States is still, in terms

of America's national income, a modest affair and the Arms Bill, which provides over a billion dollars for rearming the countries of western Europe, has been passed only with the greatest reluctance and after a determined attempt to halve the sum. In spite of Soviet screeching about American warmongering and belligerency, this is not the mood or tempo of an armaments race. Nor will the pace quicken unless there are the most provocative proofs of Russian preparations for aggressive war.

The certainty or otherwise of an arms race will thus be decided in the Kremlin and, however unaccountable its ultimate designs may be, there is at least some evidence to suggest that the precipitation of a major war is not among them. The communique issued by Moscow after the western announcement that Russia has the bomb could hardly have been written in less aggressive terms. It contained no flourishing of the new weapon, no warnings, no menaces. On the contrary, a half-amused attempt to lower international tension can be read into the suggestion that, although Russia has in fact possessed the atomic secret for two years, what the western powers may have overheard was blasting operations in connection with Russian reconstruction.

★

It would, of course, be rash to base an estimate of Russian policy simply on the Soviet Government's published statements. As Mr Bevin pointed out in his speech to the Assembly, the regime has perfected a method of double talk in which words are used in the sense precisely opposite to the normal meaning—“people's democracy” for dictatorship of the party, “free election” for forced plebiscite, “peace-loving and independent” for subservience to Russian policy, and so forth. But there are sound reasons, quite apart from Russian professions, for believing that vigorous preparations for an aggressive war form no part of the Soviet grand strategy. The Russian system, based upon a vast underdeveloped, underpopulated empire, does not need the outlet of war. In any case, even if Russian ideology were as essentially aggressive as that of the Nazis, the strategic conditions in Europe have undergone a revolutionary change. Even Hitler might have hesitated to launch a war had he known that aggression in Europe would have brought the United States into it from the start. Only if the Americans were to retreat to isolationism, would Russia be exposed to any really strong temptation to expand by force. It does not need an arms race to bring home to the Kremlin America's determination to remain concerned with European defence. It entails no more than steadfast American participation in the Atlantic Pact.

The decisive reason, however, for believing that the Russians do not seek aggressive war and are not preparing for it lies in their almost certain belief that war is not the best instrument of Soviet ambitions. The last two years have given Russia danger signals enough of the risks of direct Soviet intervention in Europe. The revolt of Tito and the Allied victory in the Berlin airlift are only the two most outstanding examples of damaging failure in the Soviet conduct of foreign affairs. But at the same time, world Communism has achieved its most fateful triumph since 1917 in the Communist conquest of China. Communism is a better instrument than war for achieving Russian objectives.

★

The western Powers are thus faced with a situation that is both better and worse than their preoccupation with the atom bomb suggests. It is better because the likelihood of an immediate Soviet threat to peace is remote. It is worse because the challenge offered by the Soviets is more wide-

Back to the Atom

WHEN President Truman, Mr Attlee and Mr St. Laurent announced to the world last week that Russia can now produce atomic explosions, they chose an opportune moment. The United Nations Assembly had just started its deliberations and the chances of direct contact with Soviet Russia were thus better than usual. At the same time, the three Governments could hope that the announcement would inject a new seriousness into the discussion of atomic control in the Assembly and that a heightened sense of the bomb's menace would send the Atomic Energy Commission back to work.

Theoretically, the fact that Russia now has the bomb strengthens the case for international control. Actually, the likelihood of securing control remains precisely where it was before the spectacular announcement was made. The achievement of an effective system for the internationalisation of atomic energy depends upon the political relations between the great Powers, and these have not changed decisively as a result of Russia's atomic advance. Between, say, Britain, Canada and the United States, an international

spread, more insidious and more difficult to meet than any move that can be countered by the dropping of a bomb. The strategy of resisting foreign aggression is, after all, familiar. The speed and relative ease with which a Western Union Pact, an Atlantic Pact, joint military committees and joint chiefs of staff have come into being shows that the nations were slipping into positions with which they were familiar and had to some extent occupied before. But the struggle against Communism leads the western Powers out into uncharted lands where the sacrifice of traditional, political and economic thinking may be great and the necessary forms of collaboration will certainly be uncomfortably new.

Mr Bevin told the Assembly—with justification—that the Soviet prophets who had been waiting for a repetition of the economic crisis of 1929 were waiting in vain. History did not necessarily repeat itself and the degree of co-operation achieved in the western world gave the lie to Soviet expectations. All this is true—so far. But can any unbiased observer look at the western nations today and believe that they possess both the secret of stability and a genuine world strategy for countering Communism? In America, the recession seems in its turn to be receding but the ominous danger signal of surpluses has appeared—and no policy would play more readily into the Communists' hands than a reduction of American output because of surpluses when the non-American world remains a prey to want. In Europe, between the

extreme liberalism of the continental governments and the dogmatic statism of the British, no common term has yet been found and every economy, liberal or controlled, faces the unsolved problem of the dollar gap. In the world beyond, the new Asiatic Governments are divided between the claims of economic reality on the one hand and Communist-fanned demands for immediate economic and social betterment on the other, and the same dilemma will arise in the Middle East and Africa before very long.

None of these problems can be solved in the short run. Each demands the sustained co-operation of the western powers for as many years as any responsible statesman can foresee. But so far, they have not even taken the preliminary step of determining that, at whatever cost to sovereignty and preconceived economic thinking, they will work together and turn what is today little more than a hesitant military alliance into a lasting partnership. It is typical of the west that talk of unity has never been more widespread and examples of co-operation more frequent—in Strasbourg, in the OEEC, in the Ministers' Committee set up after the Washington talks—but also that, behind it all, remains unchallenged and unchanged the principle of exclusive national sovereignty. The decision to undertake together the long campaign against Communism and to spare nothing in the process has still to be reached. Until it is, the nations of the west will be pursuing expedients, not policies, and the fundamental problem—their survival—will remain unsolved.

Flushing Meadows and Peking

THE Chinese Nationalist Government has decided that, if its days are numbered, it will go out not with a whimper, but with a bang. Its delegation to the Assembly of the United Nations, led by Dr T. F. Tsiang, has for the first time raised before Uno the question of Russian aid to the Chinese Communists and violations of the Sino-Soviet Treaty of 1945, and has thus brought the whole issue of the Chinese civil war into the international arena. For in this case it is not only a matter of investigating, or passing judgment on, alleged acts of aggression by one state against another, it is, or soon will be, a question of deciding what authority in China has the right to speak for China and whether a Nationalist or Communist Government is represented as one of the Big Five on the Security Council.

While speeches are being made at Flushing Meadows, a "People's Political Consultative Council" summoned by the Communists to Peiping—which has been given back its old and more familiar name of Peking, as it is to be once again the capital of China—has been preparing to create a new central government for all of China now held by the Communist armies—that is to say, the greater part of the country. Hitherto there have been only regional administrations co-ordinated by the Chinese Communist party, and there has thus been no state authority claiming to be the Government of China for other governments to recognise diplomatically, even if they had wished to do so. But the challenge to the credentials of the present Chinese official representatives abroad—including diplomats in all countries, delegates to Uno, the Chinese member of the Allied Council in Tokyo and consuls in South-east Asia—now appears to be imminent. The satellites of the Russian bloc may be expected to accord recognition at once to a Communist-led Government—for Communist China has shown itself sound in relation to the Tito heresy—and the western powers will

then have to make up their minds, if they have not already made them up, whether or not to do the same. If they withhold recognition, the situation will arise in Uno, and on all international bodies, that different sets of Chinese representatives are recognised by different nations.

If the issue had been left to individual governments, it would have been decided by each according to its special views and interests, and the smaller nations would probably have followed the lead of two or three of the Great Powers. But by demanding a debate in Uno the Chinese Nationalists have made it more difficult for the leading western powers to transfer recognition without a crisis in international affairs. It is true that the Uno Assembly is not a judicial tribunal and that its decisions are likely to be swayed more by the pressures of current politics than by the rights or wrongs of events in the past. Russian aid to the Chinese Communists—for example the turning over to them of the munition stocks of the Japanese army in Manchuria—dates back four years, and on balance it can be claimed that American material aid to the Kuomintang Government was on a larger scale—though there is a great difference between providing arms to a recognised government and providing them to rebels against such a government. It has to be remembered, too, that Russia in 1945 was not only in diplomatic relations with Marshal Chiang Kai-shek's Government, but had signed a treaty with it providing for an orderly transfer of authority in Manchuria by the Russian occupation forces. If the Chinese delegate presents his Government's case effectively in the international forum of Uno, he should be able to convince the more impartial part of his audience that the complaint against Russia is well founded.

There are, however, important considerations inclining the western powers, and especially Britain, towards recognition of the regime the Chinese Communists are about to

set up. Whatever Russia did or did not do to help the Communists at the outset, it is clear that their power is now independent of Russian military aid or supplies, that they have substantial popular support and that organised opposition to them has disappeared outside half a dozen of the southern and western provinces. The resistance of the Nationalist armies which still cover the approaches to Canton, Kweilin and Chungking has been firmer than was generally regarded as likely after the fall of Nanking and Shanghai, but the Communist armies have continued to advance and there have been no signs of a successful Nationalist counter-offensive. The Communists are now counted as the victors of the civil war, even though they do not yet have control of the whole of China. There is a widespread disposition in London and Washington to say that the issue in China has been decided whether we like it or not, that it cannot be altered, and that the only practical course is to transfer diplomatic recognition to the new regime and try to do business with it, at any rate to the extent that business is done with Poland and Czechoslovakia. Additional to these arguments are the hopes of those who believe that a Communist China will not long remain contented in the Russian camp and that economic need must draw China again more and more towards the west.

★

There is, on the other hand, also a case for going slow in the matter of recognition. A revolutionary regime which has no constitutional continuity with its predecessors, but gradually extends its territory through civil war, has no automatic right to diplomatic relations with other states. It has to request such relations and give a clear undertaking that it is prepared to accept the treaty obligations and liabilities of the state it claims to inherit. If it repudiates such commitments, it is entirely at the discretion of other states whether they accord it *de jure* recognition or not. The Chinese Communists have proclaimed their intention of abrogating treaties and agreements made by the Kuomintang Government, which they describe as treasonable. It is clearly desirable that clarification of the Chinese Communist attitude towards treaties—and on the extent of their claims to territorial sovereignty—should be obtained before the granting of recognition; it should not be left to emerge in due course in a hypothetical atmosphere of goodwill, to be created by the mere fact of diplomatic intercourse. It is above all necessary that the Chinese Communists should not be allowed to suppose that recognition is a right which must be granted to them unconditionally on account of their military victories, or that the western nations are so desperately dependent on their

trade with China that they are ready to put up with any acts of violence or unilateral repudiation of agreements for the sake of a little commercial salvage.

To judge from Mao Tse-tung's encyclical to his followers in July in celebration of the 28th anniversary of the founding of the Chinese Communist party, he rates high his ability in future to call the tune while persuading the western nations, and particularly the United States, to pay the piper. In this remarkable document he wrote:

The anti-fascist Second World War, with the Soviet Union as its main force, defeated three big imperialist powers [Germany, Italy, Japan], weakened two other big imperialist powers [Britain and France] and left only one imperialist country, the United States, without loss. However, the

domestic crisis of America is very grave. She wants to enslave the entire world. . . . If we do business with these countries or if in future they are willing to lend us money on condition of mutual benefits, what is the reason for it? It is because the capitalists of those countries want to make money; their bankers want to get interest to relieve their own crises and it is not to aid the Chinese people.

It is, of course, true that international trade and the granting of commercial credits have economic motives of profit, whether conducted by private enterprise or by government organisations. But Mao Tse-tung is making an unwarranted assumption if he thinks that America is going to be a suppliant for Chinese trade, because of the severity of America's mythical economic crisis. At the present time, at any rate,

£1,000 ON RETIREMENT . . .

. . . at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12s. 6d. from age thirty. Only £4 18s. 4d. more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

The premiums for other sums assured, ages or terms of years will be quoted on application.

LIFE ASSURANCE SOCIETY
20, LINCOLN'S INN FIELDS, LONDON, W.C.2

OUTSTANDING VALUE IN LIFE ASSURANCE

What conclusions can be drawn from this short survey? There can be no doubt that fewer books are now being bought in the bookshops. This was to be expected after the exceptional circumstances of the war, now that more counter-attractions and less money are available. It does, however, seem probable that demand will stabilise well above the prewar level. This comforting reflection does not necessarily give much consolation to individual publishers. In the face of competition many of the newer publishers who cashed in on the wartime boom are bound to go under and many have already gone. There may be some increase in the number of small publishers who are prepared to go under the wing of larger ones, particularly as far as their selling and export organisation is concerned. But in spite of the financial advantages of rationalisation this is a world where individualism reigns supreme. It seems unlikely that many will be prepared to sacrifice the freedoms of independence to the financial advantages of combination—at least on the publishing side. Publishing will continue to be a matter of sink or swim.

NOTES OF THE WEEK

Muddle Over the D-Mark

Nothing could be more unfortunate than the way in which devaluation is being handled in Germany. Even now, ten days after British devaluation, Germans have still no fixed rate. The way in which the whole affair has been handled throws an ominous light on the future of allied relations with Germany. On the one hand, the authority and prestige of the Bonn Government have been severely undermined in the first week of its existence. On the other, the new Allied Commission has given an almost unbelievable example of how not to go about its task.

The sorry business begins with the fact that no preparations whatever had been made in Germany to deal with the consequences of devaluing the pound. The immediate reaction on the part of the Allied authorities was to warn the Germans against precipitate action which would rouse panic among the public. The next step was to tell Dr Adenauer that the High Commission, although it alone had the right under the Occupation Statute to decide upon the value of the D-mark, would show its good will by leaving the Germans to make up their minds first. It was envisaged that the High Commission and the German authorities would then come to an amicable joint decision.

In point of fact the Germans, after initial disagreements, proposed cutting the D-mark by 25 per cent to 22.5 cents; but opposition inside the High Commission came from the French representative, M. François-Poncet. Paris insisted that devaluation of the mark should not exceed 20 per cent. For some time past the French have not been able to sell Saar steel in the German market—where Ruhr steel is cheaper—and they object to the increase in this difference which will result if the mark is cut by more than the franc. They further dislike the prospect of paying more for Ruhr coal, which they pay for in dollars, the price being calculated on the basis of the mark-dollar rate.

Mr McCloy's flight to Paris to break the deadlock was a generous gesture. In Paris, however, it emerged that M. Queuille and his colleagues viewed the affair bitterly as another demonstration of an Anglo-American attempt to force decisions down the throats of the French. It is chiefly on their initiative that the Allied Commission decided to reject the German figure and increase the rate to 23.8 cents to the mark. It appears, however, that even this figure is not to be final; for, in the first place, the Bonn Government must reply to the Allied Commission's proposals, and it is also still possible for the French to withdraw agreement, if the Germans will not meet them on the matter of the price of Ruhr coal. As a result of this thoroughly unsatisfactory business, the authority of the Bonn Government has been made to look and sound hollow in its very first days of office, and the Allied Commission has already revealed basic dissensions.

* * *

Stubbornness in Paris

One of the bewildering features of the whole affair is the light it throws on French policy *vis-à-vis* Germany. In recent months, the French Government has gone out of its way to suggest to the German politicians that France desires nothing better than a new understanding with Germany. M. François-Poncet, the new High Commissioner, has made friendly speeches and established cordial contact, particularly with the Christian Democrats, who have the sympathy of the French Foreign Minister, M. Schuman, on the grounds of a common political allegiance to Christian democracy. Support for a friendly policy towards Germany has also come unexpectedly from General de Gaulle. The General's fear of Russia and hatred of America have now fused in a new policy of conti-

mental isolationism, in which federal Germany will be France's closest ally in resisting both the Slavs and the Anglo-Saxons. Such then, is the propaganda aspect of the French policy in Germany, which will be debated in the Chamber before the month is out.

When, however, it is no longer a question of speeches, contacts and confidential little talks after well chosen meals, French policy takes on a very different appearance. It is no exaggeration to say that the chief reason why every concession made to Germany in the last three years has failed to restore German confidence is because the French have obstructed it until it has long since lost all value in German eyes. The same process is at work now. In the devaluation of the D-mark, it is French intransigence which has left the Germans without a value for their currency since September 18th. It is the French who are trying to raise the internal price of German coal at whatever cost to the Bonn Government in terms of economic stabilisation, in order that steel from the Saar—quietly detached from Germany—may compete in the German market. Yet at the same time, the French insist that the external price of German coal, already below the world level, shall not be increased as a result of devaluation. Again, it is the French who are insisting that no change shall be made in dismantling policy, even though the three Allies have agreed that dismantling should be reconsidered in three months' time as part of a general review of allied policy in Germany. The French have made it clear that they are not committed to any concessions.

This dismantling issue is particularly galling to the British. The factories scheduled for dismantling are in the British zone, and British troops have been used for the dismantling process. Britain is thus bearing the full brunt of German displeasure over a joint policy agreed by all three occupying powers. If dismantling is to continue, the British should receive in this unpleasant business some assistance and public evidence of French and American responsibility.

* * *

Economic Debating Society

This week's emergency session of Parliament has added little or nothing to public knowledge of the economic policies favoured by either the Government or the Opposition. The Government went into the debate very nervous about the attitude of its own back-benchers and about the effect which the increased cost of living consequent upon devaluation might have upon the policy of wage stabilisation. This accounted for much backstairs scurrying beforehand, culminating in a meeting of Ministers with the Parliamentary Labour Party, for the putting up of Mr Aneurin Bevan to make one of the closing speeches, and for the emphasis in the Government's motion on "maintaining full employment and safeguarding the social services." In the event the Labour back-benchers, from preoccupation with the coming election and from lack of any alternative to the official policy, rallied solidly behind the Chancellor. This solidarity was reinforced by the Chancellor's announcement of an increase in the profits tax, which gave the Labour benches the comforting assurance that party advantage is still more important to their leaders than any nonsensical ambitions of economic statesmanship.

Nor were the Government seriously embarrassed by the attack of the Conservative, Liberal or Pritite oppositions. On Tuesday Mr Oliver Stanley was wittily destructive of official pretensions, on Wednesday Mr Churchill was amusingly eloquent, but there emerged no sign of a comprehensive alternative policy. In fact the debate in the House of Commons has been little but a series of accusations from each side of the

House that the other lacks a bold policy to meet the situation. This was accompanied by a vigorous Labour campaign to associate the Tories in the public mind with mass unemployment—a campaign in which the advantage, as is inevitable in politics, rests with the accuser. Mr Aneurin Bevan developed this theme to its climax in his speech on Thursday; in addition he set out deliberately to vilify Mr Churchill, and by suggesting that the latter was nothing but the dupe of the "guilty men," to drive a wedge through the Tory Party. Short-sighted as this kind of abuse may prove—for while it gains Mr Bevan cheers in the House it may lose him votes in the country—it differed only in the brutality of its language from Mr Churchill's attack upon Sir Stafford Cripps.

In contrast to the vulgarity of the debate in the Commons, the two-day debate in the House of Lords saw the development of much more powerful and realist arguments. While Mr Wilson with characteristic naïveté was painting a glowing picture of the great dollar wealth to be scooped up by a new race of Britons skilled in the art of salesmanship, Lord Layton was drawing attention to the far reaching effects that will occur to the pattern of world trade. No less than 60 per cent of the world's import trade and 50 per cent of its export trade are done by countries that have devalued, and the effect of devaluation is to impose a 43 per cent tariff on American exports to this large section of the world market. "It (devaluation) is a clumsy instrument that can only be compared to using a hacksaw instead of a surgeon's knife upon the living body of the world's international trade."

* * *

Mr Strachey Looks Abroad

In his party political broadcast last Saturday, Mr Strachey, the Minister of Food, compared favourably the level of food consumption in Britain with that in other European countries. Statistically this is a dangerous thing to do, but by using the appropriate figures it can be shown that Britain is better off than most European countries (that is, its calorie intake is higher) and not much worse off than the best of them. Mr Strachey did not mention the source of his information, but the accompanying table, based on the food balance sheets of the Food and Agriculture Organisation, bears out the Minister's statements. He said, for instance, that Belgium, "one of the most prosperous countries in Europe today," is getting little more than half as much milk and only about the same amount of meat and fats as Britain is. According to the table that is true. It also shows that the daily British consumption of calories was below only that of Ireland and Denmark, while the daily consumption of cereals was larger than in any country except Italy, Ireland and Luxembourg. In meat consumption Britain was third to Denmark and Ireland; but in milk and fats it was fairly well down the list, though the daily consumption was not very much smaller than in most of the countries above it.

This year's 400,000 British visitors to Europe will find Mr Strachey's way of putting things very puzzling. Do the statistics conflict with the evidence that they saw for themselves? The first obvious objection is to the use of the calorie for purposes of comparison. It measures only the amount of heat energy obtained from food, whereas good feeding depends on a large number of more subtle factors which defy statistical computation. Secondly, most of the European countries produce a large amount of food which is consumed domestically on a most generous scale and which therefore tends to escape the net of official statistics. Finally, the comparison of national diets can give quite artificial results if differences in geography and social environment are ignored. Because a country has a smaller calorie intake, it does not necessarily follow that the people are worse off nutritionally.

What is undoubtedly true is that the level of food consumption in Britain shows less variation between income groups than in most other countries; but that is due to rationing. The real question is whether such an enforced equality, which

restricts personal choice so severely, does in fact contribute to the common good. Perhaps the most suspect point in the statistics is the total calorie intake for Britain. According

FOOD CONSUMPTION LEVELS IN EUROPE, 1947-48
(Consumption Per Day Per Head of Population)

	Cereals	Meat	Milk and Cheese	Oils and Fats	Total Calorie Intake
	Grams	Grams	Grams	Grams	
Belgium.....	297.2	120.3	213.9	47.9	2,667
Denmark.....	294.5	180.8	432.6	44.4	3,125
France.....	279.7	129.0	165.2	29.9	2,567
Ireland.....	361.7	162.9	641.2	51.8	3,599
Italy.....	412.0	39.3	194.2	29.7	2,349
Luxembourg.....	303.2	108.7	345.2	55.8	2,896
Netherlands.....	295.9	63.7	433.2	46.8	2,643
Norway.....	n.a.	71.9	596.4	64.8	2,899
Sweden.....	223.8	113.6	731.2	54.7	2,871
United Kingdom.....	301.7	131.8	403.6	50.7	2,968

to the FAO figures, in 1947-48 it was 2,968, but in the Economic Survey for 1949 the calorie intake was given as 2,863. A difference of 100 calories may not seem large, but if all the figures are subject to the same degree of error, a very different picture might be obtained.

* * *

One of the most disturbing features of the debate was the preoccupation of the House of Commons with the domestic effects of devaluation. Mr Churchill and other speakers did pay some attention to the Government's failure to concert its action with the other European countries, notably France. That the Chancellor's decision to act unilaterally as far as Europe was concerned may have arrested and possibly seriously damaged the prospects of European economic co-operation had little importance for MPs, hagridden by calculations about the size of their majorities. The prospect of the legislature of the greatest international trading power with its eyes turned inwards is not calculated to edify the rest of the world or increase confidence in Britain's economic leadership. However, at one stage on Tuesday evening there was an interesting exchange between certain Labour and Conservative MPs, who had been delegates or observers at Strasbourg, as to what they had or had not said at the Council of Europe. The importance which they attached to this is a sign of the way in which the Council's deliberations may interlock with those of national parliaments.

*

First Week at the Assembly

In the last three years, there has been a certain sameness about meetings of the United Nations. The same problems have come up, the same division between east and west has emerged, the same current of fear and hostility has been underneath the brave speeches urging peace and co-operation. This year's Assembly in New York shows some signs of following the same pattern.

Nevertheless, in the first week, two or three events have occurred which promise a different and more lively meeting. In the first place, the easing of the situation in Germany has brought a certain *détente* between the great powers—though whether it can survive the acrimonious wrangle over the status of Nationalist China remains to be seen. In the second place, added urgency has been given to the question of international organisation by the knowledge that Russia has the atomic bomb. Last of all, the Soviet bloc has at last been weakened by the defection of Yugoslavia.

Hitherto, the Yugoslavs have taken the line—in the United Nations—that their exclusion from the Soviet paradise was due to the machinations of the minor members of the Cominform, whereas Russia itself was in some way ignorant of the dispute and therefore not responsible. The Yugoslav delegates therefore continued to vote with Russia on all international matters and to sustain the front against the west. This position they

have now deserted in spectacular fashion. In New York, the Yugoslav Foreign Minister, Mr Kardelj, has launched a direct attack upon the Russians telling them that it is no use calling for a peace pact unless they are prepared to give up their open aggression against Yugoslavia (the part played by the Rajk trial in this is described on p. 726). At about the same time, Mr Pijade declared in Belgrade that the Cominform had in fact "come to an end"; for whereas it had been set up as an instrument of co-operation between equal members, it was now merely a tool of Soviet Secret Police and secret intelligence services. Moscow has now retaliated with a denunciation of its treaty with Yugoslavia.

This dispute between Russia and Yugoslavia is presumably a matter of some embarrassment, even to the inscrutable Mr Vyshinsky. It is one thing to attack capitalist states as warmongers; it is more difficult when the state under attack is almost as orthodoxly Communist as Russia itself. But the implications of the dispute go farther, and may affect a number of other problems which are due for discussion in the course of the Assembly. In spite of Mr Vyshinsky's efforts, the question of Greece's northern frontier has been put upon the agenda, and Russia's willingness to bring intervention to an end in this quarter may well turn on its assessment of Yugoslavia's staying power. Similarly in the discussions on the Austrian Treaty it may well be that Russia's intransigence on the question of the oil concession may spring from the desire to postpone the whole treaty and thus keep Soviet soldiers on garrison duty in Central Europe. The Yugoslavs do not believe that there are enough Soviet troops along the Danube to mount an attack upon Yugoslavia, but their presence could be invaluable in a long drawn-out war of nerves.

* * *

Moderate Optimism at The Hague

Nearly six weeks have now gone by since the round table conference between the Dutch and Indonesians opened at The Hague. Only two more remain before the fateful two months are up, beyond which both sides have feared that time could not be made to stand still in Indonesia itself. What has been accomplished? Will the conference prove a success, a milestone in history? Outwardly, the outstanding achievement to date has been agreement in principle on the form which the Netherlands-Indonesian Union is to take. Behind the scenes, the achievement has been this: on the one hand, continued disposition on both sides to plough through the tangle of legalistic argument with good will, and, on the other, increasing Dutch readiness to compromise.

It was the Dutch who moved furthest from their starting point, to make the agreement on the Union possible. This was the crux of the conference, and by substantially accepting the Indonesian view of the mainly symbolic function of the Crown, the Dutch negotiators have shown sufficient realism to make the prospects of complete success encouraging. Perhaps for the first time in their long series of negotiations with the Indonesians, the Dutch representatives—from the senior ministers, Dr Drees and Dr Stikker, to the actual delegates, led by Dr van Maarseven and Dr van Royen—have avoided constantly looking back over their shoulders at public opinion. They have gone ahead with the job in hand, and they will deserve the fullest backing of their countrymen when it is done.

The emphasis of the conference has lately shifted to economic questions. The Indonesians rejected Holland's original proposals whereby, amongst other points, the Dutch would in effect control Indonesian fiscal policy until the public debt to the Netherlands is redeemed. This was a tall order and Dr Hatta had no alternative but to oppose it flatly. Since then, however, the Dutch have put the onus of making proposals on the Indonesians. And it seems that there is every reason to hope for a satisfactory outcome, provided that too much time is not wasted in thrashing out excessive details. A

great deal will remain to be done, in any case, after the main conference is over. On matters of principle, it is the Indonesians' turn to be as accommodating as reasonably possible.

* * *

Railway Wages

The danger of a general paralysis of the railways by reason of a decision to "work to rule" seems temporarily to have been averted. While it would be wrong to underestimate the present rebellious mood of the railwaymen as the result of the rejection of their wage claim, there are signs that common sense has found a place in their counsels. The London "go slow" movement last week, which its sponsors hoped would create chaos and paralyse traffic, was in the event supported by only a few goods depots and a handful of Underground porters on the Piccadilly Line. The failure of the great bulk of London's railwaymen to respond to the "work to rule" appeal, and the refusal of the two other railway unions to have anything to do with this unofficial action undoubtedly influenced this small minority, which agreed after two days to resume normal working. In Warrington, also, goods workers who had been going slow since the announcement of the Board's findings, agreed to listen to the instructions of the National Union of Railwaymen and leave any decision until the special delegate meeting this week. The same tendency has been shown in the weekend meetings of many branches of the NUR throughout the country.

The most moderate proposal has come from railwaymen of the North-East coast, who, recognising the obvious impossibility of securing any all-round increases under the present circumstances, have instead decided to press for improvements in the wages of lower-paid workers. This would in effect mean a return to the position in June, when the Railway Executive offered to raise the minimum rates of the lowest paid men by 3s. 6d., an offer which the NUR turned down as "contemptible." If this can be brought within the terms of permissible increases conceded by Sir Stafford Cripps—if, that is, it can be regarded as being less than "literally nothing"—it may form the basis for a compromise.

* * *

Towards a National Minimum?

The extent to which devaluation has jolted the accepted assumptions of the trade union movement can be gauged from the fact that there is now serious talk about establishing a national minimum wage. In the past this has always been resisted by the TUC, mainly on the ground that minimum wages tend to become maximum wages and that the idea of a statutory minimum wage savours too much of state interference with free collective bargaining. Two years ago, the Government was reported to have made an offer of a statutory minimum wage to the TUC, but it was then refused as the unions insisted that planning should apply to everything except wages. It is even now by no means certain that the TUC will agree to adopt a scheme for a national minimum wage. Opinion is divided on the General Council and there is strong opposition from the craft unions. The initiative for its introduction appears to come from some of the leaders of general unions, such as the Municipal and General Workers, with a high proportion of members in the lower paid groups and trades.

The theoretical advantages of a wages "floor" are fairly obvious. The practical difficulties are formidable. The figure of £5 a week is now generally discussed, but would it be tied to the cost of living index? What would be its relationship to earnings? The fact that, according to the current Ministry of Labour *Gazette*, earnings have risen by 124 per cent over October, 1938, while wage rates have only risen by 73 per cent, reveals the very wide gap between them. Would the present relationship between men's and women's wages be maintained?

Would the "social" wage, represented by family allowances, subsidies and health benefits, be taken into account?

These are but a few of the questions which the unions will have to consider. The most serious problem, however, concerns the relation between skilled and unskilled workers' wages. The maintenance of the "differential," for all the Prime Minister's appeal at Bridlington, is still a cardinal trade union principle—with, it might be added, a great deal of economic justification. The Confederation of Engineering and Shipbuilding Trade Unions—who were greatly irritated by Mr Attlee's remarks—are actually seeking enlargement of the differential in their proposals for a new wages structure.

* * *

Sterling Price, Dollar Price and World Price

The steep official increase in base metal prices (British Government policy on this question is discussed in greater detail in a leading article on p. 729) has bewildered a number of people who, while realising the inevitability of higher prices for dollar products, can see no reason why those originating in the sterling area should cost the British user more. A similar confusion exists over petrol and Atlantic passenger fares, the one partially, the other almost wholly, a matter of sterling production. Nothing could be more symptomatic of the state to which ten years of artificial markets and exchange controls has reduced the public capacity for clear thought on such topics. There is no hard and fast dividing line between "sterling goods" and "dollar goods." Some things obviously fall into one or the other category; one expects the price of tobacco from Virginia to rise after devaluation, one does not expect an increase in the price of haircuts, or for that matter of any product which, originating in the sterling area, is also exclusively consumed there. It is otherwise, however, with world staples such as the base metals. Their origin may be in the sterling area, but their market is very largely a dollar market, and their true world price is a matter not merely of costs in devalued sterling but of demand in undervalued dollars. Every ton of lead consumed in Britain represents dollars foregone just as every ton of aluminium represents dollars spent. To maintain base metal prices at their old figure would have been to falsify the accountancy of the balance of payments.

Falsified accountancy of this sort has become so familiar a feature of every kind of trade, not merely the international, that the grievance of manufacturers faced with a sudden and apparently arbitrary increase in costs is understandable. Why, having been denied by official control the full benefit of the lower prices recently ruling in New York, should they now be required to bear the full impact of devaluation? If the purpose of Government commodity dealing is to cushion such shocks as these, to achieve that stability which is so often exalted above competitive efficiency or responsiveness, why has that purpose now been thrown overboard?

* * *

Holland Balances the Budget

For the first time since the liberation, the Dutch Government has succeeded in balancing its budget; it has even shown a surplus of 20 million guilders. The surplus is a small one when compared with the total expenditure of about 3,500 million guilders envisaged for the year 1950, but the achievement is important. It comes at a time when devaluation may mean added inflationary pressure at home, and it shows a startling improvement over previous years. The budget deficit had risen from 881 million guilders in 1947 to 1,019 million in the following year, and by 1949 a deficit of 233 million still remained.

Two factors are mainly responsible for the success. The first is the reduction of food subsidies. These have declined from a peak of 523 million guilders in 1948 to 227 million in the current year and are calculated at only 171 million in 1950. Also helpful is the gradual decrease in the amount of non-

recurrent expenditure made necessary by war damage, such as reclaiming inundated areas and paying compensation to war victims. The money budgeted for these items reached the figure of 1,854 million guilders in 1948 and will be reduced to 669 million by next year. Another general contribution is the dwindling number of civil servants; they have fallen from 131,000 to 101,000 in the last four years.

Changes in tax policy will accompany the new budget. The turnover tax will be slightly increased and rents will also rise, thus placing a heavier burden on the rich. The lower income classes will be helped by abolishing the turnover tax on essentials and by lowering rates for income tax and PAYE.

In spite of the all-round improvement the Dutch Government is not entirely happy about the budget position; probably only the military departments are thoroughly satisfied. For the war and navy ministries have demanded that about 25 per cent of the whole budget be allocated to them; and although collectively the Government says it regards this as an absolute necessity under present world conditions, the Minister of Finance calls the amount "in the long run unbearable." Ministers are also concerned at the level of Government expenditure: it is still high, and efforts to promote efficiency are discouragingly slow.

Two further anxieties are low productivity—partly due to lack of new investments—and the persistent deficit in the balance of payments. As a spur to productivity, the Government hopes to apply to industrial investment a portion of its counterpart funds (the fund of Dutch guilders that Holland is required to set aside in an amount equal to dollar grants). The dollar export drive has also been conducted energetically. The Government has set up a special export promotion division, devised a novel incentive for Dutch exporters and has also created trade commissions in the United States. Even so, there is only a slim hope that by 1952 Holland will be earning the cost of its dollar imports.

* * *

Does India fear a Plebiscite?

When India and Pakistan agreed to cease hostilities in Kashmir and permit an investigation of the problem by a United Nations Commission, there were high hopes that this tangled issue would soon be resolved and that the way would thus be cleared for a definite reconciliation between India and Pakistan. Now, however, a fresh deadlock has been brought about by India's rejection of the Commission's proposals for arbitration which have been accepted by Pakistan. Mr Nehru has made a very uncompromising speech on the subject, declaring that India would not agree to any formula which does not explicitly lay on Pakistan the blame for what has happened in Kashmir.

To the outsider the supreme need in this dispute appears to be to ascertain by appropriate means the wishes of the population in the various parts of the composite realm known in its entirety as Kashmir. India cannot logically reject the plea that the issue must be decided by the popular will, for the whole political theory of Congress requires that the people and not the prince should decide. This principle was unequivocally maintained by India in the case of Hyderabad to justify armed coercion of its ruler. In view of the memories of recent bloodshed in Kashmir itself and in the neighbouring Punjab, it is reasonable to claim that the state should not be shifted to one side or the other by a bare majority vote, but should be partitioned on lines corresponding, as far as possible, with the local voting; thus most of Jammu would probably go to India, even if the Vale of Kashmir were to opt for Pakistan.

Why is it then that India is so reluctant to agree to any concrete steps for solving the Kashmir problem on these lines? It can only be because of doubt whether, in spite of professions of confidence in the popular support of Sheikh Abdullah, the Moslem population of the Vale of Kashmir would vote for union with India in an impartially supervised plebiscite. There

is now talk of India's demanding postponement of a plebiscite for at least five years—presumably in order that intensive political education in favour of India can be done in the meantime, with no chance for Pakistan to do any canvassing. But such tactics are unworthy of a Government which in other fields has shown a great capacity for moral leadership and magnanimous conduct.

If the inhabitants of the Vale of Kashmir want to belong to Pakistan, is it really a vital interest of India's, political, economic or strategic, to stop them? If they do not want to belong to Pakistan they will vote for India, and India's claim will be vindicated. It is of no concern to Britain to which state this territory is attached, but it is a matter for regret and anxiety in this country that such a dispute should continue to poison the relations between two members of the Commonwealth. It may still be hoped that India's leaders will think again before finally turning down the good offices of an international organisation which can provide a fair and peaceful settlement without humiliation to either party.

* * *

Industrial Research

The report of the Department of Scientific and Industrial Research for the financial year 1947-48 (this is yet another official report to take over a year to publish) also contains a review of the department's work over the past decade. During the war the department was given certain specific tasks of which the most important was the organisation of the British end of atomic research. Since then it has resumed the function it has had since the first world war of being the parent organisation for the various government research projects and the patron of the work done by the research associations of industry. This has been accompanied by a considerable expansion in the activities of the department which, as can be seen from the accompanying chart, is reflected in the amount which it spends both on its own establishments and in grants to industrial research associations.

The report stresses the dilemma between long- and short-term research: it admits that "the need to bring to the solution of the economic and industrial problems of the country

as speedily as possible all the knowledge and experience which science can contribute, has led to the deflection of effort from the development of extended programmes of basic research. . . ." This is a difficult problem to which there is no obvious answer. One of Britain's greatest industrial assets has been a high standard of fundamental research which has paid high economic dividends—no better instance could be found than the aircraft and aero engine industries—and it would be extremely dangerous to neglect it.

What has always been less good in Britain has been the lag between pure research and its industrial application—the development stage between the laboratory and the work bench. The Government has attempted to improve the situation by the creation of a National Research Development Corporation, but the problem is fundamentally one of economic incentives and will be solved only when industry becomes more competitive and more anxious to draw on new ideas.

What is least satisfactory about the report is first a tacit assumption that more men and more money mean better scientific research, and, second, the readiness of the Government to dissipate the available effort by starting new scientific hares. This can perhaps be ascribed to the fact that the evolution of scientific research policy is in the hands of a bewildering proliferation of committees—by no means all under the aegis of the DSIR—which appear to be co-ordinated only by the fact that they are mostly, but not all, responsible to the Lord President of the Council.

Housing Act in Action

The 1949 Housing Act received the Royal Assent in July, and the Minister of Health has now sent out a circular to local authorities dealing in particular with the two most controversial parts of this Act. These are, first, the new powers of local authorities to build large and more expensive houses "for the formation of a balanced community," and, second, the new grants available both for local authorities and private landlords for making improvements to houses at the expense of the Exchequer.

The first power arises from the deletion of the phrase "working class" from the Housing Acts. Local authorities may now build for the poor and the not-so-rich alike: the size of the larger houses can be up to 1,500 sq. ft., or in special circumstances even larger, compared to the present standard Council house of some 1,000 sq. ft. Local authorities are explicitly left free to fix the rent of these new houses as they think fit. Each house will get the standard grant of £22 a house for 60 years; the benefit of the subsidy need not be passed on to the occupier, but can be spread over those tenants whose financial needs may be greater. It is not yet possible to tell how local authorities will react to the new possibilities,

* Cmd. 7761. HMSO, 2s.

but the difficulties found on one London county estate in filling a small number of houses of rather better quality offered at something near their economic rents suggests that the first tenants may not be easy to find.

On the second point of conversion grants, the crux of the matter is the proper allocation of resources between building new houses and improving old ones. Private landlords and owner-occupiers will obviously be very tempted by the chance to get half the cost of improving their property out of the taxpayer's pocket, and the Ministry of Health has warned local authorities to take care that these demands do not adversely affect their own programmes for new houses. They have been told that the building programme must continue to be directed to giving houses to those families who still have no homes of their own. This is, no doubt, right, but this primary demand will not exist for ever, and should be satisfied in the course of next year. Is it not time for the Ministry of Health to give some guidance about phase two of the housing programme, for the time is approaching when every family wanting a separate house will have got one and the replacement of old and condemned houses will have to begin? For some authorities the time for working out this second phase must be very near.

* * *

No More Fogs

The reputation of the London fog is world-wide. The disappointment of overseas visitors in meeting only an insubstantial shadow of it, and that only once or twice in a winter, is a tribute to the popularity of gas and electricity and to the efforts of the anti-smoke enthusiasts. Dickens would be amazed to find a "London partickler" so rare and Sherlock Holmes would discover his Baker Street stripped of its mystery. For the last three days the National Smoke Abatement Society have been meeting in Harrogate to continue the good work. Their

Letters to the Editor

Costs of Production

SIR,—In last week's leading article in *The Economist*, you state that "average British costs of production (as most relevantly measured by the price level of British exports) have been rising, with scarcely any interruption, ever since the beginning of the war. They are still rising, and the number of wage-claims already proffered make it clear that they will go on rising."

This gives the impression that the price inflation of the war and immediate postwar years is still continuing unabated. The facts do not bear this out. The official index number of export prices shows no upward movement whatever between January and July of this year, and a rise of only three points between July, 1948, and July, 1949.

No one disputes the urgent importance of preventing a price rise from negating the effects of devaluation. But there is no point in making the task seem harder than it really is by giving the false impression that we are even now in the middle of a serious price inflation.—Yours faithfully,

C. A. R. CROSLAND

Trinity College, Oxford
[Mr Crosland reads into our words what was not there.—EDITOR.]

Wage Chaos

SIR,—Taken together your two articles of September 24th, "Defeat or Opportunity" and "Wage Chaos" strongly suggest that excessively high and rising British labour costs made devaluation inevitable, and you go on to criticise the British trade unions.

efforts have been helped enormously by the country's concern with the high cost and scarcity of coal, which has led to much research into methods of coal utilisation. This has resulted intentionally in the better use of by-products and a wider use of gas, electricity and smokeless fuels: unintentionally it has also resulted in less smoke. Economic forces have for once joined the side of the angels.

Because of this new concern with fuel economy, Lord Simon of Wythenshawe, in his presidential address to the conference, was able to make the optimistic forecast that after thirty years there would be no more domestic smoke, and that electricity in factories would have almost eliminated industrial smoke. For industry the change will depend upon the relative cost of electricity or oil and smoke-producing fuel. In the home it will depend on the possibility of producing cheap and efficient systems of central heating, or on the production of a stove to burn bituminous coal smokelessly, or on a sharp fall in the costs of gas and electricity. The first two possibilities assume that most old houses will be replaced by new over the next thirty years, and that the improvements will be proved economical before many new houses are erected.

Thirty years may be an over-sanguine estimate. But there is now available a weighty body of factual information on how to economise in fuel consumption and reduce smoke. Much still needs to be done to make these methods cheaper, but equally there is much to be done to make the existing techniques more widely known.

*

Correction

In the issue of September 3rd (page 493) the percentage of income from parliamentary grants received by Oxford and Cambridge Universities was given as 17.3 and 23.4 per cent. These figures should have read as 48.1 per cent and 45 per cent respectively.

Intervention in Cuba?

At the same time it must be stated that there are in the United States a great mass of adventurers ready for any kind of enterprise. The American cities overflow with bold and audacious spirits, both native and emigrants from Europe, and the landward borders of the States nourish a population inured to all the perils of the chase, and eager for excitement. Such men will find an expedition to Cuba pleasant and profitable. It will be delightful to many of the officers bred up at West Point to the trade of war, and having nothing but routine duties at home, to take service with the prospect of making a fortune in Cuba. That there are many such persons in the States eager for military renown, and for the wealth and consideration it generally bestows—and that there is a great multitude ready for any buccaneering expedition, which promises them excitement and plunder—is well known; and for such persons to engage in an expedition to Cuba, is . . . what might be expected. . . . While we count, therefore, on the United States Government stopping, as far as it can, all military expeditions to aid the Cubans, suppose them to attempt a revolt, we also count on their receiving from the American people, in spite of all the vigilance of the Government, ample assistance in men and arms, and perhaps even assistance in money. The question does not concern the policy or ambition of governments; it is a quarrel between a government and a people, and the connection between the Americans and the Cubans will gain for the latter all the help the former can give.

The Economist

September 29, 1949

[The ECE calculations have been disowned by the Central Statistical Office on the ground that they do not reflect the course

taken by the Interim Index of Industrial Production. It is obvious that if production indices, comparable in structure, and all using postwar weights, were available, the results of a comparison would be different.—EDITOR.]

SIR.—Surely there are only two ways to produce economic order out of wage chaos? The first is a really effective disinflation, strong enough to break the inflationary bargaining power of the trade unions and other pressure groups. This implies creating considerable unemployment, and which political party is willing to go to the electorate with such a policy or, indeed, could peacefully put it into effect? All three major parties are now committed to a policy of a high and stable level of employment.

The second way is the theoretical Socialist one of administered wage levels. This implies an abrogation of collective bargaining rights on the part of the trade unions, and, though the leaders may be partly won over (provided, perhaps, that administration is disguised as an Arbitration Tribunal), the rank and file will in the long run demand a price of full-blooded socialisation and control of all personal incomes, not merely of the organised workers' wages alone, in order that their sense of justice may be satisfied.

Neither strong disinflation nor strong control seems on the political cards at the moment, so we may look forward to continuing wage chaos. But there are worse things.—Yours faithfully,

JOHN WHITESIDE

Defeat or Opportunity?

SIR.—You stated in *The Economist* of last week "There is no need to abandon the welfare state, but only to base it on realism, both in respect of what can be afforded and of the way in which human beings act when offered something for nothing." The implication is that the population of the United Kingdom is getting something for nothing. What occurs is that

Books and Publications

Sidney and Beatrice

"The Webbs and their Work." Essays edited by Margaret Cole. Frederick Muller. 301 pages. 15s.

"SOMETHING different from the ordinary run of collective eulogies which appear after the death of eminent persons"—such is Mrs. Cole's description of this admirably balanced and many-sided collection of essays; and she adds "The Webbs can be portrayed now as they really were, with the blemishes and errors of judgment from which no human creature is immune." To portray anyone "as he really was" is of course a work of biographical genius, and with all due respect to the extremely able, well-informed and even (in some cases) entertaining contributors to this volume, none of them is that; not even Bernard Shaw, who provides a lively question-and-answer sketch of the Webbs' early days and insinuates with goatish complacency that Beatrice would have found him irresistible had he chosen. Each of the various facets of their joint work is treated wherever possible by those who actually shared it; of the eighteen contributors, Mr Edward Pease writes of the Fabian Society, Lord Beveridge of the London School of Economics, Mr S. K. Ratcliffe of the *New Statesman*, Mr J. S. Middleton of the Labour Party, Professor G. D. H. Cole and Mr Leonard Woolf write on "Beatrice Webb as an Economist" and "Political Thought and the Webbs" respectively, Mrs Barbara Drake deals with the final illuminating surrender to Soviet communism, while more personal reminiscences come from Mr F. W. Galton, Mr Jack Lawson, MP, and (a delightful job) Mr Kingsley Martin.

The composite portrait which emerges is impressive—and depressing. The Webbs were invaluable; as tireless illumina-

tion, each employed citizen makes a direct contribution to the National Insurance Scheme (or should do so) in addition to meeting an unusually heavy burden of personal taxation. There can be no question of being "offered something for nothing."

What is clear is that visitors from overseas are able to claim every health benefit without making any payment whatsoever. Further, an alien employed within Great Britain, as long as he is paid from sources arising outside, is not called upon to pay a National Insurance contribution in certain circumstances.

In other words we draw upon the Health Scheme as a right whilst allowing other nationals (and this is where we lose sight of realism) rich or poor, the privilege of "full membership." And this privilege is not inspired by any measure of reciprocity arranged with other countries.—Yours faithfully,

30 Gordon Street, W.C.1

COLIN A. PERRY

Anticipation Factor Index

SIR.—Is the word "new," which you apply to Moody's Anticipation Factor Index, quite fair to my Confidence Indicator? This was invented in November, 1946, when I wanted to "dedaltonise the indices"; the formula is

100.000

F.T. Fixed Interest Index $\times$ F.T. Ordinary Yield

and I have computed and published it weekly ever since. This is effectively the same formula as Moody's employ, except that the *Financial Times* Fixed Interest Index has been substituted for Consols 2½ per cent.

I find it hard to believe that others had not taken similar steps before 1946 and made a full examination of the uses and forecasting powers of the ratio bond yield: equity yield. I should be interested to hear of any such work, if any of your readers can tell me of any, published or unpublished.—Yours faithfully,

A. G. ELLINGER

36 Regent Street, Cambridge

tors of dark places, as contributors, both directly and indirectly, to the sum of human knowledge, as documentors of the social conscience, as dynamically fertile devisers of new social organs, as examples of what entire devotion, selfless industry, and integrity of mind can accomplish. It is almost impossible to imagine the contemporary scene without those elements which it owes to their partnership. As Professor Trevelyan has remarked in reviewing a recent work on the Utilitarians, there are men who make a noise and men who make a difference. The Webbs made a difference—Bentham himself hardly made more; and the difference was in the right direction.

But what a price they paid (Sidney without noticing it, Beatrice with some struggles) for their undoubted achievement; what a lamentably stunted, overspecialised, dehumanised, myopic and unbeautiful existence was theirs, and how remote their ideal of administrative order and efficiency from the *Civitas Humana*! They were, of course, Puritans, with a proper contempt for, or mere blank indifference to, fleshly or aesthetic enjoyments. Their attitude towards the arts was that of a scientific dietician, unprovided with a palate, towards a vintage wine, or of a colourblind sanitary engineer to a medieval rose-window; their attitude towards the life of sentiment and passion is summed up in Beatrice's repulsive remark that "Marriage is the wastepaper basket of the emotions." But unlike the Puritans of an older day, they included in the area of contempt and indifference not merely art and the life of the senses but philosophy and the life of the spirit. (Beatrice, it is here revealed, habitually prayed; but as a prophylactic measure.) No doubt, had they been less hopelessly lepers human beings, they would have accomplished less. But the society which they did so much to shape might, under different leadership, have accomplished more.

Local Government in England

"Problems of Local Government in England and Wales." By Frank Jessup. Cambridge University Press. 134 pages. 3s. 6d.

THIS is a valuable and stimulating little book. Like most writers on this theme, Mr Jessup is alarmed at the whittling away of local independence and discretion by a central Government which supposes itself omniscient and knows itself omnipotent. The author admits the advantages of central control and he poses the problem fairly.

Complete social justice can be obtained only at the price of the complete exclusion of diversity and of local initiative and discretion. There is no escaping the dilemma. Some men—benevolent autocrats and extremist planners amongst them—would regard social justice as worth the sacrifice of self-government; others would be content with a comparatively rough-and-ready justice (and can any form of human justice be anything more?) if men could be left more freedom to work out their own destinies, to achieve their own triumphs—and to make their own mistakes.

There can be little doubt which alternative the democrat will favour when once he has seen the problem. Mr Jessup's remedy for checking the encroachments of the central Government is to establish an independent administrative tribunal which would arbitrate on matters in dispute between a local authority and a Government department. For instance, a local authority whose Exchequer grant was cut on grounds of extravagance or incompetence would be free to appeal to the tribunal. The kind of central dictation which Mr Jessup seeks to prevent is that authorised by the Education Act, 1944, under which in any matter left to the discretion of a local education authority, the Minister may, if he thinks it reasonable, substitute his discretion for theirs. Why should the Minister be the sole judge of what is reasonable on issues which have been specifically left to local discretion? Why should large and responsible public corporations like Manchester or Birmingham be treated more cavalierly than any private academy (for which rights of appeal are provided)? It is on such matters, thinks Mr Jessup, that an independent tribunal could hold the scales of justice and common sense.

The author's proposal is interesting and attractive. Its danger is that it might further clog the wheels of government; its weakness lies in its political improbability. It is strange that Mr Jessup does not once consider the direct and obvious remedy—that of circumscribing the powers of Government departments by Parliamentary statute. But this omission on the part of the author is also significant. Parliament has been so weakened by transfusions of blood to the executive that no early cure is possible.

Middle East Future

"In Search of a Future: Salvation for the Middle East." By Maurice Hindus. Gollancz. 270 pages. 12s. 6d.

MR MAURICE HINDUS, who was born a Russian but is now an American citizen, deservedly earned great sales for his books on peasant life in the Middle East. He is handicapped in Iran and the Arab states by the problem of language. He cannot chat, as was possible in Russia, except through interpreters or with educated men. But he has read widely, used his eyes and listened to a wealth of local opinions. As a result, he has reached the conclusion that without land reform there is no salvation for the Middle East. "Either the landlords sell their surplus lands (over 100 acres) and go on leading their happy lives," says one of his Egyptian friends, "or they run the risk of ultimately losing not only their lands but also their heads." The operative word is this remark "ultimately." Mr Hindus is too experienced to be swept by such thinking into the belief that Egypt's or anyone else's 1789 is just round the corner.

His technique, as a writer, is to prove his point by a series of snapshots rather than by any topical arrangement of what he saw and heard. He has written, therefore, for the ordinary reader, not the scholar. The latter, unless he has marked

the page, will rustle interminably through the jumble of evidence for the item he can remember, but cannot find again (the book has no index). But, somewhere about, the facts are all there: that a society which remains immensely feudal is at the same time perversely democratic; that peasants do not readily dodge or defy the custom of voting as the landlord says; that nepotism, not merit, governs nearly all official appointments; that the great majority of the population of Iran, Iraq and Egypt is barely aware of the outside world; that disease retards their awakening; that the only way out of the political stagnation wrought by so-called democracy is through dictatorship or through a Communist revolution that must "inevitably bind itself to the will and the power of Moscow."

The weak point in the book is its relation of the chapters on Israel to the rest. Israel, argues Mr Hindus, provides the blue print for the development of the rest of the Middle East. Here he becomes glib and departs from reality. For he never mentions the fundamental psychological differences between the hustling Israeli and the dilatory, fatalistic Moslem, or the fundamental practical differences between an agriculture born of the Jew's welcome to an immense foreign investment and an agriculture which will accept foreign money only on its own narrow, feudal terms. But despite many missing links the book is worth reading for its picture of life in Iran, Iraq and Egypt. And it is worth remembering for the lesson it preaches at the Pasha in his limousine.

The Bear's Yoke

"Rumania under the Soviet Yoke." By Reuben H. Markham. Boston: Meador Publishing Company, 1949. 601 pages. \$4.00.

THE dust-cover of this book portrays the Russian bear in the act of savaging a defenceless peasant maiden, Rumania. This picture gives the essential spirit of Mr Markham's book. It is highly coloured journalism rather than sober history. Its purpose is to show the evil results of Russian domination of Rumania. To this task Mr Markham brings many years of experience in Balkan countries, both as missionary and journalist, a powerful hatred of communism and the unusual advantage of having visited Rumania since the war.

The book gives an account of the Rumanian people, the Rumanian Motherland, some aspects of Rumanian politics both before and during the late war, and describes how the Communists seized power and gradually gained control over the whole country after the war. The picture is drawn in the broadest outlines, and the author's generalisations are very sweeping and sometimes misleading. Rumania's history in the immediate prewar years and during the war—and particularly Maniu's part in it—are viewed by Mr Markham in a very rosy light, and his hatred of the Communist regime makes him inclined to gloss over, and even defend, many notorious evils in prewar Rumania. This hatred, which can be felt as an intense emotion and inspires the whole book, tends to weaken the force of his indictment as it leads to exaggerations, omissions and partiality which detract from the value of an otherwise useful book.

B.Sc. ECON. LONDON UNIVERSITY

- The B.Sc. Econ. Degree of the University of London may advantageously be taken by men or women seeking or holding government or municipal posts, or executive appointments in commerce or industry.
- Study for the Degree, which may be taken without residence at the University or attendance at lectures, covers a course of wide and interesting reading. U.C.C., founded 1887, prepares students by post. The College is an Educational Trust, not conducted primarily as a profit-making concern. Highly qualified Tutors. Moderate fees; instalments if desired.

AMERICAN SURVEY

Tariff Perils

(From A Special Correspondent)

AMERICAN interest in Britain's economic plight and the remedy of devaluation has been so intense that little attention has been spared for the renewal of the Trade Agreements Act by Congress. The crisis in the Senate arose and was surmounted while echoes of the Washington talks still filled the metropolitan press. On the following Monday, the devaluation of the pound dominated the news and editorial pages. Americans who had laid bets that Britain would, or would not, take the hurdle, made the appropriate adjustments. Those who had been baffled by the contrast between the joint communique and the Cripptic smile felt even more baffled, and the usual suspicion was voiced in Chicago that Uncle Sam had been diddled again. Few noted that the renewal of the Trade Agreements Act was an essential concomitant of the Chancellor's move to spur British exporters to more aggressive efforts to earn dollars.

This curious lapse can be explained, in part, by the tradition which says that tariffs in the United States are subjects for propaganda, but not for conversation. Aside from the hoary legend that they protect "infant industries," few Americans understand just what they do or how they do it. In their present form they are complex and many-layered, and bristle with technical difficulties. In addition, they are crusted with prejudice, historic folk tales, special interests, and carefully nurtured ignorance, and the deposits create heat while they blanket light. It is not surprising that the American disinclination to discuss the tariff at home should be paralleled abroad by a belief that it constitutes a wall against which it is useless for would-be importers to struggle.

★

That belief owes most of its strength to Messrs Fordney, McCumber, Smoot and Hawley, most of whom are now dead, and none of whom now directs American foreign policy. It lost its validity fifteen years ago, when Mr Hull, then Secretary of State, invented the trade agreements formula as a means of getting round the wall those gentlemen had erected. Since then, the Act has always been renewed, though never without a struggle. Its renewal in 1949 gives notice that in spite of the present slight business recession in the United States, the country's latent protectionism is still held in check by its new interest in international matters. The President has for another two years the power to make adjustments in rates after international negotiation. Moreover, the bars against imports are a little less sturdy than they were last year, in that the "peril-point" provisions inserted by the Republican Congress have now been discarded. This amendment required the Tariff Commission to set "peril points" beyond which it considered concessions were likely to injure American producers. The President might disregard the Commission's warnings, but would have to explain to Congress his reasons for doing so.

Any attempt to assess the present tariff situation and to measure its real, as opposed to its imagined, hazards for

would-be importers must start with the fact that for more than a decade the American tariff has been coming down; duties are, on the average, well below those of the low-tariff Underwood Act of 1913. (In 1947 the average rate of duty stood at a little over 15 per cent on dutiable imports as against about 27 per cent under the 1913 Act.) The American record compares well with that of other countries if critics take into effect all types of governmental obstacles to trade, including currency allotments and quantitative restrictions. Contrary to common belief, the American market can be said to rank as one of the most accessible in the world. This is chiefly because quantitative restriction of imports is a device little used in the United States but popular in countries more concerned with their balance of payment position.

But this accessibility of the American market under present world conditions is only relative. Averages are always a somewhat misleading measure of progress. Many foreign products which might be a source of greater dollar earnings are still subject to rates of duty which unquestionably restrict their sale in the United States. The *ad valorem* equivalents of the rates in effect in 1948 on woollen and worsted fabrics, for example, ranged from nearly 40 to more than 77 per cent of the rates in 1939, and those on wool hosiery from 32 to 47 per cent. Those on wool pile fabrics were 56 per cent, on silk nets and nettings 45 per cent, those on table and kitchen earthenware 35 to 60 per cent, and on bone china ware 35 per cent, of the rates in 1939.

Nor does a comparison of the average rates now in force with those of 1913 take into account the effect of changes which have taken place in underlying conditions. Both the efficiency and diversity of American production have increased notably since 1913. Apart from the handicaps created by the tariff, foreign exporters will face domestic competition far more severe than that which they used to encounter, and under these circumstances the artificial handicap of the tariff takes on added importance.

★

The American tariff is lower on the average than it was in 1913, but it ought to be much lower, in the national interest of the United States as well as of the countries with which it trades. Foreign critics are prone to insist that it ought to be lowered unilaterally, and they give as reasons the creditor position of the United States (reversed since 1913), the dollar shortage, and the heavy American export surplus which, they say, render unnecessary the equivalent concessions by foreign countries that are required under the American Trade Agreements Act. This argument is usually directed toward relieving the dollar shortage, but there is little else to be said for it. Under the arrangements agreed to by the United States, countries short of dollars are permitted to impose quantitative restrictions on imports if these are needed for balance-of-payment reasons. The United

States, on the other hand, is in no difficulties of the kind envisaged by the "escape" provisions. Therefore, it cannot avail itself of this privilege.

The practical result is that, as long as other countries lack foreign exchange for supplying their import needs, foreign tariff cuts can be made meaningless by balance-of-payment restrictions, whereupon American tariff reductions become in fact unilateral. Apart from disarming Congressional critics, the chief value of foreign cuts, and it is a great value in the long run, is that they keep protectionist forces under control. They help to ensure that goods from the United States and other countries, now kept out for balance-of-payment reasons, will not be excluded for protectionist reasons when equilibrium in international trade and payments is eventually restored.

A further aspect of the American tariff which has received unflattering attention from would-be importers is the way it is administered. One hears much of the method of determining dutiable value, the enforcement of regulations aimed at preventing the sale of deleterious foods and drugs, the hardships caused for exporters of articles with fringes (such as rugs) which must pay the same heavy duty as lace. That there is ample room for improvement in the administrative provisions of the laws affecting imports, almost every traveller can attest. But the American system is not unique in this respect, and its laws and practices will stand comparison with those of most countries. Moreover, if all procedures could be reformed and all customs inspectors provided with wings and haloes, the ability of foreign exporters to earn dollars would not increase half as much as it would if substantial cuts were made in tariffs on selected foreign products. It is the ability to accomplish this latter reform through international negotiation and executive action which renders the renewal of the Trade Agreements Act so important to countries wishing to send more goods into the American market.

The promises and the perils of the American market are, it must be remembered, created by two sets of forces. The tariff is a creation of the government, and the government can and should reduce its severity. The rise in productive efficiency, the increased sharpness of competition, the swings in the dynamic American economy which seem so fearsome to eyes equipped with Socialist spectacles, are mainly attributable to that complex of commerce, finance and business known as private enterprise. The two have their separate effects on the dollar shortage. But it is in their interaction on each other that the real danger still lies. In spite of the work done under the Trade Agreements Act, since Mr Hull first invented this ameliorating technique, the protectionist spirit in the United States is by no means dead. This year the Act was renewed, in the Senate, by a vote of 61 to 19, which looks safe. But the "peril point" provision was kept out by a vote of 43 to 38, which gives a fairer picture of the relative strengths of protectionism and internationalism today. That is the sombre side of the picture. It must not be over-emphasised, but it cannot be overlooked.

State Fair

[FROM OUR AMERICAN STAFF]

With September torn off the calendar, tents are being folded at state fair grounds after another thoroughly successful season. The beginnings of the agricultural fair in America go back to the early years of the Republic, when gentleman farmers along the Atlantic seaboard, aware of developments in the

agricultural revolution in Britain—often, as in the case of George Washington, through correspondence with that walking "Encyclopædia Britannica" Arthur Young—decided to imitate the private shows of such advanced agriculturists as the Duke of Bedford and Thomas Coke of Holkham. Their interest in farming was part of the philosophical curiosity of the age; its intellectual and literary flavour is suggested by the offer, in 1791, by the Philadelphia Society for Promoting Agriculture, of

A gold medal for the best essay, the result of experience, on the breeding, feeding and management of cattle for the purpose of rendering them most profitable for the dairy, and for beef, and most docile and useful for draught.

Similarly, the gatherings of the gentry at George Washington Parke Custis's sheep shearings at Arlington, which began in 1803, offered the great landed proprietors of the middle states a chance to compare the qualities of the wool—on which the duty rose from 5 per cent in 1789 to 35 per cent in 1812.

★

Sheep were the basis of the first fairs that were within the reach of the ordinary dirt farmer. During the Merino boom, when Spanish proprietors, harried by the approach of Napoleon, suddenly became willing to sell the precious herds of which they had a monopoly, Elkanah Watson exhibited a pair of Merinos in the public square of Pittsfield, Massachusetts, and reached the conclusion: "If two animals are capable of exciting so much attention, what would be the effect on a larger scale and with larger animals?"

As a result of his inspiration, the Berkshire Cattle Show opened in 1811; its main features are common to agricultural fairs to this day. Four marshals and the sheriff, on grey horses, led a half-mile-long procession announced by a band, featuring sixty yoke of oxen drawing a plough held by the oldest men in the county, a stage coach piled with American manufactures, groups of mechanics with appropriate flags and wheat-sheaf cockades in their hats; once arrived at the fair grounds, festivities opened with "an animated pastoral prayer" and closed with an equally animated pastoral ball.

At the 2,200 community, county and state fairs held all over the United States in 1949, with an attendance, it is alleged, greater than at any other public gatherings, the pattern is much the same. True, the motifs have been modernised; instead of Mr Watson's procession of oxen, this summer's Washington State Fair was advertised by Geronimo, the Parachuting Sheep, who descended in a series of perfect four-point landings, and was busily agaze before the air was out of his chute. Similarly, the 1948 Iowa State Fair introduced fair-goers to the Atomic Age by means of a radioactive calf. The calf had been injected with Carbon 14, which concentrates in the thyroid. Fair-goers were equipped with Geiger counters, and encouraged to explore the calf's anatomy until rewarded with a click.

The combination of education and a good time, which makes people want to go to fairs and state legislators willing to supplement gate-receipts and entry-fees, is apparent from

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

the arrangement of the average fair-grounds. Most states have purchased and equipped permanent grounds for the state fair, with permanent buildings, supplemented by canvas tents, to house the major exhibits, livestock, poultry, farm machinery, and produce; the latter includes both field crops and garden vegetables and flowers, and examples of such household arts as preserving, baking, rug-making and embroidery. Around the permanent buildings are grouped the parking lots. Gone are the days when Father Agricola, after laying out the week's work for the hired man and the womenfolk, departed importantly, by train, for the state fair. Now, the whole family rises really early and, in sputtering jalopy or sleek saloon, burns up the miles together.

Once arrived, however, a centrifugal tendency is noticeable. The older members of the family are drawn towards the permanent buildings: Pa wants to take a look at the new corn picker, Ma wants to see who won the preserving prize. Meanwhile, the youngsters have made a bee-line for the "Midway," the amusement area that bisects the grounds, with booths containing the bearded lady, the man who swallows flaming swords, the "Step-Up-and-Try-Your-Luck" concessions. There, if unrestrained, they lavish their substance on both the roundabouts and the swings, preferably waiting until after those gorge-raising experiences to sample the diaphanous wads of pink spun sugar on sticks, sold next to the hot-dog-with-mustard stands.

But two events are likely to pull everybody together again. One is the show organised by the "4H Clubs." The leaders of these clubs, provided by the agricultural extension service, supervise local projects in which farm boys and girls raise calves or pigs or chickens, make furniture, preserve or sew or bake according to choice, keep books on their costs, and learn to judge the results. Competing up the scale from community to county to state fair, the winners of the 4H projects bring with them an admiring throng of neighbours and relatives. For days before a contest, the boy or girl with a dairy heifer or a beef steer to show becomes the operator of a bovine beauty parlour, constantly buzzing over the animal with electric clippers, hand-carrying its hide, sandpapering and oiling horns and hoofs, plaiting the tail to give a Marcelled effect in the ring. When that calf is shown in the centre ring, all the folks will be there.

The other unifying attraction is likely to be the racing, which began very early at agricultural fairs, whether harness racing with slender sulkies manoeuvred by slanting drivers at the turns, or flat racing with jockeys monkey-crouched in their saddles. In the eighteen-forties, it was viewed with misgiving by puritans who wondered whether in all conscience racing could be regarded as educational. Some tried to rationalise it: wasn't speed in a horse an agricultural asset comparable to milk in a cow? Others accepted the facts as stated in 1869 by the humorist Josh Billings:

There was two yoke ov oxens on the ground, beside sevral yokes ov sheep and a pile ov carrots, and some worsted work, but they didn't seem to attrakt enny sympathy. The people hanker fur pure agrikultural hoss trots.

Latterly, that hankering has been fully satisfied—charging admission to the races is one of the best ways to keep a fair out of the red—and, as the internal combustion engine has replaced the horse, city-made sounds have partially drowned out the whinnies in the centre ring. The farmer who attended the Michigan State Fair's Centennial Celebration this September may have come to compare the merits of the various kinds of hybrid maize. But the roadside posters that urged his attendance emphasised three features remote from Michigan farming: Rodeo; Auto Races; Bob Hope.

American Notes

Arms and the Bomb

The news of Russia's success in producing an atomic explosion—if not an atomic bomb—was received calmly, though it may stiffen the House in its dispute with the Senate over the speeding of a 70-group Air Force, and make it easier to persuade Congress to allow atomic information to be shared with Canada and Britain. But for all the calm it seems likely to have a catalytic effect in Congress somewhat similar to the Russian moves which last year contributed so greatly to the passage of the Marshall plan and the formulation of the Atlantic Pact. The timing of the announcement—if it was made with one eye on Congress—has already helped to persuade the House conferees to abandon their hopes of halving the funds for military assistance to Europe and to accept the totals voted, by 55 to 24, in the Senate. They have, however, accepted also the Senate cuts in this year's appropriation for European recovery, and have compromised on a token \$110,000 for the controversial "watch-dog" committee.

Anxious for an adjournment deferred often enough to make many hearts sick, the House in the end probably would have succumbed to the heavier and more accurately trained guns of the Senate, but the tussle would have been longer. The Bill passed by both Houses this week authorises \$1 billion for the signatories of the Atlantic Pact, \$211 million for Greece and Turkey (in addition to \$50 million already authorised), \$27.6 million for Iran, Korea and the Philippines, and \$75 million for the "general area" of China, which it is suspected the Administration—in which all discretion as to the spending of this fund is lodged—may use in Burma and Indo-China. Most of the cash (\$400 million), and all the contract authority for the Pact Powers, will not be available, however, until the President is satisfied that a truly unified and effective defence plan has been worked out.

The original cut made by the House was defended as a means of attaining the same end by making a second instalment of aid dependent upon satisfying Congress on this point; the final version leaves the decision to the President and eliminates the fear that, by next year, Congress might have undergone a change of heart. The Bill is only an authorisation; the actual appropriation Bill is yet to come. But the Reconstruction Finance Corporation is empowered to advance \$125 million to get the programme going.

Except for the revision of the law on admitting Displaced Persons, this is likely to be the last as well as the most controversial international measure to come before the present session of Congress. The Administration, despite its inept beginning, has done better than it had any right to—or did, in fact—expect, both in terms of the funds granted and the votes secured. The attempts of Senator George and Senator Knowland to cut the European total, the chief threats in the Senate, were beaten back with 14 and 16 votes to spare. But there has been a perceptible strain, both on Senator Vandenberg's health and his bi-partisanship, and the alienation of Senator George, a senior Democrat, is another casualty. In view of the need for the utmost co-operation from both parties on international economic problems, and the likelihood, if Europe is to be made strong enough to take the first brunt of any onslaught from the East, that the Administration will have to ask next year for more military aid, the victory may have been more costly than it appears.

UE Blows a Fuse

The sparks which flew at the recent convention of the United Electrical Workers' union left little doubt that the Communists, instead of trying to short-circuit the Congress of Industrial Organisations from within, are now ready to allow their connections with it to be cut at the annual convention which opens on October 31st. Not only did the UE re-elect

all three of the officers whose fellow-travelling hands have been on the union switches since 1941, but it also called down lightning on the head of Mr Murray for his "traitorous" conduct of the steel wage negotiations and voted to withhold its dues unless the CIO ceased to attack the autonomy of its constituent unions. Since the CIO leaders have already threatened to expel any union which rejects such official policies as support for the Marshall Plan and boycott of the World Federation of Trades Unions, it seems inevitable that this uncompromising defiance will blow the fuses which link the CIO to its third largest affiliate.

However, at the UE convention, one-third of the union's 400,000 members followed the dynamic anti-Communist lead of Mr James Carey; many more would probably have done so if the work that, during the last few years, has made him so well-known in national and international labour affairs, had left him time to devote to those internal details which have been tended so profitably by his able left-wing opponents in the union. Mr. Carey's supporters are expected to remain with him in the CIO and to form the nucleus of a new union. This example may also be followed by some at least of the local branches of the other ten pro-Communist unions which will probably accompany the electrical workers into red darkness. These are nearly all small unions, which have been subsidised by the CIO, and the wealthy electricians are likely to find themselves paying the expenses of the trip.

The UE also instructed its leaders to sign non-Communist affidavits, essential under the Taft-Hartley Act if the union is to participate in the local elections that decide who shall organise the workers in individual plants. The president of the UE, most conveniently, is not a party member; in other left-wing unions, officials have got round this difficulty by ostentatiously resigning their membership in the party, a privilege not enjoyed by lesser Communist fry, while protesting their continued adherence to Communist principles. Without this readiness to pay signature-service to Taft-Hartley, the

dissident unions would have difficulty in fighting the raids by other unions which have already weakened them and which will be officially encouraged by the CIO, once schism has become a fact. Even if the threatened steel and automobile strikes do not materialise, the national economy is, therefore, likely to be irritated before long by a rash of labour disputes over union jurisdiction.

Point Four Tomorrow

As a contribution toward relieving the dollar shortage, and raising the level of world trade, there is much to be said for putting under way as soon as possible the programme of technical co-operation and private investment known as Point Four. This is true even though no spectacular results are expected at once. (Point Four is so called because the proposal was the fourth put forward by Mr Truman in his Inaugural Address last January.)

For Congressional consideration, the investment guarantees, which it is thought may speed the flow of American capital abroad, were split off from the plans to export American production techniques; it was hoped that the banking committees might have time to deal with the first even though the foreign relations committees were too busy to deal with the second. In fact, the Senate Banking Committee has done its bit; it has approved the Bill empowering the Export-Import Bank to guarantee American investors abroad against inability to convert their proceeds into dollars and against the risk of expropriation and physical destruction due to war. No new appropriations were proposed, as the Bank has uncommitted funds totalling nearly \$1 billion. The House Committee is expected to take similar action soon. Meanwhile the State Department is going forward with the investment treaties, which are also designed to give the American investor confidence, and is urging tax concessions for those who invest abroad.

An American Banking Connection in London

Many companies engaged in international business find it to their advantage to have a connection with Central Hanover, an old established New York bank. Our offices in London and New York are strategically situated in the two leading world trade centres.

Author and Authority

Chary of the promiscuous adjective, suspicious at all times of superlatives, The Times Literary Supplement picks its way with critical good sense and experience among the vast confusion of new books. As a guide in the selection of what to read it is unprejudiced in sympathy, erudite when the occasion calls for it, unfailingly honest in judgment. For the discriminating reader it carries a stamp of intellectual authority.

THE  TIMES
LITERARY SUPPLEMENT

Presidential pressure is now being exerted to clear the way for technical co-operation. At the hearings before the House Foreign Affairs Committee, Mr Webb, for the State Department, insisted that this was "an enlightened businesslike attempt to solve one of the most crucial problems of our age," while Mr Thorp, Assistant Secretary for Economic Affairs, outlined what it was hoped to accomplish during the first year. An undeveloped country, for the purposes of Point Four, is one whose *per capita* income in 1939 was less than \$100 a year. Two-thirds of the world's population live in such areas, and their average *per capita* income is \$41.

During the first year, about \$85 million would be spent, but Congress is only being asked for \$35 million of new money. The countries being aided will contribute about a third of the total, and the rest is to come from international agencies or other countries participating in the programme through the United Nations. This is a modest financial proposal, and Mr Truman believes, apparently, that it can be blown through Congress, at this eleventh hour, by the blast from the Russian atomic explosion. But so far the Committee—hardened, perhaps, by its exposure to so many "crucial world problems"—does not appear to have changed its view that, while some ground may be cleared this month, full consideration of so long-term a measure can well be deferred until Congress meets again in January.

* * *

America's Achilles Heel

The citizens of Washington, DC, are not likely to take seriously Mr Patman's suggestion that the capital on the East Coast is too vulnerable in the atomic age, and should be moved inland beyond the Mississippi. But Seattle, Washington, has been rocked to its foundations by the discovery that the Air

Force considers the Pacific Northwest so open to bombing in the event of war with Russia that it has decided that its new B-47 jet bombers must be built not in Seattle, but at the Boeing plant in Wichita, Kansas. Employment at the company's Seattle plant might be cut from its present 26,000 to 10,000; the move would affect 150,000 people in Seattle alone.

Satisfaction was at once demanded of Mr Symington, the Secretary for Air, cornered on his way to Alaska, but the most he could promise was some additional unspecified work, and the prospect that another plane, the B-52, still on paper, might be built in Seattle if Alaskan defences and the North-west radar screen were built up.

The economic price to be paid by the Pacific Northwest for Alaska's lagging defences may help to persuade Congress to authorise the necessary funds. Alaska has suffered from the concentration on Atlantic problems, but oddly enough, it is not

guns, but houses, which are most urgent if Alaska is to cease being what Governor Gruening calls America's Achilles heel. Alaska is, of course, a possible base for offensive action against an enemy only 54 miles away, but other offensive bases are closer to the vital targets. Alaska's main defence function is to screen Canada and the northern United States. But when it was decided after the war to shift the military base from the Aleutians to the "heartland" around Fairbanks and Anchorage, the vast installations on the Aleutians became derelict. Around the three new airfields which are the core of Alaskan operations—for it is almost entirely an air theatre—there is an appalling scarcity of accommodation for men and material. Few men with experience of Alaska ever re-enlist, remembering the overcrowded, poorly heated barracks and the prohibitive cost of keeping a family there.

The Military Public Works Bill, which contains \$138 million appropriation for construction in Alaska, is threatened by the economy hammer in Congress. But the Joint Chiefs of Staff, recently on a tour of inspection, sent an urgent request—"the most urgent I have ever received," according to Mr Johnson, the Secretary of Defence—for speedy approval of funds for Alaska, even if it means treating them as a separate item. Bad transportation, a short building season and sheer profiteering all contribute to the high cost of construction, but the first is the greatest obstacle. The Alaskan Highway is open all winter, but its capacity is very limited. Alaska is supplied almost entirely by sea, although none of its harbours is ideal, and none boasts an all-weather road into the interior. The Senate has shown itself sympathetic to the great vision of a railroad linking the United States and Canada with the Alaskan Railroad. But the cost—perhaps as much as \$500 million—makes it likely that less ambitious improvements in Alaskan transport will be tackled first.

Shorter Notes

Mr Carl Ilgenfritz, who earns \$70,000 a year as a vice-president of the US Steel Corporation of Delaware, recently was offered, and accepted, on one condition, the chairmanship of the Munitions Board. The condition was that he should continue to receive his \$70,000 salary from the steel company, thus maintaining his pension rights, instead of the \$14,000 which was all Mr Truman could offer. Steel managers are evidently interested as are steel workers in safeguarding the comforts of their old age. The Senate, however, while conceding Mr Ilgenfritz's unusual fitness for the post, and his integrity, refused by 40-28 to confirm the appointment, in the belief that to do so would set a precedent of allowing private companies, in peace-time, to subsidise government officials who might have to take decisions affecting those companies. The vote frustrated one more attempt to find a way of inducing highly skilled, and highly paid, men in private life to accept the heavy responsibilities and meagre rewards of government service.

*

The final word on the rebuilding of the White House was said at the beginning of August and the work is now to proceed rapidly after being discussed for nearly a year. The traditionalists have won a handsome victory; not only has the suggestion that money should be saved by constructing a completely new edifice been rejected, but the interior, which is to be entirely rebuilt, is to be restored to its Georgian simplicity. The cupids and reclining nudes, which were introduced under the influence of the French Renaissance in 1902, have been condemned to the guillotine. The old brick kitchen, which survived the British flames in 1814, is now to become a radio room for Presidential fireside chats.

*

During the first half of this year over \$9 billion was spent by business on new plants and equipment, rather more than in the similar period of 1948. The total for the whole year will, however, be 7 per cent less than in 1948, if it does not exceed present estimates of just under \$18 billion.

THE WORLD OVERSEAS

The Commonwealth Confers

(From a Special Correspondent)

THE informal intimacy which nowadays characterises Commonwealth consultation has achieved concrete practical results, which probably could not have been secured by other means. Sheltered from the full glare of publicity, Commonwealth statesmen have discussed their common problems without being inhibited by thoughts of possible reactions at home. They believe in "open covenants" but not that they should be "openly arrived at." The essential correctness of this approach is not in doubt, but it incurs some disadvantages. In particular it precludes publicity at a time when wide understanding of Commonwealth affairs was never more important. Within the last decade there have been profound changes in Commonwealth relations, which reached a climax in the 1949 London Declaration. If public understanding lags far behind these developments a principal reason for it is the lack of informed public discussion about them. That is why increasing importance attaches to the unofficial conferences on Commonwealth relations, organised by the Royal Institute of International Affairs in London and its sister institutes in the various Dominions. It also helps to explain why the fourth in the series, which recently took place at the invitation of the Canadian Institute at Bigwin in northern Ontario, has been the most successful.

The Bigwin Conference, at which the Asian Dominions were represented as such for the first time, and to which the Republic of Ireland sent a delegation as evidence of their desire for continuing close co-operation with the Commonwealth countries, afforded reassuring evidence that the loosening of formal ties has not impaired the deeper sense of community. There was little disposition on the part of the conference to examine at all closely the implications of the recent Declaration which allowed India's republican status to be consistent with full Commonwealth membership. On the contrary the delegates from Asia, as well as from the older Dominions, were disposed to endorse the liberal, unrestrictive interpretation of constitutional ties and to feel, with some reservation on South Africa's part, that its wisdom was not a matter for fruitful debate. The constitutionalists, in fact, had done themselves out of a job by proving to most people's satisfaction that constitutional ties must be subordinated to political realities.

Questions from Asia

The inquiry of the Asian Dominions was indeed more fundamental in character. They asked, politely but persistently, what is the true nature of the Commonwealth, and unlike the jesting Pilate, they stayed on in Bigwin Island waiting for an answer. When it came it was not explicit but implicit, and they had in no small measure formulated it themselves. The Commonwealth was an international association of states, an international democracy, whose life-blood was free discussion among equals and whose aims were to be realised through a common purpose, but not a common policy. Those aims, shared by all men of good-will, were liberty, peace and a higher and more equal level of material well-being. The Asian Dominions were not, significantly enough, interested in a self-styled new Commonwealth. They had become members because they liked what they had known about the Commonwealth in the past. But they believed that its spirit required revitalising, that its practical co-operation needed more emphasis on its positive aspects.

Delegates from the west, with their gaze for the most part firmly fixed on Europe, were reminded by their colleagues from Asia and from the Pacific that the victory of Communism in China was something that could not be countered by policies suggested by easy parallels from their own experience. In particular there is little to be gained by talking of regional security pacts in areas where as yet there exists no solid foundation for them. Neither in the Indian Ocean nor in the Pacific does there exist a state with the industrial potential, the manpower or the administrative machine essential for successful defence against aggression by a major power. Nor does there exist either within the Indian sub-continent or without the measure of political agreement indispensable to military co-operation. The still unresolved dispute in Kashmir estranges Pakistan from India; the slowly yielding imperialism of Holland and France evoke a hostility little if any less marked than the Communists themselves; while further afield looms the yet more fundamental problems of racial discrimination dividing India from South Africa. Finally, all over south and south-east Asia there exists a standard of living so low that the struggle for subsistence precludes understanding of those values which Communism would destroy. The problem of defence, observed a delegate from Ceylon, may be first in point of time but the raising of the conditions of life is first in point of importance. That was a conviction insistently stated by all the delegations from Asia.

Closer Economic Planning

It is clear to everyone that a general raising of the standard of living in an area where population presses so heavily upon the means of subsistence is not something which can be done in a year or even in a century, but that is no excuse for neglecting it. If it is to be tackled realistically, one essential is economic aid from without and that can come only from the United States. While fears of dollar imperialism are dwindling, they suffice still to prompt reservations in India about dollar loans from official sources. Private investment is free from such objections but conditions sufficiently attractive to the private investor do not yet exist. Because of this, Indian delegates were disposed to think in terms of closer planning for investment and for economic development by the Commonwealth countries, and of a consultative body which might enable the Commonwealth to act in an intermediary capacity. All this merits careful consideration; for a feeling exists, which may prove to be of critical importance in the case of Pakistan, that the economic policies of the Commonwealth and particularly of the United Kingdom, do not take their desperately pressing needs sufficiently into account.

Large as the economic aspects loom in Asia they must not be allowed to obscure the strategic. In the past it has seemed to some observers that a struggle for power between India and China fought out in Malaya lay in the logic of history. Now, if adequate defensive measures are not taken in time, that conflict may loom near, superimposing an ideological upon its national character. The resolve of India, Pakistan and Ceylon to resist Communist attack from without or infiltration within is notably hardening. It has infused into their thinking a greater appreciation of defence needs. At Bigwin there was no disposition to criticise Britain for its determination to defend Hong-kong or to suppress disorder in Malaya. The Treaty arrange-

ments allowing British Forces the use of bases and air fields in Ceylon are viewed with satisfaction by its people. And there were also not lacking indications that India, if it could preserve its prestige, would be happy to reach a settlement over Kashmir. At present defence consultations between the United Kingdom and the Asian Dominions are bilateral; they should become multilateral.

The problems of western Europe, of the Atlantic and of the Middle East were analysed at Bigwin with as much care as those of the Asian Dominions. But the discussions reflected on the one hand a general feeling that, however urgent the problems of the west, they had been temporarily eased as a result of the breathing space afforded by the Brussels Treaty and the Atlantic Pact; on the other hand a qualified recognition of the truth of Dr Evatt's remark that the centre of gravity of the Commonwealth had moved eastwards. Indeed, one of the most fruitful purposes served by the Bigwin Conference was to place developments in western Europe in perspective against the wider Commonwealth scene. It was instructive to learn of Indian misgivings lest Britain's more intimate association with western Europe should lead her to support "reactionary imperialisms" in Asia; to be reminded of what critical importance the direction of Colonial policy in Africa may be to the future of the Commonwealth, and it is well to understand that this country's graciously-acknowledged moral prestige in Asia is conditional upon her remaining, for all her faults, the "greatest liberal, progressive force in the world."

Show Piece in Budapest

[BY A CORRESPONDENT]

AFTER the Hungarian election of last May the new Parliament reassembled, and it was noticed that the Minister of Foreign Affairs, Laszlo Rajk, was absent. At the beginning of June a short communiqué announced his arrest on a charge of high treason. Official comment in the Hungarian press and radio hinted that he was the originator of a "nationalistic anti-Soviet" *coup d'état*. Too many British and American commentators at once concluded that in all the Communist Parties of the satellite countries there are certain trends of opinion which, although orthodox Marxist, repudiate subservience to Moscow; Gomulka in Poland, Petruscanu in Rumania and Rajk were all quoted as examples of this so-called "National Communism." By grouping these "National Communists" under the supposed leadership of Tito, and by broadcasting in this sense to the satellite countries through the BBC and the Voice of America, western commentators helped to create an atmosphere for the Rajk trial which was most useful to the prosecution.

The Economist reprinted

The United Nations Educational, Scientific and Cultural Organisation proposes that back numbers of *The Economist* from 1939 to 1945 shall be reproduced by photo-lithography for sale at 1/- per copy. It will, however, be necessary to have a minimum of 100 orders for any one issue.

It is also proposed that issues before 1939 shall be micro-filmed; the cost of this will depend on the number of pages in the issues concerned.

Those who wish to obtain sets of *The Economist* for these years, or single issues, should *not* address their inquiries to *The Economist*, but to:

UNESCO

Clearing House for Periodical Reproduction,
19 Avenue Kléber, Paris, 16.

Preparations by Press and Radio

In Hungary, on the other hand, no further mention was made of the conspiracy for over three months, save in a short communiqué which disclosed the names of those who were said to have collaborated with Rajk in his "treacherous activities," among them two Yugoslavs. The dramatic silence was broken on September 11th when the State Prosecutor published his indictment. The trial opened on September 16th, and it ended on the 24th with sentence of death on Rajk and two of his collaborators. During that fortnight the Hungarian press devoted almost its entire space to the trial. Budapest radio ceased all entertainment broadcasts and confined itself to transmissions of the trial, followed by quotations from the international Communist press. The same predominance of the trial in the radio programmes of Moscow and of all the satellite countries showed that the Rajk case was a show-piece designed for the Moscow-directed one-fifth of the world.

Although Rajk's name had not been mentioned during the weeks preceding the trial, Moscow's diplomacy and propaganda in August and September were busily preparing a suitable atmosphere for the direct blow against Yugoslavia which took shape in his trial. Two Soviet Notes to Yugoslavia were published in August referring to the Austrian Treaty negotiations, and intended to prove that it was Tito—not Stalin—who gave up the Yugoslav claim to Southern Carinthia. A further Soviet Note, released on August 18th, protested against the "persecution of Soviet citizens in Yugoslavia." These Notes were followed by numerous articles and broadcasts in the Soviet and satellite press and radio, implying that Yugoslavia had become a "servant of American imperialism." Finally, two days before the publication of the Rajk indictment, the new broadcasting station of the "Anti-Tito Yugoslav Revolutionary Emigrés" was inaugurated.

It is against this background that the indictment, the confessions and the convictions of the Rajk trial should be assessed. It was far more than an isolated Hungarian incident supposed to reflect "nationalistic tendencies" in the Communist Party of Hungary. The indictment as well as the confessions were presumably drafted under Cominform direction as an important step towards liquidating the Tito regime. Hungary was chosen for this particular stage of the Communist campaign, just as it was selected as the best country in which to test the power of resistance of the Catholic Church. For the Soviet campaign against Yugoslavia it offered many advantages. In the present stage of establishing the open dictatorship of the proletariat, it had become ripe for a purge any way. The Rajk trial is therefore in its secondary, local aspect only the beginning of a series of purges, which will eliminate and liquidate all elements in public life not considered as 100 per cent reliable. Rajk's reference in his confession to the alliance between Tito and "right-wing Social Democracy" foreshadows the next trial, which might lead to the liquidation of all former Social Democrats who are not trusted and who would be, of course, accused of espionage. Hungary was also geographically, politically and strategically suitable as a launching site for a political—perhaps eventually a guerrilla campaign—against Yugoslavia.

The comment of the Yugoslav vice-president, Pijade, that the presence of Rajk and the others in the dock was purely accidental, seems correct. According to him they were selected for this part "because they suited technical conveniences and current political combinations." It seems likely that the whole affair was devised and staged in the following sequences. First, it was decided to hold a spectacular trial in which all Soviet measures contemplated against Yugoslavia were to be embodied in the indictment *in reverse*, that is to say as alleged Yugoslav plans for aggression against a neighbour. Second, it was decided to hold the trial in one of the countries bordering Yugoslavia, to make the threat quite clear. At the third stage, Rakosi was probably invited to select the victims. Rajk has been considered by all those who have some knowledge of the Communist machinery as a candidate for liquidation ever since

he was degraded a year ago from the all-powerful post as Minister of Home Security to that of Foreign Minister. Against him were these facts: he was not Moscow trained, and he was an intellectual (a former student of French literature); therefore both of the new slogans "class alien" and "cosmopolitan" could be conveniently applied in his case. Then he had spent a considerable time abroad in Spain and in France, which made it easy to construct ties between him and western intelligence organisations, and with Yugoslavs whom he is supposed to have met there. Moreover, as the former ruthless master of the political police, he was as unpopular in wide spheres of the population as the Soviet Yagoda, who ended his career in the same way about 12 years ago. Last, but not least, the Premier, Rákosi, disliked him.

Choice of Rajk's Collaborators

His collaborators were chosen in order to satisfy certain points of the indictment. Rajk's relationship to Tito had to be proved; hence the presence of two Yugoslavs in the dock. They were not condemned to death, and they may have been agents who played their prescribed parts. Tito and Rajk were supposed to have planned a *coup d'état* with the help of the Hungarian army. In order to substantiate this, officers of the Hungarian army had to be involved. The victim selected for this role was George Palffy-Oesterreicher, who was suitable because he had been a commissioned officer during the Horthy regime. This helped to introduce the familiar element of "Horthy-Fascism." Furthermore, it had to be proved that the Tito plan was devised and fostered by the Americans. Therefore it was necessary to involve persons who had had opportunities for contact with the American intelligence service during the war. The choice of those victims was fortuitous and based mainly on geographical coincidences. Szönyi spent the war years in Switzerland and was responsible to the Party for all important appointments, including those which involved the selection of Hungarian Communists to work abroad during the war. Finally, and this is the unmistakable Moscow touch, the equation Titoism-Trotskyism could not be left out. Therefore Paul Jusztusz had to be produced in the dock as well. This left-wing Social Democrat was generally known as a Trotskyist during the inter-war period. After 1945 he recanted and became one of the most ardent Stalinists. Nevertheless, his old reputation came in most useful, and he had resided in Paris some time before the war. This again made it possible to involve the French Press Attaché, Gachot.

A remarkable aspect of the trial was its almost complete resemblance to the prewar Soviet purges. Apart from the privileges of selecting and supplying the victims, the Hungarians were not permitted to improve on the Moscow technique, although the new Hungarian Minister for Ideological Education, József Révai, spent two months in Moscow prior to the trial on the invitation of the Soviet Government. The crudeness and cunning of the accusations, the monotonous Marxist terminology of the confessions, the vituperative jargon combined with oriental flourish which prevailed throughout the trial, seemed to indicate that he had no part in drafting those documents. All are lacking the finesse and psychological insight one could expect from an educated Hungarian intellectual.

Parallel with Moscow Trials

The full Moscow technique of the Zinoviev-Kamenev-Bukharin trials was applied almost without any variations. In Moscow the guilty men confessed not only to alleged deviations from the party line, but enlarged their guilt retrospectively. They had to admit, therefore, participation in acts of sabotage and violence ever since 1917, including the murder of Kirov and even the attempt against Lenin's life in 1918. Likewise the accused in Hungary confessed that they had been police agents and spies ever since they joined the Communist movement. In the Moscow purges the scope of the confessions had not only to be enlarged in terms of time but also in terms of

space. The confessions included plotting with foreign powers, conspiracy to betray the Soviet Union to Fascist Germany, Japan and Poland. Now Rajk and his fellow accused confessed that they endeavoured to betray Hungary to the "American-Yugoslav combine." In both cases the accused men also confessed to plotting against the life of the leaders of their respective Communist Parties and to pursuing the object of abolishing Socialism by violence and re-establishing the capitalist system.

Canada and the Devaluation of Sterling

[FROM OUR CORRESPONDENT IN OTTAWA]

No one here, not even the Government, expected the pound to go as low as Sir Stafford Cripps and his advisers finally decided. Indeed, it is a matter of speculation whether, if the pound had dropped to only \$3.20 (which was about what was expected), the Canadian dollar would have been devalued at all.

In face of the British action, the main Canadian difficulty was to decide the degree of devaluation appropriate. The British decision, it is assumed, was based on the black market rate and designed to remove any suspicion that this was not the final step. The Canadians had no such guide, for the limited free market in Canadian dollars in the United States, running at about 95 cents, would not serve. Yet some devaluation was necessary to mitigate the rise in sterling prices for Canadian products, to give Canadian manufacturers some protection against the cut prices of British goods, and to improve their competitive position in other markets. This might have suggested a 15 per cent cut, but that would have meant an increase in the purchase price of goods from the United States more drastic than the Government felt to be justifiable.

Ostensibly the devaluation of the Canadian dollar should help, if not solve, the exchange problem with the United States. Actually it is doubtful if this will be the result. Imports from the United States, running latterly at a rate of about \$2,000 million a year, are of such a kind that it is doubtful whether a price increase will do much to reduce them. To a great extent they involve such things as coal, oil, steel and the like which are essential for Canadian industry. Canadian exports to the United States, running currently at about \$1,500 million a year, will not automatically increase by the 10 per cent of the devaluation. Increased volume might be expected if the advantage of the 10 per cent cut were passed on to the American purchaser; but if it is not, it would be unwise to expect that sales volume will be increased. In either case it is not safe to bank on greatly increased earnings of US dollars.

It might be hoped that increased imports from the sterling area could replace some imports from the United States, but this seems to be possible only in a limited field. The really big items such as coal and steel which Canada buys from the

Fine fabrics and scarves by

Jacqmar

are available in most countries. For your nearest representative, write Jacqmar Wholesale and Export Ltd 16 Grosvenor Street, London, W.1

United States are things which Britain cannot supply in sufficient volume to meet the demand. Last August Britain promised to double its deliveries of steel to Canada, but even the doubled total is only 160,000 tons a year, whereas total consumption is counted in millions.

The optimists here are saying that when the major price adjustments which must follow the revaluation are accomplished, in about six months the Canadian cost of living will be no higher than it is now. But most Canadians find it difficult to share this optimism. They are facing immediate increases in the cost of coal and fuel, and winter is coming on. They will have to pay more for all manufactured goods, whether made in Canada or the United States, which depend on American materials. The housewife is glad to think that British china and cotton goods may now be cheaper, but that does not make up for the higher price of fruit and vegetables, fuel, washing machines and all the other household appliances for which she looks directly or indirectly to the United States.

Grateful Farmers

It is by no means certain that the 10 per cent price differential introduced by the devaluation will save the Government from the need to tighten up the exchange conservation programme of import restrictions. If it is at all possible, it will remove the ban on imports of fruit and vegetables from the United States, because the growers of California and Texas have a powerful lobby, and the ban is distinctly embarrassing to the United States Administration; but it is still doubtful whether the threatened control of steel imports can be avoided. Thus far, price has appeared to be a minor factor to Canadian importers, and in the absence of adequate supplies from soft currency countries the demand for American steel products may be maintained even with a price increase of 10 per cent. If this appears to be the trend, in a few months the Government may be forced to impose import controls.

The farmers of western Canada have never been so grateful as they are now for their long-term selling arrangements. Devaluation makes no difference to the price they receive for this year's crop though they will be paying more for their machinery and other supplies made with American materials. The price of \$2 per bushel for 140 million bushels under the British wheat contract, now in its final year, stands unchanged. If the Canadian dollar had remained at its previous level the British Government would have had to pay 44 per cent more than it had expected for the Canadian wheat. With the Canadian devaluation not only has this been reduced to a 30 per cent increase, but the value of the \$175 million now to be provided by ECA is appreciated 10 per cent in terms of the Canadian dollar.

After this year the farmer has only the international wheat agreement to rely on, and he relies on it a good deal more firmly than some officials do here. The prices provided under this agreement were to be at the rate prevailing at the time it was made. So if Canada can manage to sell its wheat in 1950-51 at the maximum price under the agreement the farmer would get a price of \$1.80 plus 10 per cent, or only two cents less than \$2.

Prospects for British Goods

The prospects for British sales to Canada are of course greatly improved. The theoretical price advantage they will now enjoy is 23.6 per cent. Shipping and other charges reduce this substantially, but exporters should have plenty of leeway. In textiles, the effect of the tariff reimposed last summer will be wiped out and British exporters should be able to compete on favourable terms with domestic manufacturers. As against American firms they have a double advantage because American imports will have to meet, not only the quota and continuing tariffs, but also the 10 per cent price premium. In the field of cars and other manufactured goods which are made in Canada

largely from American materials, the British exporter has the double advantage of his own price reduction and an increase in the cost of the domestic product. Small British cars should become about \$200 cheaper and short of price-cutting the cheapest Canadian-built car will have to be almost \$200 dearer.

Provided, therefore, that British manufacturers do not allow the increased cost of raw materials to raise their sterling prices unduly, price should cease to be an obstacle to the sale of British goods in this market. The "merchant adventurers" will have a clear field for adventure but they will have to be adventurous. Canadians will not buy things they do not want, even if the price looks favourable. They will not, for example, buy leather wallets which fit pound notes but will not hold dollar bills. If the desired switch from the United States to Britain as a source of supply is to be accomplished, Canadians will have to be persuaded, not only that the British price is competitive but also that the British goods meet the standards and styles to which they are accustomed.

The whole of the sterling area will also have to take part in the increased sales. An excellent example is the citrus fruit industry of the British West Indies. For every reason Canada would like to see West Indian fruits supplanting some American products here. The price should be no obstacle, but the general attitude here is that the West Indian fruit, in comparison with that from California or Texas, is badly graded, badly packaged and badly marketed, and devaluation of the pound is not going to make up for that.

All the main items that the United Kingdom has been buying from Canada will now cost about one-third more than they did and it is doubtful how many of them can still be imported. This thorny question is now being thrashed out in Ottawa by the permanent Anglo-Canadian committee on trade. The most important categories by far are food and base metals. Of the food purchases wheat is the most important and it is difficult to see where else Britain could get the required amount. But the other contracts for bacon, eggs and cheese are not sufficiently large to make up a very important part of the British ration, and at post-devaluation prices they may not be very attractive to Britain.

Prices of Bacon and Cheese

The 1949 cheese contract for 50 million pounds was fulfilled in August and the British Government has already refused to take anything beyond the contract quantities. The bacon contract was for 160 million pounds. Deliveries up to September 17th amounted to just over 21 million pounds and although the main season comes in the autumn months the total deliveries for the year are not likely to be above 60 million. Eggs are also well behind the contract figures, and it is expected that some of these which might have come to Britain during the rest of the year will be attracted south of the border.

The Canadian Government is pressing for the renewal of these contracts. In theory the price differential resulting from devaluation might provide a market in the United States, but official circles here know very well that if any significant quantity of agricultural products moves into that market the pressure on (and by) Washington to stop them will be very great. In the second important category—base metals—the British Government seems to have less choice. Industry needs aluminium, copper, lead, zinc and nickel and it is difficult to see where else they could come from. Of the smaller items on the British purchasing list Canadians fear that things like lumber, salmon and canned vegetables may have to be foregone.

In general the Canadian picture is full of uncertainties. The two developments which could really cheer it up are hoped for, but not expected with any degree of confidence. These are a substantial increase in earnings of US dollars and a spate of British goods which would reduce Canadian dependence on American imports—without, it is necessary to add, completely putting Canadian manufacturers out of business.

THE BUSINESS WORLD

Freedom for Metals

DEVALUATION has brought to the fore the important issue whether dealings in non-ferrous metals are to be kept in the hands of the Ministry of Supply or allowed on a reopened London metal market. On no issue of commercial policy has the Government been more opinionated in the past. There was a period soon after the war—the period when what remained of the Liverpool Cotton Exchange was wantonly demolished—when it was a favourite argument among Ministers that bulk purchase and selling by a Government agency was the cheapest and most satisfactory method of furnishing British industry with its raw materials. Such illusions did not survive the experience of the next year or two. So far as metals were concerned, the Ministry of Supply proved to be no more long-sighted than any other fallible being. For a time, it sold metal "cheaply"—that is, below replacement value. Then, when it had to buy new supplies, it charged the full purchase price, even though replacement values began to fall, and thus prejudiced the competitive power of British manufacturers in the export markets. Then, throwing all pretensions about "averaging of prices over a period" to the wind, the Ministry decided to base itself on the American market, and to charge equivalent prices to British users.

That system has been working since the beginning of July. Its introduction was at least a shrewd piece of timing for American prices of non-ferrous metals began to recover almost simultaneously. Nor (as was emphasised in these columns last week) is the Ministry of Supply to be blamed for raising the prices of copper, lead and zinc close to the new dollar parity after devaluation took place. Its rule was to follow the American market, and it was only playing the game according to the rule. It disregarded—and was right to disregard—any childishness about "profiteering." For once, it took good care of the taxpayers' real capital (that is, its stocks of metal) and refused to squander that capital by selling it at an uneconomic price. But tactics may be right and strategy at the same time wrong. The test of the Ministry's policy is not to be found in its behaviour on a special occasion such as devaluation, but in the assumptions on which its trading policy is based.

On this question, the Minister's most recent and most explicit apology for keeping the trade in non-ferrous metals in his own department was given on July 11th and was analysed with some care in *The Economist* of July 16th. His case against restoring an open market was founded on two main points. First, the overvaluation of sterling at that time would have been an irresistible temptation to buyers in other countries to pay for their metal in cheap sterling and resell it to the United States at a cut dollar price. If \$2.80 to the £ is a realistic rate, that argument loses its force, for it depends on the existence of unofficial markets in which sterling is offered at a discount. Secondly, Mr Strauss claimed that to abandon bulk buying of non-ferrous metals from sterling area sources might deprive Britain of supplies and drive purchasers into dollar markets. This, of course, was a confusion which also reflected the artificial value of the pound in the weeks before devaluation. If the dollar-sterling exchange rate is right, and the prices of metals in the

two markets thus have a solid economic foundation, there is no reason why the dollar market should suck in supplies and endanger the flow of raw materials to British industry.

It is for these reasons that devaluation has reopened the issue whether the metal market should now be reopened. Whatever force the arguments to the contrary may have had last July, they are plainly altered by the new conditions. As long as the pound was overvalued in terms of the dollar, there was something in the case for isolating the sterling and dollar markets for non-ferrous metals, for undoubtedly at the old \$-£ rate, British metal prices were much cheaper than was justified by the true relative values of the two currencies. Open dealings in metals would have reflected this disparity long before devaluation took place, and the prices of metals would have risen steadily towards a parity which the Government were eventually forced to accept. Thus the shift of prices which has come about suddenly as a result of devaluation would have occurred over a period with much less troublesome consequences. But fundamentally the argument remains: if the exchange rate is right and dollar and sterling prices are in line with that rate, there is no danger of one market being pulled out of control or denuded of supplies by the other.

★

Much of the criticism of Mr Strauss for hitching his wagon to the star of American prices has taken the line that these prices are the result of a market process far less efficient and far less competitive than was the London metal market in its prime. The pull of demand for base metals has indeed shifted in the last ten years very strongly towards the United States. Formerly almost self-sufficient, America now needs much larger imports of copper, lead and zinc. But American consumers are not in a position, as were purchasers on the London market before the war, to obtain their requirements in a market where the competition of suppliers and purchasers determine the price. A reopened metal market in London would not be able to restore such a degree of competition immediately. It would necessarily have to work within the general ambit of exchange control (which the rubber market finds no difficulty in doing) and it would have to reckon with the fact that the sterling area is a net exporter only of tin, and a net importer of the other base metals from dollar sources. But, to repeat, that fact alone does not justify the mulish adherence to Government purchasing, and the slavish reproduction of every adjustment of American prices.

Tin has always been a case apart—at least in the view of the Ministry of Supply—in the argument whether the metal market should be reopened. Last July, Mr Strauss declared that "other considerations" (which he did not specify) would determine whether private trading in this metal alone might be permitted. A decision was promised later, and this week it has been announced that bulk buying is to end. Discussions are afoot between the Ministry and the Committee of the London Metal Exchange about reopening the Exchange for dealing in tin "at the earliest practicable

date" and the conditions under which it will be allowed to operate. Meanwhile the Ministry has rather belatedly raised its price for tin to British buyers to £750 a ton, compared with £569. The price to American buyers is reduced from \$1.03 a pound to 95 cents, which corresponds to £739 a ton ex Straits smelter. But this new price will presumably only operate as a stop gap until the market reopens. It will be noted that the Ministry has taken a very different line in fixing the new price of tin from its decisions last week on the other metals, for the new price is £70 below the new parity. The fact that the dollar price has been reduced can hardly be unconnected with the threat—to put it no higher—of consumer resistance to paying an extremely high price at the very time that supplies are increasing and there is talk of restriction of output. It was not long ago that some spokesmen for the tin industry were describing the possible re-opening of the tin market as a "retrograde step." The Ministry has at least found enough courage to disregard such comment, and to come down on the side of the industrial user. The decision will be salutary for the tin mining industry and without question in its own long-term interest.

The reopening of the metal exchange to deal only in tin would raise many practical problems. Turnover will be very restricted, even compared with prewar dealings. Up to 1943, the United States bought most of its supplies in the form of metal, and mainly through the London market. Now, however, nearly half of America's annual consumption (which is no larger than it was before the war) is met by the output of the Texas smelter which uses Bolivian ore. For political reasons, the United States may continue to buy Bolivian ore direct; if so, its purchases of tin metal through the London market will *pro tanto* be reduced. There is also the question of the international allocation scheme, which has limited the purchases of individual countries to their current requirements—except for special needs such as stock piling. If international allocation were abandoned, presumably some export control would still be needed to make sure that Russia did not buy undue quantities.

One question, however, has been disposed of by the events of the past fortnight. They destroy the arguments for an international marketing scheme for tin. If there is to be a free market, there is no room for a scheme which must base itself on restricted output. Only the blind or perverse could argue that the high price of tin has no connection with the fact that world production exceeds consumption at that price. Nor, after the raising of the sterling price, can it be maintained that restriction is necessary in order to maintain high prices in order to preserve political stability in Malaya.

But if open dealings in tin would test the meaning of a "fair price," they would by themselves do nothing to ensure that the price of all non-ferrous metals were in orderly relation with each other. That would be a function performed—as far as it was performed at all—by the New York market, with all its limitations. In New York, it is the custom smelters who determine the rise and fall of market prices, but as often as not such quotations bear little relation to actual prices paid by consumers to producers, because both interests are largely integrated under common financial ownership. Under present conditions, and given the broad limitations within which a commodity market must now operate, a reopened metal exchange in London would not provide a perfect market. But it would almost certainly provide a better approach towards a satisfactory market than the present combination of Government buying and selling in obsequious pursuit of the New York "price." If the Government resist the demand for the reopening of the metal market, it will be widely suspected, until there is proof to the

contrary, that it is trying to keep down the contract prices which it pays to sterling producers to the levels which obtained before devaluation. If this is "incentive" for greater selling effort to the dollar market, it would certainly be a very peculiar one. It would in fact be a grotesque exploitation of the Ministry's selling monopoly.

Would a reopened metal market be short of supplies and therefore incapable of functioning smoothly? On this point, an analysis of the expansion in world production of the four base metals is illuminating. In the accompanying table production of each metal for the years 1946 to 1948 (and 1949 where possible) is expressed in the form of index numbers based on the prewar average 1934-38. In each year, the sterling area's share of world production is also given.

By 1948 world tin production was only 4 per cent less than before the war. Production within the sterling area, however, was still 15 per cent below the 1934-38 average while its share of the total was only 37 per cent against 41 per cent prewar. During the first half of 1949, however, production in the sterling area continued to expand whereas production in the rest of the world declined. World output of copper

	1934-38 Average	1946	1947	1948	1949
Tin :—

Zinc :—					
World	100	97	110	119	...
Sterling area	100	113	113	125	118
U.S.A. and Canada	100	152	165	166	193
Proportion of sterling area to world	10	12	11	11	...

in 1948 was 33 per cent larger than prewar; output in the sterling area fully kept pace and comprised, as before the war, over 12 per cent of the world total. In zinc, the sterling area by last year had increased its output by 25 per cent, compared with prewar, while world production was only 19 per cent higher. World production of lead in 1948, however, was still 13 per cent below prewar, whereas output in the sterling area was 31 per cent below and its proportion of the world's total fell from 21 per cent in 1934-38 to under 17 per cent last year.

These figures at least show, that in copper and zinc, the recovery in sterling area production has been better than that for tin and indeed that it has kept pace with the expansion of world production. But the final test is price. A distorted set of prices, such as prevailed until last week, invites failure for free market dealings from the start. An orderly set of prices, for which at least the foundation has been provided by last week's decisions, should give market dealings a fair start, so long as the Ministry is discreet in unloading its stocks (which are thought to be equal to one year's consumption in this country). Having taken the right decision in tin, the Ministry has no excuse for failing to release the rest of the non-ferrous metals.

Ships, Shipyards and Devaluation

SHIPOWNERS are not yet in a position to calculate exactly the effects of devaluation on their business, for many changes which are possible in their operating costs have still to be reflected in voyage accounts. Certain short-term effects are plainly discernible. Ships operating in trades which require direct disbursements in dollars will now require increased expenditure of sterling at the new rate of exchange. In the nation's trading account, expenditures by British ships in foreign ports are invisible imports, and an immediate effect of devaluation is to increase these outgoings in terms of sterling. Conversely, the invisible exports represented by the disbursements of foreign ships in British ports will decline in terms of dollars and other currencies which have not devalued. It remains a matter for conjecture whether this deficiency will be made up by an increase in the invisible exports represented by shipping services. If the devaluation of so many currencies does lead to an expansion of worldwide trading, British shipping can expect to find more scope for employment.

Short of any such general expansion, has any new competitive advantage been gained? The other maritime countries have offset any such advantage to the extent that they have devalued their own currencies. A theoretical advantage has been gained in the competition with American shipping itself. But is it likely to be effective in practice? It is a firm principle of American maritime policy that the State should subsidise the mercantile marine to the extent of paying the difference between American and foreign operating and building costs. Unless that policy is changed, a reduction of the level of foreign costs in terms of dollars will merely lead to higher subsidies to the American shipowners, to enable them to compete in the international market.

The trades most directly concerned by the devaluation are those serving North American ports, and in those trades the companies operating transatlantic passenger services took the first step. The Atlantic Conference met in London and agreed to follow the lead taken by the International Air Transport Association in increasing the sterling charges for transatlantic passages by 44 per cent. The alternative would have been to reduce the dollar charges, but this action would merely have sacrificed dollar earnings. Passenger capacity cannot be expanded overnight, and the Atlantic Conference evidently saw little prospect of increased sales of accommodation on a scale to offset a reduction of dollar fares, except possibly during the off-season. Even in that season the ships concerned are generally engaged in maintenance and overhaul, or in cruising from African ports. The principal American member of the conference is the United States Lines, cannot have been anxious to see its fares reduced.

Some of the considerations which affect the passenger conference to raise its rates apply equally to the passenger tramps engaged in North Atlantic traffic, but to liners and any means certain that these are in a position to meet yet by sterling rates to offset the reduced dollar value of their currencies. They have more competition to meet, and do not share the advantage of an assured two-way traffic. A manipulation of freight rates for transatlantic cargo traffic is likely to have more far-reaching consequences, since freight rates are a direct element in the cost of imports and exports alike. For the time being, at any rate, exporters to North America will not be asked to pay higher sterling freights, since the conferences concerned have decided not to increase

outward freight rates to Canada and the United States at least until the close of the St. Lawrence shipping season in the middle of November. What is to happen after that date remains for the shipping companies to decide in the light of experience.

The tramp freight market has reacted only slowly to devaluation. Shipowners are normally cautious in committing themselves to a new course of action, and they are not yet able to assess the full effects on voyage accounts. The transatlantic trade has been in a depressed condition for some months. One or two ships have been fixed for grain at 8s. a quarter, an increase of one shilling since devaluation, but it is doubtful if an increase of that order will fully cover the increases in the cost of dollar disbursements. Other factors, apart from devaluation, have their effect on the tramp market, and it is possible that these fixtures at rates as low as 8s. represent, in fact, a further depression in the market which has been disguised by the devaluation factor. The lack of cargoes in the Plate trade still exerts strong pressure on the freight market and a surplus of tonnage has recently developed in the East, depressing freight rates there and possibly attracting tonnage in the homeward direction. Tramp shipowners can derive no consolation from the knowledge that imports of bulk commodities from North America to Europe, particularly grain, sugar, timber and coal, are likely to decrease, while the increase in westbound exports—if it comes—will consist mainly of manufactures, for which the liners are better suited than the tramps. Increased opportunities of employment on time charter with the liner companies may appear after a time. It would be logical to expect increased exports of anthracite to Canada, and of British coal to overseas bunkering depots, to displace American coal, but the slow rate of increase of British coal output does not suggest that those hopes are near to fulfilment. So far as ECA cargoes are concerned, American insistence that 50 per cent of these should be carried in American ships means that no saving can be gained by switching such cargoes to sterling tonnage.

Much the same considerations apply in the tanker market, where chartering came to a standstill with the announcement of devaluation. Charterers as well as owners are disposed to wait for the outcome of the Anglo-American oil talks in Washington, since these may decide the movement of oil trading conditions. The trend of opinion is that freights will probably rise in sterling and fall in dollars, at least for a time.

Apart from port disbursements in dollar areas, the greatest factor affecting freight rates is the inevitable rise in oil fuel prices in the sterling area, and this will concern shipping in all trades. As an article in *The Economist* pointed out last week, sterling oil has a large dollar content, and its prices are bound to rise; but until the extent of that rise is known, shipowners cannot determine its exact effect on their operating costs. Other operating costs may be similarly affected, at least by the increased sterling price of their dollar element, and possibly by sympathetic increases in sterling prices.

Aside from meeting operating costs, shipping companies should make provision for the eventual replacement of their ships. It is necessary to consider carefully the movements of ship costs which are likely to follow from devaluation. Shipping is an industry which is especially sensitive to cost increases outside its control. Almost every increase

October

With the close of the holiday season industry and trade are in full swing again. Special efforts are being made to expand exports, and all interested in overseas trade, particularly those who are entering this field for the first time, are invited to consult the Midland Bank. At Overseas Branch, 122 Old Broad Street, London, the Bank has a Foreign Trade Information Department which is specially equipped to give information, advice and assistance on matters concerned with trade with other countries. This service is at the disposal of traders and merchants in all parts of Britain and is available at any branch of the Midland Bank.

MIDLAND BANK LIMITED

In industrial wages, almost every change in the cost of a raw material (whatever its principal use), and almost every change in the costs of services or public utilities, is reflected somewhere in the price of a finished ship. The raw materials most extensively used are steel and timber; these—and steel in particular—are among the commodities less likely in the short term to cost much more as a result of devaluation. But the sterling prices of non-ferrous metals have been raised to keep them in line with dollar prices at the new parity; they are widely used in the components which go into a ship, and particularly in the engine-room.

*

The shipbuilding industry can only be expected to find that its problem of high costs has become more acute even than before. It is faced with the prospect of still higher prices for some of the raw materials and many of the components of a ship. In the background is a further claim for an increase of £1 a week in wages from the Confederation of Shipbuilding and Engineering Unions before devaluation. Even shipbuilding prices had already reached the point at which shipowners, finding that their freight incomes were falling, were growing reluctant to contract for the future. The danger now is that the gulf will be even further widened between what shipbuilders charge and what shipowners are able to afford. Reduced costs, and higher productivity, in ship operating are desirable and necessary, but they depend on factors largely outside the shipowner's control. In the light of this, increased productivity in the shipyards, and in the engineering industries which supply the shipbuilders, appears as the decisive and urgent necessity.

Shipbuilding is also an exporting industry of considerable value. At present about one-third of the ships under construction are for export, mainly to countries which have devalued their currencies in the wake of sterling. Britain's competitors in shipbuilding may be expected to experience the same pressure towards higher costs as a result of their devaluation; the change in the value of sterling will not itself, therefore, lose or gain much business for the British shipyards. The truth of the matter is that the decline of export orders for British shipbuilding had already set in before devaluation began to appear probable. Reviving activity in Continental yards, assisted by lower labour costs, had already been depriving British yards of contracts which they might have won if prices and delivery dates had been better suited to the ever more exacting requirements of foreign shipowners.

Devaluation is not likely by itself to enable British exports of ships or of shipping services to the dollar area to be increased. Only a change in United States maritime policy could bring that about. Since the Merchant Marine Act of 1936, and even before, American maritime policy has kept British dollar earnings from level which the shipping and of ships well below the equipped to attain. No other shipbuilding industry such an advantage over the United States in the rest. To take a recent example, the lowest building in for a certain ship was \$3,490,000, compared with an American bid of \$1,720,000. The immediate effect of devaluation would be to reduce the British price to £600,000; but this is an academic advantage. Shipbuilding is preserved for American shipyards by the payment of a differential subsidy. The finished ship is kept in operation on international trade routes by an "operating differential" subsidy which is designed similarly to make up the difference between foreign and American operating costs, a difference in which wages are the largest

single element. There seems, therefore, to be no assurance that devaluation will increase the dollar-earning power of British and other European shipbuilding industries, or will make possible the winning of more dollar freights in the face of American subsidised competition on the high seas. It could, equally, mean an increase in the cost of subsidies to the American taxpayer; and the chairman of the United States Maritime Commission, on his recent visit to Britain, made this clear.

Shipping was one of the subjects raised in the recent Washington discussions. There has been no evidence that Sir Stafford Cripps obtained any specific concessions in the matter. The kind of concession that Britain would seek is not hard to see. As the recent report of the maritime trans-

Business Notes

The Political Chancellor

Sir Stafford Cripps's opening speech in this week's debate may have been an impressive defence of his change of heart about devaluation. But beyond that it ranks as one of the profoundest disappointments since he took office. Sir Stafford as politician overshadowed Sir Stafford as Chancellor—who must now be written off as Beethoven wrote off Napoleon in the dedication of the third symphony. There was again the self-peddling of the effect of devaluation on prices—bread and flour will put up the index by just over half a point

and it may be that by the end of the year, if there are no counterbalancing decreases, the index will have gone up by a point or so. That is the sort of measure of the immediate justification for price increases.

Again there was emphasis on the increased cost of imported dollar raw materials ("how much will depend on the course of dollar prices")—a proviso which has little or no meaning unless the Chancellor was actually contemplating a slump in American markets) but again no mention of the inevitable effect of devaluation in raising sterling raw materials.

There is no room to repeat the arguments put forward in last week's issue about the effect of devaluation on prices, but it is significant that Sir Peter Bennett, who took part later in the debate, declared that the increased costs of raw materials used by the companies with which he is connected amounted to 10 to 12½ per cent. The notion of costless devaluation, which even last Tuesday the Chancellor seemed at some pains to inculcate, is empty. The speech was equally empty of any proposals for effective collateral action to secure the advantages which are claimed for devaluation. The whole investment programme is to be reviewed, but "without major dislocation and waste we cannot bring about any very quick change in the volume of capital investment." There was no mention of any policy towards an increase in the rate of interest—surely one of the most effective means of choking off the excessive demand for new investments. A substantial ("though not spectacular") reduction in expenditure is expected from the pruning of "less necessary services," but the main items of Government expenditure are obviously sacrosanct.

Nor is any radical change in the disposition of labour and the rest of the apparatus of production called for. "Low efficiency in the factory can often be traced to faults of management"; that can be righted by closer attention to human relations in industry "which has been carried so far in America"—a claim which would surprise as many American employers as it would American workers. There is some excuse from "a long history of unemployment in the past" for some feather-bedding on the part of the workers, and it is to be deprecated. But only "in one or two industries" will higher productivity lead to redundancy and compel workers to move to new jobs elsewhere.

port committee of the Organisation for European Economic Co-operation showed, the deterioration in European (including British) shipping earnings in relation to the dollar area has played a serious part in widening the dollar gap. This is the more unfortunate since, on a basis of costs and efficiency, the European maritime industries would be well able to compete; but only a relaxation of American maritime policy would enable them to increase their dollar earnings. Such a relaxation would be a logical corollary to the liberalisation of American import and tariff policies which was suggested in the joint statement issued at the end of the Washington talks. It would, however, be politically awkward for the United States Government. Will the awkwardness be faced? The responsibility would seem to be squarely in American hands.

Profits Tax Raised

Disappointing and partial in its general approach, the Chancellor's speech produced out of the hat a wholly inexcusable and unjustified threat about dividend limitation and an announcement that the tax on distributed profits is to be raised as from September 27th from 25 per cent to 30 per cent. Here the Chancellor was politician indeed. He admitted that the incentive to exporters to increase their dollar sales was the expectation of higher sterling profits. But, he proceeded,

there is no way I have been able to ascertain by which selectively we can catch the extra profits arising out of the alteration of the exchange value.

Presumably, if there had been a way, the Chancellor would have taken it, offering incentive with one hand and taking it away with the other hand. Then followed the threat. A few companies had "deliberately broken away" from the voluntary understanding to limit dividends. Therefore, industry generally must be warned that

if there is any further breaking away I shall consider myself at liberty to introduce legislation to restrict dividends in the next Finance Bill.

This is not merely ungenerous to industry; it is gratuitously offensive. For the facts are as well known to the Chancellor as to anyone else. The general acceptance of industry last spring was for a policy of restraint in dividend policy, and it has been generally observed. Some 2,095 companies of all kinds (including many which were still recovering from the war) showed the following figures in the year to last June 1—

	Preceding Year	Latest Year
	£ mn.	£ mn.
Total income	699.5	826.6
Depreciation	81.6	98.9
Taxation	280.8	328.2
Other charges	133.3	162.2
Net profit	203.8	237.3
Preference dividends	26.0	26.5
Ordinary dividends	94.4	96.4
Profits retained	83.3	114.3

The ordinary dividends of these companies increased by £2,000,000, compared with an increase of £331 million in their net profits. If this is not dividend limitation, what is it? How can the Chancellor, in the face of these facts, launch threats against industry about a breach of an undertaking which has been far more scrupulously observed than the corresponding undertakings by the unions? What kind of encouragement or incentive is provided by such a partisan outburst?

*

But more was to come. The lower income groups, as the Chancellor rightly said, will feel the effect of the rising cost of living more severely than "the average profit earner."

Therefore, as a measure of "rough justice," Sir Stafford Cripps announced the raising of the tax on distributed profits by one-fifth. The justice is indeed rough. To the general and familiar objections to a specific tax on distributed profits (which falls on industry, not on individuals) there is now added the crudity of a further impost supposedly to catch higher returns from exports (which would mean so much the less incentive to export if it succeeded) but levied on the distributed profits of all industry—in the home market or the export market without distinction. It will console a brewery company, no doubt, to make this fantastic contribution when its costs are rising and its sales are confined to the home market. It is really a monstrous and perverted political logic which gives a sop to organised labour by drawing additional taxation from industry's less than adequate reserves. It can easily be calculated that if the companies whose results are shown above maintain their dividends (they will in any case have to maintain their preference dividends), some £20 million out of the £114 million set aside to reserve will be absorbed in higher taxes.

It remains to be seen whether "as from today" means that all dividend payments made on and after September 27th attract the full burden of the new increase, or whether there will be an apportionment of the increase of tax according to the period in which the profits were earned. Apart from its basic unfairness, the increase would be additionally unfair if it was put on profits earned before devaluation. This point must be settled quickly, for it will be a gross injustice on investors if dividend payments have to be postponed until Parliament reassembles. If Sir Stafford made up his mind so quickly on the increase, he should explain equally quickly how it is to work in precise terms.

Devaluation and After

The Choice of the Rate

In the historical passages of his speech on devaluation the Chancellor of the Exchequer devoted some time to a justification, first of the decision to choose a fixed rather than a free rate for sterling, and, secondly, of the rate of \$2.80 which was actually chosen. The Chancellor dismissed as wholly unacceptable any "floating rate" which would imply that all exchange and import controls had been taken off and that sterling would be allowed to find its own level within that setting. Any such suggestion, however, has never seriously been made, and this was merely an Aunt Sally which the Chancellor set up himself in order to demolish with impressive deadliness.

But even within the limited range of transactions permitted over the exchange, the Chancellor said that the Government had decided it would be unwise to allow the rate to find its own level. He pointed out that there was a most pressing need today to encourage and expand world trade. For that purpose some degree of stability in exchange rates was essential. Sterling held a pre-eminent position in this respect as the currency so largely used to finance trade in the non-dollar world. Its stability was therefore necessary "to provide a firm anchorage" for non-dollar currencies. Even to our own exporters uncertainties regarding the rate of sterling would have been unsettling and damaging. Sir Stafford also produced a telling technical argument by pointing out that the constant intervention which would be required if a free rate were to be made safe for sterling would require substantial reserves and that at present British reserves were inadequate to attempt any such experiment. The main argument for allowing the rate to go free, of which much has been heard in this week's Parliamentary debate, is that it would ultimately lead to a more valid and realistic rate of exchange than any now chosen by the authorities.

Having decided on a fixed rate, the Chancellor said that two limits had to be observed. It must not be lower than was necessary to achieve the objective of the Government, but it must also be low enough to be capable of being held and to

make quite obvious to all the world that there would be no second alteration. In examining this problem the Government used as a criterion the competitive level of prices both in dollar countries and in other markets where Britain had to compete with dollar goods. The guidance of free markets in sterling had also to be taken. This evidence suggested that the rate should go as low as \$3 to the £ "and probably a bit lower." The final consideration was "to make it absolutely plain that this was not a tentative first step, but a final and completed operation." It was for all these reasons, said Sir Stafford, that a rate of \$2.80 had been fixed.

Diagnosing Inflation

No one will dissent from the Chancellor's assertion that "the results of the last budget are—if anything—working out as less disinflationary than we intended." In this context, as in so many others, his diagnosis is more defensible than the conclusions he drew from it. On this issue, indeed, Sir Stafford showed a considerable realism, for it is not easy to test the inflationary temperature merely by scrutinising the familiar estimates of national income accounting, and the Chancellor, avoiding reliance upon these, based his opinion on more empirical judgments. Thus he declared the most disturbing features to be the rate of dis-investment of savings and the fact that the slackening of exports, combined with rising production, has not produced any "noticeable easing of the position in the home market." This was a wise approach, for any conclusions based merely on the available figures—or at least upon those which are publicly available—would certainly have understated the extent of the danger. Thus, while the budgetary position has deteriorated, the shortfall compared with the estimates, though considerable, seems to have been rather smaller than is popularly believed. In the first 5½ months of the current fiscal year the "above-line" surplus amounted to a mere £8,000,000, in contrast with £224 million in the similar period of 1948-49, a deterioration of £216 million. For the full fiscal year, the budget envisaged a fall of £371 million in the "above-line" surplus and one of £192 million in the so-called "true revenue" surplus.

"Below the line," the deterioration has been less marked: net expenditure has amounted to about £238 million compared with £195 million in 1948-49, so that the overall deficit amounts to £230 million, compared with £29 million last year. For the full fiscal year, the overall surplus was expected to fall from £352 million to £14 million. Very little information is available about the trend of the other factors in the nation's capital account. In the early part of the year, gross savings by companies were probably still running above their 1948 level, but are probably now turning downwards. Personal savings, however—in so far as their trend can be judged by the behaviour of National Savings—have fallen throughout. For the first 25 weeks of the current year, before taking account of interest paid out on encashed Savings Certificates and excluding repayment of Defence Bonds at maturity, there was a net dis-saving of £41 million, compared with a dis-saving of £13 million in the similar period last year.

On a narrow statistical reckoning, however, it might have been deduced that the increase in inflationary pressure resulting from these adverse trends in the budget and in savings had been at least partly absorbed by the worsening of Britain's external balance of payments considered as a whole—since the effect of this has been to release "frustrated exports" for the home market. Such a calculation might lead to the conclusion that the disequilibrium in the capital account is of only minor proportions—which is plainly contrary to the facts. It is better by far to look to more general indicators of inflationary pressure—the persistent rise in costs, the recurrence of wage demands, and, above all, the persistently very low volume of unemployment, the trend of which has been downwards. But if such proofs as these of the rising pressure of inflation show the dangers of relying too much upon the purely statistical

analysis, they demonstrate also—what close observers suspected at the time—that the last budget promised to be insufficiently disinflationary even in the conditions in which it was framed.

* * *

No Correctives in Sight

While the Chancellor now in effect admits this, he plainly has no intention of making any heroic efforts to retrieve the ground which has been lost. There are to be "substantial but not spectacular" economies in administrative services, and there is to be another pruning of the investment programme. In addition—though Sir Stafford did not mention this—the budgetary position should be reinforced by an increase in the sterling value of Marshall aid. If the Chancellor does in fact stick firmly to the limit of £465 million which has been put upon the cost-of-living subsidies and if the internal accounting of receipts from ECA is honestly conducted (in the sense that, e.g., the Ministry of Food is debited with the full dollar value of ECA supplies), then these supplies will now be sold to the public at an average of 44 per cent more than before devaluation. In the current fiscal year, this might bring some £40 million of relief to the budget.

Even with this reinforcement, however, there is evidently no prospect that the disinflationary policy will be pushed to the point at which it exerts any positive effect. The Chancellor's aim, quite plainly, is merely to take some limited counter-inflationary action, to put a brake on the rise in sterling incomes, but never to impose such pressure as to create the general disinflationary slack in the economy which is indispensable if the requisite mobility of men and resources is to be obtained. Given this timidity in the budgetary approach to disinflation, it might at least have been expected that some attention might have been given to the possibility of recourse to monetary policy. No significance, presumably, need be

attached to the fact that this time the Chancellor did not reaffirm his adherence to the cheap money policy. But, if that is to be taken for granted, as he doubtless intends, the authorities might at least take the trouble to scrutinise their own lending arrangements. Having allowed the gilt-edged market to fall to a 3½ per cent basis, it is high time that the rates charged for loans to local authorities were adjusted accordingly. At the present level of 3 per cent they give a positive inducement to borrow in advance of need, and this not only tends to depress the market rate of interest now but will surely also increase the pressure on real resources later on.

"Profiteering" Markets?

Although the excitement in Throgmorton Street in the unofficial dealings on September 19th gave pain to those ignorant of the mechanics of a free market—including, if one is to take his Llandudno speech at its face value, the Prime Minister himself—the most remarkable feature of the stock markets since devaluation has undoubtedly been the smallness of the price movements which have taken place. Anyone unaware of the currency events of the last two weeks who compared the current price list with that of a month ago would be hard put to it to deduce that a financial earthquake lay between. This is well demonstrated by the monthly security index compiled by the *Investors' Chronicle*, which covers a wider range than some other indices, and is usefully broken down into sub-indices.

The latest index, made up to a date before the news of the increase in profits tax is reproduced overleaf. The comparison with August tells its own story. It will be seen that industrial ordinary shares rose, on the average, by only 3.9 per cent between August 25th and September 22nd (they have, of course, certainly lost the whole of this small gain since). Those groups

... the Barclays Group can help

IN THE UNITED STATES

With a coast to coast network of correspondent banks, a New York office of Barclays Bank (Dominion, Colonial and Overseas), and a representative in San Francisco covering the West Coast, we can:

- Get information for you on markets in the United States;
- Introduce you to agents who can handle your goods;
- Provide all the necessary banking services:

IN CANADA

Barclays Bank (Canada), a Canadian Chartered Bank, with branches in Montreal, Toronto and Vancouver offers the same services in Canada.

IN THE UNITED KINGDOM

Ask any Branch Manager of Barclays Bank Limited to explain to you how easily exporters can make use of these facilities, or write direct to 54 Lombard Street, London, E.C.3.

THE BARCLAYS GROUP OF BANKS

CONSOLIDATED MAIN REEF MINES & ESTATE, LIMITED

(Incorporated in the Union of South Africa.)

Extracted from the Annual Report for the Year ended 30th June, 1949.

CAPITAL, £1,247,602 IN £1 SHARES. ALL ISSUED, FULLY PAID.

DIRECTORATE.

W. M. FRAMES (Chairman), P. H. ANDERSON, W. M. BARCLAY, MAJOR C. S. GOLDMAN, P. S. HAMMOND, G. V. R. RICHDALE.

	Tonnage Milled, 2,225,000.	Per ton milled
Total Working Revenue	£2,852,833	£1 5 8
Total Working Expenditure	2,628,936	1 3 8
Working Profit	£223,897	£0 2 0
Total Profit for the year		£225,260
Balance unappropriated at 30th June, 1948		433,332
Transfer from Shareholders' Contingency Reserve		13,400
Amount previously appropriated for Capital Expenditure, now reversed		15,519
		£687,511

This amount has been dealt with as follows:—

Dividends declared during the year:		£644,067
No. 78 of 8½ per cent. and No. 79 of 8½ per cent.		218,320
Leaving a balance unappropriated of		£425,723

The available ore reserve was re-estimated as at 30th June, 1949, as follows:—		
	Tons	dwt.
Main Reef	825,000	4.2 .. 56.3
Main Reef Leader	1,068,000	4.5 .. 51.0
South Reef	845,000	3.8 .. 45.1
Bird Reef	1,575,000	2.9 .. 31.8
Kimberley Reef	300,000	2.8 .. 30.1
Total	4,175,000	3.7 .. 55.1

There were in addition 1,233,000 tons of possible ore valued at 4.2 dwt. per ton contained in shaft and safety pillars not at present available for stoping.

Compared with the estimate for the previous year, the available reserve decreased by 24,000 tons, the stoping width being 0.1 inch less and the value unaltered.

The shortage of European and native labour adversely affected mining operations.

The full Report and Accounts (with Plans of Workings) may be obtained from the London Secretaries, A. MOIR & CO., No. 4, London Wall Buildings, London, E.C.2.

of industrials which made the best showing seem to be not so much the expected dollar-earners as the groups (such as shipping, newspapers and radio) which had registered particularly heavy falls in the preceding months. Outside the industrial market, gold mining shares, as the most obvious beneficiaries from devaluation, advanced by 12½ per cent, but this was actually a smaller percentage rise than was recorded in July when the rumours of exchange adjustment really started. Rubber, tin mining and base metal shares increased in very much the same ratio as gold shares, although here again the percentage rise in price did not come up to the previous best monthly performance. Gilt-edged and industrial fixed-interest stocks stood up to the month's news virtually unmoved.

This sober picture shows how grossly distorted was the impression conveyed to the general public by the headlines and news-photographs of the "Street" market. Inevitably, any

major change involves profits and losses in security dealings, but the investing community, taken as a whole, had little cause for satisfaction with the post-devaluation behaviour of markets. Obviously, the most astute operators have made profits, and it may disturb the Chancellor to reflect that the Treasury was among them. Armed with its fore-knowledge, and knowing that the gold share market would be strongest at the outset, it wasted no time in selling large blocks of the gold shares it acquired from the French. Perhaps Sir Stafford regards these tactics as a righteous effort to damp down speculation and confine as much of the profits as possible for the one speculator who can do no wrong.

Help from the Fund?

Canberra has for some time past been one of the more fruitful sources of advance information about financial matters of general Commonwealth interest. The latest "leak" of this

character was the report published early this week from the Australian capital that during the Washington negotiations the British representatives had made a formal request to the International Monetary Fund to restore facilities for the purchase of dollars from the Fund by Britain. The message from Canberra went on to suggest that Australia would also be entitled to the facilities of the Fund and spoke in terms of a total "loan" to the two member countries of a little over \$1,000 million spread over the next three years. The best available information in London suggests that this "leak" is not up to the usual standard of accuracy. The IMF decision which prevents those member countries receiving Marshall Aid from buying dollars from the Fund still stands. The arguments which underpinned the decision remain intact. The only development which might conceivably have changed the situation is that the devaluation of sterling may in the eyes of the IMF have changed the position of Great Britain from one of fundamental disequilibrium to one of temporary disequilibrium and to that extent to have made Britain a more eligible applicant for assistance.

It should, however, be remembered that the IMF decision banning ERP countries from access to its dollars was not justified by any argument relating to the economic position of the countries in question. It was based on the contention that the normal dollar requirements of these countries would be satisfied by the Marshall Plan and that the dollar resources of the fund should be kept intact for the post-Marshall Aid period when, according to all available evidence, the dollar would remain a scarce currency. If the British representatives in Washington asked for a reversal of this decision, they must have been even more hard-pressed than the available evidence on the reserve position would seem to suggest. No word has yet come from the Fund to suggest that such a request was made or that it met with a favourable answer. As for Australia, that country not being a direct recipient of Marshall Aid has normal access to the facilities of the Fund and should be able to buy dollars from it up to the amount of about \$50 million a year.

New Exchange Rates

Apart from the devaluation of the West German mark, which is discussed in a following note, the principal currency decisions announced this week have been those by Switzerland, Italy, the Netherlands West Indies and Turkey. The Swiss announcement has silenced the rumours that there had been a wavering towards "partial" devaluation, or at least to a system of differential rates involving a "tourist franc" designed to cushion the impact on the hotel industry. Herr Nobs, the President of the Confederation, has described the maintenance of parity as Switzerland's contribution towards world recovery, because it would induce an expansion of Swiss purchases from soft currency countries. In the long run, he declared, Swiss tourism would benefit from the spending of these increased export proceeds, and he hinted that this consideration would be strongly urged in any future negotiations of trade agreements involving an increase in Swiss purchases. Meanwhile, it seems evident that any special aid for the tourist services will not take the form of exchange manipulation.

Italy has still not made any definitive move; the only formal change so far is that the official exchange rates are now being based on the daily free rate instead of upon its average during the preceding month. This has avoided the lag which would otherwise have occurred in the response of the official rate. After being steady for some months at 575 lire to the dollar, the lira depreciated at one time to just over 636, but is now settling down at a little under 633 lire. This represents a fall of 9.1 per cent against the dollar and gives a cross-rate of 1,772 lire for sterling, the effective depreciation of which in terms of the lira is on this basis reduced to 2½ per cent.

The Netherlands West Indies, the Philippines and Colombia have all announced maintenance of their dollar parities.

Similar announcements have also been made by Turkey, Syria, Hungary, Yugoslavia, Brazil and Chile. But in each of these latter cases special considerations reduce the significance of the declaration. Iraq and Iceland have followed the Commonwealth members of the sterling area by a 30 per cent devaluation. Thailand has devalued by 20 per cent against the dollar, involving a reduction of the sterling rate from 40 ticals to the £ to 35 ticals.

Prices after Devaluation

The week has seen no startling changes in commodity prices. The absence of proper terminal markets for many commodities lengthens the delay before the effects of devaluation become apparent. In Britain, the Raw Cotton Commission on Monday raised its selling prices for the second time within a week. All American types of cotton were increased by 1d. a lb., and Egyptian cottons were increased by between ½d. and 3d. a lb. The new cover quotation for American cotton is 29.15d. a lb., for Brazilian (Sao Paulo) 28.90d. and for Egyptian (Giza 30 and 7) 38d. a lb. Even so, it is generally believed that the Commission's new prices are still below replacement costs. The Commission's case is that it is holding large stocks of cotton bought at much lower prices and that it is averaging the cost of replacement over its whole stock. This policy, however, prevents the building up of a reserve fund to enable it to reduce its selling prices when world prices fall.

The London wool sales opened on the Thursday following the devaluation. Prices were on the whole higher than at the closing sales in July. Greasy merinos were 5 per cent dearer, and crossbreds were between 7½ and 10 per cent dearer. There was no evidence of any American buying, and unless activity in the American wool textile industry increases, purchases by the United States this season may not (in spite of the devaluation of sterling) be much larger than last. Yorkshire dominated the market as usual, but appeared to be buying only for current needs. France, Belgium and Switzerland were the main continental buyers. Even in this market, which was very well attended, a general air of caution was apparent, with buyers waiting to see how prices in general will move and whether consumers will be in a position to pay more for finished products. In the Calcutta tea market, however, American buyers have been much more active than of late and prices generally were bid up by between 3d. and 6d. a lb.

The American markets have, as yet, shown little change. The cocoa price has dropped slightly but there has so far been no active dealing at the new level. Base metals, with the exception of lead, have held their prices, though at the beginning of the week the Ministry of Supply reduced its selling price of tin to the United States from 103 cents a lb. to 95 cents. Last week a leading American custom smelter reduced its price for lead from 15½ cents a lb. (equivalent to £121 a ton) to 14½ cents (£118). This move has not yet been generally followed by the market or by the Ministry of Supply. In March the fall in the price of lead in the United States precipitated a general decline in base metal prices. The experience may not be repeated, but this weakening of price might suggest that American recovery from the recent recession may not be so secure as is generally believed.

Revaluation Clauses

The devaluation of sterling has brought into operation the exchange revaluation clauses which are incorporated in a number of payments agreements negotiated by Britain. The list of such agreements carrying revaluation clauses expressed either in gold or in terms of the rate of exchange between the two contracting parties was last officially announced in Parliament in November, 1947, as follows:—Argentine

Belgium, the Belgian Congo, Brazil, Iran, Paraguay, Portugal, Sweden and Uruguay. Since this list was published Chile has come into the group of countries enjoying a reciprocal exchange guarantee on its sterling holdings, while Brazil has dropped out of the list as the result of the new payments agreement negotiated with that country last year.

The revaluation clauses on Argentine accounts are expressed either in terms of gold or dollars. These, however, are unlikely to cause the British Government any appreciable loss. Argentina has been rapidly running down its sterling holdings, and can now hold little more than negligible balances in London. Some of the confusion regarding the Argentine position was due to the fact that the apparent exchange reserves reported in the Argentine Central Bank returns have included the £100 million advance made by Britain to Argentina under the Andes Pact and intended as an advance payment for the subsequent year's imports from Argentina. Over this period there have therefore been no current sterling receipts by Argentina, the proceeds of whose exports to the sterling countries having merely been used to repay this advance. If all amounts due by Argentina to residents in the sterling area were in fact paid, it is probable that the Argentine accounts in London would today show an overall debit balance. Revaluation in respect of these should therefore cost little or nothing.

The revaluation clause in the case of Argentina also applies to the net forward position which that country may have covered in respect of her prospective sterling receipts for four months. It is, however, the *net* position that is involved, and since there are substantial amounts still due to Britain in respect of short-fall of deliveries under the Andes agreement, it may well be that the net position to which any revaluation condition would apply will be found negligible or non-existent. The position regarding the Argentine meat contract was somewhat clarified by the Chancellor this week when he admitted that the price would have to be re-negotiated; no automatic guarantee had been given to the Argentine Government but in the negotiations, the British side "indicated" that meat prices would be discussed again "if the sterling-peso rate of exchange was varied as a result of action taken by us." If Britain gives way on this issue, it can only be on the ground that a reduction in the meat ration could not be tolerated so near to a General Election. If, however, the British Government gives ground on meat, it may also have to do so in the prices paid for coarse grain to Argentina, and this in turn might well bring into question the other contracts for coarse grains, including that with the USSR, which have been established on a sterling basis.

Of the other countries enjoying a gold or dollar guarantee, Portugal and Iran will be the main beneficiaries. The revaluation guarantee to Belgium is based on the direct sterling-Belgian franc rate, which, as a result of the differential changes in parities announced last week, has involved a 20.4 depreciation of sterling. The consequent writing up of Belgian sterling balances will certainly lift these balances above the gold ceiling. This is therefore a case in which the devaluation of sterling will involve an immediate and probably quite substantial loss of gold. The revaluation guarantees to Latin American countries, including Chile, Paraguay, Uruguay, will reflect the full depreciation of sterling in terms of dollars, since those countries have for the time being decided to remain at parity with the dollar. The losses involved, however, should be small.

Devaluation of the D-Mark

The new conversion rate for the D-mark is still not finally fixed. The long delay has inflicted much damage on Germany's foreign trade, which has been practically paralysed since September 19th. Against this damage may be set the psychological value of restoring the prewar relationship of the mark to the dollar. The provisional decision of the High Commission to approve a devaluation of the D-mark by 20.6 per cent would

bring the D-mark back to the old parity of RM4.20 to the dollar.

The German authorities proposed a cut of 25 per cent to the High Commissioners, and have protested against French stipulations designed to reduce German competitive power; but it should be noted that a body of German opinion favoured the rate of DM4.20 to the dollar that has now been approved by the High Commission, subject to further discussions. The conversion rate which valued the D-mark at 30 cents was fixed only eighteen months ago, and for a considerable range of German exports has not proved excessive. Last year, before increased production and efficiency lowered costs, one authoritative German survey estimated that a cut of 10 per cent would render exports adequately competitive. The British action brought demands varying from a cut of more than 30 per cent to no cut at all. In general, an enquiry among business circles made last week by the *Handelsblatt* brought the reaction that industry preferred to limit devaluation and forgo an advantage in exports. Those business men who are not keenly imbued with the export spirit, in spite of the extent to which internal demand has dried up this year, recalled that, after all, the export markets absorb on an average only about 20 per cent of western German production.

The devaluation to a 23.8 cent mark (if adopted) will increase the cost of imports by one billion marks during the current Marshall year, 1949-50. The German Federal Republic takes from hard currency areas nearly 40 per cent of its total imports; these are largely accounted for by grain imports from the United States. It is faced during 1949-50 with a dollar gap of \$750 million, dollar imports amounting to \$1 billion against an estimated export total to the dollar area of a mere \$250 million. The prospects of expanding dollar exports are viewed with pessimism, now that Britain, France and other European competitors have devalued to a greater extent than Germany.

Furthermore, increased costs of imports are likely to upset the prospects of lower prices, stabilised wages and a tax reduction for business enterprises with which the German economy had reckoned. The Government has announced that there will be no rise in food prices, but that the increase in this sector will be met by means of subsidies. It is hard to see in these circumstances how taxation can be reduced in order to enable manufacturers to re-equip their plants; and the trade unions, hitherto extremely accommodating, intend now to come forward with fresh wage claims.

Industry and Trade

Freer Trade in Europe

Britain's opening bid in the move to free European trade was made by the President of the Board of Trade on Thursday when he announced that a number of goods imported into Britain on private account would be transferred from specific general licences to open general licences as from October 5th. Last July, the British Government notified the Organisation for European Economic Co-operation that it was willing to remove import restrictions on a wide range of goods provided that Britain was not involved in a loss of gold or dollars. The OEEC supported this move and requested member countries to submit by October 1st similar lists of goods on which they were also willing to abolish import licences. The only other country which has so far published such a list is France.

The British list is impressive. Admittedly, it covers only goods imported on private account, but the range includes all groups of imports. A number of important classes of goods, however, have been omitted. They are mainly goods which are made in Britain but not freely available to the home market, for example, motor-cars, typewriters, nylon stockings, silk goods, carpets and pianos. The total import value of the goods now placed on open general licence amounted to £75 million last year or about half of the total trade on private

account from OEEC countries. This at least shows that the British offer is meant seriously.

The open general licences will apply to all countries except those generally known as "hard currency" areas. Thus the United States, Canada and the dollar account countries of Central and South America as well as Argentina, Uruguay, Japan, Russia, countries of eastern Europe, Belgium and the Belgian Congo, Luxemburg, Switzerland and western Germany, are all excluded. It is impossible to assess the effect of such freedom to import, but it should afford some element of competition in the home market and it may even help to restrict a general rise in prices caused by devaluation. What is more important is that this list is only the first move; it is hoped to complete the liberalisation of European trade by progressive stages by 1951. The next step must await similar announcements from the other OEEC countries.

Radiolympia

The second postwar exhibition of the British radio industry was opened by Mr Herbert Morrison on Wednesday after a confused weekend in which its opening had begun to seem improbable. The woodworkers and painters working on the stands went on strike on Saturday, claiming the higher wage rate which was being paid by some small firms. On Monday they were joined by the electricians. Work was resumed on Tuesday morning, but the organisers, the Radio Industry Council, were obliged to cancel the invitation day for special visitors which was to be held before the general opening. The exhibiting firms had allowed themselves nearly a week of preparation instead of the usual three days; but this did not save them from being driven by an opportunist strike into a situation in which some of them were obliged to pay high prices for labour in the last-minute rush.

The radio industry has made an effort to reduce its prices and stimulate sales. Since the last exhibition was held in 1947, the price of an average portable radio set has fallen by 18 per cent, and at least five manufacturers show receivers priced at less than £10 without tax. Manufacturers are finding it more difficult to reduce the prices of television sets, but four firms are showing sets which cost (without tax) less than £40, and one of these costs £30.

The show is organised primarily for the home customer, but the radio industry does a considerable export trade in radio components and electronic equipment. British firms manufacturing in Canada expect to be able to compete with American manufacturers of television receivers, but there seems to be no faith in the practicability of exports of complete television sets from Britain to the United States. The American market for television equipment, and particularly for cameras and testing apparatus, is more promising. A British firm is shortly to demonstrate in Washington a British-built transmitter working on the American system, in the hope of proving the British claim to transmit a better picture. When the building of new television stations in the United States is resumed in the near future, British firms may be in the field for contracts for these complete stations.

Pye Limited is one of the few British firms interested in the industrial uses of television. The market for individual applications is held by some makers to be too small to cover the development costs, but this firm estimates that its development costs on the new closed-circuit colour system which it is demonstrating could be covered by the sale of three of the transmitters. The high cost of colour receivers would make it impracticable at present to use the colour television process for entertainment. It is to be marketed in this country for teaching and commercial uses and, presumably, for the monitoring of nuclear reactions which has to be done in colour if the reactions are to be interpreted correctly. Export sales are not to be undertaken until further development work has been done.

When sudden overload or storm damage interrupts the mains, you will see, in any darkened urban area, some few lighted buildings here and there: hospitals, factories, public buildings, stores and cinemas. Places where sudden darkness holds risks too great to be tolerated and a battery stands by against emergency. In buildings such as these, all over Britain, Chloride Batteries are on duty; and the list of new installations increases steadily. The Chloride Electrical Storage Company, originators and makers of the Keepalite automatic emergency lighting system, have over 50 years' experience of battery design and manufacture. Chloride, Exide and Exide-Ironclad Batteries can be trusted: and they are.

Have you ever seen a bamboo bicycle?

A few 'safety' bicycles with bamboo frames were made in the late 1870s when it was found that using solid steel bars made the new machine too heavy. The inventiveness of the men in steel soon found a cure for that — in the steel tube, strong and light — and the 'safety' became a practical job in 1885.

SUNDAY BREAKFAST.

Our exports of goods made from steel are now twice the pre-war volume and in value almost half of our total exports. They include bicycles, which have a 'sure fire' sale wherever they go, to the tune of over £20 million a year.

It is, of course, by those exports that we live and eat, so you owe your Sunday breakfast in a way to the 70-year-old bamboo bicycle!

PRIVATE FORESIGHT. This sort of development now is all in the decade's work for our steel industry, which indeed may be said to have changed its whole nature with the changes and chances of each succeeding generation. To-day the focus of attention is on the development scheme that is giving us ever-increasing quantities of steel. But let us not forget that only the foresight and inventiveness of our pioneers in steel made possible the vigorous industry that embarked on that bold enterprise as soon as the war was over.

18,000,000 TONS

The industry's own £240-million development plan ensures us a capacity of 18 million tons in 1952 — the figure agreed on with the Government as the right level.

STEEL

BRITISH IRON AND STEEL FEDERATION

Dollar Steel for the Motor Industry?

British car prices have been reduced by an average of 20 per cent in the American market, and the few British manufacturers who have established themselves in that market believe that they can sell every car which they can send to the United States within the next three or four weeks. When the pound was devalued, American dealers held among their stocks about 1,000 Austin cars and 500 cars of the various Nuffield makes. These were sold within a few days. Manufacturers were at first inclined to treat the telegrams which came in from their American dealers as "panic" orders; but the tone of overseas buyers attending the Motor Show suggests that the immediate stimulus to sales may last for a while yet.

The industry has taken the occasion to re-open its campaign with the Ministry of Supply for increased steel allocations. Its capacity has been increased, largely as a result of the war, to about 800,000 vehicles a year; but the manufacturers are still getting supplies of steel appropriate to their prewar capacity of about 500,000 vehicles. They do not wish to incur the odium of depriving the home market of its quarter-share in the present output. They also argue that a larger output would enable them to spread their overheads more widely and reduce their prices, and that this would stimulate exports further.

Home production of sheet steel for the motor industry cannot be quickly increased, but the steel could be imported from hard-currency countries. In preliminary talks between the Minister of Supply and the motor industry this week, a case has been put forward for spending dollars on the import of steel in return for an assurance from manufacturers that more dollars will be earned by the sale of cars. The Minister would have to be assured that the extra steel was not used for sales to the home market or to soft-currency countries. This means that in allocating the extra steel he would be obliged to discriminate against the many British manufacturers who have not felt able to undertake marketing arrangements in the United States.

Although manufacturers were threatened in the past with cuts in their steel allocations if they failed to export a full 75 per cent of their production, the threats were not carried out in practice. The industry has again begun to wonder whether the Ministry of Supply might begin to withhold steel from such firms and from other manufacturers whose dollar earnings are low, and to allow more to those who can expand their hard-currency sales. Such action would bring some dislocation to the motor industry and would be a threat to "full employment" as at present interpreted. The industry feels it to be more probable, therefore, that a favourable decision will be reached on the allocating of foreign steel to one or two manufacturers. But, if the decision is made, the final choice of firms and the proportions to be allocated to them will raise some difficult questions.

Radical Talk on Productivity

The steel founders' productivity team—the first of the teams sent to the United States by the Anglo-American Productivity Council—has produced a startling report*: imaginative, reasoned and blunt. Its members estimate productivity in the American steel founding industry (measured in man-hours per ton) to be between 50 and 90 per cent higher than in the British; and their report seeks to explain not only the technical and trading differences, but also the differences of social atmosphere, which produce that result. The cause is not to be found in the use of large numbers of skilled workers. American foundry labour is, by British standards, conspicuously unskilled. The trade union organisation is not on a craft basis, and more than half the workers are coloured. "The exercise of skill has been taken from the shop floor into the pattern-shop, the methods office, and the brains of the supervisors." Where skilled men are found on the shop floor, they

* Productivity Team Report: Steel Founding. Anglo-American Council on Productivity. 3s.

are fully serviced by lower-grade men: "Since labour is expensive, the best possible use is made of it."

The report makes detailed comments and suggestions. A few main points on American methods and organisation may be picked out. More machines are used than in Britain. Technical innovations are more readily taken up; methods still being hesitantly tried out in Britain are in wide use by Americans, who have not waited for corroborative evidence. Standardisation is advanced, and price policies are devised to encourage long runs. The product is expected to be physically adequate for its purpose—not analytically flawless. Power is freely used and freely available; the fear of power cuts is not present to deter innovation. Wage systems are simple. Incentives—crude, direct and powerful—seem to have struck the British team with the force of complete novelty. There must, says the report, be a direct incentive: "It is a waste of effort to act as though abstruse economic problems can be understood by the whole population." Those problems must be understood by the leaders who influence policies and negotiate agreements. The rewards of productivity must be shared not only by workers and technicians, but also by the investors who lock up their money in productive equipment, and by the customer whose co-operation may be needed.

The authors of the report had not had the opportunity of hearing the Chancellor of the Exchequer remark on Tuesday that "nothing—and I mean literally nothing—should be done to increase personal incomes arising out of wages, profits, or salaries." They did, however, perceive whither the search for incentives might lead:

Increased wages in the hands of the population are useless as an incentive unless they can purchase goods corresponding in some proportion to the increased productiveness of effort.

In the ethical climate of this week, it appears that hardship—not effort—is to be the ground for better pay. But the steel founders' team was already aware of the different society with which, in the United States, it had to deal. It was aware of "a widespread degree of productivity-consciousness"—which it distinguishes from "production-consciousness." It perceived the incentives at work, and observed the sovereignty of competition. Its report therefore turns, and rightly, on the question: "Is high productivity really desired?" And before too easy assent is given to that question, it substitutes another: "Over what features in the British industrial system does the desire for high productivity take preference?" Such penetration will upset many of the preconceptions on which industry, labour and government in this country have long been content to act.

Higher Wheat Price

The devaluation of sterling and of the Canadian dollar has raised difficulties in the operation of the international wheat agreement which came into force last July. The maximum price for the current season was put at \$1.80 a bushel and the minimum at \$1.50, both quoted in terms of Canadian currency as determined by the International Monetary Fund on March 1, 1949. Since the Canadian dollar has been devalued by 10 per cent in terms of US dollars, the question arose whether the limits would continue to be \$1.80 and \$1.50 or \$1.98 and \$1.65 in Canadian currency. The executive of the Wheat Council, however, has ruled that the prices fixed in the agreement were in fact related to the price of gold in terms of Canadian currency, and since, through the devaluation of the Canadian dollar, the price of gold has risen, the new limits for the current season will be \$1.98 a bushel maximum and \$1.65 a bushel minimum. In terms of American currency the old price limits still hold.

This interpretation of the wheat agreement does not affect the British wheat contract with Canada, which still has this season to run. Under the contract Britain agreed to pay \$2.00 a bushel (Canadian currency) which at the time was equivalent to 10s. With the 30 per cent devaluation of sterling and the subsequent 10 per cent devaluation of the Canadian dollar,

the sterling equivalent is now 13s. a bushel. But Britain's purchases from Australia will cost more, even though Australia followed sterling all the way down. In terms of sterling the price limits under the agreement before devaluation were 9s. a bushel maximum and 7s. 6d. a bushel minimum, and the price agreed to by Britain and Australia would have had to be within this range. The new sterling equivalents of the limits are 12s. 6d. a bushel maximum and 10s. 9d. a bushel minimum. Australia is, therefore, now guaranteed a higher minimum price, while Britain is now confronted by a higher maximum. It looks as if the experience of the first postwar international marketing scheme may not be a happy one for consuming countries, particularly as the price range was from the outset put fairly high.

International Commodity Clearing House

The existence of surplus food supplies in certain countries with under-consumption in others, owing to the non-convertibility of currencies, has spurred the Food and Agriculture Organisation to examine the whole problem of commodity policy. A committee was set up in July for this purpose, and its report on world commodity problems has been sent to the 58 member countries. It will be examined at the November meeting of the FAO Council. The committee has recommended the creation of an International Commodity Clearing House (ICCH) which would permit producing countries to maintain a high level of output of agricultural commodities and would render unnecessary such restrictive measures as the destruction of crops. At the same time importing countries which, for lack of foreign exchange, are now unable to buy as much as they require, would be able to buy from the ICCH at full price in their own currency or at reduced prices in the currency of the supplying country.

This is an imaginative proposal. The ICCH would be a public corporation with a capital equivalent to \$5 billion contributed by member countries in their national currencies. Only 20 per cent of the authorised capital would be initially called up; the remainder would be called upon as needed. The payments would be earmarked for use in the contributing country to buy commodities declared in surplus supply. The ICCH would not interfere in normal trade; it is intended only to facilitate the disposal of surplus goods.

Such a scheme would in itself raise many questions. There must, of course, be an agreed definition of "surplus goods." Goods are ordinarily in surplus supply only because their price is maintained at an artificially high level. It is possible, theoretically at any rate, to calculate an average cost of production for each commodity and for each country, and this might be used as a basic "floor" price below which the market price would not be allowed to go. But then the question arises: on what level of output should the cost of production be calculated? Again, what is the "full price" at which importing countries buy these surplus goods in their own currency? Is it the support price set by the producing country, or a world market price? What happens to a country like Britain which would be mainly a purchaser of goods, presumably in sterling, when it has few or no agricultural goods in surplus supply? Part of the sterling so obtained could no doubt be used to help other countries to purchase sterling area products, but a time could be foreseen when the ICCH might be holding an embarrassing quantity of sterling. In fact, the ICCH would tend to become an international bank, exchanging inconvertible currencies against one another. But in that case, might it not be necessary to extend its scope to cover manufactured goods—so that "surplus" agricultural commodities could be exchanged against "surplus" manufactures?

* * *

Pakistan and India

The jute trade in the Indian sub-continent is virtually at a standstill. The Government is still attempting to

sell at the old price in terms of Pakistan currency (its own rupee has remained at par with the dollar, and is now at 2s. 2d., compared with 1s. 6d. for the Indian rupee), while in Calcutta merchants are refusing to buy raw jute at the premium of 44 per cent which arises from this disparity between the two rupees. Apart from jute, Pakistan also sells to India raw cotton and food grains when they are available for export. India, for its part, exports to Pakistan coal, sugar and manufactured goods, particularly cotton cloth and jute goods. Given the new rates of exchange, Indian goods (if export prices are unchanged) now become 30 per cent cheaper in terms of the Pakistan rupee. In the long run, the relative prices of imports and exports between the two dominions would depend upon relative elasticities of demand. At a pure guess, India might have almost as good a chance of raising its prices to Pakistan to the full extent as Pakistan has of extracting the full premium for its exports to India in terms of its own unchanged rupee.

But even before the short run has expired, some action to remedy the present muddle in trade and the rupee exchange will be inevitable. The more probable outcome would be the devaluation of the Pakistani rupee to bring it once again into line with the Indian rupee. During the past fortnight illicit trading between the two dominions has increased enormously—an inevitable consequence of distorted exchange rates which cannot be defended in the absence of any administrative mechanism for exchange control. The Pakistan frontier is wide open for trade of this kind, and extreme pressure on the Pakistan rupee through the unchecked flight of capital is quickly developing. The Pakistan Government no doubt felt justified in trying to maintain its rupee at the old dollar value. The new dominion needs capital equipment, and by maintaining its rupee rate no doubt expected to be able to reduce the rupee cost of such imports. It now remains to be seen whether this policy will work or whether it will create pressures so extreme as to defeat its object.

* * *

Repayment of Czech Debts

Settlement has at last been reached with Czechoslovakia on the repayment of its debts to Britain. The Czech Government has agreed to pay £8,000,000 over the next ten years for British property nationalised or expropriated: £5,000,000 of this sum is to be paid within the first five years. In addition the Czech Government will repay the debts owing to the British Government and private creditors. The sum agreed to is £28 million, which will be repaid over a number of years, unspecified, but £10 million of it will be made available in the next five years. In total, therefore, Britain is to receive £36 million, of which Czechoslovakia has undertaken to pay less than half (£15 million) before the end of 1954. The original British claim was for £40 million—£10 million as compensation for sequestered property and £30 million for repayment of debts. The agreed figure is admittedly somewhat reduced, but the efforts of the British negotiators have not been in vain.

To enable Czechoslovakia to meet these financial commitments, the repayments over the next five years have been incorporated into a general trade and financial agreement. Czech exports to Britain are to total £10½ million a year; £3,000,000 of these earnings will be set aside for compensation and debt repayment, making a total of £15 million over the five years of the agreement. The remaining £7,500,000 of the annual earnings will be used on purchasing goods and services from Britain and the sterling area. A list of specific exports from Britain—mainly machinery, cotton yarn, chemicals and medical supplies—accounts for £1,500,000 each year, and the balance of £6,000,000 will no doubt be used by Czechoslovakia to buy raw materials from the sterling area, in particular rubber, wool and cotton. British imports from Czechoslovakia will include timber (15,000 standards of softwood are scheduled in the first year), machinery, 25,000 tons of sugar and a variety of manufactures.

INSURANCE SURVEY

Nationalisation Examined

WHEN Lord Beveridge prepared his famous report he gave a good deal of attention to the industrial life offices, and came to the conclusion that they should be nationalised. His advice to the Government was that the state should have a monopoly of the use of collectors, and be empowered to issue policies (either direct or through collectors) up to an amount of £300 each. In other words, no office, proprietary or mutual, would be allowed to carry on industrial life insurance; and the Government would not be allowed to grant a non-industrial policy for more than £300.

If this recommendation had been followed, the Prudential and the Pearl—big composite offices—would have been taken to the operating theatre and cut into two almost equal parts, of which one would have been hurried away by the Government, and the other handed back to the shareholders for resuscitation and the resumption of normal life. The recommendation was not followed. Industrial life insurance was not nationalised and the question of an operation did not arise. But now the intelligentsia of the Labour Party have decided to proceed with the scheme of nationalisation, and have been taking another look at the patient to determine whether Lord Beveridge's operation is either necessary or desirable. They have decided against it. They have dismissed the surgeon and declared that this is a case for adoption, not operation. When the voter's decision has been reached at the next General Election, a good home will be ready for the patient.

The point at which the Labour Party openly differs from Lord Beveridge is in the results that would follow from dividing up the offices. Lord Beveridge assumed that the division was possible and could easily be made. The Labour Party manifesto challenges that view. It says that if the industrial sections were segregated and nationalised by themselves, confusion would follow, and that the only practicable course will be to take over all the business, absorbing at one gulp the ordinary life, the fire, the accident, and the marine departments (at home and abroad) of such great composite offices as happen to cater for working class life insurance in this country. It may be that Lord Beveridge was wrong and that the Labour Party proposal is right in this forecast of chaos, but the difference between the two opinions springs probably from the fact that the Beveridge scheme was worked out in the calm atmosphere of a world war, whereas Labour is thinking about the votes it will need in the turmoil of a General Election. In other words, it has its eye on the agents and collectors. These men, who work for the industrial offices and societies, are said to number about 65,000, and with their womenfolk they must account for nearly 100,000 votes—a block not to be sneezed at in a close fight. And if they draw, as they are believed to do, substantial commissions from fire and general business, they would naturally resent any change that cut them off from this source of income. In their resentment they might on election day put their crosses against the wrong name; and it may well be that possibility, rather than the danger of confusion and chaos, that has guided the hand of the Labour

Party in drafting its proposals. Indeed, page 20 of "Labour Believes in Britain" is unmistakably directed at the agents' vote, for it openly offers them more security, no dismissals, greater benefits, more trade union representation, and full compensation for their book interest.

★

If the back-room boys of the Labour Party are right in suggesting that Lord Beveridge underestimated the difficulty of separating industrial from general business, they themselves most certainly miscalculate the effect of their own proposal to take over "as they stand the Prudential, the Pearl and the other offices doing industrial insurance and the larger collecting societies." They realise the dangerous possibilities, but look at them through the wrong end of their field-glasses to make them at once remote and trivial.

In handing a bouquet to the insurance industry as a whole they say:

The insurance industry has rendered great service to the community. Millions of people have been protected against the hazards of life and every single person has benefited indirectly from the overseas earnings of insurance.

But they then proceed:

Industrial assurance companies, however, conduct only a small proportion of total overseas insurance.

Both these statements are correct, but the second statement, in which the sting lies, would be true of almost any British company. The invisible exports of British insurance are made up of contributions from a large number of offices and a large number of underwriters; and with one or two possible exceptions each of the tributaries by itself provides only "a small proportion" of the full stream. What the Labour election pamphlet obviously wants its readers to believe is that the foreign business of the Prudential and the Pearl is negligible, and that the loss of this business can from the national point of view be disregarded. In the light of this implication it is worth while to examine the figures of the two offices and see how they are made up. Their total premium income is almost £100 million a year, drawn from industrial life and from fire, accident, ordinary life, motors, sinking fund and marine; between industrial life and the other departments, the split in round figures is: industrial life, £52 million; other business, £48 million. How much of this £48 million is drawn from the two companies' overseas enterprise is not precisely known; but it is known that the American subsidiary of the Prudential had a dollar premium income equivalent in 1947 to £1,130,000 and in 1948 to £656,000 (at the old rate of \$4.03 to the £). The Prudential has branches or agencies in not less than 32 countries apart from the United States, and the Pearl has branches or chief agencies in not less than 34; and as the offices are managed by very able business men it may be safely assumed that the income contributed by these 67 outposts is at least substantial. If no premiums or only negligible premiums were produced the foreign field would be abandoned as sterile. In fact the income derived from abroad by the composite industrial offices is probably a little under £20 million a year.

So the Labour Party's innuendo—that the overseas business of the offices is negligible—cannot be supported by facts and can fairly be called misleading. In an electioneering manifesto, where a high level of candour is not to be expected, that is not surprising and in itself the statement is not significant. But the inference to be drawn from it is very significant indeed. Why do Labour's intellectuals think it necessary to belittle this overseas premium? Why do they dismiss it as unimportant? They do it because they know that when these offices are nationalised the overseas connection will be put under sentence of death, and they find it prudent to discount and minimise in advance the value of what they are proposing to destroy.

If their policy is carried out their expectation will certainly be fulfilled. When foreign nationals know that the Prudential is not the old Prudential, nor the Pearl the old Pearl, but that both are the British Government camouflaged to look like two different insurance companies, then the pseudo-offices will find themselves involved in a double tribulation. They will have lost the good will of their most important overseas policy-holders, and they will also strengthen and sharpen the protective instincts of the foreign governments. The certainty that the good will of the policy-holders will be impaired can easily be demonstrated by the dependence of insurance companies on the business of industrial concerns—large, medium-sized and small—managed on capitalist lines by capitalist owners, to most of whom nationalisation is the abomination of desolation standing in the holy place. If, for example, the two companies had been nationalised in August, 1949, what chance would they have had of holding their position in America? A campaign against the British Government and its schemes of nationalisation hardly provides a congenial atmosphere for inspectors and managers in their task

of persuading old clients to continue their policies and new clients to take out new ones. Can it be doubted that in America certainly, and in most other countries probably, nationalisation would kill the business of the nationalised companies and react heavily on the business of the other British offices not yet taken over?

Behind the foreign policy-holders lie the foreign governments. For fifty years the habit of protecting native insurance companies against invaders from abroad has been increasing, and has been met with growing difficulty by the great British offices. Thanks to the skill and energy of their management the offices have succeeded in maintaining, and even increasing, their premium income from overseas; but their proportion of the total premiums has fallen, not risen, and their contribution to British invisible exports is checked in almost every country by national prejudice, which finds its expression in more stringent regulations and in higher barriers raised against British insurers. Surely it is patent that local nationalism and protection will be intensified and embittered when the invader is not a private British company but His Britannic Majesty's Government, sending its travellers round to cajole American or European or Asiatic manufacturers to entrust their fire and accident risks to a foreign government. If it is galling to have private aliens touting one's nationals for insurance, it will be a hundred times more galling to watch the touting done by an alien government. The result must be fresh restrictive legislation, injuring not only the nationalised concerns but every insurance company working from Great Britain; and *pro tanto*, British invisible exports will suffer and decay. To ignore that certainty is to admit that the proposal to take over the offices as they stand is fed by politics and not by logic.

Insurance and Dollars

THE devaluation of the pound in terms of the dollar focuses attention on the valuable contribution made to the balance of payments by British insurance earnings in the United States and other countries in the dollar area. Insurance protection furnished by British companies and underwriters at Lloyd's occupies a position in American economic life unequalled by any other British industry.

The development of an insurance industry is essentially a long term operation. Seeds sown take many years to come to fruition. Nearly all the British offices working in America have the roots of their organisation in the nineteenth century and one company—the Liverpool and London and Globe, now forming part of the very large Royal Group—has a record of continuous operation since 1848. Reserves have to be built up carefully over a long period to enable insurers to withstand catastrophic losses and the phases of adverse trading which sometimes persist for a number of years. More important still, reputations must be established. Once established, they endure; it is still remembered that British companies settled generously in the disastrous San Francisco earthquake of 1906.

There have been phases in the history of British insurance in the United States when the volume of business transacted changed little or actually declined. Other periods have shown rapid expansion. The war and postwar years have witnessed such an expansion to a quite unprecedented extent. The figures in Table I, which have been prepared from published sources of information and relate only to the

United States branches of British companies and their American affiliates, show an increase in total premiums received for fire, marine and casualty insurance from \$256 million in 1940 to \$497 million in 1948, a gain of \$241 million, or 95 per cent. Unfortunately it must also be recorded that the absolute gain has been accompanied by a relative fall in the position occupied by British offices. In 1940 the total volume of fire, marine and casualty premiums written by stockholding companies, domestic and foreign, operating in the United States was \$1,714 million, of which the British share of \$256 million represented 14.9 per cent. In 1948 the corresponding total figure had increased to \$4,356 million and the British share of \$497 million had dropped to 11.4 per cent.

What are the reasons for this relative decline? The answer lies partly in the very stringent financial standards applied to insurance companies in the United States and partly in Britain's dollar shortage. Insurance companies in America are required to carry unearned premium reserves—reserves relating to unexpired periods of the policies in force—at the rate of 100 per cent of the unearned premiums, without any deduction for the expenses incurred in obtaining the business. This imposes a heavy strain at a time of rapidly increasing premium income, especially where, as in the United States, a considerable volume of fire and other business is transacted on a three-year basis. A further strain is involved in making provision for an increased volume of outstanding claims, the reserves for which are required to be on a

A Fifteenth Century Fire Extinguisher

A Couvrefeu taken from an old print

Few probably realise that 'Curfew' derives from the French 'Couvrefeu'—an appliance for extinguishing fires, shaped like a Dutch Oven. At sundown, it was placed over the embers to exclude air and the fire soon died away. The hardship of having no fire in the evening led to a "raising of the Curfew," but as not all citizens were careful, disastrous fires occurred. When in 1710 the Sun Fire Office came into being it gave active service in the limitation of fire damage as well as providing insurance cover for which it is famous to-day.

The Centuries-old Sign of Public Service

Branches and Agencies throughout the World

generous scale and, in certain forms of casualty insurance, are checked by reference to various formulae. It is, moreover, accepted practice that after allowing for these reserves the capital and free reserves remaining shall amount to not less than 50 per cent of the annual premiums written.

Happily, the United States branches of British companies and their domestic subsidiaries were for the most part well supplied with resources at the outbreak of war. The total volume of free reserves (including the capital of domestic subsidiaries) amounted at the end of 1940 to \$337 million, equivalent to 133 per cent of premiums. In 1941, however, there came the Reconstruction Finance Corporation's loan of \$425 million on security largely consisting of insurance interests, and the offices naturally felt in duty bound to contribute to the utmost to payment of the interest on and amortisation of this loan. When the upward surge of premiums set in after the war, it was possible at first to accept business with some measure of freedom; but afterwards it became necessary to apply the brakes, because the offices wished at all costs to avoid aggravating British difficulties by seeking permission from the Bank of England to remit additional funds to America and were also under the obligation of maintaining the service of the RFC loan. By contrast the American companies were able to raise additional capital to enable them freely to take on increased commitments. It is highly improbable that British insurers will now be able to make up the lost ground.

In actual figures the free reserves amounted at the end of 1948 to \$343 million, very little more than the figure eight years before and only 69 per cent of premiums, against the former ratio of 133 per cent. These total figures cover a fair degree of variation as between one office and another and even as between different offices in the same group; generally the companies transacting fire insurance, because of the greater catastrophe risks which are considered to be inherent in the business, maintain higher standards than the companies writing casualty insurance. The British offices for some years to come will have to follow a policy of conservation and building-up of resources to conform with the enhanced volume of business which they are now undertaking.

Some comfort for the reduced share of American insurance now written by British companies can be derived from the fact that in controlling the growth of premium income the offices will have applied a more rigid selection policy

than they would otherwise have done, so that the average quality of their business must have improved. Moreover, a considerable part of the increased business written has been due to the development of group accident and sickness insurance on which the profit margins are very small and in this development the British offices have participated only to a very small extent.

Such are the dimensions of British insurance business in the United States. What of the profit-earning power? Table II shows the net underwriting profits and net interest income for the 10-year period 1939-1948.

TABLE II—EARNINGS OF UNITED STATES BRANCHES OF BRITISH COMPANIES AND AMERICAN SUBSIDIARY COMPANIES (\$'000)

	Underwriting Profit			Net Interest Income	Underwriting Profit and Interest
	Fire and Marine	Casualty	Total		
1939	5,890	11,181	17,071	27,773	34,844

1948	20,962	697	20,555	23,936	43,391
TOTAL	4,829	51,236	46,407	193,737	240,144

For the first five years of the decade, profits averaged about five or six per cent of premiums, the indifferent fire results being compensated by good casualty figures. After the war the business entered a phase of adverse trading. Fire insurance was bad because sums insured did not keep in step with inflated values. In automobile insurance the very substantial increase in the cost of claims necessitated large rate increases which were slow in coming and usually inadequate when they did come. The process of increasing rates was not assisted by the uncertainty which prevailed after the Supreme Court decision in United States v. South Eastern Underwriters as to whether rates were to be controlled by the Federal Government or by the States—now happily resolved in favour of the States. But perhaps the most important reason for the adverse results was the necessity for establishing reserves on a stringent basis for the increased volume of business transacted.

As the table shows, the fire business earned a good profit

In 1948 and the ills which affected this section of the business are now thought to be largely surmounted. Casualty business, though still "in the red," showed a big improvement; automobile insurance is now back on a profitable footing and the outlook for the casualty account generally is much brighter. It would seem reasonable to expect henceforth an average profit of at least five per cent on the combined fire, marine and casualty business, producing on an income of \$500 million an annual profit of \$25 million. Interest earnings now stand at \$23 million, having risen from \$17.8 million in 1939, so that total expected future earnings may be put at about \$48 million. This figure is not exhaustive because it relates only to companies operating through United States branches or American subsidiaries. There is also a very considerable business, especially in marine insurance, transacted on the London market by underwriters at Lloyd's and by the companies, the figures of which are not available. Operations in Canada and other parts of the dollar area also attain substantial dimensions.

Challenge of Change

TWO world wars have brought about great changes in British economic and social life. Three aspects of change have particular importance for insurance. The first is the breaking down of a stratified society of more or less definable classes by the progress of education and by the heavy taxation of higher incomes and personal property. Secondly, economic planning, which has so greatly encouraged these social changes, has also fostered earlier tendencies towards closer organisation in industry, resulting in great business unions or associations of firms working in agreement. Thirdly, there is the slowing down of the expansion of Britain's population which has been described so recently in the Report of the Royal Commission.

To understand the effects on insurance of these major changes it is necessary to distinguish its two broad sections. General or commercial insurance embraces marine, fire insurance and the many forms of casualty insurance which are required in the ordinary business of commerce and industry. Secondly, personal insurance embraces life assurance in its many forms, including annuities, pensions, and personal accident insurance. The broad social and economic changes which have been gathering force in the life time of the present generation affect these two classes of insurance in quite different ways.

Industry and commerce have three separate ways of dealing with the elements of risk in their business. Some forms of risk by reason of their very character are not insurable; these have to be carried by the businesses themselves and covered, if at all, by reserves set up from profits. Where, however, a business is big enough to average the numerous individual hazards in its own undertaking, it may decide to carry its own risks even though they could be placed with an independent insurer. Typical examples of such self-insurance are to be found in railway and steamship practice. A second method is by mutual insurance, of which a typical example occurs when a body of employers in a given industry set up a mutual association for their own insurances. In the past, workmen's compensation insurance was extensively covered in this way. The third method, and the most common, is to place the risk with an insurance company or Lloyd's underwriters.

It would be wrong to convey the impression that all is now set fair for British insurance in the United States. As old problems recede new ones take their place. The new so-called "multiple underwriting" laws, permitting fire companies to transact casualty insurance and vice versa, in place of the previous rule whereby each class of company was limited to its respective sphere, will almost certainly lead to intensified competition. The trend away from the general agency system of representation to a branch office system more on British lines, though calculated to bring important benefits in the long run, is expensive. But on the whole the outlook is vastly improved. British insurance interests in the United States are administered by a small body of experts at little cost in manpower and none in scarce materials. It is greatly to be hoped that the Labour Party will withdraw its threat to nationalise industrial insurance, which is so damaging to a valuable source of dollar earnings built up with care and skill over a long period of years.

Greater uniformity in income may not affect general insurance directly, but its indirect effects are important. It means greater uniformity in the character of demand for housing, food, and semi-essentials. A more even distribution of income is expressed in a greater demand for three- or four-roomed houses, a larger consumption of milk and other high quality foodstuffs, a greater standardisation of furniture and kitchen equipment and a demand for a small family car. The pattern of social habit and the character of the family budget are far more uniform than they were. This greater social uniformity should give a wider outlet for the services of the general insurer catering for the income earner in his home. But this wider opportunity for insurance business is not pure gain, since the business to be won increasingly consists of a larger collection of smaller individual risks. If greater uniformity in social and economic life can be measured at all in insurance terms, it suggests steady business rather than highly profitable business.

*

The new income pattern has in turn accelerated the tendency towards mass production, larger business units, concentration of capital and greater economy and efficiency in production. The day may not be far off when associations of firms in particular industries come to examine their costs more carefully, including the costs of insurance. If they discover that it would pay to carry such insurance risks by self-insurance they may well begin to do so. Alternatively industrial firms may form mutual assurance associations.

Given the present competition from the mutual offices and the potential competition of other mutual associations which may be formed, the composite companies and Lloyd's underwriters may during the next decade have to conduct their business with greater economy if they are to maintain their present share of the insurance market. There is little doubt that in some directions their expenses are high, particularly in respect of business which normally goes through brokers. The termination of the wartime standstill agreement has led to a degree of competition which from time to time results in the transfer of large blocks of insurance business from one insurer to another, involving considerable cost but producing little benefit. The inevitable result of

overlapping insurance facilities and excessive commissions, where they exist, will be to encourage the growth of mutual insurance.

This possibility of a wider area of mutual insurance presents a challenge to the companies and to Lloyd's. However ably the challenge is met, it still seems likely that in future years organisations which are big enough to do so will tend to carry at least a measure of their own risks. Many risks average out within a year and the setting up of an annual account with but a moderate reserve is all that is necessary to cover them. Larger risks and catastrophe risks can only be averaged by covering a wider area or by extension over a longer period. Losses such as these can be and are dealt with by insuring the risks over and above a specified amount of loss.

Thus it seems advisable for the British insurance industry to expect a larger measure of self-insurance and associative risk-carrying in future. Whether the aggregate of premium incomes received by the companies and Lloyd's from general insurance in this country may fall as a result is difficult to guess. Recent years have seen a continued increase in the number of branches of insurance. Private property, although more equally spread, may in the aggregate increase and the more modest means of its owners may also increase their demand for cover. On balance, it seems early to expect any immediate reduction in the magnitude of the general business conducted by insurers within the United Kingdom.

The overseas business of the composite companies and Lloyd's, however, greatly exceeds that carried out in the United Kingdom itself. It has recently been estimated that 70 per cent of their fire, accident and marine insurance is transacted outside the United Kingdom. Except, perhaps, in the case of marine insurance, insurers are very much under the control of the governments of those countries where they do business overseas. There is a natural tendency on the part of important foreign customers of British insurers to favour their own nationals, even if they are less efficient, by imposing on British offices regulations and taxation to such an extent that it becomes increasingly difficult for them to make a reasonable profit. Such foreign markets as are still open to British insurers may present greater difficulty as time goes on, although the development of new markets and new types of insurance may enable the industry to maintain its position in the overseas field.

The more equal distribution of wealth is likely to have a marked effect upon personal insurance, particularly as it is accompanied by the extension of social insurance. The modern state provides through social insurance a minimum which, together with free education and a free health service,

prevents any victims of misfortune from becoming stranded. Given these guarantees by the state, it might seem at first sight that the need for personal insurance would be reduced. There is, however, no sign of waning popularity of life assurance. Indeed, the substantial increase in incomes during the postwar years has prompted a great increase in saving by way of premiums on life assurance. Despite its reduced real value, the pound retains sufficient credit in the eyes of the British public to encourage them to make provision under money contracts for a distant future. Such confidence, however, is tenuous, and a violent movement in prices and the cost of living might eventually have important consequences on new insurance business. Moreover, the volume of life assurance, effected or maintained, was in prewar years very sensitive to economic fluctuations and unemployment. Much new life assurance placed since the war is based on the unformed postulate in the proposer's mind that full employment is here to stay.

It remains to consider the slowing down of the rate of increase in the population and the change in its age composition. In future, the number of people in this country beyond the age of 65 will form an increasing proportion of the total. If the average age for retirement remains at 65, more and more people will be drawing incomes for which they make no current return in service, and they will therefore be dependent on the work of others. Apart from the pension provisions under the National Scheme, a large and increasing number of employed persons now belong to contributory pension schemes, some of them set up as internal funds in the hands of trustees and some administered by insurance companies. The reserves of such new pension schemes managed by life offices often represent a considerable proportion of their life funds, and they are steadily increasing. To the extent that they are invested in productive industry they will provide in themselves an answer to any suggestion that the retired represent a parasite class. This shift in the age of the population has opened up a new field of life assurance activity, and it is likely that in future more attention will be paid to income insurance in all its forms rather than to capital payments.

The social and economic changes outlined at the beginning of this article present the British insurance industry with a challenge. On balance the outlook for British insurance seems by no means unpromising. Effort and imagination may well be needed in future to stimulate the growth of insurance on a scale to match the achievements of the past, but the industry may well find that by the exercise of greater efficiency and ingenuity its contribution to the British economy can be steadily raised.

Investment Policy

THERE is a well-established principle that insurance offices cannot postpone indefinitely the investment of their accumulating cash balances. The insurance business is not one which can exercise liquidity preference for very long, for it cannot afford to be without a return on its funds if it is to meet its contracts. Last year there were several periods when the insurance offices were temporarily out of the market; it follows that new investment demand on the part of the offices must have been an important factor in the market rallies when they occurred.

The measure of their demand is shown by the totals for the investments of 38 offices (mutual, proprietary, industrial

and ordinary, and composite offices) as shown by their reports at the end of 1947 and 1948. Their investment portfolios increased by £178 million, from £1,933.1 million to £2,111.4 million. Apart from the increase in the offices' funds, there was another major factor which affected the comparison between 1947 and 1948—namely, the exchange on January 1, 1948, of transport stock for the former railway debentures and preference and ordinary stocks. No doubt this exchange accounts to some extent for the fact that British Government securities (which includes guaranteed stocks) increased by no less than £150 million, from £699 million to £849.3 million. As a result, gilt-edged securities repre-

Consequential changes arising from the transport operation appear in other categories. Debenture holdings were smaller by £5,000,000 at £199.4 million. The fall in preference stocks was more pronounced, from £185.5 million (9.6 per cent of the 1947 total) to £168.4 million (8.0 per cent);

perhaps it is possible to see here not merely a consequence of the exchange of railway stocks, but also a revision of ideas about the investment status of preference shares themselves. Apart from these changes, the increase in mortgages and loans on policies illustrates a growing outlet for the investment of insurance funds.

The percentage figures discussed in these paragraphs are radically different from those shown for prewar years. The 1947 and 1948 figures and percentages relate to the assets of all offices included in the computation. The prewar averages are arithmetic averages, calculated by adding the percentages for the individual offices and dividing by the total number of offices. Thus the percentage of gilt-edged held by, say, the Marine and General received an equal weight with the percentage shown by the Prudential, whose holdings were two hundred times as large. The new figures therefore are much more representative than the old.

Last year brought some relief—not very great but certainly welcome—to the persistent fall in interest earnings on life and annuity funds. For most offices, interest earnings do not change very violently from year to year, and the average gain from a quite significant rise in interest rates is damped down by the weight of old investments in the funds. For the 38 offices whose figures are given in the third table, the rise in the average net return was a mere five pence per cent, from £3 9s. 4d. to £3 9s. 9d. Save in a few cases (and some of these exceptions may be explained by the arbitrary, though entirely reasonable, method of calculation), movements in net earnings shown by individual offices were generally limited to a few pence.

BOOKER BROTHERS, McCONNELL & COMPANY, LIMITED

SUGAR INDUSTRY: ECONOMIC FOUNDATION OF BRITISH GUIANA

HUMAN RELATIONSHIPS CONSTITUTE MAJOR PROBLEM

MR A. F. V. McCONNELL ON THREE MAIN FACTORS

The forty-ninth annual general meeting of Booker Brothers, McConnell & Company, Limited, was held on September 28th at the registered office, 37-41, Gracechurch Street, London, E.C.

Mr A. F. V. McConnell, the chairman, presided.

The Secretary, Mr C. C. Batch, A.C.I.S., read the notice convening the meeting and the report of the auditors.

The following is the statement by the Chairman, which was circulated with the report and accounts for the year ended December 31, 1948:—

Since we last met there have been two changes in the constitution of your board. Mr A. W. Armour, who joined the company in 1982, indicated to us that on account of advancing years he wished to relinquish his directorship from January 1, 1949. Although during recent years failing health had led Mr Armour to take a less active part in the administration of the company, it was with the most sincere regret that we accepted his resignation.

On August 16, 1949, Sir Frederick J. Seaford, C.B.E., was invited to join the board as a managing director. To those of you who have been connected with our company for any length of time, Sir Frederick Seaford will need no introduction. After many years' outstanding service to Bookers in British Guiana, Sir Frederick agreed to come to London to assume the general charge of the administration of the sugar side of our activities. We all offer him our warmest congratulations on his recent knighthood. No son of British Guiana has been more worthy of honour or has done more for the Colony with which and with whose peoples he has so fully identified his life and career. His intimate experience of British Guiana is proving of invaluable assistance in London. His former colleagues and associates in the Colony feel that they have lost a great ally, but your board are satisfied that his work in London can, at the present time, do even more to further the interests of British Guiana; furthermore, we are confident that the team now responsible for our sugar undertakings there will prove most able successors.

PARENT COMPANY'S ACCOUNTS

From the opportunity which you have had of studying the directors' report and accounts for the calendar year 1948, you will have seen that after taxation the profit was £157,162. You will also have seen that your directors recommend the payment of a final Ordinary dividend of 5 per cent. and a bonus of 3½ per cent., both free of income tax. We further recommend that £60,000 should be transferred to general reserve, the remaining small balance being added to the credit balance brought forward. Our recommendations, as last year, fall in with the wishes of the Chancellor of the Exchequer, but circumstances which should become plain to you as you read this statement would in any case have decided us to recommend no increase in the rate of dividend.

Examination of the parent company's balance sheet will show that the two salient features of interest are the appearance of the

£1,000,000 Notes of which I told you last year, and the changes that have taken place in the distribution of our assets. It will be more instructive to deal with the former when considering the consolidated balance sheet of the group, but the latter requires elaboration here.

A NEW SUBSIDIARY

A new subsidiary company, Bookers Drug Stores, Limited, was formed on January 1, 1948, to take over all our activities in the manufacturing and retail drug trades in British Guiana. From the point of view of the distribution of our assets this has had the effect of transferring some of them from the fixed and current assets headings to shares in subsidiary companies, which consequently total £1,521,956 this year, as against £1,159,271 last year.

Under current assets, debtors, you will see, show an increase of nearly £300,000 over the previous year, while stocks are rather less than the 1947 figure. Had it not been, however, for the transfer of assets consequent upon the formation of the new drug company, these two items would together have exceeded the previous year by more than half a million pounds. This formidable increase in stocks and debtors is the direct outcome of increased sales and further inflation—factors also influencing our subsidiary companies, as is clear from the current assets shown in the consolidated balance sheet. Stocks are conservatively valued and they are turning over regularly.

Three main factors have led to an increase of nearly £650,000 in net advances to subsidiary companies. These are, first, a greater quantity of produce on hand at the end of the year; secondly, the extensive programme of exceptional work being carried out upon our sugar estates; thirdly, expenditure upon our new ship, the *Amakura*.

Creditors, you will see, show a material reduction against the previous year, while loans from bankers show an increase. This is largely due to the fact that last year the item creditors included some £600,000 of temporary finance.

THE CONSOLIDATED ACCOUNTS

Having called to your attention these salient changes in the parent company's balance sheet, I now turn to the overall financial position of our company which is reflected in the consolidated balance sheet. Here you will see that the excess of current assets over current liabilities and provisions is more than £1,600,000—in contrast to a small deficit in the parent company. This contrast results from the fact that a large part of the current assets of our group are held by subsidiary companies, whereas the borrowing to finance these assets is mainly the responsibility of the parent company. This incidentally is a good example of the complexity of the financial problems of our group with its activities so diverse and so widespread. Your directors are continually considering the possibility of simplifying the internal structure of the group to make the

handling of financial and administrative matters easier.

Comparing the consolidated balance sheet as at December 31, 1948, with that as at December 31, 1947, it will at once strike you that we are employing almost exactly £1,000,000 more finance. This £1,000,000 has been obtained by the proceeds of our Note Issue, and generally speaking it is being used to finance higher current assets. There is, it is true, an increase of some £250,000 in fixed assets and trade investments which has been largely financed by money ploughed back into the business. You will see that the way in which we are employing the proceeds of this £1,000,000 Note Issue coincides in nearly all respects with that foreshadowed in my statement last year, with the one important exception that little of it has in fact been spent on fixed assets. This is satisfactory and coupled with our £1,600,000 excess of current assets implies a healthy financial position.

As you know, your directors have always before them the question of whether or not it would be wise to raise more permanent capital, but before I tell you their present views, you should have before you the broad picture of our financial problems as we judge them.

FINANCIAL FLEXIBILITY

First of all it must be emphasised that the very nature of our business dictates a high degree of flexibility in our financial arrangements. We have to forecast and to provide not only for the repair, maintenance, and improvement of our fixed assets of all kinds but also for the provision of adequate stocks of merchandise in our stores, and the financing—at times very heavy—of our sugar crops. The amount of money necessary for these and our other undertakings varies greatly at different times of the year. For these reasons it may always be necessary for our company to make use of ample overdraft facilities with our bankers. It would clearly not be provident for us to employ permanent capital up to the peak of our financial needs since that would result in holding money idle—sometimes for long periods. Furthermore, we must never lose sight of the important fact that on the evidence of the consolidated balance-sheet now before you, were there to be any real degree of deflation leading to reduction of stocks and debtors, we might find ourselves with more money than we require. Neither, on the other hand, must we forget that we have to accumulate funds to repay our note holders by 1958, and we can see our way to this provided our group continues to earn reasonable profits, which—taking one year with another—we hope it may.

CAPITAL EXPENDITURE PROGRAMME

Since our last annual general meeting we have advanced much further with our programme of expenditure on our fixed assets. We have finished paying for our new ship, the *Amakura*, we have made strides with our buildings, and we have completed well over half our programme of renovation and improvement in both field and factory on our sugar estates. This latter statement is, you will see, borne out by comparison of this with last year's balance sheet notes covering commitments for capital expenditure; nevertheless, we expect that, as was the case in 1948, a material proportion of this expenditure will be met from current revenue. In 1949 and 1950 drawings from the rehabilitation fund will also be available. In other words, the notes covering capital commitments and contracts show a larger sum than will in practice become a charge upon our liquid resources.

There is the picture, and in view of the progress which we have made with the ex-

penditure on our fixed assets your directors feel that they are able to judge it more clearly than they were able to do a year ago. At that time I told you that we were unable precisely to define our company's capital requirements, and the picture which I have just painted for you will, I think, show you that precision is still impracticable. We are, however, operating on overdrafts larger than we think altogether desirable, and that, coupled with a comparatively small programme of capital expansion which we wish to undertake in our Central African business, may justify an increase in permanent capital when market conditions allow. Indeed, from the notice which you received dated June 20, 1949, you will know that your directors have, in increasing the authorised capital of the company, made provision for an issue of ordinary shares. I must say frankly that we had been thinking of making such an issue soon after the publication of these accounts, but the effect of market conditions upon recent issues inclines your directors, in the light of the healthy situation disclosed by these accounts, to the view that it would be unwise to reach any hasty conclusion.

Before leaving our finances there is one further point in the group balance sheet which needs comment. There is a sum of £35,000 deducted from our revenue reserves for "unrealised profits on inter-company transactions." This deduction—following upon Note 3 in the consolidated profit and loss account last year—has been made to show the amount of unrealised profit contained in the stocks of our subsidiary companies which have bought their merchandise from the parent. This, or a similar sum, has of course always existed, and it is only the presentation of consolidated accounts which has raised the question of making an appropriate entry. It is a technical accounting matter.

BRITISH GUIANA

The year 1948 has been a difficult one, both on the sugar estates and in our general commercial undertakings. Taking our sugar estates first, output of sugar was 120,000 tons, as against 117,500 tons during the previous 12 months—a not unsatisfactory result considering unfavourable weather conditions for the spring crop and the six months' strike on the east coast which caused the loss of some 6,000 tons of sugar. This strike, as you know, led to the appointment of a commission of inquiry under the chairmanship of Dr Venn, of Queens' College, Cambridge, "to inquire into and report on the organisation of the sugar industry in British Guiana, with particular reference to means of production, wages and working conditions, and any other relevant matters; and to make recommendations." I understand that the commission's report is now in the hands of the printers, and it may well be published at about the same time as these accounts. Your directors can have nothing to fear from it; indeed, they believe that a full and impartial statement of the position of the sugar industry in British Guiana will do great good.

The sugar industry is, as you know, the social and economic foundation of the colony. Its prosperity, and thus the prosperity of British Guiana and its peoples, depends upon three main factors: first, the efficiency of the industry; secondly, the price paid for its products; and, thirdly, the human relationships within the industry and within the colony.

You already know that we are doing everything within our power to achieve maximum efficiency for the industry and to expand production.

SUGAR PRICES

As regards the second factor—the price paid for our products—the position is that

In 1948 the price of export sugar was increased by a net figure of about £2 16s. per ton over what we received in 1947. In 1949, however, a sound case for a further increase was rejected by the British Ministry of Food, the buyer. Production costs, however, continued to rise owing to ever-increasing prices of imports from the United Kingdom. Moreover, the value of and demand for our by-products has decreased very sharply.

You may have seen in the press that British West Indian Sugar Producers have been representing to His Majesty's Government the need to secure the future. During July and August two delegations visited this country to give powerful support to these representations, one with the mandate of the Jamaica Government, led by the Attorney-General, supported by Mr Bustamante, Mr Henriques, and Mr Barker; the other from the British West Indies Sugar Association, under the chairmanship of Mr Harold Robinson, chairman of that association. Two trades union leaders from British Guiana, Mr Thorne and Mr Edun, also came over and did valuable work in the same cause.

H. M. GOVERNMENT'S DECLARATION

The West India Committee have participated actively throughout all these prolonged negotiations—negotiations which culminated in the publication on August 10 of a communique which is so important a declaration that I quote it in full:—

"A series of discussions regarding the future sugar policy of His Majesty's Government in the United Kingdom has taken place in London in the past few weeks, first with representatives of the British West Indies Sugar Association and subsequently with representatives of the Jamaica Government. There have been full exchanges of view which were most useful to both sides.

"His Majesty's Government assured the delegations that they recognise that the prosperity of the Sugar Industry is vital to the maintenance of an adequate standard of living in sugar-producing colonies, such as the British West Indies. It is their intention to make long-term arrangements which will give to the efficient producer of sugar in these areas and elsewhere in the Commonwealth firm assurances of markets for agreed tonnages of sugar, at reasonably remunerative prices to be negotiated with the producers. It is the declared policy of H.M.G. to maintain and improve the economy of the Colonial territories and where, as in the British West Indies, sugar production is the main and indispensable basis of a healthy economy, this will be given special consideration in fixing the quantities of sugar to be covered by these arrangements.

"Before these arrangements can be completed, representatives of other Commonwealth producers will have to be consulted. It is the intention of H.M.G. to undertake these consultations in the autumn. Representatives of the West Indies will, of course, be included in these further discussions.

"The two delegations from the B.W.I. insisted throughout the negotiations that any assurances which might be given must, to meet the needs of the situation, cover a period of at least ten years. While appreciating this view, H.M.G. regarded the period of the agreement as a point to be covered in the negotiations in the autumn."

SECURITY OF THE SUGAR PRODUCER

It is true that this is essentially a declaration of principle, but if, as we are sure, it has been made in good faith, the final negotiations, when they take place in the autumn, should be conducted in an atmosphere and against a background which will ensure to British West Indian sugar producers the real

security which they justifiably seek and without which the Colonies where they operate will be devastated by social and economic disintegration. It is also true that His Majesty's Government have at this stage not found themselves in a position to discuss the length of term which the proposed arrangements should cover. I am satisfied, however, that producers will be able to convince those concerned that ten years is the shortest period to be of real value.

HUMAN RELATIONSHIPS—EFFORTS TO ACHIEVE HARMONY

The third factor is the all-important question of human relationships in British Guiana and in the sugar industry and they present probably the most difficult problem which we have to face. There are three parties directly involved—Government, labour and the sugar industry.

On the part of the industry much has been done, is being done and will continue to be done to improve the conditions of our workers. I must confess, however, that there exists in the Colony an atmosphere of suspicion of our motives and even of hostility which often depreciates if it does not actually thwart our efforts and our aspirations. This atmosphere is generated not by our own employees but by certain sections of the general community, including, I regret to have to say, some Government officials. For the good of British Guiana it is essential that this atmosphere be dispelled and towards this end it has been decided to appoint for the British Guiana Sugar Producers' Association a full-time manager of high calibre. This important post was offered to, and has been accepted by, Mr W. A. Macnie, Colonial Secretary of the Leeward Islands. Mr Macnie, who was born in British Guiana, is a Colonial officer of wide experience who has served with distinction in his motherland and elsewhere.

The working population have for their part made further welcome strides towards organising themselves. The recent visit to this country on their own initiative of two leading trades unionists in connection with sugar negotiations was an impressive and significant event.

Government, by means of legislation and at times exhortation, have striven to achieve a happier relationship.

None of these endeavours, however, can independently achieve that relationship without which the colony can never prosper. We all wish to make British Guiana a place fit for all its people to live and work in, in the greatest attainable degree of prosperity, happiness, and freedom, but we shall surely fail unless we all strive in concert to that goal—unless every one concerned believes that "we are all in the same boat"; unless, in short, we all of us realise the identity of our interests.

REPLACEMENT COSTS

Finally, on the subject of sugar I must tell you that our sugar companies did not as a whole show profits in 1948—their expenditure in fact exceeded their revenue. In this connection, however, you will have seen the sixth note on the consolidated balance sheet, which explains that there has been charged to the profit and loss account expenditure upon replacements, which includes exceptional expenditure on rehabilitation. As you know, in the case of our sugar companies we use a "replacement" basis of accounting and not a "depreciation" basis. This means that expenditure upon the replacement of major units is charged to revenue wholly in the year in which it is incurred. Improvements or extensions are, of course, capitalised. Drawings from the rehabilitation

fund, which are also mentioned in this note, will, at any rate during the next year or two, be barely sufficient to cover the capitalised portion of expenditure. This "replacement" basis of accounting creates very real difficulties for all sorts of reasons, and whatever merits it may have had in the past, it may be that your directors will, with the advice of our accountants, seek to modify it at some future date.

Turning to our general commercial undertakings, here again, as I have told you, we have had a difficult year and our difficulties have arisen largely from a decrease in gross profit margins forced upon us as a result of Government action. I can only say that traders generally in Georgetown are considering putting before Government, and if necessary the Secretary of State for the Colonies, a full case supporting revision of these profit margins.

Since the beginning of this year we have agreed with the Colonial Development Corporation to sell them our Timber Company. The price obtained was fair to both buyer and seller and we are satisfied that the sale is in the best interests of British Guiana and of Bookers. The acquisition of Bookers Timber Company by the Colonial Development Corporation will enable them to integrate their interests in the timber undertakings of the colony and will facilitate the plans they envisage for the ordered expansion of the timber industry. We, for our part, enjoy the most cordial relations with the Corporation and have undertaken to step back into the industry when the time is ripe and provided any proposition put up by them to us is in our view a sound commercial undertaking. In Trinidad Stephens, Ltd., have once more proved a most valuable unit in the group.

AFRICA

Our Central African Subsidiary Group, of which Campbell Bros., Carter and Company (Central Africa) Limited is the parent, had a very satisfactory trading year in 1948. This group of companies, under the most able and energetic leadership of a magnificent team, continues to make good progress and we are more than ever pleased with the success of our large-scale incursion into the wholesale and retail trading business in the Rhodesias and Nyasaland. Indeed, the trading results achieved not only by our recent Central African Group but also by their old and well-established progenitor, Campbell Bros., Carter and Company Limited, London, have been responsible for the fact that the trading profits of Bookers as a whole are as satisfactory as they are in the light of the difficult conditions in British Guiana during 1948.

UNITED KINGDOM

Our London and Liverpool branches, together with our Steamship Company, have made an encouraging showing during 1948. Our new ship, the *makura*, was launched on March 2nd this year and we are proud once more to have two vessels running on the only direct service between the United Kingdom and British Guiana, particularly at a time when shortage of British passenger services is causing such intense anxiety throughout the West Indies.

It is too early to tell you more than you already know about our latest subsidiary, United Rum Shippers, Limited, although we hope that their acquisition will make a substantial contribution towards solving the problems created by the very greatly reduced demand for the by-products of the sugar industry.

CONFIDENCE IN THE FUTURE

The future undoubtedly holds great difficulties for our company, as it holds difficulties

for everybody else in the world as it is today. Profits will be harder to earn, and I am certainly not going to indulge in optimism. Nevertheless, we face the future with confidence for the diversity of our interests and the wide spread of our operations give breadth and strength to the foundation of our structure, as indeed the results of 1948 have proved.

Before thanking the management and staff of our companies for the fine contribution they have made to our working during 1948, your board would like to pay tribute to the Colonial Office, with whom the nature of our business brings us inevitably into regular contact.

Much criticism is levelled nowadays at Government departments and their so-called bureaucrats. I and my colleagues can say in all sincerity that in the Colonial Office we find men of great ability and vision who are prepared at all times to discuss our many problems with us and to give invaluable assistance and advice where it is possible and proper for them to do so. Mr Creech Jones as head of the Colonial Office is a true friend of Colonial peoples.

Our management and staff throughout the group your directors on your behalf thank most sincerely for their continued work and endeavours. During 1948 many of them have worked under conditions of great and sustained strain and we must never forget that without them we could not now present to you the accounts which I shall ask you to pass.

The report and accounts were adopted.

The retiring directors, Mr A. F. V. McConnell and Colonel F. C. Drake, O.B.E., M.C., were re-elected, and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

BRITISH HOMOPHONE COMPANY, LIMITED

SIR HERBERT MORGAN'S SPEECH

The annual general meeting of the British Homophone Company, Limited, was held on September 28th in London.

Sir Herbert E. Morgan, K.B.E. (the chairman), who presided, said:

The net profit for the year, before providing for taxation, amounts to £13,850, as compared with £16,007 for the previous year. The fact that the net amount of dividends we are proposing to pay for the year is slightly greater than the Homophone net profit should cause no worry, as the consolidated accounts show an appreciable increase in the total carry-forward of the group.

The accounts summarise the results of this company and its wholly owned subsidiary, Ebonestos Industries Limited.

During the period under review, the consolidated profits which the group earned in the previous year were maintained during the first six months only. In the second half of the year there was a substantial falling off in those of Ebonestos Industries Limited. Last year, I gave some indications of the reasons why I thought that the moulding industry was entering a difficult trading period. The directors, however, despite the present difficulties, view the long-term outlook for your group of companies with confidence. Our organisation is sound economically and competitively, with a "know how" second to none in its field of activity.

As you know, the Homophone Company, with its wholly owned subsidiary, is controlled by Crystalite Limited.

We should all be proud of our executive and staff and its loyalty and effort under the direction of our managing director, Mr Jack Lessert.

The report was unanimously adopted.

GEORGE COHEN SONS AND COMPANY, LIMITED

STRONG POSITION

The twenty-fifth annual general meeting of George Cohen Sons and Company, Limited, was held on September 28th in London, Mr Cyril M. Cohen (chairman and managing director), presiding.

The following is an extract from the statement by the chairman:—

The consolidated balance sheet again presents an overall picture of financial strength and flexibility, with current assets double our total liabilities and combined reserves of approximately £1,800,000.

In comparison with the previous year—a record one in the long history of the company—the net profits have dropped, but, none the less, the final figures cannot be regarded as unsatisfactory. The combined profits of the Group show a return of 14 per cent. on the real capital employed and, after the payment of the Preference dividend and profits tax, as shown in the accounts, are equivalent to 50 per cent. of the nominal Ordinary share capital.

The fall in our profits is not attributable to any serious decline in the volume of business transacted, which, as foreshadowed in our circular of October 22, 1948, proved to be substantially the same as last year, the total aggregate turnover of the Group being under 2 per cent. lower than that of the previous year. This small reduction was not at the expense of exports, which, despite the many difficulties, showed an increase.

We have encountered a combination of the various factors which have adversely affected so many undertakings of late. Markets, both at home and abroad, have progressively become more competitive, necessitating smaller profit margins as well as increased selling effort and expense to maintain turnover—whilst certain other major costs have, at the same time, steadily risen from causes quite outside our control.

In regard to selling prices, we have made a few minor increases—these being authorised by statute—but, rather than augment those of our main proprietary manufactures to figures liable to prove uncompetitive or which might be detrimental to our goodwill, we have deliberately absorbed the aforesaid higher costs and have not passed them on to the customer.

Improved plant, facilities and methods achieved many reductions in operating costs, and it is unfortunate that these direct savings are at present being counteracted by increases arising from external causes, for example, transport, fuel, social services, etc.

Our extensive programme of modernisation continued during the year, but, due to various restrictions and shortages, the headway made in the concluding stages of some of our schemes was not as rapid as we would have wished.

After the payment of the Preference dividend for the year ended March 31, 1949, amounting to £29,906, and after writing off the expenses of the new issue of £13,730, there remains a balance attributable to the year's trading of £166,135, which is sufficient to cover some 2½ times an Ordinary dividend at the same rate as was paid last year.

We regard the volume of business which the Group is handling as satisfactory. In particular, production at our major plants has expanded and they have well-filled order books at remunerative prices, which should keep them fully occupied for some time ahead. Your board, whilst acutely mindful of the complexities of the industrial outlook, faces the future in a mood of steady and reasoned confidence.

The report was adopted.

STEEL BROTHERS AND COMPANY, LIMITED

PROGRESS IN OLD AND NEW TERRITORIES

WIDESPREAD ACTIVITIES

MR J. K. MICHIE ON THE OUTLOOK

The fifty-eighth annual ordinary general meeting of Steel Brothers and Company, Limited, was held on September 29th, at Winchester House, Old Broad Street, London, E.C., Mr J. K. Michie, chairman and managing director, presiding.

The following is the Chairman's statement circulated with the report and accounts for the year to December 31, 1948:—

The necessity to comply with the conditions of the new Companies Act and the consequent difficulty in getting audited accounts from our subsidiaries have, I regret, delayed the presentation of our accounts for 1948, but I hope they will be considered to be satisfactory. For convenience and because of the increasingly widespread nature of our business geographically, I propose to comment on our activities under separate territorial heads, but first there are certain general observations to be made.

HIGHER PROFITS

The expectation expressed in my last report that profits would be less in 1948 than in 1947 I am glad to say has proved too cautious, for profits are actually higher by £40,222. This has been due to the energetic pursuit of business in both old and new territories; to the receipt of £16,588 for assets left in Burma in 1942; to the realisation of the sum of £16,307 in respect of profits accrued but not actually received in previous years; and to a credit of £5,384 being a provision for workmen's compensation insurance in Burma no longer required. Before arriving at these results stock values have been carefully considered, and we are satisfied that all necessary provisions have been made.

The sum available after paying dividends on preference and preferred ordinary stock enables us to do certain things which have been for some years objectives of your Board. We have allotted the sum of £115,401 for depreciation of our assets and our investments; we have been able to set aside the sum of £100,000 to inaugurate a pension fund for the covenanted staff overseas and the staff in London and we have been able to pay dividends to the deferred ordinary shareholders after a period of denial of seven years.

WAR DAMAGE SETTLEMENT

In spite of the encouraging results of the year's workings certain of these decisions would not have been so easily made but for the fact that at long last an overhead settlement has been reached with His Majesty's Government on compensation for war damage suffered by British interests in Burma in 1942. On June 24th last the Chancellor of the Exchequer made the following statement in the House of Commons:—

"Without prejudice to any further action which may be taken by the Government of Burma or to any claims made against that government, His Majesty's Government have decided to make an *ex gratia* payment of limited amount to United Kingdom business

interests whose property sustained war damage in Burma primarily for the purpose of assisting them in overcoming their capital handicaps in the task of rehabilitation. They accordingly propose to seek Parliamentary approval for an *ex gratia* payment of £10,000,000 to be allocated on the advice of an independent committee consisting of Mr W. Carter, C.B.E. (chairman), formerly of the Royal Insurance Company and adviser to the Board of Trade on war damage matters; Mr J. A. Halford of Messrs A. L. Sturge (Underwriters to Lloyd's) and Mr F. K. Davies of Messrs Robinson Davies and Little (fire loss assessors).

"The committee will receive applications in respect of war damage to property in Burma (other than private chattels) which occurred between December 8, 1941, and March 31, 1946, from persons being British subjects domiciled in the United Kingdom or companies wherever registered which are mainly owned or which are managed and controlled by British subjects so domiciled."

Our claims along with others are now being examined by the assessing committee who will allocate the sum among us and we hope sincerely this difficult task will be completed and the money paid out before the end of the year. Meantime it is impossible to say or to guess what our share is likely to be.

I regret that the *ex gratia* grant by His Majesty's Government—which they regard as implementing the promise made to the Hay Committee in 1942—is so small in relation to the losses suffered and the sacrifices made by the claimants. I can only assure you that no effort has been spared and no argument left unused in our endeavours to have it increased. As you will appreciate governments are the final arbiters of the cash value of their moral responsibilities. When received our share will be used to write down the book values of our properties and investments in Burma and our balance sheet will then be presented in normal form.

We are now left with our legal claims against the Government of Burma for what is termed "denial"—and these are being pursued. "Denial" applies to only a small part of the parent company's losses, though the losses of our main subsidiaries fall very largely under this head.

Last year I commented on the change in our then cash position as compared with a year before. The balance sheet now presented shows that bank overdrafts at December 31, 1948, had reached the large sum of £1,183,703—an increase of £98,622 in the year. This looks suspiciously like over-trading, but the cause was that the stocks represented by these overdrafts were being carried by us as agents for governments and not as principals; and if the prewar machinery of financing shipments by bankers' credits had been in force this position would not have arisen.

BURMA

Our trading profits in Burma were satisfactory mainly because we entered 1948 with large stocks of readily saleable goods which we had laid down some considerable time ahead. For several reasons our business in Burma became progressively circumscribed as the year went on. Trading, both export and import, was affected by new licensing systems and by currency restrictions made

necessary by the deterioration in the economic position of the country.

On May 31, 1948, a large part of our forest areas was taken over by the state, and on May 31st of this year they assumed possession of the balance of our areas. So we are no longer forest lessees in Burma, although we still own our sawmills in Rangoon and Moulmein. A settlement of our claims for our assets and stocks taken over by the Government has not yet been achieved.

Although since the war ended we have been unable to work any of our remaining rice mills, we hired certain small mills in the Bassein district in 1948, where we also acted as buying agents for Government. Unfortunately, that area was the scene of serious disturbances from August onwards and considerable quantities of our stocks were lost. The financial responsibility for these losses, in our view, rests with the Government of Burma and/or on the insurance companies, but a settlement has not yet been reached.

As from December 31, 1948, we ceased to be rice buying agents for the State Agricultural Marketing Board, and this year we are not engaged in rice milling so are temporarily out of the rice business of Burma. Our organisation, however, is intact and could be put into use at short notice.

STRAND HOTEL

A new company—Strand Hotels, Limited—in which we hold the major interest, was formed in April, 1948, to take over and reconstruct the old Strand Hotel in Rangoon.

Owing to the unsettled conditions in Burma there was some delay in completing the extensive structural alterations and the refitting necessary to adapt the building to meet modern needs. The hotel was opened on August 1, 1948, and the results for the five months to end-December showed a small loss. In spite of present difficulties and the high cost of catering in Rangoon, the hotel is now paying its way. It is the premier hotel in Burma and is admittedly one of the finest in the east. It meets a crying need in Rangoon and is very well patronised by all sections of the community.

OTHER COUNTRIES

India: Our business in India, which is largely an agency one, has progressed satisfactorily and I would like particularly to mention our association with the Indian Tea Association in Bengal, for which we have acted for several years as buyers of their rice and other requirements. Results from the trading sections of our Indian branches have been encouraging.

Pakistan: We are now firmly established in Karachi and Chittagong and the volume of our business at these ports has been satisfactory.

Hongkong: During 1948 business continued to develop but recent events in China are likely to affect it adversely.

North Borneo: Our business is still in its beginnings as is the development of the territory and we cannot expect profitable trading for some time to come.

Siam: In Bangkok we are a member of the Siam Rice Agency, Limited, which is again functioning this year. We are also developing our business in the export and import trade of the country.

Ceylon: Our subsidiary, Messrs E. B. Creasy and Company, Limited, had a satisfactory year, but trading conditions have since become much more difficult.

Middle East: In spite of many difficulties our activities in these territories were well maintained and our relations with the various Governments are cordial.

East Africa: I have recently returned from a tour of East Africa, where I had the

pleasure of visiting the various branches of Messrs A. Baumann and Company, Limited, with whom, as then reported to you, we became associated last year. It is a pleasure to be able to say that everything I saw confirmed our previous good opinion of our new friends. We have just concluded an agreement with the Government of Tanganyika under which we shall become lessees of a forest area in the southern province of that territory. The arrangement will be a profit-sharing one and we have good hopes that it will prove mutually satisfactory.

SUBSIDIARY COMPANIES

Carbutt and Company (1928), Limited: This wholly owned London subsidiary, which operates rice and barley mills in London and Hull, again had a satisfactory year.

Mactaggart and Evans, Limited: Last year I referred to the formation of this company. On June 18, 1948, a large gathering, representatives of the technical and industrial community assembled at Sondes-place laboratories for the opening ceremony, when Sir William Larke, K.B.E., in an inspiring address stressed the dearth in this country of research laboratories which are available to trade and industry generally, and explained how this company fills a long-felt want. In its first year, which included only six months' operations at Sondes-place, as might have been expected, the company made a loss. Work is steadily increasing and we look forward to improved results in the future.

SOUTH AMERICA AND JAPAN

Brazil: In October, 1948, we closed our agency in Rio de Janeiro, having been unable to pay our way. H.M. Treasury puts a limit on losses where foreign exchange is involved, but, that apart, prospects were not encouraging.

British Guiana: During the year we became associated with the Colonial Development Corporation and Messrs Booker Brothers, McConnell and Company, Limited, in a survey of the timber potentialities of this colony.

This survey is not yet completed, but in the meantime the Colonial Development Corporation have acquired a forest concession and timber mills there and an arrangement has been come to whereby we operate their concession and mills as their managing agents.

Japan: We have just opened an office in Tokyo with the object of entering the import and export trades of that country.

PROSPECTS

As to prospects for the current year, I have already given you certain indications. It is our opinion that with the changed position in Burma and the end of the sellers' market throughout the world, results must show a definite recession, but every effort is being made to develop the old and to find new sources of revenue.

Staff: Once again a warm tribute must be paid to the staff in all sections of our business. Difficulties have been many, but they have been met as they must be in the spirit that they can be overcome. A good staff is the first essential to successful enterprise and in that respect we can count ourselves fortunate.

The report and accounts were unanimously adopted; the board's dividend proposal was approved; the retiring directors, Mr T. T. McCreath and Mr R. H. L. Langford James, were re-elected, and the remuneration of the auditors, Messrs Deloitte Plender Griffiths and Company, was fixed.

Resolutions were passed amending the memorandum and articles of association to give power to the board to establish a pension fund for employees, including directors.

INTERNATIONAL DIATOMITE COMPANY LIMITED

The fourteenth annual general meeting of International Diatomite Company Limited, was held on September 28, 1949, at Winchester House, E.C.2, the chairman, Mr E. W. D. Tennant, OBE, presiding.

The Secretary (Mr Jesse Wood) read the notice convening the meeting and the report of the auditors was read by Mr H. J. Binder.

The following is the chairman's statement which had been circulated with the accounts for fifteen months ended June 30, 1949:—

In my statements to you last year and the year before I was able to refer to the improved position of the Company which was reflected in the Accounts for those years. It is with pleasure that I now refer to the present position. A further improvement for the fifteen months under review has been achieved, and your operating Subsidiary Company, Moler Products Limited, has made great strides forward.

GREATER EXPORT BUSINESS

The export business obtained by Moler Products Limited is considerably greater than prewar, and the total orders executed for home and abroad are at a rate 30 per cent. higher than the previous year. The Works Plant at Colchester has been well maintained. Considerable improvements have been achieved and production has been brought up to the maximum of which the present plant is capable, and this is considerably above any previous output in the history of the Company.

Orders continue to come in freely and, with a substantial order book in hand, I am able to anticipate a further satisfactory year. In this regard the Company has already made a good start.

In the field of High Temperature Insulation, our products are in great request, and our present production is unable to cope with the demand. This is being remedied. A new section of plant is being erected for the manufacture of the special products in this field. It is anticipated that this new plant will be brought into operation before the end of the present financial year. In order to finance this important extension a secured loan of £50,000 has been obtained on suitable terms repayable by instalments over a period of fifteen years, or earlier at the Company's discretion.

THE DANISH COMPANY

In regard to our Danish sub-Subsidiary Company, a/s Fur Moler Kompagni, that Company has made a small profit, which has been deducted from the loss it made while in enemy hands. Fur Moler has, during the period under review, supplied all the Danish Moler which Moler Products Limited requires for its own consumption. During the period our Managing Director has on three occasions visited Denmark and on each occasion has made a satisfactory report regarding the Danish Company's condition. In September, 1948, I had the pleasure myself of visiting Denmark and inspecting the quarries at Fur and Ejerslev, and I am satisfied that the supply position is assured for many decades.

Viewing the profit achieved against the Issued Capital of the Company, one might erroneously come to the conclusion that the ratio of profit was high in regard to capital employed in the business, but this is not the case. In March, 1935, by an Order of the High Court, a Scheme of Capital Reconstruc-

tion was sanctioned, which scheme wrote off a total amount of £254,605, including £100,000 off the fixed assets of Moler Products Limited and of a/s Fur Moler Kompagni. These fixed assets are still there and, in fact, have appreciated in value, but they are not reflected in our present capital. Actually, therefore, the real capital that has been invested in the business is substantially larger than the figures shown in the balance sheets and the shareholders own a security of a value considerably greater than the book figures.

TRIBUTE TO MANAGING DIRECTOR

During the past seven years, subject always to the Board of Directors, the control of your affairs has been in the hands of our experienced and energetic managing director, Mr Robert Wood, and thanks to his sound and progressive management, the Company has recovered from the effects of the war, and of the German occupation of its mines, and marked success has been achieved. In order that this progress shall continue into the future, the directors of Moler Products Limited have appointed to the Board of that Company Mr W. J. Shaw, the sales manager, and Mr Ronald Ingham, the technical manager.

I feel sure that the shareholders will join the directors in expressing to our managing director and to all the officials and employees of the company sincere appreciation of the results they have obtained.

The report and accounts were unanimously adopted, and a final dividend of 10 per cent., making 30 per cent. for a period of fifteen months, was approved.

The retiring director, Sir Ronald W. Matthews, J.P., was re-elected. Messrs Binder, Hamlyn and Company continue in office as auditors.

COAST LINES LIMITED INCREASED PROFIT

The thirty-sixth annual ordinary general meeting of Coast Lines Limited was held, on September 27th, in London, Sir Alfred H. Read (chairman of the company) presiding.

The following is an extract from the chairman's circulated statement:—

The trading profit of Coast Lines Limited and its subsidiary companies for 1948 has reached a total of £1,449,177, representing an increase of £191,806 over the 1947 figure. An interim dividend of 5 per cent. was paid on July 21, 1949, and in view of the necessity for conservative finance, the directors do not recommend the payment of any further dividend for the year 1948.

The coastal and cross-channel fleet owned by the group in December, 1948, consisted of 100 vessels in service, of which 18 were passenger ships, 15 cattle carriers and 67 steamships and motorships.

The very high level of building costs is a cause of serious concern to shipowners and shipbuilders alike. At the present level of costs new tonnage is uneconomic, and future large-scale replacements cannot be contemplated until the cost of building is drastically reduced.

Our freight services to Eire and Northern Ireland have been active with a welcome increase in tonnages shipped of 8 per cent. The advent in 1948 of the new passenger ships, the *Leinster* and *Munster*, on the Liverpool to Dublin service, and the *Innisfallen* on the Fishguard to Cork service has brought a very gratifying response from the travelling public.

Although shipping is a hazardous business the industry has nevertheless faith in its future. It has faced and met its difficulties in making good the huge war losses and re-establishing the British Mercantile Marine in its former pre-eminent position.

The report was adopted.

PALESTINE ELECTRIC CORPORATION, LIMITED

SATISFACTORY RESULTS

The twenty-sixth ordinary general meeting of the Palestine Electric Corporation, Limited, was held on September 23rd in London, the Rt. Hon. Viscount Samuel, F.C., G.C.B., G.B.E. (the chairman) presiding.

The following is an extract from his circulated statement:—

During the year under review, the affairs of the Corporation were profoundly affected by the striking events occurring in Palestine. After a prolonged period of acute tension and disturbance, the country was exposed, on the termination of the British Mandate, to all the devastating effects of war. In addition, the exclusion of Palestine from the sterling area in February, 1948, gave rise to economic problems of great difficulty.

Considering the adverse circumstances of the year, the financial results, as shown by the report and accounts, may be regarded as satisfactory. The number of units sold was 246,247,651, only 12 per cent. less than in the previous year. The evacuation of a great part of the Arab population necessarily involved a loss of consumers; nevertheless the total number of consumers increased by 4,241, making the total at the end of the year 128,561. The gross revenue for 1948 was £2,663,751.

In my statements in previous years, I referred to orders placed by the Corporation in connection with our plans for extensions. The 12,000-kw turbo-generator set ordered in 1945 for installation in the Reading power house was put into commission last year. With regard to the 30,000-kw turbo-generator set for the Haifa power house, also ordered in 1945, progress could not be made according to the original plans, owing partly to delay by the manufacturers and partly to the dislocation resulting from the situation in Palestine. The work of erection of the plant for that set continues, and it is expected that the boiler and turbo-generator will be ready for operation before the end of the current year.

It is reasonable to anticipate that the future demand for electricity stimulated by intensive settlement and colonising activity and by expansion of industry and agriculture, will show a steep upward trend. To cope with this, additions to the generating capacity of the Corporation's system will be required beyond the total for which plans are now in progress. Such extensive development schemes will involve considerable additional finance in the coming years, and the directors will therefore propose, in order to allow a sufficient margin for the future, that the authorised capital of the Corporation be increased from £4,000,000 to £10 million.

The directors will also propose that, subject to the consent of the Capital Issues Committee, the share premium account be capitalised, and that there be distributed to the existing holders of ordinary and "A" ordinary shares one fully-paid ordinary share in respect of every six ordinary and "A" ordinary shares now held, thus absorbing £289,604 out of the £290,818 standing at

credit of this account. The directors will further propose that the issued shares of the Corporation be converted into stock units.

Last year, although the available profit would normally have justified the payment of dividend, the directors did not consider it advisable in the circumstances then prevailing to recommend a dividend on the ordinary and "A" ordinary shares. This year the directors feel justified in recommending a dividend of 5 per cent., free of tax, on the ordinary and "A" ordinary shares.

The report was adopted.

SILENTBLOC LIMITED

EARNING CAPACITY UNIMPAIRED

The fourteenth annual general meeting of Silentbloc Limited was held on September 28th in London.

Mr Harold Vezey Strong, the chairman, in the course of his speech, said: The Government at an earlier date requested industrialists to maintain the price level despite increases in wages and cost of raw materials, and endeavour through raised output to reduce the all-over cost of production. Your subsidiary company attempted what proved to be an impossible task, and this failure was the outstanding cause of the unsatisfactory results of the early months of the financial year. As soon as the position became apparent a revision of prices was made, which, with other adjustments, resulted in the earlier losses being recovered and the year ending with a net profit of over £17,000.

The parent company, too, has not been without its disappointment. When incorporated some dozen years ago it catered almost exclusively for the motor trade. That was not a healthy position. Consequently, it has always been the board's aim to find uses for the company's products in as many other industries as possible, and thus lessen the effects of bad trade in one.

We still derive from the motor trade a substantial volume of business. Owing, however, to changes in design and the general introduction of independent front suspension systems, mostly using metal to metal bearings, our sales have been affected to some extent, and this is reflected in our turnover. Active steps have been taken to meet this new situation by the development of a new type rubber bush, which is now being offered to motor car manufacturers as a practical solution of this particular problem.

The trading profit has fallen by £22,789, which leaves it only slightly higher than the 1946-47 figures—£95,639 as against £91,827. The net profit at £27,978 represents a fall of £10,435, but we bring in the sum of £6,163 over-provided in respect of previous years, and these, together with £22,314 brought forward from last year, make available on profit and loss account a total of £56,455, against £56,430. Your directors have under consideration the provision of permanent finance and at the same time they will consider the desirability of distributing by way of bonus shares such capital reserves as may legally be dealt with in that fashion.

Sales have increased in all the industrial

groups, that is to say in general and marine engineering, road and rail traction, the textile industry, collieries and aircraft, but among motor manufacturers, as I have already told you, demand slackened. It may reasonably be anticipated that the recent Washington agreements will provide the impetus for an improvement in that position.

I now turn to our wholly owned subsidiary, the Andre Rubber Company Limited, whose affairs are so closely woven into our fabric. The volume of sales of textile products has increased 200 per cent. over last year and the increase continues, orders being received from Canada, Australia, New Zealand, South Africa, India, Egypt, France, Belgium, Holland, Sweden, Norway and Switzerland. Some of this business is new, some repetitive.

The view of your board is that, economic and political blizzards apart, the earning capacity of your company is unimpaired. Indeed, it will be very disappointing to your board if the results of the year under review are not comfortably exceeded in the current year. Your board has recommended a final dividend of 4d. per share, making with the interim already paid, 7d. less tax for the year, which is the same as was distributed both last year and the year previous.

The report was adopted.

GOLD MINES OF KALGOORLIE, LIMITED NEW PROSPECTS

The fifteenth annual general meeting of Gold Mines of Kalgoorlie, Limited, was held in Melbourne, Australia, on September 28, 1949, Sir Walter Massy-Greene presiding.

The mill treated 161,363 tons for a return of approximately 5 dwis. per ton. The net revenue at £65,943 was £16,740 less than the previous year's figure.

A dividend of 1s. per unit of stock was declared. The dividend is totally exempt from Australian taxation, and only 15 per cent. of it will be subject to tax in the hands of United Kingdom stockholders.

The chairman referred to two important prospects on the Kalgoorlie field, about to be tested by the company.

On the southern prospect a geophysical gravity survey is about to begin. In this area there is the possibility of a repetition of the Kalgoorlie mineralisation existing at depth. G.M.K. holds leases over all the ground which is considered to be of interest in this investigation.

The other potentially important prospect is that of ore in the second dolerite bed which is believed to underlie the calc schist throughout most of the Kalgoorlie field. A proposal has been made to certain companies with adjoining leases to join with G.M.K. in working the second dolerite bed as one mind. A special statement will be issued as soon as a decision is reached.

The association with Mines Consultants Pty., Limited, which is a subsidiary of the Consolidated Zinc Corporation group, has been preserved by their appointment as consultants and advisers to the company.

The chairman's statement is to be circulated to stockholders.

NOTICES

IMPORTANT Retailing and Manufacturing business with large branches in London and Provinces invites applications for Head Office appointment of Manager in control of all branch offices, involving about 20 in number with 300 personnel.

Applicants, not over 35 years of age, must be professionally qualified as accountants, actuaries or bankers, or hold good degrees in commerce or economics, and have experience and capacity for organising retail office systems and managing office staffs. The successful candidate will be trained as a specialist in the installation of accounting schemes for management control. Four-figure commencing salary and good prospects. Send full particulars of age, education, qualifications, experience and present salary to Robson, Morrow & Co., 59, New Cavendish Street, London, W.1, marking envelope "Application."

Investment Statistics

Company Notes

Standard Motor.—The balance on trading account increased from £1,651,466 to £2,617,515 and net profit from £453,833 to £555,249 in the year ended August 31, 1949. The dividend is unchanged at 25 per cent.

William Doxford and Sons.—Net profit before taxation increased from £362,174 to £457,163 in year to June 30, 1949. The total distribution of 20 per cent for the year, including 5 per cent bonus, is the same as for 1947-8. It is proposed to issue 50,000 £1 ordinary shares by way of a free bonus on the basis of one new share for every ten ordinary shares held on October 17, 1949.

Southern Kinta Consolidated.—Profit for the year to March 31, 1949 amounted to £632,705 (£157,279) after providing £196,087 (£70,000) for depreciation and depletion but before taxation £320,000 (£101,500) and £130,000 (nil) written off restoration expenditure. A total distribution of 22½ per cent is recommended for the year compared with 10 per cent paid in 1947-8.

North Broken Hill.—After providing £1,046,500 (£408,000) taxation and royalties and £75,000 (£30,000) depreciation, net profit amounted to £1,712,451 (£979,822) in the year to June 30, 1949.

Olympic Portland Cement.—Consolidated profit amounted to £43,212 in the year to March 31, 1949, compared with £16,368 for the previous 15 months period. A dividend of 12½ per cent for the year is recommended.

London Tin Corporation.—Consolidated net profit increased from £425,921 to £452,516 in the year to April 30, 1949. A dividend of 8 per cent has been recommended for the year compared with 6 per cent for 1947-8.

Clarkson's Old Brewery, Barnsley.—Trading profit declined from £112,901 to £101,885 and net profit from £57,519 to £35,963 in the year ended June 30, 1949. The distribution of 25 per cent, including a bonus of 15 per cent, for the year is unchanged.

Neepsend Steel and Tool Corporation.—Consolidated profit increased from £459,430 to £528,649 in the year to March 31, 1949. Net liquid assets at March 31, 1949, were

£429,935 (£396,121). It is proposed to capitalise £305,847 of reserves by way of a bonus issue of ordinary shares on a one for one basis.

Clifford Motor Components.—Group trading profit declined from £290,459 to £252,847 and net profit from £73,047 to £55,580 in the year to March 31, 1949. The dividend of 30 per cent is unchanged. Net current assets at the year-end were £699,414 (£713,561) and fixed assets less w.o. £453,555 (£429,524).

Jays and Campbells (Holdings).—Consolidated trading profit increased from £397,538 to £766,943 in the year to March 31, 1949. Net profit rose from £139,878 to £265,266. Net current assets at March 31, 1949 were £3,661,000 (£2,608,000).

J. Mandelberg.—Group trading profit declined from £189,771 to £177,439 and net profit from £65,325 to £61,823 in the year to June 30, 1949. The dividend of 12½ per cent for the year is unchanged.

Capital Issues

Acrow (Engineers).—Application has been made for permission to deal in London in the 200,000 5½ per cent cumulative £1 preference shares. Earnings for the year to March 31, 1949, cover the preference dividend 14 times.

Job Wheway and Son (Chain manufacturers).—Lists opened on September 30, 1949, for an offer for sale of 760,000 Is. ordinary shares at 3s. a share. The directors' dividend estimate of 30 per cent for the year to September 30, 1949, is equivalent to a yield of 10 per cent on the issue price.

West Riding Worsted and Woollen Mills.—It is proposed to capitalise £254,100 of reserves by paying up in full 254,100 £1 ordinary shares to be allotted to ordinary shareholders on a one for two basis. An increase in the authorised capital by the creation of an additional 125,000 5½ per cent cumulative £1 preference shares ranking *pari passu* with the existing 500,000 £1 preference shares and a further 250,000 £1 ordinary shares is being sought.

Austin Reed.—It is recommended that £252,509 of reserves be capitalised by an issue to ordinary shareholders of one fully paid ordinary share for each £1 ordinary share held.

Johannesburg Consolidated Investment.—Shareholders' approval is being sought for an increase in the authorised capital from £4,345,000 to £7,000,000 by the creation of 2,655,000 £1 ordinary shares and also for the power to issue at directors' discretion the new shares together with 395,000 £1 shares at present authorised but not issued.

Austin Motor.—It is proposed to capitalise £582,625 of reserves by way of a paying up in full 2,330,500 5s. ordinary shares to be allotted to holders of ordinary and "A" ordinary stocks in the proportion of one for two. A further resolution to consolidate the issued ordinary and "A" ordinary shares into one class of 5s. ordinary shares will also be submitted at the annual meeting of the company in December.

Palestine Electric Corporation.—Permission is being sought to capitalise £289,604 of reserves by way of paying up in full ordinary shares to be issued to ordinary and "A" ordinary shareholders on a one for six basis.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there are two exceptions (assuming 4 per cent and Consols 4 per cent) on which yields are taken to earliest date and marked 'e'. (b) Net yields are calculated after allowing for tax at 9s. in £. (f) Flat yield. * Assumed average life 15 years 6 months.

(a) Interm. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To latest redemption date. † Free of tax.

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 24, 1949, total ordinary revenue was £58,580,000, against ordinary expenditure of £59,958,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £8,197,000, the surplus accrued since April 1st is £2,244,000 compared with £256,122,000 for the corresponding period a year ago.

ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS
APPOINTMENTS REGISTER

Employers seeking the services of Certified Accountants are asked to write to the Secretary of the Association, 22 Bedford Square, London, W.C.1. (Telephone: Museum 5163.)

LONDON TRANSPORT EXECUTIVE

Applications are invited for a vacancy in the Staff Administration Office. The work, which is under the direction of an Actuary, is concerned with the various aspects of superannuation funds and friendly societies and also involves the collection and appraisal of staff statistics and statistics of sickness-absence on a large scale. Applicants must either have passed the first three parts of the examinations of the Institute of Actuaries, or the Faculty of Actuaries, or hold a University Honours degree which includes statistics. The commencing salary for the post would be about £500 per annum, with prospects of further advancement.

The appointment is subject to a medical examination. On completion of a satisfactory probationary period the selected applicant would, where eligible, be expected to join a Contributory Superannuation Fund, canvassing, directly or indirectly, with disqualify. Applications, giving full particulars of age, experience and qualifications, should be sent within fourteen days of appearance of this advertisement to the Staff Officer (F/EV.96), London Transport Executive, 55 Broadway, Westminster, S.W.1. For acknowledgment enclose addressed envelope.

EXPORT SALES MANAGER.—Responsibility for organisation and administration of Export Sales Department; and to share visits overseas markets regularly in turn with Assistants. High-grade Painters' Brushes and other brushware. Adequate remuneration and assistance. Reply letter only stating age, career and any linguistic capabilities, etc., in confidence to The Secretary, Christopher Leng & Son, Ltd., Hazelwell Brush Works, Birmingham, 30.

ECONOMISTS. January, 1916-June, 1949, for sale. Good condition. Offers: Box 216.

The Economist's Bookshop Ltd.
caters for specialists and students in
Economics and the Political and Social Sciences
11-12 Clement's Inn Passage, Aldwych, W.C.2.

Head Office: Toronto, Canada.

It is now more important than ever that all intelligent men and women in Great Britain should read

P. M. S. BLACKETT'S
Military and Political Consequences of
ATOMIC ENERGY

TURNSTILE PRESS 12s. 6d.

WORKS MANAGER (ASSISTANT).—Responsibilities involve sound knowledge labour utilisation and methods, rate fixing, production management, stores control and relationship with costing organisation. Painters' Brushes and other brushware and component parts. Experience light industry desirable but not necessarily in Brush Trade. Adequate remuneration. Reply in confidence, letters only, stating age, scope of capabilities, experience, etc.—The Secretary, Christopher Leng & Sons Ltd., Hazelwell Brush Works, Birmingham 30.

THE CHARTERED INSTITUTE OF SECRETARIES. Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16 George Street, Mansion House, E.C.4.

UNIVERSITY OF SYDNEY

Applications are invited for the position of *Lecturer in Economic History*. The salary is in the range £500-£750 (Australian) per annum, plus cost of living adjustment with annual increments of £50, and is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to qualifications and experience. The successful applicant will be required to take up duties as early as practicable in 1950. Further information may be obtained on application to the Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1. Applications, supported by testimonials and giving the names of three referees, should be forwarded to reach the undersigned not later than October 31, 1949.

G. DALE, Registrar, University of Sydney,
New South Wales, Australia.

Auction For Germany

THE contest for power in Germany—and in central Europe—has this week reached a new stage. The Federal Republic of the west is now challenged by the "German Democratic Republic" of the east. The success of Allied policy in the west has forced the Russians to produce in the east a fraudulent imitation and some dubious promises of improvement. The backers from beyond the Rhine and the Vistula have set their champions face to face, the seconds are getting out of the ring, and the weight of Bonn is now matched against the cunning of Berlin.

At first sight, it looks an unequal match. Behind Bonn are the power of the Ruhr and the churches, the support of Marshall Aid and the Atlantic Pact, a majority of votes cast in a free election by the largest part of the German nation, and the evidence—for all to see—of more food, more clothes and more production. Berlin, it is true, has behind it the power of the Soviet Union, the conspiratorial skill of the dominant Communist Party, and the prestige of the old capital. Although the Russian concessions to the new regime have fallen far short of expectations, the state over which the Communist Herr Pieck presides—"Pieck republic" will distinguish it as well as any other name—will also boast that it controls its foreign affairs, that it has its own armed police force, and that it has been promised a peace treaty.

Against this, the eastern republic has somehow to overcome the hate and distrust that Germans everywhere still feel for its Russian patrons, who have brought the frontier of Poland up to the Oder-Neisse line. If it has any hope at all of success in the mission that it has proclaimed—to unite Germany, to destroy the "separatist" Bonn Republic, and turn Germans against the Atlantic Pact and Western Union—it must rest on the belief that world economic forces, and the mistakes of the Americans, British and French could in time turn the eyes of western Germany eastwards; Herren Pieck and Grotewohl must hope secretly—whatever they say in public—that such a change of allegiance would be regarded by the Russians as worth the revision of the eastern frontier and a new partition of Poland. If they have no such ideas in mind, then their claim to lead nationalist Germany back to unity is mere foolishness—and Communists are more likely to be rascals than fools.

The challenge and the warning are unmistakable, and the western allies must now raise their eyes from the day-to-day tasks of occupation and look at the future without blinkers. The challenge, indeed, was implicit as soon as it became clear that the Russians would not work the Potsdam agreement, except on terms which would give them the power to control the whole of Germany. Soviet policy in Germany has been one of long-sighted and realistic conspiracy for power, whereas American policy has gone through a 180-degree revolution since 1945. And if British policy has not so completely abandoned its principles, that is only because there have never been any clearly

stated principles to abandon. In practice, the policy of the western allies has been one of short-sighted improvisation, a flurried effort to adapt old directives to new situations, and to pursue at one and the same time policies as contradictory as the Marshall Plan and dismantlement. Matters have come to such a pass that governments which undertook to reform, disarm and re-educate Hitler's Germany are already bidding for the favour of the Germans of Dr Adenauer and Herr Pieck.

That this is so is a measure of the imbecility of Allied policies towards Germany from the days of saturation bombing and unconditional surrender onwards—policies against which this journal has never ceased, during and since the war, to protest. The worst of it is that, now it has come to an auction, the very ruthlessness of the Russians gives them a great advantage. They can offer all sorts of liberties and equalities to Germany, safe in the knowledge that they can all be quickly rescinded by a Communist secret police in Germany; the west has to mean what it says. Their system of government enables them to settle in a matter of weeks policies over which the western allies would argue for months—and then not agree.

It is the obvious and compulsory object of any western diplomacy—American, British or French (for all that some embittered Frenchmen deny it)—to prevent the Russians from winning the auction for Germany. Moreover, the time over which the auction will be conducted will be distressingly short. Very few people would have imagined, at the time of the Potsdam Conference, that it would take only four years to reach the stage of an open auction, with all the opportunities it provides for German manoeuvring. In three more years the Marshall Plan will be over, and one of the most powerful means of western influence in Germany will have gone. Within the next five years defence arrangements under the Atlantic Pact will be completed. It will then be difficult for an American government—and none too easy for a British—to justify to its own taxpayers (let alone the Germans) the retention of troops in Germany; and the question will then present itself, how is an unarmed western Germany to be defended? It will not be long before western Germany will be free to break away from the Atlantic community if it wishes to do so.

★

In the bidding for Germany that is already starting, the attractions of what Moscow has to offer could be very strong. Any sensible German politician knows that the occupying armies of the west are the only safeguard of Germany's freedom and that he ought to despair of his liberty, and possibly of his life, if they were withdrawn. But if the Russians raise the cry of evacuation (their own troops into Poland, the Americans to the other side of the Atlantic), it would be folly to expect any re-echo from the Germans of the west; the primitive urge to national freedom will be too strong. Germany ought to prefer to remain under mild western tutelage, with very large and real freedoms, rather than to have the outward form of complete sovereignty with the reality of complete subjection and suppression; but it is very doubtful whether that will be the preference that German politics will in fact show. No moderate German government will be able to survive the criticism of right and left extremists unless it is obtaining—or

has already obtained—some of the hundred and one concessions which are implied by the word *Gleichberechtigung*—equality of rights or status. (It is none too soon to recall the bitter struggle which killed Stresemann and ruined Brüning.) And every major demand under this heading will cause disagreement among the Allied High Commissioners and hesitation in America and Britain. Already after less than a month of activity within the limits of the Occupation Statute, Mr McCloy, General Robertson and M. François-Poncet have shown a capacity to disagree on fundamental matters, which will encourage a persistent and impatient German Cabinet to exploit their differences and whittle away their powers.

★

Time, therefore, is short and if important concessions are to be made to the Bonn Government at all, nothing is to be gained by delaying them. The Adenauer government is as good as we are likely to see in Bonn. It is weak and it needs prestige; concessions made to it now, before they are suggested or demanded, will have far greater effects than if they come piecemeal after German propaganda campaigns. What then is to be conceded? What will be the dominant ideas in the public opinion of western Germany, which the Bonn government must be helped to master and harness? They have been mentioned already: the demand for frontier revision, the demand for independence by treaty, the demand for a trade policy that will produce and sell goods sufficient to pay for enough foreign food and raw materials, the demand for a share in the defence of western Europe. One has only to state these demands to see that they will acquire, as the years pass, a moral authority which will impress British as well as American public opinion. Neither Britain nor America will wish to deny Germany a right to equality with other nations—especially if that is what Russia ostentatiously (and however deceitfully) offers. The form in which these various forms of equality are to be conceded, the conditions which will have to be met, even their timing, should be decided quickly while German opinion is still unorganised and largely apathetic. To give them in time will reinforce the western case in Germany; to give them only as something extorted by a Communist-led campaign is to turn western concessions to Russia's account.

Clearly not everything can be done, and what can be done cannot all be done at once. Revision of the Oder-Neisse line is an international and not a purely German problem, and nothing can be done about it without Russia's consent—short of war, that is, and certainly the western powers have no intention of starting or being involved in a war about it. On the other hand, the demand that independence be recognised in a peace treaty is one that should be met quickly. A date should be fixed by which the restrictions on the sovereignty of the Bonn government will be reduced to three: the maintenance of occupation troops, the right of inspection to prevent rearmament or military training, the right to intervene for the protection of civil rights. Nothing more than these can be, in the long run, tolerated by German or supported by western opinion. It is better to admit the fact now before the Germans argue us into doing so.

It will be objected that this policy simply opens the way for a nationalist government to do whatever it likes; that it makes nonsense of all the talk about ensuring that Germany co-operates with the west and makes its con-

tribution to European stability. This is true, it does; it may be that the only choice left is between the Communist and non-Communist forms of nationalism. This is another of the fruits of the allies' German policy, but the fact that it is most shocking and unpleasant that things should so soon have come to such a pass is no excuse for not doing what can be done to secure the lesser evil. In point of fact, however, there is still one way of escaping from the dilemma—that is if, *pari passu* with a policy of concessions to the German demand for equality, the British and French governments were to take really seriously the task of organising European unity with the Bonn Government. The only restraints on Germany which will work for more than a year or two are those which its Government accepts because it believes they are profitable, in terms of prestige, security and prosperity. For example, the Ruhr Authority as now constituted will not work unless the Germans want it to. They are still hesitating to be obstructive because they have been encouraged to believe there is some chance of its becoming a planning authority for the heavy industry of all western Europe. The question is now on the agenda: will the French and the Belgians, who have pressed so hard for European unity in theory, give a practical demonstration of their sincerity by considering such an expansion of the Ruhr Authority? If they will not, then it will be surprising if the Germans support an experiment in international planning at their own expense.

Precisely the same choice presents itself in the political sphere. If the Council of Europe does not admit Germans now, to take part in making a reality of the possibilities it offers, what is to prevent them concluding that their only fruitful diplomatic role is to play the Russians off against the Americans? The idea of belonging to the Council of Europe, of taking part in the movement towards European unity is one which could make a great appeal to the imagination of thinking Germans. It is the one idea that German statesmen might pit successfully against the nihilism of the nationalists, that might offer politicians the moral support outside Germany which would give them the courage to be moderate in their patriotism.

In the military sphere the question is less immediate,

Rescuing the Left

IT is now clear that the opportunity of devaluation has been missed. Abroad, there has been much disappointment, mixed with amazement, that so sharp a reduction in the exchange value of the pound sterling was not accompanied by any relaxation whatsoever of the restrictions that keep the pound so tightly inconvertible. "Devaluation," says one experienced continental commentator, "is usually the price paid for getting rid of exchange control. To pay so high a price and get none of the reward is a very bad business." At home, ever since September 18th, Ministers have been busy nailing flags to the mast and enunciating sacrosanctities. They could not have been more anxious to demonstrate that nothing at all has been altered except the arithmetic in the exchange tables. If that is so, there will be some months of relief while the level of costs fills up to the new danger line. But there will be no change in any fundamental relationships.

but just as crucial and difficult. On the one hand the claim of the Germans to take part in the defence of western Europe cannot be indefinitely ignored. On the other hand it is unthinkable that a German government should just be left free to form an army and revive the armament industries. If western Europe is to be provided with sixty divisions by 1954 the idea is tempting; but to those who recall the part played by the German army in politics it is intolerable. Is there no way out of the dilemma?

Again the answer is that a practical solution is possible if the western governments mean what they say about European unity. Would it be quite impossible for the Brussels Pact governments to form a long-service, volunteer, international force in which Germans could enlist? Indeed, can they implement the defence plans of the Atlantic Pact at all unless they have such a nucleus of integrated forces? Is there any sufficient reason why Germans should not form part of such a force, in the control of which a German government would have only one voice among five or six? The alternative is that the American and British governments maintain indefinitely in Germany forces which they know to be inadequate for its defence, and that a west German government watches helplessly while the people's feeling of insecurity turns into frank militarism.

★

In proposals of this kind there are many risks and difficulties, both inside and outside Germany; but they are no bolder—only more specific—than the talk so frequently heard, particularly in France, about incorporating Germany into a west European structure. That talk means nothing if it does not mean taking risks of this kind. So far the talk of European union has shown little awareness of the speed with which events in Germany are moving. Conditions there make a policy of constructive concession easier and less dangerous now than it will ever be again. Many of the Sibylline books have been burned, but some still remain. To make such a policy conditional on good behaviour by Dr Adenauer's Government and by forces over which he has no control is simply to allow Russia all the time it needs to play Mephistopheles to the German Faust.

This unbending attitude is being adopted in the name of the favourite objectives of the Left—of social security, of full employment and of fair shares. These objectives were put clearly on record in the motion that the Government carried through the House of Commons in the recent three days of debate, which declared that devaluation had been undertaken "for the purpose of enabling the economy of the sterling area to maintain stability independent of external aid . . . while maintaining full employment and safeguarding the social services." But a motion so worded is a gigantic *non sequitur*. The road to Hell is paved with good intentions of reaching Heaven. Ministers apparently still do not realise the real grounds for the alarm that their policy is creating. What a significant section of public opinion—perhaps the most significant of all, since it lies in the centre—holds against them is not that they are aiming at the social democratic welfare state but the opposite,

that they are putting it into jeopardy, not that they are steering in a Left direction but that they are doing it with their eyes shut.

The full extent of the jeopardy in which the British economy is being put is perhaps not yet fully grasped. It is usually presented in what is, indeed, its most menacing and dramatic aspect—the balance-of-payments problem. That is serious enough in all conscience. Perhaps the public reaction to visions of food and raw materials cut off for lack of means to pay for them has been blunted by too much iteration. But everybody in authority knows that the visions may well turn into grim reality—in fact, that cold-blooded assessment of the visible possibilities makes it seem more likely than not. Yet behind this generally accepted grim forecast of the future on the international payments plane, there lurks the conviction that if only, by hook or by crook, by charity or good luck, by a little pinching here and a little scraping there, the international accounts can be brought into balance without actually starving anyone or throwing him out of work, that then the British economy can run along with tolerable satisfaction to the party in power—in short, that there is nothing very much at home that is wrong. It is still just possible to believe that.

But it is, of course, a great illusion. It is true that the economy works well enough at present to please at least half the nation. Balancing security against real standards of living, the British working class is better off today than it has ever been. The catch is that the present state of affairs cannot last for ever. It has lasted so long because the war-created backlog of demand—here and in the rest of the world—for several most important commodities has not yet been run off, and because the period of inflation that follows all wars is only now, and very patchily, coming to an end. But the writing on the wall is there for all to see. Some figures were quoted in these columns some weeks ago to demonstrate that present British incomes, even at their inflated level, are not large enough to support the still more inflated prices of British goods. We have not only priced ourselves out of dollar markets but out of our own domestic markets as well, and that is a condition that no devaluation can cure. But, if it is not put right, it can only mean that there will not be demand enough to sustain our own industries.

★

One or two simple examples of this may perhaps make the point clearer. Anyone who today contemplates building a new hotel to cater for the flood of devaluation tourists or for holidays-with-pay will find that the cost per room of building an hotel, reduced to an annual figure, is very much higher than the profit per room that can be expected after allowance is made for the effect of the Catering Wages Act, for the five-shilling limit on meals, for purchase tax on furniture and fittings and for income tax on the money needed to amortise the capital. It is a plain impossibility, so long as present conditions or anything like them continue, for any new hotels to be built. This is perhaps an extreme example; but it must be generally true that very few economic processes are profitable enough to support the present mountainous cost of building. Dwelling houses can only be brought within range of the mass of incomes by a subsidy that equals about half the total cost. As soon as the waiting lists for houses are reduced, and local authorities there-

fore begin to look severely at the cost of building, and as soon as the bulk of reconstruction works, financed by the War Damage Commission on a cost-of-works basis, begins to run off, it is a mathematical certainty that there will be a slump in the building trades with severe unemployment. The true maintainable economic demand for building at present costs is very small, and not even Mr Aneurin Bevan can put the whole industry on the pension roll.

Another example is suggested by the recent motor show. Before the war, when the cheapest British car cost about £125, there were, in round figures, 2,000,000 private cars on the roads. There were also, in equally round figures, 2,000,000 people with net incomes, after income tax, of, say, £550 or over. The market for cars equalled the number of people with annual net incomes equal to some four or more times the price of the cheapest car. The cheapest British car today costs the purchaser well over £300. How many people are there with net incomes, after tax, sufficient to support a car at this price? If the prewar relationship holds, the answer will be the number of people with net incomes of at least £1,250 a year, of whom there are not more than about 400,000. To say that the domestic market for cars has been reduced by 80 per cent would be unduly pessimistic. But whatever the answer is, it is certainly not anything like 2,000,000. Unless the present relationship between costs (including purchase tax) and incomes is very radically altered, the permanent domestic market for the British motor-car industry—which must in the long run be the backbone of its business—will only be a fraction of what it was.

★

To point out these awkward facts is not to argue that the community can never generate enough incomes to buy its output. But it is clear that the aggregate demand in present-day Britain, massively redistributed as it has been from the rich and the middle class to the state and the wage-earner, is of an entirely different shape from what it used to be. That again, may not be a bad thing; but if the economy is held rigid it will create shortages in some places and, as the backlog runs off, heavy unemployment elsewhere. The state largely consumes special sorts of services—so there is a shortage of town planners and dentists. The wage-earners consume imports—if they can; so there is added pressure on the balance of payments. And increasingly these scarcities will be counter-balanced by unemployment, representing the old demands that have disappeared. If the whole economy is held rigid, if nobody's wage or price may go up to attract resources to the new areas of demand, and nobody's wage or price may go down to induce resources to leave the old areas of demand, if the direction of labour is vetoed by the TUC, then there is no reason why this dislocation, these pools of unwanted labour in new depressed areas, should not go on for a very long time. Britain in the 1920s and 1930s showed how very great are the resistances to change even in an economy that put up many fewer artificial obstacles to movement than we have at present.

This, in all sobriety, is the goal towards which the present policies are leading the country. The attempt to freeze the pattern of income distribution that resulted, more or less accidentally, from the war, and similarly to freeze the existing pattern of manpower, cannot possibly succeed. It must, within the lifetime of the next Parlia-

ment, result in heavy unemployment. And if the attempt is made to cure that unemployment by still higher Government expenditure, that can only result in still further distortions that cannot be permanently maintained.

Continuance of the present course can, therefore, only mean that the Labour Government's experiment in the welfare state will come down with a crash. So far from safeguarding full employment, they are making it impossible. So far from making the social services sacrosanct, they are building up a crisis in which they will probably be cut to the bone. So far from ensuring "fair shares," they are inviting a reaction, such as is already fully visible on the Continent of Europe, to a policy of complete freedom of action for the rich. It will be the story of 1931 all over again, magnified many times over.

It is the view of this journal—and, we believe, of the decisive sectors of British public opinion—that the crisis of 1931 was an unmitigated disaster. It led to long years of Tory rule, which started the fatal process of enervating the British economy and, in its foreign policy, led directly to the war. Yet the tragedy of 1931 was that the Labour Government, by sheer stubborn refusal to see where it was going, created conditions in which the neutral, decisive mass of public opinion had no option but to put it out of office, even though it half-saw the

consequences. The same circumstances are building up again, and if there is not to be another 1931—it is incumbent on progressive, radical, liberal opinion—on all that opinion which would far rather have a government of the Left in office than one of the Right—to try to save the Labour Party from itself.

This involves trying to set down the outlines of an economic policy which would be designed to correct the mistakes of the last few years without abandoning their ambitions. There is nothing wrong with the objectives—that the citizen should have a decent minimum standard of living guaranteed to him as of right, that mass unemployment should be banished, that the distribution of the material rewards of life should more closely correspond to relative services to the community, that the state, as trustee for the people, should exert a certain purposive direction over the development of the national economy—all these things combined with maintaining the efficiency of the national economy. What policies would a government of the Left, starting afresh without prepossessions, apply, in the present situation, to rescue these great objectives from the peril in which they have been placed by the unthinking idolatry paid to them in the last four years?

An attempt will be made in later articles to sketch an answer to this difficult question.

Dollar Exports

(By an American Correspondent In London)

"WE must take man as we find him and if we expect him to serve the public, we must interest his passions in doing so." For a hundred years Alexander Hamilton's dictum provided the mainspring of economic progress throughout the English-speaking world. It seems lately to have fallen into disrepute in Britain. Its neglect may account for Britain's failure to succeed in the drive for increased exports to North America.

It is possible to find the individual British businessman who has rolled up his sleeves and is wrestling eagerly with the American consumer—but not in any great numbers. Far more common is the manufacturer who says: "Of course the dollar gap has got to be closed, but what can I do? If I succeed in selling product 'X,' then the United States tariff will be raised against it, or the American producer will simply make the same article better and at half the price. Besides, it's too vast a market for the small British firm."

The genuine defeatist has at least made some show of looking at the problem. But his argument is often used to mask an even larger group of manufacturers—those paralysed by complacency. They are perfectly happy to cultivate their familiar garden of half an acre and see no point in running after the worries and risks attendant upon breaking new ground. Take the example of the British textile manufacturer who was approached by an American firm shortly after the war. The Americans were prepared to throw over their domestic supplier on condition that the British producer guaranteed to fill their orders within a certain price range. The manufacturer rejected the offer, partly because of price difficulties, but mainly because he was unwilling either to disappoint his traditional customers in the sterling area or to expand his output to satisfy both markets.

Since that incident, two years ago, very little has apparently happened to dissipate either of these moods.

Who, or what, is to blame? High American tariffs? The British Government? Or is the British businessman himself at fault?

The United States Congress has undoubtedly been reluctant to face drastic tariff cuts. In recent months, however, the American business community has been undergoing a change of heart toward the problem of European imports and those of Britain in particular. Lip service to the principle of two-way trade is gradually giving way to conviction and a new note of urgency. Admittedly the businessman has not carried his concern much beyond the talking stage, but a revolution has occurred when the conservative National Association of Manufacturers can ask itself publicly: "An export surplus is often referred to as a 'favourable' balance of trade; but is it really so favourable?" This change in outlook may not translate itself into lower tariffs the day after tomorrow, but for the first time it does provide some hope that a desire of the Administration to lower the American tariff will not be met with a stone wall of refusal from Congress and from industry.

As for the British Government, it would seem on the surface that no government could have done more. It has cajoled and pleaded, it has subsidised expensive agencies to carry out market research in the United States, it has made radical reforms in its overseas trade services and appropriated scarce dollars for advertising and sales promotion. But in spite of all this helpfulness, there are a great many businessmen who do not avail themselves of the Government's assistance. One could point to a recent experience with a British exporter to New York. When offered the advice of the new Commissioners of the Board of Trade in the United States, he asked instead for the addresses of the branch offices of the US Department of Commerce which were situated in the same towns. The Board of Trade, he explained, was "Government." Part of the trouble is due to the fact that the Government was as slow off the mark as industry. In 1946 and 1947, the years when it would have been easiest to establish consumer preference in North America for British goods, the Government was ill prepared. The internal organisation of the Board of Trade was not designed for emphasis on dollar earning, and the consular and trade commissioner services were not equipped to give high pressure assistance to British businessmen. And these defects have only been remedied very slowly. The necessity for a regional approach to the American market, recognised by the creation of regional trade consuls in mid-1949, was a truism of knowledgeable British merchants in 1946.

Devaluation, the Government's most recent device for stimulating dollar exports, has made the job of selling a little easier by reducing the price the American consumer has to pay for British goods. But it is questionable whether price cuts, by themselves, will have a galvanic effect on the British manufacturer. The defeatist is still apt to feel overwhelmed by the prospect of battling single-handed to conquer a billion-dollar market. The complacent will still find it as profitable to sell in Pakistan as in Paducah. If the one is to be fired to storm the Atlantic wall and the other to be weaned away from his traditional ties in non-dollar markets, then action of a different order seems called for.

What the American businessman would demand for himself in similar circumstances is an appeal to crude, vivid, monetary self-interest. The British business

mentality is said to differ from the American in many respects, but this is not one of them. Sir Graham Cunningham, Chairman of the new Dollar Export Board, stated his position with considerable feeling in a broadcast debate recently: "There is no crime in making profits," he declared, "for they enable expansion and the like, so the question of 'beating down' upon high profits is the wrong attitude."

This question of incentives is the kernel of the dollar export problem, and so far no one seems to have swung a hammer at it. The American approach is naturally an individualistic one—big carrots for smart donkeys. A typical suggestion is that the British exporter be allowed to keep a percentage of his dollar earnings to spend as he pleases—on travel in the United States, on advertising, or on acquiring imported dollar goods. In Holland a Socialist-Catholic government has just launched an experiment of this kind, permitting the Dutch businessman to retain 10 per cent of his dollar earnings. Before long it should be possible to measure the results.

Schemes of this kind have so far been given a chilly reception in Britain, especially in official circles. It is said that they would outrage the national instinct for fair play and that they are alien to the Socialist philosophy of "fair shares." To make them palatable, it would probably be insisted that the successful exporter share the spoils with his employees—e.g., American nylons in the workers' canteen—a reasonable suggestion that might have the effect of attracting manpower to the export industries. Possibly it would also be demanded that the exporting trades share their dollar rewards with those manufacturers who preferred, or were compelled, to remain in the non-exporting trades—which would make nonsense of the scheme. A further suggestion that the British Government hand out bonuses in sterling to deserving manufacturers meets with similar objections and emasculations. The idea of a tax rebate to successful exporters also has staunch advocates, but it hardly fits in with the Government's profit-cutting policy and besides it might stir up trouble in the United States. Tax rebates would undoubtedly be regarded by the American manufacturer as an export subsidy and as grounds for demanding higher tariff protection.

★

If such proposals as these are to be rejected for ideological or other reasons, then what remains? One possibility is the "negative" incentive. If selling for dollars cannot be made more attractive by positive enticements, then the same object might be reached by lessening the attraction of non-dollar sales. To do this would require a far more drastic realignment of economic forces than has yet taken place. Devaluation has stimulated American demand for British goods without so far doing anything to check appetites in Britain and the soft-currency areas. In fact, the domestic consumer has already been assured that his buying power will not suffer from devaluation; the pressure he exerts on British production is to remain at least as great as before. Nor is there any visible move on foot to dam up the sterling balances, the enormous reservoirs of purchasing power still held by Britain's wartime debtors.

The almost total absence of incentive is bound to hamstring the work of the Dollar Export Board. Its first public announcement—issued ten days after devaluation—contained the same battery of pop-guns that have failed

before to fire the dollar campaign. Once again the amorphous manufacturing world has been assailed with the familiar vocabulary of exhortation—"sacrifice," "urgency," "voluntary effort" and "new spirit."

Within narrow limits there is a certain amount the Board can usefully do. It might well help to reduce to less formidable dimensions the task of marketing in the United States. It will need to create for the whole of Britain's export trades a network as effective as the one which nature has presented to the Scottish businessman. Stretching throughout the forty-eight States are dozens of Scottish expatriates who occupy high commercial positions and who are devoted to their native soil with an exuberance of sentiment seldom found in the transplanted Englishman. It might encourage British firms to enter the American market by way of the Canadian one, where similar market reactions can be studied on a smaller scale.

The Dollar Board apparently intends to tackle the job in two ways. First, groups of British industry will be encouraged to put their collective resources behind joint organisations for distributing British products in the United States. In this way the small British producer may be able to enjoy the advantages of the costly selling agencies that the American market demands and that

Point Four in Asia

WESTERN aid to the backward areas is once more under discussion. In Washington, the Foreign Affairs Committee of the House of Representatives is criticising President Truman's "bold new programme" for laying out \$35 million to this end. At Lake Success, a United States delegate has told the other United Nations that such criticisms imply no slackening of American intentions. Mr Nehru is visiting the United States to discuss, among other subjects, American investment in India. In Iraq, irresponsible journalists are inveighing against "western imperialism disguised as aid for Arab refugees." In Rangoon, Thakin Nu, the Burmese Premier, has stated the terms on which Burma will admit foreign investment and aid. One deduction that can be drawn from the sum of these facts is that western aid to eastern poverty is not going to be as easy of execution as optimists had expected. It is going to meet with resistances indigenous to Asia as well as with its plain adversary, which is Communist propaganda.

Much of the blame for any over-optimism there has been lies with President Truman. His Point Four—so called from its place in his inaugural address of January last—was starry-eyed to a fault. It had at its back far too little forethought about how the plans were to be executed:—

We must embark on a bold new programme for making the benefits of our scientific advances and industrial progress available . . . to help the free peoples of the world, through their own efforts, to lighten their burdens. This should be a co-operative enterprise in which all nations work together, through the United Nations, . . . to help create the conditions that will lead eventually to personal freedom and happiness for all mankind.

When he spoke, he was prompted partly by genuine concern for the lot of the underdog but partly by thoughts of increasing the purchasing power of backward areas and their potentialities as markets. Since he spoke,

only the large-volume manufacturer can usually afford. This is already being successfully done for British books through a book centre in New York organised by Bitsfords. In the second place, schemes may be promoted for placing the sales facilities of large American firms at the disposal of British manufacturers.

American firms may be persuaded to do this by the revival of such projects as the Westinghouse experiment, tested without success two years ago. What the American company proposed at that time was to use its own sales apparatus, or to set up a new one, for distributing in the United States the products that it would buy in Europe. The Westinghouse Corporation asked that the dollars so earned be made available to its organisations in Europe for the import of dollar goods. The project misfired, in part because European manufacturers had little to offer the American consumer and partly because European treasuries refused to sanction the request for import licences.

As matters stand, however, the various plans for distribution now being mooted are all of limited value. Certainly they will ease the path of the British manufacturer who turns toward the dollar market. But what they all lack and what still needs to be devised is a magnet powerful enough to pull his energies single-mindedly in a westerly direction.

Communism has captured China. The present prime purpose of Point Four was summed up last week by a New York newspaper as: "To demonstrate that a humanitarian and democratic capitalism can outdo anything that communism can achieve." But can it? Can Mr Truman's promises to the underdog in an under-developed area compete with Mr Stalin's? What are the chances, not in Latin America or in Africa, which are far from Russia's borders, but in that testing frontier area, the under-developed, under-fed, under-administered independent states of Asia?

Since the President let his thoughts fly in January, official Washington has done some serious thinking. It has realised that there are in Asia and Africa few independent states in which conditions lend themselves to vast foreign expenditure on overall projects, and that small beginnings and slow progress may be inevitable. But it still lacks perception of the difficulties that confront would-be western helpers at the receiving end. It hopes that the techniques for aid to Latin America worked out by its Institute of Inter-American Affairs are simply transferable to other areas. It leaves out of its calculations the xenophobia and mistrust that riddle countries newly freed from western tutelage. It has no special plans for selling its projects to Asiatics whose only conception of the westerner—rooted, not without reason, in the nineteenth century—is as someone who has come to exploit them or else as someone to be exploited.

If anything, Pandit Nehru's visit is likely to increase Washington's misapprehension of the psychological problem ahead of it in Asia. For it will judge him to be typical, which he is not. India is, as a recipient for aid, in a class apart from the other would-be democracies. Indian acumen has already indigenously produced the type of business mentality that sees development in terms of investment, good management, profits ploughed back,

and other concepts familiar to western minds. Elsewhere—that is, in countries like Burma or Iraq, Iran and Syria—the leaders' conception of the term development is different. To them, natural resources are so many assets to be milked for the money they can be made to yield—at best, to play politics with, at worst to pocket. Well-to-do politicians are all ready to pay lip service to schemes for social reform, but all unready to tax themselves to pay for it, or to forgo any part of their life of ease in order to administer it properly.

The aid that the politician in such countries likes to imagine as on its way from the west is either Santa Claus bounty in the shape of gifts in money or kind, or else technical advice, which he may take or reject as he sees fit. But the westerner with experience in Asia no longer believes in getting any return from either of these forms of aid. He has become convinced that his help does not serve his purpose unless it is accompanied by the condition that he must supervise its execution. The Americans are sore from their experience in China. Their recent white paper on this subject was described in *The Economist* of August 20th. Because they took the view that it was undemocratic and intrusive to supervise another country's plans and operations, their government "reduced itself to the role of pouring hundreds of millions of dollars into China while remaining a helpless spectator of the uses to which its aid was put." They are chary of making any further unconditional gifts. In the field of advice, the British have had the more experience, particularly in the Middle East. And the fruits of this are that, usually through the politician's unwillingness to impose the taxes and other innovations that action would entail, the advice is not taken. It lies in his drawer. What form of aid, then, can the western contributor devise in order to fulfil two requirements: a satisfactory outlay from his point of view and a scheme acceptable to the jealous nationalists at the other end?

*

The expression "Point Four" has come to be loosely used to cover all sorts of fountain-heads for aid to underdeveloped areas, whether or no they come within the vague outline of the President's original statement. These include specifically American projects, such as loans sought from the Export-Import Bank, or private investments protected by that bank's guarantee, as well as international projects, such as money lent by the International Bank or technical assistance and equipment provided by Uno. But the aid in question also falls into two different groups—the one that from the banks, American and international, who lend money, and expect a dividend and ultimate repayment; the other that contributed—as is Marshall aid—on a politico-philanthropic basis by westerners who feel a concern for hard lots, as well as a desire to demonstrate that their way of life can, materially speaking, offer the masses just as many benefits as can communism.

It looks as if, from the Asiatic receiver's standpoint, the biggest sums are for the present to be had on the bank loan basis. But loans are going to be conditional upon foreign inspection—even supervision—of a type that is distasteful to him. Countries in which a prime consideration is a job for the premier's nephew are not easily ready to swallow terms which entail a foreign right to inspect and manage, hire and fire. At least two of Asia's independent democracies have, though needing money from the International Bank, so far been too proud

to sign its stock clause requiring periodic right of inspection. Politicians dare not confess to their vociferous nationalist followings that they have granted a foreigner something of a whip hand. Similar obstacles, though for different reasons, beset leaders as far removed from one another in thought and upbringing as are an Arab landlord-politician and a Burmese socialist. From an investment standpoint, the International Bank or Export-Import Bank are fully justified in putting strings upon their loans. But in view of these facts, too much faith should not be placed in them as agencies for demonstrating to the masses that capitalism is as good as communism.

There remains the strictly "Point Four" or politico-philanthropic type of aid that various contributors are now planning to operate through Uno. From the Asiatic politician's standpoint, this type of aid is easier to present to the home public. From the standpoint of the principal contributor, which is the American Congress, it is unlikely to provide so telling and effective an advertisement for western ways as would a more direct form of contribution. There are only remote means of controlling the way in which the money is spent locally, and there is little guarantee that the tap will be turned off directly the spending does not match the contributor's aims. It follows that the funds available by this route for improving the lot of the Asiatic peasant are, so long as administration by Asiatic governments remains as bad as it is at present, likely to be less than those which could be had through Asiatic borrowing, on conditions of foreign supervision, from Washington or Wall Street or even the City of London. It should be remembered that the sum for which the President is asking Congress as a first year's appropriation is only \$35 million for the whole world's "underdeveloped areas." (Compare the \$3,628 million contribution to European recovery—that is, to relatively efficient government administrations—in the current fiscal year.)

Above all, the contributor to Point Four schemes would be mistaken in thinking that, even where the spending of his money is successfully administered, it would serve as an immediate antidote to communism. Paradoxically, any change for the better in the Asiatic peasant's miserable circumstances seems to wake him out of his fatalistic lethargy only to render him receptive to communist whisperings that he ought to be getting more.

What then is the right course for capitalist democracies who want to prove that they can give as square a deal as can communism? Are they to insist upon running the schemes for which they are prepared to pay? Or are they to look for local Mustapha Kemals who will run them more efficiently than do democratic cabinets who live in terror of losing office to rivals who outbid them in anti-foreign protestations? Or are they to settle down to long years in which they pay for Uno experts, on an ever-increasing scale, and wait for them to make themselves indispensable to the masses, much as medical missionaries and the teaching orders have done for generations without changing the peasant lot except in tiny areas? Or are they to go on bolstering the present politicians on the false assumption that change is always for the worse, thereby achieving little or no improvement in the faulty social structure of Asiatic countries? The last seems to be the present policy. If no more drastic western method is devisable, communist chances look promising.

NOTES OF THE WEEK

No Election

Speculation on the possibility of an autumn election reached its climax as the *Queen Mary*, bearing Mr Ernest Bevin, neared the shores of Britain; but in less than twenty-four hours after his arrival the whole bubble of rumour had been burst by a curt announcement from Downing Street that there would be no dissolution this year. There is no doubt about the wisdom of making an announcement, for the fall in the gilt-edged market and the air of uncertainty overhanging the country had made it imperative for the Government to state their intentions. But it is difficult to see what has prompted the Government to take this course. The economic situation may be very much less propitious for them in the spring, Mr Churchill's demand for an early election would have disarmed any criticism of electoral sharp practice, and the Government could have fought the election on an issue of confidence. Both the party and the national interest would seem to have dictated such a course.

One can only presume that Mr Attlee's decision was influenced by his own attachment to the Steel and Parliament Bills, by the unpreparedness of the party managers, by the desire to be in office at the time of the Labour Party's jubilee next February, by the anxiety of the older Cabinet Ministers not to vacate the comforts of office before they had to, and by general inertia and Micawberism. One thing is certain, that the Government have chosen a much more difficult road. Having decided not to have an election, they must now have a policy, and any policy which makes even a beginning at underpinning devaluation must inevitably be unpleasant to the Government's opponents and supporters alike.

* * *

Tories in Conference

On Wednesday, the annual Conservative conference opened its proceedings with a debate on devaluation amid the encircling gloom of the Empress Hall. The size of the conference was impressive, but its reactions were confused and lacking in that enthusiasm which it is the object of party conferences to produce. On the whole the delegates spoke with a seriousness and a sense of urgency—apart from a knockabout turn by the recently converted Mr Ivor Thomas—which was impressive if not particularly constructive. A speech by Mrs Bird, of Jarrow, illustrated a point noticeable at previous Conservative conferences, that when Conservative representatives of a working class area take the rostrum, they advocate orthodox socialist measures—a fact which should, but never does, disturb the conference.

Mr Anthony Eden, winding up the debate, made his points with a clarity and force which, despite a rather weary platform manner, shows why he has regained his place at the head of the working members of the Conservative front bench. He used to its full the failure of the Government to follow up devaluation by policies which would ensure its being more than a temporary fillip to the British trading position. But when it came to satisfying the demands of earlier speakers to know what a Conservative policy would be, he politely but firmly refused to be specific. Until the party had all the facts and information—that is until they were in office—it was impossible to say what their plans would be. There is a grain of sense in this; modern government is so complex that a party out of office can easily go awry on questions of fact. But this is a lame reason for not attempting to lay the framework of a policy before the electorate. Now that the Government have finally decided against an autumn election, the Conservatives have acquired a breathing space, which they do not really deserve, in which to

devise a better formula than a contrast between "more socialism with those rigid bureaucratic methods" and "the sound foundation of enlightened free enterprise."

* * *

The Gremlin Strikes Again

On Monday morning the *Daily Express* featured side by side the exploits of Pierre, the Channel swimming sealion, and the political programme of Lord Beaverbrook. The main points of the programme were a demand for a system of Empire free trade—that is an impenetrable tariff barrier round the areas marked red on the map—a minimum wage of £6 a week, a floating rate for the pound, the abolition of the British Council and the House of Lords, and large scale manufacture of the atomic bomb. The purpose of the manifesto is clear enough—Lord Beaverbrook is shocked at the concern for international and especially European co-operation which of late has gained ground in the Conservative Party, and also at its lack of a forthright policy. His platform points are pure chauvinism and show an ignorance of contemporary realities remarkable even in the chancellor of a university. "The Empire" for which Lord Beaverbrook would throw over the rest of the world is an abstraction existing only in the minds of himself and his editors: if he means the Commonwealth, there is not a country in it which could agree with the autarkic policy he demands. The demand for a £6 minimum wage is irresponsible, and Lord Beaverbrook is presumably actuated by the same calculation as the Communists: a desire to gain popularity with the unthinking wage earner, knowing full well that he will not have to bear responsibility for the repercussions of such a policy.

It is remarkable that the London newspaper press (other than the *Express* group) considered his policy worthy of comment, since he occupies in the contemporary scene much the same position as that of Lord Brougham a hundred years ago, adding something to the gaiety but little to the wisdom of nations. It is therefore difficult to believe that the Conservative Party will be seriously inconvenienced by Lord Beaverbrook's veiled threats to support only those candidates who agree with his policy, for he is without question the greatest liability they possess, and it is generally agreed that his intervention in the 1945 election was contributory to the withdrawal of the electorate's confidence from them. The truth is that Lord Beaverbrook has never begun to understand the psychological mainsprings of the British people. He is adept at producing the crispest and most readable school of journalism in the country; but this appeals only to one side of the public's nature, and he has never known that the other side exists. For the majority of the British electorate, he exists through the eyes of his own cartoonists, and the nation is not yet sufficiently scared of the Kremlin to throw itself into the arms of the gremlin.

* * *

TUC on Tenterhooks

The malaise among the leaders of the Trades Union Congress has increased rather than diminished in recent weeks. It is nearly a month since Sir Stafford Cripps announced the devaluation of the pound, but the General Council has given no lead to its member unions. All that has appeared so far is a statement by Mr Vincent Tewson, the general secretary, in the TUC's official publication *Labour*, calling for courage and patience and telling the unions that, in the meantime, the decisions taken at Bridlington in support of wage stabilisation stand.

Mr Arthur Deakin, secretary of the Transport and General Workers' Union, has shown his hand more clearly. His article in his union's monthly journal is the first public pronouncement on devaluation by any member of the General Council. He flatly rejects the idea of a national minimum wage, on the ground that it would upset the "differential" between skilled and unskilled workers, and lead on'y to "chaos and confusion." Any suspicion of statutory wage regulation or interference with free collective bargaining would be "a major disaster." Mr Deakin's only answer is continued restraint, increased output and greater efficiency.

All this may be sound common sense—it is certainly familiar—but it does not really carry the argument a stage further. A national minimum wage, to assist the lower-paid workers, is one of the only two concrete proposals that have so far emerged from the welter of discussion. Everybody is now agreed that it should not be entertained. But the only other proposal before the public—for a central wages board, to advise on the merits of different wage claims, would surely lend itself to the very same objections by Mr Deakin—that it meant interference with free collective bargaining.

The impasse would seem to be wellnigh complete. Devaluation is a *fait accompli*, and the only problem the unions can envisage is how to cushion its effects. The TUC leaders, it is reported, are waiting to see Mr Bevin before making up their minds. If this is true, it is surely rather a sorry reflection on the present level of industrial statesmanship. For all his experience, the Foreign Secretary has been out of active union affairs for over nine years and has other pressing problems on his mind. All he can be really expected to do is to pour oil on troubled waters, and persuade his former union colleagues to swallow the pill and get down to the work of formulating a policy to make the benefits of devaluation lasting and effective.

* * *

New Coalition for France?

As *The Economist* goes to press the chances that M. Moch will get from the Assembly the majority he needs to form a new coalition government seem fair. It may seem strange that a Socialist may succeed where M. Queuille failed. The Radicals, who are essential to any coalition—the champions of a "liberal" economic and an austere financial policy—can hardly tolerate a Prime Minister far to the left of themselves; and the Socialists to whom M. Moch belongs—although he is much more of a Bevin than a Bevan—broke up the Queuille Government because they were afraid of what the trade unions would think of any policy which did not concede rises in wages to meet alleged rises in the cost of living.

A week's reflection seems to have brought home to the politicians two facts: first, that the credit and authority of the state are at stake, second that one abortive attempt after another to form a government can only lead to a general election for which no one is ready. All the parties that can put a coalition in power have therefore an interest in doing so as quickly and as firmly as possible.

What is most unfortunate, both for the French themselves and for their associates in the political and economic re-organisation of Europe, is the possibility that no government will have the strength to do for the French economic situation what Sir Stafford Cripps is hesitating to do for the British. M. Queuille's government shelved most of the real problems, and a mere reshuffle of posts within his combination would not give M. Moch real power. It looks at present as if the Communists will make things easier for the moderates by demonstrating to the people that organised trade unionism in the CGT is more interested in the class war and political opportunism than in finding remedies for the nation's financial plight.

Socialist Triumph in Norway

The Norwegian Socialists have won a victory as great as it was unexpected. There is no other reasonable interpretation of the result of last Monday's general election. The only question was whether or not the country supported the Socialists after four frustrating years and in the face of growing criticism. It has been decisively answered. The general estimate was that they would be lucky not to lose more than two or three of the 76 seats they held in a *Storting* of 150 members. Even such a slight change would have destroyed their precarious absolute majority and opened the way, if not to a coalition, at least to some working agreement which would have limited their freedom of action.

Now, after a record poll, the Socialists are confirmed in office with at least 84 seats and over 46 per cent of the votes compared with 42 per cent in 1945. Even so, the prophets were correct in that the right has gained from the left—but only one seat—and the consolidation of the Labour Party far outweighs this. As against a Labour gain of nine members of Parliament, the Communists lost ten of their eleven representatives and their votes fell from 174,000 to only 99,000. The Conservatives also have fewer seats, 23 compared with 25. The Liberals with 21 gained one, and the Agrarians increased their representation from ten to twelve.

With the prospect of an election before long in this country more may be read into the Norwegian results than is justified, in spite of the close similarity between the economic positions of the two countries and the policies of their governments. The outlook and traditions of the dominant parties are different. The Norwegian Labour Party is both more Marxist and more moderate than the British, more doctrinaire in theory and yet more empirical in practice. Nationalisation hardly figured in its election propaganda, although some schemes for forming state monopolies in the import of cattle fodder and medical supplies were discussed. And in his first statement after re-election the Prime Minister, Mr Gerhardsen, said that the long debated nationalisation of banks and insurance companies would merely be examined further during the life of the new *Storting* and put to the people as an issue in the 1953 elections.

Consolidation and continuity, then, are the orders of the day. The ambitious programme of capital investment will probably continue, together with limited dividends, cheap money, high taxation and strict rationing. Abroad, there will be the same active and sincerely interested participation in the OEEC and the Council of Europe, the same reliance on the Atlantic Pact to guarantee Norway's security.

* * *

Trade across Germany

Trade between eastern Germany and the Federal Republic of the west has at last been put on a regular basis in a nine-months trade agreement valued at about DM600 million signed last Saturday. Negotiations began over three months ago in accordance with the decisions of the Council of Foreign Ministers. It is a pity that celebration of their successful outcome was marred by the High Commissioners' sudden demand that signature of the agreement should be held up for forty-eight hours.

The length of the negotiations was mainly due to difficulties over payments and prices caused by the disparity in value between the east and west marks. The western Germans were determined not to accept payment in over-valued east marks, and were anxious that prices should be reckoned in west marks. They also wanted to prevent the undercutting in which some Soviet zone firms have been successfully indulging. As it stands the agreement leaves the question of prices to be settled by agreement between individual firms. No rate of exchange between the east and west marks is laid down and it is specifically stated that both parties

are entitled to refuse to receive or deliver goods if the prices agreed on are considered to run contrary to the economic interests of their zone. A more determined effort is made to solve the payments problem by setting up clearing accounts in each zone into which importers will pay their respective currencies and out of which exporters will be paid in their own currencies. It is hoped that the two accounts will balance, but each side is prepared to support a limited overdraft.

The economies of the two parts of Germany are naturally complementary and even during the blockade of the Soviet zone by the western allies a trickle of trade continued between them. Since the lifting of the blockade the lack of a trade agreement has not prevented a large number of individual deals from taking place. But the blockade did force the two parts of Germany to do what they could to make themselves independent of each other economically, and the western zones have gone some way towards emancipating themselves from their very close economic connections with the east. The eastern zone, on the whole, stands to gain more from an expansion of supplies from the rest of Germany. In particular it needs the iron and steel products of the Ruhr. To the industries in the west the prospect of disposing of unsold stocks will be most welcome.

It is the effect of the agreement on the very serious economic plight of the western sectors of Berlin which will be most anxiously watched in the west. Since the lifting of the blockade firms in the Soviet zone seem to have gone out of their way to avoid giving a helping hand to the industries of western Berlin. An appendix to the inter-zonal trade agreement contains a letter from the head of the Soviet zone delegation in which he undertakes that a western request that one-third of the Soviet zone's orders should go to western Berlin will be taken into consideration as far as possible.

It can only be hoped that this will turn out to be a firmer commitment than appears at first sight.

Harder Work or Longer Hours?

Last week Mr Jack Jones, the Parliamentary Secretary to the Ministry of Supply, on a tour of northern factories, stated that a longer working week might be necessary in British industry. This has found little support either in industry or in Whitehall, since it is clear from further remarks of Mr Jones about the necessity of overtime working at all costs that he has little conception of the nature of the problem. If longer hours are merely imposed upon the basic framework of the five day week, it means that the marginal increase is paid for at the high rate of overtime. Since cost of production, rather than the quantity of production, is now the key to economic progress—even in the basic

AVERAGE HOURS PER WEEK, 1948

Country	Mining other than		
	Coal	Manufacturing	Building

United Kingdom..	46.3	44.9	46.7

* Fortnightly basis. † Adult males only. ‡ European adult males.

industries—a mere increase in the number of overtime hours worked is unlikely to contribute very much to production at an economic cost. In point of fact, the average number of hours worked per week in Britain has decreased very little since 1938, from 46.5 to 45.3, although the prewar figure undoubtedly contained less overtime. Figures recently published by the International Labour Office and abstracted in the accompanying table show that, by comparison with other countries, average hours of work in Britain stand midway between those of a highly productive country like Canada and those of a highly industrious one like the Netherlands.

There is probably not very much to be said for contemplating a general return to a 5½ day week throughout the

whole of industry if it merely means Saturday morning working. Some basic processes such as steel have a continuous shift operation lasting throughout the week which is highly economic. But in fabricating industries it is not the extra half day which is required but greater production from the existing working week. The fact that leaps to the eye on visiting British—after American—factories is the number of breaks for tea, the hold ups in supply of components or raw materials and the amount of unnecessary handling operations. Higher productivity is not a trick and it does demand harder work in addition to more intelligent management, but the harder work can be better concentrated within the hour or the day than spread over a longer week.

Grim Smile of the Potteries

The main trouble with North Staffordshire, the subject of a master plan prepared by Sir Patrick Abercrombie and Mr Herbert Jackson, is the poor quality of its urban life. The heart of the area is the industrial Potteries; and Arnold Bennett's five towns, now uneasily coalesced in the county borough of Stoke-on-Trent, still wear a grim smile. The expansion of industrial premises and the fouling of the air by noxious fumes have driven most who could afford it from the central areas. The employers and professional classes have gone—many to the nearby borough of Newcastle-under-Lyme, others farther afield; the workers have remained—often in congested and noxious conditions. The result is that Stoke itself, with a population of around 275,000 persons, is too poor to sustain the usual culture and amenities

of a large town—or rather, group of towns. Rarely has an official document been so class-conscious. It appears that the real trouble with the Potteries is that they lack a middle class.

The planners favour the bold solution of breathing back life into the urban heart of the Potteries. Industry, as is now fortunately possible, should be compelled to avoid atmospheric pollution. The overcrowded working families, instead of being sent afield to new towns, should be rehoused nearby in better conditions. A real effort should be made to lure the middle class back, by the provision of suitable houses, of parks, of theatres—even the idea of building a cathedral is looked on with approval. It is suggested that Hanley, one of the five towns, would be the best site for a proper regional capital having good all-round facilities. Can this attempt succeed? Given the amount of refurbishing which

the Potteries need and the precarious state of the national finances, the project is bound to move slowly.

It would be a shabby piece of neglect for an industrial nation to leave this important and wealth-producing region in perpetual shadow. But this, like every regional plan produced so far, underlines the fact that if it is to be fulfilled the nation has got to devote a great deal of its resources not to consumption but to capital development—and not to new capital either, but to the replacement of existing capital—for many generations to come. This is a decision that the nation does not show much sign of being willing to take.

* * *

Conservatives and Local Government

The Conservative conference on local government which preceded the main conference endorsed the party's aim of restoring greater vigour and independence to local government, and of freeing local councils from the excessive central controls under which they now labour. Mr Churchill himself deplored the removal of functions from local government, and condemned Mr Bevan for sacking the Local Government Boundary Commission. The Conservatives' general objective is salutary and desirable. But do they sufficiently appreciate what their policy entails? Services have not been transferred from the smaller to the larger local councils, and from local government itself to appointed regional boards, out of sheer Socialist malevolence. These transfers, undesirable as they are from a democratic standpoint, have been largely forced on the Government by the administrative weakness of the present local government system. Only a drastic reform can cure this weakness. But is Mr Churchill ready to provide the cure? Is he prepared, for instance, to stomach the proposals of the Boundary Commission, which proved too strong meat for Mr Bevan, or to introduce some equally effective plan of his own choosing? Unless he is, the Conservative aspirations will bear no fruit. It is of little use, indeed it may even be harmful, to give wider powers to local government without first making it more viable.

No political party—save, paradoxically, the Communists—has laid down a policy for local government that goes beyond pious aspirations. The Conservatives, for instance, have the merit of wishing to restore many powers to the smaller councils; but this is only administratively feasible given a drastic reorganisation of county districts and some such device as the union of urban and rural districts. Will they face this implication? All that the Conservatives will commit themselves to is consultations with the local authorities themselves about the overhaul of their boundaries, functions, and finance. This is a diplomatic move, but the last half century has shown it to be a sterile proceeding. The local authority associations, each with its own special interests to safeguard, will never agree together to put their house in order. Some Government must have the courage to do the task for them. On the other hand the Labour Party, following Mr Bevan's huffing of the Boundary Commission's plan, appear even more bankrupt of constructive ideas. The Conservatives still have the field open, if they enter it boldly.

* * *

Retreat from Canton

After a prolonged pause the Chinese Communist forces have resumed their advance on Canton and the Nationalist Government has been hurriedly evacuating the city which has been its capital since the fall of Nanking. The collapse of the defence line covering the capital has been the sequel to the decision of General Pai Chung-hsi, commanding the army in Hunan, to withdraw into his native province of Kwangsi, thus uncovering the approaches to Canton held only by the inferior troops of the Kwangtung provincial army. There does not seem to have been any defection of Pai to the Communists, but he was doubtless afraid of being

cut off in Hunan and considered that his best chance of resistance was to fall back, while there was still time, into his autonomy-loving home province, where his personal influence is at its strongest.

Whatever its motives, however, this move made it impossible to conduct a unified defence of the zone of South China which had remained under Nationalist control, and the fall of Canton will remove the geographical link between the Nationalist forces still holding out in the interior of China and Chiang Kai-shek's island stronghold of Formosa. The Nationalist capital has been officially shifted to Chungking, in the mountain-girt western province of Szechwan, where it was for seven years during the war against Japan,

and President Li Tsung-jen has gone there by air. The decision to move there, however, is reported to have been opposed by Chiang Kai-shek's faction, which wanted political authority and as many troops as possible to be concentrated in Formosa. Chiang, in any case, intends to remain in Formosa with the forces evacuated from Chekiang and Fukien as long as he can keep the loyalty of his soldiers and ward off invasion from the mainland.

The Nationalist holding in continental China now consists of five provinces—Szechwan, Sikang, Yunnan, Kweichow and Kwangsi. The mountainous terrain of south-west China favours defence, and on paper there are still considerable armies left to carry on the war. On the other hand, the Communists have now an overwhelming prestige of victory as well as the attractions of their social programme, and have many underground supporters in the Nationalist provinces, as was shown in the recent disturbances in Yunnan. Moreover, if the Nationalists are once driven from the coastline of China, they will be cut off from all possibility of obtaining overseas supplies—with the exception of the routes into Yunnan and Kwangsi from Tonking. Geographically there is also contact with Burma, but the civil war there and the disrepair of the old wartime "Burma Road" virtually isolate China on that side. It depends, therefore, on the French whether the Chinese Nationalist Government will now be completely encircled by Communists or whether it will still have an open line to the outer world.

* * *

China, Burma and India

The demand of the Chinese Communist Government for diplomatic recognition has proved embarrassing for the government of Burma, a country which borders on China and was once a vassal state of the Chinese empire. The Burmese Government has to take account of three facts: that Burma has a large Chinese immigrant population, including some Communists and many bandwagon-climbers; that a large part of Burma is in the hands of armed Burmese Communist rebels, who look forward to getting

help across the frontier when the Chinese side of it is in Communist hands; and that China has extensive territorial claims on northern Burma which were never settled up to the time of the British departure.

The territorial dispute has indeed been hanging over Burma's head from the beginning of Burmese independence, but the Kuomintang Government has been too preoccupied with other things to give it much attention. It is possible that the Chinese Communists also will let it lie dormant, but to revive it would be an effective way of putting pressure on Burma, if they wished to make trouble in that quarter after getting control of Yunnan—which is so far still in Nationalist hands. It will be interesting to see what attitude the Burmese Government now takes up towards the Peking regime—whether it will try to ingratiate itself by early recognition or wait to see how the principal western powers deal with the recognition question. In any case a Communist China is likely to be a difficult neighbour for a small nation which, even under the most favourable circumstances, cannot hope to recover stability for some time to come.

India is reported to be one of the nations most inclined to recognise Mao Tse-tung's government at an early date. India still strives to follow a policy independent of the western powers and in line with the concept of a solidarity of Asian nations. But the Chinese Communist victories certainly provide cause for apprehension in Delhi, not only by the impetus given to Communism within India, but also by the potential threat to Burma, and above all by the officially declared Chinese intention of "liberating" Tibet. Tibet has had *de facto* independence of China since its revolt in 1912, and as the Tibetans form a nationality quite distinct from the Chinese in language and culture, they are likely to make a fight for their national independence against Chinese reconquest in whatever guise it comes. Their only hope of success in the long run against China's superior power lies in Indian support. For India the continued inde-

pendence of this inoffensive buffer state is a matter of considerable interest; there is no wish in Delhi to see Chinese outposts on the Himalayas. The encouragement which India has recently given to Tibet has already been sufficient to cause Mr Nehru to be denounced by the Chinese Communist radio as a "stooge of Anglo-American imperialism."

Economic Framework for Indonesia

During the past week the atmosphere of the round-table conference on Indonesia at The Hague has got tenser, as the financial and economic committee has got to grips with its problems. The main emphasis has been on future liability for outstanding public debt contracted in respect of Indonesia. The Dutch argue that the new Indonesian government should assume responsibility for all except that proportion of the debt which was floated to finance Dutch military action against the Republic. The Indonesians now argue that this, and certain other Dutch indebtedness to themselves out-balances by some 540 million guilders (£50,750,000) what they would owe to Holland; hence there is no debt for them to take over. In the course of the argument the two sides have appeared to move so far apart that the United Nations Conciliation Commission has chosen this as the moment to step in—for the first time at the Hague—and use its good offices.

It would be easy to deduce that a satisfactory economic settlement is as far away as ever, but it would probably be wrong to do so. The conference has already cleared its most difficult hurdle—agreement in principle about the Netherlands-Indonesian Union—and there are strong forces continually driving the two sides together. These are best understood by examining the Indonesian point of view—as for the Dutch, it is clear that their interest is to retain as much control and as many safeguards as possible over their economic stake in Indonesia.

The Indonesians do not want to throw out the foreigner.

DON MURRAY makes his living from the tall gum trees of Western Australia. His mills send to the world magnificent hardwoods. But, like softer woods, even these splendid timbers suffer from sap stain and other diseases caused by minute fungi

So, following modern practice, Murray treats these timbers with a Monsanto preservative, which doubles their usefulness, their life, and their value

Monsanto products, available the world over, increase Britain's own exports, increase the value of Empire trade, and help to provide you with goods you need. Just one more example of the way Monsanto is 'serving industry, which serves mankind'

Monsanto makes nearly two hundred chemicals of vital importance to British Industry. If you have a chemical problem it is highly probable that Monsanto will be able to assist you

MONSANTO CHEMICALS LIMITED 8 WATERLOO PLACE • LONDON, SW1

but they do want complete sovereignty. They are, therefore, determined not to bind themselves to any formal commitments like those originally proposed by the Dutch—that Holland should retain a right of veto on Indonesian banking policy until all debts were paid off, and so on. On the other hand, the present Indonesian leaders do intend to pursue a realistic and, so far as possible, magnanimous economic policy towards foreigners, particularly the Dutch. They do not mean to nationalise more than the railways, public utilities and probably inter-island shipping. They consider that to do more would be to run the risk of reproducing the chaos of Burma, while to do less would leave them at the mercy of Dutch monopolies. They do not mean to force a greater part of company capital into Indonesian hands; yet they do intend to secure much greater representation for Indonesians on the boards of foreign companies operating in their territory. In all this, they are guided by a desire to reach a settlement with the Dutch which will survive the test of political and economic life in the new Indonesia. It is these facts that are pushing the Dutch and Indonesians together in the economic negotiations.

All This and Bevan Too

Mr Bevan was evidently on the defensive when he reviewed the first year's working of the health service at a press conference last week. That he should have given the press conference at all was significant. The gradual public awareness that, somewhere, somehow, Government expenditure must be curtailed has tended to focus on the health service, partly because its cost has so greatly exceeded the estimates, partly because it is often held up as a good example of extravagance in administration, and partly because in his Budget speech Sir Stafford Cripps specially mentioned it as a social service whose cost could not be allowed to increase indefinitely. Mr Bevan gave the impression that the object of his press conference was to strangle at birth any campaign for attenuating the general principle that the health service should be comprehensive and free.

He also, however, reiterated a very dangerous argument. He said that the health service was not an addition to the total expenditure of the nation but a gigantic transfer of expense from the private pocket to the public purse. This argument has been used in support of almost every social service scheme that has been put forward; but not only does it ignore the increase in demand that arises when the service is no longer paid for directly by the individual, more important, it ignores the total effect of all such transfers for all the social services on the national finances. "The possibilities of taxation," Mr Bevan said, "are infinite." It cannot be too often repeated that this is not true. The bounds of what it is possible to raise in taxation without dangerously straining the national economy were reached—and passed—some time ago.

* * *

Meeting the Cost

It is quite true that Mr Bevan made this statement on taxation in reply to a question whether the cost of the health service would be partly met by an increase in the weekly national insurance contribution. But the effect of such an increase would be just as harmful as an increase in taxation. Moreover, it would probably encourage people to make even greater demands on the health service than at present in order to get something for their money.

The most attractive suggestion that has been made for meeting its cost is that small payments should be made by the patient for each visit to the doctor or dentist, for each prescription that he has made up, and so on. If the administrative difficulties are not insuperable, small payments of this sort are probably the best way of reducing the burden of the health service. At the very least they would prevent much of the abuse that occurs at present and would

relieve the congestion in surgeries and at the optician's. There would, of course, have to be provision for remission in cases of real hardship, and this would involve a test of means; it may be for this reason that the Government, according to Mr Bevan, has set its face against them. (In this connection it is interesting that the Conservatives are now hinting, through Lord Woolton, that they are considering introducing a needs test for social service benefits—a proposal that is bound to get out of hand in the atmosphere of a general election but which is nevertheless worthy of serious study in the country's present circumstances.)

The only other way to reduce the burden of the health service is by a straightforward cut in the money voted by Parliament. Eventually this would lead to an extension of private practice and therefore have much the same effect as restricting the benefits of the public service to those who prove their need. Which, of all these suggestions, does the Government, Mr Bevan notwithstanding, really prefer?

* * *

No Axe to School building

Amid all the vague currents of speculation about a reduction of government expenditure, reports have been published in the press about cuts in the country's school-building programme as if these had been imposed unexpectedly by the Ministry of Education on local education authorities. The "cuts" are, however, nothing but the fruits of over-optimism on the part of the authorities themselves. The Ministry asserts positively that from its point of view the position remains unchanged and that the Cabinet's allocation of manpower for school building, which permits of a gradual increase in building year by year until 1952, has not been altered—though it is true that the allocation may well be heavily reduced when this or any future government decides on a domestic policy to fit the economic situation. In these circumstances how comes it that local authorities have put forward projects for 1950 which would cost three times as much as the projects they put forward for 1949? One local authority will always think it can claim a shade more than its share of national resources compared with another authority. But an optimism which leads to multiplying the possibilities by three is over-fanciful.

Nothing could be more precise than the letters and circulars addressed to authorities by the Ministry of Education on the possibilities before them. Not only were they told that the 1950 programme would be little if at all larger than that for 1949, but they were warned to take into account the arrears in their current programmes, and the bottlenecks in their own technical departments which would hamper a rapid expansion—bottlenecks which are often a more realistic brake on building work than any ministerial ceilings. Yet, in spite of all this advice, the programmes for England have trebled in size over last year.

The fault lies with the unwieldy machine of local education administration, and the remote control exercised by the county councils through their district executives. Both the political and administrative machine of a county council are ill-adapted to deciding between the competing claims of the smaller authorities. It is the line of least resistance to aggregate the claims and to send them up whole to the Ministry of Education. The Ministry can then be blamed for the consequential cuts that ensue. If local authorities aspire to be considered as responsible planning organisations such behaviour is not a good advertisement. Apart from being wildly unrealistic it undermines the case of those who argue for a greater measure of local government.

* * *

Rebuke from Count Sforza

If British relations with France have lately suffered devaluation, a similar process may be said to have started some time ago in those with Italy. It is unfortunately the fact that there is now more coolness between London and

Rome than at any time since the Italian Peace Treaty was signed. Just before sailing from New York this week Count Sforza, the Italian Foreign Minister, drew attention to the way in which this trend is running counter to all the movements lately made towards western European unity. This coolness developed, he said,

at the OEEC, it happened with the trade relations between the two countries when we signed a trade agreement, and in the period which followed. And it happened, above all, in relation to the problems of our former African colonies. . . . One cannot help raising the question why England does not change her spirit towards democratic Italy. It should be clear to anybody that western Europe cannot consolidate and develop as long as Italo-British relations remain hampered by mutual misunderstanding and mistrust.

Count Sforza might have added to the former Italian colonies, and the economic disputes, a third reason for misunderstanding—that is the way in which Italy has sought to play in the North Atlantic Pact a part greater than its resources warrant. The important question, however, is not only who is to blame, but what can be done to improve matters. The main source of friction has been the colonies, and if that can be removed by a settlement at the present session of the Uno General Assembly, there should be no reason why the two countries should not see the other's point of view better. It is Italy which has set the pace of the dispute; but it is only fair to Count Sforza and the Palazzo Chigi to record that the British have sometimes been over-optimistic in their estimates of what they could achieve in persuading the world to accept Italian colonial claims.

The present complaints from Italy that the lira has been left high and dry by devaluation of the pound—and that consequently the Italians will be unable to sell their fruit and vegetables—ring strangely after previous accusations that British goods were being priced out of the Italian reach. The fact is that, with European affairs in their present fluid state, there must be a good deal more give and take both by governments and individuals than has yet been apparent, if any greater degree of unity and prosperity is to be achieved. The Italians are not alone in their intensely national attitude, but they should be among the first to re-examine their consciences. The next to do so might well be those followers of Mr Churchill and others who speak generally of sacrifices for European economic union, without having the courage to tell their constituencies what that might mean to the earnings and profits of their supporters.

* * *

Two Years' Work on Tariffs

The results of the Annecy tariff negotiations were published this week. The documents published at Geneva include the new voluminous schedules of tariffs which now apply to the trade among the contracting parties. In London the Government has issued a White Paper (Cmd. 7792) which gives the text of the Annecy protocol and describes in general outline the results of the negotiations undertaken by the United Kingdom during the conference. It will be recalled that the Annecy negotiations were devoted mainly to the task of incorporating ten new countries into membership of the General Agreement on Tariffs and Trade. This agreement was signed by 23 countries at Geneva in 1947, and the ten additional countries which wished to accede to it were Denmark, the Dominican Republic, Finland, Greece, Haiti, Italy, Liberia, Nicaragua, Sweden and Uruguay. All 33 countries were represented at Annecy. But with the single exception that the United Kingdom and Norway took the opportunity to complete negotiations that had been opened at Geneva in 1947, negotiations were restricted to the tariffs between the 23 old members and the ten acceding countries. These acceding countries also negotiated between themselves. In total, 147 agreements were completed and their results appear in the 28 schedules of tariff rates which have been published this week. Although there were no direct negotiations between the existing participants, they

gained some benefit from the extension through the most-favoured-nation clause of concessions granted in the other negotiations.

It would, however, be straining the truth to claim that the prolonged negotiations at Annecy have carried the work of liberalising trade much further forward. The concessions are mainly undertakings by the contracting parties to "bind" duties at existing levels. Diligent search discloses few actual reductions in tariffs or preferences, and if the search is diligent enough it reveals some actual increases, as, for example, in the American import duties on earthenware and certain types of internal combustion engines.

Alterations in existing British rates will not be made before January 1, 1950. The United Kingdom has undertaken for the period of the agreement not to increase duties on goods of which imports from all the 33 countries involved were valued at £73,900,000 in 1938. The United Kingdom has also agreed to reductions of duties affecting goods the importation of which in 1938 was valued at £5,200,000. Guaranteed margins of preference have been reduced in the case of cod liver oil and blue veined cheese. These concessions were offered in agreement with the Commonwealth countries to which the margins had been guaranteed, but they in turn were able to claim credit for the reductions when negotiating with the foreign countries primarily interested in the export of these goods to the United Kingdom. The benefits to the United Kingdom, whether derived directly or indirectly from the new tariff schedules, affect export trade which in 1938 was valued at £22 million. Most of this benefit represents undertakings not to increase tariffs.

*

The United States carried on negotiations with all ten of the acceding countries at Annecy, but the sum total of its concessions other than the "binding" of existing duties was extremely modest. The US delegation was negotiating with the knowledge that the reciprocal Trade Agreement Act, under which the Administration has power to negotiate tariff reductions, had lapsed on June 30th and was not in fact renewed

The Threat of War

After a general peace of thirty-four years, all the nations of Europe have become so interlaced by their commerce one with another, that war must now be totally different from war at any antecedent period, and would be more like tearing asunder families and friends than the conflict of strangers and enemies. Every nation would bleed at innumerable pores not now thought of. The credit of every Government, for all are deeply in debt, would be endangered, and the disturbance caused by the revolution of 1848 would be slight compared to the disturbance of a general war in Europe in 1850. To Russia, as well as to England, a war would be disastrous. Nicholas might find it, as Paul found it, the grave of his popularity; and, awakening anew the revolutionary epidemic, it might overwhelm both the Czar and his throne.

At the same time, whatever may be the dangers and the cost of war to us, they would be less than the dangers and cost of allowing the Czar to give laws to Europe. It would be quietly subjecting Europe anew . . . to the empire of barbarians. Already Austria has become little better than a vassal of the Czar, and depends on him for national existence. . . . Should Turkey, too, become the vassal of Russia, or be compelled by the union of Austria and Russia, to submit, it would be nearly equivalent to placing all the three under the sceptre of Russia. This power, then, coming to the Mediterranean, and meeting in its progress a great number of its co-religionists, would interrupt our present route to India, and would threaten the whole of Western Europe. Against such a contingency, it would be our duty to take the field at whatever sacrifice; but we repeat, that we hope and believe the occasion will not arise.

The Economist

October 13, 1849

by Congress until well after the Annecy negotiations had ended. This fact undoubtedly made the American representatives at Annecy more hesitant than they might otherwise have been. Nonetheless, the further progress, small though it is, which has been made in reducing the level of customs barriers must not be despised. Plans are being made by the 33 countries for holding a third round of tariff negotiations next year. By that time the ratification of the Charter of the International Trade Organisation by the United States may have taken place. This is the signal for which all the other signatories of the proposed Charter are waiting. Without this lead from the United States, the ITO must remain stillborn.

Cheap Japanese Labour Again ?

Western industrialists who suffered from Japanese competition during the 'thirties have never forgotten the experience. Ever since the war ended they have sought at every stage in the resuscitation of Japanese industry to ensure that they will never again be exposed to "unfair competition" based on cheap labour. A recent survey, carried out in Japan by the International Labour Office (ILO),* outlines briefly the efforts the occupation authorities have made to bring about the major social and labour reforms needed to reassure the outside world.

The job, says the ILO report, has been enormously complicated by the fact that Japan's industrial revolution was not accompanied by the social ferment that took place in the west. The social basis for modern industrial relations did not exist in prewar Japan. When General MacArthur came on the scene in 1945 he found an almost total absence of protective labour legislation and an industrial system, part

Letters to the Editor

Devaluation and Sterling Markets

SIR,—The effect of devaluation on our dollar-earning capacity is discussed mainly in terms of the North American markets (for example, in your article on "Trade and the New Pound" published on September 24th). Judged purely by that criterion the prospects are bleak. They are better, it is true, in Canada, where our manufacturers now have the opportunity of displacing United States products, than in the United States itself, where we are up against the firmly entrenched domestic producers. But Canada is by no means the only market in which dollars are to be gained by effecting a switch from United States to British products. In South Africa it is directly a matter of gold, and therefore of dollars, which we can earn only to the extent that our favourable balance of trade (together with that of the rest of the sterling area) with South Africa exceeds her capital influx from the sterling area (all too likely to increase again, with the restoration of South African prosperity, to a degree that we shall find very costly). As regards the sterling area proper, it is equally true that dollars are earned, in this case through the sterling-area dollar pool, by any additional exports from the United Kingdom to a country like India which replace dollar imports. In one sense our dollar troubles can be attributed to the enormous expansion, compared with the prewar position, of the dollar imports—largely in the form of machinery—of countries like South Africa and India.

It would, of course, help enormously if our Government were readier to use its bargaining power. The fact that we can now offer goods at competitive prices should make it easier to insist on proper concessions from sterling-area countries in return for the readiness with which we admit their

totalitarian, part paternalistic, in which the government sponsored all trade unions and the employers took part openly in their activities—carrying union officials on their payrolls, giving strike pay to workers, and, of course, controlling them.

In so far as anyone can "give" a new set of laws to a nation, SCAP has done so. The Japanese have a Ministry of Labour for the first time in their history. They have enacted a labour standards law which limits the hours of work to eight a day and forty-eight a week. A scheme for compulsory unemployment insurance has been started, and a system of free public employment offices is intended to eliminate such undemocratic figures as the "labour boss," a species of sub-contractor of labour. Japanese workers (with some exceptions) now have the right to bargain collectively. As a result, membership in trade unions has bounded up, from just over 5,000 in 1945 to over 6½ million in 1948.

However, the Japanese have not yet got the hang of the new laws and there have been wholesale evasions on the part of both capital and labour, especially in the small firms where the bulk of workers are employed. It is still more alarming that real wages, as a result of inflation, have sunk below even their prewar level. Wages in the textile industry are among the very lowest—3,000 yen (£3) a month as compared with an average of 7,000 yen in all the manufacturing trades.

For the worried industrialist in the west the authors of the ILO survey can hold out only a long-term and rather tenuous hope. They say that the consolidation of the new labour gains in Japan depends on three factors: the trade unions must develop independent and responsible organisations; employers must give their support to the evolution of a modern pattern of industrial relations; and, finally, the Japanese economy will have to be reintegrated with the world economy. Without an expansion of its export trade an impoverished Japan will have to depress labour standards even further.

products into the United Kingdom. But the prospects are that the effects of the 25 per cent cut on dollar imports (applied indiscriminately to just and unjust alike) will soon disappear in many parts of the overseas sterling area, like those of previous cuts introduced at periods (all too short) of momentary desperation. Restrictions on releases of sterling balances affect the total imports of the sterling-area countries rather than bring about a switch from American to British goods, and in any case they are ineffective in the case of countries to which we are sending large amounts of capital (as we are in danger of doing to an excessive degree). So a good deal turns on the effectiveness of our competition in these markets.

We are no doubt doomed to continue to carry a heavy burden of unrequited exports to the sterling area. It does not by any means follow that additional exports of the right things to sterling-area countries will not earn us dollars—provided that the increase is the result of our own more active competition in their markets and not of an expansion of their capacity to import brought about by releases of sterling balances or a movement of capital funds.—Yours faithfully,

King's College, Cambridge

R. F. KAHN

Cost of Production

SIR,—Your comments on Mr Worswick's letter, published on October 1st, and the further comments you made on my own letter published on October 8th, force me to ask for the hospitality of your columns once more.

(1) On page 717 of *The Economist* of October 1st, you wrote

The E.C.E. calculations have been disowned by the Central

Statistical Office on the ground that they do not reflect the course taken by the Interim Index of Industrial Production. It is obvious that if production indices, comparable in structure, and all using postwar weights, were available, the results of a comparison would be different.

I feel I must point out (a) that the calculations of the ECE Secretariat, quoted by Mr Worswick, were directly based on the Interim Index of Industrial Production of the Central Statistical Office, so they could hardly have been "disowned" by that body on the ground that they do not reflect the course of that index. The Central Statistical Office, in fact, have made no pronouncement whatever on the subject, but the Chancellor of the Exchequer quoted the calculations in question in Parliament (cf. Hansard, Sept. 27th, p. 15) which he certainly could not have done if the Government's own statistical department had "disowned" them as unsound. (b) The question of whether prewar or postwar weights are used is wholly irrelevant to comparisons between different postwar years (to which Mr Worswick's letter referred); this is only relevant to comparisons between prewar and postwar years. The sole reason for choosing an index of prewar weights for such comparisons in the case of the United Kingdom was that the alternative of using postwar weights (while the index numbers of the other countries are based on prewar weights) would clearly have introduced an unfavourable bias in comparisons between the United Kingdom and other countries. (c) Finally, as was explained in my letter published on October 8th, there is no reason to suppose that if production indices using postwar weights were available for all countries, the results would come out very differently. In fact, the general presumption is the contrary: indices based on postwar weights would tend to reinforce the general conclusions of the study.

(2) On page 775 of *The Economist* of October 8th, in dealing with this last point, you wrote:—

The foregoing argument can be summarised: If an industry increases its productivity, the result is to bring down the price of its product—and consequently its production or productivity as measured by value of output will tend to fall. Such calculations are self-defeating, and analyses based on them can only be fictitious.

I do not pretend to be able to follow this summary of my argument, but it clearly indicates, as your present view, that calculations based on index numbers using *postwar weights* are self-defeating and analyses based on them must be fictitious. If this view were correct (which I do not, of course, accept) it would clearly contradict your own criticism of the ECE calculations made on pages 639 and 717 of your paper on the ground that such calculations should have been based on index numbers with postwar weights, instead of prewar weights.—Yours faithfully,

NICHOLAS KALDOR

SIR,—Will you allow me to strike a blow for either side in the controversy about the Economic Commission for Europe's index of comparative labour costs?

Not all items in indices of production are based on value calculations, as you imply in your Note on page 775; physical measurements are used for the simpler products and account for most of the index. And the compilers of these indices naturally deflate what value calculations they do use. It is therefore not true that technical progress, by lowering prices, depresses production indices.

Mr Kaldor's point about the shift in weighting is correct, and your attempt to discredit his calculations on the ground that "the American industrial economy has changed more rapidly than any other" breaks down. For this argument supports him *a fortiori*, as he shows. Your objection, referred to in paragraph 1, would not refute him even if it were true: it would be a separate point.

The ECE figures are based on the official rates of exchange—rightly enough if we are considering competition in world markets rather than some academic comparison of efficiency. The fact that the £ has not been progressively and gradually

devalued in the past—and up to the date of the ECE calculations—has raised British labour costs relative to American. But there is now a 30 per cent relative fall to take into account, and your view that British labour costs have risen relatively to US since the war is certainly untenable after devaluation.

Statistically then, Sir, you have the worst of the argument. Nor is it contrary to common observation that US—and Belgian—labour costs have risen relatively to British. The contemplation of our own labour problems must not blind us to those of our neighbours. US labour has won many more spectacular wage victories than British, and the Belgian social services have expanded much faster than ours. But as a matter of policy it is surely right to complain of British labour costs. For the United States—and, *pace* Mr Worswick, Belgium—can afford high labour costs. We cannot. That ours should have risen more slowly than theirs is not enough. They should have risen more slowly still. Nor are there many other compressible items in the economy that have not already been fully compressed.—Yours faithfully,

New College, Oxford

P. J. D. WILES

The Health of the Book Trade

SIR,—May I offer the following comments on your article "The Health of the Book Trade"?

1. There were few publishers with "basic years" which left any margin for accumulating reserves. Most had the whole of their available profit, and many, part of their working capital, taken as EPT. If the entire stocks of slow-selling lines which have been consistently written down are suddenly sold and cannot be reprinted or replaced by others, an abnormal position arises. In many cases practically the entire proceeds of sales were handed over as EPT leaving the publisher with neither stock nor cash. The destruction of books by bombing accentuated the process. In one case where over the years 200,000 copies of slow-selling scholarly books had been written off, the entire proceeds of insurance were taken as EPT. The head of the Inland Revenue solemnly maintained that the publishers had lost nothing—though the eventual proceeds of the sale of some of these books represented the only possibility of profit from them and were in any case needed to finance further slow-selling titles.

2. New books have to compete with those produced at prewar prices or reprinted from prewar settings. In what other trade is the prewar commodity, *at the prewar price*, to be found alongside a similar commodity produced at two to three times the cost?

3. About 85 per cent of the total book trade turnover is represented by the sales of at most fifty firms.

4. Book publishing is a personal affair and whereas in the amalgamation of many businesses $1+1$ equals $2+x$, in book publishing $1+1$ would equal $2-x$.—Yours faithfully,

STANLEY UNWIN

George Allen and Unwin, Ltd.

The English Landowner

SIR,—In the interesting articles on the present position of the agricultural landowner you have recently published, the author has stressed the state assistance landowners are now receiving in the form of rebates of taxation, and subsidies. The impression gained by your readers may be that the private landowner is being bolstered up to a very material extent by the Exchequer, both by subsidies and by tax reliefs, and I feel this point calls for further examination.

Although it is difficult to form a just estimate of the sum of grant-aid made available to landowners (as distinct from tenant farmers), I should hazard a guess that the total subsidies (for land drainage, farm water supplies, and hill farm improvement schemes) have not much exceeded £2,000,000 per annum over the past three years in England and Wales.

Generally speaking, these subsidies help the tenant as much as—if not more than—the owner, where farms are let. In the case of the housing subsidy, the benefit goes entirely to the occupier, to close the gap between the economic rent and the rent he can afford to pay. (This housing subsidy does not apply to service cottages, which form a fair percentage of the total of farm cottages.)

Against the amount of grant-aid paid out, expenditure by landowners on the capital re-equipment of farms in the past three years has been very appreciable. Estimates prepared this year by my Association, based largely on figures supplied by the Ministry of Agriculture, showed that while about £9,750,000 was spent by owners in England and Wales in 1946, this rose to £12 million in 1947 and to £16½ million in 1948. This expenditure relates to capital improvements and not to repairs or maintenance, much of it being incurred at a time when labour and materials were scarce. It is fair enough to assume that landowners would have done still more had the facilities been available, despite the penal effect of high taxation, death duties and the "Special Contribution" payable under the 1948 Finance Act.

But, it may be argued, much of this expenditure may be relieved from taxation. As far as relief for maintenance is concerned, this is simply an embodiment of the principle that only *net* income should be taxed, on the analogy of setting off operating costs against receipts in industry before tax is assessed on profits.

The state owes something to British agriculture, which over a period of half a century (apart from brief periods of war

prosperity) was allowed to fall into economic decay because it suited national policy at the time. The need for the rehabilitation of farm equipment and for the injection of capital into the industry is largely the result of political action; surely it is not unreasonable that some amends should now be made by the state in the form of subsidies and tax concessions to recreate a great national asset.—Yours faithfully,

FRANCIS F. TAYLOR, Secretary

The Central Landowners' Association,
24 St. James's Street, S.W.1

The Webbs

SIR,—Each week I get great pleasure and benefit from reading *The Economist*. It saddens me all the more when you allow the reviewer of "The Webbs and Their Work" to write "What a lamentably stunted, over-specialised, dehumanised, myopic, and unbeautiful existence was theirs." May I say that, as a result of over thirty years' close friendship with the Webbs, I regard this as spiteful, ridiculous, and caddish nonsense.—Yours faithfully,

SIMON OF WYTHENSHAW

116, Marsham Court, S.W.1

[Lord Simon is letting his affection run away with him. Our reviewer (who also knew the Webbs) takes a different view of them from his. But the review was certainly not spiteful, and none of the adjectives that Lord Simon quotes supports an accusation of caddishness.—EDITOR.]

Books and Publications

No Savoury Solution

"Documents on British Foreign Policy, 1919-1939." Third Series, Volume II. Edited by E. L. Woodward and Rohan Butler, assisted by Margaret Lambert. HMSO. 692 pages. 21s.

WHAT emerges most clearly from this latest volume of Foreign Office documents, more clearly than from the various recent commentaries on the Munich crisis, is the need to distinguish what the British Government was trying to do from the incompetent and sometimes despicable way in which it did it. The commentaries have usually been critical of British policy; it is undoubtedly the fashion today to take that stand; but present-day criticism, like the contemporary opposition to Munich, is based to no small extent on the failure to make this distinction. Shame and indignation at the methods adopted, at the unintelligence displayed, still distort, if they do not quite obliterate, the estimation of the ends. The importance of the present volume, which covers the period from the announcement of the Runciman Mission to the Munich agreement, is that it forces us at least to hesitate before pouring out the baby with the bath-water. It performs this useful function—or it will if it is properly read—as much by its omissions as by the mass of material it contains.

British shame and indignation, this material leaves no doubt, were more than justified. The behaviour of the nominally independent Runciman Mission, in practice more than biased; the constant, repetitive efforts of Sir Neville Henderson to ensure, from Berlin, that the Mission should reach conclusions acceptable to Berlin; the spinelessness in action, the vagueness in thought, which characterised Whitehall; the surrender of the British representatives during the visits to Hitler—these things, of which we already had evidence enough, rise up again on every page of this detailed, objective collective. No end, one feels, could justify these means, no policy could succeed which met with such shortcomings in its execution.

Yet the policy and its objects remain to be considered; it is far less obvious than at first appears that "appeasement"

was wrong and insane; or that it failed. However difficult it may be to distinguish ends from means, there are still two sides to the question; and Munich would cease to be a problem if there were not. It is here that the volume should introduce its note of warning. More effectively than any individual interpretation, this bald and bulky documentary tale forces it upon the attention that an assessment of the policy pursued by the British Government is not a matter for glib and easy conclusions; that it is a question of immense complexity. This volume, it is true, does little to resolve the complexity; on the conflicting issues it throws little light. Like its predecessors, because of the nature of the material to which this whole collection is confined, it is purely tactical in importance. Its evidence is almost entirely limited to telegrams into and out of the Foreign Office; it contains no minutes or memoranda; it has little to say about the main-springs, as opposed to the execution, of British policy. Yet, to an even greater extent than the earlier volumes, it reveals, by the limited nature and the very bulk of its evidence, the extent of the material which is not divulged.

At a time when the conduct of British policy, if it was odious, was odious because it was desperate, it has singularly little to say about the fundamentals of the situation. At a time when, more than ever before, the formation of policy was in the hands of the Prime Minister, there are no Cabinet papers, and the Prime Minister's material is represented only by the record of his meetings with Hitler and with the French Ministers and by occasional letters. Although the danger of war was imminent for months, no light is thrown on the views and proceedings of the Service Ministries or the Chiefs of Staff. The reports of our military attachés, on the other hand, are included simply because they were received through Foreign Office channels, a fact which illustrates the arbitrary and inadequate basis on which the selection of these documents has had to be made.

There are arguments in favour of releasing the information which is so obviously withheld, not the least of which is the fact that the publication of the German archives, which has

just begun, should in any case reveal a great deal. Equally, no doubt, there are arguments against it. But on the merits or otherwise of British policy the judgment of historians, at least, will be suspended until this other material becomes available; and even a temporary judgment, within the limits of what is now being published, should be delayed until more of these volumes have appeared. For Munich was the culmination of a policy pursued at least since 1931; it cannot be judged in isolation; and, in choosing to publish Series 3 before completing Series 2 of their volumes, the editors have left us for the present with nothing later than 1932 against which to assess their evidence for 1938.

When these other volumes appear some estimate of the British policy will become possible; and, though their evidence will still be incomplete, they will make these things, already obvious, doubly clear: that in politics there is no easy or sovereign remedy; that for the problems of Europe in Hitler's day there could be no quite savoury solution.

An Illuminating Historian

"The Elizabethan House of Commons." By J. E. Neale. Jonathan Cape. 455 pages with illustrations. 18s.

IN the century between Henry VIII and Charles I the English Parliament changed its form. From being an occasional gathering of delegates, reluctantly accepting a summons to vote taxes, it became a political institution with high, indeed sometimes shocking, pretensions. After the great Reformation Parliament there are no obvious landmarks in this process. It continued gradually, moving by precedent and procedural change rather than by signal gestures, and perhaps the greatest growth in the stature of the Commons was that which was achieved most silently: for the exquisite political virtuosity of Queen Elizabeth always prevented such dramatic clashes as enliven the reigns of her two successors. This silent development has been examined, brilliantly but briefly, by the American historian Professor Notestein in his Raleigh Lecture of 1924. Now the most distinguished Elizabethan scholar in England, Professor Neale, has illuminated the whole subject in a new work of fine scholarship and lucid exposition. *The Elizabethan House of Commons* is a book such as seldom appears in historical writing: the material new, the learning profound, the style clear and vivid, deceptively concealing the labour behind it.

The first part of the book is a social analysis. Everywhere the same conclusion emerges. The House of Commons, which was to become the most successful political institution in Europe, was—in the reign of Elizabeth—quite unpolitical. Social competition determined the choice of candidates. The gentry, eager to find seats for themselves and their sons, rallied their supporters, attached themselves as clients to great magnates, and overflowed, from the socially grander county constituencies, into the more numerous boroughs. In this

eager competition the claim for parliamentary wages, at least by county members, was gradually dropped; new boroughs were created to cope with the demand; and the elections in some counties—where the social pattern admitted it—were hotly contested and dubiously decided. Sheriffs were seldom impartial. Family or political alliance determined their conduct at the poll. They had many opportunities to cook the returns; and provided the favoured party would underwrite their liabilities if found out, they often did. This is a fortunate fact: for it is from the depositions of aggrieved candidates in such cases that Professor Neale has drawn much of the evidence for his excellent narrative of county elections.

The pattern of borough elections is more complex. Here too there is evidence of the growing pressure of the gentry (who elbow out the merchants) and the rise of great aristocratic "interests." One by one the boroughs sank under noble patronage—apart from London only five of them retained consistent independence—and on the ruins of the urban oligarchies arose the organised patronage of those disastrous politicians—Essex, Robert Cecil, and finally Buckingham—whose exploitation of social ambition and economic necessity brought a disastrous nemesis in the next century. Under Elizabeth, until the 1590s, there was no such organisation. The pattern was changing and miscellaneous, conditioned by random pressure from beneath and contained by political responsibility at the top. The shadows of party organisation are there, but not the reality.

How did such a body become the formidable political engine of the next century? Partly by indirect means: social competition raised the intellectual standard of admission, and we have convincing evidence of the improving quality of members. But largely the change was procedural. In three excellent chapters Professor Neale, drawing on the scattered manuscript diaries of members, is able to describe that silent development of rules and organisation to which political institutions ultimately owe their success—the method of seating (of great practical importance), the little economies of time and method, the increasing use of committees. "Between the days of Edward VI and Mary, when—a sure sign of immaturity—most bills were not committed, what a transformation." These quiet changes of detail are as significant in political development as the more spectacular manifestoes and the clash of parties by which, in the pages of less skilful and judicious historians, they are often drowned.

Full Employment on the Left

"The Problem of Full Employment." By Joan Robinson. Workers' Educational Association. 36 pages. 1s.

MRS ROBINSON remains one of the most skilful, as she was the first, of the interpreters of Keynesian theory. In this pamphlet the data of the full-employment problem are set out, the basic relations between them explained, so lucidly that one wonders

THE ECONOMICS OF PRICE DETERMINATION

By C. CLIVE SAXTON

12s. 6d. net

This book is intended to be a logical outcome of the methods of economic analysis of the theory of monopolistic or imperfect competition propounded and developed by modern economists, particularly Chamberlin and Mrs. Robinson. It will be of interest not only to academic economists and those having a fair knowledge of economics, but also to the larger industrialists who are concerned with the formation of prices for the products of their industry.

OXFORD UNIVERSITY PRESS
Amen House, London, E.C.4

why the task of popularisation should ever have appeared difficult. It takes Mrs Robinson only nine pages of easily-flowing exposition to display the connections between consumption, investment and saving, the dynamics of instability and the relations between particular and general unemployment; half a dozen more to dismiss false remedies and outline the true; about the same to present her case for the planned economy and discuss its methods; while the remainder of the booklet glances at international problems, deals with a few fallacies (e.g. the "Treasury View") and concludes with a warning about the dangers of inflation. It is all, from a technical point of view, quite masterly.

From every other point of view it is unrealistic, sour and casuistical. It is really instructive to any reader interested in the technique of propaganda to identify the means by which Mrs Robinson gets her effect; the effect, of course, being that anyone denying the necessity of full-blooded Socialism must be a squalid combination of knave and imbecile. Note her use, to illustrate the inequality of incomes, of the figures of 1938—so much more telling than those of today. Admire the question-begging treatment of consumers' choice: "In a rational economic system, the productive resources of society would be used deliberately to meet the needs of the people," and "investment should be regulated on a system of priorities" (instead of by the profit motive). Which needs? What priorities? Has recent experience taught Mrs Robinson nothing about what happens when Mr Bevan's priorities, for instance, collide head-on with Sir Stafford Cripps's? Experience apart, all the serious literature of Socialist planning, from Dickinson and Durbin to Lange and Landauer, rejects this cavalier optimism. Then, watch the "mights," "woulds," "coulds" in the paragraph on "Planning and the Choice of Work": "When voluntary recruitment fell short, mere advertisement might be sufficient to set matters right," "many who had no strong preference . . . would take the right training," "slightly higher pay . . . could be used." One would never dream that present manpower objectives and the degree of their attainment could cast a light on these hopeful conditionals.

It is harder to ascribe any significant purpose to the hostility displayed by Mrs Robinson towards the business and professional classes—her own. The total effect is certainly unpleasant, a modulation into the Social-Democratic key of the typical cacophonies of Communism. Nothing could be less like Keynes; it is really time that that great man were rescued from his posthumous captivity.

Economics of the Long Weekend

"Economic Survey, 1919-1939." By W. Arthur Lewis. Allen and Unwin. 221 pages. 15s.

ANY history or analysis of the economic events of the inter-war years is likely to be either ponderously unreadable or inaccurately sketchy. Professor Lewis has contrived with great skill to provide something which is neither; which, without pretending to be more than a "starting point," a first approximation, gives the reader both a perspective against which to set special knowledge or to verify speculations, and a guide to further learning, and which introduces and relates to one another facts and theories, hitherto only available in specialist publications, in a style which any intelligent lay reader can appreciate.

He has adopted a somewhat odd but decidedly effective technique, covering the ground three times in three successive sections headed respectively "The Cycle," "National Policies," and "Trends." The first charts, as it were, the economic meteorology of the interwar years; the period of dislocation, demobilisation, revolution, monetary collapses and provisional stabilisation of 1918-25, the patchy but hopeful fair weather of 1925-29, and the catastrophic 'thirties. The second traces the fortunes and expedients, over that period, of the

United Kingdom, Germany, France, the United States, Japan and Russia. The third endeavours to establish valid generalisations, setting the interwar years in the longer perspective of secular economic development and isolating those factors (relating chiefly to international trade and the balance of economic activity between its primary, secondary and tertiary forms) which account for its distinctive features. He reaches the conclusion—on the whole a reassuring one—that the misfortunes of the interwar period had a specific, *ad hoc* explanation; "they were not linked," he says, "either with prewar trends or with permanent long-term trends which must be adverse to us in the future."

This explanation consists in the relative overproduction of primary commodities, "which, by keeping the terms of trade unfavourable to primary producers, kept the trade in manufactures so low . . . even in the 'twenties, and . . . pulled the world economy down in the early 'thirties." There were, of course, other contributory factors, especially in the financial and political fields; this was the chief. The lesson for the future is that the first essential for stability is, while encouraging both industrial and agricultural development, "to take care that the rates of growth do not diverge disastrously." It is, of course, true that the divergence to be guarded against may not be in future, as it was between the wars, on the side of excessive primary development. But the principle of harmony is important.

Professor Lewis's analysis makes the Marxist picture of capitalism in crisis look remarkably silly; it is disconcertingly hard to fit into the categories of Keynes. It is one of the puzzles of this excellent book that its author should take the trouble to investigate the "long wave" depression theory of Kondratieff and Schumpeter, only to condemn it, while leaving his readers without any clue to the bearing of his researches on the best known theoretical structure to emerge during his period. That one should thus feel tempted to ask for yet another approach to the subject is perhaps the most striking evidence of Professor Lewis's success. One remaining complaint is more reasonable: the index is hardly more than an airy gesture. What is the use of giving thirty-nine page references under the undifferentiated heading "United Kingdom"? Loathsome as is the job of index making, one may hope that in a later edition Professor Lewis will take pity on his otherwise appreciative readers.

Sense on Erosion

"Deserts on the March." By Paul B. Sears. Routledge and Kegan Paul. 178 pages. 10s. 6d.

THE theme of soil erosion of the "rape of the earth" has been, over the last dozen years, orchestrated with more than Wagnerian thunders. The effect on public opinion, while certainly not negligible, has been rather reduced than otherwise by the extreme vehemence with which the campaign has been conducted—not to speak of the equally extreme innocence, in matters of market economics, of the writers concerned. The response of the reader to a title like "Deserts on the March" is apt to be "Oh, another of these erosion merchants!"

Professor Sears' book has reached this country after a long delay; its first American edition appeared in 1935. It covers the familiar ground, glancing at the rest of the world but concentrating on the United States, in a refreshingly civilised style which one would call urbane but for its occasional unmistakable flavour of cracker-barrel. A postscript dating from 1947 strikes a note of cautious optimism. Professor Sears does not panic; he does not denounce, though he is not chary of blame; there is no shrillness about him; and there is not a dull page in his book. No "general reader" wanting to know what all this erosion business is about, no student seeking an introduction to serious study, could do better than begin with "Deserts on the March."

Man's happiest contrivance

A stay at an English inn is one of the chief inducements to prospective tourists now being advertised by the Travel Association in the United States, a country not notably backward in the matter of hotels. There are still to be found in our inns the comfort and civility which prompted Dr. Johnson to say: "No sir, there is nothing which has yet been contrived by man by which so much happiness is produced as by a good tavern or inn." A tradition of good and hospitable service still lives on.

But for the brewing industry many of these inns would have vanished.

The industry has acquired them largely during the past fifty years, since the policy of public house improvement was inaugurated. It has renovated and enlarged them when necessary and let them at low rents to enterprising landlords. The industry could not

conserve all the old inns: many were condemned by the authorities as redundant and others had to be rebuilt. But in hundreds some link has been maintained with the days when hospitality to travellers was a duty resting on monasteries and great households, even if this link is nothing more than a name or a place or a tradition of service.

There is surely something here of credit to those, the owners, who are preserving this feature of our national life so much appreciated by our overseas visitors.

AMERICAN SURVEY

Testing Prosperity

(From Our American Staff)

FOR more than four years since the jubilant summer and autumn of 1945, American prosperity has been subjected to periodic—even persistent—testing by adversity. At least, many events during that period have been widely viewed, both here and abroad, as being adverse. To mention a few, there have been repeated economic and political crises abroad, strains between labour and management at home and government policies which most business interests felt to be incompatible with continued prosperity, coupled with frequent warnings that the back-log of demand piled up during the war years was at last exhausted. Moreover, there have been periods of definite business decline, notably in 1945-6, when the index of industrial production fell from 236 to 152, and in 1948-9, when it receded from 195 to a low of 162 in July, 1949. But on all occasions the tests have been withstood: not even a Marxian—if he were honest—could describe the troughs as anything but prosperity, accompanied by very high employment and a standard of living of unprecedented abundance.

How great the increase in welfare has been the accompanying table shows. Real income per head is now \$1,405 a year. This is almost double the level reached at the peak of the boom immediately following the first war and is 56 per cent above 1929, 108 per cent above 1933, and 41 per cent above 1940. And this level has not been achieved by drawing on pre-existing stocks of goods or on the resources of others or through any form of compulsion of labour or capital; indeed, it has been realised although nearly all segments of the community have been working somewhat less efficiently than they might have done with existing skills and equipment.

Now the economy is being subjected to another major test from events and developments which in themselves would be regarded as adverse and which, in combination, and when popular reactions are taken into account, are perhaps fully as severe, if not more so, than anything experienced since the end of hostilities. They include a very marked appreciation of the currency against most of the rest of the currencies of the world, simultaneous stoppages in the coal and steel industries and on one major railroad, the unnerving news that the Russians have produced an atomic explosion, and the early prospect of extensive tariff reductions. This chilling combination of threats is encountered at a time when taxes remain very high, and the already heavy direct burdens on production from labour and social insurance costs are likely to rise.

Yet the general state of expectations in early October,

with this latest test already begun, is one of real, if moderate, optimism. This view prevails among business men, civil servants, and among economists of various schools and connections. A level of production and employment within the range of the past 12 months is generally projected as far into next year as projections are made, with only the qualification that the current steel and coal strikes may cause October to be a "holiday," and thus discontinuous, month. The effects of dollar appreciation are belittled as affecting only a part of export business, with the export trade as a whole considered to be too small to be of much significance anyway. The production—and consumption—of steel and coal now being lost through strikes are looked on as being merely deferred. The Russian atomic achievement is expected to stimulate public, and some private, expenditure.

Aside from these interpretations of current events, the optimists use arguments that have become familiar during recent years. The technological revolution, given a competitive economy, the continuing consequences of underinvestment during the nineteen thirties, and the concentration on war production in the first half of the 'forties, give a buoyancy to investment which will not be lost for many years. Consumption is, and will be, maintained by the same factors, reinforced by financial reserves of individuals (which are still far higher than at any prewar

time, in spite of a small decline in recent years, and are protected by both social and private insurance and pensions). Large government expenditures serve to maintain both consumption and investment and easy money is a pervasive stimulant. No large area of over-extension or over-expansion exists to initiate a sizeable collapse, and the increase in the population, which is far greater and more persistent than any estimates suggested, is another broad expansionary force.

A minority dissents from this rosy view, both of current events and the basic position. It argues that the appreciation of the dollar against the currencies in which most of the world's trade is carried on is a deflationary force of great potency. It believes that the struggle for power between labour and management has reached, or is reaching, a significantly destructive stage. The international political tension will, with Russian progress in fission, increasingly discourage expansion. Recent "prosperity," according to this view, has rested essentially on unsound inflationary expenditure, the consequences of which, in the form of burdens on and dislocation of enterprise, cannot long be prevented from producing a downward spiral.

Both cases have considerable force, especially when stated in their fully developed form, instead of the highly summarised version used here. The experience of the past four years supports the optimists—but for a long time during the nineteen twenties the economy seemed depression-proof, and for many dismal years of the 'thirties it seemed recovery-proof.

The prudent business man of whatever persuasion—or confusion—has only one choice. It is to operate neither in the anticipation of nearby Marxian doom, nor in the happy belief that depression has been excised from economic behaviour. He attempts to keep his plant in condition to produce goods as attractive and meritorious as those of his competitors—or if possible, a little better—while at the same time maintaining a financial position sufficiently flexible to adjust to fluctuations in demand. He is, in short, cautious, but far from paralysed.

Taft's Tour

[FROM A CORRESPONDENT IN OHIO]

SENATOR TAFT'S 100-day tour of Ohio, now nearing its half-way point, is a political nine days' wonder. Rarely, if ever, has a candidate canvassed his entire state fourteen months in advance of a Congressional election. But the Senator from Ohio has compelling reasons for his unorthodox early start: back in 1944, when the war riveted Congress to its job, he barely won his first race for re-election, and Governor Dewey's debacle is a recent object lesson in over-confidence. If nearly one-third of Ohio's registered Republicans stay away from the polls in 1950, as they did last November, when the Democrats won the state, it will not be the fault of Mr Taft.

The Taft tour is defensive tactics. Organised labour is planning an all-out campaign against the hated author of the Taft-Hartley Act, President Truman's brace of speeches on Labour Day, to the workers in Pittsburgh and to the farmers in Des Moines, foreshadowed his strategy for 1950 and 1952—a farmer-labour partnership. Ohio, with its big urban and rural votes and its tradition of independent voting, should be an ideal proving-ground for the Truman strategy; it is regarded as the critical state in 1950.

Senator Taft calls his tour "A Report to the People." On a schedule that would kill many a man of half his sixty years, he is invading every one of Ohio's eighty-eight counties, speaking almost around the clock and flying back to Washington from time to time to vote on important issues. He is trying to counter the Roosevelt-Truman tradition of personality, coupled with large promises to large blocs of voters, by an uncompromising statement of his own hard-grained opinions, heavily larded with facts and figures. He also wants to find out the weaknesses of his position, not from Washington correspondents but from the men and women who will cast Ohio's ballots next year.

Apparently unconcerned by any threat of a farmer-worker coalition, Senator Taft regards organised labour as his real enemy. The two national labour organisations have decided to use Ohio in 1950 as an advance test of their political power in the presidential year of 1952. Though not unified, their attack follows parallel lines and they propose to raise a multi-million-dollar campaign fund from rank-and-file contributions. The Senator's views on many domestic issues are a far cry from the Republicanism of the nineteen-thirties. He has sponsored bills for Federal aid to public

housing, education and public health and has voted for the 75-cent minimum wage—all measures which must trouble the spirit of Calvin Coolidge. But this means nothing to the labour leaders. It is enough for them that he wrote the "slave-labour law." The Senator was encouraged by a recent Republican victory in a Pennsylvania by-election, in a district that includes industrial Johnstown—which labour had indiscreetly heralded as "a preview of the Ohio 1950 race." Nevertheless, Mr Taft must take the opposition of organised labour for granted. His major task is to win over the other half of the Truman coalition.

The defection of the normally Republican farm vote was mainly responsible for putting Ohio in the Democratic column in 1948. But Mr Taft speaks the language of Ohio farmers, as Mr Dewey did not. The farmers admire him "because he stood up to the labour unions." His warnings against the political and economic perils of the "welfare state," which he sees as the end-product of Mr Truman's fair deal, fall on willing ears wherever local politicians gather. The farmers are worried by the spread of Communism abroad, but no less by the mounting cost of stemming the red tide. They do not oppose the European recovery programme but they ask persistently: "Where will it all end?" And the return of deficit financing disturbs the rural taxpayer.

Of course, the farmer wants nothing to interfere with crop-price supports, which Mr Taft favours in a flexible form and which, in the 1949 fiscal year, cost the Treasury three billion dollars in loans and purchases. But even as he insists upon price supports, the farmer agrees with the Senator that he is paying too much in taxes for what he gets. Moreover, the farmers are suspicious of the Administration's farm plan—a favourite Taft target—which promises to lower prices to consumers and yet to maintain a high farm income out of the taxpayer's pocket. When Senator Taft asserts that this Brannan plan would end in complete government control of agricultural production, the farmers and their wives nod solemnly.

The Senator's views on foreign policy, which more and more hark back to isolationist days, are sharply attacked along the eastern seaboard but have thus far done him little harm in rural Ohio. He is not an isolationist of the *Chicago Tribune* school. If Russia attacks, he says, the United States should at once go to war in defence of western Europe. His isolationism is of a new midwestern type, which fears national bankruptcy no less than war and sees in the former the more immediate danger. These views are not shared by most Republicans in the Senate, who follow Senator Vandenberg's leadership, but they carry weight with the farmers of Ohio. They help to explain why Mr Taft is attracting bigger crowds now than he did last year when he tried to win the presidential nomination.

Senator Taft's chances may seem better than they actually are, thanks to the difficulty of finding a worthy opponent. So far, the labour leaders and Democratic party officials have been unable to agree on a Senatorial candidate in Ohio. The

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

best man in sight, Governor Frank J. Lausche, a Democrat, but not a Fair Dealer of the Truman stamp, has shown no inclination to contest the Taft seat, and indeed is one of the Senator's admirers. This attitude of the state's leading Democrat towards its leading Republican raises an interesting question—the influence of anti-Truman sentiment among Democrats on the state level in 1950. Any day in Washington one can hear Democratic members of Congress—not all of them from the south—voilunteer the opinion that a Taft defeat would be a political disaster for the country. But they always say it privately. While labour busily tries to dislodge the right-wing Democrats in the south, there is as yet no sign in Ohio, or elsewhere in the north, of an organised anti-Truman movement in the Democratic Party. Many Ohio Democratic newspapers will be on the Taft side next year. But however much individual Democrats may dislike aspects of the Fair Deal, it is not to them an incendiary issue, like racism is in the south. At the moment the only unsolicited gift the Republicans can hope for is a split in the Congress of Industrial Organisations. Should the left-wing labour unions break away from the anti-Communist majority in the CIO and put up fellow-travelling candidates for Congress, Mr Taft and other Republicans would naturally profit.

The influence of a Taft victory in 1950 would be felt primarily in domestic affairs. Nevertheless, his growing opposition to the bi-partisan foreign policy may alienate many voters who look upon 1950 as only a preparation for 1952. If illness should incapacitate Senator Vandenberg and if Senator Dulles, one of the originators of the bi-partisan approach, should lose his seat in the New York special election next month, Senator Taft would have the commanding voice in Republican foreign policy. On the other side, it must be remembered that the isolationism of the minority party in Congress has more to do with methods than aims. Then, too, the Senator may yet temper his assaults on the bi-partisan policy, in deference to the impact on public thinking of the atomic bomb explosion in Russia.

As the fear of war rises, the fear of "bankruptcy through Socialism" tends to decline. While a sudden change in the temperature of the cold war would not injure Mr Taft's standing with the regular Republicans, who regard him as a domestic life-saver, it could persuade many independent voters that his intelligence cannot be trusted beyond the twelve-mile limit. And the independent urban voter may hold the balance of power in this most critical state election in decades.

American Notes

Mutiny on the Quarter-Deck

The second birthday of the unification of the armed forces is being celebrated—if that is the right word—by a noisy civil war. Thanks to a captain who has wrecked his career to startle the House Armed Services Committee into resuming its hearings, the Navy now has a second chance to put before the country its conviction that unification is strangling sea power, and that the dominant strategic thinking of the Air Force is a positive threat to the nation's security. These are the important issues which never had a hearing in the earlier inquiry into the procurement of the B-36.

The Navy—never less a silent service—has put up virtually its whole higher command to denounce the official policy of Mr Johnson, the Secretary of Defence, of the Joint Chiefs of Staff, and of the Navy's own new, and not very impressive, civilian head, Mr Matthews. The Navy believes

it has had a raw deal from the air-minded Mr Johnson and the Chiefs of Staff, where it is persistently outvoted. It is convinced there is a plot, under the excuse of economy, to rob it of its aviation and hence of its offensive power, and whittle it down to a mere shadow of its former self. Still worse, according to Admiral Radford, an expert on naval aviation, the B-36, the Air Force's chosen instrument for delivering the atomic bomb, is little more than a "removing van," a billion-dollar blunder, vulnerable, when unescorted, to existing fighters and improved anti-aircraft defences, incapable of precision bombing from a safe height, and inferior, for example, to the Navy's *Neptune*. (The Navy is not impressed by the objection of the Air Force that the argument between the B-36 and the Navy's fighters could only be settled by a duel with live ammunition; to some naval airmen this seems to be a positive advantage).

The failings of the B-36, however, according to Admiral Radford, are less disastrous than the kind of war planning of which it is a symbol: reliance on the atomic blitz. This, the Navy is convinced, will win no wars, particularly if Russia can produce the bomb, but its use will certainly wreck any hopes of subsequent peace. In the meantime, the concept stimulates an indefensible public complacency. These broader contentions are shared by many more disinterested observers. The suggestion of Mr Vinson, chairman of the House Armed Services Committee, that a "fire" should be built under the weapon evaluations group to hasten a report on the B-36, and that the National Security Council and a special board should report on strategic air warfare, hold out hopes of some authoritative guidance.

The Navy appears to be more at sea in its complaints that it is being "scuttled." Economy has, it is true, been practised at the expense of the Navy, though Mr Johnson is also opposing the House in its desire to shower new appropriations on the Air Force. But Mr Johnson's defence has force; it is that the naval strength of the United States, Britain, and France is overwhelmingly greater than that of Russia, the only conceivable enemy at present. Some observers believe logic requires more, rather than less, severe pruning of the Navy. National security would hardly be served by erecting a Congressional bomb shelter into which the Navy could dive to escape from reality. Yet this is what Mr Vinson is proposing when he tries to protect naval appropriations from Mr Johnson's pruning hook.

Playing Politics with the Atom

When early last summer he charged Mr Lilienthal, chairman of the Atomic Energy Commission, with "incredible mismanagement," Senator Hickenlooper hoped to impress his name so favourably on the memories of his Iowa constituents that his re-election in November, 1950, would be assured. In fact, it is on the Washington vocabulary that the impression has been made: Hickenlooper is the current synonym for a fiasco, but it might also be used to signify negative stubbornness. Mr Hickenlooper entirely failed to substantiate his charges before the Joint Congressional Committee on Atomic Energy and its hearings ceased many weeks ago, since there were neither witnesses who wished to be heard nor members who wished to attend. Yet when the Democratic chairman of the committee, Senator McMahon, tried to get it to vote on a report, so that Mr Lilienthal might be formally cleared before Congress adjourned, the hearings were only closed over Mr Hickenlooper's protests and by a vote on strictly party lines.

Mr Hickenlooper's Republican colleagues then found a further means of postponing a report which will inevitably be favourable to the Administration and embarrassing to the Senator. Mr Knowland insisted that a secret investigation be undertaken. It apparently concerns the means by which atomic bombs, in the custody of the AEC, are made available

to the Air Force when it decides to drop them. The topicality of this question arose from the announcement of the atomic explosion in Russia, an explosion which Senator Hickenlooper takes to be proof of his charge that the AEC has been lax in its security policy. The explosion has focused attention on civilian defence, or rather on the lack of it, in the United States, and there is also fairly general agreement that the atomic bomb programme must be reviewed and probably accelerated. This may involve additional appropriations, although Mr Hickenlooper doubts if they will be necessary.

The Russian explosion also gave new significance to the discussions going on in Washington between the United States, Canada and Britain on questions of atomic co-operation. These discussions have been adjourned for a few weeks, but the Under Secretary of State gave an interim report on them, in which he referred to the possibility of an atomic partnership. This reference immediately called down a Hickenlooper on his head, because he had discussed such an idea without consulting Congress. If atomic partnership is to become more than an idea, Congress will certainly have to be consulted, and the provisions regarding exchange of information in the present Atomic Energy Act will have to be amended. However, it is not expected that such legislation will be requested before January and it is to be hoped that in the meantime, the Republicans may have been sufficiently mellowed by the Christmas spirit to put their country's co-operation with its allies before their political intransigence.

Labour Liaisons

At its verbose and leisurely convention last week, the American Federation of Labour made another of those proposals of marriage to the Congress of Industrial Organisations which never get as far as an agreement on the terms of the marriage contract. Mr William Green, beginning his second quarter of a century as president of the AFL, hardly helped this year's negotiations by his derogatory contrast between the single harmonious voice with which the AFL presses its cases and the cacophony from left and right which has recently characterised the CIO. With a further disparaging glance at the readiness of the CIO's Mr Murray to abandon his wage demands on the recommendation of the steel fact-finding board, Mr Green declared that the AFL would never surrender its right to fight for wage increases for its members. Indeed, he added unctuously, the AFL had recently been very successful in obtaining such increases—15 cents an hour for 20,000 teamsters in New York, for example.

The AFL's Executive Council, following the lead of Mr Lewis, has now set a five-day, thirty-five hour week, with no lowering of wages, as the peak to which labour may aspire, once it has scaled the heights of its present pension demands. Such a reduction in hours, the Council suggested, might be preferable to higher wages. It would not only give labour a share in the benefits of rising industrial productivity, but would also prevent the unemployment which would otherwise follow the approaching return of productivity to its normal rate of increase, about 2½ per cent a year.

While no wedding is likely to be solemnised as yet between the AFL and the CIO, two liaisons between them have now been firmly established. One of these is only for foreign travel: both organisations are playing an amicable and equal part in the formation of the new world labour federation. The other liaison, to which the AFL still refuses to give the official dignity of national recognition, is a local affair between branches of the CIO's Political Action Committee and the AFL's Labour's League for Political Education. They are co-operating closely in their efforts to secure repeal of the Taft-Hartley Act and it is to secure this that Mr William Hutcheson, the Republican leader of the Carpenters' Union, has contributed \$100,000 to the rapidly growing League.

This gives it a little of that non-partisan look without which Samuel Gompers would turn in his grave. But the father of labour's non-partisan policy is likely to haunt his centennial celebrations next year if, as is now planned, they are made the occasion not only for a drive to increase the AFL's present membership of 8,000,000 by another 1,000,000, but also to induce all those members to contribute voluntarily to the League. Even if it would like to be politically neutral, the League finds itself regularly working for Mr Truman and his Fair Deal.

The Farmer's Applecart

All hope must now be abandoned that Congress, despite its nominal attachment to economy and free enterprise, will permit a real reform of the agricultural subsidies to take place in 1950. Such an Act, written by Senator Aiken, was passed last year, to take effect in 1950. But the House has already repealed it, and substituted the Gore Bill, which would simply continue for one more year the present system of high and inflexible supports; and last week the Senate displayed its own unwillingness to upset the farmer's applecart. It is hard to imagine that the next session—at the end of which the whole House and one-third of the Senate must seek re-election—will find Congress more willing to risk losing the farmer's good will even for his own good.

The Anderson Bill, which the Senate is debating, is basically the Aiken Act sugar-coated. Like the latter, its aim is to lighten the burden of the farm programme on the taxpayer, and encourage farmers to conform to the changing pattern of demand, by lowering support prices somewhat from the high level adopted to increase production during the war, making support prices vary with supplies of each commodity, and modernising the basis on which they are calculated. To make the dose more palatable, the Anderson Bill includes the cost of farm labour in the calculations, raising support levels by about six per cent; and puts off the introduction of lower, and flexible, supports until 1951. How little enthusiasm for reform there is in the Senate—with its heavy representation of agricultural States—was shown last week when, for a day or two, before the vote was reversed, the Senate went on record as favouring the permanent extension of the present high levels of support. Spokesmen for the wheat and cotton farmers, who find it so hard to agree on the requirements of a modern farm programme, found it temptingly easy to sink their differences at the expense of taxpayers and consumers.

SUPPORT PRICES FOR BASIC COMMODITIES UNDER VARIOUS BILLS
(In Dollars)

	Gore	Aiken		Anderson	
		With Quotas or Allotments	Without Quotas or Allotments	With Quotas or Allotments	Without Quotas or Allotments
Wheat (Bu)	1.94	1.70	1.41	1.84	1.72
Corn (Bu)	1.41	1.07	0.89	1.35	1.12
Cotton (34)	0.27	0.22	0.18	0.25	0.31

Tobacco (lb the cured) ..	0.42	0.43	0.34	0.45	0.45

From the Washington Post

If the Senate, as seems likely, approves the Anderson Bill, it will have to persuade the House to swallow its long-term provisions. The trump card of the Senate conferees is that, without agreement on a new Bill, the even more spartan fare of the Aiken Act will be forced down the farmer's throat in January. Last year it was the Democrats' desperate need for a long-range farm programme to display at their convention which induced the House to pass the Aiken Bill—though for future consumption only. This year Congressional advocates of a flexible and realistic farm programme have been deserted by the Administration. It was the Vice-President, supported implicitly by Mr Truman,

who at one point broke a tie and nearly committed the Senate to permanent high, rigid, price supports.

Mr Brannan's eagerness to stab the Anderson Bill in the back was more fitting to the author of a rival farm Bill, which he hopes to revive next year, than to the Secretary of Agriculture, who must be aware that the Commodity Credit Corporation lost \$600 million on farm price support operations last year and that the government already holds, directly or under loan, substantial proportions of last year's wheat, cotton, peanut, and flax-seed crops. Cynics may suspect that the Administration, unable to secure its own Bill this year, is not averse to a costly stop-gap which will keep the farm issue alive for 1950, and is willing to take the risk that heavy farm subsidies, coupled with high prices in the shops, may permanently prejudice the cause of farm security.

* * *

Polio's Peak

The Chicago insurance company which, last June, introduced a scheme for family insurance against polio (poliomyelitis, or infantile paralysis) chose an inauspicious year to launch the new idea, that has been received so enthusiastically by the public. It has sold more than 500,000 policies, covering expenses up to \$5,000 and costing \$10 for two years, and claims were said to be coming in at the rate of 45 a day by the end of August. The annual polio epidemic had then reached its peak, a month earlier than it ordinarily does, probably as a result of the very hot weather over most of the United States this summer, which may also explain why this year's epidemic has been the heaviest ever recorded. In August 9,016 cases were reported, compared with 4,839 for the same month in 1948; in the whole of last year 27,900 cases were reported, a very high figure, but from January to October this year there were 33,140, over three thousand more than in the previous record year of 1916.

But there is now very much greater awareness of, and knowledge about, the disease than there was then, so that cases are detected more often and more quickly. Consequently they are properly nursed and the mortality rate for children under 15 is only one-fifteenth of that in 1916. The incidence of infantile paralysis nowadays, however, seems to be increasingly on adolescents and young adults rather than on infants. Both the high number of recorded cases this year and their comparative mildness may be explained by a new virus recently discovered by three scientists at Yale University, which causes the same symptoms as polio, but apparently leaves patients without the harmful after-effects. It is difficult to assess the prevalence of this infection because complicated tests are needed to distinguish it from real polio.

*

To counteract the frightening newspaper reports on this year's epidemic, and such disquieting events as the cancellation of the first football match ever to be arranged between Yale and Fordham Universities because one of the Yale team and two other students had polio, the progress of recent research has been publicised by the National Foundation for Infantile Paralysis. Knowledge of how the virus is transmitted is growing, but so far no effective antidote or vaccine has been found. The Foundation not only encourages research but also assists its local branches, or chapters, to give hospital and after-care to the victims of the disease. It is estimated that while 25 per cent of this year's cases will recover completely, 75 per cent will need varying amounts of treatment to reduce their handicaps as much as possible. Both the National Foundation and its chapters depend for their funds partly on the famous March of Dimes, collections of money made on the anniversary of President Franklin D. Roosevelt's birth, in honour of a polio patient who overcame his handicaps magnificently. It is, however, not only the enemies of the late President who feel that the nation's health might be improved if some of the attention which has

been given to polio could be turned to the benefit of victims of other even more distressing diseases—rheumatic fever, for example.

* * *

Automobiles in Flood

The record flood of automobiles which poured off Detroit assembly lines in August and September, and brought the total output for the year to the 4,000,000 mark as early as the first week in October, was in part at least an attempt to forestall anticipated strikes in the industry itself and in the steel industry. Retail car dealers had a struggle to keep their heads above the flood and it drowned a number of used car firms which had been in difficulties for some time. The quantity of new cars in dealers' hands increased by over 60,000 during August, even though the record number of 480,000 were sold, and in September, when the seasonal demand was over, output continued at a high rate. The steel strike and the production shut-downs which several companies are planning between now and Christmas, while they retool for their new models, may restore the balance between output and sales. But there is no doubt that the sellers' market for automobiles is over, even if the buyers' market has not yet permanently returned. Furthermore, devaluation of foreign currencies is expected to reduce exports, a matter which seems to worry manufacturers more than does the increase in foreign competition in the United States arising from the same cause.

The spring tide of automobile output was one of the currents which kept the American economy from running aground in the shallows of the recent recession. Not only does the automobile industry provide very substantial employment itself, but it also creates a heavy demand both for raw materials and for the products of other industries. But if the recession is resumed, that tide will almost certainly have lost much of its force.

*

Since the beginning of the year manufacturers have been increasing both their advertising expenditure and the number of their dealers, some of them by as much as 50 per cent. There are already dealers who will accept anything from a diamond ring to a land contract in part exchange for a new car or who will pay the fare of any customer coming to collect his car, even from thousands of miles away. But when over 40 per cent of the 35 million cars on the roads are more than ten years old, there is a certain flatness in the traditional sales talk about the economy, as well as the social desirability, of having a new car every year.

Lower prices would be a much more inspiring argument, especially when the average outlay on a new car has risen from \$1,200 in 1941 to over \$2,000. But this increase has only kept in step with similar increases in costs and no substantial reductions on existing models seem likely. Manufacturers are, however, producing an increased proportion of the lower-priced cars in their range. The Kaiser-Frazer Corporation, continuing its youthful custom of disturbing the industry's peace, is proposing to enter the low-priced car field next spring, with the help of the \$34 million loan which it has just obtained from the Reconstruction Finance Corporation. But even this terrible child has had to confess that it sees no prospect as yet of achieving the \$1,000 car which is its goal—and that of other firms as well.

Shorter Note

The United States gave or granted over \$5 billion to foreign countries in the last fiscal year, nearly twice as much as in 1947-48. Over one-third went to three of the former enemy countries, and Germany, receiving nearly \$1 billion, was the chief beneficiary; the United Kingdom came next, receiving \$983 million.

Anaesthesia

The anaesthetic properties of ether were discovered by Michael Faraday in 1818. Nineteen years before that, another British chemist, Humphry Davy, anaesthetized himself with nitrous oxide, or "laughing gas," which has since become so important in dental surgery. Then in 1847 chloroform was introduced by James Young Simpson, an Edinburgh physician.

Though ether and chloroform are still used in surgery, the quest for improved anaesthetics has continued to this day; chemical research has produced even safer and more efficient materials. Procaine, a synthetic local anaesthetic widely used in dentistry, has developed from a study of the chemical structure of a natural substance, cocaine. Other milestones in anaesthesia have been the introduction of ethyl chloride, cyclopropane, vinyl ether, trichloroethylene, and also other anaesthetics which are administered not by inhalation but by injection into the veins or the spine. The achievements of British chemistry in the field of anaesthesia are two-fold. Firstly, its research has contributed greatly to the range of anaesthetics available to-day. Secondly, the British chemical industry is now producing these anaesthetics to the high standards of purity essential in the field of medicine.

HOW

**do we manage to export now
more steel manufactures
than ever?**

The increase in our exports since the war is almost entirely in steel and goods made of steel. Machinery, motor cars, and engineering products already exceed twice the pre-war volume.

In steel to-day five hundred firms are free to compete with one another, to keep costs down and output up.

Here, in steel, we have a highly efficient industry collaborating with Government itself to the national advantage, in a working partnership between free enterprise and public supervision.

STEEL

is serving you well

THE WORLD OVERSEAS

Allies on the Adriatic

(By a Correspondent Recently in Trieste)

THE Trieste traffic-policeman tilts his British-type helmet and performs his British drill with efficient if slightly operatic gestures. Through the stream of traffic runs a continuous glitter of American transport; each jeep, as well as each staff-car, is so highly burnished as to give the waterfront the appearance of a *concours d'elegance*. This is the Anglo-American Zone "A" where the Allied Military Government (the last of the "Eisenhower pattern") has created conditions which contrast so sharply and so favourably with those in the Yugoslav Zone "B" that the Italian population are inclined to discount the realities which will face them on its retirement.

These realities are not so discounted, however, by the Zone Commander, the greatly respected British soldier-diplomat, Major-General Terence Airey, who has seen Trieste through all its political, economic and even military crises since 1945. In his last report to the Security Council, General Airey expressed his conviction that:

Trieste's prosperity must be founded upon that political stability which springs from rational and tolerant democratic values, and it would be gravely menaced by any nostalgic backward trend towards the discredited doctrines of Fascism and Communism.

Both General Airey and his British and American advisers recognise that Italian nationalist feeling in the Zone needs to adjust itself after the inevitable sense of triumph which accompanied the results of the local elections in Zone "A" last June. These gave a 65 per cent vote to the Christian Democrats and those other Italian parties which stood for the return of the whole of the Free Territory to Italy in accordance with the Tripartite Declaration of March, 1948. The Communists who followed the Cominform line that Trieste should remain a Free Territory, in accordance with the original provisions of the Peace Treaty, recorded little more than half the number of votes gained by the Christian Democrats alone.

Relations with Tito

In spite of the Communist defeat, the resolution passed by the party's central committee after the elections developed a line of propaganda which has played with some success on the nerves of the nationalist-minded Italians. The Communist statement asserted that negotiations had taken place between Tito and the Anglo-Americans which aimed:

with the connivance of de Gasperi . . . at achieving agreement based upon a barter. Its terms are expected to be the annexation of Zone "B" to Yugoslavia and the maintenance of the Anglo-American occupation and military regime in Zone "A."

The Trieste Italians (82 per cent of the population of Zone "A") are now acutely sensitive of any evidence of better relations between Tito and the western Powers. They showed this in their reception of parts of Signor de Gasperi's speech on the eve of the local elections, when he warned (with Signor Saragat at his side):

Do not forget that we have always borne in mind that the port of Trieste is not for the use of Trieste alone nor even

for Italy alone, but it must serve the hinterland if it wishes to return to its former glory. . . . This can be achieved by means of agreement with other countries.

The inference of a *modus vivendi* with Yugoslavia is especially distasteful to the neo-Fascists who talk openly of a western "deal" with Tito over Zone "B" and do their best to spread alarm and despondency among the more moderate Italians. This is made easier by their deep-seated fear, which is a legacy of the Yugoslav administration of May, 1945, and the persecution which has continued against the Italians in Zone "B," believed to number some 30,000 out of a total zone population of 73,500. Apart from action against the Catholic church, and even against the person of the Bishop of Trieste and Capodistria, the Italians in Zone "B" whose work lies in Zone "A" have been very heavily penalised ever since Tito replaced the local lire by the dinar at the time of the elections. These Italians are, of course, paid in the lire currency of Zone "A" which, according to the Peace Treaty, was to be the currency of the whole Free Territory. An enforced contribution of 10,000 lire a month has now to be made from each worker's wage packet in return for a credit of 1,000 dinars of relatively worthless value. A high wage for skilled workers in Trieste is 60,000 lire a month, but the average wage is more likely to be in the region of 35,000 lire a month, perhaps less, and the 10,000 lire forfeit is all the more disastrous because of the goods it could buy in Zone "A" by comparison with the acute scarcity in Zone "B."

Nationalism of the Italians

The Italians generally have taken the attitude that the Tripartite Declaration of 1948 can be regarded as a *fait accompli*. In the city streets of Trieste, Zone "B" seems no more than a shadowy presence. It is inevitable, but unfortunate, that the presence of the British and American troops has provided a background of security against which the Italians sometimes give rein to an irresponsible and provocative nationalism. The excellent work done by the Allied Military Government in safeguarding the interests of the Slovene minority, in providing them with their own schools, their own radio programme and newspapers, has aimed at teaching the Italians that the repressions practised under Mussolini was the very way to exacerbate Slav nationalism against them.

The political picture in Zone "A" is an encouraging one save for the outcrop of Fascism already mentioned. The executive council or "Giunta" which is under the presidency of Signor Palutan and which was established by the elections reflects in miniature the composition of the Italian Government proper. The Cominform Communists, however, remain very active despite the loss of their daily paper which was forced, for financial reasons, to cease publication recently (they now have to seek guidance from a page inserted for their benefit in the *Unita* published in Milan). A sidelight on the local Communist split is provided by the lawsuit between the Cominform and pro-Tito factions as to the ownership of the printing press they formerly shared together.

Marshall Aid for the Port

At present 75 per cent of the port activity comes from the handling of deliveries of ERP material for Austria. But the construction programme of 94,000 tons of new ships, with ERP aid, is making steady progress, and on its completion rests the maritime future of the territory. Meanwhile the last figures for registered unemployment in Zone "A" showed a total of just over 17,500 persons out of a working population of 90,000 with the maritime and manual labour classes fairly high on the list. The highest class of unemployed, however, is the clerical worker, and the prospects for the young educated men and women are likely to remain very limited.

To quote again from General Airey's last report:

The future of the Free Territory of Trieste is not to be found in its perpetuation as a fragmentary and unnatural State, thrown up by the disintegration of war, but rather in early agreement among the Powers concerned on its return to Italy as the natural home of the majority of its people and the source of their prosperity when Allied Administration is withdrawn.

The original Peace Treaty's compromise was never workable, and events have overtaken it beyond the possibility of a return. In the first period of occupation the Allied policy was to hold the balance between the ally, Yugoslavia, and the ex-enemy, Italy. Now the ex-enemy has attained, if only through membership of the Atlantic Pact, the status of a western ally; the status of Yugoslavia, in its relations with the west, can still only be indicated by a large question mark.

It is difficult to avoid the conclusion that the solution of the riddle of Trieste rests on an Italo-Yugoslav *rapprochement* rather than on the agreement of the Powers. Trieste's natural role, to serve the central European hinterland, can never be fulfilled until the political antagonism between the Italians and the Slavs is resolved.

Political Crisis In Switzerland

[FROM OUR SPECIAL CORRESPONDENT]

SWITZERLAND, a neutral onlooker during two world wars, may be termed the most prosperous country in Europe. Since 1945 its factories have been working at top pressure to re-stock its exhausted neighbours with the machinery and chemicals of which they stood in sore need. Not only was there full employment, but entrepreneurs competed for the favours of skilled workmen and were even known to buy the promise of the later services of children still at school. Foreign labour was imported and the country people were drawn away from the land into the towns. All this time, however, the Federal Government has been searching

for a way in which to pay old debts and meet new expenses, and the search has led for the moment to a constitutional *impasse* which raises interesting constitutional issues.

It is popularly supposed that the Swiss constitution of 1874 forbids the Federal Government to levy direct taxes. This is not exactly the case. Article 42 of the constitution defines the sources of federal revenue; direct taxes are not among them and have therefore traditionally been considered the affair of the Cantons. During the first world war, however, the Federal Government levied a direct tax; in the slump years of the early thirties, when the Federal Government felt it necessary to relieve unemployment, it again levied direct taxes based on emergency decrees; on the eve of the second world war, the Federal Government was provided with special powers, which temporarily permitted an extension of taxation by the central authority to meet the costs of mobilization and wartime food supplies. These special powers have been prolonged to the end of 1949 pending a new fiscal order, the much-discussed *Finanzreform* which is to adjust taxation to the needs of the central and cantonal governments, but about which it has been found impossible to agree.

Opponents of Planning

As soon as the war was over public opinion became restive. Some people disliked the hangover of undoubtedly arbitrary power, others simply resented the taxation which they had hoped would end with the war. A good part of the increased expenses of the *Bund* was due to the increased costs incurred by the technical and social development of the century independently of war; for this reason the Social-Democrats wished this expenditure to continue while the enemies of *dirigisme* wished it to be cut. The most popular line of attack was, however, to complain that the Federal Government was encroaching upon the prerogatives of the Cantons, and this naturally appealed to the federalism of the French Swiss who are always on their guard against the German Swiss majority. In July, 1946, two Initiatives, drawn up in Lausanne, were duly tabled with the required number of signatures. The second of these two demanded the end of emergency rule by August, 1947, at the latest. This was, however, ignored by the Federal authorities, who, on July 22nd, 1949, capped their own clumsiness by claiming emergency powers for another five years.

Exasperation Against the Government

On May 22nd of this year two referenda were held. The Government and both Chambers recommended the people to confirm a decision they had taken in favour of compulsory medical examination for tuberculosis. This was rejected; at the same time the people voted against the continued use of paper money as legal tender, introduced as such at the time of the 1936 devaluation of the Swiss franc. In other words the public already showed signs of

exasperation which led to something of an outcry after the announcement of July 22nd. The Government had decided to put the first of the two Initiatives to the vote on September 11th. This asked for an amendment of Article 89 of the Constitution, so that if the Government should propose an emergency decree the latter must be submitted to a popular vote within twelve months; if rejected by the public the emergency decree would become inoperative at the end of one year from its coming into force, and it would not be possible to renew it. The Ministers and the Chambers and the political parties recommended against this proposal and worried very little more about it, thinking that the public was in the mood to say no to any proposal, and anyway that people were scarcely back from their holidays. But as it turned out, on a low 40 per cent poll, a few more voters said yes than said no.

The Chambers assembled in an uneasy Berne between September 19th and 29th and will meet again in the second half of October. The *Ständerat* approved a temporary financial plan according to which the direct federal tax called the *Wehrsteuer* will begin at a higher income level, while the indirect *Warenumsatzsteuer*, which has hitherto been paid on virtually everything one bought, will be taken off all non-luxury foods. This will reduce the federal income, but it is, of course, intended to recapture popular support. The *Nationalrat* will no doubt approve the provisional project this month and it is to be submitted to a referendum within the following twelve months; if it is accepted it is to last for two years, but if it is rejected it must now automatically be dropped at the end of one year, and the financial gap will still be unbridged.

Need for Drastic Measures

The federal authorities have shown themselves to be tactless and oligarchical; on the other hand, apart from the *drigisme* issue, the vast increase in the cost of government now as compared with its cost at the time when the Swiss constitution was drawn up points to a fairly drastic constitutional readjustment. Not only the *Bund*, but also the Cantons, are spending much more on administration. If the Confederation is no longer to levy the extra-constitutional taxes upon which it has come to depend to meet the rise in federal expenditure, what alternative is there? The federalists are only able to propose that each Canton shall pay a lump sum or quota (*Kontingent*) to the central Government. But the fiscal apparatus of the Cantons is already overburdened without this and the poorer ones are perplexed as to how to raise the funds they need locally. Further no one can explain satisfactorily how the cantonal contributions can be assessed.

Among the charges which weigh heavily upon the federal budget are the cost of a citizen army with up-to-date equipment and the protection of farming. The peasantry has now dwindled to scarcely 20 per cent of the whole population, but Swiss public opinion considers it essential that at least this proportion shall be maintained; the peasant element is valued as such, and the country does not wish to become more dependent than it already is upon food supplies from abroad. The consequences of this policy, however, are frequently distasteful for the urban population, and it is significant that in the voting on September 11th, not only did the French-speaking Cantons of Vaud and Neuchâtel show large majorities against the Government's methods which the Chambers had supported (and which make subsidies to the farmers possible) but nearly all the German-speaking towns did the same. This was particularly astonishing in Berne and Brugg, both towns in strongly peasant Cantons (Berne and Aargau) which gave pro-Government majorities against the Initiative. The peasant interest is well organised with a political party of its own and an organisation called the *Bauernbund* with its headquarters precisely at Brugg.

Out of Touch with the Public

Since so few people voted—only 20 per cent in the Canton of Berne—it is of course difficult and even dangerous to attempt to draw hard and fast conclusions from the figures of September 11th. In a way it was an excellent thing that the Federal Government should be called to order even through a chance vote largely due to indignation in the towns over the high cost of living. What disturbs more serious observers, whether they incline towards the right or towards the left, is the irresponsibly subversive propaganda campaign conducted by the supporters of this Initiative. Although a Lausanne lawyer named Regamey may be regarded as its father, the fairy godmother to this child was Herr Duttweiler of Zürich. The latter is what has in the last decade or so become known as a dynamic personality. It may well be that he is nothing but the successful manager of his *Migros* chain stores and that his flair for publicity simply runs away with him. He seems prepared to finance any "stunt" with a popular appeal and his popularity in Zürich is becoming tremendous, even a little hysterical.

It is clear that fiscal necessity requires some modification of the Swiss federal structure, in itself an expensive governmental form. In spite of recent delays and friction there are many who consider that the necessary adjustments can be made as constitutional amendments have been made before. There are a few pessimists, however, who foresee the repeated popular rejection of the financial proposals brought forward by the Government; this would mean a constitutional breakdown. It is perhaps not merely self-righteous for the British critic to wonder whether the fault does not lie partly with the Swiss type of constitution which is almost a plebiscitary oligarchy rather than a parliamentary democracy. Where ministers are not responsible, do they not, as it is frankly admitted that they now have done in Switzerland, lose touch with the public? The Swiss form of constitution was, of course, chosen partly for federal reasons; the Cantons gave up their unrestricted sovereignty in 1848, but according to the 1874 constitution they preserve their independence when not otherwise stated. By now the technical developments of the twentieth century have modified the basis of Swiss federal union; it is perhaps only in educational affairs that cantonal autonomy can hope to remain unimpaired.

Communists and the Kailan Mines

[FROM OUR SPECIAL CORRESPONDENT IN HONGKONG]

PRODUCTION at the coal mines of the Kailan Mining Administration, the largest single industrial enterprise in North China in which British interests are involved, is currently running at 4,000,000 tons a year, compared with approximately 4,500,000 tons during the last year under the Nationalists and a rate of 6,000,000 tons a year in the 1940-41 period. Like all other large-scale employers of labour after the change-over, the management of the KMA has had its full shares of labour trouble and has at times been the target of violent abuse in the North China press. Recently, however, there have been signs that the Communist leaders themselves have decided that the sort of "workers' spree," during which the wildest demands received official encouragement, must now be brought to an end and the emphasis placed less on the rights of the workers than on the maintenance of production and increased efficiency. Committees comprising representatives of the management and of the workers are to be formed at different levels. Although it is intended that they will eventually take over much of the responsibility of direction, for the present they are remaining consultative and advisory only, and managers have been told that they must resist the demands of the workers if they

are unreasonable and not in the interests of efficiency. The trained Communists who have been appointed to the organisation have not been put into the management, whose personnel remains virtually unchanged, but have been placed in charge of various workers' organisations. The entire scale of salaries and wages is being overhauled on the basis of the theory that the worker at the coal-face should be paid more than the white-collar worker above ground.

Exports to Japan

Earlier this year the stock position was acute, when more than 1,000,000 tons were piled up at the mines awaiting movement. Stocks are now slightly under 1,000,000 tons, but they are better distributed. All this coal belongs to the North China government which has been advancing cash, food, and supplies like pit-props, to the company in return for coal. The question of finding markets for the coal is at present the most serious question confronting the KMA. Kailan coal is one of China's most valuable potential exports and before the war about 2,000,000 tons annually was shipped to Japan. The Communist authorities and the KMA

want to resume these shipments to Japan, and Japanese industrialists, who know and like the special qualities of Kailan coal, would like to use it. Japan, under SCAP, has been importing coal from the east coast of America, paying for it in dollars. There are said to be considerable stocks of this American coal in Japan at the present time. In principle SCAP is not opposed to the import of Kailan coal but wishes to retain control of the use to which the proceeds of the sale are put. Therefore SCAP favours some sort of direct barter agreement rather than any arrangement through the Hongkong-SCAP two-way account. A high official of the company is leaving for Japan shortly for discussions with the American occupation authorities. The nationalist blockade has also temporarily suspended all shipments from Chingwantao to Shanghai.

Excluding the Foreigner

The number of foreign employees of the KMA (mainly British on the administrative side and Belgian on the technical side), which two years ago exceeded 100, is now less than 40, and by the end of the year is expected to be still further reduced to about 20. The Communists have underlined a trend which was becoming increasingly obvious in recent years, even under the Nationalists—namely, that in every large-scale industrial undertaking the Chinese today can (or at any rate wish to) dispense with foreigners in administrative and executive positions, although they will continue to need foreign technical specialists and advisers. The 20-year agreement which the KMA has with the Chinese Government is due to expire at the end of November next year. By the terms of that agreement, it can either be renewed for a further period or else the Chinese have the right to buy out the foreign interest, paying compensation at rates to be fixed by a neutral and impartial third party. So far the Communist authorities have given no indication of what their intentions are, although eventual nationalisation is, of course, in line with their political principles. They may still find it convenient for the time being to maintain a formal foreign connection to assist them in the provision of technical skill, the obtaining of supplies and equipment, and the marketing of their coal abroad.

Is Sweden a Model for Socialism?

[BY OUR SPECIAL CORRESPONDENT]

STATE excursions into industrial management and the rapid establishment of the welfare state by various European Governments in the last few years, not least by the British Labour Government, are now a familiar target of American critics. They feel that many of these measures are unwarranted doctrinaire excesses for which the American taxpayer is called upon to make an unduly large payment. The nationalisation of key industries and the detailed interference with trade in general are commonly singled out for attack as examples of faults inherent in Socialism. It is surprising, therefore, that Sweden has attracted comparatively little attention from these critics, even though the Socialists, with a brief interruption of three months in 1936, have controlled the Government in Stockholm since 1932.

Examination reveals that Socialism in Sweden has little to do with state interference in industry. This fact lies behind the paradoxical remark of Professor Myrdal—who was Socialist Minister of Commerce before becoming executive secretary of the Economic Commission for Europe—that “when the Socialists came to power in Sweden socialisation stopped.” The reasons why the Socialists felt no need to rush through measures to nationalise this and that industry are instructive. In the first place, they came to power during the slump, at a time when such experiments were at a discount. This mood was reinforced by the cautious and non-doctrinaire approach of the Socialist leaders. They were the better able to maintain this position, because most of the giants of monopoly had already been slain and the oppressors of the common man disciplined. The task of the Swedish Socialists on coming to power, therefore, unlike that of other radical parties in a similar situation, was to extend and intensify a well-established process for which there was a large measure of support and with which there was comparatively little disagreement, rather than to initiate root and branch reforms of a highly controversial nature.

Efficiency and Enterprise

For state intervention in Swedish industry has a long history going back to the Middle Ages. The old tradition of economic regulation and control; the ancient and comprehensive rights of the state to the ownership of a large part of many basic resources such as forests and waterfalls; the concept embodied in the Common Law rule that Sweden's resources should be exploited only for the benefit of Swedes—all these combined to produce an outlook which judged the desirability of state intervention by its efficiency, and measured efficiency in terms of the material benefits accruing to the community. The emphasis is not on public enterprise or private enterprise, but on efficient enterprise—efficient in the sense that the best use is made of the national resources concerned. An arbitrary doctrine of state ownership *per se* is a recent and rather sickly growth.

The practical basis and limited range of state intervention in Swedish industry have had several important results. One is that when the state has entered a particular field of enterprise it has done so—except for the state monopolies which are industrially unimportant—on an equal footing with its competitors in that field. The measure to establish a state Business Bank, however, which was passed in June, may herald a departure from this salutary principle. Similarly, if the proposal to establish a state monopoly in the import and distribution of oil and petrol had been accepted in 1947, the state monopolies would have assumed a much more important role in the country's economy.

Another result of this empirical approach is that the extent and form of state participation in a particular industry are dictated by severely practical considerations. This leads to some curiously hybrid forms of enterprise. The supply of electric power, for example, illustrates the effective collaboration of public and private interests. The state first entered this field in 1906, largely because it already owned certain well-sited waterfalls, and not for any theoretical reasons. The same is true of the deliberations of the Riksdag which, in 1854, decreed that the main railway network should be the responsibility of the state, since this was the only safe way of ensuring that the new means of transport should be developed according to some nation-wide plan. Practical considerations of efficiency were the prime consideration; and it is to the credit of the Swedish Socialists that, by and large, they have observed this rule.

Efficiency First

They have also respected another well-tryed Swedish custom in these matters continuing to refer to an expert and reasonably impartial committee the whole question of the best organisation of the particular industry the committee is charged to investigate. The committee is instructed, not to work out plans of nationalisation, but to present its views on the most efficient organisation of the industry in question. Thus when it reported in 1947, the Committee of Investigation into the Importation and Distribution of Oil and Petrol remarked:

The nationalisation of an industry, a trading concern or some other branch of economic activity must never be merely doctrine. A decision for or against nationalisation must in every individual case be taken only after an objective appraisal of the practical economic issues.

No Hurry to Nationalise

It could be argued, it is true, that this particular committee failed to stand by the principles it thus enunciated. But when so much turns on definitions, some credit is at any rate due for the mere acceptance of the principle; and it is not surprising that committees appointed by a Socialist Government are more inclined to consider nationalisation as the most efficient form of organising a particular branch of economic activity than committees appointed by a right-wing régime would be.

Even so, Socialist nominees have not always recommended nationalisation with the ingenuous persistence that has marked the industrial deliberations of the British Labour Party. And on these occasions, as on others when further measures of state intervention have been advocated, the committee's findings have invariably been accepted. For circumstances have made it possible for the Swedes to move in a leisurely way in these matters. Late industrialisation, with the widespread use of electricity in civilised surroundings, the absence of the economic and psychological stresses of two great wars and the unique rôle played by the Co-opera-

tive Union (*Ko-operativa Förbundet*) have combined with the old traditions to produce an atmosphere in which, given suitable circumstances, state intervention in industry has long been considered natural and even desirable.

Even the fiscal policy of the Social Democrats expresses this attitude, sometimes not without prodding from the trade unions, which are enlightened enough to see how the encouragement of a high rate of capital investment in industry can benefit their members. As a result, joint stock companies—although they must pay local and national income tax and real property tax on the same principles and at the same rates as private individuals—have nevertheless, in the words of a recent report of the Swedish Taxpayers' Association,

a right to practically unlimited depreciation of equipment, machinery and inventories, and in this way the taxation of profits may partly be postponed to a subsequent year.

Monopolies for Revenue

What lessons then has Sweden for a Socialist Government in a country taking its first doses of nationalisation? Very few. Swedish experience has little relevance to the situation facing other Socialist parties on their accession to office. The Swedish State, for example, has never been faced with the problem of taking over a large and highly developed industry as a going concern. Indeed, it has control of very little of the country's industry. The degree of socialisation of industry—by which is meant the actual direction of business by the state, rather than that increasing state control of general economic policy which is a feature of all modern governments—is very much less than commonly supposed. State industries comprise only about 2.5 per cent of Sweden's manufacturing industries. Its most important ramifications are in electricity generating (but not retail distribution), where 40 per cent of total production comes from state-controlled stations, and in railway transport. The State Railway Administration controls over 70 per cent of the total railway mileage and carries 85 per cent of the total traffic. It also has various monopolies, created as the need arose for increased revenues. The tobacco monopoly, for instance, was formed by a Conservative Government in 1914 to finance the old-age pension scheme. Posts and telegraphs, broadcasting and airlines are examples of other state monopolies not unfamiliar in other countries.

Similarly, the Swedish Government, on grounds of public policy common to most modern states, has financed new ironworks in a depressed area or has established general control over the export of strategic materials—iron-ore, for example, which in any case it owns under very ancient rights. Thus, in general, this paragon of successful Socialism is in industrial matters rather at the stage of British Liberal policy in 1911 than of the Bridlington Conference of 1949. But the chief lesson that Sweden has to offer other countries beginning to nationalise their industries is a most important one—that each case should be treated on its merits.

ECONOMICS

- Courses of Study are provided at moderate fees by University Correspondence College, founded 1887, in ELEMENTS OF ECONOMICS, PRINCIPLES OF ECONOMICS, APPLIED ECONOMICS, ECONOMIC HISTORY, or similar branches. Tuition is conducted for the Intermediate and Final examinations for the B.Sc.Econ. Degree of the University of London. The College is an Educational Trust, not conducted primarily as a profit-making concern, and has a staff of highly qualified Tutors.

THE BUSINESS WORLD

More Coal or Cheaper Coal?

AN autumn campaign for higher output in the coal mines is becoming a British tradition. This year's exercises, which appear to be following accustomed lines, opened with a meeting of the National Consultative Council on September 12th; it was agreed then to make an appeal for higher output in the last three months of the year. Lord Hyndley, in transmitting the message to every colliery manager in the country, has stated that if the present rate of production continues, output for the year is unlikely to exceed 202 million tons:

This is far short of the amount the country needs to meet home demands and to take full advantage of the opportunities to sell coal abroad.

Divisional consultative councils have been asked to meet to consider what can be done. The executive of the National Union of Mineworkers has written to its area secretaries. The colliery managers are urged to consider steps to get extra tonnage between now and the end of the year.

There can be no question that a campaign for higher output is necessary between now and midwinter. But if the attention of the industry has to be concentrated on quantitative output, it is to that extent distracted from questions of efficiency and cost. Lord Hyndley's message was concerned exclusively with quantities; so, no doubt, will be the exhortations in the divisions, areas, and pits of the National Coal Board which must follow.

It is reasonable to hope that the Minister of Fuel and Power, who was meeting the representatives of the Coal Board, the managers' and overmen's associations, and the mineworkers as this issue went to press, will try to take a wider view. The similar series of meetings in London a year ago laid what emphasis they could on efficiency, but their efforts were dissipated in their journey from London to the pits. The pressure for more coal is hardly less immediate now than it was a year ago, and the unresolved questions which inhibited any clear line of policy then are still unanswered today.

★

The difficulties of output in 1949 can be simply stated. The *Economic Survey for 1949*, discarding earlier and larger estimates, put deep-mined output for the year between 202 and 207 million tons and opencast output at about 13 million tons. The total—between 215 and 220 million tons—was to provide 198-200 million tons for home consumption, and 17-20 million tons for export and bunkers. As things have turned out, these figures allowed some room for error, because home consumption was to have been 5,000,000 to 7,000,000 tons higher than last year; in the event home consumption has been lower than was expected, and in the first 40 weeks of the year was only 2,100,000 tons higher than in the same period of last year. It is this unexpectedly favourable factor which has enabled exports and bunkers to be maintained at something approaching the intended rate; exports in the first 40 weeks were 9,700,000 tons

and bunkers 3,800,000—a total of 13.5 million tons. This is not satisfactory, because the chance of expanding exports more rapidly, which was offered by unexpectedly low consumption at home has been missed.

This is one reason for the Government's concern about coal output. The other reason is that the slow response of output to all the efforts that have been made does not promise well for the future. Some impression has at last been made on output per man-shift; OMS for all workers is now running at 1.17 tons, or 4½ per cent above last year's figure, while OMS at the face is 3 tons—3 per cent above last year. These are small increases, but it is true that—as Sir Stafford Cripps said on Wednesday—

With an increase in productivity of this magnitude, one would have expected total output of coal to be higher than it is, but unfortunately this increase in output per man-shift has been offset to some extent by the failure to increase the number of face workers as rapidly as had been expected, and because attendance has also failed to improve compared with last year.

The Chancellor's explanation is significant in that he avoided—and, no doubt, deliberately—placing the blame on the failure of recruitment. In fact there has been in the last few months a rapid decline in the manpower employed in the mines. The total of 712,600 workers on colliery books on October 1st is 12,200 less than a year ago. There was a net loss of 4,000 men in September, and no sign has appeared of a reversal of this trend. Last year's man-power target for the mines was 750,000 workers, and even this year's reduced target of 736,000 workers has already become absurd.

Yet the Chancellor did not blame the shrinkage of the labour force; he blamed, instead, absenteeism and the failure to deploy more workers at the coal face. It is true that absenteeism is intolerably high; for the first 39 weeks of 1949 the average has been 12.59 per cent, and this compares with an average of 11.45 per cent in the first 39 weeks of 1948. Schemes for increasing the proportion of face-workers in the pits, on which such hopes were placed at the beginning of this year, have largely failed. The number of face workers, which was to be increased from 296,000 to 310,000 during the year, had instead fallen to 294,500 by the end of September.

Attempts to divert more labour into the mining industry, at a time when the attendance and use of the existing labour force are so unsatisfactory, would be wasteful and ill-judged. If, therefore, the Government is refusing to accept arguments about the declining labour force as an excuse for unsatisfactory output, it is right to do so. Clearly, the phase in which the mining industry had first call on the national manpower and resources—the phase of high output at almost any cost—has come to an end. What is not apparent is the alternative policy on which the mining industry is to be run.

British coal may soon have to face serious commercial difficulties. Spokesmen of the National Union of Mine-

workers expressed this fear at the conference of the Trades Union Congress in September—though, it is true, the conclusions they drew were of a reactionary and restrictionist kind. The NUM spokesmen took the old-fashioned line that the British export trade, and therefore the employment of British miners, were threatened by ill-paid, low-cost foreign producers. They therefore urged "international understanding to avoid cut-throat competition," and a resolution was passed demanding an inter-Governmental conference. The same note was heard in the international miners' congress at Amsterdam last week, when a resolution was passed calling for a tripartite conference of Governments, employers and workers from the coal-producing countries, to regulate output, prices, exports, and imports. A demand for the 40-hour week for all miners was incorporated in the resolution. Mr. Arthur Horner pointed out that, so far as Britain was concerned, there was already evidence that the "honeymoon" was over. He doubted whether the National Coal Board would be able to go on for long charging higher prices for export coal than for its sales to home consumers. By the time Britain had regained its prewar output of 50 million tons of coal for export, the problem would be to dispose of the surplus.

It is not necessary to accept Mr Horner's conclusions to recognise that (as so often) his observations about the industry were accurate and penetrating. Delegates from Belgium, where honeymoons do not last so long, told the conference that they already had six weeks' stocks on hand, pits closing down, and miners becoming unemployed. References were made to the growing competition of Ruhr coal and Polish coal. The recovery of Ruhr coal output in the past 18 months has indeed been formidable. Ruhr output of hard coal averaged 8,250,000 tons a month in the first five months of 1949, compared with about 6,500,000 tons a month in the same period of 1948; and it has since risen again. The growth of German and Polish exports is

shown in the following table, which also shows how slowly British coal exports have been resumed since the war:

	Great Britain	Germany British Zone	Poland
1937	3,680	3,125	...
1945	299	...	465
1946	420	972	1,349
1947	96	880	1,922
1948	965	1,465	2,495
1949 (Jan. to June)	1,144	1,815	2,809

Source: Coal Committee, Economic Commission for Europe.

No doubt the miners' representatives were over-stating their case. Export coal still commands unreasonably high prices in Europe. Welsh steam coal last year was 334 per cent dearer than in 1938. The European coal-exporting countries are still keeping their export prices well above their inland prices. American coal exports to Europe are still substantial, in spite of the heavy transatlantic freights. High prices may, and do, produce sales resistance, but it would be absurd in the circumstances to claim that a surplus already exists in Europe. But it can be predicted with reasonable confidence that, unless prices are severely cut, a surplus will soon arise, and that coal will become difficult to sell overseas.

"Bunker and export demand," said Professor A. Beacham in a recent paper to the British Association, "will be much affected by future prices and the availability of supplies abroad. Future world supplies are likely to be more than adequate to demand." These simple and incontrovertible statements point to the necessity of adjustments in the British coal mining industry, which will not be easy or pleasant to make. They require that coal production policy should no longer be based on the assumption of an insatiable demand. It is to be regretted that Britain could not, or did not, get back into the coal export business on a

larger scale while the opportunity was open; but the opportunity is passing, and the plodding progress of British coal output will not now overtake it.

The need now is for a reassessment of production policy in which costs will play the prime role. If it is assumed, as it should be, that the Coal Board must pay its way and that the home price will not be called upon to subsidise the coal export price, then the level of British coal exports that can be achieved will depend not on the rate at which the British mines can increase their output, but on the rate at which they can reduce their costs.

How quickly can costs be reduced? So long as Britain clings to inflation and a soft economic policy it is quite possible that they will not be reduced at all. Sir Charles and Dr William Reid, in their Cadman lecture to the Royal Society of Arts earlier this year, estimated a reduction of 5s. a ton by 1965—assuming a capital expenditure of £300 million (pre-devaluation), an increase of output per man-shift to 30 cwt., a modest increase in earnings and an unchanged level of wages. Two competent critics—Professor Beacham and the chairman of the East Midlands Divisional Coal Board,

Kaffir Calculations

THIS week, for the first time since devaluation four weeks ago, there has been a check to the rise in gold shares. On the famous Monday of "obscene plundering" (the Minister of Health's term for the market's inevitable response to devaluation) the *Financial Times* index of gold shares jumped from 109.52 to 129.63. By the middle of last week, it had put on another nine points to 138.46, but on Wednesday this week it had fallen again to 132.64. In a volatile market such as the gold share market, one must always be on guard against the danger of accepting the movements of a few days or even of a few weeks as a reliable indication of a longer trend. Yet it is clear that part of the speculative impetus to the gold share market has now been exhausted. It is time for more sober calculations of the effect of devaluation now that the initial impact of the unexpectedly low rate of \$2.80 to the £ has produced its effect.

Some of the factors in a long-term assessment of gold share values after devaluation were set out in *The Economist* of September 24th. There was emphasis on the market impact of devaluation on the fortunes of the low-grade mines. Rising costs and taxation had to be measured. And, most complicated of all, the mines were faced with a re-calculation of mining policy—whether to aim at prolonging the life of their properties and thus to limit, at least to some degree, the expectation of higher immediate profits which would otherwise accompany a rise in the sterling price of gold from 172s. to 248s.

The September Rand gold mining returns make it clear that the gold mining companies have indulged in some intelligent anticipation of devaluation in two respects—one lasting, the other transient. First, they show that a steady reduction has been made in the grade of ore reaching the crushing plants. Secondly, a large part of the September gold output was withheld from sale until after devaluation to take advantage of the higher gold price. The scope for lowering the grade of ore varies from mine to mine. Where the ore reserves approach 100 per cent payability, as in the case of the

Sir Hubert Houldsworth—have found that estimate to be on the optimistic side, at least without a revolution in production policy. Sir Hubert Houldsworth suggested a "revolution of technique" as the alternative, and a reduction of costs by 10s. to 20s. a ton "in a very much shorter time than 15 years" as the objective. Professor Beacham suggested a revolution of a different kind:

The Board should press the Government for lower output targets, be more active in eliminating uneconomic mines, and should set about reducing its labour force.

This would mean sacrifices, hardship, and social dislocation, but the eventual readjustment would in that way, he suggested, be made less severe: "The Board will be well advised to trim its sails before the approaching storm."

In fact, both a technical revolution and a revolution in economic policy will no doubt be needed. Without them, the mining industry—with its costs inelastic, its manpower wastefully used, and its prices high—will be faced with unsaleable surpluses and with depression; and the appearances of the moment should not be allowed to distract attention from that danger.

rich Blyvooruitzicht mine, the possibilities of reducing the average grade taken from the mine are very limited. But in the older mines of the Central Rand the case is very different. These mines contain much low grade ore which was formerly unpayable at the old gold price. In others, such as Randfontein on the fringe of the Central Rand where the whole ore body is of low grade, extensive reserves have immediately entered the range of payability as a result of devaluation. The desire to prolong the life of dying or low grade mines is readily understandable. And even mines with a long life ahead of them are anxious to extend their life as far into the future as possible; in doing so, they are in line with the Union Government's policy.

Mining taxation provides the main spur in milling policy. The scale is geared to favour low grade producers. The revised taxation formula introduced in the 1948 Budget did indeed lower the burden of taxation on the high grade producers and retained the favourable treatment of the low grade mines. The present formula is

$Y = 60 - \frac{360}{X}$ where Y is the percentage rate of taxation on profit and X is the percentage ratio of working profit to working revenue. Under this formula—as in the 1946 version—no taxation is payable when X has a value of 6 per cent or less. The percentage of profit absorbed by taxation increases as the value of X rises above 6 per cent. For example where X=9, taxation takes 20 per cent of profits and where X=18, 40 per cent is paid.

There are modifications of this basic formula which *inter alia* allow mines to offset amortisation of capital expenditure against taxation at an annual rate of 27½ per cent of the unredeemed balance of the total expenditure incurred either before or after reaching the production stage. This and other complications (including the Union Government's participation in leased mines) render any precise estimate of future taxation for a particular mine difficult, if not impossible. None the less, it is

TRENDS IN THE BRITISH COAL INDUSTRY

strikingly evident that, even assuming that the existing formula remains unchanged—though this is by no means certain—a large part, possibly not less than 50 per cent for the whole industry, of the increase in revenue at the new gold price will ultimately find its way into the South African Treasury.

The indeterminate extent of future taxation is the first of several imponderables which prevent a precise measurement of gold mining share values under the new conditions. Another unresolved question is the extent to which costs will rise. That they will rise admits of no doubt. The question is: by how much? The outcome of recent meetings between the Gold Producers' Committee of the Transvaal Chamber of Mines and the South African Mineworkers' Union has at least provided a starting point for a calculation of the minimum addi-

TABLE I.—SOUTH AFRICAN GOLD MINING STATISTICS
WITWATERSRAND AND EXTENSIONS

tion to labour costs which must now be expected. After its recent discussions with the Mineworkers' Union, the Gold Producers' Committee offered to implement the recommendations in respect of pay made by the Van Eck Committee in a report on the conditions of employment in the Rand gold mining industry published shortly before devaluation. The offer makes no mention of previous demands for a 40-hour week and seems only to cover European daily paid workers.

The total cost of the seven concessions offered—the most important is the increase in the basic wage rate of 12½ per cent—is estimated at about £2,000,000. Higher payments to the staff and native workers on the same basis would raise the cost perhaps to £4,500,000. This figure appears modest in comparison with the prospective increase in mining revenue. At first glance it seems quite inadequate to meet the workers' demands. Prior to devaluation they were asking for a 30 per cent increase in wages. In fact the offer of the Gold Producers' Committee goes no further than satisfying the demands made by the unions in June, 1947, and it is

not surprising that it has been rejected out of hand. Under the glare of the big profit increases revealed in the first mining returns after devaluation it looks puny. If the figure of £4,500,000 has any significance at all it is as an indication of the lowest amount by which labour costs may be expected to increase.

The basic wage element represents the bare minimum received by the mineworkers on the Rand, and it accounts possibly for a third of total mining costs, exclusive of capital expenditure. On top of this are several thick layers of allowances. Increases in some of these allowances, in particular for medical benefit, savings funds, holidays with pay, and payment for overtime, Sunday and holiday work have been included in the offer. But actual wages paid to mineworkers on the Rand are also adjusted according to a sliding cost of living scale. It is possible that in framing its offer the Gold Producers' Committee had in mind the probability of heavy future commitments under this head.

It would indeed be surprising if devaluation did not lead to further inflation in South Africa and the offer of the gold producers may be no more than they could afford if inflation were to take control. The ceiling to gold mining revenue has admittedly been raised substantially, but it is unlikely to be pushed as high as the new theoretical limit of payability. Changes in mining policy towards lower grade extraction may in the coming months cause a reversal of some of the sharp increases in profit shown in the latest mining returns. But a rise in the cost of living seems certain and its extent may be considerable. Moreover it would be reflected not only in the cost of living bonus, but also in the cost of supplies purchased locally.

Nor is this the only direction from which increases in costs may be expected. All supplies, stores, plant and equipment bought overseas are likely to cost more. This effect of devaluation is automatic in the case of purchases from countries whose currencies either have not been devalued at all or have not been devalued to the same extent as the South African pound. But higher prices of imports from the sterling area, particularly from the United Kingdom, are almost as certain, even if the cost of sterling imports does not rise to the same extent as imports from hard currency countries when the latter are converted in terms of the South African pound. The heavier burden of increased import costs will fall on the developing mines whose capital equipment must be largely furnished from overseas. But the producing

mines will not escape, for many items directly consumed in their operations will be affected.

Future developments in wage negotiations on the Rand may show that labour is ultimately prepared to accept the gold producers' view that wage increases—warranted though they are—must be tempered by consideration of the heavy additional outlays for other items which the industry will have to meet from the increase in its revenue. In no sense is devaluation a cure all for the troubles of the industry. It goes some way to rectify the long-existing disparity between the price of gold and the prices of other commodities which are still broadly subject to the play of demand and supply in the world's markets. But if the mineworkers stand firm on their demands for a 30 per cent wage increase and a 40-hour week, the new opportunity which devaluation provides to put the gold mining industry on a more economic and more stable basis would be seriously prejudiced.

It is a hardy statistician who attempts at this stage to assess the fair values of the shares of the producing gold mines, so numerous are the indeterminates which enter into the calculations. That point is well illustrated by estimates published by several firms of brokers, which show wide variations in the values attributed to particular shares.

Estimates of share values for the main Rand producers prepared by two different brokers are set out in Table II together with other statistics relating to the mines. They are shown, not to make invidious comparisons, but rather to indicate the wide range of estimation which enters into the exercise. Broker A has calculated the probable profit to recovery ratio with gold at 248s. per oz. on the basis of the present taxation formula, allowing for a 30 per cent increase in costs and after making "reasonable" assumptions in respect of ore reserves and future milling policy. For mines with a life of over 15 years the "proper market price" has been arrived at by applying the estimated percentage increase in

earnings to pre-devaluation prices calculated on a 6 per cent dividend yield basis net Johannesburg (equal to roughly 7 per cent to British holders after allowing for Dominion Income Tax Relief). In the case of mines with a life of 10 to 15 years the post-devaluation price has been calculated on a 10 per cent basis, for a life of 5 to 10 years on a 15 per cent basis and for the deep level mines on an 8 per cent basis. This method allows for adequate amortisation in the price, though on an admittedly rough scale. Broker B has estimated the half-yearly dividends which would be justified by earnings in June, 1950 (the detailed assumptions are not stated), and his estimates are based on the argument that gold shares should now be valued on an 8 to 10 per cent basis.

The differences in the two sets of results are not in themselves important. It is more significant that both series suggest that, with one or two exceptions, the rise in share prices of producing mines since devaluation has already gone a long way towards discounting the benefits which are likely to accrue from the new gold price. For the past nine months the Kaffir market has, in fact, been in a buoyant mood—interrupted only for brief periods when the prospects for a higher gold price seemed to be flagging. The *Financial Times* index of gold share prices has left its postwar low level of 86.22 established on January 19th this year far behind, but it is also several points lower than the post-devaluation peak. The outlook for the industry, owing to the rapidly deteriorating economic conditions of the Union in the past year, has seemed most unpropitious, especially for the low grade and short life producers. It has now been relieved by an increase in the price of gold, and share prices of some mines have advanced by 50 to 75 per cent. Gold fever is not easily cured by a dose of statistics, especially when no statistician can be very certain of his figures. It has been excited, and will not disappear. But if the Kaffir chart over the next few months is likely to rise further, its course can hardly be so febrile as in the past four weeks.

Business Notes

Speech Without Policy

Impulses to speak plainly—to clarify for the sake of clarification—are too strong in the character of Sir Stafford Cripps to be always suppressed. The purpose of the Chancellor's press conference on Wednesday was to discuss production, exports, and costs; it was not to announce a policy, and there is evidently no policy to announce yet. Higher output, more exports to the dollar markets, restraint by everybody—these notions are familiar; but it is plain that no decisions have been taken on methods of causing them to be realised. But, while he brought no policy, the Chancellor had some bleak things to say, and said them directly.

"The fall in the standard of living" was one such bleak phrase, introduced (with deliberation, no doubt) into the Chancellor's prepared statement:

It is by our increase in productivity and production that we shall be able to make good the fall in our standard of living, which is the immediate price we have to pay for the improved opportunity of dollar earning provided by devaluation.

The Chancellor seized the opportunity of a later question to make it quite clear that he did not mean "prevent" the fall in the standard of living. He conveyed firmly that the fall is an accomplished fact—expressed, for the moment, in the higher price of bread—which can no longer be prevented, though it can be "made good." Here is an advance in clarity.

Sir Stafford drew attention to the "pockets" of unemployment which have appeared in ship-repairing, and went out of his way to say that the future level of employment in shipbuilding will depend on success in dealing with certain questions: high prices, long delivery dates, and the earning power of new ships. This illustrates a general point (he said) of great importance:

Full employment does not and can never mean that every individual job is guaranteed for as long as the present occupant wishes to stay in it. That would be industrial stagnation.

As if to deprive the lesson of any mere academic flavour, he went on to say that the business of getting into the dollar markets "will undoubtedly entail some change in the pattern of employment."

Sir Stafford made it clear that the idea of a statutory national minimum wage, if it ever lived, is dead. The Government had no views on whether a national minimum was desirable, but the whole matter was one for the voluntary agreement of employers and employees, and the Government had no idea of using statutory means for such a purpose.

★

The future of oil prices (as of many other prices) has still to be settled. The Chancellor repeated his injunction to manufacturers in general to put off raising their prices, "wherever possible," until their stocks which were paid for before devaluation have been used up. Pressed to explain the relationship between this exhortation and the actual price policies of the Government trading departments since devaluation, he said quite cheerfully that the departments "are responsible to Parliament for conserving their assets." Were not industrial managements responsible for conserving their assets also? Not to Parliament, said the Chancellor; they enjoyed some freedom of action, and might consider it "wise" to maintain their present prices as long as possible.

The doctrine that Ministries are immune from those considerations of the public interest which ought to actuate

commercial firms is fantastic enough, but more fantastic still was Sir Stafford's bland and uninhibited exposition of it. Can he have intended the doctrine to be swallowed? It seems unlikely.

★ ★ ★

Sir Stafford's Arithmetic

Sir Stafford was at pains to substantiate his initial claim that devaluation would only cause the cost of living index figure to rise "by nearly one point." His first argument was that the effect of increased import prices on the manufacturing costs of British exports need not be "anything like as great as has been suggested in some quarters." He admitted that any exact calculation was difficult and then went on to show that, in 1938, prices of imported materials represented only about one-seventh or one-eighth of the f.o.b. prices of total British exports. At this point the argument about the effect of devaluation was dropped, and his audience departed to do their own calculations. In *The Economist* of September 24th (page 685), it was shown that the direct effect of devaluation might raise the cost of imported raw materials by 10 per cent (apart from any increases in the prices of sterling imports). Presumably, therefore, Sir Stafford would argue that prices of total exports should not rise by more than one-eighth or one-seventh of that amount—that is by 1¼ or 1½ per cent. This, indeed, seems an insignificant amount. But it is worth while examining the Chancellor's calculation.

In the first place, he related the increased price of imported raw materials to prices of total British exports. That is fair enough if it is intended to show what effect devaluation will have on the terms of trade. But the Chancellor had previously mentioned "the effect of increased import prices on the manufacturing costs of our exports," so that the more relevant calculation would have referred to the export prices of British manufactures. In 1938, 12 per cent of total exports consisted of raw materials.

Secondly, between 1938 and 1948 the terms of trade deteriorated by about 20 per cent—that is, import prices rose by 20 per cent more than export prices. Hence even if the Chancellor's calculation can be accepted for 1938, it is less applicable to the present time. On the cost of living, Sir Stafford was on the defensive. He justified his statement that the index would rise by one point on the ground that the price of bread rose to 5½d., and added that "there is no reason for any other immediate increases in retail prices of food on account of devaluation." That may be true, for the question turns on the meaning of the word "immediate." Apparently, Sir Stafford means between September and the end of the year. If the average industrial gestation period is taken as six months, the effects of dearer raw materials may not be reflected in retail prices until March. At least the Chancellor was courageous enough to admit that next year retail prices would tend to rise, and that "some further rises in food prices may, during next year, add another few per cent to household bills." Can this be taken to mean that Sir Stafford agrees with the estimate made in *The Economist* three weeks ago that, as a direct result of devaluation, the cost of living would rise by between 5 and 7½ per cent?

★ ★ ★

The Sterling Balances

The "further study" of the complicated question of the sterling balances is not to be conducted in any haste. At any rate, that appears to be the inference properly to be drawn from the Chancellor's observations on Wednesday.

He admitted the need for some diversion of unrequited exports now being shipped to sterling area countries into the dollar markets, where they would earn dollar income. But the drawing agreements recently made between Britain and countries such as India and Egypt have nine months to run. It seems, therefore, that the "further study" cannot, even on the best assumption, produce any practical results before the middle of next year. In the meantime the sterling area itself will be increasing its magnetic pull to attract British exports. That is one of the consequences of devaluation, in so far as it raises the sterling prices of raw materials produced in the sterling area.

In a review published this week, the Economic Commission for Europe comes out quite bluntly on unrequited exports:

To reap the benefits of devaluation, it may be necessary for the United Kingdom to impose more rigid limits on the level of unrequited exports, financed through reducing sterling balances or other capital transfers.

Again, Sir Jeremy Raisman, speaking with a background of experience as Finance Member of the Government of India during the war years, has this week emphasised that "further study" must aim at a constructive solution. Sir Jeremy suggested that some sharing of the burden (with the United States) would provide "enormous relief" for this country, and give American producers access to markets which were at present largely closed for lack of dollars. This line of thought has in fact been suggested by a number of American commentators. It provides a principle of action, but there is a long way to go before it can be translated into terms of practical policy. It would involve political as well as economic changes of great consequence. But it may well present the only way, acceptable alike to Britain, its creditors, and the United States, of sharing—and reducing—the burden of the balances.

If the Government are thinking on these lines, they have given no sign. They may be forgiven for walking delicately on a matter which would affect the future of the whole sterling area, where feelings in certain directions are already tender. The tone of last week's debate on devaluation in the Indian Parliament was critical of the need, the extent and the timing of devaluation. The Finance Minister, Dr Matthai, declared that the British representatives at Washington "exceeded the brief" which the Commonwealth Finance Ministers gave the Chancellor in July. This may be no more than a dialectical point, but it is not lightly to be dismissed solely for that reason. As for any reduction in the sterling balances (which Mr Churchill had suggested in the debate on devaluation) Dr Matthai declared forthrightly that "we in India will resist it by every means in our power." Attitudes such as these may be an inevitable consequence of Indian political conditions and of the failure to tackle the problem of the balances three years ago. A solution now will present incomparably greater difficulties, even with American assistance.

Finance and Investments

Reverse for Gilt-edged

The post-devaluation honeymoon in the gilt-edged market seems to have ended rather abruptly. It appeared impermanent from the very beginning, and this week prices have fallen so sharply that for all stocks with a life of fifteen years or more, yields today are higher than they were before devaluation. Undoubtedly the spreading discussion on the likelihood of a November election has played a big part in bringing the market into a less romantic frame of mind. That contingency is now disposed of. But the possibility of a rise in bank rate and a general leveraging up of

This question of Exports

We are all of us striving to increase the sale of British goods in foreign markets. But trading abroad is a specialized business and the manufacturer who enters the field for the first time treads unfamiliar ground in more ways than one. To help him, the Westminster Bank has issued a booklet which deals in non-technical language with the intricate business of export finance. It describes, too, some of the ways in which the services and resources of the Bank can be used to advantage by the manufacturer and trader. Ask at any branch for a copy of *The Foreign Business Service* of the Westminster Bank

WESTMINSTER BANK LIMITED

Do you trade with AUSTRALIA

As a market for British manufactures and as a source of food and raw materials, Australia plays an important part in Britain's economy. Whether your interest is in imports or exports, the services of the Commonwealth Bank of Australia can be of considerable assistance. With over 400 Branches in the Commonwealth and New Guinea, and guaranteed by the Australian Government, the Bank can provide the British trader with up-to-date, authoritative information on every aspect of Australian commerce.

COMMONWEALTH BANK OF AUSTRALIA

the whole structure of interest rates has also been at work and is likely to remain so. In truth, the two factors were scarcely compatible one with the other. If an early election was on the cards, so much smaller, surely, must have been the chances of any immediate action to raise interest rates. The psychological moment for such action was at the moment of devaluation.

But there is good ground for the market's scepticism about the maintenance of gilt-edged prices, even if the bank rate

remains untouched. There has been for several months a solid foundation for the argument that the pull of economic forces was in the direction of higher rates. Thursday's announcement disposes of the immediate possibility of a new government less wedded to the notions of cheap money which have done so much to feed the postwar inflation. But the tendency towards higher rates is likely to continue, even if it is not reinforced by direct action to secure them. If the British economy is to be eased of the rigidities which at present bind it, if a spontaneous supply of savings is to be encouraged, and if the future rate of capital investment is to be governed more directly by economic considerations than by ideas of what the Government or the public would like, a rise in interest rates is inevitable.

South Africa Borrows

After an unsuccessful attempt by South Africa earlier this year to borrow £50 million in the London market, Mr Havenga has now been able to announce a more modest programme. The announcement was coupled with a fairly stiff increase in treasury bill rates in the Union. As this issue was going to press, the Reserve Bank announced an immediate increase in the bank rate from 3 per cent to 3½ per cent, thus restoring the rate to its 1941 level.

Two loans of £10 million each are to be raised by South Africa, the first this year and the second in 1950. These operations are not likely to have been conceded with some *quid pro quo* from South Africa designed to benefit the sterling area gold and dollar reserves. What exactly has been extracted from Mr Havenga remains to be seen; but as a result of devaluation it should certainly be more attractive for South Africa—to resume the sale of gold to London. It is, indeed, a forceful illustration of South Africa's sterling plight that within a few years of repatriating its £80 million of sterling debt the Union Government should need to borrow again.

At the same time, South Africa has succeeded in borrowing from the United States and Switzerland. While the two

London loans will be offered to the public, the two hard currency loans are to be handled by banking syndicates. In New York Messrs. Dillon Read and Co. will be heading a syndicate granting a \$10 million medium-term loan. The Swiss loan of SF30 million will be subscribed by most of the leading Swiss banks. The rate at present discussed is slightly below 4 per cent, though the loan will have a currency of no more than two or three years. By comparison, Belgium was recently able to issue a 4 per cent loan at 99 per cent in Switzerland, repayable in 15 years.

* * *

Free Sterling Since Devaluation

Free sterling rates, which in the first flush of a 30 per cent devaluation were firmly at or above parity, have been settling down in the past fortnight at a modest discount. The pound note in Switzerland, which soon after devaluation stood at a 3 per cent premium, is currently quoted at a 5 per cent discount. The discount on transferable account sterling (a much more significant quotation since it can be used to pay in sterling for exports that ought to be paid for in dollars) has fallen to a discount of 5 to 7 per cent. It is difficult to see how foreign importers availing themselves of this roundabout method of payment can at the moment be making a profit, since payment with transferable account sterling generally involves trans-shipment via a third port, at increased cost. Given the commissions payable to dealers in transferable account sterling (which is doubtless high) it would be surprising if there is much extra incentive for foreign importers to use transferable sterling. So long as the discount remains within such narrow confines it is unlikely that many dollars will be lost to this country by such dealings. By way of contrast there was, for about 10 days after devaluation, substantial buying of forward sterling at a premium by foreign importers covering the risk of

revaluation. But this movement was short lived, and forward sterling has again fallen to a small discount.

The discount on sterling securities quoted in New York remains more significant, and devaluation has hardly affected its extent. This discount has always been of psychological rather than practical significance, and it is well recognised that

FOREIGN TRADE AND ITS PROBLEMS

New problems are always arising in Foreign Trade and the recent changes in Foreign Exchange rates have emphasised this. In many of these problems the banker's advice and assistance can be valuable. For nearly two centuries Glyn, Mills & Co., have maintained close touch with financial and business interests all over the world, and are always ready to help those whose business is affected by changing conditions of Foreign Trade.

some relaxation of the existing switching regulations for non-residents in sterling securities would go some way towards eliminating it. On the other hand, as a result of devaluation, interest and dividends in sterling remitted to the United States buy 30 per cent fewer dollars, and the yield on British government securities, at one time over 9 per cent, is now only 6 per cent. The American investor, who can obtain a yield approaching 9 per cent on many good dollar securities, may consider a 6 per cent yield on a foreign government security as being no more than adequate. The premium on dollar stocks in London, which before devaluation was 37 per cent, is (perhaps rather surprisingly) still as high as 15 per cent. The explanation seems to be not that British investors are willing to pay a continued premium to get out of sterling securities because they distrust sterling, but that, even with the premium, first-class American industrials can still be bought in London to yield close on 5 per cent, and this without the curb of dividend limitation.

* * *

Air Corporations' Results

The three airline corporations are entitled to credit for a material improvement in their operating results for the year to March 31st. Their aggregate loss (before crediting Exchequer grants) was £9,740,000 compared with £11,090,000 for 1947-48. More important, it is evident that operating efficiency was greatly improved, and the bloated staffs effectively reduced. The three corporations together flew 132 million "capacity ton-miles" (a capacity ton-mile is the usable capacity on each flight, multiplied by the distance flown) compared with 100 million capacity ton-miles. Thus the total carrying service provided by them increased by 32 per cent. The "passenger miles" flown (which measure the extent to which the service provided was actually utilised) increased by 20 per cent, from 471 million to 566 million.

The deficits remain, and they are still important. British Overseas Airways last year lost 16.2d. per capacity ton-mile and British European Airways 25.2d. These figures show a reduction compared with the previous year of the order of 40 per cent; although capacity ton-miles increased by one-third in total, the cost of operation was reduced by 14 per cent from 68.5d. per capacity ton-mile to 58.9d. in 1948-49. This is creditable, but the full advantage of reduced costs was not realised, since the load factor was lower—in other words, although a greater volume of service was provided more cheaply, it was less fully utilised than in 1947-48. On the BOAC services, the load factor fell from 66.3 per cent to 61.9 per cent and on BEA services from 74.6 to 66.2 per cent.

This problem of adequate payload will not be solved until the Corporations are able to fly modern aircraft. The new types which are about to come into service should materially improve the commercial and competitive standing of the two corporations (as they will eventually become when British South American Airways is merged with BOAC). British European Airways should this year greatly reduce its deficit, while BOAC, affected by the withdrawal of the Tudor aircraft, by delays in the introduction of new aircraft, and by the continued lack of centralised maintenance facilities, must be expected to make less rapid progress. But at least the initial results of reorganisation are visible. They bear witness to the efforts of the corporations in the past year, and to the effectiveness of public criticism of past mistakes of policy.

* * *

Mr Snyder Kills a Rumour

Mr Snyder's blunt statement last week that the United States Treasury is opposed to drawings from the International Monetary Fund for purposes "other than those outlined in the Fund's articles of agreement" seems to dispose of recent

rumours that recipients of Marshall aid will soon be allowed to purchase dollars from the Fund again. It was never intended that the Fund's pool of member currencies should be used for patching up fundamental—as distinct from temporary—disequilibria in the exchanges; in particular its holding of dollars was not designed to meet the chronic dollar famine of the postwar years. That was to be satisfied, in the first instance, by the American and Canadian loans. Then, after the European Recovery Programme was safely launched in April, 1948, the Fund—acting in accordance with the principles of Article 14 of its charter, which states that the immediate postwar demands of members must not be allowed to impair the Fund's ability to give assistance after the transitional period—announced that it would put up its shutters until 1953 against further purchases of dollars by countries receiving American aid. Even although the Marshall countries are out of the hunt, the Fund's holding of American dollars has already fallen by \$704 million from its original level of \$2,062 million.

Although the British Government have given consideration to many schemes to conjure up dollars from the bottom of the barrel in recent months, there is no reason to suppose either that Sir Stafford Cripps made any approach to the Americans on this matter at the recent Washington talks, or that he was disposed to make an approach before Mr Snyder spoke last week. The rumour that such an approach might be under consideration seems to have originated in Australia, where it was linked with the suggestion that, following the devaluation of sterling, the state of the British economy had been raised to one of temporary, instead of fundamental, disequilibrium. How satisfactory that would be—if it were true. But Mr Snyder is not the only observer who would question its truth.

* * *

Bond and Price—

It is entirely proper that shareholders should be asked for their approval of a provisional agreement which has been made between Standard Motor and its managing director, Sir John Black. It provides for the allotment to Sir John of £25,000 in ordinary stock of the company; for his part, he binds himself, in the event of severing his connection with the company, not to engage during the remainder of his life in the manufacture of motor cars or agricultural tractors in what are described as "widely defined areas."

At this week's price of 20s. for the 5s. stock units of Standard Motor, the value of the contract to Sir John is £100,000. By a recent decision in the House of Lords, this would be tax free in Sir John's hands. The question arises whether Sir John's capitalised value to the company over, say, twenty years (he is now 56) can be rated as high as £100,000—apart from his annual emoluments as managing director. (The total emoluments of the seven directors were £66,826 last year. It is necessary to be quite clear about the circumstances in which the contract is proposed. No person can claim a greater share in the growth of Standard Motor to its present impressive strength than Sir John Black himself. But the proposed arrangement does not purport to be a payment for past services. If it were, it would attract income tax. It is offered as a consideration for restraining him from taking his services elsewhere in the motor industry at some future time. There have been such changes in the industry before, and they can make an important difference to a company's fortune.

But two questions then arise. Is Sir John's manifest capacity for organisation in motor manufacturing so unique that in the hands of a competitor it could have a serious effect on Standard Motor? And if so, is the risk that he might transfer his services a matter which could not be covered by an ordinary service contract, rather than by special arrangements such as those proposed? Shareholders will certainly require better information on these points before they approve the agreement.

It is difficult to see the special merits of the proposal so far as the company is concerned. No doubt it wants to keep its managing director as long as possible. That is a question of a competitive price for his great services. It is easier to see the attractions of the proposal from Sir John Black's side—the opportunity of a tax-free payment which must be far beyond anything he is likely to be able to set aside from his taxed income towards retirement. But as a consideration for an undertaking not to transfer his services elsewhere in the industry, the price appears altogether too high.

* * *

Furness Withy Points

In the view of Sir Ernest Murrant, chairman of Furness Withy, devaluation is likely to prove a mixed blessing for British shipping. At the annual meeting of the company last week, Sir Ernest declared that increases of 31s. to 112s. a ton in bunker oil and from 123s. to 172s. a ton in diesel oil in Northern European ports were "horrifying" and "superficially appear to be extravagantly high." His estimate of the increased cost on a typical voyage of one of Furness Withy's modern ships was around £2,250 or the equivalent to an increase of 5s. per ton in the current freight on grain. So far, it must be remarked, higher prices do not apply to bunkering in United Kingdom ports but some increase is inevitable, and probably of the same proportion as in foreign bunker prices. On the other hand, the company expects to gain from the higher sterling return from freights fixed in dollars, at least if these rates are maintained at their level before devaluation. But increased competition may be expected for dollar freights, and there are in fact signs that this is happening already. Moreover, the company's substantial dollar expenditure will cost it more in terms of sterling. Sir Ernest is by no means confident that the net results of trading under the new conditions will be advantageous.

The chairman referred to an anomalous effect of the Income Tax Act, 1945, in connection with the loss of one of the company's vessels by marine peril. During the life of this vessel, the total taxation relief arising from depreciation allowances, totalling £206,000, at the varying rates current from year to year amounted to £69,000—an average rate of taxation of approximately 6s. 10d. in the £. After the loss of the vessel, the company is now called upon to account for tax on the total allowances of £206,000 at 9s. in the £—in other words to pay to the Inland Revenue £92,000, some £23,000 more than the total benefit received. This anomaly arises because the balancing charge provisions of the Act make no allowance for changes in the standard rate of income tax during the life of the ship. But this does not end the matter. If the company wants to replace the ship, it will not be liable for the balancing charge; but it will not be

entitled to take credit for the £206,000 of depreciation allowances which had accrued on the lost ship for the purpose of calculating depreciation allowances on the new vessel which replaced it. The net effect is that normal depreciation allowances on the new ship would expire after 12 years, and after that period its total net earnings would be subject to taxation. Since the cost of replacing the lost vessel is likely to exceed the net amount recovered from insurance by some £650,000, it is obvious that the replacement would entail a heavy drain on the company's resources and also place a heavy burden of taxation on future earnings.

Industry and Trade

Steel Supplies and Consumption

British output of steel ingots and castings recovered in September, as the holiday season approached its end, to a weekly average of 305,900 tons; this is equivalent to an annual rate of 15.9 million tons. The Iron and Steel Federation is confident that the upper limit of the estimate contained in the *Economic Survey*, 15½ million tons for the year,

will be reached. The Chancellor of the Exchequer, when he discussed industrial output on Wednesday, was slightly more cautious; he pointed out that shortages of certain steel products—and particularly sheet, tinplate, and wire rod—were still serious, and that until new capacity was ready, not all demands could be met. But the Chancellor seems to take a brighter view than the steelmakers would take of the capacity of manufacturing industry to use more steel.

CRUSADER TIMEPIECES LIMITED, VICTORIA ROAD, SOUTH BUNSLIP, MIDDLESEX

An article in the *Statistical Bulletin* for September of the British Iron and Steel Federation brings up to date the assessment of supply and demand which was made in April. The decline of exports in the summer had some effects on the steel programme; and no doubt devaluation will have other effects. The opinion that "all foreseeable home market demands" can be met is not, however, changed. Crude steel output is running true to form. Imports in the first six months of 1949 were at the expected level of 1.2 million tons, but there was "some increase" in July and August. More than half of these imports are from the United States, Belgium, and Luxemburg, and the higher sterling prices of these may reverse the increase which took place before devaluation. Stocks have been built up further this year, against expectation. Direct exports of steel have been higher than was expected, and the estimate is raised from 2.2 to 2.5 million tons.

As a result, steel supplies for the year are estimated at 17.3 million tons less 500,000 tons for additions to stocks. This gives a figure of 16.8 million tons (in ingot equivalent) for "usage," which is distributed as follows:—

	Million tons	
	1948	1949
Direct exports	2.1	2.5
"Indirect" exports	2.7	3.0
Home investment and consumption	10.4	11.3
	15.2	16.8

Thus the quantity of steel sold abroad, whether as steel or as manufactures, will rise from 4.8 million tons last year to 5.5 million tons in 1949 if these estimates are realised. But the *Bulletin* adds a caution about the capacity of the engineering and other steel-using industries to absorb more steel:—

In conditions of full employment a larger home consumption of steel must pre-suppose an improvement in output per head in at least some of the using industries.

But higher productivity does not happen automatically. And, as the accompanying table shows, it cannot be assumed that steel deliveries and the activity of the steel-using industries will always keep in step.

Film Policy and the Finance Corporation

The National Film Finance Corporation has completed its first year's work—in effect, though not in form; during the first six months of its life it existed as a company, not as a state corporation. It is still early to attempt any general review of its work, or any judgment on the success or failure of the experiment. Mr. J. H. Lawrie, the managing director, said on Tuesday that 26 loans had been made so far for the production of 44 films. The four distributing companies account for the bulk of the loans and of the product. The biggest of them, British Lion, uses the Corporation's loans as a revolving credit which has made possible some expansion of feature output by what are sometimes called "independent" producers.

A tendency has also been noticeable for the producers to carry out some of their work on location in Continental countries; and this has caused some ill-feeling. Mr. Lawrie, when he met the trade press on Tuesday, was pressed to condemn the practice. He refused, quite rightly, to do so. Complaints against the use of state money to provide employment for foreigners raise the question of what the Corporation is for. It has interpreted its duty as being to finance the production of British films and help to revive the British film producing industry. While the discharge of this duty has the result of providing employment for British workmen in British studios, the overriding purpose is distinct and different.

A good recent example is *The Third Man*, which was

made with money partly from the Korda group, partly from the National Film Finance Corporation through its loan to British Lion, and partly from Mr. David Selznick, who acquired the rights for the western hemisphere. Some of the film was taken on location in Vienna, the remainder in England with actors from Britain, Austria and Hollywood. The result is a first-class film which cannot fail to be a commercial success; it owes much to British talent but not a little, also, to American commercial sense and Viennese atmosphere. Granted that a film was to be made on this particular subject, it could have been made in British studios with exclusively British actors and a plywood reproduction of the Spanische Reitschule. But would the result have had the same world-wide appeal? In this case, it would not.

If the purpose of putting state money into film production is anything more than to fill the quota and keep the studio electricians and carpenters busy, the Corporation cannot afford a parochial approach. The producing companies can afford such an approach even less. Some of their hopes of revived activity depend on attracting more investment from the American film earnings in Britain. Some of them also have blocked earnings of their own in Continental countries, which may be more profitably used for location work than in any other way.

Tin Complications

The Ministry of Supply has still to announce its new buying price for Malayan tin, though, at the time of going to press, an announcement was said to be imminent. Since devaluation, the Ministry has continued to buy at £553 10s. a ton although it has increased its selling price to £750 a ton. But in any case both buying and selling prices will hold only for the period until the London tin market is reopened. The complications which still have to be solved before the market can be reopened suggest, nevertheless, that these interim arrangements may be in force for some months. There is little or no news about the American "bilateral" agreements for tin, or what quantities they will take off the market. At least it is believed that the price under any such agreements will be fixed for a period. The second complication is the proposed international tin marketing scheme. The British Government still appears to favour a scheme which will restrict output as being the only one which could be worked if market prices are to be free to move. Since American acceptance of such a proposal seems very unlikely, the scheme may be doomed from the outset.

The third complication is whether international allocation will continue. If it ends, and if the United States imposes no bar on the sale of tin to certain countries, then Russian buying might be an important factor in the reopened tin market. Even if Russian buying appears, it is generally thought that the sterling price will be below the Ministry of Supply's current selling price. This raises the fourth complication. If the price of Straits tin falls to, say, 90 cents a lb. in New York, how will the American contract with Bolivia be affected? Although American manufacturers want large quantities of tin at a cheap price, the American administration is interested in the political situation in Bolivia. Hitherto, the British buying price for Straits tin and Bolivian ore and the American buying price for Bolivian ore were related to one another. The London market will not deal in tin ore, but there must still be a direct relationship between the price of tin and the price of ore.

Each of these complications can be solved. But each must be solved before the London tin market reopens. The narrow view taken by the Ministry of Supply that because tin is a sterling area product and a dollar earner the market for it can be freed, while for other base metals (which do not fulfil these conditions) it must remain closed is clearly wrong. Tin is subject to more international factors than any of the other metals, and by no means all of these factors are economic.

A NEW IDEA FOR YOUR BUSINESS

Here are 12 Schemes for
Simplifying Your Work

FREE DETAILS AND/OR
SPECIMENS AT YOUR DISPOSAL

Below are 12 different plans for helping every type of business executive.

They are at your service: they entail no expensive outlay. They can be embodied in your existing equipment.

Each of them can provide an *extra* free service in conjunction with your filing or be set up as a separate system.

Briefly, this is how they operate:—

A series of shannographic flat-topped files, suspended on standard metal frames, go into your existing cabinets, deep desk drawers or in separate self-contained units on your desk. The box-like files contain the correspondence, invoices, orders, delivery notes, samples or whatever is connected with the file. The flat-tops (which go right across the file) carry VISUALLY such desirable data as order number, name of customer (or supplier), address, type of products, etc.

At the right is a ready-printed strip bearing the numbers 1 to 12 and 1 to 31. These can be colour-signalled datally. They can also be used as a "code" for identifying a "progress" sequence, a list of products, percentage of deliveries against contracts, stock positions, components in short-supply and a host of other essential things.

In front of each file is a slotted-in record card (standardised or specially designed) to annotate contents of file, costings, deliveries, or other data.

The system is VISUAL. You have all the essential facts and figures before your eyes. And the associated documents are correlated without demanding cross-reference or searching.

This is only the "mechanics" of the system. The actual applications need (and deserve) individual attention.

Below are a few basic plans. Tick the ones about which you want details. Tear out the coupon and post with your letter-heading. Full information will be provided by return.

PERSONAL FILE.—Incidentally, have you seen the new Personal Home File? The Efficiency of your office in your home. This totally enclosed metal attache-case file, with lock and keys, will enable you to keep a close watch on your personal affairs—letters, bills, receipts, tax returns, etc. Please ask for full details.

SHANNON SYSTEMS

NICKEL AND CLOTHING

Do you know that nickel plays an important
part in the production of our clothing?

Take wool, for instance . . . the

equipment used on the sheep farms,

the plant for producing the yarn, the tanks

for dyeing it, the machinery for weaving

it into fabrics, even the sewing machines — in

all these nickel is present, toughening

and strengthening the metals used in their

construction, making them staunch

against the attacks of wear, corrosion and heat.

Thus nickel is contributing to the

efficiency of the tools and equipment

with which Britain is achieving

her recovery.

Fall in Base Metals

Six months ago a cut in the price for lead in the United States began a major slide in base metal prices. During the past three weeks, lead in the New York market has fallen from 15 cents to 13½ cents a lb. (equivalent to £110 a ton), and the Ministry of Supply has faithfully followed this downward trend by reducing its selling price on Wednesday to £111 a ton against £122 on September 22nd. Zinc is also cheaper. In the New York market the price has fallen from 10 cents to 9½ cents a lb. (equivalent to £74 a ton) while the British price was reduced from £87 10s. a ton (to which it was raised after devaluation) to £81 10s. a ton. Copper is still unchanged at 17½ cents a lb. (£141 a ton) but recently the price for scrap has fallen. In the past changes in scrap have preceded changes in the price of copper. Certainly the margin of 4 cents a lb. between scrap and electrolytic copper should enable smelters to reduce their price if demand should slacken.

The weakness in the American metal market has occurred since devaluation, and it is generally attributed to increased offering of foreign lead in the United States. But the quantities involved are not very large and the fact that their re-appearance was sufficient to reduce the New York price shows that American demand is far from buoyant. Buying has on the whole been cautious, though galvanisers are still active in the zinc market and battery manufacturers in the lead market. In Britain stocks of non-ferrous metals are more than adequate and consumption is, on the average, about 10 per cent below last year's level.

Deliveries of copper from Nchanga and Rhokana mines are being bought by the Ministry at prices based on the old dollar exchange rate, and these prices will remain in force until the end of November. Mr S. S. Taylor, at this week's meeting of Nchanga Consolidated Copper Mines, showed that if the price payable for future deliveries is calculated at \$2.80 to £, it would amount to £145 14s. 6d. a ton. This means that the current sterling price paid to producers is £101 5s. a ton. Mr Taylor added that the Ministry had invited copper producers to consider the adoption of a new method of price fixing; at present it is based on the New York export price. As the Ministry of Supply is also buying tin from Malayan producers at the sterling price ruling before devaluation, it must be well on the way to recouping any losses it made between July and September. It is certainly quite unreasonable that the Ministry should recoup the entire devaluation profit, as it is now doing.

September Trade

The provisional trade figures for September show a welcome improvement in the adverse balance which at £35.8 million was the lowest since March. Exports during the month increased by £4,700,000 to £141.8 million. This figure was a fraction higher than in July but nearly £11 million higher than in September, 1948. The daily rate of exports increased by 3½ per cent, thus restoring the daily rate for July, but it was 10 per cent greater than twelve months ago. Shipments to the two main dollar markets again showed contrary trends. In September, however, exports to the United States increased to £4,100,000 compared with £3,300,000 in August and £3,800,000 in July, while exports to Canada declined to £5,300,000 from £5,700,000 in August and £6,700,000 in July. This improvement in the export trade was mainly seasonal, following on the end of the holiday period. The time-lag between goods leaving a factory and being recorded as exports by the customs authorities is such that any increase in exports caused by the devaluation of sterling could not have been reflected in the September figures. It is doubtful whether even the October figures will show any major effects.

The improvement in the balance of visible trade last

month arose from a reduction in imports. The provisional September figure is given as £181.2 million or nearly £19 million less than in August; apart from February, when imports totalled £162 million, this is the lowest monthly figure of the year. Re-exports totalled £3,600,000, so the visible trade balance in September fell to £35.8 million or £23 million less than in August, when the deficit was exceptionally large.

Coal for Lancashire Miners

There are now hopes that a renewed strike of Lancashire and Cumberland miners will be avoided, if the latest proposals for settling the dispute over concessionary coal can be finally agreed between the National Coal Board and the National Union of Mineworkers. The outlines of the new scheme were formulated after a special executive meeting of the NUM in Amsterdam last week, and they have now been agreed by the Board. All that now remains is to determine some of the details.

Under the new scheme, Lancashire and Cumberland miners will each receive six tons of coal a year at the price of 24s. a ton plus a contribution of 1s. 6d. a week. This works out at less than half the Lancashire pithead price. The concession will be made without adding to the national total of 5,000,000 tons now distributed annually in cheap or free coal, since the other districts will contribute altogether about 250,000 tons, in amounts varying with the quantities of concessionary coal they are now receiving. The Board will make some financial contribution, but the exact amount has not yet been fixed.

The settlement of this dispute would remove a dangerous trouble-spot which arises from a real grievance of the Lancashire and Cumberland miners, who have been alone in receiving no concessionary coal. By removing an anomaly (though only one of many) between districts it may serve as a minor but necessary step towards the general reform of the mining wage structure. Its main significance is in the fact that it is an agreement between districts made in a co-operative spirit, and a gain for national thinking against sectional interests among the miners themselves.

Redundancy on Tyneside

The contraction of work in the ship-repairing industry has come into the open in the last two or three weeks, and, as Sir Stafford Cripps said on Wednesday, "some pockets of unemployment have been developing." On the north-east coast, about 1,800 workers have been dismissed from the ship-repairing yards since the middle of September. This is in no way unexpected, and the Government does not seem inclined to treat it as alarming. The northern regional office of the Ministry of Labour has announced that out of the first 1,500 workers dismissed, 800 have already been placed in other jobs within reasonable reach of their homes. The labour force of the shipyards in the region has been reduced from its wartime peak of 57,000 in 1943 to less than 40,000; opportunities of other employment have been ample, and the reduction has been gradual and painless, as such processes go.

It would still be useful to form an estimate of the prospects of employment over the next few years, not only in the ship-repairing yards—which have been hit first as the series of postwar refits and reconversions begin to come to an end—but in the shipbuilding yards themselves. The rush of shipbuilding activity after the first world war ended by 1922. In the following years, activity varied between 30 per cent and 60 per cent of the 1919 average until business collapsed in the slump of 1931. Since the second world war, the demand for new ships has lasted longer. The yards on the north-east coast had 823,000 tons of shipping under

construction in the second quarter of this year; and this, though it was only three-quarters of the level in 1919 (for the industry in this region underwent a permanent contraction between the wars) was only slightly less than the average of tonnage under construction in 1948. Most of the building yards have enough work on their order books to carry them through next year, though there are exceptions. But new orders have fallen off heavily this year, and unless the relation between shipbuilding costs and shipping earnings can be sharply improved there seems no reason to question the opinion which is held in the north-east that another 10,000 workers will have to find other employment within two years or so.

Shorter Notes

The Commercial Minister of the British Embassy in Buenos Aires has given a blunt warning to the Argentine Government about its failure to implement its side of the trade agreement. Unless import permits are granted for British goods within the next few weeks, he said, Britain may be obliged to reduce its purchases of Argentine foodstuffs. About Argentina's attempt to force higher prices on Britain, the Minister added that meat prices for the first year were fixed in the agreement and "the amount Britain was prepared to pay was not calculated in terms of pesos." It depended on what Britain could afford and on the price ruling in other markets. This was even more true of grain, hides, oils and fats.

The negotiations which opened in Copenhagen last Tuesday for a new Anglo-Danish trade pact have not been running too smoothly. Denmark would like to see what effect devaluation would have on British prices before committing itself to a rigid framework of trade. If British prices rise

Denmark would seek to revise its prices for butter, eggs and other agricultural produce. But it could only do that by forgoing the security of the seven-year contract which it signed with the Ministry of Food earlier this year.

Draft proposals made by the Board of Trade for a development council for the pottery industry were discussed in London this week between the Board and representatives of the pottery manufacturers. The manufacturers are opposed to the idea of a statutory development council.

The scheme of reconstruction of Cable and Wireless (Holding) is now ready. Unless unforeseen difficulties arise details will be posted to stockholders on November 1st and meetings will be held on November 25th to consider and, if thought fit, to approve the scheme. The necessary court formalities are proceeding.

Allen, Harvey and Ross in a preliminary statement this week disclose a net profit of £64,357. This is some £10,000 lower than the profits disclosed in the previous year, but the latest figure has been struck after making an allocation for amortisation of premiums on investments; in the previous year there was no such provision.

A commission of seven members has been appointed by the House of Deputies in Brazil to examine the take-over proceedings of Great Western of Brazil, Leopoldina and Bahia South Western Railways. This move follows a motion tabled last week and has been prompted by reports that certain persons were to receive payments amounting to £90,750 in consideration of services rendered in arranging the sale of the Bahia South Western Railway.

EXPORT SERVICES

LLOYDS BANK offers to exporters • Comprehensive information on market conditions all over the world. • Names of potential buyers and agents in overseas countries • Guidance on questions arising from exchange control. • Finance for all classes of foreign trade.

The manager of any branch will gladly make these services available to you.

*Abridged Particulars***JOHN EDWARD CROWTHER (HOLDINGS) LIMITED***(Incorporated under the Companies Act, 1948)*
WOOLLEN MANUFACTURERS**CAPITAL**

<i>Authorised:</i>	<i>Issued and fully paid:</i>
£500,000 in 500,000 5½ per cent. Cumulative Preference Shares of £1 each ...	£500,000
£500,000 in 500,000 Ordinary Shares of £1 each	£500,000
£1,000,000	£1,000,000

Neither the Company nor its subsidiaries has any Mortgages, Debentures or Loan Capital outstanding.

The List of Applications will open and close on Thursday, the 20th day of October, 1949

for an
OFFER FOR SALE*by*
THE CHARTERHOUSE FINANCE CORPORATION LIMITED*of***500,000 5½ per cent. Cumulative Preference Shares of £1 each at 22s. per Share***The following extracts are from a letter from Mr. P. D. Crowther, Chairman and Managing Director of the Company, which is printed in full in the offer for sale:—*

1. The Company was incorporated on 10th October, 1949, and has acquired the whole of the issued Share Capitals of John Edward Crowther Limited and Crowther, Bruce & Co. Limited. For four generations, my family has been engaged in the wool textile industry in the Colne Valley, near Huddersfield. The very high rates of Estate Duty now prevailing compel me to provide funds against the ultimate incidence of this form of taxation which might otherwise affect the financial stability and continuity of the Group. It is the present intention that all the Ordinary Shares of the Company shall be retained in the family.
2. The Operating Companies undertake every process from the preparation of raw wool to the production of all types of finished woollen cloth. An analysis of turnover for the year ended 31st March, 1949, shows that in terms of linear yardage sold, over 33.42 per cent. went in direct and over 18.84 per cent. in indirect exports.
3. The combined profits of the Operating Companies for the past thirty years ended 31st March, 1949, show that, after providing for all outgoings except taxation, profits were earned in all but one of those years despite the difficulties which beset industry in this country—and the textile trade in particular—at various times during that period. The average of the combined trading results is £122,215 per annum, an amount sufficient, after providing for Profits Tax at the proposed new rates, to cover the dividend of £27,500 (gross) on the Preference Shares over three times. In my opinion, this average rate of profits should, in the absence of unforeseen conditions, at least be maintained in the future.
4. The Operating Companies' net assets, exclusive of Goodwill, at 31st March, 1949, of £1,028,756 are equivalent to 41s. 1.803d. for each Preference Share. In the Directors' opinion the fixed assets which stand in the books at a written down value of £244,543 are at present worth several times this amount. The value of the stock which stands in the books of the Operating Companies at £894,077 is well below current market value.
5. Combined turnover of the Operating Companies for the first six months of the current year is equal to that for the corresponding period last year and I am satisfied that the profit for the year ending 31st March, 1950, will be substantially in excess of the thirty year average of £122,215. The Operating Companies' long record of successful trading and their high reputation in the wool textile industry for efficient production at economic prices are proof that they should be well able to withstand the effects of any future trade recessions and to meet the severest competition. I am, therefore, confident that future profits will continue to provide substantial cover for the dividend on the Preference Shares which you are now offering for sale.

Copies of the full Offer for Sale, on the terms of which alone applications will be considered, and Forms of Application will be obtainable on Monday from:

COMPANY MEETING**ANGLO-PORTUGUESE TELEPHONE COMPANY, LIMITED****CONSIDERABLE EXPANSION PROGRAMME****DEMAND MAINTAINED****NEED FOR FURTHER CAPITAL****SIR ALEXANDER ROGER'S SPEECH**

The sixty-second annual general meeting of the Anglo-Portuguese Telephone Company, Limited, was held on October 11th at Strower House, Arundel Street, London, W.C.

Sir Alexander Roger, K.C.I.E., chairman and managing director, said: Gentlemen, since 1940 the sterling/escudo rate of exchange remained stable at Escs. 100 to the £ and consequently the currency accounts for the year 1948 have been converted at that rate.

On September 21st last it was announced in Lisbon that the Portuguese Government had decided to fix the new exchange rate for the dollar at 28 escudos and 75 centavos instead of 25 escudos, and for the pound sterling at 80 escudos 50 centavos instead of 100 escudos 25 centavos.

This will mean some adjustment of the company's accounts for the year 1949, but the accounts under review remain unaffected. Total revenue for the year was £846,664 as compared with £758,675 for 1947.

The consulting engineers have carried out their annual investigation into the depreciation position of the telephone plant, and have recommended that over and above the normal allocation a further contribution should be made out of revenue to cover the exceptional wear and tear suffered by the plant during the war years. An additional contribution for this purpose has been made and, in fact, this has been done since 1944. After providing for depreciation and provision for renewals, and including interest on loan, interest on the 5 per cent. and 5½ per cent. debenture stock and the appropriate sinking fund instalments, expenses totalled £786,191 against a 1947 total of £700,863.

RESULT OF YEAR'S OPERATIONS

Net profit for the year is £60,473, as compared with £57,812. The usual dividends of 8 per cent., less tax, on the ordinary stock and "A" ordinary shares absorb £57,172, leaving to be carried forward £46,033 as against £42,732 brought forward. The cost price of telephone plant installed and in operation amounted to almost £3,700,000 at the date of the balance sheet.

The sum under the heading of provision for renewals, after writing off losses on plant withdrawn from service during the year, amounts to £1,144,351, or 31 per cent. of the cost price of the telephone plant. This provision, and the company's other reserves, which are relatively small, are invested in the business, which is economically and financially advantageous to the Portuguese telephone community and to the company.

Experiment and research for improvements in all fields of telecommunication is continuous, and only the most modern and up-to-date equipment is sent to Portugal.

During the three years—1946, 1947, and 1948—telephone material of British manufacture to the value of approximately £1,000,000 has been shipped to our company in Portugal, and the company has purchased in Portugal itself further material costing over £330,000.

EXPANSION AND DEVELOPMENT

To carry out our heavy expansion programmes necessitates a regular flow of new capital. The extent of new capital required

is reduced by the amount of reserves which we are able to plough back into the business each year, but by far the greater proportion of capital must be provided from outside the business.

For the past three years all new capital has been advanced on loan account by Telephone and General Trust Limited, and at December 31, 1948, our loan from the trust amounted to £787,612. At this date it is about £738,000.

The trust and its associated companies have a staff of experts in all branches of the telephone business, financial, manufacturing, engineering, operating and research, and your company's close connection with these interests have brought substantial benefits to it over the past 20 years and more.

The day to day loan arrangements which your company has with the trust are on a mutually satisfactory basis, but the development and expansion of your company requires that these temporary advances be converted into a more permanent form of capital, and it is the present intention of your directors to take steps to do this as soon as plans can be completed following a settlement of our negotiations in Portugal to which I refer in a moment.

In 1948, 7,913 stations were added to the system, bringing the total at December 31st to 88,459. During the war years development was necessarily curtailed, but since expansion became possible three years ago, 23,254 stations have been brought into service. We regard this expansion as a considerable achievement, and we have gone ahead with the supply of plant and equipment to carry this out clearly on the understanding, and in the full belief, that the company's tariff structure would be satisfactorily adjusted.

In spite of our efforts the demand for telephones shows no abatement, and at December 31st last the waiting list was 23,000 and today is 25,000.

TARIFF NEGOTIATIONS

At the last annual general meeting on September 9, 1948, I informed you that the necessity for an adjustment of the company's telephone rates, owing to our great expansion programme and the continual rising cost of labour, materials and all expenses, had become increasingly urgent, since the company had first broached the subject to the Government in 1945.

I told you then that during my visits to Portugal in connection with this matter, I had found a ready understanding of the company's difficulties and the nature of our problems, that our case was being examined in detail by the Government representatives in co-operation with the representatives of your company, and that we were hopeful of a satisfactory outcome at an early date.

The present contract between the Portuguese Government and the company was entered into on January 25, 1928, and is for a period of forty years. At the end of that time the Government has the right to acquire the company's property on payment of a sum to be fixed by the arbitrators.

The conditions governing the payment are incorporated in two separate clauses, the first in the contract itself and the second in an

addendum to it which is an integral part of the contract.

The Government and the company have always considered that the clause in the addendum had annulled the first version and, in fact, throughout the years this has never been questioned.

HOPE OF SATISFACTORY SETTLEMENT

Owing to some ambiguity regarding these clauses, however, both the Prime Minister, H.E. Dr Salazar, and I considered that this position should be clarified at the same time as the settlement of the new tariffs.

Unfortunately the negotiations have been protracted as various Government entities are concerned, and I have been twice, personally, to Portugal, covering a period of nearly four months since we last met, to press the matter on, and on each occasion have been cordially received by Dr Salazar and his representatives.

We have been repeatedly informed by the authorities that they are no less anxious than the company to settle these matters in harmony. The negotiations are active, and your directors are hopeful of a settlement which will be mutually satisfactory to the company and to the Government.

I was fully expecting to be able to tell you that the negotiations had been concluded, but I am unable to do this today, which I am sure is as disappointing to you as it is to your board.

We will advise shareholders further as soon as it is possible to make a specific statement.

PORTUGAL

Marshal Carmona, who has been President of Portugal for over 21 years, was re-elected in March, 1949, by an overwhelming majority for a further period of 7 years.

Trade and financial discussions between the United Kingdom and Portugal in the early part of 1949 resulted in an extension of the principal existing Anglo-Portuguese Monetary Agreement for a period of one year, namely to April 15, 1950.

In August last the National Assembly of the Government of Portugal ratified the signing in Washington of the Atlantic Pact by its country's representative. This, in fact, was a logical continuation of the policy which has been pursued by H.E. Dr Oliveira Salazar, the country's Prime Minister, since the regime of the Corporative State was set up under his influence and guidance over 21 years ago.

The Government recognises that greater industrialisation is required to increase the standard of life, and to forward this end large schemes of public works have been undertaken, particularly hydro-electricity projects connected with the rivers Zézere and Cavado.

Progress is being made in all these works but, as in other countries, the rate of progress is dependent upon the financial resources available.

INTERCHANGE OF VISITS

Personal contacts between representatives of your London and Portugal boards have been maintained in both countries.

We are especially happy to welcome any member of our Portugal board and anyone of our advisers from Portugal, and the chairman of our board in Portugal, Senhor Branco Cabral, together with Dr Bustorff Silva, the company's lawyer, have been in London on several occasions during the past year for consultation with us.

We are greatly indebted to these two Portuguese gentlemen for their untiring and unsparing efforts over a long period on behalf of the company in its business relationships with the Portuguese Government Departments, and particularly in connection with the present negotiations. Their endeavours are constantly devoted to a settlement of all problems on a basis satisfactory to the interests of the country, the public and the company.

In this they are at all times ably assisted and supported by Mr R. S. Thorp, our general manager, who accompanied our Portuguese advisers on their London visits. As already mentioned, I have been to Portugal twice since we last met. Mr Hollier accompanying me on those visits. In addition, Mr Rye and Mr A. F. Roger have made valuable visits. Exchange of visits between the engineers and accountants have also been continued. All these visits are essential to enable the administrations at both ends to understand the problems pertaining to each.

TRIBUTE TO MR RYE

Mr A. N. Rye, who has been a director since 1936 and joint managing director since 1940, decided in 1948 to relinquish the latter position. During his tenure of this office he has unhesitatingly given his time and experience to the betterment of the company. His resignation as joint managing director was received with great regret by his colleagues.

STAFF AND WORKPEOPLE

We do our best to secure the contentment of the staff by providing pensions, sickness, accident and medical benefits, family allowances and other welfare services.

The board in Portugal and Mr Thorp and his executive and departmental chiefs, have a willing band of workers. On your behalf I should like to thank our administration in Portugal and all the workpeople numbering about 3,000, over 99 per cent. of whom are Portuguese, for their keenness and loyalty, and particularly for the patience of our workpeople in Lisbon and Oporto in the delay in settling their wage conditions through circumstances beyond the company's control. The report and accounts were unanimously adopted.

Resolutions were passed converting the issued "A" Ordinary shares into stock and adopting new articles of association.

INDUSTRIAL FINANCE AND INVESTMENT CORPORATION LIMITED

MR J. N. BUCHANAN'S STATEMENT

The twenty-fourth annual general meeting of this company will be held on November 4th in London.

The following is an extract from the statement of the chairman (Mr J. N. Buchanan, D.S.O., M.C.), circulated with the report and accounts.

Last year I warned you that the large increase in the profits of the last two years was not likely to be maintained and that we expected a fall in our revenue for the year ending June 30, 1949. Gross revenue received by the company was £198,000 against £254,000 in the year before. Thanks, however, to the tax provision being substantially lower, the balance carried to appropriation account shows a considerable increase, being £150,000, against £103,000 last year.

The value of the company's investments has fallen in accordance with the general experience. It was to meet such fluctuations in values that we have built up the investment fluctuation reserve. This year we have used £45,000 of that reserve to write our investments down to the market value current at June 30th last. We recommend the same dividend, and £50,000 is added to our carry-forward.

With regard to the current year, there has so far been little, if any, falling off in the number of propositions which reach us for provision of finance for developing businesses. How many of these may come to a fruitful issue depends to a large extent on conditions and regulations outside our control. With regard to our investment income, suffice it to say that there is at present no material sign of a decrease.

RANSOME AND MARLES BEARING COMPANY LIMITED

NEW PROFIT RECORD

The thirty-third annual general meeting of this company was held on October 13 at Newark, Notts.

Mr F. W. Baker, the chairman, who presided, in the course of his speech said:

The net profit creates a new high record at £300,487, and as our financial year covered what might be regarded as a transitional period in industry, this is, in the opinion of the board, highly satisfactory. For the first six months to December 31, 1948, sales were still rising steadily, but the general decline in ordering, due partly to some small recession in trade and probably more to liquidation of unduly high stocks held by users, was reflected in the sales for the second half of the year. The rescheduling of delivery dates and suspending of orders have brought out a more realistic and healthy programme, and much "dead wood" has been cut out. In spite of this the sales for the 12 months were again a high record.

One or two industries experienced something of a boom period after the war, and the easing of their demands will now enable us to replenish our badly depleted stock and allow us to give better service both at home and overseas; this is most essential, particularly in the latter case.

DIVIDEND AND BONUS

The proposed allocation of the profit and loss balance provides for the full final dividend and bonus on the increased capital, and after the transfer of £150,000 to general reserve and other small allocations, the carry-forward is increased to £116,253, which represents more than the yearly distribution at the present rate.

Turning to the balance sheet, you will, I am sure, agree as to the great strength shown by the figures. The liquid position has, of course, been greatly strengthened by the recent new issue.

In recent months bonus issues have been very much to the fore, and it might be thought that with its reserve position this company should make such an issue. The board have seriously considered the question, but are of the opinion that in existing circumstances no good purpose would be served by adopting this course.

FUTURE PROSPECTS

You are naturally interested in future prospects, and in these difficult times more so than ever. Although our industry has wide interests, and is therefore less vulnerable than some to sudden changes, we are still subject to the general ebb and flow of trade. So far, while there is a slowing down in the demand from certain industries, others are still increasing and express considerable optimism, and the demand at the present time is still several times the pre-war level. I feel sure, however, that you will understand my reluctance to indulge in anything in the nature of prophecy while the international and national situations are so grave and unpredictable. Currency difficulties, import licence restrictions, and labour troubles in far quarters of the world affect not only our own trade but our customers' as well, and we must hope that the present efforts being made to solve the international problems in Europe and America will meet with success. If the present level of consumption continues amongst the main industrial users, and no further international obstacles are created to restrict both our direct and indirect exports, we should be able to keep production at a level sufficient to earn a reasonable profit.

The report was adopted.

OLDHAM AND SON LIMITED

ACTIVE AND SUCCESSFUL YEAR

MR JOHN OLDHAM'S REVIEW

At the thirtieth annual general meeting of Oldham and Son Limited, held on October 13th at the company's head office, Denton, Manchester, the chairman, Mr John Oldham, O.B.E., J.P., reported a year of great activity and continued progress. Trading profit at £283,450 showed an increase of £23,509 on the previous year. Part of the company's reserves would be distributed in the form of a bonus share issue to ordinary shareholders of one shilling ordinary share for each ordinary share held.

Total volume and value of production and sales had increased substantially, and exports had risen by 50 per cent. over last year's figure. Comprehensive developments had been carried out in all fields to increase the scope of the company's sales force, to create new sales outlets, and, by close study of the markets served, to add to the range of the company's products.

A programme of re-organisation and re-equipment had gone steadily forward; new plant had been installed and certain new processes of manufacture established. Technical and market research had been stimulated and expanded as a result of extensive journeys made overseas, covering a number of countries.

IMPORTANT DEVELOPMENTS OVERSEAS

The chairman said that an important technical association had been formed with the Gould Storage Battery Corporation of New Jersey, a subsidiary of the National Battery Corporation of America, providing for the exchange of complete technical and development information concerned with design and production of power batteries.

An associated company under the title of Oldham and Son Africa Ltd., in which the English company held 50 per cent. interest, had commenced operations as from January 31st last. Oldham and Son had been engaged in South Africa since 1938 in the supply of their portable mine lighting equipment, and many thousands of Oldham lamps were in use in the gold, coal, and copper mines of South Africa and Northern Rhodesia.

A French subsidiary, Société Française des Procédés Oldham had been formed in conjunction with S. A. d'Éclairage et d'Applications Électriques, manufacturers and distributors of Oldham mine lighting and general electrical equipment in France. Oldham and Son held 75 per cent. of share capital of the new company, which had now commenced complete manufacture of Oldham mine lighting accumulators. Oldham self-service lamps were used to a greater degree than any other in the French mining industry, and the French manufacturing facilities now provided should prove an important factor in the firm's continued development on the Continent.

In conclusion, the chairman said that, from the broad outline he had given of the results of the company's operations during the period under review, and having regard to the fact that its activities were so widely spread over the fields of mine lighting equipment, storage batteries for automobile, traction, and general electrical use, together with its activities in the mechanical engineering field, shareholders should, subject to conditions beyond control, be able to look forward to the future with confidence.

The report and accounts were unanimously adopted, and a final dividend of 30 per cent. approved, making a total of 60 per cent. for the year.

NCHANGA CONSOLIDATED COPPER MINES

DEVALUATION PROBLEMS

The twelfth annual ordinary general meeting of Nchanga Consolidated Copper Mines, Limited, was held on October 11th in London, Mr S. S. Taylor, C.M.G., D.S.O. (deputy chairman), presiding.

The chairman, in the course of his speech, said: You will note that the profit for the year, before providing for taxation, is £1,609,924, which compares with last year's figure of £814,975. The increase is due to greater production and a higher average price. Taxation on the profit for the year amounts to £822,615, out of which £811,129 is transferred to the reserve for future income-tax.

Production for the year was 9,255 long tons greater than the previous year. This permitted us to appropriate substantial tonnages towards our stocks and our proportion of the refinery extension requirements.

REVALUATION OF STERLING

The revaluation of the pound sterling at a lower level in relation to the dollar or in common parlance its devaluation has, of course, a profound effect on the prices payable in sterling for copper. The basis of the price paid by the Ministry of Supply to the Northern Rhodesian producers has been the world price as ascertained from the quotations in the New York Engineering and Mining Journal in cents per pound for copper (f.a.s. New York, converted at the rate of \$4.03 to the pound sterling).

When devaluation was announced, the Ministry suspended all sales by it of copper to consumers in Great Britain pending the publication of new selling prices. On September 23rd, the Ministry announced that its selling price for electrolytic copper thereafter would be raised from £107 10s. to £140 per long ton. The price payable to this company and also to Rhokana Corporation, Limited, had already been fixed for deliveries up to and including the month of November.

NOTICES

THE Civil Service Commissioners invite applications for permanent appointments as Assistant Experimental Officer to be filled by competitive interview during 1949. Interviews will be held shortly after the receipt of the completed application form and successful candidates may expect early appointments.

The posts are in various Government Departments and cover a wide variety of scientific (including engineering) qualifications. Places of work are spread throughout Great Britain.

Candidates must be at least 17 years and under 26 years of age on 1st August, 1949; time spent on a regular engagement in H.M. Forces may be deducted from actual age. Candidates must have obtained the Higher School Certificate with mathematics or a science subject as a principal subject, or an equivalent qualification. Higher qualifications will be regarded as an advantage to candidates over the age of 20.

The inclusive London salary scale (men) is £230-£490. Salaries for women and for posts in the provinces are somewhat lower. Superannuation provision is made under the Superannuation Act.

Further particulars and forms of application from the Secretary, Civil Service Commission, Scientific Branch, 27, Grosvenor Square, London, W.1, quoting No. 2522. Complete application forms should be returned as soon as possible.

EX Lieut.-Colonel, Senior Temporary Civil Servant and Schoolmaster aged 38 with 15 years' experience in welfare, personnel work, staff selection and training, catering, office management, building maintenance and stores organisation, requires post in large organisation in executive or administrative capacity. Capital available for investment, will serve in any country. Available for interview week commencing October 24.—Box 235.

EXPORT SALES MANAGER—Responsibility for organisation and administration of Export Sales Department; and to share visits overseas markets regularly in turn with Assistants. High-grade Painters' Brushes and other brushware. Adequate remuneration and assistance. Reply letter only stating age, career and any linguistic capabilities, etc., in confidence to The Secretary, Christopher Leng & Son, Ltd., Hazelwell Brush Works, Birmingham, 30.

FOR SALE: Volumes of *Economist*, unbound, 1946 (except 5368, 5370, 5372, 5384/5, 5387); 1947 (except 5436); 1948 (complete); 1949 (to June 4).—Box 212.

1949. That is to say, for such deliveries payment would be made at a price calculated at the exchange rate of \$4.03 to the pound sterling. If the price payable in sterling for future deliveries were calculated as heretofore—save that the rate of exchange were taken at \$2.80 instead of \$4.03 to the pound sterling—it would amount to £145 14s. 6d.

PROGRESS OF EXTENSION

Our programme for the extension of production to a figure of 64,000 long tons of copper per annum has proceeded satisfactorily during the year. I think we can confidently expect that the extension will be completed by the end of 1950 as I forecast last year. I then informed you that we had found it necessary to provide for additional items of plant and machinery and for further housing.

Our consulting engineers' most recent estimate indicates that the total cost of this programme will be £4,087,000. The increase in our production will, of course, make it necessary to carry larger stocks of copper and stores and to have a larger working capital.

For all these purposes we shall require not only the amount that was raised by the issue of shares in September, 1946, but also a substantial amount of the profits which the company has made. Your directors, therefore, in spite of the most satisfactory results of the year's working and of the increased profit arising therefrom, do not recommend to you the payment of a dividend for the year.

COAL SUPPLY PROBLEMS

Dealing with the coal supply difficulties, Mr Taylor referred to a statement issued in September by the Minister of Mines and Transport of Southern Rhodesia to the effect that the Central African Territories were facing a coal crisis likely to persist for at least another twelve months. The statement laid stress on the importance of the maintenance of copper production in Northern Rhodesia in relation to the dollar position of the Commonwealth and formulated the aim of the Ministry that the copper mines in Northern Rhodesia should be supplied with 46,000 tons of coal per month by next December or January. Mr Taylor expressed

the view that if these supplies could be delivered at the time forecast, and if some further increase in deliveries could be effected, in subsequent months, full production from all mines could be maintained until the end of the period of the coal crisis.

The report was adopted.

GENERAL CEYLON RUBBER AND TEA ESTATES, LIMITED

ADVERSE CLIMATIC CONDITIONS

The fifty-second annual ordinary general meeting of this company was held on October 11th in London, Mr J. Gilroy Annan (chairman and managing director), presiding.

The chairman, in the course of his speech, said:—

Tea crop shows a reduction of some 120,000 lbs. but it must be remembered that climatic conditions in 1948 were adverse. Rubber crop is only 7,000 lbs. below 1947. Due to the increased prices obtained for Tea and Cardamoms net sale proceeds are higher by £5,260 despite the lower price obtained for rubber. Estates working costs, however, have increased by £11,000.

The chief cause of the decrease in profit is the exceptional figure of £12,835 for capital expenditure written off. The heaviest individual items of capital expenditure during the year were the building of additional lines to the latest official specification on Gonamotava Estate and a new engine of higher horse-power on Veralupitiya Estate.

The available profit is £16,064. The board recommend a dividend at the rate of 5 per cent. after provision for which the amount recommended to be carried forward remains at almost the same figure as in the previous year. Provision for current taxation remains a grievous burden amounting to no less than £33,450 out of a profit of £56,729 before providing for capital expenditure.

Latest reports indicate that conditions have improved, and this gives hope that the results for 1949 may not compare unfavourably with the year 1948 now under review.

The report was adopted.

BRITISH born ex-Intelligence Officer, fluent French/German, now employed import/export firm in Germany, with 4 years' thorough working knowledge of Ruhr industry, seeks position with responsible British firm.—Write Box 226.

ASSISTANT Export Advertising Manager required by well-known Pharmaceutical and Toilet Manufacturers in London. Sound knowledge of advertising and media particularly in continental and colonial markets. Fluent French and German. Under 35. Excellent prospects for right man. Full details to Personnel Manager, Box 227.

INTELLIGENT, alert girl, 21, B.Com. (Including Statistics), fluent French, seeks interesting post.—Box 230.

RETIRED Regular R.E. Officer aged 50, seeks employment such as Secretary-Accountant or Assistant Works Manager, economic and accountancy qualifications.—Write Box 229.

EXPORT Executive, Graduate B.Com. London (first-class honours) and M.B.A. (Marketing) Chicago, age 33, now consular trade officer in Middle West. Experience marketing, market research and advertising practice in U.S.A. Open to offers, but prefers appointment in U.K. or U.S.A. developing U.K. exports. Interview U.K. October/November.—Box 214.

BRITISHER, 32, permanent resident U.S.A., wide knowledge American market conditions, good contacts Washington D.C., prepared to undertake research analyses or reports on commission basis on behalf exporter to U.S.A.—Write Box 228.

WIDELY travelled English gentleman aged 33, and his wife aged 27, shortly returning to the States, wish to help Export Drive in any possible way. Considerable selling experience; excellent contacts available.—Box 220.

SECRETARY required for large group of companies in Midlands. Previous industrial experience not essential; young chartered accountant of high mental ability with final examination honours or very good University degree preferred. Reply in confidence stating age, education, qualifications and experience.—Box 219.

YORKSHIRE—Good speakers on economics, industry and international trade required for occasional engagements; please indicate in first letter experience, qualifications and general attitude to nationalisation.—Box 218.

TRADING OVERSEAS?

Are you shipping to Canada, or the West Indies? Why not take advantage of this Bank's complete facilities? Our first-hand knowledge of these markets is at your disposal.

THE BANK OF NOVA SCOTIA

108, OLD BROAD STREET, LONDON, E.C.2.

Over 350 Branches across Canada, in Jamaica, Cuba, Puerto Rico, Dominican Republic, and London, England; an Agency in New York and Correspondents throughout the world.

Established in Canada in 1832 with Limited Liability.

REFUGE ASSURANCE COMPANY, LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £18,000,000
ASSETS EXCEED £107,000,000
CLAIMS PAID EXCEED £198,000,000
(1948 Accounts)

ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

Employers seeking the services of Certified Accountants are asked to write to the Secretary of the Association, 22 Bedford Square, London, W.C.1. (Telephone: Museum 5163.)

UNIVERSITY OF LONDON

A course of two lectures on "Britain's Land Economy" will be given by A. W. Ashby, Director of the Agricultural Economics Research Institute, Oxford, at 5 p.m. on 28th October and 4th November, at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. Admission free, without ticket. JAMES HENDERSON, Academic Registrar.

FAR EASTERN ECONOMIC REVIEW, LIMITED, HONG KONG

WANTED.—A Sub-Editor, with prospect of promotion for an established economic and financial Review published in Hong Kong and circulating throughout the world. Satisfactory salary and pension provided and terms to be agreed.—Apply Far Eastern Economic Review Ltd., c/o Hongkong and Shanghai Banking Corporation, 9, Gracechurch Street, London, E.C.3.

UNIVERSITY COLLEGE, EXETER

Applications are invited for a Research Studentship in Economics. Candidates should have a knowledge of Elementary Statistics. Further particulars may be obtained from the Registrar.

THE NATIONAL COAL BOARD invite applications for a senior post at their Headquarters, the holder of which will be responsible to the Board member concerned, to supervise the branches dealing with education and training, recruitment and related manpower functions. The functions of these branches include preparing recommendations on Board policy at national level, supervising its execution and dealing with Government departments and other bodies in relation thereto. The post, which is new, requires proved administrative ability of a high order. Applicants should have some knowledge of industry and of the educational and academic structure of the country. Salary according to qualifications and experience, but not less than £2,250 per annum. The post is superannuable. Apply in writing, giving full particulars (in chronological order) of age, experience, qualifications, and education (with dates) to National Coal Board, Establishments (General) Branch, Holport House, Grosvenor Place, London, S.W.1, marking envelope T.T.160. Original testimonials should NOT be forwarded. Closing date October 31, 1949.

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with limited liability).—ONTARIO AND QUEBEC RAILWAY CO., FIVE PER CENT. DEBENTURE STOCK, SIX PER CENT. COMMON STOCK.—In preparation for the payment of the half-yearly interest payable on the 1st December next, the Debenture Stock Transfer Books will be closed on 1st November and will be re-opened on 2nd December. The half-yearly interest on the Common Stock will be paid on December 1 to holders of record on November 1. R. F. TREMAYNE, Deputy Secretary, 8, Waterloo Place, Pall Mall, London, S.W.1. October 10, 1949.

PUBLIC RELATIONS.—Well-known, old-established consultants with extensive Parliamentary, official and commercial experience are prepared to undertake limited amount of additional work.—Box 221.

PETAUKE AFRICAN PRODUCERS ASSOCIATION require an ASSISTANT MANAGER. 1. DUTIES.—Responsibility for office routine and accountancy, supervision of agricultural activities of members and association, building construction and vehicle maintenance. He will also be called upon to deputise for the Manager when necessary. 2. QUALIFICATIONS.—Secretarial and accounting, versatility, preparedness to live in outstation and interest in outside work involved. 3. CONDITIONS OF EMPLOYMENT.—Will be governed by three year contract. Salary will be £500 to £600 per annum according to experience and free accommodation and essential heavy furniture will be provided. The successful candidate will be expected to commence duty before January 1, 1950. 4. APPLICATIONS.—Will be received up to and including November 15, 1949, by the Manager, Petauke Producers Association, Petauke, Northern Rhodesia.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22, Ryder Street, St. James's, London, S.W.1. U.S. Representative: R. S. Farley, 111, Broadway, New York, 6.—Saturday, October 15, 1949.

BANK OF SCOTLAND

Constituted by Act of Parliament 1695

AUTHORISED CAPITAL £4,500,000
CAPITAL FULLY PAID £2,400,000
RESERVE FUND & BALANCE carried forward ... £3,183,107
DEPOSITS & CREDIT BALANCES
as at 28th February, 1949 £94,056,630

Head Office: THE MOUND, EDINBURGH

Over 200 Branches and Sub-Branches throughout Scotland

London Offices:

CITY OFFICE, 30, BISHOPSGATE, E.C.

THE ALEXANDRIA WATER COMPANY, LIMITED

ALEXANDRIA—EGYPT

INTERIM DIVIDEND

NOTICE IS HEREBY GIVEN that an Interim Dividend of FOUR SHILLINGS per £5 share on Coupon No. 122 will be paid without deduction of British Income Tax but less Egyptian Government and Alexandria Municipal Taxes amounting to 5.994d., making 3s. 6.096d. net, on and after October 15, 1949, at the National Bank of Egypt, in Alexandria at Rue Toussoun, or in London at 6, King William Street, E.C.4.

Dated, Alexandria, Egypt, October 1, 1949.

By Order of the Board,
ROBERT WALTON, Manager.

UNIVERSITY OF LONDON

DEPARTMENT OF EXTRA-MURAL STUDIES

Applications are invited from persons with high academic qualifications and suitable experience of adult education for inclusion on the panel of University Extension lecturers. University Extension lectures offer an essentially liberal opportunity for information and discussion of University standard. All appointments are of a part-time character. Vacancies are most likely to occur in the following subjects:

Applied Science
Archaeology and Local History
Economics and Economic History
Field Biology
Literary and Artistic Criticism
Music
Psychology
Social Studies

Successful applicants may be invited to undertake evening lecturing in the Greater London area and in several Home Counties. Applications are particularly invited from persons resident in Essex and Surrey. Further information and application forms may be obtained from the Director (Extension Lectures), Department of Extra-Mural Studies, University of London, Senate House, W.C.1.

UNIVERSITY OF SYDNEY

Applications are invited for the position of *Lecturer in Economic History*. The salary is in the range £500-£750 (Australian) per annum, plus cost of living adjustment with annual increments of £50, and is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to qualifications and experience. The successful applicant will be required to take up duties as early as practicable in 1950. Further information may be obtained on application to the Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1. Applications, supported by testimonials and giving the names of three referees, should be forwarded to reach the undersigned not later than October 31, 1949.

G. DALE, Registrar, University of Sydney,
New South Wales, Australia.

A BANKING CAREER IN THE EAST

THE EASTERN BANK LTD. has a few vacancies in executive positions for suitable men willing to enter into a banking career in the East. Applicants should be between 20 and 24 years of age and unmarried. Applications, which should include particulars of banking training, should be addressed to The Secretary, The Eastern Bank Ltd., 2-3, Crosby Square, London, E.C.3.

FEDERATION OF BRITISH INDUSTRIES. Applications are invited for the post of Head of the Industrial Research and Education Section. Candidates should have a good technical or science degree, administrative ability and some experience in scientific and educational work in industry. Initial salary £800 per annum. Post is pensionable. Desired age range 30-40. Full particulars from The Technical Director, Federation of British Industries, 21, Totterdell Street, London, S.W.1.

INTERVIEWER for public information research (girl) required. Applicants should have good education, be under 30 years of age and have experience of some work involving personal contact. Must be prepared to travel for approximately half time. Good appearance and manner important. Salary up to £375 per annum according to experience.—Write giving age, details of experience, photograph if possible to Personnel Officer, Mars Limited, Slough, Bucks.

Realism on the Left

THE announcement of what the Government think it necessary to propose as the "consequential measures" of devaluation has been postponed until Monday. It would be foolish to speculate on what will be in the proposals. One prophecy can, however, be made with complete certainty about what will not be found in them. There will be no major changes of policy. There is not the slightest reason to suppose that Ministers are planning anything more than another holding operation, another attempt by trimming incompatibilities down the edges to pretend that they can be made to fit. The object of the present plans was clearly stated in Sir Stafford Cripps's speech in the devaluation debate. Last April's Budget, he said, was turning out to be less disinflationary in its effect than had been intended. It is therefore necessary to propose measures to put this right. The Government are not contemplating any new policy; at the most they are trying to get back to where they thought they were six months ago. Even this is evidently proving to be difficult, and it will be necessary to wait until Monday to see whether the whole of the Cabinet is able to screw its courage even to this preliminary sticking-place. It is perfectly safe to proceed on the assumption that they will not go beyond it.

Ministers' speeches in recent weeks have revealed very clearly which way their minds are turning. They now openly avow that a reduction in the standard of living is inevitable—nor do they any longer claim that it will be limited to a rise in the price of bread. Even the old belief that there are reserves of productivity, to be summoned by oratorical magic from the vasty deeps of the Labour movement, has disappeared. It is a static conception of the economy that peeps out of Ministers' speeches and it puts them into a defeatist mood. Since imports must be cut and exports must be increased, and since there is nothing more that can be done at home, the only recourse is to cut down the real standard of living of the people.

This defeatism is wholly unjustified. There may, indeed, have to be some reductions in the general standard of living (though the necessity should not be taken as by any means self-evident). But it makes a very great deal of difference whether these cuts are temporary measures forming part of a specific programme for the liberation and re-invigoration of the economy—much as the hand-brake of a car has first to be pulled tighter before the catch can be released—or whether they are one more instalment of cuts in a procession that is no longer leading anywhere. What is most depressing about the Government's proceedings is that they have obviously lost their hope. They have no more shots in their locker. They cannot apparently lift their eyes to the possibility of restoring the dynamism of the British economy.

Defeatism inevitably leads to defeat, and, as was argued last week, this is what now clearly faces the Labour Party. This is not a prophecy that they will be thrown out of office at next year's General Election, but it is a prediction that, if their present course is unaltered, most

of what they stand for in British politics will be forced to beat a retreat, and the humiliation to the party may be worse if it is then in office. But any such result would be a tragedy, and a defeat for the British people too. What the country needs—and, to judge by any visible indication, would vote for overwhelmingly—is a realistic and effective policy of the Left, one that accepts the objectives of Labour (or most of them) but pursues them, not by the blind rule-of-thumb of theory and prejudice, but by effective policies based on realistic assessment of the facts. It is just this quality of scientific realism that has been most disappointingly absent from the Labour Government's activities.

★

As Professor Pigou pointed out many years ago, there are three objectives of economic policy—to make the national income larger, to make its flow more regular and to make its distribution more equitable. Everything that is worth doing can be comprehended within those three aims. The first is a high standard of living, to be achieved by the efficiency of the economy. The second is nowadays known as full employment, to be achieved by stability. The third is social security or, in vaguer terms, “fair shares” or social justice. What has happened to this country for a generation past is that it has been led by a variety of causes to pay almost exclusive attention to two of the three objectives, to stability and social justice, while ignoring the efficiency of the economy. Accidents of world history insulated the British economy in the inter-war years from the effects of neglecting efficiency, but they are now falling upon us in their full weight. Even now it is not necessary to ignore the other two objectives—stability and equity, full employment and social security—or to compel them to beat a retreat. But what is absolutely essential is that the pursuit of economic efficiency—which is not the same thing by any means as mere quantitative productivity—should be restored as quickly as possible to the top priority. A Labour Government which was earnestly interested in saving its skin would devote itself to the search for all possible means of rapidly increasing economic efficiency. It would not deceive itself with the belief that efficiency (any more than stability or equity) can be secured merely by saying how desirable it is, or by pleading for it. It can be secured only by the deliberate creation of conditions that put a premium on it and a severe discount on the absence of it. There is no mystery about what these conditions are—they involve bringing back the great adjusting force of competition and liberating the price system.

It is intended in the present series of articles to discuss what could be done in the immediate future to restore the necessary flexibility to the British economy. But it may be as well, as a preliminary, to inquire what moral sacrifices such a programme of economic liberation would require of the Labour Party. It would not involve the abandonment of any fundamental objectives of the Left. There is no incompatibility between full employment and a price economy—indeed, if genuine employment is to be kept at a maximum it is more than ever necessary that the economy should be equipped with some automatic test of efficiency and some equally automatic method of adaptation to changing conditions. There is also no necessary incompatibility with the principle of social security—quite the contrary, since a comprehensive

scheme of social security removes the reproach from the price economy that it achieves its results by inhuman methods. There is not even a necessary incompatibility between the price economy and the principle of public ownership, for which it would provide some of that “efficiency auditing” of which Mr Morrison has spoken.

But if an attempt to liberate the adjustment mechanisms of the British economy would not require of the Labour Party any abandonment of their fundamental objectives, it would require them to submit some of the positions they have taken up in the last four years to the test of a comparison with the facts of life, especially with the facts about the imperfections of the human race. They would have to stop behaving as if to say that a thing is desirable is the same thing as to say that it is possible. For example, in an ideal world there would never be any unemployment. But if in the actual world any policy that runs any risk of raising unemployment above its present absurdly low level is to be banned, the only result, as everybody knows, is to freeze the manpower of the country in its present distribution and prevent it from making its maximum contribution to the efficiency of the economy. In an ideal world, workers would not mind changing their jobs when the national interest required it. In the real world, as everybody knows, they will not do so unless there is something to push them in that direction. A sound policy does not require the abandonment of full employment; but it does require the acceptance of what Maynard Keynes, the inventor of the term, would have been glad to accept as full employment—that is, the minimum that is compatible with leaving some motive force for adjustment in the economy.

Similarly, in the case of social security, including the health and education services, there is no need to abandon the salients that have been pushed out, but only to base the administration of the schemes on assumptions about human nature that correspond to reality. In an ideal world, people would not abuse a “free” service; in the real world, a disappointingly large number of them do, and it is silly not to admit the fact and draw the obvious consequences from it. The principle of “less eligibility”—that is, that people should be better off when earning their own keep than when living on state benefit—is not a favourite of the idealists; but in a human society some element of it is necessary, and any social security scheme that wholly ignores it will not only be hopelessly wasteful of public funds but will drag down the efficiency of industry.

★

This is not a plea to Labour to admit that human beings are motivated only by fear and greed; but it is a plea to Labour to admit that human beings are not motivated by idealism alone—even when the wicked profit-earners are excepted. So long as human beings remain less than perfectly altruistic, they will achieve more under a system of sanctions and rewards than without it. There is no need to go back to the nineteenth century. But the British economy will not be as efficient as it could be so long as there are so few sanctions for inefficiency and so few rewards for efficiency as there are today.

“Fair shares” is another Labour doctrine that needs not abandonment so much as re-definition. It has come to be almost synonymous with “equal shares,” which is

an entirely different thing. Whether or not “equal shares” is ethically desirable, it certainly spells ruin to economic efficiency. Even the trade unions see that, within their own ranks, as they show by their insistence on the retention of wage differentials—though they still do not see it as between themselves and the rest of the community. If the concept of “fair shares” is not to ruin the country, it will have to be elastic enough to permit a larger share for those who contribute more than their fellows to the efficiency of the economy. And though the ability to offer a higher price is by no means a perfect test of contributions rendered, it is the only test that exists—and not nearly as bad a test in general as the highlighting of its failures would suggest.

Finally, a government of the Left that was concentrating on efficiency, as a means of saving its other policies, would have to revise its attitude towards profits. Within the individual firm or industry, at any one time, wages and profits may be rival claimants for a limited income. But in the economy as a whole, anybody ought to be able to see that wages and profits are partners, not rivals. Certainly they go up and down together, and there has never been a time when one was high without the other also being at a peak. The sensible attitude for a workers' government to adopt is, by enforcing competition in industry, to make it as difficult as possible for employers to earn profits without being efficient and that having been done, to allow those who do succeed in earning profits to derive some benefit from them. What the Labour Government has in fact done, is the exact opposite—it has made the earning of profits as easy as falling off a stool, but has allowed neither industry nor the owners of industry to derive enough benefit from them to provide any incentive. High profits today, like high wages, are neither a proof of, nor a spur to, efficiency; until they are, there will be less efficiency in the British economy than there might be.

In all these matters of attitude and approach, there is no call to rush to the opposite extreme. But there is a need to allow common sense and common knowledge to

modify the extreme positions that Labour has taken up.

The country so badly needs an increase in its economic efficiency (which is almost synonymous with a reduction in its real costs of production) that it will have to pay whatever price is required to get it. In fact, however, the price is not higher than a government of the Left could reasonably be required to pay. Certainly, the Labour Party will be very foolish if they persist in refusing to pay the price in mental concessions that is needed to secure efficiency. For they really have no choice. If they swallow their pride and pay the price, they could evolve a policy that would release the dynamic forces of the economy and provide real hope of a final solution of the British economic crisis within a very few years. If not, there is no prospect but of sullen retreat from one ditch of expediency to another until one of them proves to be the last. It is possible even now to have an economic policy that would banish mass unemployment, that could afford a comprehensive scheme of social security, that would preserve at least the greater part of the redistribution of national income to the poor that has occurred in the last decade, that would leave room for public ownership of some sectors of the economy. Such an economy would not be as productive as one that was less directed and less burdened with government expenditure; it would not achieve North American standards of output or of income. But there is no reason to doubt that it could attain the minimum of efficiency that is imperative for any British economic policy at the present time—that is, enough efficiency to support the present standard of living and to balance the international accounts.

That is the prospect which could be held out by a government of the Left that set out to have an effective policy, that stopped governing by instinct, by sentiment and by ancestral grudge, but defined its objects and chose methods that were rationally designed to achieve them. What an almighty pity it is that the Labour Party prefers to prove the Tory contention that a government of the Left leads infallibly to disaster.

The Pieck Republic

THE shape and purpose of the new regime in eastern Germany are now clear. The new “German Democratic Republic” in Berlin has joined the group of east European satellites of Soviet Russia. Its carefully picked government, dominated by Communists and fellow travellers, has been given by Moscow promises which, though vague, provide Herr Grotewohl and his colleagues with a measure of power and an appearance of sovereignty sufficient for the task in hand. They probably hoped to graduate straight into the company of genuine people's republics; but they have not made the grade. Not only is Soviet—or rather Russian—distrust of the German as great as ever it was; but Herr Grotewohl needs more time to work through the well-known stages of conspiracy, blackmail and suppression, by which Communists in a coalition squeeze out their “bourgeois” collaborators, overwhelm all opposition in a rigged election, and then liquidate the critics and the “splitters.” Only a “monolithic” German republic will command any confidence among the Russians. So there is much to do before the right verdict on the new government and its powers can be secured in the elections to be held next October.

That Herr Grotewohl and his president Herr Pieck can work fast and efficiently has been demonstrated in the events of the last fortnight. Between the sudden demand for a rival government to that in Bonn and the formal approval of the new Cabinet and constitution, only eight days passed. It was the Socialist Unity Party—Communist controlled and dominant throughout the Soviet zone—that launched the demand, and so gave the signal on October 4 for the party machinery in factories, offices and villages to roll out resolutions, demands and proposals for a programme and a government. It was the People's Council—long held in readiness for just this occasion—that proclaimed itself a “provisional people's chamber,” approved a constitution prepared last May and set up a chamber for the *Laender* and eastern Berlin. By October 12th these two chambers had elected as President Herr Pieck, whose past record is a guarantee of subservience to Moscow, and as Prime Minister, Herr Grotewohl. Their cabinet was approved in a matter of seconds. To welcome Herr Pieck there appeared, as if by magic, in the Unter den Linden some half million demonstrators, whose marching by torchlight in columns

of sixteen matched that of the storm troopers who marched past Hitler on the night of January 30, 1933.

This rapid, vigorous, demonstration of "national self-aid in an emergency" was planned to reach its climax in a speech by General Chuikov, head of the Soviet Military Administration, which was expected to announce a revolutionary change in the relations between Russians and Germans.

★

And here we come upon a mystery. What General Chuikov said was limited in interest and cautious in tone. The key paragraphs were these:

In connection with the above-mentioned decisions of the German People's Council, the Soviet Government has decided to transfer to the Provisional Government of the German Democratic Republic the functions of administration which hitherto belonged to the Soviet Military Administration.

In the place of the Soviet military administration in Germany a Soviet Control Commission will be established charged with exercising control over the fulfilment of the Potsdam and other joint decisions of the Four Powers in respect to Germany.

Whatever else this may be, it is not an assurance that sovereignty and independence are given to the Pieck Republic. It is not a promise to bring the occupation to an early end. In fact, the nearest that General Chuikov came to such a gesture was when he said that "one cannot help but recognise as legitimate the striving of German democratic circles to take into their own hands the restoration of the unity of Germany and bring about the renaissance of the country and democratic and peace-loving principles." Equally cautious is the comment of the newspaper in which Communists look every fortnight for the party line—the Cominform journal. This simply says that "the Soviet Government has handed over the functions of administration in eastern Germany."

The colleagues of Herr Grotewohl have been far less restrained in their interpretation. They hint broadly that the new republic has genuine independence and that it will manage its own foreign and trade policies. Their information authorities have even put out the claim that Germany now has "a sovereign legal government entitled to recognition under the law." Herr Dertinger, who has been given the title of Foreign Minister, has spoken of "the moral conclusion of a peace treaty" and of "sincere avowals of friendship" between Russia and Germany. There have been exaggerated and unconfirmed reports of imminent withdrawals of Soviet troops. Moreover, in all the bitter and unceasing attacks that have been made against the Bonn government, the suggestion is made that everything which is still controlled in the west will now be free from outside interference in the east. It is implied that the Russians will, henceforth, have no hand in the running of eastern Germany's economic life, that reparations will cease, that political and intellectual life among the 17 million Germans east of the Elbe is free, and that a unified Germany can gain independence only under the leadership of the Pieck clique. Only when the Polish-German frontier is mentioned does the truth break through: the Saar, it is said, must come back to Germany, but the Oder-Neisse line must stand as the "frontier of peace."

The game that is now beginning is perfectly clear. To the west the Pieck Republic will present a smiling, pink, cleverly made-up profile; to the east it will present a profile with serious, plain, modest expression. Its propaganda activity will be the principal political weapon

of Moscow in the struggle for Germany. Its government will claim rights to enjoy power and liberties which the Soviet Government will not publicly deny but which in practice it will ignore. In turn the government in Berlin will offer leadership—extreme nationalist and patriotic leadership—to all west Germans who will listen. If they should begin organised and violent resistance to the Allied occupation, then they can be officially disavowed by Herr Grotewohl in the same way that Hitler used to disavow Henlein's rowdies. They will be simply members of the "National Front" struggling for German unity and independence. This is what Herr Pieck means when he speaks of "collaboration with progressive forces in western Germany"; and he has made it quite clear that, so far as he is concerned, every nationalist and "peace-loving" German is a good German.

We must gain the votes of every section of the population in western Germany, including those who followed Hitler and were made to collaborate in this disastrous war.

The game is a difficult and dangerous one, because the Pieck Republic cannot enjoy the full protection of the iron curtain. There will be sufficient movement of individuals, sufficient trading relationships, sufficient listening to radio and reading of newspapers to enable the Germans of the west to ascertain what is really going on among the Germans of the east. And if Herren Pieck and Grotewohl are to get the majority they want in next year's elections and to move forward to the genuine people's republic on the Soviet model, they will be obliged to take measures which will look tyrannical and unscrupulous to those who enjoy the freedom and relative prosperity of the Federal Republic in the west. What success they can achieve will depend more and more on what concessions they can seem to secure from the Russians; it is only with those concessions that they can make nationalist feeling in the west strong enough to overcome German fear and hatred of the Russians.

★

Stalin himself has done what he can to give the Pieck Republic a flying start. He sent last week to its president and prime minister a message which will take a high place among the cynical and sinister documents of history. Wishing them success on their "new and glorious" road, Stalin said:

The experience of the recent war showed that the biggest sacrifices in this war were borne by the German and the Soviet peoples, that these two peoples possess the greatest potentials in Europe for accomplishing great actions of world importance. If these two peoples display determination to fight for peace, straining their energies to the same extent as they did to wage war, peace in Europe may then be considered as secure.

Some such message from Stalin to the head of a German state was sooner or later to be expected; Soviet policy has pointed that way ever since 1945. But that such a message should be sent already, only four years after the war, is a measure not only of Soviet determination to harness German nationalism to its own "actions of world importance," but of the weakness of the men chosen to be its leaders. The Allied governments should take heart from this gesture and counter it with a bold, genuinely liberal policy towards the freely elected government of Dr Adenauer. That government may not be perfect. But its virtues shine brightly when compared with the pre-fabricated attractions of the Pieck Republic.

The Principles of Libel

THE Prime Minister refused on Tuesday to find time in the present Parliament for any reform of the law of libel. Whether or not this will turn out to be a pity depends on whether the public discussion of the subject remains where the Porter Report left it twelve months ago. Sir Valentine Holmes, KC, than whom nobody has a more profound theoretical knowledge of the law of libel or a wider practical experience of its working, performed a real public service in his recent address to the Institute of Journalists by removing the whole subject to a wider plane. Far more than either the Porter Committee or, indeed, the Press Commission itself, he presented the basic considerations that must control the balance between what is published and what is not published in the press. The Press Commission had a great deal to say on why newspapers do not publish political views they do not agree with; rather less on the other restrictions on the freedom of the press. Today newspapers are small. They deal with events, politics, sex, crime and sport. It is easy to forget what is largely left out: comment on people. There is a little social gossip, rather more publicity for the entertainment world, and that is all. No English newspaper could have exposed the machinations of Mr Sidney Stanley while they were in progress, nor even undertake the kind of personal appraisals to be found in the "Profiles" of *The New Yorker*. Why? One of the main causes is fear of a libel action. It does not matter very much (except to the proprietors of the paper) if a defective law of libel compels a newspaper to pay £5,000 in damages when the fair sum should have been £500. Nor does it matter very much if a newspaper pays £50 to settle a libel action that should never have been brought. What does matter is that the reporter, the sub-editor and the editor may be frightened to publish what they know to be true, frightened to state a belief that they honestly hold, because a defective law of libel may make them pay for their sense of duty.

Sir Valentine Holmes goes back to principle. In his address he gave what he thought were the principles of the law of defamation as they emerged during the nineteenth century—that is, before it began to be changed by the further verdicts and rulings of the last fifty years. They are, first, that a defendant should not be

liable for a published libel if his conduct in the matter had been that of a man of ordinary intelligence and foresight using ordinary care and, second, that the right of the individual not to be defamed must be subject to the overriding right of the community to be given information on certain subjects, on certain occasions, on matters in which it may properly claim to have a public interest.

The basis of the law of defamation is this: the common law right of every man not to be held up to the hatred, ridicule or contempt of his fellows as a result of a false statement made about him by some other party. Obviously, the field of possible false statements is of infinite range, from a whisper in a shopping queue that Mrs X's husband habitually cycles at night without a rear light to a headline in a newspaper that a Cabinet Minister has been arrested for embezzlement. The law of defamation has been compelled to adapt itself to a fast changing civilisation. It has made valiant attempts to keep pace, but it has failed, and failed particularly where newspapers are concerned. That failure has many social consequences. The report of the Porter Committee had some valuable recommendations to make concerning the law of defamation where the defamer and the defamed are, so to speak, on the same level of influence. But, from a public point of view what is of much deeper importance is the position of the public purveyor of news and comment, the publication which has a duty to perform and which can yet do so much damage to the individual as and when it performs it.

★

As the law stands today, a newspaper has various defences open to it when sued for libel. It can set out to "justify" the statement complained of, that is, prove that the statement was absolutely true. But if the published words were wrong in one single fact, that defence will almost certainly fail. It can plead "fair comment," that is, that the comment it made was based on opinions honestly held. But again if any fact mentioned in the same context as the comment was incorrect, that defence may fail, because the courts have held that opinions apparently based on even a single mistaken fact cannot be said to be "fair comment." The newspaper may plead, where the libel is contained in a report of some

£1,000 ON RETIREMENT...

... at age sixty-five, or on previous death, may be assured through an endowment policy for an annual outlay of £25 12s. 6d. from age thirty. Only £4 18s. 4d. more secures the right to participate in profits which, if maintained at current rates, would yield a further £607 by way of reversionary bonuses at age sixty-five.

The premiums for other sums assured, ages or terms of years will be quoted on application.

OUTSTANDING VALUE IN LIFE ASSURANCE

event, that the occasion on which the libel was uttered or printed was privileged. The privilege may be "absolute." In that case the newspaper need only prove the occasion on which the words were uttered, but absolute privilege only extends to what is said and done in Parliament or in contemporaneous reports of judicial proceedings (and the phrase "judicial proceeding" is of uncertain meaning). The privilege may be "qualified." Qualified privilege exists in common law where the person publishing the statement has a duty or interest in publishing it and each person to whom it is published has likewise a duty or interest in receiving it (an uncertain state of affairs for a newspaper editor to decide in his nightly rush). It also exists under statute law, the Law of Libel Amendment Act, 1888. Under that Act a "newspaper" may publish reports of certain proceedings, such as public meetings, and claim qualified privilege if it does so fairly. But "qualified privilege" is no defence if the person libelled proves that the writer or the publisher was motivated by "malice," or wrong motive, and what editor can check every motive in the head of every contributor? Further, the definition of "newspapers" in the 1888 Act does not cover publications where the interval between each published number is greater than twenty-six days.

That is a skeleton of the law of libel as it applies to newspapers; it closely resembles the game of snakes and ladders. A twist of luck may defeat almost any defence, bring calamity on the completely innocent. When, in 1939, the *Daily Express* published the fact that a certain Mr Y, of Camberwell, had been convicted of bigamy (which was true), how was the sub-editor who passed the paragraph to know that there were two Mr Y's in Camberwell, with identical names but not identical habits? The non-bigamous Mr Y recovered damages.

★

To return to Sir Valentine Holmes's propositions. The first is, in essence, the case of Mr Y of Camberwell all over again. No newspaper can know how many men of the same name live in the same place at the same time, nor can its staff be expected to check every statement made to them by the person who should know; as, for example, that the lady with him when his photograph is taken is his wife (acceptance of a man's statement on that subject cost the *Daily Mirror* damages in 1929). A newspaper gambles every time it publishes the briefest statement of fact. The Porter Report recommended that the newspaper should be entitled to offer the injured party a published correction and apology, refusal of which would leave on the complainant the onus of proving that the newspaper had failed to exercise reasonable care. But it is still important that the principle on which amendments to the law are made should be settled before the detail. The case of the two Mr Y's is essentially simple. It is based on a statement of fact and, if that statement of fact is wrong or misleading, it can be corrected. What is important is that the men responsible for publishing a newspaper should not feel that the law expects from them an impossibly high standard of care. They know that they cannot maintain it consistently and, as a result, they refuse to take any risk. If the same standard of care were demanded from the motorist, the roads would be empty.

What is infinitely more complex, and yet has far

greater social consequences, is the statement of opinion or comment. On what occasions can the rights of the public to information be said to override the rights of the individual to personal protection? That is the core of the question, too easily obscured in the fog of technical detail.

Comment is as much a function of a newspaper as the supply of news, and a function increasing in importance as the public comes to rely on other sources for its plain news. At the moment it is a fact that it is more difficult for a newspaper to comment adversely on the activities of a man with a bad record than on one with a good record. A newspaper has greater facilities for obtaining information than any individual, and yet the law has come to tie its hands in this way. It may be said that newspapers would abuse any larger measure of freedom to criticise those in public life. The press is not perfect, but may not some of the cynicism of Fleet Street be due to the fact that working journalists know that nothing is more dangerous to them, personally, than an honestly based attack on a vicious and astute public figure?

But there is another side to the argument: is the public figure who fears and resents any adverse comment a wholesome adornment to public life? No man today can be a social island. The tides of taxation wash away every man's substance, even though the currents of social security may offer him a lifebelt in exchange. The man in public life has his own rewards for what he gives up; they may be the sense of duty done, they may be the sense of fulfilment in power. But he cannot at the same time claim that he is still so much the private individual that he is entitled to escape comment, particularly adverse comment, in everything he does. He has given that up by his own decision. If he repents its loss, he can retire. He cannot ask that his cake remains whole while he is eating it.

It is not necessary, or possible, here to consider all the various detailed amendments to legal rules proposed by the Porter Report. All their proposals are important. If implemented to the full, a great many of the specific criticisms of the law currently made would be met. But the Porter Report has not been enough; it certainly has not produced results in the shape of legislation. May that not be because it is, to the layman, no more than a mass of legal technicalities? On this, in particular, the principles that Sir Valentine Holmes has extracted may have a force that the Porter Report lacked.

Will anything be done? It is hard to avoid cynicism over the attitude of politicians when the need for this kind of legal reform arises. Perhaps politicians are not to be blamed if they pay no heed to the silences imposed upon the press when all their days are filled with the clamour of those who can shout. Perhaps it is inevitable that the claims of a sectional interest are easier to satisfy—or, at least, appease—and therefore are given the parliamentary priorities. And this Parliament is too near its dissolution to be deeply concerned over its sins of mere omission. It is to be hoped that the next Parliament will have as much inclination as it will have time to deal with a controversial but, for once, non-partisan subject.

But it is not a matter which can be put right by legislation alone. Even if a new statute could expunge

the rulings which have tended to give a false interpretation to the principles on which the law of libel rests, there would still remain the difficulty that the attitude of judges and more particularly of juries tends to be hostile to defendants in libel cases, especially if they are newspapers. Perhaps the time that must now elapse before new legislation can be introduced could

Indians in the Empire

THE Indian minorities in the Commonwealth are in many ways like the Jewish minorities in Europe. In two Dominions and a dozen colonies, covering the tropical belt of the world, they constitute a growing problem in Commonwealth relations and an important factor in the domestic affairs of the countries concerned. Cut off for many years from their homeland, these 2,500,000 Indians have nevertheless rigidly maintained their racial and religious identity. They have not intermarried or mixed with the local populations. They have the reputation of being sharp dealers in trade. They work their small holdings more economically and more industriously than their easy-going white and black neighbours. They are for the most part thoroughly disliked, as much for their virtues as their vices, and in some parts of the Commonwealth they have been hounded into slum areas as bad as any of the ghettos of Europe. From time to time, as in Durban in January this year, feelings against them are excited to such a pitch that waves of anti-Indian rioting, like the periodic waves of anti-Semitism in Europe, break out.

During the past two years, the grievances of these Indian minorities have been thrust on to the international scene because of the emergence of India and Pakistan as powerful, independent nations with highly sensitive governments. The minorities have been encouraged by India and by some other members of the United Nations to make greater efforts to secure the same political, economic and social rights as the dominant section of the people among whom they live. In each country where an Indian minority exists, demagogues have come to the fore, rousing the local Indians to strike out for themselves and to demand a radical improvement in their status. So far they have approached success only in the colonies of Mauritius and Fiji, where they are not strictly minorities at all but actually outnumber the local population.

★

The Indians were brought into most of the countries concerned under the indentured labour schemes which were introduced by sugar planters in the middle of the nineteenth century; all the important minorities are to be found where there are, or were, big sugar plantations. The original workers were for the most part coolies and, although their contracts provided for their return to India after five years, the great majority elected to stay on in the countries to which they had been sent. Many settled on small holdings which they worked themselves and a few took to trade; their net reproduction rate in every area is greater than that of the local population. Even by the beginning of this century, when the indentured labour schemes came to an end, their numbers had already swollen enormously.

profitably be employed by the press in creating a wider recognition among the public of the vital importance of being able to expose fraud, hypocrisy and evil without fear of retribution. Only if the public can be won to an appreciation of the necessity for hearing whole truths can an intelligent attitude to libel and defamation be rekindled.

The present approximate distribution of Indians in the Commonwealth is as follows:

Country	Total Population	Indians	Natives	Europeans	Others
Kenya	4,055,000	90,900	3,907,600	29,500	27,000
Tanganyika ..	5,491,000	44,200	5,417,700	16,100	13,000
Uganda	3,962,000	33,900	3,918,300	7,600	2,000
South Africa ..	11,258,300	282,500	7,735,000	2,335,000	905,000
Malaya	5,900,000	608,000	2,544,000	47,000	2,700,000
Mauritius	439,000	279,000	137,000	10,000	(2,615,000 Chinese) (12,000 Chinese)
Ceylon	6,000,000	666,000	Natives and Others		
Fiji	246,000	126,000	5,354,000		
British Guiana	376,000	165,000	120,000		
Jamaica	1,350,000	26,000	165,000		
Trinidad	590,000	140,000	211,000		
			1,324,000		
			450,000		

There are also a small number of Indians in West Africa and some 40,000 Sikhs permanently settled in Canada.

The political status of the Indian minorities varies to some extent from country to country. In South Africa they have very few political rights and no representation in the House of Assembly. They may not own land except in certain specified areas, and they are suppressed as much as the other coloured races. In East Africa they are represented on the Legislative Councils, but they suffer from a number of minor restrictions designed to ensure the position of Europeans and Africans. In Mauritius, Fiji and the West Indies, they enjoy equal political rights with the local population; but in Fiji there are special regulations to protect the islanders against exploitation and against the danger of being forced by pressure of numbers out of their own country. In Ceylon the Indians are represented in Parliament, but they are under minor restrictions to prevent the swamping of the native vote at elections by temporary visitors from India. In all the countries their political position is further complicated by the division of the Indian minorities into Moslems and Hindus, one group looking to Pakistan and the other to India.

The ways in which the Indians earn a living in the various countries have more in common. They fall roughly into two groups—traders and husbandmen—of which the second group is usually much the larger. The traders specialise in buying local produce for marketing elsewhere and in supplying the minor needs of everyday life. Here and there they have grown exceptionally wealthy: in Nairobi, for example, they own most of the major hotels. The husbandmen work small plots, growing sugar cane, vegetables and fruit. They are skilful cultivators, but only a few have risen above their original coolie status. A handful of Indians in each country have taken to politics or to one or other of the professions.

The Indian Government's attitude to the minorities is that they are primarily nationals of the countries in

which they have settled, and that India's interest in them is the same as it would be in any other racial minority in any other country. Nevertheless, the Indian Government has sent special commissioners to each Commonwealth country which has a large Indian minority. The commissioners have been charged with the task of looking after the interests of Indian settlers, but inevitably they have come to take prominent parts in the life of the local minorities. Without actually fostering local agitations against the different governments they do not withhold their sympathies and they serve as a strong link between the local Indians and India itself. News of Indians abroad figures prominently in provincial Indian papers, while news of India is usually the main topic in the press of the minorities. The visit of the Indian cruiser, HMIS *Delhi*, to Mauritius and East Africa in the early summer was also calculated to cement the bonds between India and the Indian minorities and, one suspects, to demonstrate something more than verbal support. It is clearly the Indian Government's policy to help the minorities to obtain an equal say with the other races in the government of the countries concerned, even if that involves seeking support outside the Commonwealth—for example, at Uno.

Dominion and colonial governments, on the other hand, have been more concerned with ridding themselves of the racial problems which the Indian minorities have caused. It is their fear that the more rapid increase of the Indian populations and the growing violence of the agitations and counter-agitations may lead to upheavals which will be beyond their control. The tendency, therefore, has been either to try to segregate the Indians or to induce them to return to India.

Neither policy has succeeded. Segregation is only possible where there is fertile land to spare; in any event, for all their racial isolationism, the Indians depend for their living on their trade with the other inhabitants. To cut them off from this trade and to herd them together in "reserves" is impracticable and morally indefensible. It could only exacerbate Indian feeling

and it would inevitably lead to bigger and better agitations. Returning the Indians to India is also more difficult than it seems. India regards these minorities as South Africans, East Africans, Jamaicans, or whatever their nationality is, and will not accept responsibility for them. The Indians themselves do not want to return to India, where most of them would probably be worse off than they are now, and the fairly substantial cash inducements which the South African Government, for instance, has offered have had very little effect. Nor is it right that the Indians should be asked to abandon their homes and to start new lives in a country which, to most of them, would be strange and foreign.

*

There is no single or easy solution to the problem. The one possibility is that the Indians should be absorbed into the countries of their birth and that they should abandon their minority status. They will have to be persuaded to give up their racial identity, to allow their children to attend the same schools as the children of other races, and to mix freely with the people among whom they live.

If this is indeed the only practical solution, then the first step—as many Commonwealth delegates at the conference at the Bigwin in Canada argued last month—is thorough re-examination within the Commonwealth as a whole of the subject of racial relations. For there are two sides to the discussion, which can best be resolved by the joint action of the Commonwealth. On the one hand, the Dominions and colonies which contain the minorities have to be persuaded that their true interest lies in removing the legitimate grievances of the Indians; on the other hand, India and Pakistan have to be persuaded that their irredentist support of the minorities only serves to heighten their racial exclusiveness, and that they should not seek support from governments which are not genuinely interested in the minorities but which are interested in fostering discord in the Commonwealth.

NOTES OF THE WEEK

Parliament and Policy

The Cabinet is finding the evolution of an agreed economic policy a painful and protracted business. So much was observable during the hurried conclaves of last week, and was made nakedly obvious by the announcement, when Parliament reassembled on Tuesday, that no news would be given until next Monday of the forthcoming changes in economic policy. Economy in national and primarily governmental expenditure is the only purpose of any conceivable policy under discussion, and economy is never pleasant for departmental ministers. The arguments appear, however, to have been exacerbated by political factors, for one of the big spenders on the home front, the Minister of Health, is also the most powerful member of the Government outside the inner triumvirate. Mr Bevan appears to have resisted threats to the national health service and to housing with his usual vigour, but it would appear almost inevitable that his estimates should suffer some of the reductions. His resistance seems, however, to have been strong enough to force the Cabinet to re-examine the costs of the defence services, that sacred elephant so jealously guarded by both Mr Alexander and Mr Bevin. Some reduction, even if only of a token character, must clearly be made for political if not for any other reason. A good deal of feeling was expressed at the

Parliamentary Labour Party meeting on Wednesday that the Services must not go scotfree, and a reduction of expenditure there—or at least the promise of it—might help to win acceptance in the country of cuts in the social services, housing and educational building as well as in some of the frivolities of Government expenditure. Vigorous administration by vigorous ministers could undoubtedly prune defence costs without affecting efficiency. But since neither Mr A. V. Alexander nor his three Service ministers are remarkable for either vigour or ability it is hard to see effective action being forthcoming. No important economy in defence expenditure is possible without either contracting overseas commitments or drastically modifying conscription.

* * *

Parliamentary Timetable

Among the influences which eventually decided Mr Attlee not to accede to the pressure of certain of his colleagues for an autumn election, the desire to get the Steel and Parliament Bills on to the statute book undoubtedly ranked very high. The passage of these two Bills will provide almost the only legislative interest during the winter

The Parliament Bill already appears on the Order Paper of the House of Commons, but it cannot, under the existing law, be passed until after November 11th—the date on which it received its first Second Reading in the Commons two years ago. It is likely, in fact, to be taken on Monday, November 14th, and after going through its second reading stage for the third time in the Commons it will be sent to the House of Lords. They must have it for a month before the end of the session, which is therefore likely to be brought to an end about December 15th. Whether they let it go by default or reject it outright, the Bill can then receive the Royal Assent under the procedure of its predecessor, the 1911 Act.

Presumably a new session will then be opened immediately, and when the House returns after Christmas recess—that is about the third week in January—the Steel Bill could be brought forward for the second time in the Commons. Under the new Parliament Bill, which includes retroactive clauses to cover this point, it will have to go through the Commons only twice, with at least one year between the two occasions. It could, therefore, go to the Lords by the end of January at the latest, leaving the Lords with the complete month of February in which to consider or reject it. If the Lords have not rejected it by the end of February the Government would then be free at any time to declare the session closed. This would automatically enable the Steel Bill to be given the Royal Assent (although the iron and steel industry would still be in private hands since the vesting date for nationalisation cannot fall before May 1st). If the completion of Labour's legislative programme is still a determining factor, a general election could be held towards the end of March.

The Iron and Steel Bill at present is in limbo between the two Houses of Parliament, having been sent back by the Lords to the Commons in July, with a note insisting on their amendment that the vesting day shall not be until July, 1951, at the earliest, and that the Bill shall not come into force before October 1, 1950. They add curtly their reason: "because they consider that the Bill should not come into operation until the electors have had an opportunity of expressing their opinion on it." The Government is bound to recommend to the Commons that these final amendments of the Lords be rejected. Once that is done, the Bill returns to the Lords and, if they insist on their amendments—which they will do—then the Bill will have completed this laborious first journey through the two Houses, and will remain on the shelf waiting for its second, and more brusque treatment at the beginning of the year.

* * *

Vyshinsky on the War Path

Whatever the result of the quarrel that has been raging between Mr Vyshinsky and other delegates to Uno over the vacant seat in the Security Council, the Soviet representative will carry off some trophy. If Czechoslovakia gains the seat instead of Yugoslavia, an American conspiracy to back Tito before world opinion will have been frustrated. If Yugoslavia gets the seat world opinion will have been shown the extent to which Tito, the heretic of Communism, has become associated with "capitalist-imperialist" circles.

It should be known by now to the planners of American policy how often Mr Vyshinsky wins on the swings as well as the roundabouts. It was, therefore, rash of them to back the Yugoslavs for a promotion in the councils of the United Nations which they have done little to deserve; it was a pity too to upset the gentlemen's agreement by which seats in the Security Council are allotted with rough equality between regions and spheres of influence of the Great Powers. The Foreign Office was quite right to have nothing to do with the scheme, to back Czechoslovakia, and so to show east Europeans that western governments think for themselves and do not behave monolithically.

Doubtless the American support for Yugoslavia will be thought in some circles a shrewd move in the cold war. It would be, if one could feel certain that the next move and the one after that had been thought out as well. Many of the State Department's minor actions in the cold war suggest a lack of clearly defined final objective, a tendency to live from hand to mouth on bright ideas. This particular line of support for Tito is no more welcome for coming in a week which has seen American commentators announcing that the west will give Yugoslavia all aid short of war. It is difficult to imagine anything more stupid, at this stage of the Tito-Stalin quarrel, than to tell Moscow just what would be the limits of the west's reaction to violent moves on their part.

* * *

A Huddle of Ministers

The almost grotesque overlapping of committees that now exists in the west European camp will be visible for all to see a fortnight hence. Foreign Ministers of governments belonging to the OEEC (18 strong), to the Consultative Council of the Brussels Pact (5 strong) and to the Committee of Ministers of the Council of Europe (12 strong) will be visiting Paris in their various capacities, accompanied by trains of officials who will be hard put to it to prevent any confusion of files or thought. Each committee is, of course, designed to further co-operation and unity; but each is jealous of its special right to handle exclusively such distinct subjects as the earning and borrowing of dollars, the planning of Western Union and the development of a parliament of Europe.

The decision of the Council of Europe Ministers to meet in Paris is sensible and was made for reasons of convenience; it should provide the opportunity tactfully to suggest that Strasbourg cannot be the permanent seat of this new and expanding body. Mr Bevin's suggestion that the Council of Europe should meet there was intended—and taken—to be a delicate compliment to M. Schuman, then French Foreign Minister. Alsace could not have been more friendly and French officialdom could not have been more efficient than they were at the August meeting; but the two facts remain: that Strasbourg is a difficult place to reach and leave quickly, and that it is not the best setting in which to stage a Franco-German reconciliation. Strasbourg is a city whose citizens clap loudest when Mr Churchill boasts of having *balayé les Nazis*, and which is acutely sensitive to whatever is strident or arrogant beyond the Rhine.

There will be no ill-feeling now if someone like M. Spaak suggests that a more traditional and spacious setting on the outskirts of Paris should be chosen for the Council's headquarters. As for the meetings of the Consultative Assembly, there is no good reason why they should not be held in the capitals of the member countries in turn.

* * *

Mr Nehru in Washington

In accordance with the custom which permits distinguished foreign statesmen to address the United States Congress, Mr Nehru has spoken in Washington to the American legislature about the policies of his country. Without making any direct reference to the Soviet Union or to Communism, he said that the aims of India's foreign policy were "the preservation of world peace and the enlargement of human freedom"; India had to be prepared to defend against aggression the freedom she had gained, and the force to be employed "must be adequate to the purpose. Yet, said Mr Nehru—

even when preparing to resist aggression, the ultimate objective, the objective of peace and reconciliation, must never be lost sight of, and heart and mind must be attuned to this supreme aim and not swayed or clouded by hatred or fear.

Mr Nehru referred to Gandhi's technique of non-violence, which "led us not only to freedom but to friendship with those with whom we were till yesterday in conflict." He said that he did not know how far Gandhi's technique could be applied to "wider spheres of action," for "the means to prevent evil have to be shaped and set to the nature of the evil;" but he was convinced it was ultimately "the right approach to human affairs."

To some of the more hot-headed American wagers of the cold war Mr Nehru's speech may have seemed somewhat non-committal. When, however, it is remembered how difficult it has been for political leaders—and even more for the rank and file—of the Indian Congress party even to contemplate an alignment with a *bloc* of nations including the British ex-Raj against a power which was for so long reckoned the Galahad of anti-imperialism, the cause for wonder is that India has come so far. When Mr Nehru said that "we are neither blind to reality, nor do we propose to acquiesce in any challenge to man's freedom, from whatever quarter it may come," he was making what was, for the leader of an Asian nationalist movement recently struggling against western ascendancy, a very strong declaration.

Speaking for the national movement which Gandhi once led, Mr Nehru did well to stress India's faith in methods of peaceful persuasion and conciliation. But it may be hoped that from his talks with President Truman and Mr Acheson he has gained an idea of the importance which the American, as well as the British, Government attaches to the Kashmir question as a field for the application of such principles.

* * *

From the Balkan Frontiers

The last report of the United Nations Special Committee on the Balkans should dispel any doubts about the help which Albania and Bulgaria in particular have given to the Greek guerrillas. (Like most Uno reports it reaches this country late.) The report is based on the direct experience of members of the committee and of their observation groups, on the statements of 1,105 witnesses, on the examination of captured war material, and on the texts of official statements made in most of the satellite countries. Members of the committee were necessarily restricted to the Greek side of the frontier as Albania, Yugoslavia and Bulgaria refused to acknowledge their legality; but they were able to observe from the air much of the fighting and were themselves fired upon from gun positions clearly located in Albania.

Three well-attested facts in the evidence stand out. First, the principal strategy of the Greek guerrillas has been based on the unrestricted use of a main lateral road which runs on the Albanian side of the mountain frontier with Greece. By using this road, and with the help of Albanian trucks and drivers, the guerrillas have been able to bring up supplies to the frontier area and to carry out unimpeded the hit-and-run warfare in which they excelled. Second, Albania has played a major part in recruiting and training guerrillas. The Albanian police had lists of Greek refugees, and in March, 1949, forcibly conscripted them for the guerrillas; in a military camp at Sukth in Albania, some 600 recruits were being trained in February by both Albanian and Greek officers. Third, Bulgaria has supplied much of the arms, ammunition and food which the campaign needed, and, like Albania, has allowed the guerrillas to use Bulgarian territory in order to move from one part of Greece to another.

In the light of these factual reports, the denial of the Albanian and Bulgarian governments that they had given any material assistance to the guerrillas is the lie direct. There should be no hasty withdrawal of these experienced observers just because the Greek rebels say they have called off the fight. They may soon be needed to protect Tito against similar activities by his Cominform neighbours.

Distant Prospect of Earls Court

The evident signs of deepening anxiety within the Cabinet and the announcement that the election would be postponed until the spring gave the Conservative conference a more optimistic background than Lord Woolton had probably dared to hope for. It certainly gave Mr Churchill the opportunity to make a more temperate and pointed speech than has been his habit in the past two years or so. But the Conservative policy to solve the urgent problems of the nation remained carefully veiled. This is partly due to the feeling of Mr Churchill that it is wiser not to reveal an electoral hand until the last moment—a view which may be based far too much on experience of elections considerably earlier in the century with a considerably smaller electorate. But it is also partly due to the awareness of the Conservative leaders that they do not know any better than the present government how many of the contemporary problems could be solved.

Three things, however, were made clear by last week's conference. First, that the moderate Tory Socialism of Mr Butler commands greater adherence in the party and greater acquiescence among his colleagues than it did a year ago. Secondly, that Conservatives are prepared to wage a lengthy battle for the souls and votes of the trade unionists: Sir David Maxwell Fyfe asserted that there are now 3,000,000 Conservative trade unionists, a statement which would gain greater credence if he could show the basis upon which the figure is calculated. And thirdly, the rank and file of the Conservative Party, whose grandfathers were taught to care about Empire unity, will need considerable education before they come to share Mr Churchill's and Mr Macmillan's enthusiasm for European unity.

Confusion and Defiance on Wages

The growing confusion among the trade union movement in wage matters is clearly reflected in the wage claim of the railway shopmen. The National Union of Railwaymen, which claims the allegiance of about 95,000 of the industry's 130,000 shopmen, having been thwarted in its demand for an all-round increase in wages, is now seeking an improvement in the wages of the lower-paid railway workers only. The Confederation of Shipbuilding and Engineering Unions, which organises the remainder, is out for an increase of £1 a week in the wages of all engineers.

Mr. J. B. Figgins, the Secretary of the National Union of Railwaymen, who has presumably learned by bitter experience, has now decided to associate the two other railway unions with his claim for the lower-paid men. The Confederation, however, which has openly declared its aim of expanding rather than contracting the differential between skilled and unskilled wages, is determined to resist any policy which discriminates in favour of the lower-paid workers. As a compromise between the two conflicting views, the trade union side of the Railway Shopmen's National Council has decided to ask for a "substantial" but unspecified increase for the shopmen.

*

Opinion among influential trade unionists would seem to reject the Government's desire that increases in wages for lower-paid workers should not involve compensating increases in the wages of their higher paid colleagues. Even Mr Deakin, whose union—the Transport and General Workers—has done as much as any to reduce the size of the differential, has written in favour of its maintenance. And the journal of the Iron and Steel Trades Confederation, whose secretary, Mr. Lincoln Evans, is also chairman of the TUC's economic committee, has come out in support of the maintenance of the differential in terms which are a direct challenge to the Government to dare to persist in its present attitude.

The trade unions must be allowed to solve these problems in their own way, and for anyone to attempt to interfere with an intricate wages structure built out of years of experience and hard work is simply inviting trouble.

An official expression of dislike for a rigid adherence to the principle of the differential in wage rates is not a very coherent national wages policy—in many cases the higher paid workers are making a proportionately more valuable contribution to the economy than the lower. But this is no reason why the Government must not adopt a proper wages policy, and there will be great disappointment in the country if the measures announced by the Prime Minister next Monday do not take the first steps towards it. The trade unions can rest assured that, with an election so near at hand, the Government will treat them very kindly; but they will be seriously misreading the temper of the nation as a whole if they imagine that it will accept their attitude of defiant autonomy at a time when their own solutions to problems have signally failed to produce the answer.

Purges in Prague

The present wave of arrests in Czechoslovakia seems to comprise several distinct types of "purge." Priests and devout Catholics are being arrested for opposition to Mr Cépicka's *Kultúrka*. Peasants are being punished for support of the Church, for opposition to the preliminary stages of collectivisation of their farms, or simply for being—or being denounced as—"kulaks." The middle class, both professional and bureaucratic, is attacked both because it is the chief stronghold of the "obsolete and reactionary" Masarykian democracy of the old Republic, and also because it is hoped that its sufferings will give pleasure to the Stakhanovite labour aristocracy which Mr Zapotocky is trying so hard to create.

The most important of the purges is that which is reported as taking place within the Communist Party. The party almost doubled its membership in the first six months of 1948, and the routine purge last winter only expelled 100,000 out of more than 2,000,000, while relegating 500,000 to probationary status. This was very mild, and the Czechoslovak Communist Party still is without doubt the least "pure," the most infected with "petty bourgeois opportunists" of any in Europe. The present arrests must be partly aimed at the elimination of insincere careerists, especially of the large number who are doing office jobs of little use either to the party or to national production. But it is at least very probable—certain evidence is not yet available—that the purge has wider aims, and is aimed at "nationalist deviationists" and admirers of the "fascist renegade Tito," who in Czechoslovakia alone of the six "people's democracies" have not yet been unmasked. It would be surprising indeed if a few exalted heads did not roll before the purge is over.

Candidates for the Court-room

A good candidate for the next court-room confessional in eastern Europe is the Czech Foreign Minister Mr Clementis, now at the centre of the dispute at Uno as to whether he or his Yugoslav colleague should sit on the Security Council. He committed in 1939-40 the hideous offence of premature anti-fascism, supporting the western imperialists and their abject tool Benes against Stalin's treaty partner, Adolf Hitler. Although he has since licked every object proffered to him by his masters, and obligingly ate his own words when Moscow acquired Hungary and Czechoslovakia to replace their democratic enmity by a still more democratic friendship, it may be doubted whether he has convinced the genial teacher of progressive humanity that he has a truly firm grasp of Marxist-Leninist methodology.

Another candidate is Minister of the Interior Nosek who,

through no choice of his own, spent the war years in London. Non-Communists consider him ruthless, but by the blood-thirsty standards of MVD—or its Bulgarian or Rumanian pupils—he must seem culpably tender to enemies of the people.

The most reliable and vigilant Bolsheviks in Prague are the Czech Jew Slansky (Secretary-General of the party) and the Sudeten German Jew Geminder (representative on the Cominform). These two comrades have already succeeded by their arrogance in spreading anti-Semitism among the Czech people, which until recently was freer than almost any from this virus. The others on whom Moscow can count are the Minister of Education Nejedly and the Minister of Information Kopecky. An erudite and embittered *Musik-historiker*, Nejedly is well qualified for office by a passionate hatred—often publicly avowed—for the whole Czech educated class. He closely resembles the late Colonel Moravec in being a gifted demagogue, with the voice of a bull and the vocabulary of a fishwife. With such fine instruments to hand, Moscow should be able to turn the Czechoslovak party into a vanguard of steel-hard vigilant Bolsheviks, proletarian internationalists obediently serving the nationalism of the toilers' fatherland and its historically inspired leader.

London's Planning Machinery

When the Abercrombie plans for London appeared—the first dealing with the Administrative County of London, the second with the Greater London region—a start was made in bringing order and balance into the sprawling, chaotic growth of the metropolis. The general principles of the London plans were comparatively simple and won general acceptance; they have been endorsed by the Government and by the 173 local authorities in the London region. But their translation into practice is not only a slow and costly business but involves great administrative complexities which have not yet been solved, and which are dealt with in the report of the London Planning Administration Committee.*

The planning authorities responsible for carrying out the London plans consist of nine counties (five of which have

most of their area outside the region) and three county boroughs. The report emphasises, however, that much of the development which is required cannot be carried out by the planning authorities. For instance, there are in the region 173 local housing authorities, 71 water undertakers, 6 joint sewerage boards, 7 new town development corpora-

* HMSO. 1s. 6d.

tions, and many other agencies which are responsible for various aspects of development. A typical problem is presented by the need to expand many country towns beyond the green belt. What real incentive is there for the local authorities and statutory undertakers on the spot to undertake this work, which may burden the local rates and is wanted not for their own residents but for overcrowded Londoners? Similarly, why should London councils wait for their surplus population to be settled far afield if there is land for building in the green belt. It is difficulties such as these which are already wrecking the plans.

The committee is emphatic that the co-ordination of the development of the London region should not be left, as at present, to an ineffective inter-departmental committee. Its solution is to reform the local government system of Greater London, and to set up "some kind of regional authority," which would have powers of supervision and finance and possibly also of execution. It is a pity that this central proposal is left so vague; but the committee argues that the subject is one for a Royal Commission, which should be set up forthwith. As an interim measure, a majority of the committee want to establish an advisory planning committee for the region, but a minority report goes much further and demands that the 12 local planning authorities should be merged in a joint planning board. Here is another challenge to Mr Bevan to reform local government.

Warning from the Shipyards

In hardly any industry could the reappearance of even a moderate degree of unemployment produce so deep a psychological effect as in shipbuilding. The name of Jarrow has lost nothing of its symbolic value. Shortage of work in both Tyne and Mersey repairing yards, and recent layoffs in new ship construction, drew from Sir Stafford Cripps last week the unexceptionable assertion that full employment guarantees no one the permanency of his present job (a lesson which the Labour movement as a whole is little disposed to digest), and from the secretary of the Boilermakers' Society a reassuring forecast of improvement. Prospects would, no doubt, be considerably brighter if the level of costs could be reduced by comparison with that of freights; but there is no blinking the fact that shipbuilding faces, in a particularly acute form, the problem common to all capital goods industries in a time of change: that of the enormous disparity between expansion demand and replacement-and-maintenance demand. It stands to reason that a smaller shipbuilding force is needed to maintain in being a merchant fleet of a size adequately meeting current passenger and cargo requirements than to build up such a fleet from the remnants and wreckage of war. Getting Britain's—and the world's—merchant shipping back into shape and up to strength is a once-for-all job which, to judge by the present state of order-books, is recognisably within sight of completion.

The ending of such a job presents to the architects of full employment a problem quite different from that arising from a minor shift of competitive power, demand, or technique in an industry catering for a continuing market; a problem at once more acute and, luckily, more foreseeable. Here, if anywhere, the planned economy with its boasted length of time-horizon should score over the unplanned. The ending of the once-for-all job is not unlike a military demobilisation in little; it can be foreseen, even if not exactly dated, and measures can be taken or planned to smooth the necessary redistribution of men and resources. Due credit should be given, on these grounds, to the policy of diversification in the Development Areas. But is anyone really preparing to cope with the outflow, over the next few years, of that proportion of the shipbuilding industry's labour force which is likely to prove surplus to the needs of a merchant fleet in being, or, for that matter, to the surplus labour that will eventually appear in the building industry? One cannot help feeling that, if any work were in fact being done on these lines, Sir Stafford Cripps would have mentioned it; but he did not.

Stalinism Expounded

Any serious attempt to present simply and briefly the theory and practice of Stalinism is to be welcomed. That such attempts are rare is due less to timidity among authors than to the deplorable state of Russian studies in this country and to the real difficulty of reducing turgid jargon to understandable English. Indeed, it is scarcely safe to tamper with the jargon because its most involved phrases and complicated words have precise and special meanings, which it is essential that non-Communists should understand. "Westerner," the author of a pamphlet* that has just appeared, has made a very fair effort to overcome these difficulties. He is not concerned with British party politics, and his pamphlet should be widely read, not only by Conservatives but by members of other parties or of none.

The core of the exposition is a summary and explanation of an article by Burdzhakov in *Bolshevik*, the fortnightly organ of the Central Committee of the All-Union Communist Party. Its argument is that the lessons of the experience of the Russian Bolsheviks, from 1903 to the present day, are obligatory for Communist parties, and for genuine (not Social Democratic, that is, degenerate) working-class movements in all countries. Tito, by presuming to decide for himself how to apply Marxist-Leninist principles to the Yugoslav situation, instead of carrying out detailed instructions from Moscow, was committing unpardonable heresy.

The last section of the pamphlet briefly mentions a number of important issues, each of which deserves a publication to itself. Among them are the views of Varga on "capitalist economies," the Soviet view of post-war changes in the structure of the British Empire, the meaning and limitations of the notion of "class" in Soviet usage, Soviet doctrine on national sovereignty and on war. Its weakest section is that which deals with the stages by which Communists achieve their aims, for the author is clearly less familiar with the history of the sovietised states of Eastern Europe than with Communist theory on the state and nationalism.

Communists before Hongkong

The Chinese Communists have now occupied Canton and reached the boundary of the British territory of Hongkong. These events have been so long expected that their actual occurrence came almost as an anti-climax, and there has so far been no trouble on the Hongkong border either with fleeing Nationalists or with the oncoming victors. The Nationalist forces have nearly all retreated westward from Canton, presumably to try to hold out in the west of Kwangtung province as a right wing to General Pai Chung-hsi's army in Kwangsi, or have been moved by sea to the island of Hainan, which the Nationalists perhaps hope to make a second Formosa, though it is much nearer to the mainland. With the Communists now in direct contact with Hongkong and in possession of the whole of the railway from Peking and Hankow down to Canton, a considerable British trade with Communist China is now possible. In Shanghai there have been signs of improving relations between the new Chinese authorities and the local British community.

It has been reported that Mr Bevin discussed the problem of China very fully with Mr Acheson and Far Eastern specialists of the State Department when he was in Washington, with the result that British and American policies are now being better co-ordinated than at one time appeared probable. The manner of the Chinese Communist Government's request for recognition—which was addressed to the American Consul by name without any of the forms customary for such a communication—has certainly made it easier for the American Government to play a waiting

* *Communism, Revolution and War*. Conservative Political Centre. 1s. 6d.

game, and with one eye on the Security Council—where a Chinese veto might be very useful to Russia in a Russo-Yugoslav crisis—Mr Acheson is in no hurry. The United

States wants clarification of the new regime's attitude to China's existing international treaties before the granting of recognition, and in a matter so obscure clarity may take a long time to attain.

Back to Palestine at Uno

The United Nations Assembly, plodding through its agenda, is approaching the Palestine item and the moment when it must take decisions about Jerusalem and the Arab refugees. Neither decision will be too easily reached. The Conciliation Commission's proposals for the internationalisation of Jerusalem are viewed with contempt by both parties in physical possession of the area—Israel and Jordan. That almost all the other Arabic-speaking states disagree with Jordan on this issue is being made plain at the current meeting of the Arab League. As regards the refugees, the Assembly is due to receive shortly the report of its economic study group, under Mr Gordon Clapp, the head of the Tennessee Valley Authority.

This group has now completed its tour of the capitals concerned and is in Beirut, writing its draft. The moderate caution with which this was received by the Arab governments is much to their credit, considering the violence of the Arabic press campaign that was being waged against it. This last has been receiving ammunition in plenty from the refugees themselves, who have set up committees, issued handouts and staged demonstrations reiterating that they will accept nothing except repatriation. Few imagine, or want to know about, anything of the changed circumstances they would find on the site of their former homes.

Most sensibly Mr Clapp has concentrated, at this stage, upon a single task—the short-term provision of work for the able bodied. His purpose is to improve the refugees' morale and to obtain some material yield for the money that is being spent upon their daily bread. In a word, he wants to turn a dole into a wage. If this means public works, performed free of charge upon the local budget, in certain impecunious Arab states, some of these may be brought to agree to the plan. It is therefore possible that it might turn into the thin end of the wedge for a policy of resettlement. Mr Clapp met with a *non possumus* only in Israel, which is so absorbed with its own unlimited emigration programme and with the strain that this is placing upon its economy, that it rejected all proposals to discuss the admission of Arabs except "within the framework of a general peace settlement."

Even if Mr Clapp goes ahead in the Arab world, there are several ticklish problems ahead of the Assembly. Where is it to get the money to finance such a programme? A State Department calculation reveals that to finance a refugee's employment costs five times as much as simply keeping him alive. The \$32 million special fund to which certain states members contributed during 1948-49 for this latter purpose was due to last for nine months from December, 1948, but has in fact been spun out to last until next December in the bank, and until mid-January in foodstuffs. But more will be needed. Who is to contribute it, and who is to run the scheme? Ought the Assembly to prolong the life and alter the nature of its UNRPR (United Nations Relief for Palestine Refugees) organisation? Or should it extend the mandate of the International Refugee Organisation, originally intended for victims of the European war only? Or must it set up a new specialised agency? Someone must make proposals on all these points. It would become the State Department or the Foreign Office to give the necessary lead.

Arab Light on Arab Problems

As was reported in *The Economist* of September 17th, the recent social welfare assembly for the Arab states—a request meeting held in Beirut by the United Nations—lost some of its value because politics and Palestine warped some of its closing discussions. The Uno officials present made a vain attempt to get the rest of the participants to put social problems first and political considerations second. Admittedly, such self-restraint is difficult for an Arab at a time when the Palestinian refugee problem overshadows the social scene. Yet it is not impossible, because there emerges from the conference one piece of serious Arab thinking that shows the necessary sense of proportion and urgency about certain social and economic scandals of the Middle East.

Professor Said Himadeh, who is professor of economics at the American University in Beirut, gave before the conference a lecture, of which, happily, he circulated the text. This first outlines the familiar scene: meagreness of national resources in relation to the mounting population, uneven distribution of the wealth accruing from oil, inevitable dependence on agriculture, handicap of retrogressive land systems and ill-co-ordinated water supplies, a pathetic poverty resulting from these economic factors combined with ignorance, fatalism and conservatism. It then goes on to newer ground, and asks the questions which the Arab governments ought to be answering here and now:—

First are the available data and studies [for economic reform] adequate to serve as a basis for it? Secondly, is there a sufficient feeling of social responsibility on the part of those in power to implement it? Thirdly, who should be entrusted with planning and execution? Fourthly, are the finances of the Arab governments adequate to enable the carrying out of the plan? Fifthly, what advantages can be secured from co-operation among them? Sixthly, can the United Nations be of help?

In Professor Himadeh's view, there already exist studies "reasonably adequate," or at least for the initial short-term stages of change. But he goes on to conclude that

a deeper sense of public responsibility is needed for carrying out economic and social reform of the kind required, especially where the interests of those in power seem to them to conflict with the interests of the masses, as in the case of reducing the inequalities of land ownership.

As regards the financing of such plans he points out that it is now too late to tax war profits which went so largely into private pockets and so little into public treasuries; but he suggests other purely domestic means of securing foreign currency for the purchase of capital equipment. Underlying the whole thesis is the conviction that the Arabs themselves could—if they would—get on with some of the

needful changes without waiting upon the west, or blaming the foreigner, or letting local quarrels get the better of common sense.

Oiling the Wheels

The Annual Conference of the Institute of Personnel Management, held at Brighton last weekend, revealed amusing differences of opinion among visiting speakers regarding this profession's task of making people happy on forty-six hours a week. Mr Spates from the United States formulated no less than sixteen ways of getting people to work harder, from telling people clearly who was their boss to diffusing a friendly spirit "like sunlight filtering through an autumn wood" and the rest also tended, in somewhat highflown and pedantic terms, to idealise the humanitarian motives of management in seeking to oil the wheels of industry—or rather their human cogs—by appointing specialised labour managers.

Perhaps it was only tactful of the speakers, as the Institute's guests, to ignore the growing spate of governmental orders and collective agreements regulating so many aspects of employment today, which form the main work of personnel departments, or the background of labour shortage which makes it necessary at present to treat workers not merely as human beings, but as very sensitive human beings. However, this vagueness about the hard-headed practical value of specialised personnel administration is apparently shared by a high proportion of firms of all sizes. The Ministry of Labour now keeps a staff of eighteen people busy advising those managements which complain of labour difficulties on how to set about labour control on the best modern lines. No doubt the advice is the best of its kind, but even plain common sense would receive the same welcome if it were reliable and free of charge.

Conscience or Profits?

But from the great division of labour that now takes place, every part of society is closely dependent on every other, and Sabbath labour in one place compels it in another. . . . The railway train and the steamboat keep the check taker and giver in activity on the Sabbath; and the accounts for that day must be made up as for another. There seems to us much inconsistency, if not hypocrisy, in tolerating all these various branches of labour, and in objecting to a little sorting, arranging, and delivering letters to persons asking for them on the Sabbath, which is only the complement of much other labour. . . .

One of the great arguments put forward by all tradesmen who advocate the suppression of all trading on Sunday is, that if others open shop, they must do so likewise, or lose their customers. . . . We are much afraid that a similar motive operates on many of those merchants and bankers who now oppose the proposition relative to the post office. They wish to observe the Sabbath, but they much more wish to keep equal to or a-head of others in the world, and they are alarmed at the possibility of others having an advantage in which they do not participate. They are not content with saying, as a really conscientious man would say: "I do this for conscience' sake. It is my firm belief that the Sabbath should be strictly observed as a principle of religion; and, acting on that principle, I am ready to abide the consequences." But they say: "I wish to have the sanction of my conscience and the advantages of the world—the self-gratulation of virtue and the profit of sin at the same time; and, as I do not choose to receive and send away letters on Sunday, I will not allow other people to receive and send away letters." That spirit is at the bottom of much of the secular opposition given to the proposal to extend post-office accommodation.

The Economist

October 20, 1849

Whether labour management is mainly applied common-sense or not, there certainly is a useful job to be done, and the people who are doing it now seem to be divided all too sharply between the old hands—practical folk from management desk or bench who have shown a special knack for dealing with people—and young B.Sc.s who have invested in the relevant academic training but who may or may not subsequently have displayed any very special aptitude. The best of both worlds is needed if labour management is ever to be in a healthy state in England's peculiar industrial climate. The Institute has already pointed the way by fostering the provision at various colleges of short full-term courses for older people of proved aptitude, but at present few firms see fit to finance candidates for such schemes. The whole idea of systematic specialised personnel management is new enough in this country for its existing exponents still to feel a certain quality of pioneering in their efforts and a resulting exclusiveness among their ranks. Its future success, however, depends upon its ability to recruit enthusiasts with both the "flair" and some relevant academic training for this kind of work.

Western Berlin in Danger

When one-quarter of the working population of western Berlin is out of work, to discuss constitutional methods of associating the city with the German Federal Republic seems a curiously roundabout method of remedying the situation. It is generally, if not always openly, admitted that the agitation to admit western Berlin into the Republic as the twelfth Land must fail. The administrative difficulties involved are practically insuperable, quite apart from the diplomatic complications with the Russians which must ensue. Yet western Berlin cannot be allowed to remain completely isolated if economic collapse and bankruptcy are to be averted.

Western Berlin survived the blockade with its treasury practically empty. Its industries, already severely crippled by war and dismantling, short of capital, short of raw materials, are burdened with high costs of production and generally in no condition to compete with the resurgent industries of western Germany. The trains and lorries which might have brought in raw materials for the city's industries brought instead consumer goods which nobody could afford to buy. The people of western Berlin have taken advantage of the fact that they can obtain over six east marks for one west mark to do most of their shopping in the eastern sector. The currency thus drained away at the expense of west Berlin's retail trade is not even spent on the products of west Berlin's industry, but in western Germany. The Berlin Magistrat is in no position to help with loans and credits. The economies which the Allies insisted should be made in its budget estimates last summer have forced it to cut down drastically on its public works programme and thus to add to the steadily mounting number of unemployed.

Western Berlin is, in fact, suffering from a serious collapse. There is no disagreement over the diagnosis or over the remedies needed to bring it round. But the doctors are not in a sufficient hurry to end their consultations and get on with the cure. Over two months ago the western commandants asked the Military Governors for credits amounting to 455 million marks to help put Berlin's trade and industry on its feet again; and they added that the sum eventually needed would be more like 700 or 800 million marks. Over a month ago General Robertson said that Berlin was desperately in need of help and was entitled to get it. Yet his proposal to set up a committee of experts to see what could be done can hardly have matched the expectations which his forthright recognition of the city's need must have aroused among 2,500,000 Berliners who look westward.

Letters to the Editor

Dollar Exports

SIR,—Your American Correspondent in London wrote sympathetically about our dollar-exports problem. But few American visitors realise the dilemma before which most of our exporters are placed when told to increase their exports to America. I think devaluation will increase the limitations on our national resources, aggravate the dilemma before which British exporters are placed, and thus exacerbate those domestic strains and stresses which are responsible for most of the disincentives imposed against dollar-exports since 1945.

Firm A is fully engaged, selling its output of fine cotton textiles within the sterling area. That is largely owing to our Government's investment programme abroad, and to its magnanimity in letting India, Pakistan, Ceylon, Australasia, South Africa, etc., "unfreeze" their sterling balances at the total annual rate of some £200 million of British exports, or roughly 10 per cent of all our exports. From now on, those countries are *earning* more pounds, directly, or by way of dollar-sales. Firm A has traded in these areas for 100 years. Its capacity is 100 per cent occupied. It has been making rising profits. It cannot get capital, permits, labour, etc., to expand its mills. A's earnest hope is that the Government will do the honourable thing by it, stop the sterling area from buying so much, and *enable* the firm to earn dollars!

To ask firm A to do so itself, and switch over to speculative work for the American market, is too bad. Firm A knows that if it does so, Firm Z (in the same line) will scoop Firm A's old-established sterling area business, while Firm A can have no certainty of doing so well in America. Moreover, as Sir Stafford has just clapped an extra tax on Firm A's profits, why

should it dip further into its badly depleted working-capital to finance a risky experiment in America? And just when raw cotton prices are moving up after devaluation, too!

The Government, say Firm A's board, cannot have it both ways. If they contrive to keep up the flow of unfrozen sterling balances, in order to keep up "full employment" in Britain *at any cost* (the sterling area owners of those balances paying that cost), then they cannot simultaneously get British exporters working at an effective 100 per cent capacity to boost exports to America. At least they cannot unless they, the Government, are prepared to slash the amount of textiles coming on to the British home market—or to switch labour and materials to the expansion of textile plants from other parts of our home capital and social service programme. But apparently the Government are not so prepared.

You will note, Sir, that much of Firm A's argument is applicable to most British export firms, running at full effective capacity, on orders from the home trade and the soft-currency countries.

Now Firm B, who *has* tried to break into the American market, both before and after devaluation. Before devaluation it contrived to sell a modest quantity of British goods there, for the first time in history! It sold them through a big New York and mid-western distributing firm. That firm was also imbued with a sense of need to help Britain. Immediately after devaluation, when firm B's Sales Director tried to cash-in for bigger sales and the American distributor tried to do likewise, the latter sadly had to reply to Firm B that "a stop-order was on." Domestic American manufacturers had threatened to withdraw their supplies from the American distributing

take a good look when it passes you

house, if the latter handled more of the British stuff! Their total custom represented 20 per cent of the American distributing house's turnover. The British stuff did not represent one-half of 1 per cent.

Restraint of trade? Sure! But no increase in the US tariff; no trouble with Congress; no onslaught upon the recent US Government's 10-point Agreement with Britain! Just a private turning-on of heat. It worked. What does your American Correspondent suggest we do? Tell tales to the ECA, to the White House, to the Justice Department, etc. etc.? No tales out of school, and at least we preserve our private channels of distribution in the United States, and don't get ourselves involved in the pleasant little problem that looms up as an alternative: namely, trying to break into the American market by British governmental, subsidised, public selling and distributing Boards inside the United States. What a hope we should have, then! And what a civic American reception committee.

No, Sir; your American Correspondent seems to me to see the British exporters' problem of boosting trade with America in too simple, clear-cut, black-and-white, and even too moral terms. Morality, public spirit and patriotism *do* move British exporters. But morality, public spirit, and patriotism have got to move them simultaneously by the same percentage if they are to squelch *the same proportion* of their work for the home trade, for Europe, and for the sterling area, and then switch the savings into production for dollars! That is not to ask for morality from Britain's exporters. It is to ask for a miracle. It is not the exporters, not human beings, that are non-moral; it is the facts. And the nasty facts are two.

The first is that devaluation has raised the pound-earning power of the sterling area's primary producers, by way of their dollar-sales; so that to the current high level of unfreezing of sterling balances is added this new premium in pounds; and the twofold flow of extra pounds is channelled upon Britain, where alone pounds can buy more manufactures, now that buying from the dollar area is to be cut. Thus, there is more incentive, after devaluation, to sell for sterling! And the second nasty fact is that old, familiar fact: the pound-inflation here and in the sterling area, which also acts as a disincentive against sales to America, and pre-empting our limited resources. The two facts, after devaluation, spell more pound-inflation.

The remedy is simple, economically. Who controls the flow of all these pounds, at its sources? Who keeps on proclaiming the vital necessity of that control? If they want to bridge "the dollar gap" another way than by continually cutting out more and more of our imports from America, the Government will have to raise the sluices against the flow of pounds, thus forcing (not exhorting) British exporters to replace their missing pounds by satisfying an American dollar demand, and then getting pounds for the dollars! This remedy, however, is not simple politically, so near an election. It isn't, because it is glibly dubbed "deflation." Yet what is there "deflationary" about switching resources from manufacture for the home and sterling area markets, to manufacture for America? Isn't that what the Government is coyly begging industry to do, instead of doing it itself?—Yours faithfully,

Tubney, Abingdon, Berks

GRAHAM HUTTON

SIR,—I must comment on the article headed "Dollar Exports" in *The Economist* of October 15th.

It would appear from what your correspondent writes that the textile industry is run by men who are lacking in both enterprise and patriotism. I wonder *The Economist* has never been moved to ascertain why the British textile industry—and particularly the wool textile industry—has been able to hold the world's markets against American industry, including those markets which are on the American doorstep, especially Cuba, where the USA has considerable Customs preference. It is because the British textile manufacturer studies the market on the spot, builds his cloths to fit each country's customs require-

ments, and designs and colours them to individual market tastes. Why, then, has he not been more successful in the USA? He knows the cloths, styles, etc., which sell, and the large majority of British textile exporters has experience of the USA. That, I am afraid, is why they want no more business. . . .

Perfection in a wool tissue does not exist, but it is generally conceded that British textiles come nearer to that desirable state than those of foreign manufacturers. The American importer has his goods examined by independent "cloth examiners." These organisations are responsible for "stringing" (i.e., marking) any fault in the pieces, and consequently for not so marking any which may exist. The result is that many pieces are thrown off as unmerchantable, while considerable allowances are claimed on the remainder. The British textile exporter is therefore mulcted in heavy losses, and in most cases refuses to repeat his experience when he can sell his goods in other markets, including hard currency markets, without any such difficulties arising.

Your correspondent instances a case where a British manufacturer rejected an American offer "partly because of price difficulties but mainly because he was unwilling either to dis-appoint his traditional customers in the sterling area or to expand his output to satisfy both markets."

First, the price difficulties: If the British manufacturer can beat his American competitor outside the United States, then it follows that it is the American tariff which precludes his doing so inside that country. Secondly, the question of dis-appointing his traditional customers in the sterling area. What sound businessman is going to accept a proposition which would mean canalising virtually his whole production into one channel which is anything but reliable? Thirdly, how could a manufacturer expand his output to satisfy both markets when he can neither obtain delivery of machinery nor the labour to run it?—Yours faithfully,

F. CROWTHER

Food Consumption Levels

SIR,—In your note on Food Consumption Levels in *The Economist* of two weeks ago you refer to the difference of 100 calories between the estimate for 1947-48 given in the *Economic Survey* for 1949 and that given by the Food and Agricultural Organisation. This difference is not the result of different estimates of food consumed in the United Kingdom, but is the result of using different nutrient conversion factors. As it would be unfortunate were a wrong impression to be created by attributing to margins of error what in fact is due to differences in the factors used, a brief explanation appears to be desirable.

The nutrient factors used in United Kingdom publications on consumption levels and in the *Economic Survey* are based on those computed by the Accessory Food Factors Committee of the Medical Research Council. These were first used by a Special Joint Committee set up by the Combined Food Board in their 1944 Report entitled "Food Consumption Levels in the United States, Canada and the United Kingdom," and have been continued to provide comparability with subsequent figures. The FAO has now taken up the study of international food comparisons and has produced a new set of nutrient factors which give somewhat higher calorie figures and which have been used in the tables you reproduced. International agreement has not yet been reached on the conversion factors to be applied, but discussions are proceeding with this end in view.

It will be appreciated that the FAO was faced with great difficulties in making international comparisons of food consumption, especially where countries concerned are widely different in climate, wealth or social structure. Some of the difficulties can be overcome by the use of common denominators, and of these the calorie is the most suitable single measure where overall comparisons of foodstuffs have to be

made. This introduces a further difficulty in determining the appropriate factors. When more information becomes available FAO will be able to refine its figures and improve the basis of international comparison.—Yours faithfully,

K. G. FENELON,

Director of Statistics and Intelligence

Ministry of Food, W.1

Documents on British Policy

SIR,—Students of contemporary history will be grateful for your judicious review of the "Documents on British Foreign Policy" since you rightly point out that the selection offered is too limited to be of much use. Little outgoing material—containing actual policy-statements of British Foreign Secretaries—has been included; practically all policy-making minutes and memoranda have been excluded. Is it to be wondered why the editor, Professor E. L. Woodward, who rebuked "many British and more American historians between the two wars" for having accepted the German documents for the years 1871-1914 as "revealing the innermost secrets of German policy." (p. 14 of his Inaugural, February, 1945) should have agreed to undertake the work in such circumstances. The first two volumes, of the First Series, were merely a shortened re-issue of the complete American *Paris Peace Documents* of 1919; the Second Series contains an overabundance of useless material; and the Third Series, meant to forestall the opening of the German archives, is, as you say, of "purely tactical importance." Why, one wonders, cannot this mistaken policy of faintheartedness be replaced by one of courageous action? I am writing as one who believes that British Foreign Policy, if properly explained, appears not at all incompetent, and certainly not despicable (your reviewer's words). Hence I believe that the fullest documentation is in the interest of both the good name of Britain and historical scholarship. Should public opinion not enforce a change in policy and thus a return to the frank publication of all relevant material as was decided by the late Ramsay MacDonald and Austen Chamberlain in

the case of the British Documents on the Origins of the War of 1914.—Yours faithfully,
F. W. PICK
Stanford Hall, Loughborough

Welcome to Amethyst

SIR,—It is pertinent to ask two questions about the decision to give an official welcome by the Lord Mayor of London to the company of HMS *Amethyst*. They are simply these:

(1) Was the whole incident in the Yangtse a reverse or a triumph for the Royal Navy, did the British interest benefit or suffer from the action with the Chinese Communists and the subsequent escape?

(2) Have the ship's company deserved better of the City of London and its people than say the pilots of the Berlin airlift, or the troops fighting in the Malayan jungle?

We do not question for a moment the gallantry of officers and men of the *Amethyst*; that has been properly rewarded with decorations and publicity. Nor do we deny for a moment the right of the Royal Navy and the general public in Hong-kong or Devonport to give the *Amethyst* a spontaneous and right royal welcome home from a severe and bravely borne ordeal. But we do feel deeply disturbed that the Royal Navy should have allowed itself on this occasion to take part in a formal and organised celebration of what was a reverse for British arms and—according to your own comment at the time—a serious error by the British diplomatic and naval authorities on the spot.

We feel certain that the average officer and man in the Royal Navy dislikes the way in which the *Amethyst* story has been used to cover up weakness and error. The skill and bravery which the ship's company showed in their escape are only what everyone expects from the Services; and there is a lack of decent and traditional restraint in the Admiralty's decision to allow this march through the City to take place.—Yours faithfully,

The Planning Debate

"Problems of Economic Planning." By E. F. M. Durbin. Routledge and Kegan Paul. 210 pages. 15s.

"Economic Calculation in the Socialist Society." By T. J. B. Hoff. Hodge. 251 pages. 21s.

In the contemporary literature of planning there is a striking predominance of what one may call the nineteen-thirtyish mentality. It is natural enough that the decade of the Great Depression should also have been that in which most systematic thought was devoted to the development of a rational economic order emancipated from the tyranny of "blind economic forces"; and it is natural enough that the ideas then evolved should preserve some momentum even under very different conditions. But the complacency with which they are cherished is still surprising. With the exception of Professor James Meade's "Planning and the Price Mechanism" no revaluation has been made of the master concepts of modern Socialism, and no check attempted, in the light of experience, on probabilities estimated beforehand.

Had he lived, Evan Durbin might by now have provided that revaluation. This posthumously published collection of essays mostly derives from the middle 1930s, only two papers dating from after the end of the war. One of them—"The Problems of the Socialised Sector," 1946—comes nearest to the needed restatement. Even here, however, the references are all to the future rather than the present. "There is every sign," he writes, "that one of the consequences of nationalisation will

be the establishment, in full force, of the financial incentive that links earnings to productivity, skill and responsibility"; and, on the more fundamental theme of consumers' freedom, "The programme of production, outside the limited field of socialised consumption, should be guided by their wishes." Summarising the argument of his earlier essays, he then outlines the policies which the various autonomous Boards should be instructed to follow in order that their use of resources shall accurately reflect the consumers' free preference. "The strategic objective of production will then be secured—to give consumers what they want."

How remote do these arguments appear from the realities of 1949! They were, of course, remote enough in 1946. But 1946 genuinely was a transition year; to a convinced Socialist, current economic shortcomings no more foreshadowed the pattern of the future than the chaos of moving day foreshadows similar discomfort in the settled home. Now it seems likelier that moving day, as it were, sets the tone. A rigid and irrational price system, once established, perpetuates rigidity and unreason; the nice blend of public and private incentive prescribed by the democratic Socialist proves about as reliable as a spastic's reflexes, and the principle that the consumer should get what he wants and not what suits sundry departments is submerged in a welter of patchwork expedients mostly reflecting either class prejudice or sheer fiscal desperation. Nor is any closer approach to what one may call the principles of 1935 foreseeable for the future.

These considerations detract somewhat from the interest of

the prewar intellectual controversy. Mr Heff's book, published in the original Norwegian in 1936, is a scholarly, copiously documented, meticulously reasoned survey of that controversy, with its main emphasis on the theoretical question whether public ownership of the factors of production permits of a "rational" price system. He concludes that it does not; that while there is no theoretical reason why a comprehensively planned economy should not "work" after a fashion, it has no means of selecting that production pattern corresponding to consumers' wishes and must necessarily be arbitrary. One can, of course, protest that this conclusion, even if conceded, is irrelevant. Even in pure theory, free capitalism itself can only achieve a completely rational distribution of resources in an economy lacking all dynamic characteristics; why worry about an ideal unattainable, except on wildly unrealistic assumptions, under any system whatever? As well discuss the blueprints of rival perpetual-motion machines.

It is, indeed, performance rather than blueprint consistency which matters; performance in the hands of limited and fallible human beings. One can find a possibly useful parable in the story of the Brabazon plane. In the last resort, what flies an aircraft is human brainpower acting through human muscles on information received through human senses; just as, in the last resort, what runs an economic organisation is human brainpower exercising human authority in the light of knowledge reaching it through human channels. In the normal-scale aircraft as in the normal business the "feel of the controls" comes automatically to the directing brain; in the outsize Brabazon new and ingenious mechanical devices have successfully replaced the pilot's direct apprehensions; but no corresponding social devices enable the directors of that outsize economic organism, the planned society, to "feel" its reactions and delicately correct them. To this essential deficiency no supporter of the all-in Plan has, so far, paid the slightest attention.

One wonders what Mr Durbin, who in 1946 wrote of "learning from our mistakes" and condemned "the slavery of fixed ideas" would have written in 1949; and how many Socialists of his kind, clear-sighted and liberal-minded, are suffering today the misgivings which he was spared.

The Bank of Ireland

"The Bank of Ireland, 1783-1946." By F. G. Hall, C. P. Curran, Joseph Hone and George O'Brien. (Dublin.) Hodges, Figgis and Company, Limited. (Oxford.) B. H. Blackwell, Limited. 523 pages. £3 3s net.

THE Bank of Ireland has always occupied a unique place among the commercial institutions of these islands. It was founded (after several previous attempts) in the bright autumn of Protestant nationalism that also produced Grattan's Parliament (whose home it inherited). Such a birth inevitably meant that the Bank should be regarded as one of the pillars of the

Ascendancy. Yet by the exercise of wise tolerance (the Court admitted Catholics as soon as the law permitted it to do so) and the practice of professional integrity it has always retained the trust of the whole Irish people and is still beyond question the premier bank of Ireland—of the six counties as of the twenty-six.

The chaos of monetary affairs in Ireland at the end of the eighteenth century was almost indescribable. This was partly due to the existence of a separate Irish currency which, though wholly dependent on the British currency, was not at par with it. The rate of exchange was 13 to 12, which was convenient enough for calculating in pence, but produced the oddest results in pounds. Since British and Irish currency circulated alongside each other (as they do today), commercial life in Ireland must have been a liberal education in mental arithmetic. Bank notes were issued for odd amounts, to make them correspond to round amounts British—for example, an Act of 1799 specified 3s. 9½d. as one of the permitted denominations. In addition to all this, during the period of the suspension of cash payments after 1797, the English and Irish currencies depreciated at different rates (both, however, continuing to circulate) and Belfast, distrusting both London and Dublin in financial matters as in political, clung to gold. The complication of exchange rates can be imagined.

In this curious situation—financially neither wholly dependent nor wholly independent—the Bank of Ireland came to occupy a role that can only be described as that of a semi-central bank. Particularly in its earlier years, it acted very much—but by no means exclusively—as a banker's bank for the cloud of small private banks that rose and fell. It was certainly the leader, and often the master, of the whole banking system (if the word does not imply something far more systematic than ever existed). But it was not quite the lender of last resort—there was always the Bank of England to fall back upon, sometimes to that institution's great annoyance. (Irritation caused by Irish calls on English gold is a phenomenon that recurs at intervals, right up to the present time.) The final assimilation of the currencies in 1826, which had been preceded by the amalgamation of the Exchequers and National Debts ten years before, and the coming of joint-stock banking from the 1820s onwards inevitably changed the character of the Bank of Ireland. But though it is now one of eight commercial banks in the Republic, it is not an ordinary commercial bank. Some relics of a high and exclusive status remain. The Bank still holds the Exchequer account, and it still looks, acts and is the leader.

Of this most interesting institution the present volume is the authoritative history, and enough has perhaps been said to give the reader some notion of the colour of the story. It is banking history shot through, like everything in Ireland, with politics, personalities and paradoxes. The main author is Dr F. G. Hall, who has been his own researcher and has discharged his task with exemplary thoroughness and skill. There is an architectural chapter by Mr C. P. Curran—as is entirely fitting, since

the head office of the Bank on College Green is the old Parliament House and one of the most graceful buildings in Europe, as the photographs amply demonstrate. Mr Joseph Hone has contributed biographical notes, and the whole undertaking has enjoyed the editorship of Dr George O'Brien, Senator and Professor at the National University, the dean of Irish economic historians. The authors, and the Bank itself, are to be congratulated on producing a volume that is worthy of their material.

Autobiography of a Communist

"Fils du Peuple." By Maurice Thorez. Editions Sociales. Paris. 253 pages. 170 francs.

IN the present fortunes of the French Communist Party the publication of M. Maurice Thorez' autobiography has come as a useful propaganda stunt. But the book, if it is read simply as an emotional document, is nevertheless of great interest as the record of the political rise of a young man who came of age in 1918 in the victorious but shattered republic. Once upon a time M. Thorez must have been more than a party hack: his story of his childhood in the grim northern coal-fields is tersely brilliant, with passages not unworthy of Gorki; and the whole tone of his recollections of his Communist beginnings carries conviction, with only an occasional lapse into retroactive theorising.

Maurice Thorez was born into a mining family at Noyelles Godault near Lens. One of his first clear memories is of a mining disaster in 1906 in which there were 1,300 dead. A strike of 52 days followed the accident. When war came he and his grandfather, separated from the rest of the family, were evacuated to another part of France where they worked on the land. By the time that he returned to his ruined village Thorez was prepared intellectually and emotionally for political revolt. The Russian Revolution, the rapid growth of French trade-unionism (the CGT was already

Not only in Manchester

but throughout the whole country
more and more people are making
