1952 Is Now

THE much advertised difference of opinion between the governments of western Europe which has been creating an atmosphere of crisis in Paris and Brussels and London this week is, on the surface, concerned with the technicalities of the Intra-European Payments Scheme. These technical difficulties (which are discussed in detail in an article on page 31) can undoubtedly be removed—they may indeed have been settled by the time these lines appear—and a compromise can be worked out by which the strict bilateralism of the present arrangements can be relaxed without costing Britain any gold. But the technical details of the dispute are not at the real root of the crisis. The conflict over drawing rights and transferability is a symptom, not a cause, of Britain's present difficulties. Sir Stafford Cripps's insistence that no scheme should threaten Britain's reserves springs from his knowledge that once again those reserves are draining away. The figures for the three months from March to June, to be published next week, will show a sharp fall, and it is this knowledge of a steadily diminishing reserve which accounts both for the Chancellor's rigidity in the discussions on the Payments Scheme and for the violent attack of nerves that has overtaken the London money market.

The truth is that the crisis which the British did not expect until 1952—and hoped to be prepared for by then—is already upon them. It has always been recognised that by 1952 the stream of external assistance—whether by loans or Marshall aid—which has gone on uninterruptedly since 1945, would have come to an end and the British by then would have to live on what they earned in a competitive world. In the long run, nobody owes the British people a living and the point must come when they enjoy only that standard of living for which they are prepared to work. What had not been expected was that Britain's difficulties in paying its way would remain so dire that even with Marshall aid, the books would not be balanced and the eating up of the reserve would continue unchecked, or might even be accelerated. As in the "phony war" of 1939, the belief that time is on our side has again proved a myth. Time, now as then, is on our side only if we use it. And, now as then, time has not been used to sufficient effect. The crisis, staved off two years ago, is returning in a more acute form.

Such is the present prospect. The biggest cause of the sudden transformation has been the change, in the past six months, in the economic climate of the world. Britain's present trading methods do not equip it well for trade in a buyer's market. A large part of its commerce is regulated by tightly-drawn payments agreements in which the sterling earned by sales to Britain may be spent only within the sterling area. British producers thus tend to feel themselves insulated from price changes in the rest of the world economy. The incentive to lower costs is slight. But in a world which will no longer buy anything that is available and in which the price at which goods are offered is again becoming a decisive factor, sterling which can only be spent in the increasingly high-cost sterling area loses its attraction.

of newspaper." The largest single ownership lies with Kemsley Newspapers, with 17.18 per cent of the total of general daily and Sunday newspapers. It is true that there was a strong trend, between 1921 and 1929, towards concentration of ownership in provincial newspapers which now appears to have ceased; but in national newspapers there has been a strong trend away from monopoly in the last twenty-five years. The Commission sees no reason to expect the trend to concentration to reappear and it finds that the decrease in the number of daily newspapers "does not yet prejudice the public interest."

In short, it is argued that the appearance of monopoly arises more from mass circulation than from facts of organisation and direction; and in the course of the argument the Report acquits the great newspaper "chains" of the main general charges against them. It accepts the sensible view, which is that the "chain" system can afford to give its provincial papers feature and foreign material, as well as first-hand reports of events of national interest, such as the independent provincial paper can no longer afford and without which it cannot compete for long against the national papers. As for the news agencies, the Commission is satisfied that two providing home and four providing foreign news ensure effective competition and coverage. The Report is, therefore, content with two minor recommendations in this part of its inquiry: that every newspaper belonging to a "chain" should make the fact clear on its front page, and that any cases of real monopoly should be investigated by the Monopolies Commission.

*

On the charge of inaccuracy in news and unreasonable bias in comment the Commission could, of course, recommend no cure by legislation or prescription. In two excellent chapters entitled the "Performance of the Press" and "Formation of Policy" they describe the chief causes for these obvious faults: competition for circulation—especially between the *Daily Express* and the *Daily Mirror*—the "re-write man," haste and straining after effect, changes between editions, and the influence in the editor's chair and the proprietor's home of powerful personalities with strong opinions. The examples they give are fair and salutary, ranging from the brutal candour of the editor of the *Sunday Express*—"the plain fact is—and we all know it to be true—that whenever we see a story in a newspaper concerning something we know about, it is more often wrong than right"—to the winning frankness of Lord Beaverbrook who, when his editors disagreed on matters of Empire, "talked them out of it." In fact the root of the trouble lies in the journalists themselves and the conditions of their work—not in facets of organisation, "commercialism," or malevolent influences. To quote one of the most sweeping expressions of a judgment that often recurs in the report:

The public can therefore dismiss from its mind any misgiving that the press of this country is mysteriously financed and controlled by hidden influences, and that it is open to the exercise of corrupt pressure from self-seeking outside sources.

*

It should be made clear, however, that the Commission describe and severely condemn individual cases of distortion and untruth which have been proven; what they avoid is the reckless, critical generalisations about the press as a

whole which led to its appointment. Indeed, some of the most remarkable examples of inaccuracy exposed in the Report are not drawn from the newspapers at all but from the evidence of that little band of MPs, journalists by profession and socialists by conviction, whose allegations stirred up

the agitation of 1946 and led to the appointment of the Commission. With the help of their research staff and by the confronting of witnesses the Commission were able to show how fallible is the human memory, how often a case is ruined by exaggeration. The allegations about "black lists," about pressure from advertisers, about film critics being victimised by film companies have been much deflated by inquiry. This is the conclusion of the Commission on the performance of these critics:

We called before us several of the journalists who spoke in favour of the motion demanding the appointment of the Commission, but neither they nor the National Union of Journalists produced much positive evidence in support of their criticisms, and some of what was produced did not stand up to examination. The Memorandum submitted to us by the union was not a survey of the press as a whole but rather an attack on the right-wing portion of it.

In short, this little group of politicians—the Fifth Column of the Fourth Estate—allowed their political ambitions and prejudices to blind them. There is a delicious irony in the fact that the net effect of their initiative is to provide an impressive demonstration that the capitalist owners of the press have a much better sense of accuracy and fairness than at least the Socialist partisans among their employees. Those who remember the succession of events in 1946 will find it difficult not to believe that a certain element of vindictiveness against their critics also inspired the Cabinet, or some of its members, in deciding to set up the Commission. They also have been hoist with their own petard. Mr Aneurin Bevan is not mentioned in the Report; but his severest enemy could not wish to have the irresponsibility of his references to "the most prostituted press in the world" more completely exposed and discredited.

What, then, do the Commission recommend? Is all well with the press? Certainly, that would be going much too far. Apart from many detailed comments and criticisms, the Report makes one general point of great force. The British press, it says,

provides for a sufficient variety of political opinion but not for a sufficient variety of intellectual levels. . . . There is a lack of newspapers more serious and better balanced than the popular papers but more varied and easier to read than the quality.

It is also apparent that the Commission is not at all happy—as who can be—about the intellectual level of much that is offered to the mass of the public, and that its unhappiness remains even after it has made the point that "a newspaper

cannot raise its standard far above that of its public." The tendency to lower standards in order to seek competitive advantage, it says,

is not always resisted as firmly as the public interest requires. The press does not do all it might to encourage its public to accept or demand material of higher quality.

This week's headlines saying "British Press Is Vindicated" therefore fall below the standard of accuracy that the Commission enjoins. But where the Report is quite flat-footed is in saying that the causes of the shortcomings of the press "do not lie in any particular form of ownership." Capitalistic ownership of the press, so far from being poisonous, is essential.

Free enterprise is a prerequisite of a free press, and free enterprise in the case of newspapers of any considerable circulation will generally mean commercially profitable enterprise.

The Commission see no need for legislation, for public action, for a purge of Fleet Street. They have found that they cannot draw up an indictment against a whole industry, an entire profession. But they do recommend most emphatically an effort to recruit and train better journalists. They find the methods of recruitment—especially in the provinces—haphazard; the arrangements for training are judged crude, save in the Kemsley group. The Report draws a clear distinction between learning to be a journalist and acquiring the degree of general education which it is necessary for a journalist to have. It insists, quite rightly, that the cure for many evils lies here, and it was worth having a Royal Commission just to say this.

*

When we come to the main—in fact the only considerable—recommendation of the Report approval must wait on further explanation and definition. It is proposed that a General Council of the press, with a paid chairman from outside the profession, should be constituted by the press itself. It would have 25 members, representing proprietors, editors, and other journalists, and one fifth of their number would be "lay members." (Two journalists on the Commission disagree with the proposal for "lay members" and point out that no other professional organisation has found

A Year of Titoism

DURING the year which has followed the famous resolution of the Cominform expelling Yugoslavia from its membership, Titoism has become an international phenomenon. With the single exception of Czechoslovakia, all the east European Communist parties have undergone purges of "nationalists." Their first victim was the Rumanian Patrashcanu, whose disgrace actually preceded that of Tito. Later in 1948 came the turn of the Pole, Gomulka, and the Albanian, Koci Xoxe, of whom the first has so far escaped lightly with the loss of his important state and party functions, while the second was executed a month ago. In 1949 Bolshevik vigilance has unmasked the Bulgarian vice-premier Kostov, the Greek rebel leader Markos Vafiades and the former Minister of the Interior in Hungary, Rajk. The last-named has even been accused of espionage on behalf of the imperialists, and thousands of spontaneous telegrams have already poured in from the toiling masses demanding "a rope for the traitor."

Each case has brought further confirmation of the fact, long pointed out in *The Economist*, that Titoism consists not in any mistake of social or economic policy, or party

their presence necessary.) The Council would represent the press as a whole and "safeguard its freedom"; it would encourage the sense of public responsibility and service in the profession; it would improve education and training. It would also—and here comes the difficulty—build up a professional code by "censuring undesirable types of journalistic conduct," by receiving complaints about the press, and by dealing with these "in whatever manner may seem to it practicable and appropriate."

The question at once arises whether such a Council could do anything that cannot already be done by proprietors, editors and journalists through their existing organisations. The great majority of those who know the trade will answer no. Such an organisation tends to be staffed by those who have the time to serve on it—which, in a busy trade, means the less successful and the less imaginative. It would concern itself much with formalities and trivialities, and if it did take up something important, how could it enforce its judgments and its code? The answer is that it could not, without statutory authority; and this the Commission rule out. The only argument for the proposed Council that is likely to carry any weight at all in Fleet Street is that the press should regard it as a necessary part of its public relations and that it would play a useful part in reassuring those sections of public opinion that have been much disturbed by reckless allegations. But the Report itself is likely to be the strongest counter to this. In any case, the Royal Commission make it clear that their proposal is no more than a recommendation to the press. For the essence of their report is that the press, having been acquitted of general charges, should be trusted to set its own house in order and abolish or restrain those practices that have brought some newspapers into disrepute. In fact the Royal Commission have handed over to Fleet Street the problem over which they have spent two years—not, it is true, without reducing its proportions and clarifying its nature. The result could have been foreseen, and it is to be hoped that more sober counsels will be contributed to discussion of the proposed Council than were contributed to the campaign of 1946, which led to this illuminating but inconclusive inquiry.

tactics, but in insufficient adulation of the majestic figure of Stalin, "leader of the world proletariat," and of those men whom, in his infinite wisdom, he has appointed to give instructions to the young and inexperienced Communist parties of the "liberated" countries. The crime of Kostov, as described in an article in the organ of the Cominform by a former Secretary of the Comintern, the Bulgarian Vasil Kolarov, was that he failed to realise that "secrets and commercialism do not figure in Soviet-Bulgarian relations." Kostov "systematically withheld from Soviet trade representatives the price at which Bulgaria sells certain goods to capitalist states." The great George Dimitrov himself declared Kostov guilty of "the shameful assumption that the Soviet Union might injure the state interests of Bulgaria." Thus, any Communist who considers his country an independent state when dealing with a representative of the USSR is guilty of the impious offence of "nationalism." The most eminent criminals have been publicly denounced, and in each party the lesser offenders are being sought out and rendered harmless.

The purge is unlikely to stop there. The history of Soviet

Communism shows that the suppression of one "deviation" is usually followed by the "unmasking" of its opposite. When the Trotskyists had been liquidated, it was the turn of the Bukharinites. The Soviet press today denounces with equal rage the twin opposite sins of "nationalism" and "cosmopolitanism." Both heresies are, it maintains, weapons of American imperialism for undermining the true faith. It is significant that the campaign against cosmopolitanism in the USSR is specially directed against that group among its citizens whose whole history and character make it most liable to this sin—the Jews. In the recent purge of dramatic critics guilty of cosmopolitanism, the defenders of the true faith took special pleasure in "unmasking" the Jewish names of several sinners who wrote under Russian pseudonyms. Thus the Moscow *Literary Gazette* of March 9th unmasked comrades Zhadanov-Liefschutz, Sanov-Smulson and Martich-Finkelstein. Readers will remember how the *Völkischer Beobachter* used to refer to Litvinov-Finkelstein. There are many Jews among the leaders of the east European Communist parties. The Hungarian party's leaders, Rákosi-Roth, and his colleagues, Berman and Minc in Poland, and Pauker in Rumania, will now presumably make great efforts to avoid the accusation of cosmopolitanism.

★

The grotesque aspects of this purge should not be allowed to obscure the fact that it has attained its main object—to clamp down the Russian vice still tighter on eastern Europe. Just as the wartime phrase "governments friendly to the Soviet Union," accepted at its face value by President Roosevelt, proved in practice to mean quisling regimes of Soviet puppets, so the slogans "socialist comradeship" and "proletarian internationalism" are a rhetorical camouflage for total obedience to the Politburo of the Soviet Communist Party. The Politburo recognises only two categories of human being, whether within or beyond the frontiers of the Soviet Union—enemies and slaves. At present in eastern Europe the first category outnumbers the second. The purge has consolidated the second category; for its increase the Moscow planners rely on time and their well-trying methods of education. When, for a whole generation, all children have been removed from the influence of either priests or liberal teachers, a substantial army of enthusiastic slaves should be available to do the master's work.

Meanwhile, as a result of the spring-cleaning of 1949, the east European Communist parties will be more perfect instruments. Some discontent and bewilderment will have been caused within their ranks, but it is unimportant. There is plenty of hatred of Communism and of Russia in eastern Europe, but it is unorganised and powerless. Communist Party members have to fear the wrath of their hierarchical superiors in Moscow and the wrath of the non-Communist masses of their own peoples. The double fear will keep them to the party line. Perhaps a more serious loss to Moscow will be dismay among Communists beyond the Lübeck-Durazzo line. With the examples of Kostov, Gomulka and Rajk before them, can western Communists maintain that Communism would bring their countries freedom, independence and prosperity? Would it even bring them, personally, the office and the influence of which they dream? But this is, generally speaking, only a reaction of intellectuals. The hard core of French and Italian labour will remain loyal to the party as long as prices are high, food is scarce and unemployment threatens. And it is on the indoctrinated party cadres and the industrial masses that Moscow relies to keep western Europe seething.

The debit side of the balance, for Communists, is Yugoslavia, and the loss is serious. Until Moscow deliberately picked its quarrel with Tito, Yugoslavia was the south-western bastion of the Soviet position in Europe. Through its territory the Soviet Union had access to the Adriatic. Now bitterness and suspicion have reached such a point that Moscow can certainly no longer rely on Tito. Abandonment of support for Yugoslavia's claims against Austria at the Paris Conference last month is only the last of a series of injuries to Yugoslav interests. Though Tito is still far from the subservience to the western powers of which Soviet propaganda accuses him, he is certainly no longer a reliable Soviet vassal. This means that only Albania is left as a lonely outpost of the Soviet empire on the Adriatic. It is true that its ports, Durazzo and Valona, though lacking in modern equipment,

possess great strategic importance, as they dominate the Straits of Otranto. Some, at least, of the Soviet military and civil technicians withdrawn from Yugoslavia are now in Albania. Polish, Soviet and Rumanian ships, passing through the Danish Belts, Gibraltar or the Dardanelles, are bringing materials required for the projected industrialisation of Albania. High among its priorities are the extension and fortification of the ports and the construction of a railway to link them with Albania's eastern frontier. But even if mass labour conscription, police terror and supervision by Soviet engineers could soon accomplish these enormous tasks, the result would be of small value to the Soviet Union as long as the obedient vassal Albania is cut off from the obedient vassal Bulgaria by the Macedonian provinces belonging to Yugoslavia and Greece. Perhaps the most important reason for creating the Dimitrov empire, or "South Slav federation," with its enlarged Macedonian republic gravitating towards Sofia rather than Belgrade, would be to give the Soviet Union direct access to two branches of the Mediterranean, to the Aegean at Salonica and Kavala, and to the Adriatic at Valona and Durazzo. The ghosts of Aehrenthal and Izvolsky might smile to see the revival, in the age of "people's democracies," of the Balkan railway-building imperialism of the turn of the century.

Meanwhile, however, resistance in Yugoslavia and Greece is a fact. Tito is perfectly capable of suppressing any revolt among his Macedonians, and there is not even any evidence that his Macedonians wish to revolt. The hold of the Greek rebels over Greek Macedonia is precarious, and the removal of Markos cannot have improved the morale of those of his followers who believed themselves to be fighting, not for Russian imperialism, but for Greek democracy. Civil war

has not sufficed to destroy Greece, and in Yugoslavia civil war is not a likely prospect. Invasion of Yugoslavia by Bulgarian or Hungarian troops—of which there is no sign—would be repelled: invasion by Soviet forces would involve unpredictable international risks.

Access to the Mediterranean will remain one of the principal objectives of Soviet policy. The Yugoslav and Greek obstacles may cause Moscow to postpone its plans; they will never be abandoned. To keep the Russians back from the Mediterranean should be one of the principal aims of the western powers. It is worth financial effort to strengthen the Greek economy and to hasten the victory of the Greek army over the rebels. If necessary, more funds must be spent,

More or Less Competition?

IT was recently reported in the American magazine *Fortune* that Mr Vincent Tewson, General Secretary of the TUC, on being asked in New York, where he was attending the meetings of the Anglo-American Productivity Council, whether British industry needed more or less competition, replied laconically "less." It is perhaps unreasonable to expect Mr Tewson, as a good trade unionist, to hold any other view, although it might have been hoped that a first-hand inspection of American productivity and American wages would have produced a more constructive reply. No correspondingly succinct comment has been elicited from the representatives of the British employers on the Anglo-American Council, but there is no reason to think that it would have been very much different. Capital and Labour in British industry are formally divided on the issue of "free enterprise" versus "socialism." But except on the point of who shall own industry (which is by no means a vital one to the unions), there is not a great deal of difference between the visions they cherish of what the ideal organisation of industry should be. Both of them accept the notion of a non-competitive industrial order, closed to irritating newcomers and accepting technical advances only at a pace that does not involve either loss of investment or displacement from jobs for those who are committed to older methods. This is what the unions mean by "socialism." And it is also (with a reservation on ownership) what most businessmen mean by "free enterprise."

It is very easy to rail against this general attitude. But the very fact that it is so general suggests that it corresponds to something very real in every contemporary society. If the question is raised in the abstract, then the overwhelming

more experts sent, and more intervention take place in the organisation and personnel of Greek government, provided that Greece is thereby strengthened. It is worth short-term economic loss to help Yugoslavia resist the Cominform boycott, provided that it is reasonably certain that Tito will in fact use such help to increase his power of resistance. It is worth diplomatic effort to bring the Yugoslav and Greek governments to recognise the lesson of both countries' histories: that when threatened by Bulgarian and Albanian tools of a Great Power both must stand together. Success or failure in these tasks by the western powers will decide whether the campaign against Titoism will have served or harmed the Soviet cause.

popular vote, as a recent Gallup Poll has shown, will go in favour of the society that provides maximum security (which is the same thing as maximum protection for established activities) as against one which provides the maximum material income. The intensely competitive American system has produced, according to the claims of its advocates—and some at least of them must be conceded—the highest standard of living, the greatest technical achievements, the most invincible military and naval power, the highest level of athletic excellence, and for that matter the best-looking girls and the finest babies, that the world has ever seen. It is also just as well for the Old World to remember that it provided the where-withal for Lend-Lease and for ERP.

But it has undeniably produced in addition a larger crop of stomach ulcers, psychoses, neuroses, suicides, divorces, and miscellaneous and highly coloured crime than in less competitive countries. So far as the available information goes, all these phenomena of personal instability and unhappiness are more frequent—and some of them much more so—in America than in Britain. To live the whole of one's life at the competitive pace and concentration of a Grand National jockey is good neither for private happiness nor for civic health. Better a dinner of herbs, many Europeans would sincerely hold—better a dinner of herbs supplied by the inadequately aggressive economic system of the Old World, and some measure of peace of mind therewith, than a stalled ox gobbled at the competitive quick-lunch counter. Nor are Europeans the only people to hold this opinion. The Gallup Poll asked the same question, posing the choice between more security and more income, not only in Britain and Sweden, but in the United States, in Canada and in Australia. Every-

where there were large majorities for security; but it is significant that the majorities were notably higher in the pioneering, risk-taking atmosphere of the New World and the Great Open Spaces. If it is a straight contest, as a matter of abstract principle, between Security and Competitive-Efficiency, then competition is apparently not what people want even in the land where its praises are most loudly sung.

★

But in Britain in 1949, unfortunately, the case is not abstract and academic, it is concrete and pressing. The choice is not between more income and more security but between more efficiency (which almost certainly means less security) and less income. It might be that if the public were asked in a Gallup Poll if they would prefer less income or less security they would still answer less income. But they would not mean it, for they would not understand the implications of the question, and they would certainly be quick to howl down any Government that accepted such a verdict and gave up the fight to maintain the standard of living. The choice of security at the cost of income is acceptable if those who make it are, in fact, prepared to content themselves with a dinner of herbs. But it is evident that they are not. Organised British labour, whose interests Mr Tewson represents, demands nothing less than a stalled ox: roomy and well-equipped houses, good and varied food, secondary education for all, health services on tap, ample spending money, shorter hours, longer holidays, and a substantial "floor" to the economic system for the benefit of all those who fail to make the grade. It demands, in short, all the fruits of the highest productivity, a higher productivity than Great Britain has ever achieved. And in view of the mass of human suffering and frustration, of slums and malnutrition, of ignorance and ill-health, of wasted lives and wasted talents, which is summed up in the word "poverty" and is implicit—at all events in an industrial community—in that innocuous metaphor of the dinner of herbs, they are perfectly right.

Who wills the end, however, must will the means. High standards can only be supported by a highly productive economy—not in the naive sense of maximum quantity at any cost, but in the genuine economic sense of a high return from all the productive resources. It means the use of labour, enterprise, equipment, and raw materials in the place and the manner in which they will count for most. That can never be achieved under any corporative system of self-government in industry, for it presupposes all that the vested interests in industry, who would do the self-governing, would most heartily oppose. It means that the low cost producer—the firm who by an intelligent use of their labour and their skill could sell a better product at a lower price—would attract capital, brains, and labour, while the less efficient, albeit the old and more famous firm, would either follow suit or dwindle into bankruptcy. It means that towns or districts historically associated with a particular process or product would have to face either a radical change of pursuit or insolvency and depopulation. It means that famous names in British industrial history would be replaced by those unknown ten years before.

If the demands that the British people in fact make upon their economy (whatever answers they may give to Gallup Pollsters on abstract issues) are to be met, it is not enough to avoid any further decline in economic efficiency, there must be a sharp increase. The present British standard of living is sustained by free American dollars. To support it without this aid requires a sudden and substantial jump in efficiency—by which is meant (to repeat) not the piling up

of records of production achieved at any cost, but lower real costs of production, the giving of better value for money all round. The total of units produced is now becoming less important than the cost of producing the average unit. It is quite certain that there will be no such jump in efficiency if Mr Tewson gets his way and there is less competition. It is only one whit less certain that it cannot be done without a substantial move back in the direction of real competition.

★

This clearly, is what the national interest requires. But nobody should be under any illusion that it will be easy to reverse the trend. The forces in Great Britain arrayed against low cost production through a competitive economy are very great. The whole climate of a mature civilisation militates against the crudities and disturbances of a turbulent economic system—a fact which is reflected in the attitudes of management and labour and of the two great political parties. There is nowadays a very strict limit to the amount of social tension and upset which Englishmen of any class have the nerves to stand. The planners, including the Civil Service generally, would not welcome a dynamic economy, constantly altering its shape and pattern. One of the most interesting aspects of the Government control of industry since 1939 has been the way in which it has accepted the industrial order as it then existed, and by its system of controls has done its best to petrify it. Organised labour views the competitive economy with deepest suspicion. That it would mean a more materially prosperous society does not in the eyes of most trade unionists overcome the disadvantage that it would involve, first, genuine mobility of labour between localities and between industries, and, second, a much greater difference between the earnings of the industrious and the idle.

But possibly the greatest stumbling block to the creation of a fully competitive economy is the social climate which in Great Britain surrounds success in business. So seductive is the way of life which industrial Britain inherited from agrarian Britain that almost every industrialist has sought to make himself, in greater or lesser degree, a country gentleman. This has not been without gain to the community. But such a social system has dangers for a Britain which is confronted with the need to kindle its economic activity into white heat. It leads to the assumption that a man or a family or a business which has gone up in the world cannot possibly go down. A self-made man with a Cotswold manor house and a son at Eton is not likely to venture his fortune on a new technical improvement or to face with equanimity the thought of cutting his losses and starting again. All the fruits of success in England give a man the strongest possible interest in a quiet life. Rather a convenient arrangement with his competitors, an acquiescent attitude to the demands of general labour, and a friendly chat with the Government about a quota or a subsidy. The aristocratic ideal which has helped to make England one of the most intelligent and the most enduring of nations has also contributed towards making it one of the most economically unadventurous.

But if the social climate of the community exerts so strong a pressure towards a course that will clearly be disastrous for the nation, then the task of statesmanship is to plead and argue and act against it, not feebly to acquiesce. Everybody now accepts the abstract statement that the British people must somehow contrive to balance their books before they can decide what to do with any surplus. Everybody would accept such a statement in words. But few people act as if they were prepared to accept the social and economic consequences of transforming Britain into an efficiently productive nation.

NOTES OF THE WEEK

Railwaymen Turned Highwaymen

While the eyes of the world are turned anxiously upon the peripatetic figure of Sir Stafford Cripps to see how far and in what way the crisis of Britain's payments will develop, the British railwaymen and dockers are doing their best to undermine the confidence and prestige of the Government at home. After months of negotiation the National Union of Railwaymen have made it quite clear that the only settlement which will satisfy them is a complete surrender to their terms. Having rejected the Railway Executive's offer to raise the wages of the lower paid men, and having refused to abide by arbitration, the Union is trying one device after another to force the hands of their employers and the Government. The latest weapon taken from their armoury is the threat of introducing "work to rule" from midnight on Sunday unless their demands are met. "Work to rule," the sticking to the letter of an old-fashioned rule book and no overtime, is half-way to a complete strike and will induce a state of lethargic paralysis not only on the actual railway lines but probably among the numerous road haulage undertakings connected with the railways. That this is purely a move in the game and not caused by the spontaneous indignation of underpaid railwaymen is obvious from the fact that the decision was taken at a special delegate conference only six days before the annual conference of the whole union is due to assemble. It is another mark of the intemperate ambition of the union's secretary, Mr J. B. Figgins—a man who is on the way to becoming the best hated figure in Britain both among the union movement whose standards of conduct he is betraying, and among the general public.

★

The action of the NUR has placed the Government in an impossible position. The Railway Executive is their administrative agency and the union is one of their most powerful political supporters. By producing this head-on clash the union has exposed the frailty of the whole structure of relationship between Government, industry and labour. But it is hard to see what the Government can do beyond patiently attempting to bring the railwaymen back to the path of reason and arbitration. To concede the claim of the NUR would add about £25 million to the already inflated running cost of the railways. At the same time to apply the strong medicine of running the railways with troops and volunteers would place the Government on uncertain ground unless a full strike was declared, for it would embitter the dispute and strain the loyalty of the rest of the trade union movement. To mobilise road haulage facilities to replace or supplement the railway services would be very costly in imported petrol. But that is what it may have to come to if the railwaymen are to be made to see the impasse in which the tactics of Mr Figgins will get them involved. Until they do realise this, it is impossible to discuss methods of achieving actual friendship among the railwaymen. One lesson stands out very clearly from the action both of the railwaymen and of the London dockers who are pursuing a quixotic strike dispute with the employers about the unloading of Canadian ships—that all the propaganda, the pamphlets, the speeches, and the broadcasts about the national interest go no more than skin deep, and can easily be erased by the fiery words of unscrupulous union leaders.

★ ★ ★

Mr St. Laurent's Victory

The victory of the Liberal Party in the Canadian general election has outstripped the wildest hopes of its supporters and the deepest fears of its opponents. Having dissolved with a majority of only 5 seats, they return to office having won 193 out of a total of 262. The Conservative Party, which under its buoyant new leader Colonel George Drew had hopes of

forming a government, was reduced from 67 to 42 members, and the Co-operative Commonwealth Federation, which had hoped to secure the solid votes of organised labour in the industrial areas of Ontario and to emerge as the champion of the workers, had its representation of 28 more than halved. The Liberals secured the largest number of seats in every province except in Alberta, which remained faithful to the Social Credit Party, a peculiar brand of local conservatism. In Ontario, the province of which Colonel Drew has until recently been Prime Minister, 56 out of the 83 seats fell to the Liberals. In Quebec, whose provincial government is in the hands of the anti-Liberal Union Nationale Party of M. Duplessis, there was a strong possibility that the French-Canadians would turn from that constant support of the Liberal Party in federal politics to which Sir Wilfred Laurier had won them at the beginning of the century. Yet the Liberals secured 68 out of Quebec's 73 seats.

★

The division of the popular vote shows that this landslide is caused partly by the vagaries of direct representation, as was the Labour landslide in Britain in 1945. In fact, the Liberals secured only just under 50 per cent of the total vote while the decimated Conservatives received 30 per cent. But to receive the confidence of even half the electorate is a remarkable feat for a party which has been fourteen years in office. It is partly attributable to the sluggish movement of the political pendulum in Canada. Out of its 81 years of independent nationhood four Prime Ministers have between them covered a total of 65 years. But the principal cause is undoubtedly the same as that which produced a similar result in the United States last November, that the electorate in a prosperous economy has no reason to alter a government which has created an adequate amount of social security and material abundance. The workers and farmers withheld their support from the CCF, as their neighbours south of the border did from Mr Wallace. Nor was Colonel Drew any more successful than Mr Dewey in scaring the electorate into demanding the policies of the right. The Canadian Liberals could in fact point to a solid record of achievement—particularly in the stabilisation of prices—while the enormous economic problems which confront Canada are beyond the horizon of the ordinary man's understanding. The Conservative programme was thus merely one of factious opposition—it condemned the British wheat contract to the western farmers, and vaguely talked to the Ontario business men of making sterling and dollars convertible. In Quebec they formed an undercover alliance with the Union Nationale which, as it turned out, was their undoing, for the Catholic Church, worried lest the reactionary policies of M. Duplessis might promote the growth of Communism, is beginning to throw its formidable weight against him.

But it is also a personal triumph for Mr St. Laurent, whose integrity and clarity of mind have made as great an impression in Canada as they have abroad. It may be that Canada has found a man who can really unify and lead her, for Mr St. Laurent possesses most of the characteristics which were politically valuable in Mr Mackenzie King, but also qualities of leadership which Mr King never had. The Liberal Party has managed to rejuvenate itself from within and has thus escaped the decay normally associated with a long tenure of power, but probably its greatest test will be in the coming Parliament with virtually no opposition to keep it unified and alert.

★ ★ ★

"Delicacy" in China

HMS Amethyst remains a captive under control of Communist guns in the Yangtse, while negotiations for her ransom

are being carried on. According to a spokesman of the Admiralty the situation is still "delicate." The ship is not being directly molested and is permitted to purchase supplies locally for the crew, but the Communists have shown no sign of allowing her to descend the Yangtse until a bargain on terms has been struck. Nobody expects that Britain will ever receive either an apology or a penny of compensation for the attack on the *Amethyst*; on the contrary, Britain has still to pay a price of a kind not yet disclosed for the release of the ship, which is being used as a blackmailing lever for Chinese Communist political purposes.

Having reproved by fresh experience the inability of warships on a river to cope with a powerful land artillery, the British Navy is admittedly unable to obtain the release of the *Amethyst* by direct intervention. Nor is it permitted to exert any indirect counter-pressure, as by a threat of naval blockade of Shanghai, because that would be lacking in "delicacy." Moreover, it would be contrary to British commercial interest, which requires that the port of Shanghai in Communist hands be not merely immune from the effects of any British action to obtain the unconditional release of the *Amethyst*, but also be defended against any measures of blockade applied by the Nationalists. Towards the Nationalists, indeed, no delicacy is needed, and the British lion can roar with all his ancient majesty. It has, however, refrained from roaring until it can observe with what gestures the American eagle flaps its wings.

The United States has now declared its refusal to recognise the legality of the Nationalist Government's order closing Chinese ports in Communist hands, unless the Nationalist Government "declares and maintains an effective blockade." The British Government is expected to give naval protection to British shipping against Nationalist interference, and the *Black Swan*, which was driven back in its attempt to ascend the Yangtse to rescue the *Amethyst* in April, has already been stationed off the mouth of the Yangtse to deter Nationalist warships from barring access to Communist Shanghai.

It is thought that the Nationalists cannot make a naval blockade "effective" in the sense required by traditional international law, and that they will be in any case reluctant to confer belligerent rights on the Communists by declaring a full blockade. On the other hand, if Nationalist aircraft bomb the wharves of Shanghai, foreign shipping may get hit incidentally to the waging of the civil war, and this is perhaps what the Nationalists really have in mind. They could point out that when the RAF bombed German ports, they did not take much thought for the welfare of Swedish ships which might be in their harbours. But the rights assumed by a Great Power at war are not to be recommended to the weak.

* * *

Conservative Imperial Policy

The Conservative Party have in their latest pamphlet on Imperial Policy* produced a more statesmanlike document than the "charters" published hitherto. Their irritating and historically unfounded claim to the spiritual paternity and

* "Imperial Policy." A statement of Conservative Policy for the British Empire and Commonwealth. Conservative Central office. 64 pages. 1s.

guardianship of the British Empire is less in evidence than usual. The pamphlet contains the usual sallies against the colonial policy of the Labour Government, but despite evidence of a carefully controlled distaste for certain new constitutional developments the pamphlet shows evidence of a desire to frame a policy in accordance with the facts as they exist today. Stress is laid on the necessity to repair and renew "the machinery for common action." This would include a Commonwealth Defence Council and Combined Staff; a civil liaison staff to provide a connecting link between frequent meetings of Commonwealth Prime Ministers; machinery for Commonwealth economic consultation on the lines of OEEC; and a Commonwealth Tribunal to take over the functions of the Judicial Committee of the Privy Council (a proposal of considerable value if a tribunal could be constructed with greater appreciation of local conditions than that possessed by the Judicial Committee). These proposals have the merit of being definite, but the tide of opinion in the Commonwealth is still so inimical to the abrogation of any fraction of Dominion sovereignty as to make it unlikely that any Conservative government would have much success with them. Moreover, on the question of defence, the commitments of Britain and the Dominions are now largely regional, and the idea of a Commonwealth defence policy no longer has any real validity except perhaps in the Pacific.

*

In matters of international political and economic policy, however, Conservative views of Imperial policy have a good deal more practical importance and their traditional attitude is strongly restated in this pamphlet. The United Nations may be all very well, and so may regional agreements such as that for Western Union; but the Conservative Party will not

permit any such agreement to override or conflict with the political, economic or defence obligations falling on Great Britain as a member of the British Empire and Commonwealth.

The Geneva and Havana agreements on international trade are regarded as snares from which Britain should escape as fast as it can. Imperial preference and the general principle of Imperial discrimination, renamed "Imperial Priority," are the essentials to prosperity.

In any general sense this is economic nonsense. From the purely economic point of view Britain and the Dominions and Colonies would do better in a world-wide economic co-operation, wherein each could buy and sell in the best market, than in the high-cost Commonwealth autarky of an Empire Crusader's dream. Economically the best that can be said for Imperial preference is that to abolish it outright and forthwith would be a greater evil than to maintain it for the time being. Politically, of course, the situation is different. Economic co-operation underlines and underpins political unity. That the constituent parts of the Commonwealth and Empire should do a large proportion of their trading and investment between themselves is conducive to their general cohesion; and that cohesion is of incalculable value to the world. If an economic price has to be paid for it, it may be well worth paying. There is nothing to be gained, however, by pretending that, so far from payment being necessary, higher standards are thrown in as a bonus to political advantage.

*

Nor does the value in political terms of a moderate and elastic degree of Imperial preference, or other discrimination, prove that a more discriminatory policy would bring about proportionately closer cohesion and more reliable imperial unity. Already the outlines of a quandary in colonial economic policy are becoming visible. If a colony, like Malaya or West Africa, sells a substantial proportion of its produce outside the Empire, and is therefore exposed to the intemperate climate of a buyer's market, but is constrained by considerations of Imperial (or sterling area) policy to import from the high cost sources inside the Imperial ring-fence, its reaction is more

likely to work for disruptive resentment than for enhanced solidarity.

While it would be a piece of gross irresponsibility to jettison all Imperial obligations in the interests of new international groupings, it is hardly less irresponsible to oppose, in the name of Imperial commitments, a blank *non possumus* to every measure designed to cement European, or western, co-operation. It takes no account of the positive encouragement which the Dominions have given to Britain's participation in Europe, nor of the fact that the political and economic conditions of the 1950s will be very dissimilar from those of the 1930s. If such an attitude were really maintained by a Conservative government in office, the political advantages of Imperial discrimination would be paid for not merely in economic terms but in a lack of political realism more dangerous to the welfare of the Empire than any exposure to the allurements of foreign markets or the winds of foreign competition.

Shaping Road Transport

There can be little ground for quarrelling with the decision of the Minister of Transport to set up a new Road Passenger Executive under the British Transport Commission. The combination of both passenger and haulage operations under the original Road Transport Executive seemed from the first a somewhat dubious step; the fact that both forms of traffic go by road affords few common economic or technical links between them. The Road Transport Executive now becomes the Road Haulage Executive, and the two separate transport functions will be conducted by two distinct bodies under the general charge of the British Transport Commission.

It is well, nevertheless, that this change has been made at a relatively early stage. It follows, in part, from the acquisition by the Commission of the Tilling and Scottish Motor Traction bus undertakings, which provide the backbone of the Commission's road passenger operations and whose operating structure, at any rate for the time being, is to be unchanged. Until the new Executive has worked out area schemes for the re-organisation of road transport—a task which is likely to be long and delicate, for it involves some tender municipal susceptibilities—its functions are likely to be advisory, rather than operational.

*

The other side of the medal is the fast progress which the Commission is making towards the acquisition of road haulage undertakings. According to figures given by the Chairman of the Commission, Sir Cyril Hurcomb, payments for the purchase by agreement of road haulage undertakings will soon reach almost £25 million. This sum will cover many of the largest undertakings in the industry. In addition, nearly 1,300 notices of compulsory acquisition had been served on other road hauliers up to the end of May. Thus Sir Cyril was able to show that the appointed day was approaching, after which independent road haulage operation will be restricted to 25 miles except under permit. He promised the Road Haulage Association last week that permits would be issued "in a manner and in a spirit which will acknowledge the importance of just treatment of the individual haulier and the interests of the trade, as well as the convenience of administration." But when these permits come up for renewal "more difficult decisions" will be involved. These are fair words, but they would still leave the independent road hauliers with what might well be a conditional and a temporary franchise. That, of course, was implicit in the Act from the beginning, but it does not make the position of many road hauliers any more comfortable. Sir Cyril hopes that conflicts between the Commission and the industry will be narrowed and progress towards co-ordination advanced; he intends to be scrupulous in avoiding harsh or arbitrary action, and will not "seek to press the Commission's

competitive activities unnecessarily for the sake of doing so." But the Commission is charged with the duty of paying its way and integrating all forms of inland transport; it may be that by the time it is ready with new charges schemes, economic necessity may compel the Commission to take a tougher line with outside competition than Sir Cyril is at present disposed to suggest.

* * *

Strikes in Australia

It is difficult to imagine a more irresponsible strike than that of the 24,000 coal miners in Australia. Relations between the coal owners and the miners have never been happy, and in the past, the coal owners have been to blame for some at least of the disagreements, but in the present dispute the miners have far exceeded any reasonable claims. They are demanding a 30s. a week increase in wages and a reduction of working hours to 35 hours per week. The miners have refused to submit their claims to the usual arbitration tribunal, and the owners, backed this time by the Government, have refused to give in.

The strike is rapidly paralysing Australian industry. In the States of New South Wales, South Australia and Western Australia there is no coal, gas or electricity available for industries and some 500,000 men have been thrown out of work. Transport services have been drastically reduced, and what little power is available is enough for domestic users in the big cities to cook only one meal a day.

The extravagant demands of the strikers make it seem likely that they were never expected to be met, and that the strikers are activated solely by the desire to make mischief. To judge also from similar strikes in Australia in the past, this strike shows all the signs of Communist inspiration—the motive, presumably, being to embarrass the government at a critical point in its career. If it follows the usual course of former Communist-inspired strikes, it will continue until strike funds run out, and the Federal Government is trying to reduce the strikers' supply of money by making it illegal for any other trade union to lend them financial support.

Mr Chifley is probably right in saying, as he did last Tuesday in Canberra, that punitive legislation aimed directly at the coal miners would be ineffective, and, moreover, might even arouse the sympathy of other workers who at present condemn the strike. But surely some way can be found of restricting this persistent nuisance in the Australian economy? It seems a pity, to say the least, that the Government postponed until the next parliament the private Bill of the Leader of the Opposition, Mr Menzies, who sought to eradicate one evil by enforcing secret voting and supervision of trade union ballots.

The Economist by Air direct to New Zealand

From this week we are starting a direct Air Express Service to New Zealand. Copies are due to arrive in Auckland on the Friday after publication and will be posted to subscribers immediately.

Air Express Subscription: £7 15s. a year

Existing subscriptions sent via Sydney at an annual cost of £10 10s. will be transferred to the new service. Unless we receive instructions to the contrary, the saving effected will be used to prolong the validity of subscriptions.

Faint Hopes in Indonesia

This week the Dutch have begun evacuating Jogjakarta, the former capital of the Indonesian Republic, which they captured by a raid from the sky during the police action of last December. When they have left, the Republican leaders, headed by Dr. Soekarno and Mr Hatta, are to come back and establish their government, under the terms of the Van Royen-Rum Statements of May 7th. In return, the Republicans undertake to do their best to enforce a cease-fire among the guerrillas. This apparently satisfactory turn of events, however, has only taken place after several weeks of hard negotiation about the detailed execution of the Statements. Those who have been watching events on the spot are inclined to believe that the fresh hopes raised are already doomed to bitter disappointment.

The fundamental trouble is that, so long as the Republican leaders believe they have the United Nations predominantly behind them, they will never come to an honest agreement with the Dutch, except on their own terms. The main point which has emerged since May 7th is that the Republicans never meant to call a cease-fire, until they had secured Dutch recognition of their unquestioned rule over every bit of territory in Java and Sumatra not already effectively occupied by Dutch troops. And on this the Dutch have been forced to give way. The result is that threats and intransigence have once more been shown to pay. The Indonesian Federalists who had co-operated with the Dutch have had their thunder stolen, and are now frightened; and Asian opinion has had time to form up once more against Dutch "colonialism," thus strengthening the Republican hand—which is what Soekarno and Hatta were playing for in the protracted boundary negotiations after the apparently final Van Royen-Rum statements.

There are only two ways by which there now seems any chance of bringing this dangerous dispute in Indonesia to an end. First, on the Dutch side, it is absolutely essential to regain the confidence of the Federation and of world opinion by launching at the earliest possible date the United States of Indonesia, with or without the Republic. Unfortunately internal politics in the Netherlands look like continuing to prevent this—and the fiddling looks like going on until Rome burns to the ground. Secondly, Washington and London should initiate and lead a hands-off policy, if they really mean to prepare this vital piece of south-east Asia to meet the Communist test. Unfortunately, neither finds it easy to take such a downright stand when so many cross-currents of public opinion are ebbing and flowing around them.

* * *

New Trade Union International

Last week, in the hall in Geneva where Lenin once expounded the principles of Communism, the first welcome steps were taken towards the formation of a democratic—non-Communist—international organisation of trade unions. Since last January when the British, American and Dutch delegates finally gave up the hopeless attempt to co-operate with the Communist majority in the World Federation of Trade Unions, there has been a steady stream of secessions from that body. This new assembly in Geneva brought together delegates of thirty-eight national trade union centres from all over the world, claiming a total affiliated membership of 43 millions. The conference, presided over by Mr Vincent Tewson, devoted two days to a general airing of views. It then appointed a preparatory committee to draw up a draft constitution and programme for the new international, and to make arrangements for a constituent assembly in November.

In the past the inability of the two great American labour organisations, the American Federation of Labour and the Congress of Industrial Organisations, to agree on a common international policy has frustrated the organisation of the democratic trade unions on an international basis; and the

spectacle of delegates of both bodies presenting for the first time a united front at Geneva, was both a heartening sight for the other delegates and a happy augury for the new undertaking.

None the less, the organisation of the new international will cause many headaches. There is, for instance, the old problem of its relationship with the international trade secretariats, whose representatives at Geneva were as jealous of their autonomy as ever in the past. There is also the new problem posed by the inclusion of both American organisations. For, having allowed American labour to be represented by more than one "national centre," it will be difficult to resist the claims of the powerful Catholic trade union organisations existing in many European countries to join as well as their socialist counterparts.

The new international owes its existence first and foremost to the strength of the anti-Communist sentiments of its creators. Indeed, Mr Tewson warned delegates against allowing it to represent nothing more than a negative opposition to the Communists. To outbid the rival WFTU, which opened its second Congress in Milan last Wednesday, they must work actively and effectively to improve the standard of life of workers throughout the world. The conference did in fact show itself fully aware that the struggle between the two rivals will be most fiercely waged in those great areas of Asia, Africa, South America and the Middle East where standards of living are still very low and where trade union organisations are still in its infancy.

* * *

End of the Boundary Commission

Mr Bevan has given the Local Government Boundary Commission a curt notice of dismissal. The Act under which the Commission operates is to be repealed, and the decisions it has made to date, including several provisional orders relating to county boroughs who urgently need land for housing, become null and void. The Minister's main excuse for this step is that local government needs a more drastic re-organisation than the Commission has power to perform. This argument is indeed perfectly true. The Commission itself has pointed this out, has produced a plan, and has suggested how its own powers could be extended to cope with the situation. But the Minister is evidently not prepared to let the Commission reform local government, nor has he passed an opinion on its plan. If this attitude betokened a willingness to take action himself, on the grounds that controversial decisions relating to local authorities needed the full weight of Government authority, the Minister's behaviour would be reasonable. But in the same breath as he accepted the need for a major reform, Mr Bevan made it clear that the Government is not going to undertake it in the foreseeable future. The problem is again shelved—this time indefinitely.

Changes in the boundaries and status of local authorities must from now on be effected in the old way, by the tiresome and costly method of promoting a Private Bill. Many local authorities, however, have an immediate need for boundary extensions or other changes, whatever new system is ultimately introduced. The Commission, within the framework of its present powers, could have attended to their needs expeditiously and achieved other minor reforms.

Why then abolish the Commission, without notice or acknowledgment and without making proper alternative arrangements? It can only be that Mr Bevan wants to rid himself of an embarrassing encumbrance and to dodge a reform which he reckons may interfere with his own central empire. The Commission has been troublesome, because it has put a number of unanswerable points before a Government which would prefer to forget the matter. Therefore it must go. Such rank political opportunism compares strangely with the note of high-minded evangelism with which Mr Bevan regaled

his followers at Blackpool. It is all the worse since the issue at stake is of real importance to the maintenance of an effective democracy.

* * *

Civil Servants and Politics

With the growth of the Civil Service from 335,000 non-industrial and 125,000 industrial staff in 1935 to more than 700,000 and 400,000 respectively today, the existing barriers to political activity have become more and more irksome. The Report of the Committee on Political Activities of Civil Servants* was published and accepted by the Government on Tuesday: its effect is to increase the number of civil servants who will have complete political liberty (including the right to stand for Parliament without being required to resign unless elected) from about 200,000 to 666,000.

The problem before the Committee was to find the right balance between preserving the impartiality of the Civil Service, and freeing as many individuals as possible to join in the activities and responsibilities of citizenship. The civil service unions went so far as to recommend that all the existing prohibitions should be removed. The Committee rightly refused to go so far as this, and drew the new line of demarcation roughly below the "white-collar" line, as is shown in the table following. The distinction is based on the theory that all those who are concerned with policy making; those who serve the policy makers, for example, typists and clerks; or those who deal with members of the public on matters involving even minor decisions concerning such matters as tax assessments, allowances or entitlement to rationed goods should be exempt from all suspicion of political bias. Outside these categories the maximum freedom should be allowed.

*Cmd. 7718. 9d.

THE LINK OF DEMARCATION PROPOSED BY THE COMMITTEE

Grades	Approximate Numbers on Jan. 1, 1949
Administrative (home and foreign).....	4,500
Professional, scientific and technical.....	80,700
Executive.....	61,000
Clerical.....	275,500
Typing.....	32,000
Service departments' constabularies.....	6,500
Post Office supervisory manipulative.....	12,800*
Total above the line.....	470,500
Minor and manipulative grades:—	
(a) Post Office.....	207,700
(b) Other.....	49,750
Industrials:—	
(a) Service departments.....	214,000
(b) Ministry of Supply.....	65,000
(c) Post Office.....	67,000
(d) Others.....	62,500
Total below the line.....	666,950

* The majority of the Committee recommend that these grades be placed above the line.

The effect of these proposals is to free the 666,000 from almost all restrictions subject to their political activities not interfering with their official duties. They will benefit from the existing rule which permits an officer to take up to 12 days special leave with pay for local authority duties: in addition they will now have certain rights of reinstatement if they wish to return to official life after a period in Parliament. Above the line all political activity is barred, except that a limited and qualified approval is given to some participation in local government. The dividing line is a very reasonable one. Unfortunately—and it is a problem which cannot be solved—it is those above the line whose participation in politics would be most valuable, particularly in these days when the demands

WHOLESALE

Brings it to You More Economically

Britain's Wholesale Textile Warehouses provide the great pipeline which speeds the flow of goods from factory to retailer in every town and village. No more economic system can be devised. Research has proved that Britain's costs are lower than those of any other country.

A Farmer's Warning

It is a rare event indeed for a British farmer to warn his fellows that they are the spoilt darlings of economic conditions which are rapidly changing. Mr Cherrington, the Hampshire farmer who uttered these salubrious words, pointed out that the gap between the guaranteed domestic prices and world prices was widening. Even the price of home-grown meat, a sore point with many British farmers, was shown to be more than twice that of Argentine beef or New Zealand lamb, although the domestic product is admittedly of superior quality. The milk producer in this country, who enjoys a naturally protected market anyhow, has been the most favoured of all by price incentives. The result is that the costs of milk production here are over double their level in North America, Holland or Denmark. The gap in cereal prices is not yet so wide, but it is widening with the re-emergence of world surpluses. Mr Cherrington's recipe is equally salubrious. "Suppose prices were cut 25 per cent tomorrow," he asks, "could you make your farm pay? If not, why not? The time to consider this is now, not in panic once the blow has fallen."

British agriculture, which once suffered from a grievous instability, is now exhibiting the opposite evil of too much security. This fact is not only to be seen in the steady upward curve of the guaranteed price schedule, which faithfully covers the costs of the less efficient farmers and lulls the remainder into a sense of easy-going assurance; it can also be observed in the excessive security of tenure conferred by the Agriculture Act, which is reducing mobility within the industry and giving a new lease to the indifferent farmer who is not so grossly inefficient as to merit dispossession. In quantity of production, British agriculture has much to its credit over the last ten years—although recent results, in view of the large incentives offered, have been disappointing. It is the costs of production that have been so persistently disregarded, until a high and rigid structure of costs has come to be taken for granted. Agriculture is not, of course, alone in the malaise which is common to the whole British economy. But the Government has at least warned the export industries of the grave urgency of cost reduction, whereas the Ministry of Agriculture has consistently lulled the farmers into believing that production is all that really counts. Agriculture may suffer an especially cruel awakening, since the full blast of world competition may well be felt there before it smites industry, and with a force which no government, however loyal to the farmers, could withstand.

* * *

A Bad Decision

Last week Mr Bevin announced the Government's decision not to make any further contribution to the United Nations International Children's Emergency Fund. This decision is so inexplicable and short-sighted that it is hardly surprising that Mr Bevin's defence of it was entirely unconvincing.

It should not be forgotten that the Fund is not just a charitable organisation created to meet a sudden emergency. It is also a great co-operative international enterprise through which permanent foundations for improved child welfare services have been laid in many of the countries in which it operates. Every dollar contributed to it (in whatever currency) not only provides seventy glasses of milk, or eight anti-tuberculosis vaccinations, or three hundred doses of cod-liver oil, but also stimulates Governments to do what they can to help themselves. All UNICEF supplies are distributed on the written understanding that they are supplementary to, and not a substitute for, the participating Government's own efforts to

provide for its children. In addition, all these Governments make whatever contribution they can to the common pool. Poland, for instance, has provided sugar-beet, Finland the paper for millions of BCG vaccination record forms, and France facilities for training in child welfare. It is estimated that by such means every individual contribution to the Fund is more than doubled in value by the time it reaches the mother or child.

*

Moreover, the United States Congress has appropriated \$75 million, which is being released to the Fund in the ratio of \$2.57 for every dollar equivalent contributed by other Governments. Unfortunately by the beginning of April these other government contributions were only sufficient to allow the release of less than \$55 million of the American appropriation. Therefore at least \$20 million of American funds alone will be lost to UNICEF unless some Governments make a more determined effort than they have in the past to match American generosity. And since the Fund's activities have used up its other resources—\$32 million from Unrra and \$10 million from the Appeal for Children—it looks as if it will have to give up at the end of the year with its work only half done.

The British Government appears to consider that UNICEF's financial straits provide an excellent excuse for withdrawing support from it. Moreover, it puts the blame for the Fund's predicament on all the other rats who are deserting the sinking ship when it is, in fact, itself by far the most important rat of all. For its support of the Fund has all along been distinguished only by its half-heartedness and inadequacy. It is sufficient to point out that while the Australian Government has contributed the equivalent of over \$7,000,000, and the Swiss Government \$1,000,000, the British Government has contributed just over \$400,000. Its offer to contribute a further £100,000 for the relief of Arab refugees only serves to awaken grave suspicions that the Government is most inadequately informed of the extent of UNICEF's activities. If it feels that the Arab children have first claim on its charity, why does it not send the money to UNICEF? There it will not only release over \$1,000,000 from the United States, but will also help the \$6,411,000 programme which UNICEF has already undertaken among refugee Arab and Jewish children.

Bad to Worse in Prague

In 1937, the Catholic hierarchy of Germany, deprived of the power of communicating freely with their flock, their papers controlled or abolished, their telephones tapped, managed to startle the Nazi tyranny to its roots by reading out in all the pulpits of Germany the secretly delivered papal condemnation of the regime, *Mit Brennender Sorge*. Last Sunday, under totalitarian repression, daily increasing in its resemblance to Nazism, the Catholic clergy of Czechoslovakia succeeded in reading from the pulpits their Bishops' pastoral letter. This in moderate language, without threats or complaints, set forth their grievances against the regime—which include arrests, kidnapping, total censorship—and their reasons for refusing to come to an agreement with a state which not only refuses normal guarantees to Catholic worship and education, but deprives priest and layman alike of their ordinary civil rights.

The Czech Government responded immediately by banning all pastoral letters and all clerical meetings under pain of punishment and by ordering the fining and imprisonment of the priests who read the pastoral letter in their churches. The next step will undoubtedly be the final arrest of Archbishop Beran and there is no reason to suppose that the other bishops will be spared. In Rumania, all eleven Catholic bishops have now disappeared to prison, and all clergy who will not purchase immunity by complete subservience face sooner or later the same fate. In the short run, this intensified persecution may not shake the foundations of Communist power. In the long run, Stalin may find that *qui mange du pape, en meurt*.

Doctors and Arbitration

As was to be expected, this year's representative meeting of the British Medical Association was for the most part an occasion for the ventilation of grievances about the national health service. Of these, most prominence was given to the alleged refusal of the Ministry of Health to fulfil its promise that the medical profession should have the right to resort to compulsory arbitration if disputes could not be resolved by the normal Whitley machinery. Dr Dain, the chairman of the council, went so far as to say that unless doctors are given complete freedom to take their case to arbitration, they will be compelled to leave the service. Why, Sir Lionel Whitby, the retiring President of the association, had previously asked, should a profession be denied the right to compulsory arbitration that is enjoyed by large sections of workers in trade and industry?

The answer presumably is that compulsory arbitration is not a normal part of industrial conciliation procedure. It was introduced in wartime as a necessary counterpart to the prohibition of strikes and lockouts, and it remains in force now only by virtue of the Supplies and Services (Transitional Powers) Act, which, *pace* Mr Morrison, is due to expire in 1950. After that date, the Minister of Labour will have no power to compel either party to a dispute to go to arbitration; he can refer it to arbitration only if both parties agree.

Doctors, of course, cannot strike to achieve their demands. They have, therefore, a case for asking that the right to resort to arbitration should be stronger in disputes over the health service than in normal times in industry. The employer is in this case the Government, and the doctors argue that the Minister of Labour, because he is on the same side as the Minister of Health—and the Chancellor of the Exchequer—may refuse to refer a dispute to arbitration. But this possibility might just as well be true of the civil service; yet there is a civil service arbitration tribunal to which the Minister of Labour automatically refers disputes, provided they are within the scope of the arbitration agreement made between the staff side and the departmental side. For instance, disputes about pay in the higher salary ranges are not referred to arbitration, but there is no reason to suppose that any agreement for setting up arbitration machinery in the health service would not cover all practitioners.

In the second reading of the National Health Service (Amendment) Bill, the Government spokesman said that it was intended to set up an arbitration tribunal for the health service on the lines of the civil service tribunal. It is difficult, therefore, not to feel that the British Medical Association is beating the air. It is to be hoped that the Minister of Health will take the opportunity of setting doctors' minds at rest when the relevant clause of the Bill is discussed in committee.

Justices of the Peace

The Justices of the Peace Bill, now introduced into the House of Lords, is a measure well in keeping with the English tradition that the speed of any reform in the legal machine or profession should never exceed the speed of the slowest current of opinion. The Bill is based in the main on the Majority Report of the Royal Commission and it institutes a system which, over a period of five years, will impose an effective age limit, 75 years, beyond which magistrates will not sit on the bench in open court. It provides machinery by which, in process of time, the areas covered by the various commissions of the peace will be regrouped. It establishes magistrates' courts committees which can, also in process of time, revise the boundaries of petty sessional divisions in each county. In addition the Home Secretary will be equipped with one or two additional spurs. The Bill lays down more definite rules governing the appointment and conditions of service of magistrates' clerks and of stipendiary magistrates, but without upsetting any magistrates' clerk now in office. It introduces

for the first time into the system of an unpaid magistracy the principle that magistrates should be paid travelling expenses and a lodging allowance when their duties require them to travel, and it includes in that proposal members of probation committees and case committees. All these are desirable, if not startling, reforms.

On the other hand, the Bill does not propose to end the anomaly that certain elected local government councillors become magistrates *ex officio*, nor does it in any way make it more likely that more stipendiary magistrates will be appointed to serve in those areas where their presence and experience will improve the quality of the justice locally available. In short, the Bill can be criticised for what it does not do, hardly for what it does propose.

A Concatenation of Orchestras

That Sir Thomas Beecham should crack a whip against the excessive exuberance of orchestra promoters has a piquancy which all who have followed his career will relish. Speaking at the Hastings Musical Festival he roundly condemned the policy of the Arts Council on the grounds that it was supporting more orchestras than the country can afford. Since Sir Thomas has played a leading part in the creation of two out of the five principal London orchestras, his rebuke takes on the shape of a boomerang rather than of an arrow.

There has, indeed, been quite a flurry of excitement over the alleged decline in concert-going. There is no doubt that with less money around and more alternative attractions, some ebb from the high tides of wartime concert-going was bound to occur, but it is likely that demand will remain at a higher level than ten years ago. The trouble is more among the concert givers than among the concert goers. Not only have

The Peers, the Citizens and the Jews

On Tuesday the Peers rejected the Bill [admitting the Jews to sit in Parliament] . . . by a majority of 95 to 70. On Wednesday Baron Rothschild accepted the Chiltern Hundreds, and a new writ was issued for the City of London. On Thursday his address to the Citizens was published in the morning journals, offering his services again to the Citizens, distinctly stating that "the contest is now between the House of Lords and yourselves. . ."

. . . According to modern opinions, it is scarcely justified, except in very particular cases, to impose any restriction whatever on the rights of the electors to choose whom they please. . . . The progress of opinion . . . is even against a property qualification. The electors will very rarely elect persons who are not at once opulent and respectable; and it seems to be generally supposed that the constituencies should be left, consistently with the principle of representation, to choose freely, without any restrictions, who shall be their representative. But both the general opinion and the general progress are still more strongly directed against any limitations on the score of religion. They have been gradually got rid of. To prohibit any class of Christians to select whom they please, on account of the faith of the candidate, is insulting to their Christianity. To prohibit the most enlightened mercantile community in the kingdom from electing one of the greatest merchants in the kingdom as their representative . . . is to impose on them an unbearable as well as an insulting restriction. We regret that the question has been brought to this issue; but, since it is forced on the electors of London, they have no alternative but to stand up for their own rights, and convince their lordships, by a calm and constitutional display of their power, that justice must be done to them.

Home grown for exports

From the farms of Britain comes the straw needed by Bowaters for the manufacture of strawpaper at their Sittingbourne Mills. The straw is cut to short lengths by mechanical means before being cooked in caustic soda solution. After washing, giant machines beat and refine the straw with other pulps and convert them to strawpaper—vital material in the fibreboard packing case and box manufacturing trades. British industry relies upon the efficiency of British-made containers for the safe transit of a thousand commodities on their journeys inland and overseas. Units of the Bowater Organisation are engaged in the processing of bags, corrugated cases and fibre drums from tough kraft materials and from strawpaper—helping the exports of Britain on their way. The Bowater Paper Corporation controls a vast, self-contained organisation, planned and equipped to give an unrivalled service for the supply of paper, board and allied products to their customers in any country in the world.

POWER

For nearly a quarter of a century water-tube boilers and power station engineering by Simon-Carves have helped to feed the modern world's gigantic appetite for power. Today, with impressive resources of skill and experience, Simon-Carves are helping to provide new generating capacity on an unprecedented scale. Steam power plant now being designed and built in Britain, the Middle East and Australia will supply thousands of tons of steam an hour to aid in overcoming one of the most critical of post-war shortages. More than a million horsepower is being added by Simon-Carves to the enormous flow of power that keeps industry and civilisation on the march.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

a number of the prewar music societies now been revived but the wartime growth of British orchestras has not diminished, and this season has seen an influx of foreign orchestras from Amsterdam, Berlin and Philadelphia. The Philadelphia Orchestra played twenty-eight times in twenty-nine days; even if all its concerts were not full, an audience of some 60,000 people in a month cannot be ranked as a failure. With such a volume of playing the market is well satisfied, and if those who promote concerts lose money they cannot complain.

The orchestras who play for such engagements have little cause for complaint since the promoter guarantees their fees

Letters to the Editor

A Liberal Revival?

SIR,—In *The Economist* of June 25th, Mr L. A. Jackson invites the Liberal Party to do what, grievously hampered by want of the money which its rivals can obtain by sectional appeals, it has been doing unintermittently for thirty years. The hospitality of your columns could hardly be generous enough for a statement of our policy, and for an examination of the question how far it satisfies Mr Jackson's requirements. But his letter demands some reply on broader issues.

We have remained an independent party, and we have never lost seats for want of a policy. Indeed, it is notorious that Liberal policies and programmes have been a quarry in which both the other parties, but particularly the Labour Party, have worked. And, as you, sir, have recently pointed out, we have at least the virtue of sincerity, and of belief in our own policies; we have that natural affection for the children of our own brains which can never be inspired in the same measure by adopted children. The average sensual voter, to give the sense of your own words, smiles with amused cynicism when Socialists present themselves as champions of the liberty of the individual, or Conservatives advertise a crusade against monopoly and restriction.

We suffer from another handicap almost as frustrating as the want of money—the attitude of millions of people in this country who say that “they are Liberals, but...” If they will delete their qualifying clause and work for Liberalism they will in measurable time “scotch the prevailing view that a Liberal vote is a vote wasted.” So long as we have an electoral system which can only by the most mathematically improbable of accidents produce fair results when more than two parties seek the votes of the electorate, votes will be wasted. The anti-Labour vote is split by Conservatives as well as Liberals; the anti-Tory vote is split by Socialists as well as Liberals. These are votes against and not for a cause; the vote for Liberal measures can only be split by Liberals who either lack the courage of their convictions, or are foolish enough to believe that a Conservative victory, or even a series of Conservative victories, could ensure political or social stability. That belief can only be called, in the words which Dr Johnson applied to a second marriage after an unhappy first one, “the triumph of hope over experience.”—Yours faithfully,

ANDREW MACFADYEAN,
President, Liberal Party Organisation

Hongkong

SIR,—Please let a mere parson say “thank you” to Mr Walter Fletcher, MP, for his letter on Hongkong, as reprinted from your columns in our local press this week.

Chinese divide foods into two classes: yeet=“heating” and leung=“cooling” (the pronunciation is Cantonese).

After far too much “yeet” in the English press and in the House of Commons, we have benefited greatly from the “leung” which has come to us from Mr Alexander's personal

and shoulders the losses. The orchestras who suffer are those like the London Philharmonic Orchestra, the Hallé or the Liverpool Philharmonic, who run their own concerts and therefore take the brunt of any losses. These orchestras receive subsidies, as non-profit-making concerns, from the Arts Council, but their costs have risen sharply with the rise in the union rates. As a result it is now as difficult to have sufficient rehearsals or to reduce the number of concerts in the interests of better performances as it was two years ago, when the grants were smaller. This position is particularly grievous to those who wish to lead rather than follow the public's taste in music.

demeanour and quiet, homely words; and now from Mr Fletcher's “cooling” letter.

May I, through you, beg all those who care about Hongkong and the Far East to remember that in the present state of the patient only food that is “leung” should be given to us? More of the “yeet” variety might well prove fatal.—Yours faithfully,

R. O. HALL, Bishop of Hongkong
Bishops House, Hongkong

The Danger Line

SIR,—Your article, “The Danger Line,” in the issue of May 21st, is a very interesting contribution to the understanding of the social trends in our days. But does Sir Hartley Shawcross, and do you, really believe the difference between the two branches of Socialism to be so large? I, for one, and as an international lawyer, with experiences in practically all of the following regimes, have so far not been able to establish any essential difference between Communism, Socialism, Fascism and Militarism, once this latterism has assumed political power. Regimentation of body and soul varies only by degree; and the standard of living, not to talk of the cultural standard, invariably goes down, just because the most productive energies are wasted on the administration of what cannot be administered, namely, nature.—Yours faithfully,

J. RUSER
La Berzosilla, Torrelodones, Spain

India and Mauritius

SIR,—In your note “India and Mauritius” in *The Economist* of June 18th, the Indian official communiqué you mentioned invited “all sections of the population to manifest enthusiasm” on the “historic occasion” of the visit of the Indian cruiser HMIS *Delhi* to Mauritius because “a large section of the population of the colony look upon India as the champion of peace and freedom as well as the symbol of their own aspirations.” This communiqué, though it is perhaps an extreme example, illustrates fairly well the present Indian agitation in Mauritius.

It may seem to the 267,000 Indo-Mauritians that their numerical superiority in the colony is reason enough for them to aspire that Britain should be replaced by India—the “champion of peace and freedom”—as the mother-country. I would simply like to stress here that, to at least the 10,000 Europeans settled in Mauritius, there does indeed seem to be, as your article rightly suggests, absolutely no justification for India's interest in Mauritius becoming in the future more than “friendly.”

It is to be hoped that, whatever form India's “active interest” in Mauritius may take, it will prove safe for a colony to be British.—Yours faithfully,

ADRIENNE LINCOLN
73 York Mansions, London, S.W.11

The Demand for Spectacles

SIR,—I would like to comment on a few of the points made in your review of the report of the Select Committee on Estimates published in your issue of June 18th.

The mistake of the Ministry of Health was in trying to estimate the demand for spectacles under the National Health Service by comparing it with the conditions existing previously under the National Health Insurance Acts. Prior to July 5th only persons in employment were entitled to ophthalmic benefit, and the majority of women workers found that their approved societies did not give ophthalmic benefit, so only a very small proportion of the population were covered. The next point to realise is that the majority of approved societies only gave about 15s. towards the cost of spectacles, and so there was a substantial contribution by the patient in most cases. The range of appliances was very restricted, and in view of the fact that the grant was so small, the majority of patients preferred to dispense with the restrictions and form-filling, etc., and obtained their spectacles privately.

The cost of a pair of spectacles under National Health Insurance was about 45s. per pair, including sight-testing; but opticians would have found it impossible to make a reasonable living if the majority of their practice had been National Health Insurance work. In actual fact, in most instances, this work constituted less than 15 per cent of the total. With the introduction of the National Health Service Act, and the probability that over 90 per cent of patients would use the scheme, opticians had to demand a more equitable scale of remuneration, and the average of £3 5s. 6d. per pair of spectacles, including testing, which exists at the moment, is still considerably below the ordinary private practice charges, prior to July 5th. A special sub-committee is to investigate these economic aspects, and we are confident that their report will show that the fees being paid to ophthalmic opticians are not excessive.

Lastly, may I point out that only about 30 per cent of patients are supplied with two pairs of spectacles, and it is an unfortunate fact that many millions of people do require two pairs of spectacles, one for distance and one for close work. In fact, many people require an intermediate pair as well, if they are to be able to see comfortably in all circumstances. Many patients who have their eyes examined are not prescribed glasses, and in some areas the proportion is as high as 10 per cent.

The cost of the ophthalmic service is very high, and if the country cannot afford it, other financial arrangements should be made. For instance, the patients might be asked to contribute towards the cost of each pair of spectacles, but I deprecate attempts to denigrate the great contribution towards the health and efficiency of the community which is being made by the ophthalmic services.—Yours faithfully, S. BLACK,

Director, Information Bureau,
Association of Optical Practitioners

A glass of DRY FLY SHERRY is the ideal aperitif, and is a gracious welcome to your guests. Obtainable all over the world from your own Wine Merchant, or from:

FINDLATER MACKIE TODD & CO. LTD.
Wine Merchants to H.M. The King.
Wigmore Street, London, W.1.
The price is 20/- a bottle.

Working Party for Tin

SIR,—The succinct review of the tin position contained in your issue of June 25th was impressive.

The present growing surplus of tin is *not* due to the price. It is due (a) to excessive production of the metal, and (b) to the existence of US Government consumer controls which hamper industry and deliberately stimulate recourse to substitutes for tin. In normal times the general level of industrial activity, rather than the tin price, has fixed the demand for the metal. The fact that the proportion of tin in most manufactured articles that use it is small makes the demand for tin unusually inflexible to alterations in the price.

Your argument that a low price would benefit the consumer is, therefore, debatable. It is, in any case, much to the consumer's advantage to have a prosperous and reliable tin mining industry over a period of years.

Your desire to encourage low-cost production is incompatible with the wish to abolish inefficient mining. Low-cost production is itself inefficient. No efficient industry can be anything but a high-cost one in these days of over-worked minefields, rehabilitation losses and increased charges all round.

"A lower price for tin," you say, "would undoubtedly mean some domestic readjustments to the economies of the tin producing countries." I venture to suggest that a lower price, while doing nothing to reduce the current US Government-made surplus of tin, would ultimately lead to the economies of the main producing countries to the verge of bankruptcy.—

Yours faithfully, ALDRIDGE CALDWELL, Editor
"Tin," 25 Charles Street, London, S.W.1

[A letter which flatly states that "low cost production is in itself inefficient" is presumably not to be taken too seriously. The notion that the price of tin has no effect on demand or supply is a familiar doctrine of the industry. But it is difficult to believe that tin defies ordinary economic rules. If the "growing surplus of tin is not due to the price," what is it that is causing "excessive production of the metal?"—Editor.]

Colonial Terms of Trade

SIR,—I regret that through an unfortunate error Jamaican balance of trade index figures were inserted in my letter appearing in your issue of June 18th. The correct price indices, upon which my comments were based, are as follows:—

	Imports	Exports
1938	100	100
1945	228	220
1946	279	260
1947	324	299
1948	326	319

Yours faithfully, R. L. M. KIRKWOOD
Legislative Council, Jamaica. (By cable)

Spotlighting Waste

Administrative costs rise imperceptibly, but steadily. Every unnecessary record, every needless clerical operation pushes costs up. Our new booklet "500 Unnecessary Miles" tells how we can help you to get them down. Why not write for a copy? Consultancy Division, Remington Rand Ltd., Dept. 3, Commonwealth House, 1-19 New Oxford Street, London, W.C.1.

Books and Publications

The Future of Education

"Secondary Education for All." By H. C. Dent. Routledge and Kegan Paul. 224 pages. 8s. 6d.

"The Modern School." By C. G. Stillman and R. Castle Cleary. The Architectural Press. 151 pages. 21s.

THESE two books, one on the intellectual and the other on the physical plane, represent two valuable advances in educational ideas in this country. They are in no sense comparable, but they are complementary. The ideas which lie behind educational reform must govern the kinds of buildings in which it is carried out.

Mr Dent's thesis is that the 1944 Education Act changed the whole basis of secondary education, but that no one has really thought out the implications or understood the magnitude of the change. Secondary education for all is a new conception and in spite of a succession of highly competent consultative committees such as the Hadow, Spens and Norwood, no precise definition of secondary education has yet been made. A grammar school education for a highly select group of intellectual children is an entirely different conception from a secondary school education for all types of children. Since the whole range of possibilities from secondary education is so inadequately apprehended it is not surprising that confusion and controversy surround the various proposals for implementing the Act by means of comprehensive or multilateral schools and the types of education suited to the unintellectual type of child who is now entitled to a secondary education.

Mr Dent has no easy solutions; he believes the provision of universal secondary education "to be a matter of truly formidable difficulty," and not least for the reason that all thought about secondary education is impregnated by the conceptions of the grammar school tradition. To escape from the processes of thought that this entails means a degree of effort and detachment that few are willing to attempt. Mr Dent says some hard things about the muddle-headedness of the Ministry of Education in thinking out their educational policy. The Hadow Report in 1926 advocated two types of secondary education—grammar and modern; the Spens Committee in 1938 extended it to three, adding a technical element; the Norwood Report in 1943 turned the tripartism of grammar, technical and modern types of education from a proposal into a doctrine and justified it on historical grounds. They rejected, however, any fundamental justification of their views.

Whether such groupings are distinct on strictly psychological grounds, whether they represent different types of mind, whether the differences are in kind or in degree, these are questions it is not necessary to pursue.

In spite of the rejection of the three Norwood "types" of mind by authoritative psychological opinion the Ministry of Education swallowed the proposals whole; and since then has been fighting a diffused and confused battle with the local authorities over their development plans. While there are strong arguments in favour of the Ministry's stand against a rapid expansion of the very large schools, which combine all three types of education on one site, with perhaps 1,250 to 2,000 pupils, the Ministry's case for tripartite education remains very weak. Fortunately there is no danger of any set type of secondary school developing. The plans of local authorities contain every variety of permutation and combination even if the content of the education within the different plans of physical organisation remains extremely vague. Very few people yet know what they are aiming at in the modern and technical schools, and Mr Dent has many interesting things to say about their objectives.

Taken as a whole this book is the clearest and most constructive book about education which has been written for many

years, and it has the outstanding merit that it neither meanders loosely over theories of education nor curtails itself with discussion of only the tangible questions of educational administration, but marries the two sanely and constructively. These two types of approach are seldom met with in one man.

Mr Stillman is the County Architect to the Middlesex County Council. Mr Castle Cleary is an architect in the Ministry of Education. Their book is one both for the architect and the layman concerned with school building. But it is not the dry subject this description would suggest. Both these technicians look at their work as educationists—an attitude all too rare among school architects—and they have some hard things to say about the ideas lying behind school building in the past. The kernel of their argument is that educational ideas by their nature are always changing. What seemed "advanced" in 1938 is out of date by 1948. Therefore schools must be built on a flexible pattern, with space and a structure which lends itself to alterations and additions. And they put forward a number of suggestions for building on these lines. This is a lesson which the local authorities could take very much to heart. Even if the educationists could clarify their ideas, as Mr Dent urges, they should not let their architects assume that present educational theory is perfect.

The Plight of the Bourgeois

"The English Middle Classes." By Roy Lewis and Angus Maude. Phoenix Press. 289 pages. 15s.

It would certainly be an exaggeration to assert that the "condition-of-the-middle-classes problem" is replacing the "condition-of-the-people problem" as a prime topic of sociological and economic interest, but it is at least increasingly recognised that such a problem exists. But of the medieval growth of trade and differentiation of professions, out of the Puritan revolution in social attitudes to wealth, out of the crumbling of feudalism, out of the catch-as-catch-can technical and commercial progress of the nineteenth century, out of the aspirations of the thrifty worker and the needs of younger sons, there has evolved something hardly homogeneous enough to be called a class, certainly not homogeneous enough to conduct a class war; including, sometimes dubiously, small shopkeepers, industrial magnates, ladies in circumstances reduced below a farmworker's pay, bureaucrats, artists, bank managers and their clerks and so forth in a profusion which (if the Gallup Poll's account of subjective estimates is to be trusted) amounts to nearly half the total population. Partly as a direct result of its income-getting activities, partly by indirection, it has played a part in national and human development which, for all its imperfections, is essential; it has provided leadership, ingenuity, enterprise, stability, a decent standard of social conduct, and a medium (in the bacteriological sense) for the development of the arts and the sciences. It has done these things imperfectly, and there are black marks on its record; but it has done them. Now the economic conditions which made its achievement possible are disappearing, mostly as the result of deliberate expropriation; and there arises, among other questions, the question of who in the future is going to perform its functions.

The comprehensive and generously-planned book that Mr Lewis and Mr Maude have written is at once a history, an acute sociological analysis, and an honest (and good humoured) piece of special pleading. The historical section, occupying roughly the first third of the book, follows the development and fortunes of the middle class from medieval times to 1948; the analytical section discusses (to quote the blurb) the functions and problems of "the five

main groups of middle-class avocation; public servants, business men and managers, the professions, farmers, and trades and shop keepers"; what one may call the diagnostic section deals with the painful subject of the middle-class standard of living and particular manifestations (e.g. in leisure and in child-rearing) of its decline; and a brief final section looks doubtfully but still hopefully forward. The whole thing is quite excellent, in structure and detail, matter and manner; well-informed, shapely, tolerant, and enlivened by a very pretty wit. Of few books could it be said, as it can of this, that it could be equally appropriately placed on the desk of a professional sociologist or on the bedside table of the vanishing middle-class spare room.

The First World War

"The Coming of the First World War." A Study in the European Balance, 1878-1914. By Nicholas Mansergh. Longmans. 257 pages. 15s.

MR MANSERGH'S book is a competent and sensible outline of the course of international relations between the Congress of Berlin and the outbreak of the First World War. It is going too far to call the book a "reinterpretation"; practically everything in it either in the way of fact or comment could have been found in print before 1939, and there were signs even earlier of a reaction against the naive schools of British and American historical writers who had swallowed uncritically volume after volume of German propagandist literature on the war-guilt question. Moreover it is perhaps a little misleading at the present time to talk about "reinterpreting" the diplomatic history of the years 1878-1914. The greater part of the German military, naval, and diplomatic archives for this period are now in American or British hands, and there is at last a chance of filling the huge gaps deliberately left by the editors of *Die Grosse Politik*. Only after this work has been done will it be possible, if at all, to talk, in a strictly historical sense, of "reinterpretation."

If, however, Mr Mansergh's book is a résumé of known facts and opinions rather than a new contribution to historical criticism, it can be read with interest and profit. The narrative is clear and well-balanced; most of the judgments on people and things are sound. It might be argued that William II was slightly less silly after 1909 than in his earlier years, and that, all in all, Francis Joseph was more of a curse to Europe, but these are matters of opinion; anyhow Mr Mansergh is fortunately free from sentimentality about the house of Habsburg and pre-1914 Vienna.

A book dealing with nearly forty years of international relations in the short space of 250 pages cannot be expected to give an account of the internal regimes of the countries concerned. Nevertheless it would have been worth while to have said a little more about the importance of these regimes from the point of view of parliamentary control, or lack of control, of foreign policy. Thus Mr Mansergh might have explained how and why the German General Staff were able to commit the Reich to the grave political decision—the violation of Belgian neutrality—involved in the Schlieffen plan. Mr Mansergh might also have given more consideration to this plan in discussing the much-debated question whether a clearer British attitude in July, 1914, could have prevented war. His arguments are in themselves convincing, yet it is worth noticing that on strictly military calculations the German General Staff was not vitally concerned over British intervention. Obviously they did not want it; on the other hand they did not regard the B.E.F. as likely to turn the scale on the western front. They expected to defeat France in a few weeks and Russia soon afterwards, i.e., they would have been in occupation of the Channel ports long before a British blockade could have become effective. Once the Schlieffen plan had failed, the position changed, and the fact of British intervention was all important, but the German High Command did not expect their plan to fail.

Anti-Keynes

"The Economics of Illusion." By L. Albert Hahn. Squires Publishing Company. 273 pages. 54s.

THIS root-and-branch onslaught on the whole Keynesian structure of economic thought is the work of a repentant easy-money man who can claim to have anticipated, as early as 1920, "all that is wrong and exaggerated in Keynes." The "illusion" of the title is that on which Keynes based his theory of the behaviour of real wages, the preference of labour for the shadow of an inviolable money wage rate over the substance of unimpaired real purchasing power; but it applies also to the state of mind of those who envisage the problem of depression or recurrent slumps predominantly in terms of demand while neglecting the implications of cost. "The Economics of Illusion" is a collection of papers and essays published, some in America and some in Europe, over the last half-dozen years; not all are directly aimed at Keynes and Keynesianism, but all are relevant. Some of Professor Hahn's criticisms are demonstrably valid. Others are not. Accusing Keynes of neglecting costs as an element determining the volume of investment, he disregards Keynes's own definition of the marginal efficiency of capital, which takes costs fully into account. Claiming that the Keynesian analysis of the stimulating effect of price increases rests entirely on the unreliable "illusion" of wage-earners, he overlooks the arguments by which Keynes demonstrated the solid foundation of the "illusion"—that is labour's inability, whatever its power in particular cases, to control the general level of real wages. His attempt to prove that thrift can never generate depression rests unconvincingly on a supposed limitation to special cases of Keynes's "psychological law" of the relation of savings to income. On the other hand, his warning to the light-hearted supporters of continuous deficit finance, and his comments on the "god-given" passivity of the balance of payments of some countries, would strongly recommend themselves to so good a Keynesian as Mr R. F. Harrod, while his demonstration of the lopsidedness of the "General Theory," its comparative neglect of the problems of any but the depressed or depression-threatened economy, provides a valuable corrective to the "modernist stuff . . . gone sour and silly" which Keynes himself condemned. The application of remedies appropriate to general unemployment in a situation where men are unemployed because of gross particular maladjustments is a disastrous—and only too probable—mistake. If Professor Hahn raises a few salutary doubts the excesses of his attack will matter little.

Studying the USSR

"Soviet Studies." A Quarterly Review Edited by J. Miller and R. A. J. Schlesinger and published for the University of Glasgow by Blackwell, Oxford. 7s. 6d.

"Bulletins on Soviet Economic Development." Editor A. Baykov, University of Birmingham. Subscription to Four Bulletins 51s.

THE two publications reviewed here are intended to give readers with academic interests information on contemporary developments in the U.S.S.R. Of the two ventures "Soviet Studies" is the more ambitious one. The first issue covers a wide range of topics, from Mr E. H. Carr's instructive, balanced analysis of Soviet policy in 1938-39, in the light of recently published documents and Mr M. H. Dobb's scholarly, although not quite convincing, essay on Soviet economic statistics to a number of informative reviews—not all of equal value—on recent Soviet publications. A very useful feature of the publication is its extensive summaries and translations of important or characteristic documents such as the late Zhdanov's speech to the Soviet philosophers (which is analysed with greater didactic solemnity than the subject deserves), an interesting review of Vyshinsky's *magnum opus* on Soviet law, an analytical survey of the Journal of the Moscow Patriarchy, providing glimpses into the present relations between State and Church; and so on. Mr Baykov's "Bulletins" are concerned with economic matters only. The first "Bulletin" gives an informative and detailed summary of industrial development in the USSR, although it contains little original analysis.

AMERICAN SURVEY

Science and Welfare

(From Our American Staff)

THE extent to which the ideal of the welfare state has captured men's imaginations may be measured by Mr Truman's reference at Little Rock to those millions in under-developed areas "who for centuries have known nothing but exploitation and poverty, and whose economic life is still primitive." He did not mean the voters in Arkansas. Ostensibly he was explaining Point Four to the furthest reaches of the Middle West. By implication, at least, he was declaring the American intention to court for the democratic way the underprivileged in foreign lands for whom the Soviet has shown such profitable concern.

In American thinking, however, the underprivileged are to be succoured not so much by a new division of the world's goods, according to the Marxian doctrine or the Socialist gospel of equal shares, as by their multiplication. The American sees no inescapable reason why the increase in the total of goods and services available for all, which has been brought about in the short history of his own nation, should not be repeated throughout the world, with corresponding increases in the size both of the common pie and of each share of it, not excluding his own.

This view may seem naïve to older nations, but its effect on American thinking can hardly be over-estimated. It accounts for the increasing American impatience with European assumptions that the common lot can best be improved by securing for one's own country a larger share of the too-small European pie. It explains the horror with which Americans regard the nightmare of a depression, with its apparent denial of further possibilities of expansion, its implication of the closed frontier and the end of opportunity, ideas which to Americans seem to have prevailed in Europe.

Asked how they would go about exorcising old fears and producing new miracles, Americans usually answer in terms of industrial production and technological "know-how," with a bow toward removal of trade barriers. Behind these stands the primary tool of which they are less conscious—their customary dependence on the scientific method in almost all fields of endeavour. The importance of this tool to society in the middle of the twentieth century has been obscured on the one hand by the abstruse and symbolic language which its specialists use, and on the other by awkward if well-meant attempts to make it understandable to the common man. The latter have created a mixture of faith and scepticism, but, far from making science understandable, have distorted it in the minds of many people into a kind of alchemist's circus, free from the laws that ordinary men obey and able to produce fantastic wonders.

Atomic fission is, of course, the biggest of these and the most fearful. Its destructive possibilities have been emphasised, but what is less appreciated abroad is that it also holds potentialities of enormous good when properly applied to modern problems. Americans are dimly aware of this, and it accounts for their willingness to contemplate what seems to other nations an unmitigated terror. The

American's willingness to scare himself half to death with horror stories is equalled only by his sense of pride and accomplishment at being able to survive and master the horror. The essential element in the adventures of that significant character of the "comic strips," Superman, is not only that he continues to confront an endless series of atom bombs, death rays and other fiendish devices, but that, whether the peril takes human form or mechanical, it is Superman who triumphs in the end.

To the United States, atomic fission means not only the bomb with its proven powers of extermination, but also the beneficence of allied discoveries—of radio-active isotopes in medicine, the harnessing of atomic energy to the cheaper running of machines and heating of houses, and so on. This is not to say that many Americans know what atomic fission is, but, what is perhaps more important, they have a tenacious if blind confidence in its ability to do what they want done. It is at the moment the great genie, with its potentiality for good or evil only half explored, but promising, or so Americans believe, a net good in the long run.

★

This faith in science, this skill with its methods, is responsible for much that America achieves at home and hopes to achieve abroad. The scientific method, rather than philosophic reasoning or logical analysis, is the tool on which Americans tend to rely whether they be physicists, biologists or plumbers. "Assuming a basic and pervasive orderliness, the method combines hypothesis and formulation of theory with the observation, classification, and use of facts so as to develop techniques which are altering both man and his environment." It is at once the greatest contributor to the practical realisation of the welfare state, and the best hope for the future. It is the prime factor in that making of the even larger pie, with larger pieces for everyone, which must be produced if the hopes of free enterprise, socialism or communism are to be achieved.

The table below shows the increase in spending on scientific research from 1930 to 1947, and the vast expansion on the part of the Federal government during the war.

US RESEARCH AND DEVELOPMENT EXPENDITURES*
(millions of dollars)

	Total	Fed. Govt.	Industry	Universities	Other
1930	166	23	116	20	7
1932	191	39	120	25	7
1934	172	21	124	19	8
1936	218	33	152	25	8
1938	254	48	177	28	11
1940	345	67	234	31	15
1941-45†	600	500	80	10	10
1947 budgeted ..	1,160	625	450	45	40

* Excluding atomic energy. † Average budgeted.

Of the \$1.16 billion spent in 1947, \$1.05 billion was for applied research and development, and \$110 million for basic research.

Thus far, the scientific method has made its greatest progress in the physical domain, but it appears to hold possibilities which are equally great in other fields. Its uses to society can be grouped under four headings, each of which serves the others. First, it has increased man's productive years. Throughout most of recorded time, and despite the Psalmist's optimism, man's life expectancy at birth has been hardly more than 40 years. In the latter part of the nineteenth century it began to rise, and in the United States it has now almost doubled. An American child at birth may expect to live for 70 years; most of the extra 30 have been added to the original 40 by science in this country.

Secondly, it is increasing the life, utility and productivity of those plants and animals which the earth provides and mankind uses. Details of the story of larger crops per acre, added nutritive values, better fabrics and materials, the speeding up of life processes among plants and animals and their better adaptation to man's needs have been given from time to time in these pages. The gains have only begun.

★

Third, advances in the knowledge of chemistry and physics have made it possible to bring into play an increasing amount of useful energy which will do man's work and provide him with pleasure. A century ago the physical work in the United States was done principally by men and animals—men doing 22 per cent of it and animals 51 per cent. The other 27 per cent was done by mechanical devices. In 1900, men were doing only 15 per cent of it, animals 33 per cent and mechanical devices 48 per cent. By 1948, men in the United States did only 4 per cent of the physical work required, animals did only 2 per cent and all the rest—94 per cent—was done by those mechanical devices which man had invented, manufactured, and harnessed to his needs. Nor was this all. The shift brought with it more than a five-fold increase in the output of goods per man hour worked, not to mention improvements in quality and utility.

Fourth, with more years in which to work, better food to keep him in better health, more energy to be applied to what he wants to do, man is bringing into use materials hitherto useless or neglected. More metals, more earths, more gases are adapted to his wants. The artificial fibres and rubbers, synthetic drugs and medicines, the plastics, and the new metallic substances are only a few of these, and every week the technical literature lists additions promised or achieved.

The significance of all this for the individual and for society is something which the layman has hardly been expected, or been able, to grasp. Yet for the sake of his own future he must have enough understanding of it to give his support. His world is increasingly shaped by the findings of science. Were they to cease, he would slip back to an older and vastly poorer world. He has already forgotten how he lived there.

(Other aspects of work in these four fields and their potentialities for a richer world will be examined in later articles.)

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

The Call for Public Works

WITH a steadily downward trend in production, incomes and employment, both Congress and the Administration face a rising clamour for the development of a public works programme. In working out a compensatory tax policy there is room for wide disagreement on the need for plant expansion, investment abroad, for subsidy payments to marginal consumers (or for the benefit of farmers), or for the broader adjustment of income and excise taxes at the expense of budgetary stability. The government will meet with no lack of advice, and that advice will be given by people with exceptional intellectual powers and with unusual degrees of courage and integrity. But they will still be politicians, reflecting in their judgment the response of pressure groups to conditions of adversity. Between their proposals, the government can have no easy choice.

The development of a public works programme, however, is all too frequently assumed to be the perfect path to stabilisation, administratively easy, and one which offers ample scope for flexibility. And for this reason, the clamour for public works assumes the insistence of a cuckoo-call as the setback develops, and the complexities of budgetary policy become more fully apparent. The President and the Council of Economic Advisers apparently are not convinced that the time has come for a revival of the Public Works Administration, and for a positive era of "deficit finance"—as distinct from the gap which will accrue automatically as revenues fall away, while government commitments stand fast. But a PWA (or something very similar) appeared in both the Spence and Murray Bills, known more formally as the Economic Stabilisation, and Economic Expansion, Bills of 1949, and influential Republican Congressmen have this year given a formal blessing to public works, should depression develop. The Council of Economic Advisers itself holds divergent views on the need for that Federal control and direction of investment which figure in the proposals of Mr Spence and Senator Murray. But the longer-term goal, both for the President and the Council, is stability via the Employment Act of 1946. Leaving aside the plans for a general expansion of governmental power, the disagreement on public works covers only the timing of such a programme, and not its desirability, or inevitability, at some later stage.

★

The area of agreement is in turn confined to "worth-while" expenditures and does not apply to "leaf-raking" (to use the epithet reserved for many of the projects financed by the New Deal's Work Progress Administration), since it is assumed, rationally enough, that conditions, which demand the creation of incomes irrespective of the merits of the work involved, would also demand something more than relief payments under the guise of public works. But, even on this basis, it is too often assumed that flexibility in scope and timing demands no more than advance preparation of a "shelf" of projects—work on which Congress has so far shown little disposition to engage.

How valid is this assumption, and how far can public works save the economy from a major setback? These questions were posed recently by Mr Sherman J. Maisel,* in the light of work undertaken from 1933-38, and the conclusions drawn are by no means as optimistic as many economists, and many more politicians, would like.

* Timing and Flexibility of a Public Works Programme, *Review of Economics*, May, 1949.

The local authority which must "fertilise" Federal loans, or grants-in-aid, may prove a barrier difficult to surmount. And Congress traditionally approves such grants, not on the basis of local needs, in terms of employment and income, but on the rough-and-ready yardsticks provided by a casual examination of the vital statistics. For housing and urban development legal methods are slow. Prior acquisition (of land) is difficult, and expensive if it requires that land remain unused for a period. Opinion holds that, if government is to receive value for money, the time-consuming method of advertising for bids and public awards must be followed. "Each new job means that the contractor must form an organisation almost *de novo*. A speed-up (with greatly increased costs) is often not possible because of physical factors, or limits created by equipment and supervisory personnel."

What actually happened in the prewar era of public works finance? Says Mr Maisel: "At the end of 1938, over eighteen months after the Act (establishing the US Housing Authority) was passed, less than one-third of the authorised units had been approved. It took more than three years before two-thirds were authorised. For the normal programme slightly over a year elapsed between presidential approval and contract award. For (later) defence projects, this time was cut to eight months. Construction for normal units took fifteen months to complete, and for defence projects, fourteen months. The average period of time to complete construction for a unit under USHA was four and a-half years from the passage of the law. Two and a-half years were used in setting up the agency and local authorities, and for surveys and negotiations."

New techniques may be established, continues Mr Maisel. But these figures are significant in the light of the importance attached to housing plans in public works. "If there is a housing programme, it will probably look exceedingly like USHA. A fair estimate would be that, on the average, in the first year after it was decided to inaugurate a housing programme, no money would be spent."

Expenditure patterns for all other components of a public works programme are shown in the accompanying table. Here, as Mr Maisel observes, the speed of expenditure "varies tremendously with the type of project." In the light of these considerations, it is necessary to revise many of the political theories concerning the immediate value and flexibility of public works. The Federal Works Agency, moreover, recently stated that the "shelf" of such projects available for immediate development was not more than \$4 billion. Mr Maisel has shown that timing and flexibility are not governed solely by failure to plan. But planning failures from 1949 onwards will increase delays. Unless that flexibility is to be attained by drastic government controls (which is, to say the least, unlikely), other weapons must

PERCENTAGE OF FUNDS EXPENDED IN EACH SIX-MONTH PERIOD BY VARIOUS PROGRAMMES

assume greater importance in the initial phases of a real depression.

American Notes

Fourth Point by Instalments

The President has at last asked Congress to endorse with legislation the Fourth Point in his inaugural address, the plan for raising the standard of living of peoples in economically under-developed areas of the world, for the benefit of those areas themselves, of the United States, of Europe and of world peace. Large as is the scope of this scheme, Mr Truman's request for the first year's appropriation is even more modest than had been forecast—\$45 million, which includes both \$10 million already requested for activities of this type and the American contribution to similar programmes under the auspices of the United Nations. The money will be used to provide the "technical, scientific and managerial knowledge" needed not only for improving educational, health and other services in backward regions, but also for planning long-range development schemes which would promote world trade and stability. Latin America is expected to get the largest share of this assistance, followed by Asia and the Far East; then come Africa and the Near East, with Europe and its dependencies at the bottom of the list. Every country receiving aid will be expected itself to bear a substantial proportion of the cost. There are many existing agencies, public and private, American and international, which have experience in providing "show-how" of this kind and for this reason the President asks that he should be left free to delegate the administration of the programme to such government officers as he thinks suitable, rather than that a special agency should be set up.

★

This technical assistance will prepare the ground for productive investments. Mr Truman considers that these must come chiefly from private sources, but that government encouragement will be needed. The State Department is believed to have wanted a special fund for guaranteeing such investments, but the Treasury felt that the existence of a fund pledged to this purpose would make it more difficult to negotiate the investment treaties with participating countries, which are an integral part of the plan. Mr Truman has therefore asked that the Export-Import Bank, which has nearly \$1 billion available in unallocated funds, should be authorised to guarantee private American capital, invested abroad in enterprises which contribute to the economic development of backward areas, against the risks peculiar to such investments—chiefly currency inconvertibility, expropriation and damage by war. These guarantees are to be experimental to begin with, and it may prove that something bolder is needed than the slow and cautious methods which the Bank has followed, in accordance with sound financial principles, when dealing with the more orthodox requests which have come to it in the past. Mr Truman recognised that novel devices might be necessary if private investment was to achieve the objectives of the Fourth Point.

Congress will certainly hear a great deal about the threat to freedom of enterprise presented by these investment guarantees, on which opinion in business circles is sharply divided. This is the most controversial part of the programme, but the present request is only the first instalment of, in Mr Truman's words, "a venture which extends far into the future." In its present tired and penurious mood, Congress certainly does not feel inclined to explore such a long road, even though the initial cost will be small and the expedition may, therefore, not be seriously considered before the New Year.

★ ★ ★

Cherries and Clothespegs

The chief symptom of the economic illness, that is developing in Europe in spite of the Marshall medicine, is the

decline in the dollar value of European exports to the United States, which has followed the fall in both American prices and in American demand. Mr Hoffman maintains that American imports from Europe must be doubled if the Marshall plan is to succeed, yet the Reciprocal Trade Agreements Act, which makes tariff reductions possible, has been allowed to expire by the Senate. In itself this is not serious, since it means only that no new tariff negotiations may be completed, not that existing agreements lapse, and the Act is almost certain to be renewed before Congress adjourns.

But the Administration wants to renew the Act without the "peril point" clause added by the Republicans last year, under which the President must account to Congress for any reduction of duty below the point at which, in the opinion of the Tariff Commission, American producers would suffer injury. The effect of this was to transfer the responsibility for tariff reductions from the Administration to the Commission, which is more solicitous for the interests of domestic producers than is the State Department. In February the House made no difficulty about leaving the peril points unguarded, but the Senate's delay has allowed time for breaches to appear in the walls of America's prosperity. These breaches, in the opinion of the constituents whom the Senators will soon be meeting face to face, are caused by foreign storming of American markets and should be closed with a new tariff wall.

The cherry growers of Oregon, the watchmakers of Massachusetts, the oil producers of Texas, the textile manufacturers of New England and many others are all feeling the need of shelter. Their efforts to obtain extra protection through the European Recovery programme seem doomed to failure, for this year at least, but many Senators are unwilling to take away the existing protection of the peril point. This unwillingness will grow with every week's delay and with every rumour that Britain is to reduce imports from the dollar area. Already Senator Johnson, the Democrat from Colorado, a state dominated by wool and mining interests which always look favourably on tariff protection, has announced that he will "go with" his Republican colleague, Senator Milliken, who leads the forces fighting for the retention of peril points.

But even without the peril point, the effectiveness of the Trade Agreements Act could be undermined by the "escape clause," introduced by the Administration some time ago to reassure Senator Vandenberg, but only just invoked for the first time. This clause allows manufacturers to demand an increase in a duty, if its reduction under the Act has seriously injured them. Such an increase has been requested by the Clothespin Manufacturers of America, who claim that the lower duty imposed on their product under the trade agreement with Mexico has enabled clothes-pegs to be dumped on the American market by Swedish producers who benefited from the Mexican agreement under most-favoured-nation policy. Producers of wool berets and rattan reeds have similar claims pending before the Tariff Commission and, if these are successful, a stream of such petitions is expected to follow.

Teachers Take the Test

The end of this academic year has presented teachers and administrators, like their students, with a test. The question is whether members of the Communist party should be able to wrap round them the mantle of academic freedom, in defence of their right to teach. A commission of the National Education Association, which included General Eisenhower of Columbia and President Conant of Harvard, recently concluded that party members have given up that freedom of thought which is essential to good teaching in a democracy and that they should be excluded. The report urged, however, that no teacher should be carelessly branded as a Communist, and Communist doctrines should continue to be studied and dissected in the schools.

The University of Nebraska did not wait for this authoritative ruling to bar Communist teachers and textbooks; it has

been followed by the University of California, the third largest in the country, which now requires the 4,000 teachers and administrative workers on its eight campuses to take a more rigorous loyalty oath. Earlier, New York had passed the Feinberg Act to root out Communists and their fellow-travellers; in Illinois private institutions which do not conform are threatened with the loss of their tax exemption. The American Association of University Professors has before it a record number of allegations of unjust dismissal, including eight complaints of teachers who say they were discharged for aiding Mr Wallace's campaign.

The House Committee on Un-American Activities, which has recently seemed to be beached high and dry, could not be expected to resist the temptation to set out after this promising shoal of academic red herrings; its chairman requested 107 colleges to send in their reading-lists, prompted by the anxieties of the Sons of the American Revolution, who seem

Herblock in the Washington Post.

even more nervous than their sisters. This ramshackle fishing expedition has been disowned by the Republican committee members who had no share in its launching, but it lends some plausibility to arguments that the need for federal aid to education is outweighed by the danger of such interference. It has evoked so much ridicule and resentment, however, that it may mark the turning of the tide. Phi Beta Kappa, the national scholastic roll-of-honour society, has denounced academic loyalty oaths as likely to intimidate teachers and disillusion students. Yale, while it will employ no Communists, steadfastly opposes the loyalty oath. Harvard, an even older citadel of academic freedom, has refused to bow to the threat of a graduate to withdraw his contributions—sorely needed though they are—unless it discharges Dr Shapley, the organiser of the Waldorf conference of fellow-travelling intellectuals and another professor. The demand was lodged by a Mr Ober, who might have overlooked Dr Shapley, but was tried beyond endurance when he discovered that meetings to oppose the anti-subversive law he was sponsoring in Maryland were being graced by a professor of his old university. Harvard, however, has declared that it is "not afraid of freedom," a timely reminder to other Americans that the torch in the hand

of the Statue of Liberty is not to be confused with a red conflagration.

Labour's Half Loaf

The labour unions found a chillier welcome than usual awaiting them last week when they knocked on management's door for wage increases and other benefits. The steelworkers were told that their contract did not provide for bargaining on pensions at this time and they may have to defer their hope of securing retirement benefits such as those Mr Lewis has won for the miners. The automobile workers at the Ford Company were also told that their pension request cannot be granted without a substantial increase in the price of cars, and were urged, instead, to accept an 18-month wage freeze. The General Electric Corporation has also turned down a request for a \$500 a year "wage package."

Mr John L. Lewis alone has come up with an idea which finds immediate favour among the operators: a proposal for a three-day week in the bituminous mines to prevent overproduction and price cutting. The enthusiasm of the mine-owners is tempered, however, by a fear of the anti-trust laws and uncertainty whether Congress, which more than a decade ago passed the now defunct Guffey Act, would once more make an exception of an industry which shows signs of relapsing onto the sick-bed from which it was rescued by the war.

The unions have also suffered a not-unexpected setback in the Senate debate on the repeal of the Taft-Hartley Act. Mr Truman's lieutenants had been set a tight-rope walking exercise: to retain enough of the Taft-Hartley Act to win over waverers from the right without losing labour votes in the Senate and labour support outside it. Four concessions were passed without difficulty. Union leaders will have to sign anti-Communist affidavits and submit financial reports, but so will employers; a limited degree of free speech for employers is continued, and also the requirement that unions as well as

managements bargain in good faith. The hope, however, has been frustrated that the new labour law might emerge innocent of any reference to the use of the injunction in disputes involving the national health and safety.

The Administration's original Bill relied entirely on the President's "inherent powers" to restrain such strikes; when it became clear that this would not satisfy the Senate, the power to seize an industry was put forward as an alternative to the injunction which would be more palatable to labour. This compromise, as well as several others, was opposed by a coalition of those who thought it went too far and those who thought it did not go far enough, and in the end the Senate passed, by 50 to 40, Senator Taft's amendment authorising the President to use either the injunction or the power of seizure. For Senator Taft, this is a retreat from his original position, prompted, perhaps, by a recognition of the part labour may play when he comes up for re-election next year. The President and his labour advisers will now have to decide whether to accept this half-loaf. The veto of the original Taft-Hartley Act paid Mr Truman handsome political dividends, but a second veto of a more moderate measure might be subject to the law of diminishing returns—particularly if Mr Lewis should celebrate it with another strike.

Shorter Note

The House of Representatives, forgetting the economy campaign in the interests of a Congressional junket, recently sent five of its members to the Moral Rearmament Assembly at Caux in Switzerland, in a specially chartered plane at a cost of \$5,000. Neither the House nor its envoys had a clear idea of where they were going or for what purpose, but fortunately they found justification for their trip in Caux, since MRA is now concentrating on anti-Communist propaganda and has the approval of General MacArthur, who permitted a Japanese delegation to attend.

THE WORLD OVERSEAS

Italy's Precarious Recovery

THE strike of the Indian farmworkers which, after considerable unrest, was settled on June 23rd, was caused by genuine grievances. The labourers (*braccianti*) on Italian farms are the worst paid of all workers—their average monthly wage (about £9) is half the average in industry—and in most areas they are exposed to long periods of unemployment. In Emilia, for instance, a working year of 165 days is not uncommon. The demand of the *braccianti* for better pay and more family assistance had a good deal of public sympathy behind it. The problem is how, in an economy as restricted and hemmed in as that of Italy, to secure a genuine increase in their share of the national income.

In many ways, the Italian economy has been well managed in the last eighteen months. The deflationary policy introduced in the autumn of 1947 has been followed, as the tables below illustrate, by a long spell of steady prices, steady wages and a steady cost of living index. The budgetary deficit has been drastically reduced, the value of the lira has remained constant and confidence in the country's money, which was vanishing in 1947, has been restored.

During the same period, production in industry has reached approximately the level of 1938 and agriculture does not lag far behind. In 1948 a really remarkable effort was made in the field of foreign trade, Italian exports registering an increase of 40 per cent in the year. The following table shows the scale of the achievement:

ITALY'S FOREIGN TRADE (COMPARISONS BASED ON 1938 PRICES)

	IMPORTS			EXPORTS		
	Food	Raw Materials	Total	Foodstuffs	Finished Goods	Total
1938	100	100	100	100	100	100
1947	213.9	114.5	120.5	42.9	113.6	74.7
1948	225.0	91.6	110.9	71.3	158.6	117.8

The result was an improvement in Italy's balance of trade from a passive balance of \$788 million in 1947 to a passive balance of only \$272.2 million last year.

In spite of these genuine achievements, the Italian economy remains in a precarious state. To produce at all, it must import. If the recent oil strike in Northern Italy proves genuine, it may ameliorate one of its great natural disadvantages—the absence of indigenous raw materials—but all other basic materials are absent. Imports in turn depend upon Italy's continued capacity to export and it is doubtful whether 1948's performance can be repeated in 1949. In the first three months of 1949, the high level of exports was maintained at 47 per cent above the corresponding quarter of 1948, but in April both imports and exports began to fall.

The nature of Italy's exports increases the vulnerability. Europe's present tendency is to cut the imports of inessentials. Cheese, fruit, flowers, wine are among the first to suffer and they are all typical Italian products. The tremendous expansion in Italian exports of finished goods, particularly the products of mechanical industry, was made possible partly by the postwar shortages of these goods, partly by the disappearance of German and Japanese competition. The restoration of western Germany may restore to some extent Italy's old exports to Germany of fruit and nuts and dairy products, but German exports may close some markets to Italian industrial exports. Difficulties have arisen in Italian trade with the sterling area. At present, the Italians have a sterling balance of 40 million lire. They blame this unbalance upon the "over-valuation" of sterling, which, last November, was fixed at 2,317.25 lire to the pound sterling in order to keep sterling in line with the dollar. But some Italians are also inclined to blame the severely restricted import policy pursued by Italy.

Above all, Italian exports in 1948 gained by Argentina's trading difficulties with both the United States and Britain. In 1948, Argentina sprang ahead to become Italy's largest market. After April this year, however, trade with Argentina began to shrink and recently, Argentina has announced large import restrictions.

Too Little Re-equipment

Italian industry cannot immediately offset any decline in exports by satisfying mass demand at home. There is no large internal market in Italy. In 1948, most consumer goods were selling at levels well below those of 1938 (60-75 per cent for textiles, 65 per cent for footwear, 60 per cent for soap, 50 per cent for new furniture, and in spite of idle capacity in the textile industry and unemployment among building labourers, virtually no programmes for cheap textiles or cheap houses have been undertaken since the two Unrra-sponsored projects, *Unrra Tessile* and *Unrra Casas*, introduced three years ago. The picture is not much better for some production goods. In 1948 domestic purchases of tractors and machine tools were far below what was necessary for better and cheaper production and also below what could in fact have been produced by Italy's war-expanded mechanical industries.

This last shortcoming points to another weakness in the Italian economy, a weakness shared with other European countries, but particularly dangerous in Italy, where it has been fostered by decades of autarky. Productivity in many branches of industry is low, and one of the reasons why the export drive of 1948 was possible was because many goods had priced themselves right out of the domestic market. So far, the modernisation and re-equipment of Italian industry have been undertaken only very patchily; and it is a complaint of the

ECA mission to Italy that in 1946 and 1947 private industry, left to itself, far from renovating or installing plant, devoted a large proportion of its capital to building up speculative inventories.

The improvement of productivity in Italy faces one problem, however, which is absent in other western European communities—the rapid rise in the Italian population. The Italians are expanding at a rate of 400,000 a year and the peninsula has not the means to absorb such an increase. The classic methods of raising productivity—by increased mechanisation and the reduction of direct labour costs—can be used only very circumspectly in an economy overflowing with available manpower who must either be absorbed or go unemployed or find means of emigration.

The problems facing the Italian Government are thus formidable. The prosperity achieved so far is precarious since it has been underpinned by a favourable but probably temporary conjunction of circumstances in the export trade and by Marshall aid. Unfortunately for the Italian Government, the fundamental difficulty—insufficient resources to support too many people—is beyond their control and only a great act of western solidarity in which the United States, the British Commonwealth, Latin America and France agreed to back a programme of regular Italian emigration would put a really sound foundation under the rickety Italian house.

Need for More Investment

Nevertheless, more could undoubtedly be done to increase the size of the internal market in Italy and to improve productivity in both industry and agriculture. The rate of capital accumulation has been insufficient to exploit all the resources of the Italian community. In spite of a great increase in savings—the Minister of the Treasury, Signor Pella, recently put the percentage of savings at 18 per cent of the national income—they do not find their way in sufficient scale into industry or agriculture. The reason is in part the extent of state control. Over 70 per cent of the saving institutions are controlled by government and through direct ownership or through the mammoth holding company, the IRI (*Istituto di Ricostruzione Industriale*), large sectors of all heavy and mechanical industry are state controlled. But ever since the crisis caused by inflation in 1947, all state institutions have fought shy of credit expansion for fear of disturbing Italy's hardly gained monetary stability. The result has been a caution which has aroused Italy's American advisers to protest. A modest reversal of the trend has now been introduced and the long-term estimates for Italian investment have been increased, but this expansion is still inadequate.

Private industry has not taken up the slack left by government. Italian industry, feudal in tradition, largely monopolistic in its higher reaches, protected by decades of fascism and long financed by a series of disastrous war efforts, has missed the revolution essential to genuine "free enterprise"—the revolution of Henry Ford. Save in a few exceptions, the notion of producing cheaply for the many and gaining small profits in a large turnover is not part of the Italian business mentality. Investment remains weak, and the increases forecast in Italy's long-term plan for investment by private business are unlikely to be achieved.

This relative stagnation in Italian big business underlines another weakness in Italian society—the gulf between the small group of industrialists and landed proprietors of great wealth and the poverty of the masses. The visitor sometimes has the impression of living in a country with two almost totally disconnected economies—the small closed circle of the very wealthy and the poor, ingenious, resourceful, intensely active life of the masses. This antiquated social structure has its economic repercussions in limited high cost production and the lack of a large internal market. It has its political repercussions in the alienation of a large part of the working-class and the perpetual undercurrent of political instability. The recent strikes among the farm workers were thus symptoms of a much wider malaise.

Ten Year Plan for the Congo—I

Routes for Strategy and Trade

(FROM OUR BRUSSELS CORRESPONDENT)

No visitor to Belgium in recent years can have failed to be impressed by the nation's Congo-consciousness. The feeling is opportune, because the almost unwanted baby of 1908 has become a promising and important stripling, whose further growth and relations with his neighbours are calling for a close overhaul of parental policy. The Congo, with the trustee territory of Ruanda Urundi, straddles the equator over an area almost as large as continental Europe, stretching from the Atlantic to Lake Tanganyika. Both now and potentially, it is a source of great wealth, animal, vegetable and mineral. Through it runs the strategic traffic artery which links the Atlantic with the upper waters of the Nile and—usable though not yet complete—the first main motor highway between the Mediterranean and the Cape. Through it, too, are destined to run the two arteries linking the Atlantic with the Indian Ocean. The closing of the Mediterranean in the second world war showed the need for strengthening west-east communications across Africa. Bearing in mind the Congo's desert frontier in the north and the important mineral deposits further south, the strategic importance of the territory needs no emphasis. At the same time its internal communications have as much to carry as they can bear, and an important part of the colony's produce already leaves by other routes. Belgium can thus reverse with equanimity the traditional policy of favouring the use of the *routes nationales* and allow Congo communications to be integrated with the trans-African traffic routes.

There are three main routes into the Congo interior, all radiating from Leopoldville. From Leopoldville all traffic proceeds by steamer, the Great Lakes system following the main curve of the river as far as Kabalo—a matter of 1,500 miles—whence a rail connection links it with Lake Tanganyika at Albertville. This system is somewhat slow of operation, especially since navigation difficulties necessitate trans-shipment from steamer to rail at Stanleyville and again at Kindu. Northbound traffic links at Bumba with the strategic Royal Road to Juba and the Nile or, turning up the Itimbiri as far as Aketi, with the narrow gauge rail connection to Boma in the north and through Paulis to the Mungere terminus in the north-east. The southern route uses the Congo's left-bank tributary Kasai to the railhead at Port Francqui, where the traffic is trans-shipped onto the Katanga railway system running to Elisabethville and the principal mining districts.

Trans-African Route Inadequate

The Katanga system, by a branch-line from Tenke, links with Portuguese Angola, and provides an alternative seaward outlet through Lobito, which is used by much of the Kasai diamond traffic. It also links with the Rhodesian system, across the frontier at Sakania, and much of the Katanga copper traffic uses this route in the returning wagons sent up from the Wankie collieries. It finds its outlet to the sea, also in Portuguese territory, at Beira. There is thus, between Beira and Lobito a rather roundabout trans-African connection which, with the traffic growing in strategic and economic importance, may soon prove inadequate.

The Katanga system passes within about 250 miles of the Great Lakes system, but the two do not connect. The policy which has maintained this anomalous gap has now been reconsidered; and part of the Ten Year Plan, which the Belgian Minister for the Colonies has lately submitted to the Cabinet, is a firm project for a railway from Kamina to Kabalo. This will link both Lobito-Tenke and Matadi-Port Francqui with Dar-es-

Salaam. Unfortunately, the two Congo systems are of different gauge and, logically enough it is that between Kabalo and Albertville which is to be altered. This will necessitate a similar change over the 1,350 miles of track in Tanganyika before the link can be fully completed by the train-ferry across the lake to Nigoma, the passage involving in the meantime trans-shipment on either shore.

A further shortening of the route, by direct rail connection between Matadi and either Port Francqui or Luluabourg, does not appear for the moment to be practical. In any case, the usefulness of the connection between Lobito and Dar-es-Salaam limited by the port facilities at either end. Much may be done, in time, by expansion at the Tanganyika end; but it is clear that a second trans-African route, with an alternative seaward outlet in the east, may soon become a necessity. Little has lately been heard of the projected railway, mentioned in the Hailey report, linking Stanleyville with Kasenyi on Lake Albert and thus connecting with the Nile. This link is, however, supplied by an arterial motor road which crosses the north-south road by which Lake Kivu and Costermansville are connected with the Cape to Cairo road at Watsa and the Royal Road at Faradje. There has, nevertheless, been pressure from the British side for action which would direct traffic to Mombasa by a link with the Uganda railhead at Kampala. For this purpose the project considered has been a railway from Stanleyville to Goma, on Lake Kivu. This has been abandoned for the time being, but it is understood that a first-class motor road from Stanleyville to Goma will be provided for in the Plan. How this will link with Kampala and Mombasa will be a matter for decision on the British side. Stanleyville, however, will thus lie at the intersection of the Matadi-Mombasa system with the Cape to Cairo road, thus justifying its proverbial status as the turntable of central Africa.

Export Surplus for Belgium

The Congo is still at an early stage of its development which, nevertheless, has been rapid and was greatly stimulated by the war. In 1948 its exports were valued at some £60 million, half of which was in mineral products, almost as much in crops (including vegetable oil) and with ivory and hides as the chief remaining items. Its imports amounted to some £47½ million, of which nearly £22 million was accounted for by machinery, metal goods, ships, vehicles and parts, which can properly be charged to capital account. Almost the whole of the export surplus was sent to Belgium, the accounts with the rest of the world being in approximate balance; but they included a £10 million deficit with the United States and a credit of the order of £6,000,000 with the sterling area. This, however, does not fully state the contribution of the Congo to the economy of the Belgian franc area. In particular, it incompletely reflects the revenue from the sale of radioactive minerals; and it takes no account of the export trades which Belgium has built on a basis of Congo-produced materials, notably cotton, copper and zinc.

Development of the Congo is conditioned partly by the character of the country and partly by the distribution of the

mineral resources. In broad terms, the intractable and almost undeveloped central basin, lying at an elevation of about 1,000 feet and bounded by the Congo, Kasai, Sankuru and Lomami rivers, is surrounded by hilly country with a great number of tributary streams. In such country communications are difficult, and this partly accounts for the scattered nature of much of the mining enterprise. The most valuable resources—copper, cobalt, manganese and uranium—are indeed centralised on Elisabethville, its northern neighbour Jadotville and the expanding radium community of Shinkolobwe. These workings are close to—in the case of copper abutting on—the extreme edge of the

upper Congo at the North Rhodesian frontier, and they are well served by railways. Gold workings, however, are very dispersed, the chief developments being in the far north-east, but other concessions being as far apart as Leopoldville, Luluabourg and Costermansville. Tin workings are on both sides of Lualaba (the upper Congo) beginning 150 miles north of Jadotville, near Bukama, extending northwards to the boundary of Stanleyville province and thence eastwards into

Ruanda-Urundi. The chief diamond country is in the upper Kasai (Tschikapa), though there are workings 300 miles further east, and others in the extreme north-east between Wamba and Irumu.

(To be continued)

Surveying the Amazon

[FROM OUR CORRESPONDENT IN RIO DE JANEIRO]

THE International Institute of the Hylean Amazon has probably suffered more than most of Unesco's projects from misrepresentation. In the Amazonian countries themselves (which include six of South America's ten republics) extravagant hopes that an international brains trust would make the "wet desert" blossom like the rose doubtless owed much to the wishful thinking of Latin American spokesmen. Such hopes were bound to wane, and it seemed inevitable that the cynicism they had already evoked in the outside world should eventually supplant them in Brazil, the country most closely concerned. A prominent Brazilian scientist who is experimenting, with mixed success, with jute and rubber in the lower Amazon is openly sceptical about the usefulness of Unesco in this region, and in Rio de Janeiro little or no mention of its scheme now appears in the newspapers.

Against this crossfire from the disappointed and the sceptical—those who feel that Unesco should do much more and those who believe it can do no practical good—the International Institute of the Hylean Amazon is, in fact, advancing slowly. A beginning has been made with the field work that is part of its essential task of tropical research. In the Gurupá region of the lower Amazon a scientific party from Columbia University, accompanied by Brazilian scientists, has been studying social anthropology; and an international team of geographers, botanists, anthropologists and geologists recently spent four months exploring the Rio Huallaga, a Peruvian tributary of the Amazon. These "pilot surveys," as they were described to your correspondent by Mr E. J. Corvêr, the English scientist who is supervising the Institute's preliminary work, are only a

beginning, but expeditions of this sort are at least likely to throw light on the possibilities of a vast region little known even to scientists.

Manaos, Brazil's deep-water port 900 miles up the Amazon, has been chosen as the Institute's headquarters. The town's prosperity of the rubber boom years that culminated in 1912 has never been recaptured, and few of its citizens expect a return of that hectic era, when the wealth per head of the Amazonian capital was said to be higher than in any other city in the Americas. In those days, its only link with the outside world was the British steamship line which still plies regularly between Europe and the Amazon—at certain seasons of the year as far as Iquitos, on the river's Peruvian headwaters. Britain's long record of trade and exploration in the Amazon has not been forgotten in Manaos, whose traffic once followed the British custom of keeping to the left, and whose wealthiest families until the war made a point of educating their sons in England. In Manaos, as throughout north-eastern Brazil, British prestige still stands very high, and Unesco's initiative has been welcomed as a sign of renewed outside interest in a difficult hinterland. Here, more clearly than anywhere else, the scheme is seen in its true perspective. The local authorities accept it as modest but promising, and in his trips into the surrounding country Mr Corner has been given a great deal of practical help from the *caboclos*, native labourers who are unlettered but wise in the ways of the jungle. The Commercial Association of Amazonas is also co-operating actively in his work. The Federal Government has shown itself warmly sympathetic towards the whole scheme.

Lessons of a Laboratory

The use to which the Institute's findings can eventually be put in developing the resources of the Amazonian countries seems to depend largely on the initiative and interest of these countries themselves, and principally Brazil. Two thirds of

its immense territory—an area twice as large as Argentina—were drained by the Amazon. What can be done to improve public health has already been shown by the Americans, who, to protect their wartime garrisons on the strategic Brazilian bulge, made it safe to sleep in the Amazonian port of Belém without a mosquito net. The experts mobilised by Unesco may be able to show that crops could be raised where none had been grown before; where—or even how—communications might be improved to harvest and market much of the region's untapped wealth. But it is no part of their job to build such communications, to raise crops commercially, or to obtain capital for these ventures. Theirs is essentially laboratory work, and the use of Amazonia as an international laboratory offers an obvious approach to diverse tropical problems not only in South America but in other continents.

In Brazil itself Unesco's work might even indicate new investment channels to Mr Nelson Rockefeller's International Basic Economy Corporation (IBEC). This organisation offers a commercial approach to Brazil's great problem of feeding its population adequately, and is already a going concern in both Venezuela and Brazil. An agreement has just been signed between the Brazilian State of Minas Geraes and IBEC's affiliate, the American International Association, which will set up a "Commission for Rural Credit and Technical Assistance," and IBEC's own land-clearance schemes (none of them in Amazonia) are making impressive changes in some of Brazil's agricultural zones. In Brazil today there is obviously room for both the Unesco and the IBEC ventures as part of the gigantic and slow-moving pattern of Brazilian progress. Each in its own sphere is no more than a pioneering effort, and only the future can tell what benefits each will bring.

Trials of Modern Exploration

Meanwhile, the International Institute of the Hylean Amazon faces administrative problems of a kind spared to the free-lance explorers of pre-Uno times. Space has to be found to

Now you can fly **BEA** within Germany

Not only can you fly direct from London to Germany's main commercial and industrial centres. NOW you can fly *within* Germany. Here are the details of the BEA German Services—a vital link in Europe's business life.

1. London — Amsterdam — Hamburg (2 flights daily each way)
2. Hamburg — Berlin (2 flights daily each way)
3. London — Frankfurt (6 flights a week each way)
4. London — Düsseldorf (5 flights a week each way)
5. Hamburg — Düsseldorf — Frankfurt — Hamburg (1 flight daily each way)
6. London — Düsseldorf — Munich* (5 flights a week each way)

* The first air service London-Munich since before the war.

BOOK NOW for your Germany trip. All information and reservations from Travel Agents (no booking fee); local BEA offices; BEA, Dorland Hall, Regent St., S.W.1. Telephone: Gerrard 9833.

BEA takes you there and brings you back

house not only visiting scientists but also the secretariat of what has come to be one department of an international Civil Service; and Manaus has a housing shortage. Funds have also to be found to pay salaries. But the 17 Latin American governments which together constitute a powerful voting bloc in Unesco's councils, meet only 3½ per cent of the parent body's expenses. A more encouraging attitude has been adopted by Brazil towards the Hylean Amazon scheme. To maintain its secretariat during 1949 \$72,000 are required, and the Brazilian Chamber of Deputies has voted half of this sum. The remainder falls to be paid by the other Amazonian countries, and by Great Britain, France and Holland, which are represented because of their colonies in the Guianas.

If budget limitations help to restrain the bureaucratic side of the Institute's activities without cramping the work of the scientists, this new experiment in international co-operation may yet prove to have more practical worth than its critics expect. Amazonian exploration was never easy, as any reader who has shed sympathetic sweat over Mr H. M. Tomlinson's "The Sea and the Jungle" will readily understand. It is unlikely to be easier simply because it is carried out under international auspices. But under any auspices the real work of discovery must go on if the Amazon is ever to play a fuller part in the economy of Brazil and the world.

Uno and the Backward Areas

(By a Correspondent)

THE move of the US Government towards putting the economic work of the United Nations on the map by associating its Economic and Social Council with President Truman's "bold new programme" for the economic development of backward areas is now bearing fruit. The sub-commission on economic development, a body of Uno experts, published a report on April 12th, and the Secretary-General has just issued the Uno plan of "Technical Assistance for Economic Development." This it is hoped, will receive the approbation of the Economic and Social Council at Geneva next month and—more important perhaps—provoke the announcement of some form of financial support by the US delegates at that meeting.

It is an article of faith at Lake Success that political differences cease to be troublesome when international economic discussions are "kept on the technical level." By means of a bewildering hierarchy of committees, the discussions of the experts on economic development were in fact very comfortably insulated and protected against the upheavals which regularly afflict the political bodies. A great deal was consequently expected of their recommendations, which, it was generally assumed, would provide the opening salvo in the Uno campaign for a leading place in the bold new programme. But something seems to have gone wrong with the insulation. The plain fact is that the observations of the experts are distinguished by a startling mediocrity where they are correct and by incredible ineptitude where they are not.

The Secretary-General's report on the Uno plan for Technical Assistance is a considerably more impressive contribution to the subject. It need hardly be said that the plan involves substantial expenditure, or that the budgets, given below, are stated for the purpose of convenience in terms of US dollars:

	First Year	Second Year
United Nations	5.9	9.3
International Labour Organisation	4.7	6.8
Food and Agricultural Organisation	9.4	11.4
Unesco	6.2	10.7
International Civil Aviation Organisation	0.5	1.0
World Health Organisation	9.2	11.0
TOTALS	35.9	50.2

These seemingly modest amounts are to be spent in sending expert missions to the undeveloped countries; training students; financing scientific and industrial research and

related publications; supplying seed, medical and technical equipment, and in other ways spreading a knowledge of modern technique throughout the backward areas. The aim is unexceptionable and the law of averages will undoubtedly see to it that some of these admirable intentions bear fruit. But the grounds for some disquiet are apparent even at this early stage.

Dangers of Duplication

In the first place, as the Secretary-General explains in his introductory note, it was not possible to prepare a combined budget covering the United Nations and the specialised agencies as well. This will mystify the general public which not unreasonably fails to make any distinction between Uno and the specialised agencies. Secondly, as the budgets are separate and distinct, so are the plans. At first sight this seems not unexpected, and perhaps not undesirable, since each agency has its own field of interest and special expertise. Unfortunately, however, these fields almost exhaust the entire territory of economic development, leaving only insignificant scraps to the headquarters at Lake Success. Thus the fact that the plans of the International Bank envisage technical assistance in "industrial, power and transportation projects," while the plans of Uno involve technical assistance in the "unassigned fields" of "manufacturing industries," "mechanical power" and "road, rail and water transport" will not surprise experienced civil servants familiar with the strategy of bureaucratic empire-building as practised in London or Washington. But it may well seem incomprehensible to the general public. It is a pity that jurisdictional disputes among the Uno organs could not have been set aside on a matter of this importance.

In the absence of any generally agreed definition of economic development or any generally agreed method for developing backward areas, the plans for technical assistance are necessarily tentative, tenuous and varied in the extreme. The joint malaria control project of the Food and Agricultural Organisation, and the World Health Organisation, and the International Labour Organisation advisory services on social security are readily understandable; the Unesco quarterly bulletin on the social implications of science are somewhat less so, and the Uno pamphlets on the methods of power generation from windmills seem distinctly in the class of contributions by harassed officials anxious to make constructive suggestions in time for the next air mail. The possibility of getting action on these programmes is probably greatest for the agencies, already experienced in the business, particularly the ILO and FAO. Beginners such as Uno itself may well find the clients coy and the administrative details troublesome.

Lack of Experts

The effective spending of the budgeted \$85 million in two years is highly unlikely, if only because the competent experts simply do not exist in the numbers required. It is significant in this connection that the International Bank and the International Monetary Fund, whose importance for economic development is fairly obvious and whose staffs are ample, have contributed—almost with an air of pained surprise—only the sketchiest plans to the report and have explicitly refrained from asking for money.

It is safe to assume that the national authorities of the richer countries, who will have to make the decisions in this matter, are themselves familiar with the peculiar conventions of budgeting by public organisations. Certainly, in the case of the US State Department, which is pressing Congress for \$30 million to begin with, there will be a disposition to pay less attention to the plans than to the calibre of the experts and the international officials responsible for spending the money and to the prospect of full and frequent reports on progress. The whole scheme could be an expression of venturesome international co-operation at its best. The national authorities concerned would do well to insist that such co-operation should begin amongst the international organisations themselves.

THE BUSINESS WORLD

European Payments Compromise?

THE past week has seen the climax of the controversy on the Intra-European Payments Scheme. It has been a long argument, waged mostly by "backroom boys" in Paris, with occasional changes of venue to London, Brussels and Basle. But it is only lately that the matters in dispute, having far transcended the technical plane and entered into realms of high policy, have had to be taken up at correspondingly high Ministerial levels. Only at that moment of transition did the general public become even half aware that Britain was confronted by yet another financial crisis. Though every factor in the situation has been plainly visible for the past two months at least, it is only in the last fortnight that gilt-edged have taken their steep dive, that talk of the inevitability of dollar import cuts has emerged, and that an atmosphere all too reminiscent of that of the summer of 1947 has returned. It would be a mistake, however, to suppose that the amounts at stake in the dispute at Paris have brought on a major financial crisis. It is rather that the knowledge that a crisis is brewing in the whole of Britain's financial relations with the world has contributed to the intensity of the arguments over the payments scheme.

At the risk of some repetition, but as a help to getting the issues into reasonably clear focus, it may be well to traverse again the grounds of the dispute. In the first year of Marshall aid, which expired on Thursday of this week, the European recipient nations agreed to make available to their debtors certain rights to draw on their own currency, as set out in an agreed schedule. Britain and Belgium were the largest providers of these "drawing rights." As against a total of dollars receivable of \$1,316 million, Britain undertook to make available to other European countries a net total of £72½ million (that is, equal to \$290 million) in sterling. An amount of dollars equivalent to these drawing rights was labelled "conditional aid"—that is, the grant of it by the Americans was, in theory at least, conditional upon the giving of the drawing rights. These drawing rights, however, were not transferable. That is, if France could not use all the sterling allocated to it (as has in fact been the case), that sterling could not be transferred to any other country.

Of this original Intra-European Payments Scheme (IEPS) the following criticisms and approbations, as summarised by the faithful agent for its operation, the Bank for International Settlements, may be given:

There have been a number of criticisms of the payments scheme: e.g., that it is backed exclusively by American aid; that it is too bilateral in character; that it does little to assist in the building-up of central bank reserves, etc. There is some truth in these strictures but a number of answers suggest themselves. . . . When ERP aid first came into effect there was hardly any other choice than to build on what existed, i.e., the bilateral payments agreements in Europe.

On that basis a scheme was prepared which has shown itself capable of practical application and which has helped to sustain the volume of intra-European trade. . . . It can never equal in effectiveness the traditional multilateral settlements which worked so smoothly in the past. Before they can be resumed, however, it is necessary that fundamental

equilibrium should be restored within the various economies in a measure not yet attained and that sufficient monetary reserves should be available to cope with normally recurring fluctuations and to strengthen the feeling of confidence. While the restoration of freedom to European payments is thus dependent upon progress towards a solution of the major problem of European equilibrium, there are, of course, technical improvements which can be introduced into the current scheme with a view to rendering payments more flexible and providing more suitable incentives. Thus the payments scheme which has taken its place as part of the present European effort to achieve a greater degree of collaboration and unity may, through the experience gathered and the practical machinery which is being developed, lay the foundation for a more satisfactory monetary order in the future.

The variety of suggestions for the improvement of the scheme in the second year, beginning on July 1st, has displayed a wealth of ingenuity which could usefully have been applied to more important and constructive spheres of economic endeavour. But for the present purpose it is only necessary to give a brief outline of the Belgian proposal (backed by the United States), of the British counter-proposal and of the "compromise" suggested by the French Government.

The Belgian and ECA proposals, which went hand in hand, were intended to give the revised payments scheme the flexibility which it obviously lacked in its first version. At the same time, they were meant to use IEPS as the lever to restore the price mechanism and to provide the spur of effective competition within Europe. The intention was to remove the tendencies towards strictly bilateral trade and the consequent disregard of price equilibrium which evolved and was even encouraged by the first version of the scheme. This reform was to be achieved by expressing the contributions and drawing rights for each participant in the IEPS in global terms, instead of splitting them up into their strictly separated bilateral components—in other words the drawing rights were to be made completely transferable among the participants in the scheme. Thus, if France found itself with too much sterling it could, in effect, use it to pay for, say, more Italian goods than it could otherwise afford to import. The Americans, for their part, carried the proposal still further: the drawing rights were to be not merely transferable within the OEEC group, but also convertible into dollars; if drawing rights were transferred, some at least of the 'conditional aid' behind them should also be transferred. In this way, those European countries which showed a favourable balance in their trade with other European countries would be awarded a dollar bonus at the expense of the deficit countries.

Several modifications to these original proposals then appeared. It was suggested, for example, in a later edition of the Belgian proposal, that only 50 per cent of the drawing rights should be freely transferable, and that the balance should be used on strictly bilateral lines. Under the French compromise, which was suggested at last week's meeting of Ministers in Brussels, the proportions were whittled down

to 40:60, i.e., 40 per cent of the drawing rights to be transferable and 60 per cent to carry a bilateral earmark. At approximately this stage in the discussions the ECA suggestion for convertibility of drawing rights into dollars was dropped, a move which has made progress towards subsequent agreement a great deal easier. Although convertibility and transferability are two quite separate concepts, they have, in British eyes, tended to merge into one single objectionable category because both would cost dollars and gold. The free transferability of drawing rights would cost Britain gold if sterling contributions were in effect expended not in Britain but in Belgium or Switzerland, thus raising those countries' sterling holdings above the present gold ceilings and calling for the payment by Britain of an equivalent amount of gold.

The British attitude towards these proposals has been dominated by the desire to defend the gold and dollar reserve. The reserve is now below the danger level and its fall is causing the greatest difficulty in maintaining the voluntary discipline of sterling area countries. Therefore everything should be done to prevent further losses of gold. The British negotiators have expressed a willingness to increase the flexibility of IEPS but to go no further than "controlled transferability." This is a euphemism for saying that Britain will agree to transferability provided that any country with which the sterling area is running a deficit is excluded from it. This basic objection has been pleaded with all the unyielding logic which the Chancellor of the Exchequer has at his command. He has pointed out that the British reserve of gold, which must now be well below £450 million, serves the needs of a large area which in fact constitutes the only wide region within which the principles of free transferability of currency (though admittedly not "currencies") and multilateral trade have any real application. The British have argued that they have a grave responsibility for the defence of this reserve, and that this responsibility extends well beyond the defence of strictly British interests. They have pointed out that it would be a major tragedy to the cause of multilateral trade which the United States and most European countries have at heart if this mechanism ensuring free movement of goods and payments within the sterling area were to be seriously weakened, as it would be by further encroachment on the central reserve.

★

From this basic though inevitably short-run analysis of the situation, the British case has proceeded to a number of intricate rationalisations of objections to transferability and convertibility. In particular it has been argued that the introduction of the dollar sign into European trade would tend to contract that trade. The possession of a credit balance in intra-European trade might connote superior economic efficiency, which ought no doubt to be rewarded; but it might also be the result merely of greater ruthlessness in cutting down imports, which ought to be avoided. If all European trade were in the ultimate balance to be reduced to a dollar basis, the same discriminations between essential and less essential imports would have to be introduced into it as are perforce applied to imports from dollar countries. The British have also argued that to open Europe to American competition would at present be most "untimely" and would reduce the effective aid received from the United States. Since the total amount of goods that can be bought from America by Europe as a whole is a finite quantity, any increase in imports by the commercially stronger Europeans—and such an increase would inevitably occur in less essential categories—would mean a reduction in the purchase of essentials by other countries. Moreover, Britain would be singled out as the chief sufferer,

not because she is economically the weakest country in Europe, but because she grants the most drawing rights.

Most of these objections, it will be found, are based on the assumption that European prices in general, and sterling prices in particular, are out of line with dollar prices and that there can, therefore, be no question at present of meeting American competition on anything like equal terms. Between every line of the Belgian, French and ECA suggestions there may be read an unwritten sermon on the need for Europe to loosen its economy and to re-establish some semblance of price equilibrium with North America, if need be by the appropriate adjustment of exchange parities. Similarly, between every line of the British objections to these schemes can be read the Chancellor's firm resolve to hold to the present exchange rates at any cost.

On the theoretical plane, this is one of those awkward controversies in which there is a great deal to be said for either side. The practical issue, however, is one of finding means whereby some greater degree of elasticity can be brought into European payments while still giving the maximum protection to the British gold reserve. In the course of discussions, other European countries, and Belgium in particular, have shown an appreciation of the dangers that would be involved by any further substantial encroachment on British gold reserves. At a comparatively early stage in the discussions on the amendment of IEPS, the Belgian representatives

came forward with suggestions for a long-term loan by Belgium to Britain which would in fact consolidate the advances made under the existing monetary agreement and would be tantamount to a substantial raising of the present ceiling on Belgium's sterling holding. If this proposal were accepted, Britain's gold reserve might even be increased. The maximum loss of gold under the transferable drawing rights scheme, as successively amended, might not be more than £10 million or £15 million, or £20 million at the most, whereas the current loss of gold to Belgium under the existing Payments Agreement, which a Belgian credit would presumably stop, is running at the rate of some £30 million a year. The British refusal to consider a credit from Belgium is one of the aspects of the matter that American and Continental observers find most inexplicable. If it is based on considerations of prestige it is, of course, wholly wrong. But if the refusal is due to Belgian insistence that the loan and the interest on it should be repaid in gold, then there is rather more logic in a British refusal to be content with a mere deferment of the gold loss.

That British attitude has not, however, been wholly negative. At the second meeting of the Consultative Group of Ministers of OEEC countries which took place in Paris at the beginning of June, Sir Stafford Cripps made some constructive proposals for dismantling part of the quantitative

restrictions which now hamper the flow of intra-European trade. These proposals took the form of a scheme for the granting of open general licences in a wide range of commodities. The general intention of this proposal was to expand the volume of intra-European trade, but it was specifically provided that no such expansion should take place if it involved the danger of further gold losses.

Nevertheless, this has been widely recognised as a hopeful and significant contribution. The difficulty about it, however, is that it conflicts sharply with the doctrine of non-discrimination laid down in the Anglo-American Loan Agreement. Relaxations of import quotas, if they are to be non-discriminatory, must be made equally all round; they must not exclude hard currency countries. If the Havana Charter were in force, a plan such as the British propose could be operated among "war-shattered economies," which might cover most of western Europe, but might not cover Britain itself and would certainly not cover those countries of the sterling area which could not be excluded from any such scheme proposed by Britain. And in any case the Havana Charter has not yet been ratified by Congress. So that there would be justification in a British complaint that while one American theory, that of convertibility, threatened to make Britain lose its reserves, another American theory, that of

Depreciation Allowances Reconsidered—II

Profits—True and Untrue

INDUSTRIALISTS are beginning to realise that the concession made by the Chancellor in the last Budget, when he doubled the so-called "initial allowance" on plant and machinery, represents not an abatement, but merely a deferment of tax liabilities—it is, in effect, an interest-free loan to industry from the Exchequer. An article in last week's issue examined the nature of this loan, and reached the rather surprising conclusion that its aggregate amount could, on certain assumptions, eventually reach about £2 billion—of which roughly one-third would be attributable to the recent increase in the initial allowance and the remainder to earlier concessions. The assumptions were that the average life of industrial plant is twenty-eight years, that throughout such a period in future industry's aggregate expenditure on new plant continues each year at its present estimated annual rate, and that rates of tax and of allowances remain unchanged. On these assumptions, the aggregate interest-free loan outstanding would rise each year, reaching a maximum at the end of twenty-eight years. Thereafter, the rate of annual repayments (in the form of collection of earlier deferments of tax) would rise to the level of new "lendings"; but, provided only that industry maintained its rate of new outlay, the aggregate outstanding loan would not decline.

At first glance, the prospect of a loan for so large a sum as £2 billion, which would not only be free of interest but would continue indefinitely so long as present policy and practice are unchanged, offers an impressive contribution to industry's capital problem. Closer examination, however, leads to a different conclusion. The value of these concessions may be tested first by comparing the amount of the "loan" with the extent of capital dissipation involved for industry in the difference between the replacement cost and the original cost of its present capital equipment. Unfortunately, no reliable estimates of these aggregate costs are available, but some idea of the magnitudes involved can be formed by considering the rates of replacement outlay. The Chancellor's estimates, as

non-discrimination, prevented Britain from proposing a real liberation of trade.

The British suggestions found increasing favour and support at this week's Paris meetings of the Council of OEEC. As *The Economist* goes to press a compromise based on proposals made by Mr Spaak representing Belgium is being hammered out. It should ensure some transferability of drawing rights and therefore greater flexibility for the IEPS, including some overdue regard for the virtues of price competition in intra European trade. At the same time Britain's desire to protect its gold reserve has been duly recognised—at least so far as any additional drain due to the operation of IEPS is concerned. The British Open General Licence proposal will be given a trial run. The United States demand for partial convertibility of drawing rights into dollars has been dropped for the time being. It is along such lines that the second version of IEPS is being fashioned. It will compare favourably with the first. But it would be raising altogether false hopes to suggest that the new scheme, whether in this or in any other form, could provide even a partial cure for the renewed strain on the British gold reserve. That springs from far more fundamental factors than the particular technique of Europe's payment mechanism.

noted in last week's article, apparently envisage an aggregate expenditure on new plant and machinery of £750 million during the first full year in which the increased initial allowance operates. Evidently, this is a larger rate of expenditure than would have been required annually to maintain industry's plant and machinery intact. A fairer estimate of the annual requirement would perhaps be £500 million; but even on this basis, and with the average life of plant taken at no more than twenty years, the aggregate value of industrial plant and machinery would, at present prices, be no less than £10 billion. If the cost of this plant is assumed to have doubled over the past twenty years—surely a conservative assumption—the difference between original cost and replacement cost would still amount to £5 billion. Beside this large sum, which takes no account of the similar losses on floating capital and on fixed capital other than plant and machinery, the "loan" of an eventual £2 billion looks relatively small.

Moreover, even if a loan of this amount continued almost indefinitely as a part of the floating capitalisation of industry considered as a whole, there would be no such continuity or permanence in the fraction of it which accrued to any particular industrial undertaking. Even if there were an assurance that Government policy would not be changed, each concern could count upon the continuance of its own proportion only if it was sure that it would need and would be able to continue, year after year, to replace its plant at the present rate. Hardly any industrialists dare work on such an hypothesis. Even on the most favourable assumptions, therefore, the individual business would have to be prepared to repay in the future, and perhaps in particularly inconvenient circumstances, the loans which the Exchequer is now making to it. In practice, moreover, the actual experience might be a good deal less favourable than this. In view of the widespread attention which is now being given to the whole question of reform of industrial taxation, it would be un-

reasonable to assume that the precepts which guide Revenue policy now will remain unchanged for the next twenty years or more. The committee just appointed to inquire into the method of computing taxable profits can hardly fail to draw attention to the anomalies which result from the divergences between the fiscal and the accountancy concepts of depreciation. If a recognition of these anomalies were to lead the Revenue to revert to the strict accountancy concept (which is still the basis of its doctrine of original cost), the initial allowance would have to be withdrawn (together with the one-fourth "additions" which are now made to the "appropriate" annual allowances). Such a change would be tantamount to a demand for the immediate repayment of all outstanding loans. So harsh a decision is perhaps unlikely to be taken except as part of a far-reaching change in policy which would in fact soften the impact. But no prudent accountant or finance director of industry ought to take so sympathetic an attitude for granted when framing his present practice and policy.*

It is clear that there will be no solution of the problem posed by inflated replacement costs unless and until industry is allowed—definitively and not merely by way of "loan"—a depreciation charge based on the replacement cost of existing assets, whether by a permanent substitution of "current value" for original cost, or by a once-for-all adjustment for a period of inflation. In principle the need cannot be met by allowances (and still less by loans) related to new assets, for the installation of new assets (as distinct from the provision for capital wastage which has already occurred) is quite adventitious; and, if they are installed, they will in any case be amortised at rates determined by their cost (or current value, if the basis were changed). The efforts of the Revenue in the past sixteen years to ease the burden, by concessions which are more apparent than real, have confused an issue which was already badly blurred. These concessions would be of real, though temporary, value only if industry's main embarrassment now was an inability to command sufficient cash resources for plant replacement. That particular difficulty may increase, but at present the chief embarrassment, in this context, is the actual erosion of the capital itself. Expedients of the "loan" variety, welcome though they may be as a sign of good intentions, do nothing at all to arrest this drain. Indeed, there is even a danger that they may increase the dissipation of capital, through misunderstandings of the effects of the concessions upon industrial profits.

★

It rests with industry, and particularly with its financial and accounting advisers, to ensure that this does not happen. Whilst there is a growing realisation among industrialists that the excess of the capital allowances over normal depreciation leads to a temporary remission of taxation which in effect constitutes a loan, not all businesses would appear to draw the appropriate conclusions in their accounts. Many of the larger companies are fully alive to the problem and transfer the amount of tax deferred to suspense accounts of one kind or another. For example, in its latest accounts, the English Steel Corporation specifically states that its provision for depreciation includes "£138,116 the equivalent of initial tax allowances on capital expenditure of the year," whilst W. T. Henley has transferred to a revenue reserve £39,018 described as "relief from United Kingdom Taxation in respect of Initial Allowances." But many other companies do not appear to have taken any comparable steps, with the result that the "loan" has merged with the net profits which can be distributed at will. While profits are buoyant and dividend limitation remains, the remissions of tax are probably mostly

retained, but it may be doubted if prudence would prevail in many cases if the maintenance of dividends was at stake.

By accepted practice, profits before tax are "true and fair" if (*inter alia*) appropriate provision is made for depreciation. Similarly, profits after tax are "true and fair" if the liability arising from the assessments on those profits is set aside. But the fact that these assessments have been made after capital allowances which are often greatly in excess of the normal depreciation provisions is ignored. The official view of the Institute of Chartered Accountants is that it is sufficient to maintain normal methods of depreciation, thus avoiding any distortion of profits before taxation, and to indicate the effect, if material, of initial allowances on the amount provided for taxation. The Council of the Institute "is further of the opinion that the desirability or otherwise of transferring to reserve and spreading over a period of years the taxation benefit resulting from initial allowances is a matter of financial policy." In other words, anything set aside is a free reserve. In a joint memorandum prepared by the accountancy bodies and issued recently by the Share and Loan Department of the Stock Exchange, rather more emphasis is laid on the matter. This memorandum, which deals with published prospectuses, provides that the statement of adjustments made to profits must compare the depreciation provisions made in the accounts with the capital allowances granted for taxation purposes.

The extraordinary distortion of ostensibly "retainable" profits which results from failure to set aside the tax deferred by capital allowances can best be shown by an example in which profits are compared before and after taxation. The following table gives such a comparison for a company which is assumed to earn exactly the same amount of profit before tax for each of five years and to have incurred in the first year capital expenditure of £100,000 on plant having a life of five years and a residual value of £10,000. The point is made most clearly by taking a "straight-line" basis for depreciation:

PROFITS DISTORTION ILLUSTRATED						
	Gross Profits	Normal Depn. (Straight-Line Basis)	Net Profits before Tax (a-b)	Tax Capital Allowances	Taxable Profits (a-d)	Tax at 10/-
Year	(a)	(b)	(c)	(d)	(e)	(f)
1	100,000	18,000	82,000	T.A. 40,000* A.A. 22,500†	37,500	18,750
2	100,000	18,000	82,000	62,500	77,500	38,750
3	100,000	18,000	82,000	22,500	85,000	42,500
4	100,000	18,000	82,000	15,000‡	100,000	50,000
5	100,000	18,000	82,000	nil	110,000	55,000
	500,000	90,000	410,000	90,000	410,000	205,000

† Initial Allowance—40 per cent. of cost. ‡ Annual Allowance—four fifths of £18,000 (straight line basis). § Balance. * Balancing Charge to increase residual value to £10,000.

It will surprise many people to know that in the eyes of the law and in the opinion of many boards of directors and of the official representatives of the accountancy profession, the net profits in each year as set out in column (g) can be said to give a true and fair view of the profit of the year. It would certainly astonish shareholders who knew that the trading experience had been exactly similar in each year if they received, as they well might, a tax free dividend of £63,250 in year one, but one of only £27,000 in year five. This is of course an extreme example. Normally, there are further additions to plant year by year, and the initial allowances granted thereon hide the effects of the lower annual allowances on plant provided in earlier years. Many industrialists therefore may not appreciate what is happening until a year comes in which there are no additions, or until the law is amended to repeal the initial allowances.

What general conclusions can be drawn? In the first place it is evident that the true character of the capital allowances needs to be understood. They are not allowances for depreciation in its strict sense of capital "used up" by wear and tear. They are in fact a combination of depreciation and loan, and the loan must be repaid. Secondly, net retainable profits will be distorted unless appropriate adjustments are made in the accounts. Before this is possible the hands of the accountancy profession must be strengthened. The necessary adjustments cannot properly be made by transfers to free reserve, for they would then be merely matters of financial policy, and the resources would still be freely available. They are, on the contrary, provisions to meet accruing liabilities which must be made if true profits are to be ascertained. Thirdly, this particular aspect of the whole problem deserves close scrutiny by the Chancellor's new committee. Fourthly, it is desirable that the official view of the Treasury on the degree of permanence of the initial allowances should be ascertained. If they are merely a temporary expedient to meet the needs of an inflationary situation—until the day of reckoning, when repayment of the old loans must continue

Business Notes

The Dollar Crisis

In one immediate respect the atmosphere of crisis has lifted somewhat this week. A growing prospect has emerged (though it had not taken final shape when this issue went to press) that the difficulties which had arisen about the revision of the Intra-European Payments Agreement, and which indeed produced deadlock ten days ago at Brussels, might now be solved to the reasonable satisfaction of both sides. The differences of view, and this week's developments which have gone so far towards solving them, are described in a leading article on page 31. If the Payments Scheme had been the only factor affecting the markets, of course, there would have been every prospect of a resounding technical recovery, for the gilt-edged market can rarely have been more vulnerable to the appearance of a little good news. But this week's events elsewhere have put the question of the Payments Scheme into its proper technical context; its importance lies not in the problems of technique but in the fundamental clash of views which suggested that the problems themselves (complicated in detail but simple in essence) would not be solved.

Now the market's fears have been transmitted to these more fundamental issues. Much play has been made with unofficial estimates of the extent of gold losses during the second quarter; whether these guesses (some of which suggest that the reserve may have fallen close to £400 million, compared with the "irreducible minimum" of £500 million which was postulated a year ago) will be found to have any validity must remain unknown until the official figures are published early next week. What is important, however, is not whether the reserves have fallen by £x million or £y million, but that the fall—whatever the figure may be—is too serious to be allowed to run much further. The Government's measures to protect the reserves are plainly not working and all the signs of falling exports from the sterling area to the dollar area suggest that a further and rapid deterioration is inevitable unless speedy corrective measures are taken. The question which the market then asks itself is whether time and the remaining reserves will avail to hold the position.

It has not found a welcome answer. The meetings of the Commonwealth Finance Ministers which are to be held in London in the middle of this month have as their purpose the co-ordination of Commonwealth action to stem the depletion of the sterling area gold and dollar reserves. The arrival of the British Ambassador from Washington, closely followed by the Secretary of the United States Treasury, has inevitably sug-

gested the possibility of action with regard to the pound—and to some, at any rate, the possibility of a new American initiative to rid the western world of its financial fears, and in particular its fears about sterling. As if this were not quite sufficient for a tender market to take, this week has also produced the fell news of a go-slow campaign by the National Union of Railwaymen in pursuit of their wage claims.

In any case, while the system endures, it is desirable that the initial allowances—and also the one-fourth "additions"—should be divorced from the "appropriate" annual allowances in some way which would emphasise that they are not allowances for depreciation but deferments of tax liabilities which will ultimately have to be met. One means of achieving this end would be to charge taxation on profits arrived at after deducting only appropriate allowances for depreciation and then to defer the collection of tax equivalent to the relief given by the initial allowance and the additional one-fourth annual allowances. Such deferment would bring the realities home to directors, shareholders and accountants. The amount deferred would be set aside out of the profits of the year. Indeed, to put the position beyond doubt, post-dated demand notes might be issued, rather like inverted post-war credit certificates. They might suitably be known as post-inflation debits. But perhaps that might encourage rash hopes that the notes, like so many of the certificates, would prove a mirage.

★ ★ ★

1947 and Now

This week, then, has been spiritually akin to those weeks in August, 1947, when convertibility was being put to the test and dramatically failed. Monday was a particularly bad day, for the week-end press had not attempted to conceal its anxiety about the critical drain on the reserves, and selling persisted throughout the day. At the close of business, Consols were down 1½ to 74½, Treasury 3's by 2½ to 92, and Gas Stock 2½ to 94½. The *Financial Times* industrial ordinary share index dropped from 101.4 to 100.1, a fall in which the "blue chips" and steel shares were just as prominent as shares of lesser quality. Tuesday produced something of a rally, in which the promptness of bear covering was particularly evident, but the recovery came after a poor opening, and the biggest gains were no higher than ½ in Old Consols and Transport Stock. Leading industrials, now as sensitive as any speculative issues, shared in the recovery, which put the *Financial Times* index up to 100.9. On Wednesday, too, these conditions were roughly repeated—an opening fall, followed by some net recovery in the afternoon. Gold shares have recovered moderately well, and oil shares were better. But the market remains—with every reason—in a highly jumpy state.

To push the comparison with August, 1947, too close would ignore the fact that gilt-edged stocks, at that time, were distinctly more vulnerable than now because they still suffered from the artificial inflation of the cheap money drive. Today the question which presents itself to investors in the funds is whether the unchecked and unsupported slide of prices marks a decision of official policy to acquiesce in a general scaling up of interest rates. The yield comparisons shown in the accompanying chart do not give a final answer, for argument by analogy is never at its strongest in investment matters. But the roughly parallel course of the yield curves during the second and third quarters of 1947 and during the first two quarters of this year are enough at least to support the

hypothesis that a change of policy may be taking place. While the market remains uncertain how far the yield peg may be lifted, it is hardly to be blamed for refusing to commit itself.

All the signs suggest that it is in for a distinctly uneasy summer, even though it may be technically ripe, at this moment, for a rebound on any lifting of bad news.

* * *

The Lords Amend the Steel Bill

In assessing the results of the committee proceedings on the Steel Bill in the House of Lords, it is necessary to remember that a withdrawal by agreement may prove to have more effect on the final structure of the Bill than a Government defeat. That the Government should oppose, and be defeated on, the series of amendments designed to postpone until October 1950 the date of coming into force of the Bill, had become inevitable. Lord Salisbury explained that the proposed change would be a "thoroughly democratic course"; it would give the Government time to produce convincing economic arguments for what it was doing, and would enable it to make certain whether it had the support of the people for the measure.

Lord Samuel, who supported his arguments, added that there was "no real mandate based upon a clear expression of the popular will" in favour of the Steel Bill. It was not to be supposed that the Government would accept these arguments, and Lord Addison declared that the Government, having taken up the position that the House of Lords had no right to demand a second mandate at this stage in the life of a Parliament, stood unalterably upon it. So the first of the amendments were passed—and the remainder designed to secure the postponement will also, no doubt, have been passed by the time the committee stage ends—with the Government irrevocably committed to overturn them when the Bill goes back to the Commons. Their results are, therefore, to be sought in the electoral field rather than in any possible effects on the structure of the Bill. On this issue Lord Addison was clear and forcible; for most of the debate the Government spokesmen, seeming ill at ease and less familiar with the subject-matter of the Bill than their opponents, did not make a decided impression. Their attitude leaves in some uncertainty the probable decisions of the Government on some of the other amendments.

* * *

"Nationalisation, New Style"

Some amendments were withdrawn on an assurance that the Government would discuss their content with the Opposition. In the Commons this would mean a substantial concession; but it is uncertain sometimes whether a withdrawal by the Government light artillery in the Lords means as much.

A good deal of interest will attach to the outcome of the amendment (which was withdrawn in those circumstances) to give the publicly-owned companies a right of appeal to the Minister of Supply in the event of the Iron and Steel Corporation requiring them to do something to which their directors are, for technical or commercial reasons, opposed. Lord Swinton, who moved this amendment, described it as an attempt to reconcile the powers and duties of the Corporation with the independence and initiative of the individual companies. Lord Layton, who supported it, held that it raised a major question: the question whether it was possible, even in a nationalised industry, to retain elasticity, independence, initiative, and the internal competition which would keep the industry alive. Although this ("nationalisation, new style") was the Government's view, he thought the Bill showed no sign of it.

It is true that, as the Bill stands, the publicly-owned companies (being owned to the extent of 100 per cent by the holding company, the Board) cannot expect much freedom of action, and that anything done to define and secure their status will probably be to the good. Perhaps in this case the Government will overcome its inhibition against defining anything, which showed as clearly in the Government speeches in the Lords as it had done earlier in the Commons. The Opposition was obliged, for the most part, to seek closer definitions; the Bill is so full of latitude for authority and so empty of safeguards for the private person that this was the natural line of attack. In general, therefore, the Opposition has been applying the same principle to much matters as the selection of members for the Board, or the circumstances in which a member of the Board would lose his job, as to the definition of the powers and duties of the Corporation, or the extension (which was clearly necessary) to the producing companies of obligations laid upon the Corporation itself. It is to be supposed that the Government will insist in its turn on removing some of the innovations made by the Lords. But it is not likely to remove them all, and the Bill cannot fail to have been improved in some ways by the effort which the Lords have expended on it.

* * *

Argentine Trade Agreement Signed

Last Monday saw the successful conclusion of the prolonged trade negotiations of Sir John Balfour and his team with the Argentine authorities in Buenos Aires. On Tuesday, Sir Stafford Cripps gave the House of Commons a preliminary view of the agreement, of which the full text is expected early next week. He gave it as the Government's view that "the agreement is not inconsistent either with our long-term objective of convertibility and multilateral trading or with the obligations which we have assumed in regard to third countries." Even now, the American State Department might have some difficulty in accepting that description, but the fact that the only long-term contract under the agreement is for meat appears to have removed at any rate some of the sharp edge from official American comment.

The agreement came into force yesterday and provides for a balance of payments, on a sterling basis, at the highest possible level. For the first year, exchanges totalling about £125 million each way are envisaged—which would involve rather more than doubling last year's exports, valued at £52½ million. Argentina undertakes to supply in the first year not less than 300,000 long tons of meat (beef, mutton and lamb), and will endeavour to supply 400,000 tons in each of the five years covered by the agreement. For its part, the United Kingdom undertakes to buy up to 600,000 tons of carcass meat and 40,000 tons of canned meat if Argentina can supply them, and to buy additional quantities of pig meat up to 10 per cent of the quantity of beef, mutton and lamb supplied. The average price for all types of carcass meat has been fixed for the first year at £97.536 per long ton (that is, £96 per short ton), and prices in subsequent years will be negotiated annually.

In ancient Babylon

BABYLONIAN clay tablets of 4,000 years ago record commercial loans made against the security of the harvest of sesame, the valuable Eastern oil-bearing plant.

Nowadays, trade in every known raw material is facilitated by the banks, whose credit facilities are based on the character, ability and experience of their friends engaged in exporting or importing.

Founded 1771 Manchester, London & Branches

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA
(Incorporated by Royal Charter 1853)

HEAD OFFICE: 38, BISHOPSGATE, LONDON, E.C.2
Manchester Branch: 52, Mosley St., Manchester 2 • Liverpool Branch: 27, Derby House, Exchange Buildings, Rumbold St., Liverpool 2 • West End (London) Branch: 28, Charles II St., London, S.W.1 • New York Agency: 65, Broadway, New York
Associated Banking Institution in India: The Allahabad Bank Ltd.

The Bank's branch system, under British management directed from London, serves
INDIA • PAKISTAN • CEYLON • BURMA • SINGAPORE AND FEDERATION
OF MALAYA • NORTH BORNEO AND SARAWAK • INDONESIA • FRENCH
INDO-CHINA • SIAM • THE PHILIPPINE REPUBLIC • HONGKONG
CHINA • JAPAN

A New Export Effort

Other major items among Argentine exports to Britain include maize (£20 million), oil cakes and meal (£10 million), edible oils (£9,000,000), seed oils (£10 million), and hides and skins (£11.6 million). Britain has undertaken to supply coal (£8,500,000), iron and steel and manufactures thereof (£7,000,000), transport equipment (£25 million), machinery and tractors (£14 million), cotton piece goods (£4,800,000), woollen and worsted yarns and manufactures (£4,000,000), chemicals (£5,700,000), electrical goods (£4,900,000), pottery and glass (£3,200,000) and cutlery and hardware (£2,400,000). Comparison of these projected figures for exports with the actual values last year, as shown in the accompanying table, illustrates the degree of effort which will be required from British exporters; these are totals which each side has agreed to "facilitate," and their realisation depends upon agreement about prices and qualities, and the successful conduct of trade through normal channels.

ARGENTINE AGREEMENT

	1947		1948	
	Quantities '000 tons	Value £'000's	Quantities '000 tons	Value £'000's
Total exports	...	34,801	...	52,541
of which:—				
Coal	...	...	943	3,755
Pottery, etc.	...	949	...	1,737
Iron and steel and its manufactures	83	3,453	108	5,267
Non-ferrous metals and its manufactures	...	672	...	1,161
Cutlery, hardware	...	973	...	1,772
Electrical goods	...	1,346	...	2,796
Machinery	19	5,310	30	8,949
Cotton yarns and manufactures	...	300	...	409
Woollen and worsted manufactures	...	1,360	...	1,860
Chemicals	...	2,450	...	3,551
Paper, cardboard	59 (a)	583	113 (a)	1,040
Vehicles (including ships, locomotives and aircraft)	...	11,778	...	13,103
Miscellaneous manufactures	...	1,350	...	2,268

(a) In thousand cwt.

The arrangements about oil are of particular importance, in view of the American criticisms of the agreement. In the first year of the agreement, the United Kingdom will do all that it can to ensure that Argentina is supplied with 1,800,000 tons of crude oil, 3,750,000 tons of fuel oil, and 250,000 tons of oil products. These quantities will be furnished by British oil companies and their associated concerns at current prices, but there is no undertaking on the part of the Argentine Government that it will purchase oil to these amounts, and it can, if it desires, purchase oil from other sources.

According to a statement issued by the British Treasury, the agreement includes the normal sterling payments agreement clauses continuing the provisions for the maintenance of the sterling-dollar cross rate and the settlement in sterling of payments between residents of Argentina and the sterling area. A guarantee of Argentine balances is given for sterling acquired during the next twelve months. In all the circumstances, the new agreement is to be welcomed. It means an appreciable increase in the cost of meat which, according to the Chancellor, "will be dealt with as was stated in the Budget, in regard to subsidies"—in other words, will be passed on to the consumer. Secondly, it involves a considerable export effort from British industry, though it is hoped that the United Kingdom's capacity for export to hard currency markets will not be impaired.

Investment and Finance

FCI's More Active Year

The Finance Corporation for Industry has cast its net far wider than the four industries—iron and steel, cotton, railways and coal—which were originally expected to provide its main sphere of activities. Two of these industries have passed to the State, a third is being prepared for a similar fate, and the fourth, so far as is known, has not yet sought assistance from the FCI. The year to March 31, 1949, was the most active

since FCI was formed—at least if measured by the increase in its advances to industry in the form of "loans and participations." These, at £10,969,029, have more than doubled in the course of the year. This description of the advances in the accounts takes the place of the former division into debentures, secured loans, etc., which the chairman, Lord Bruce, considers misleading. The destination of these loans is not known in precise detail. But it may be presumed that advances to the Steel Company of Wales, which formed the greater part of FCI's commitment of £41,275,750 for further loans at March 31, 1948, have accounted for a substantial part of the increase.

In this twilight stage of steel nationalisation, the FCI has been able to fill a particularly difficult gap. Private capital has obviously not been prepared to venture very far with the Iron and Steel Bill overhanging the industry. Clause 14 of the Bill provides an adequate safeguard for the repayment of any capital the FCI may venture in assisting the industry to carry out its postwar development schemes. Its services were in fact accepted towards the end of the year by John Lysaght's Scunthorpe Works and the chairman of the parent company, Guest, Keen and Nettlefolds, has already made it known that on March 30th this year the FCI had agreed to provide some £11 million to finance extensions to the works. At March 31, 1949, the corporation had in fact entered into loan agreements totalling £50,700,000 with companies scheduled to be taken over by the proposed Iron and Steel Corporation, but only £3,187,945 had been taken up by that date. But there have been other avenues of investment. FCI believes that its participation in Petrochemicals has promising possibilities. The report shows a net profit of £65,082 compared with a loss of £3,408 in 1947-48. No heavy losses have had to be written off in the past year, whereas £90,000 had to be written off an investment in 1947-48. It is to be noted, however, that it is not the intention to show particular amounts written off investments in future years.

Gas Stock Valuations

The list of 154 prices for "unvalued" gas securities issued this week is chiefly important because it includes securities of companies which availed themselves of the war damage clause of the Gas Act. As the accompanying table shows, in the case of the quoted securities of South Metropolitan Gas and South Suburban Gas, the additional compensation which has been awarded to cover the reduction of earnings—and hence of market values—resulting from war damage is worth having, but it is unfortunate that in the process of waiting it has lost a good deal of its bloom.

It has been argued that a holder who received British Gas Stock 1990-95 at par could, two months ago, have sold his compensation stock above par. All compensation to all holders of

VALUATIONS AND GAS SECURITIES

Stock: and Par Value	Nominal Compensation Stock Allotted	Market Value June 27, 1949	Valuation Less War Damage Element
South Metropolitan Gas:—	£	£	£
8 per cent. pref. (£100)	134	127½	129½
4 per cent. pref. (£100)	102½	98	102½
Ordinary (£100)	118	103½	92½
South Suburban Gas:—			
5 per cent. pref. (£100)	115	112½	114½
4 per cent. pref. (£100)	102½	97½	101½
3½ per cent. red. pref. (£100)	101½	95½	97½
Ordinary (£100)	122½	116½	118½

the securities of the nationalised gas companies whether "valued" or "unvalued" is based on the issue of gas stock at par. But until this week, holders of "unvalued" securities have not known exactly what nominal amounts of Gas Stock they were to receive. And in the meantime, the price—which

touched 1½ premium a few days after the first issue—relapsed at one time this week to 93½ and now stands only a point higher.

It may be argued that, confronted with the delay in fixing the compensation values for these stocks, a potential holder could have covered himself by selling a bear on vesting day corresponding to the size of his holding. But that is not an argument which would count in the case of the many small holders of unvalued gas stocks to whom the Stock Exchange zoo is something of a mystery. Apart from this method there appears to be no way of avoiding the loss of capital involved, for in effect all holders of "unvalued" gas securities since vesting day have been at the mercy of fluctuations in the gilt-edged market. It was particularly unfortunate that for this batch of holders, Gas Stock slumped to a new low level on the day before the announcement of the compensation prices to be paid for their securities.

New Stock Exchange Chairman

The succession of Mr J. B. Braithwaite as the new chairman of the Stock Exchange Council had been generally expected. As senior deputy chairman during Mr Urrling Clark's period of office, Mr Braithwaite has worked most actively in Stock Exchange government during a period of eventful change. His part in the controversy about commission sharing is recent in Stock Exchange memory, and it reflected the new chairman's characteristic qualities of determination and forcefulness. Mr Braithwaite will be served by two highly-esteemed deputies—Mr F. H. Doran, already experienced in his duties, and Mr R. H. Twining, who was newly-elected last Monday. The Stock Exchange will need the best of which the new chairman and his deputies are capable, and it is fortunate that such ability has been assembled in the chairman's room at so difficult a phase in the affairs of the "House."

Iran Penalises British Bank

At the request of the Iranian Government the Imperial Bank of Iran has deleted the word Imperial from its title and renamed itself the British Bank of Iran and the Middle East. This change marks the end of the sixty-year concession which granted the bank numerous trading privileges in Iran. At one time the bank had a monopoly of banking, control of the note issues and freedom from all taxes, but most of these advantages lapsed in the course of years. The termination of the concession reflects a long accumulation of local jealousy of the Imperial Bank. Relations with the Bank Melli Iran, founded in 1932, have at times been very strained. Furthered by official support, the Bank Melli has encroached upon its competitor, and now combines active commercial banking with the sole right to issue notes. Now that the concession has lapsed, the Government has taken the opportunity to impose upon all foreign banks operating in Iran an obligation to maintain with the Bank Melli Iran, without interest, no less than 55 per cent of their public deposits. This is a penal measure of aggressive nationalisation, not a mere device of banking control. In his statement for the annual meeting of the Imperial Bank—which in practice is the only bank affected—Lord Kennet discloses that, to comply with the new requirements, the bank's capital in Iran has had to be increased "substantially." A transfer guarantee has, however, been obtained under which the entire capital can be repatriated on six months' notice, at the rate of exchange at which the additional capital was transferred to Iran.

While the bank leaves no doubt that it means to continue to trade in Iran, it has in recent years curtailed its activities there. Indeed, the number of its branches in other Middle East countries is now almost equal to the reduced number now open in Iran. In particular, the high level of economic activity

on the Persian Gulf has made that region of increasing importance to the bank. In addition to the branches at Kuwait, Bahrain and Dubai, a new branch has been opened at Muscat. It is perhaps revealing of conditions in the Middle East that in 1948-49 banking business in Syria and the Lebanon has improved as the outcome of new local regulations which are at last taking the foreign exchange business from the bazaars back into the banks. Yet trading conditions, and in particular foreign exchange regulations, call for a high degree of vigilance. Local exchange controls, making the free transfer of funds between countries difficult, have increased the reserves which need to be kept in each area.

Chinese Banks and the Communists

Evidence is accumulating that the Communist authorities in China are attempting to extend their economic influence behind the battle lines. Having, with the fall of Shanghai, taken over the head office buildings of the Chinese government banks, the Communist authorities have made a first attempt to dictate to bank branches in Nationalist China. The Communist-controlled former head office of the Bank of China recently sent a "directive" to branches abroad and in unoccupied territory requesting that they should sever all business links with the Kuomintang. But last April the Bank of China, in common with other government banks, had anticipated the fall of Shanghai and had transferred its head office staff, specie and foreign exchange holdings to Canton, the present seat of the Government, establishing a new head office there. The leading government banks (that is, those in which the Government is majority shareholder) are—besides the Bank of China—the Central Bank of China, Farmers' Bank and the Bank of Communications. This is not the first time that these banks have had to move their head offices. Theoretically, all branches are now answerable to the new headquarters, but in practice effective control can be exercised only over branches in unoccupied territory.

The Bank of China—to which alone a Communist directive of this kind has so far been addressed—is the only government bank with a foreign trade charter and branches, nineteen in all, abroad. The offices of this bank in unoccupied territory are ignoring the instruction from Shanghai, and will continue to take their orders from their legal head office, now in Canton. But the position of the foreign branches, at any rate, may become somewhat equivocal when communications between Shanghai, Tientsin and the outside world are properly re-established, enabling more normal trade relations to be resumed.

Recorded and Indexed.....

To record and index the documents and events of the week: this is the function of the records section of RECORDS AND STATISTICS. For example, last week's issue contained the decisions of the Council of Foreign Ministers in Paris, and summaries of the reports of the National Coal Board and of the Royal Commission on Population; in this week's issue is a summary of the report of the Royal Commission on the Press.

The documents, events, and statistics recorded are all entered in the monthly cumulative index.

A specimen copy of Records and Statistics may be obtained from—

R. & S. Dept., The Economist, 22 Ryder Street, S.W.1.

Second Thoughts in the Capital Market

The relapse in the share markets has dealt hardly with several of the recently outlined schemes for raising new capital. Calculations of issue terms have been thrown sadly out of gear for Guest, Keen and Nettlefolds, Babcock and Wilcox and Liebig's Extract. These three companies announced the terms of big new issues at the end of last week, when the industrial share market was deep in the doldrums. A month ago, when the programme to raise £4,500,000 of new capital was first disclosed, Guest, Keen and Nettlefold's £1 ordinary shares were firm at 48s. Admittedly, the heavy borrowing from the Finance Corporation of Industry for extensions to John Lysaghts Scunthorpe Works was a factor which affected the equity of the parent company, but the market setback has taken the price of the shares down to 37s. 6d.—the very price at which shareholders are offered 2,256,630 £1 ordinary shares, at the rate of one in four. Thus any bonus element in the issue has been eliminated, and this is bound to affect its chances of complete success, quite apart from the other uncertainties of trade prospects and nationalisation. The offer of 716,609 new £1 ordinary shares at 57s. 6d. to ordinary stockholders of Babcock and Wilcox has been similarly affected by falling markets. The old shares have fallen to 57s., so that in this case there is the offsetting advantage of merely a part of the stamp and fee to attract shareholders.

Both these companies are concurrently to make new issues, of preference shares. This class of capital has recently had its own particular troubles. In the recently rejected appeal of colliery preference shareholders in the Wilsons & Clyde Coal case, Lord Maugham's overruling of the judgment *In re William Metcalfe & Sons* has prompted many second thoughts on the rights of preference shareholders to surplus assets in a winding up. Again, the rumoured issue of £20 million 4 per cent preference stock by Imperial Tobacco had an immediate adverse effect on all grades of preference shares, particularly high grade issues in which it has been very difficult to deal in the past few weeks. The "Imps" issue has now apparently been shelved for the time being, but its shadow will linger, and it is questionable whether any big revival in preference issues will be possible while it so remains.

The slide in gilt-edged values has imparted weakness to the whole structure of fixed interest yields. It is little wonder that a proportion of three recent issues has been left with the underwriters. Of the issue of 400,000 4½ per cent cumulative £1 preference shares of Associated Fisheries at 21s. a share, some 67 per cent had to be taken up by underwriters. This week 9 per cent of the Trinidad Petroleum issue of 5½ per cent redeemable £1 preference shares and 32 per cent of the 5½ per cent cumulative preference shares of Arthur & Co. was left with the underwriters. These poor results are enough to discourage any immediate revival of new issue activity.

* * *

Bank Advances and New Issues

There is little sign, in the latest quarterly classification of bank advances, that the growing difficulties of securing finance through the new issue market are yet leading to any large increase in demands for accommodation at the banks. Nor do the figures suggest that much bank finance has been needed to provide for the stocks which must be presumed to be accumulating through "frustration" of exports. Total bank advances in Great Britain increased between February and May by £26½ million, which is an appreciably smaller increase than the £44 million experienced in the corresponding quarter of 1948. This difference, however, must have been more than accounted for by the repayments, totalling some £13 million, made early in May by the Gas Council of advances formerly made to the now nationalised gas undertakings. Despite these large repayments, total advances to public utility undertakings declined during the quarter by only £5,500,000, which suggests

that the requirements for electrical development have again been rising steeply.

The largest increase during the quarter has occurred in the food, drink and tobacco group, which has risen by £22 million, probably mainly in consequence of rising demands for financing tobacco stocks. Agricultural needs have expanded seasonally by £7,500,000, while retail trade has absorbed an additional £5,000,000. Advances to retailers now stand at £158 million, which is fully 2½ times their level at the beginning of 1946, the date of the first postwar analysis of advances; they account for 10.6 per cent of the aggregate advances and, apart from the heterogeneous "personal and professional" group, are the largest of the twenty-five categories. Additional demands for personal and professional purposes have this time been rather larger than usual, absorbing £13 million. The only other significant increase is one of nearly £9,000,000 in the "other finance" group—a movement which could and probably does reflect the recent experience in the new issue market. Under most of the other heads, there has been a decline in net demands for accommodation. Local authorities have made net repayments of £10 million, while the engineering group showed its first decline for the full three-year period, dropping by £7,600,000 to £114.8 million; this reduces its proportion to 7 per cent. There has also been a significant contraction in demands in each of the three textile categories

* * *

South Africa's Premium Gold Sales

Despite his earlier differences with the International Monetary Fund, Mr Havenga is plainly determined to push forward energetically with his plans for selling semi-processed or fabricated gold at premium prices. At this week's annual meeting of the Transvaal Chamber of Mines, Mr C. S. McLean, the retiring president, detailed a number of transactions which have been arranged or are under negotiation, involving some 620,000 ounces. The newly-formed South African company, S. A. Goldware (Proprietary) is to be operated by a London firm of bullion dealers which is to set up a factory in the Union to produce gold articles for export. When the factory is ready—which it evidently will not be for some months at least—the Chamber will supply it with gold up to 250,000 fine ounces at 17s. 6d. premium. Another company has been given an option to buy a maximum of 350,000 fine ounces at the same price before February, 1951, while other negotiations are proceeding involving a further 150,000 ounces. In addition, 20,000 ounces of gold articles are to be manufactured experimentally on behalf of gold producers.

To develop fabricating capacity of this extent is no small task, yet, by comparison with South Africa's gold output, the amounts involved are very small. Even if the whole of this processed or fabricated gold could be sold within a year on these terms, the premium would be equivalent to little more than one-half of one per cent of the aggregate value of South Africa's whole output at parity price. Mr McLean declared that South Africa fully approved the objectives of the IMF in its policy towards premium sales; but it seems evident that if the IMF is prepared to countenance these South African expedients, that is chiefly because their amount is small. No matter what safeguards are introduced, and no matter into what form the gold is fabricated, any large-scale traffic would inevitably have exchange consequences at variance with IMF policy.

Industry and Trade

Redeployment in the Cotton Commission

To endure criticism is the lot of public bodies. The Raw Cotton Commission, which has indeed been no exception in this respect, complains in its first annual report that it has been "widely and unjustly blamed for shortcomings wholly outside its control." The shortcomings of cotton supply have

July

July is the month when the farmer surveys his crops and prospects. But in all seasons the farmer can turn to his bank for counsel and help in the day-to-day financial transactions of this basic yet ever changing industry. The Midland Bank, so closely interested in agricultural conditions throughout England and Wales, offers the farmer a complete banking service.

MIDLAND BANK LIMITED

been flagrant, but it is true that there is a distinction to be made. As the commission in effect points out, the world has lately been a sadly uneconomic place. The shortage of dollars has diverted demand to Egyptian and other non-dollar growths of cotton, causing a rise in their prices out of all proportion to their merits; this reflects "the division of the world into hard and soft currency areas." The commission itself has been forced to engage in the competition for non-dollar growths; at one time in 1948 it was even buying Karnak from Russian holdings which were being offered on the Continent through the satellite countries; and, as it points out, "the sensitive fluctuations of demand in relation to price cannot easily be adjusted to the availability of foreign currencies."

From these distracting and confusing conditions of the world and the British economy it is not easy to disentangle the specific questions which have been generally asked concerning the commission itself. Is it possible for a single national buying agency to operate economically for an industry of this kind, and—if it is possible—is the commission going the right way to do it? It would be idle to look for conclusive evidence in the report, which covers no more than the first seven months of 1948 and which has taken an unconscionable time to prepare and publish. It can, however, be recorded that the commission shows awareness of the drawbacks of the service which it has so far been able to give, and awareness too of the necessity of performing, as soon as it can, a fully economic function. It inherited something of the crude and simple buying methods of the war years, and was aware that these would not serve to keep the cotton textile industry in business. Before attempting a full reorganisation, it took the unconventional step of procuring a report from a firm of industrial consultants on its own structure and methods of work; and it accepted their advice "with only minor modifications."

The report shows a welcome sensitivity on questions of quality. The step of establishing standard types of Egyptian cotton, which are available to spinners and on the basis of which buying in Alexandria is being done, is one example. Another is the effort made—though so far without full success—to create adequate sampling arrangements in Liverpool and Manchester. The provision of a hedge against price fluctuations (such as the Liverpool cotton futures market furnished before the war) is another of the more intractable tasks. The report anticipates this year's proceedings to the extent of saying that negotiations for a new cover scheme for spinners, which is to provide for the reintroduction of "on call" and "delivery" contracts, are now well advanced; and cover arrangements for doublers, manufacturers, and converters are under discussion with the relevant trade organisations. The commission shows a net profit of just over £1,000,000 in its first trading period. But this was earned in a period of steeply rising prices, and the handsome surplus shown by the cover scheme in the first few months can hardly recur.

* * *

Fuel for Jet Aircraft

On Monday Mr Erroll asked the Minister of Supply in the House of Commons why experiments were being carried out to adapt jet aircraft to burn petrol instead of vapourising oil (kerosene, their normal fuel). He also wanted to know if there was any link between the experiments and "the growing shortage of kerosene, which farmers are compelled to use because of the tax on petrol." Mr Strauss's answer was:

These experiments are being made so that our jet aircraft shall not be dependent upon one particular type of fuel.

They were not necessarily, he added, a sign of a kerosene shortage, but "it is obviously desirable to see whether any other fuels can be effectively used." The position is not quite so simple. It is clear that any future air force will consist largely, if not entirely, of jet-engined aircraft, whether bombers, fighters or transports. How can the fuel supplies of such an air

force be assured? When crude oil is refined, the kerosene obtained is at the most 8 per cent of the volume of crude. The strategic argument is clear: there is no immediate prospect of supplying enough kerosene to fuel a military air force in war. Therefore aircraft must be able to use an alternative fuel which can be obtained in larger quantities. In the United States new jet aircraft are being designed to burn petrol only, and most of the existing jet aircraft are being converted to it. The reason is the same; indeed, heavy seasonal demands for kerosene have caused severe shortages. If a similar policy were to be adopted here, aircraft designers would not be easily reconciled to it. Since aviation started, their ideal has been to design an engine to burn a fuel other than petrol and reduce fire hazards. Jet aircraft burning kerosene have been known to crash at 200 m.p.h. without catching fire.

Petrol also introduces its own technical complications. The rapid rate of climb of jet aircraft causes it to boil in the fuel tanks. The tanks must therefore be pressurised to insulate the fuel from atmospheric pressure changes; alternatively, some means must be found to enable the fuel pumps to handle boiling fluid. On the larger aircraft, e.g. bombers, the tanks may have to be pressurised, and the increased weight will reduce either the range or the bomb load. These tanks will have to be moved from the wings to the body of the aircraft. But it is unlikely that fighters can be fitted with similar tanks, and the resultant pumping problems present serious engineering difficulties. Range is also likely to be restricted because the lower calorific value of the petrol makes it necessary to carry a greater volume of fuel. It is calculated that the net effect of petrol burning will be a 15 per cent drop in efficiency.

The question is a technical one which it is not easy for the outside observer fully to assess. But one aspect which strikes him is that petrol taxation, which encourages users of agricultural tractors and others to burn kerosene for purposes for which petrol would be best, is becoming further outmoded by these technological changes. Even in aviation it introduces the anomaly that a piston-engined aircraft burning petrol is paying 9d. a gallon tax on motor spirit, while a jet-engined aircraft burns an untaxed fuel. The distinction which taxes motor spirit and leaves kerosene untaxed must have been based, at one time, on an assumption that the heavier fractions of crude oil were harder to market than motor spirit. With the development of jet aircraft, this assumption no longer holds. It may well be true that there is no prospect of large enough supplies of kerosene to meet all possible military demands. But the demands of civil flying will soon make necessary a new approach to fuel taxation.

Cargo Insurance Rates Merged

Notice was given some five weeks ago to terminate on June 30th the wartime system of separately quoting "Combined Marine Surcharges" (CMS) over and above basic insurance rates charged on cargo risks. Thus this week the two rates were merged into one rate only. All existing contracts were cancelled but have been automatically reinstated at the same cost, made up from the aggregate of the combined rates. The rates laid down in the CMS schedules, started in 1943, while not strictly binding, have always been carefully adhered to by the marine market. The surcharges were introduced originally to cover underwriters against increased marine risks arising out of the war, but not classifiable as purely war risks compulsorily covered with the Government Cargo War Risks Office. Risks falling under this head have included the cover of cargo losses arising from collisions with wrecks, longer journeys necessitated by wartime detours, extinction of navigation lights—in fact, any proper marine risk increased by war conditions. Not all these risks ceased at the end of the war. To meet the changed requirements of peacetime conditions the CMS schedules have been simplified and lowered several times since the

war without, however, invalidating the principle of charging two separate rates.

The uniform adoption of CMS rates since 1940 has not meant that all underwriters have quoted identical rates. The basic rates could always be varied, and it has been quite common for underwriters to charge different basic rates for similar cargo risks. But the basic rate element in the cost of marine insurance has generally been substantially smaller than the portion made up from combined marine surcharges. It remains to be seen whether, now that the two rates are merged, quotations for new insurances affected will fall. Competition among underwriters is sure to become much keener now that they will be able to spread the burden of any cuts made between the combination of two rates rather than by lowering the basic charge only. The market, while anticipating some rate-cutting by underwriters in an effort to increase business, does not, however, expect, any drastic reductions.

Chocolate Economics

In publishing their consolidated accounts for the first time (briefly analysed on page 54), the British Cocoa and Chocolate Company and Cadbury Brothers Limited have also issued a booklet reviewing their experience of the last ten years. The review goes some way towards explaining the queues at the sweet shops today. It mentions the high prewar consumption per head (between 7 and 7½ ounces a week) in Britain. It emphasises the shrunken supplies of materials and the other obstacles that stand between the manufacturer and his desire to meet the demands of his market. First among these is the "virtual disappearance" of fresh full-cream milk from among the raw materials of the chocolate trade. In 1938 the group's most important single product, by volume of sales, was a two-ounce milk chocolate bar which cost twopence. In 1948 the same bar cost 5½d. to those fortunate enough to catch one on the wing; but these were few, for the group's

consumption of fresh full-cream milk, which was 26 million gallons a year before the war, is now restricted to about 2 million gallons a year even with the new Irish factory, using Irish milk, included.

For lack of milk, the group cannot supply what would be the public's first choice of its products; but the matter does not end there. Dark (i.e. plain) chocolate has to be provided instead, but this introduces complications. Much of the plant is unsuited to making dark chocolate, and has to stand idle while the remaining plant works two or three shifts. This has raised labour costs. Work formerly done by girls on day shift is now done by men on night shift.

Dark chocolate has the further disadvantage that it requires more cocoa beans than milk chocolate. The increase in

the price of cocoa beans since the war has been "staggering"; and supplies have shrunk. The accompanying chart shows the scale of the price movements. To make the best use of the materials available, the makers have had to shift much of their production to "assortments." But this is a more elaborate matter than making simple chocolate bars, and 3½ times more costly in labour: that is, in the time taken by nine workers to make a ton of "assorted" chocolates, 2½ workers could make a ton of chocolate in moulded blocks.

It is clear enough, in the circumstances, that not only raw material costs but also labour costs have gone up very steeply. The review complains further that, under the twin control of the Ministry of Food and the Treasury, the group has had to take the materials allocated to it in fixed quantities, whenever the goods were available, and in whatever quantities were offered. The consequential changes in recipes necessitate "continual changes in employment" which irritate the worker and raise the manufacturer's costs. It follows that production "must continue to fall substantially behind the public's demand for variety as well as quantity."

* * *

Television and the Film Trade

The conflicting interests of the B.B.C. and the film industry in television will not prove easy to reconcile; but a speech by Mr Walter Fuller, general secretary of the Cinematograph Exhibitors' Association, this week suggested that at least some clarification of the issues at stake was on the way. Mr Fuller recalled that the film trade had urged upon the Advisory Committee on Television the desire of the trade to secure a wavelength on which it could transmit films from a studio of its own for large-screen television, to be seen by the public in cinema theatres. The B.B.C. had opposed this, and so far "very little progress" had been made with the request. But the request has not been abandoned, and will be one of the first points put forward by the film trade to the Committee of Enquiry into the renewal of the charter of the B.B.C. Mr Fuller observed that one reason for the opposition which the B.B.C. offered to the proposal was that "the B.B.C. appeared to look to cinemas to take the public service television, which would in time provide it with considerable revenue." In fact, it is fair to assume that the B.B.C. is merely resisting the thin end of the wedge.

On the other hand, the B.B.C. has shown anxiety to get a supply of films for its own transmissions, to be seen by the owners of television sets in their homes. Here the film trade is in a position to do the refusing; but the film trade is handicapped by its own relative disunity, and Mr Fuller dropped a plain hint that if it refused to make any arrangement at all with the B.B.C. it would find that individual interests would compromise and break the "present solidarity." It is worth while to note the kind of arrangement which Mr Fuller has in mind: it is that films of more than a certain age (he mentioned films made before 1939, but indicated that the date might be variable) should be made available to the B.B.C. for an experimental year. If, at the end of that year, the trade had not gained permission to run its own studio for large-screen television, he suggested that the supply of films should be withdrawn. But, in any case, he was not thinking of any supply of new, or recent, films to the B.B.C.; "all sections of the trade are fully determined not to supply films within their own (i.e., the films') commercial life."

Shorter Note

A meeting is being arranged to take place in London later this month between representatives of the Colonial Office, British South Africa Company and Northern Rhodesia to discuss the question of "Chartered's" mineral rights in Northern Rhodesia. The proposal to tax these royalties placed before the Legislative Council of the colony earlier this year has been withdrawn.

MARKS AND SPENCER LIMITED

SUBSTANTIAL INCREASE IN TURNOVER

RISE IN PROFITS

SIGNS OF NEW INFLATIONARY TREND

SIR SIMON MARKS'S REVIEW

The twenty-third ordinary general meeting of Marks and Spencer, Limited, was held on June 23rd at Michael House, Baker Street, London, W.

Sir Simon Marks, D.Sc. (chairman and joint managing director), who presided, said: Ladies and gentlemen,—I hope that, in accordance with our customary practice, the directors' report and accounts, which have been in your hands for the requisite period of 21 days, may be taken as read.

There are changes in their presentation this year, which conform with the requirements of the Companies Act of 1948. There is, in addition, a statement of interests of your company in its wholly owned subsidiaries.

PROFIT AND LOSS ACCOUNT

I am pleased to report the profit for the year, before providing for taxation, amounts to £4,193,000, compared with £3,169,000 last year. Provision for taxation, amounting to £2,350,000, is required, leaving £1,843,000, against £1,319,000.

We recommend the allocation of £50,000 to the staff benevolent and pensions fund. We also recommend a final dividend of 45 per cent. on the ordinary and "A" ordinary shares, making with the interim dividend of 15 per cent. already paid, 60 per cent. for the year. The carry-forward to next year will then amount to £2,594,000—an increase of £1,018,000.

PROPOSED BONUS ISSUE

We are also proposing that an amount of £49,168 10s be capitalised out of the general reserve of the company to enable the distribution, by way of bonus, to the ordinary and "A" ordinary shareholders of fully paid "A" ordinary shares in the proportion of one for every 43 ordinary and/or "A" ordinary shares held at May 14th.

We have taken the opportunity to issue a scrip bonus within the limits freely permitted by the Treasury. It was our practice before the war to issue bonus shares each year from the profits retained in the business. This helped to bring our nominal capital into somewhat closer relationship to the real capital employed, and with the profits earned by the resulting expansion. Since 1939, when this practice was discontinued, there has been ploughed back a sum of £3,858,000, which forms part of our revenue reserves, and is available for development.

DEPRECIATION AND REPAIRS

The amounts under this heading are larger than last year and will continue to be on a heavy scale if we are to maintain our properties, fixtures and equipment in good condition. The repairs, in particular, are heavy, as there is a great deal of wear and tear of many years to be made good owing to the enforced lack of attention during and since the war.

So far as buildings are concerned, we are carrying out as much work as possible under the limited licences which are available. In regard to our fixtures and equipment, which have been in use for many years, we have to recondition or replace them as they become obsolete. It is our policy to maintain our properties in good order and our stores up to date and generally attractive.

RESERVES AND SURPLUS

It will be noted that reserves and surplus now appear as capital and revenue reserves. Our general reserve is divided between the share premium account of £907,000, representing premiums received on the shares issued in former years, and the general reserve account of £2,393,000, built up out of profits. Altogether, with specific reserves of £566,000, also built up out of profits, and the balance carried forward of £2,594,000, the capital and revenue reserves amount to £6,460,000.

Taxation is also shown in a different form in the present balance-sheet. Future income-tax assessable 1949-50, amounting to £1,576,000, is shown as a reserve and not included among the current liabilities and provisions as last year. Current taxation of £896,000 includes £675,000 for profits tax on this year's profits, and £221,000 for the balance of our income-tax liability to 1948-49, which has still to be finally determined.

SUBSIDIARY COMPANIES

Advances to our subsidiary companies show an increase of £536,000 to £804,000 which moneys are required for the financing of cloth handled by them on our account.

The statement of interests in subsidiary companies shows a surplus of assets of £86,000 and is not included in the reserves of the parent company.

BOARD'S POLICY

The rise in profits is due to a substantial increase in turnover. Our policy has always been to bring to the public the goods they need at prices which fit their purse. It has earned for us their confidence and good will. Such intangible assets cannot be assessed too highly. They are the strong foundation on which our business rests. Wherever and whenever we can, by more efficient methods, create improvements in our goods or lower prices, our customers receive the direct benefits which they appreciate.

Our trade-mark, St. Michael, is a guarantee of our standards of value and has become a well-known brand throughout the land. In achieving these standards we enjoy the close and friendly collaboration of our producers, who are fully in accord with our policy. We extend our co-operation to the technical field, where our own teams of scientists and specialists work jointly with the experts of our suppliers. The object is to study how and where our goods can still be improved.

Obviously, the full benefits of this work cannot be derived until more materials are available. Without a proper flow we cannot derive the full advantages of the manufacturing capacities of our suppliers of garments.

Although production in most of our departments expanded we felt the shortages most acutely in our supplies of woven materials, which are made up into garments of all kinds. It was in an effort to increase these supplies that we deemed it necessary to enter into closer relationship with some of our friends in the textile industry. We consequently acquired a financial participation in their businesses, our trade investments increasing by £895,000. These investments will bring us the benefits of increased supplies and of

continuity over a period of years from these sources.

LONG-TERM SUPPLY ARRANGEMENTS

We have further made long-term supply arrangements with other textile producers in whose firms we have no financial interest and with whom we have had long and pleasant business associations. They appreciate the importance of securing a stable market for a substantial proportion of their production in difficult as well as in good times.

But even with the arrangements already made, we estimate that we shall receive, during the coming year, less than one-half of the yardage we consumed in 1939. This is a marked increase on last year but there remains a big gap to be filled before we can satisfy the pressing needs of this section of our business.

We operate our business largely within the framework of the utility scheme which serves a useful purpose by keeping prices on a reasonable level. But it acts as a bar to technical progress in the production of improved cloths for the home market. We hope that it will not be too long before a greater measure of flexibility is permitted within the scheme so that our public may benefit from the scientific and technical developments which have been made in the last decade.

DEVELOPMENT OF CAFETERIAS

We are gratified with the development of our cafeterias and our food business generally, which together constitute nearly one-third of our turnover. I believe our success in this field is due to our concern with the setting and the maintenance of high standards of quality for all foodstuffs we handle, as well as our insistence on their freshness and palatability. Raw materials, and final products are subjected to careful analysis by our experts to make certain that they conform with those standards.

We attach the greatest importance to hygiene and cleanliness in the handling of food and our staff is deeply conscious of their responsibility to the public in this regard. This is a feature much appreciated and favourably commented on by our customers.

EXPORTS

Our export trade, though it plays a relatively minor role in our business, we regard as a service to the nation as well as to our manufacturers. In the quest for business, our representatives have travelled to many countries, to Australia and New Zealand, to Canada and the United States and to the Continent of Europe, in order to gain closer contact with our customers overseas, and to discover their needs in the light of our own production.

While our own exports have expanded in the past year, we are facing increasing difficulties, particularly in the hard currency markets; price resistance in these areas is growing.

There are signs that a new inflationary trend may be developing. Many groups of workers are bringing insistent claims for higher wages. Unless these increases are accompanied by higher and more efficient production they must again be followed by rising costs and rising prices. Any attempt to raise prices in the home market in order to cover price reductions for export would intensify this inflationary trend. It is very necessary to find means of reducing prices not only for export but also for the home market. This demands a contribution by all the partners in the productive effort—from the Government (which is responsible for certain raw materials), management and labour—throughout all the stages of production. It can be achieved not by one partner alone but by all the partners in combination.

Higher money wages without higher production prevent this from being done, because of the impact on costs. The standards

of living of the mass of the people can be raised only by increased productivity. This will express itself in lower prices and better values, making wages and salaries real instead of illusory.

TRIBUTE TO MANUFACTURERS

I have, in the course of my address, paid tribute to the valuable co-operation which we enjoy with our manufacturers. It is once again my pleasure, on behalf of the board, to thank them and to express the hope that our future relations will continue to be marked by the same spirit of cordiality.

STORE DEVELOPMENTS

There is little we can report on this aspect of our business. The rebuilding of the 16 stores destroyed by enemy action still awaits the final schemes of the various Town Planning Authorities. We have, however, replaced ten of them with temporary premises, but these compare neither in size nor importance with the original stores.

We now operate 229 stores and will open two new stores during the year. We have acquired a number of sites adjacent to existing stores for future extension.

We have catering units in 109 stores. 74 have been reconstructed, re-equipped and generally modernised during the past two years. Plans are in hand to deal with the remainder.

SOCIAL AND WELFARE ACTIVITIES

Our business rests on the goodwill of our public, on our friendly collaboration with our manufacturers and last, but not least, on our devoted staff.

For many years the health and the comfort of our staff have been among the many concerns of your board. By providing canteens, rest-rooms, medical and dental advice and other amenities, we have sought to create pleasant and healthful conditions of work.

Our welfare department has initiated a wide range of social and recreational activities. They comprise theatrical and musical societies, inter-store dances and sports meetings, camera clubs and the like. These activities bring members of our staff together from different towns and districts. In this way they extend their circle of friends as well as their interests. A pleasant atmosphere is thus created between our staff and those who captain them. We take legitimate pride in that *esprit de corps* which is generated by the work of our welfare organisation.

MEDICAL SCHEME

The National Health Service has had some effect on our own medical scheme, but the basic pattern is, as yet, unaffected. Sessional and store doctors continue to give a welcome counselling service. On the other hand, the National Dental Service has compelled a complete revision in the scope of our dental scheme, which now operates on a considerably reduced scale. This is a matter of some regret for us, since our dental scheme was built up carefully over many years, and had won national recognition for the excellence of its service to our staff. We trust that they will obtain equal benefit from the national service.

Our pension scheme and benevolent fund operate satisfactorily. The pension scheme includes all men employed by the company, in either managerial or clerical capacities, and provides a pension and endowment on retirement. Provision is also made for dependants in the event of death while in the service of the company.

BENEVOLENT FUND

The benevolent fund, whose assets now exceed £500,000, is administered by a joint board, composed of directors and executives of the company. The fund provides, *inter alia*, pensions for members of the staff who

are not covered by the pension scheme, and, where necessary, for their dependants. It maintains contact with all those members of the staff who have retired on pension, and gives such further assistance as they may require from time to time.

We take this opportunity of thanking the staff for their devoted services during the year.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring directors, Mr. Harry Sacher, M.A., and Mr. Norman Laski, M.A., were re-elected and the remuneration of the auditors, Messrs Deloitte, Piender, Griffiths and Company, was fixed.

A resolution was also passed approving the capitalisation and distribution of a part of the general reserve account.

The proceedings terminated with a vote of thanks to the chairman, directors and staff.

NATIONAL BANK OF NEW ZEALAND

SATISFACTORY EARNINGS

The seventy-seventh annual general meeting of the National Bank of New Zealand, Ltd. will be held in London on July 21st.

Sir Sydney Parkes, the chairman, in his circulated statement, states that the increase of £6,472,000 reflects the effect of the appreciation in the New Zealand currency and not an expansion of the total assets and liabilities in the Dominion. If the New Zealand assets and liabilities had been converted in the 1948 balance-sheet at the same exchange rate as this year, cash in hand and balances with bankers would have increased by £1,539,000. Advances would have been down by £975,000 and investments would have been lower by £891,000. On the liabilities side deposits and current accounts would have shown a decrease of £1,184,000. The reduction in advances is the result of a return of stocks in traders' hands to a more normal level. The decrease in the deposits was caused principally by heavy payments of income-tax by customers at the end of the year.

The net profit at £160,400 shows an increase of £20,900. The profit from ordinary banking operations did not increase during the year, but the profit earned in the Dominion, being converted at a more favourable exchange rate, appears in the accounts at a higher figure. The proposed final dividend is 3 per cent. (less tax at 9s. in the £), making 5 per cent. for the year.

The satisfactory earnings of the past two years have now been strengthened by the appreciation of the New Zealand exchange, but expenses are increasing and will rise still higher on account of the recent Arbitration Court award on the salaries of bank staffs.

The appreciation in the value of New Zealand currency in August, 1948, appears to have been made without general disturbance, although a few industries, the most important of which is gold mining, have suffered severely. The rigid system of exchange and import controls should enable the Government to maintain the new rate without a material reduction in the overseas balances, but since wage rates are still increasing and the internal supply of money has not been reduced, an increase in inflationary pressures is to be expected.

Business conditions in the Dominion have continued to be satisfactory, but purchasers are showing more discrimination. The season for primary production has been excellent, and it is expected that exports of butterfat and meat will be higher than last season. Wool prices are higher than a year ago and the wool clip should exceed last year's record figure. Recent sales have, however, been rather erratic which suggests a weakening tendency of the market.

IMPERIAL BANK OF IRAN

LIQUID POSITION

The sixtieth ordinary general meeting of The Imperial Bank of Iran will be held on July 6 at 51, Gracechurch Street, London, E.C.

The following is an extract from the statement by the chairman, the Rt Hon Lord Kennet, PC, GBE, DSO, DSC, which has been circulated with the report and accounts for the year to March 20, 1949:—

In our accounts this year public deposits show a small decrease of £485,000. The decrease is a continuation of general post-war movements, well marked in Iran. Bills payable have increased £850,000, due to increased activity under several headings. Credits and guarantees are £1,400,000 more, an increase of more than 30 per cent. Most of that was due to more business in Iran and at Beirut.

The biggest change in our balance-sheet is an increase in our cash and money at call and short notice of 2½ million pounds to £11,000,000 and a reduction in our investments by £3,000,000 to £4,800,000. These changes are connected. I deal later with the new regulations for banking in Iran. These came into force on March 21, 1949, and although our financial year ended on March 20th, it was necessary to strengthen our position in advance to prepare for the new procedure which requires us to transfer a larger proportion of our deposits to the Bank Melli Iran. The balance of £500,000 was required for financing foreign trade.

Bills discounted, and advances, etc., at £7,400,000 were £900,000 more than the year before. Most of this increase was in the business of our branches in the Persian Gulf and the Lebanon. There is a new item this year on the assets side—Iraq Government Treasury bills £350,000. These are three months' bills to help the needs of the Iraq Government for short-term loans. Our statutory deposits of £1,385,000 with the Bank Melli Iran are £350,000 less than the year before, corresponding to the reduction of our deposits in Iran which I have mentioned.

PROFIT AND DIVIDEND

Our balance-sheet shows a very liquid position. Our statutory deposits with the Bank Melli Iran under the new regulations, as under the old, provide for proportionate withdrawals as deposits decrease. The value of our bank premises stands in the balance-sheet unchanged at £1,000, accompanied by a statement of their estimated value. Our profit of £105,411 compares with £100,349 last year, a small increase of £5,062. We have added £50,000 to our reserve account, raising it to £1,100,000. After providing for a final dividend of 6 per cent. we make a small addition of £5,911 to the carry-forward.

Trading conditions in all our areas have been good. There are, however, signs of the prevailing change to a buyers' market, more marked in some places than others.

The past year has been an epoch in our history. Our 60-year concession from the Iranian Government ended on January 30, 1949.

We continue in Iran as a bank of deposit, authorised to deal in foreign exchange, and with authority to maintain our existing branches. Our capital in Iran has been substantially increased under a guarantee of repatriation on six months' notice at the same rate of exchange as that at which it was transferred.

GUEST, KEEN AND NETTLEFOLDS LIMITED

THE IRON AND STEEL BILL

MR J. H. JOLLY'S VIEWS

The annual general meeting of Guest, Keen and Nettlefolds Limited was held on June 23rd, at Birmingham.

Mr J. H. Jolly (chairman and managing director) presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts for the period ended December 31, 1948:

It is appropriate that firstly should be mentioned the magnificent job that has been done by the management, staff and workpeople in all sections of the group. This co-operation has been outstanding in the past year and is a tribute to our workpeople and the works management and staff.

The making up of the group accounts for the first time at a uniform date created a new situation for your board in regard to the dividend distribution to ordinary stockholders on this occasion. We had to take into consideration unusual and non-recurring circumstances which made the profits available and the periods over which they arose not strictly comparable with the previous period. Had they been comparable the board's recommendation would have been a dividend at the same annual rate of 11 per cent. as for the past four years for a complete and normal 12 months. Complying with our undertaking, given in the national interest, to act with "moderation and restraint," and having regard to the varying accounting periods included in the consolidated accounts, our recommendation is to declare a final dividend on the ordinary stock of 6 per cent. actual, making (with the interim of 4 per cent. actual) 10 per cent. actual, less tax, for this abnormal period.

We place on record that the distribution on this occasion is not any criterion as to the annual rate for ordinary dividends for the future.

EXPANSION OF PROFITS

The profits show an expansion which is mainly due to a high production output and increased efficiency arising from our steady policy of keeping the various plants up to date and maintained so as to operate to the maximum of their capacity consistent with supplies of raw materials. To enable such plant to be fully remunerative, it is essential that a high rate of demand is maintained. Also, to ensure low costs arising from high production the plant must be constantly replaced by the latest types. At the present high level of prices, replacement of plant is a serious drain on the financial resources of an undertaking such as yours. It will be seen that, apart from a charge for depreciation amounting to £1,376,561, profits amounting to £1,388,814 have been retained in the accounts of the subsidiaries during the period so that they may have funds available for this purpose.

NATIONALISATION

One of the principal subjects which have occupied your board's attention during the last year, and still does, is the Iron and Steel Bill. It would be difficult to convey the ex-

tent of the distraction from normal management and progress that this disruptive measure has caused. It is now before Parliament and we hope for the sake of our national economy, that the Bill will not become law. At the time this statement is made the position as regards the G.K.N. group is as follows:

Companies at one time included but now excluded:

The holding companies:
Guest, Keen and Nettlefolds Ltd.
John Lysaght, Ltd.

Subsidiaries:

Bayliss, Jones and Bayliss, Ltd., Exors. of James Mills, Ltd.

Subsidiaries still included:

Guest, Keen and Nettlefolds (South Wales) Ltd. (wholly owned by G.K.N.), Brymbo Steel Works, Ltd. (wholly owned by G.K.N.), Guest Keen Baldwins Iron and Steel Company, Ltd. (G.K.N. hold 57.1 per cent. of ordinary shares), John Lysaght's Scunthorpe Works, Ltd. (G.K.N. group hold 99.8 per cent. of ordinary shares).

THE BILL

Of these, the three last-named being steel works will pass to the State if the Bill becomes law. As regards Guest, Keen and Nettlefolds (South Wales), Ltd., a submission has been made to the Minister of Supply that its undertaking can and should be divided in such a way as to comply with the conditions laid down by the Minister for separating those of its activities, namely, the rolling mills, which come within the terms of the Bill, from its other trades which do not. We can only hope that a just and common-sense view will be applied in determining the issue and not solely a political one.

Your board have done their best to obtain the exclusion from proposed nationalisation of as many of your subsidiary companies as possible. Nevertheless, some of our subsidiary companies will be subject to the terms of trading licences by the Government if the Bill becomes law.

NOT FOR COUNTRY'S WELFARE

My colleagues share my regret that in these days we cannot give an account of our stewardship without having to refer to political affairs. But we believe that we should be failing in our duty as trustees of your property and representatives of industries that have striven loyally to do their best for their workpeople's and country's welfare if we do not emphasise that it is our definite and unanimous opinion that nationalisation will not lead to greater production, cheaper production, or better quality. All these are vital if this country is to maintain even its present standard of living and remain an independent country.

Even if Government ownership of public utilities at home, monopolies as they are, should prove to be efficient, there are no grounds for thinking that an industry managed by the Government without com-

petition can manufacture so cheaply as under private enterprise. Manufacturers have to sell many of their products abroad and the customer abroad will buy from this country only if the price and service are right, whether it be coal, steel, or manufactured articles. The Government, in spite of all its planning, cannot sell abroad if the price is excessive through costs being made too high because of its own policies or its lack of skill in management. In due course the workpeople too will realise that nationalisation of industries does not mean security of employment for them.

For these reasons your board again record their views that to nationalise the iron and steel industry, and other industries, will be a disaster of the greatest magnitude for this country. It would seem, however, that the present Government has not the courage to withstand the pressure from its doctrinaires and malcontents and that the only salvation for the country's trade and therefore its well-being, is to see that this Government is not re-elected to office.

SALES ORGANISATION

Looking ahead, and with the intention of still further improving the group's reputation for service to its customers, we have increased the number of area offices. These are now operating in London, Bristol, Manchester, Sheffield, Newcastle and Glasgow. Teletypewriter service operates directly between these offices and the works, with the exception of Newcastle. We find that this service is greatly appreciated by customers who can now make prompt contact with the works of the group for information about prices, delivery, and other matters. For example, an advisory bureau at the Birmingham works of Guest, Keen and Nettlefolds (Midlands), Ltd., has been established to cope with the large number of queries received from customers on fastening problems. These are brought about by the ever increasing use of special steels, light alloys, die-castings plastics and other moulded materials used in general manufacture today.

In regard to our markets abroad, whether by way of sales or manufacturing, our policy is to maintain freshness of contact by visits of directors and officials from this country and visits to the home country by directors and officials from our overseas companies.

Since my last statement several visits from here for the above purposes and for surveys of further possibilities of manufacturing abroad have been made to Australia, Canada, United States of America, South American countries, South Africa, India, Pakistan, and many European countries. They have been worth while.

FINANCIAL REQUIREMENTS

In the statement to the stockholders last year I referred to the enormous handicap which has to be carried by British industry at a time when it must strive to regain its rightful position in competitive world trade. This struggle is no easier today than a year ago. The Government have dashed our hopes that profits tax might be lifted from that portion of earnings turned back into business.

Because of this and also due to the present high cost of buildings, plant and machinery, both for development and major replacements, your company, which believes in fully maintaining efficiency, is perforce driven to the expedient of raising new capital to supplement the sums set aside out of profits in recent years which have been retained to be utilised for capital purposes.

At the present time, the capital expenditure sanctioned for the United Kingdom companies of the group and unspent is over £7,000,000, excluding that for John Lysaght's Scunthorpe Works, Ltd., the finance for

which has been secured and to which I have referred earlier. Our financial resources now available in the United Kingdom towards this amount are approximately £3,500,000.

NEW CAPITAL ISSUE

Addressing the meeting the chairman said: In the chairman's statement which was circulated with the accounts, you were advised of the Board's view that the progress and efficiency of the group must not be stultified by the lack of adequate financial resources, and that we had made application for the consent of HM Treasury to an issue of ordinary shares. That consent has been given.

Consequently, I am now able to say that your Board has decided to issue 2,256,630 new ordinary shares of £1 each at 37s. 6d. per share. They will be offered to the ordinary stockholders on the Register at the close of business on June 15, 1949, in the proportion of one new share for every £4 of ordinary stock then held, fractions of a new share being ignored. In addition ordinary stockholders will be permitted, if they so desire, to apply for a further allotment of the new ordinary shares in the event of any of the new shares being declined by the stockholders entitled to them according to their rights.

The company has entered into a contract with Morgan, Grenfell and Co., Ltd., of London, to underwrite the proposed issue. It is intended to post the offer to ordinary stockholders on Tuesday, July 5, 1949.

The report and accounts were unanimously adopted and a final dividend of 6 per cent. actual, less tax, making 10 per cent. actual, less tax, for the period was approved.

At a subsequent extra-ordinary general meeting a resolution was passed approving certain alterations and additions to the articles of association of the company.

FORESTAL LAND, TIMBER AND RAILWAYS COMPANY, LIMITED

DIVIDEND OF 12 PER CENT

The forty-third annual general meeting of this company was held on June 29th in London.

Mr John B. Sullivan (chairman and managing director), in the course of his speech, said: At our last ordinary general meeting I made special mention of the world-wide scope of Forestal interests and the unavoidable repercussions from international difficulties and complications with which the Boards and managements of the parent and subsidiary companies are continually obliged to contend. During the year under review, as you will see from my later references to our Argentine and African interests, the former—which have constituted our principal source of revenue for over forty years—have suffered the adverse effects of a considerable drop in the sales of Quebracho Extract, due to factors beyond our control.

The latter, although representing the lesser of the two investments, has, after some twenty-seven years of steady development, justified our faith in the future of wattle extract and proved to be the mainstay of the parent company when needed, a position which we are confident it can continue to fill satisfactorily for an indefinite period. I feel confident, however, that the critical situation of the Quebracho Extract industry is only of a temporary nature.

The Natal Tanning Extract Company, our fully established South African subsidiary, again had a record year. The Calder and Mersey Extract Company, Limited, have had another successful year.

The report was adopted and the proposed final dividend of 9 per cent., making 12 per cent. less tax, for the year, was approved.

SUEZ CANAL COMPANY

UNPRECEDENTED INCREASE IN TRAFFIC

PROGRAMME OF IMPROVEMENTS

PROPOSED NEW BY-PASS CANAL

The annual general meeting of the Suez Canal Company, was held on June 21st in Paris. M. Francois Charles-Roux, the chairman, in the course of his speech, said: The considerable increase in traffic during 1948 is an intensification of the upward movement already noted in 1947. The question arises whether the record traffic figures of 1948 can be beaten in 1949. The record figures shown by the first six months of the present year lead one to think that this may well be so if the present rhythm of traffic is maintained. One should, however, be extremely cautious in drawing conclusions from the present or anticipating the future in times when circumstances are as fluid as today.

The convention signed on March 7th last ensures the continuation of the conventional regime we were anxious to retain and which we considered indispensable for the preservation of the company's special character, an essential factor in the fulfilment of its important task. The financial clauses of the agreement provide that the Egyptian Government will obtain an allocation computed on the basis of 7 per cent. of our gross profits.

DIRECTORS' REPORT

The year 1948, of which we are to give you an account today, has been marked by an unprecedented increase in traffic, mainly due to the growth of oil consignments from the Middle East.

Since the last annual general meeting, important conversations with the Egyptian Government, which had started in the late summer of 1948, were concluded after three months of uninterrupted negotiations by the agreements signed on March 7th and which are now before the Egyptian Parliament for ratification. We were prompted to seek these agreements both by Egypt's evolution during the last 12 years and by the approaching end of the present concession, which has now less than 20 years to run. The Egyptian Government agreed to negotiate and conclude a new convention intended to resolve all outstanding questions, and to allow the progressive incorporation of Egyptian directors and personnel in conditions compatible with your company's international mission, its exceptional character, and its very special organization. At the same time the £E300,000 allowance paid since 1937 has been replaced by a share in the profits, which will have the effect henceforth of associating the Egyptian State with the results of our undertaking. This participation in the gross profits has been fixed at 7 per cent., with a minimum of £E350,000, to be reduced if necessary in order not to exceed the figure of the total gross profits.

PROGRAMME OF IMPROVEMENTS

Our technical planning department was mainly concerned during 1948 with the elaboration of the seventh programme of improvements to the Canal, rendered necessary by the all-round increase in traffic.

In the first place, increased draught has made steering in the Canal more difficult, and some ships now being built might even have draught precluding their use of the Canal for lack of sufficient depth. It was necessary therefore to consider an overall deepening of the Canal by 50cms. to allow the transit of ships with a draught of 36ft as against the present 34ft. This deepening will be completed in five years and will require the dredging of 7,000,000 cubic metres of sand or soil in addition to the removal of 600,000 cubic metres of rock.

In the second place, the problems created by the passing of vessels in the Canal are

rendered more complicated both by the increased breadth of ships and by the greater number of transits, which have progressively increased. It must be borne in mind that when two vessels pass in the Canal, one has to tie up to the bank.

PROPOSED ONE-WAY BY-PASS

To reduce the number and inconveniences of passages we have already had to group ships in convoys. But to prevent undue delays at the terminal ports it has become necessary to improve the passing of these convoys; this is the second object we now propose to attain. The Great Bitter Lake offers a natural passing zone one-third of the distance along the Canal and the seventh programme provides for a by-pass nearly seven miles long two-thirds of the way between Suez and Port Said. This one-way by-pass will involve 2,500,000 cubic metres of dry excavation and 11,000,000 cubic metres of dredging which we hope to carry out in two to three years.

This programme will be completed by deepening the tanker station in Lake Timsah from 10 to 12 metres and providing new anchorages in Port Said harbour to facilitate the formation of convoys.

Canal traffic in 1948 reached the hitherto unprecedented level of 8,686 transits and 55,081,000 net tons, exceeding by 50.6 per cent. the 1947 tonnage, which was a record.

THE FUTURE

Casting one's eyes towards the future one may forecast that the trans-Arabia pipe-line, now under construction and which may well be in operation by 1952, will undoubtedly reduce petroleum cargoes through the Canal. However, the prospects of petroleum production in that area are such that one may well hope that this reduction will only be temporary and that Canal traffic will again rise, after the opening of the pipe-line, to figures surpassing those it shows at present.

After deduction of interest and depreciation of capital, i.e., Frs.815,719,723, from gross profits, the remaining available profit is Frs.13,011,895,782. To the available profit of Frs.13,011,895,782, there must be added an amount of Frs.61,348,965, carried forward from last year, forming a total of Frs.13,073,244,747. Of this amount, we propose first of all to appropriate 2,000 million francs for improvements. This would be the first of the allotments intended to cover the programme of improvements. This appears to be the least onerous procedure, the most simple, and the most expedient, since it allows advantage to be taken of the results of exceptionally good financial years to cover expenditure of an exceptional character.

Secondly, we propose to allocate 1,200 million francs to the provision for depreciation of buildings and 1,300 million francs to the provision for depreciation and renewal of plant, neither of which received appropriations last year.

Finally, we suggest a provision of 600 million francs for payment in due course of certain taxes.

After allocation of these sums you have available Frs.7,973,244,747. The proposed distribution of Frs.7,887,323,944 leaves a balance of Frs. 85,920,803 which, we suggest, should be carried forward.

The proposed distribution brings the gross dividend to Frs.7,000. To this should be added, for capital shares, statutory interest which, for 1948, amounts to Frs.975.57.

A copy of the full report will be sent on application to the Company, 1, Rue d'Amoy, Paris (8), or 6, Bishopsgate, London, E.C.2.

JEREMIAH AMBLER AND SONS, LIMITED

MR EDWARD BEDDINGTON BEHRENS' REVIEW

The annual general meeting of Jeremiah Ambler & Sons, Limited, was held on July 1, 1949, at Winchester House, Old Broad Street, London, E.C.2, Mr. E. Beddington Behrens, M.C., Ph.D. (chairman), presiding.

The following is the chairman's statement as circulated with the report and accounts:

I am again in a happy position in being able to present shareholders with improved results. Profits for the year ending December 31, 1948, after all provisions, except taxation, were £198,219, compared with £179,817 for the previous year. Our turnover increased by 30 per cent., largely due to our new mill at Carrickfergus, near Belfast, entering into full production. This increase in production has only resulted in a 3 per cent. increase in our total labour force. Taxation takes £107,786. The net dividend recommended at 14 per cent. on the ordinary shares and the dividend on the preference share capital require £30,271. The carry forward is increased from £70,155 to £138,484, equal to over four years preference and ordinary dividends at the present rate. The size of the carry forward should act as a stabilising dividend factor in future years. Our liquid position remains satisfactory, current assets of £799,811 exceeding existing current liabilities of £274,786 by £525,025.

The annex to the accounts shows the record of your Company over the five years in which Lord Barnby and I have been directors; the 1948 results comparing with £35,168 in 1944.

CAPITAL FOR MODERNISATION PROGRAMME

Nevertheless, despite our paying out in dividends such a conservative proportion of our earnings, the requirements of taxation are so high that we cannot replace existing machinery or provide for normal development, except by the issue of new capital. We are, therefore, considering the issue of further prior charge finance to provide for the completion of our modernisation programme over the next two years.

We are continuously being exhorted to increase production, and most industrial companies with the finance available are doing this by increasing the size of their plant and factory capacity. This development has been going on continuously in this group for the last few years. Here a note of warning is required. At a certain stage of development larger scale production decreases cost. In our case, however, we consider that the increase in plant expansion has gone far enough. We intend to concentrate in future on trying to reduce cost of production by the modernisation of existing installed plant and thus maintain our existing position on a more competitive basis—rather than to increase further our over-all production.

RE-ORGANISATION AND MODERNISATION OF THE MILLS

Internal reorganisation and modernisation long planned are being steadily carried out at Midland Mills in Bradford. At the Britannia Mills of Christopher Waud & Co., the new mill building is now completed and new machinery is being progressively installed. Hindle & Firth, Ltd., and Crabtree Bros. (Bradford) Ltd. continue to experience excellent demand for their specialised products which enjoy a high reputation. At Barn Mills, Carrickfergus, Ulster, I am glad to be able to report operative acceptance of Bradford production standards, and both earnings and production are increasing. I would also like to place on record the Board's special appreciation of the work done by Mr Little, a director of the Ulster company, which has contributed so considerably to this satisfactory progress. I would again take the opportunity to express our appreciation of the ready assistance in all matters which we have

received from Government and other authorities in Ulster.

The policy of trying to raise wages and reduce production costs is being carried out within the Group, as I am endeavouring to do in other textile concerns of which I am chairman.

BONUS SCHEME OF PAYMENT BY RESULTS

With this in mind, a bonus scheme of payment by results has been extended during the past year from the parent company to our Ulster company, where despite a two-shift system, initial production costs were unsatisfactory. With the full co-operation of the local trades unions and employees, we approached this question with great earnestness. The essence of the problem is to evolve the right system adaptable to the process and particular type of machine concerned, and to ensure that the worker shares fully, by increased earnings, in the savings resulting from increased production.

The scheme is proving popular with employees and the results are most encouraging both as regards higher production at reduced costs and the opportunity it gives operatives appreciably to increase their basic earnings. We hope to extend this scheme to the remaining firms in the group.

Welfare has been maintained at a high level. Social activities are well catered for and have proved a marked success. The new canteen is nearing completion and its facilities should be as good as any in the trade. Welfare arrangements at Carrickfergus have been a material factor in our increased production at Barn Mills.

WOOL EXPORTS AND STERLING EXCHANGE RATES

Speaking generally the export position of the wool textile industry, apart from other causes, is being impeded by vast leaks in the Sterling Area exchange control. As an example, imports of wool into France, thanks to sterling credits, have increased 75 per cent above the previous year. A good deal of this tonnage has been sold at a much cheaper rate to dollar purchasers than the official sterling dollar exchange. France's total wool textile activity is now higher than pre-war, and is able to supply British overseas customers at a lower price, largely through being able, by taking advantage of multiple cross-exchange rate practices to import wool at a much lower cost than British manufacturers.

Even if export sales cannot be maintained at their present levels, there is still a very profitable future for the wool textile industry as the relaxation of regulations make more textiles available for the home market and reduces their ultimate cost to the consumer.

HOME MARKET PRICES OF FINISHED GOODS

At present, the shortage of supplies in the home market is maintaining artificially high prices of finished goods. This shortage has resulted, for instance, in the fixed maximum percentage of profit allowed to wholesalers, makers up and retailers, becoming the minimum percentage. Thus, whilst the shortage of cloth continues, the consumer has no alternative but to pay a high price for his clothing. When normal conditions return and more supplies are available, retailers will compete with one another in reducing intermediary profits, in which the manufacturer is not concerned, and thus increase the volume of demand for textile products.

As I stated last year, production costs are higher than previously and still rising, thus narrowing our margin of profit, but by added production on the group's available machinery, along with efficient reorganisation still being carried out, we again hope to present you with satisfactory results next year.

In conclusion, I wish to express my appreciation of the great help which your deputy chairman, Lord Barnby, has given to the business, and to congratulate your managing director, Mr. John S. Ambler, the directors and staff of the parent and subsidiary companies on the excellent results achieved. The report was adopted.

PURNELL AND SONS, LIMITED

STRONG POSITION DISCLOSED

The fifteenth ordinary general meeting of Purnell and Sons, Ltd., was held on June 30th at the Waldorf Hotel, Aldwych, London, W.C., Mr. W. Harvey (chairman and managing director) presiding.

The secretary (Mr. Bertram Clarke, A.S.A.A.) read the notice convening the meeting and the report of the auditors.

The following is the chairman's speech, which was circulated with the report and accounts for the year ended December 31, 1948:—

May I, at the outset of my remarks, remind you that the profit and loss account now submitted to you covers a period of one year, whereas the comparisons for the preceding period cover 15 months.

The profit for the year, before charging taxation, is £801,954, as compared with an annual rate of profit in 1947 of £983,676, a decrease of £181,722. Taxation has absorbed £465,145, leaving a net figure of £336,809, which compares with an annual rate of balance in the preceding period of £436,676.

The installation of further new plant on which the 20 per cent. initial allowance has been provided, has considerably increased the provision for depreciation.

Your directors do not propose to make any transfer to reserve, and after providing for all charges and the dividends paid and recommended, there is a balance to be carried forward of £457,033.

THE REAL RETURN

The balance-sheet shows that the capital employed in the business is £2,222,891 and after deducting the Preference share capital of £300,000 there remains the equity of the Ordinary shareholders £1,922,891, upon which the dividend of 80 per cent., less tax gives a return of under 6 per cent. You directors feel, however, that it is in the best interests of all to respect the Chancellor's appeal for limitation of dividends. The current assets, together with the excess profit tax refund, total £1,010,715, which is more than sufficient to meet the current liabilities.

The consolidated balance sheet confirm the strength of your company.

At the present time the company's order book is full and although competition is getting keener and markets are more difficult, particularly in regard to export trade, I anticipate the results of the present year's trading will be satisfactory.

It is the intention of your directors to take the necessary steps, with your approval, to distribute out of reserves, one Ordinary share for every five held, as a bonus issue.

I cannot conclude these remarks without once again paying tribute to the work of my colleagues on the board, all of whom give their full time to the service of the company, and also express my hearty thanks to the staff and the workpeople, without whose wholehearted support the excellent results could not be attained.

Addressing the meeting the chairman said that the company were increasing the Nominal Capital of the company to £750,000 and application was being made to enable the directors to recommend a further bonus issue of one Ordinary share for every six Ordinary shares held.

The report and accounts were unanimously adopted and the dividend, as recommended, was approved.

CEREBOS LIMITED

A MOST EVENTFUL YEAR

SALES RECORDS EXCEEDED

MR JOHN WEEDY ON INCREASED EXPORTS

The forty-fifth annual general meeting of the company was held at Cerebos House, London, N.W., on Wednesday, June 22, 1949. Mr. John Weedy, the chairman, presided.

The following is the statement by the chairman, which was circulated with the report and accounts for the year ended December 31, 1948: The year under review has probably been the most eventful in our history. With all the complications attaching to a major reconstruction scheme, our output was increased considerably, which reflects the greatest credit on our technical staff.

Through causes over which we have no control, our plans are not progressing as quickly as we had hoped. There is a big demand for all types of packaging machinery in overseas markets, to which the Government gives priority, particularly for hard currency countries, with the result that deliveries for the home trade are quoted two years ahead or more.

CAPITAL EXPENDITURE

Group commitments under this heading total £280,000. Future plans, now under consideration, may require a further £500,000.

PRODUCTION COSTS

Despite the introduction of labour-saving machinery, the upward tendency previously noted has continued. The cost of packing material, more than three times the prewar price, is far too high, with the result that the margin of profit on some of our lines is very small indeed. In the past year there has been no increase in the retail and wholesale prices of our goods; at the same time, manufacturing costs continued to rise, with a consequent closing of the profit margin, and earnings have only been preserved and advanced by widely increased sales. During the last ten years our profits have, in each year, been won not by advancing our prices, but by increasing sales to offset increasing production costs—the race for supremacy between these two aspects of our business proceeds. In the public interest we intend to preserve, so long as we are able, our present selling prices, but this ideal will only remain practicable by even greater distribution and more efficient and economic production.

SALES

All previous records were greatly exceeded and I am pleased to report that the demand continues. Our drive for sales abroad was handicapped by the restrictions on imports imposed by many countries, and increased local competition. Nevertheless, we improved on last year's figures with a record turnover.

RAW MATERIALS

The position has been eased by removal of controls on many goods, but certain essential commodities remain under Government control. The Ministries concerned have shown a true appreciation of our problems and have proved most helpful.

TRADE CO-OPERATION

We are indebted to our trade customers and suppliers for their continued co-operation.

STAFF AND EMPLOYEES

I wish to pay a warm tribute to all our staffs and workpeople for their unstinted efforts throughout the year. The fine team spirit which imbues them all materially contributed to the good results. As a mark of our appreciation we distributed a bonus of £45,000, which was shared by all employees on the payroll at December 31, 1948. I feel sure the stockholders will heartily approve this payment.

Steady progress has been made since the pension fund was established in 1927, and the total assets now stand at the very substantial figure of £246,310.

It was at one time thought that the introduction of the new National Health Insurance Act would impinge rather sharply upon private pension funds, but the membership of the fund was virtually unaffected, a striking testimony to the high regard in which it is held by the members.

The company's group life insurance scheme, which comes to the aid of the widow or next-of-kin of a deceased member at a time when financial assistance is usually most necessary, is also appreciated.

BALANCE SHEET ITEMS

Fixed Assets.—Since the close of our financial year we have entered into a contract to purchase, subject to the consent of the Charity Commissioners, the freehold of our Greatham factory. Assuming the transaction will be carried through, we have, as explained in the accounts, made provision in sundry creditors for the cost. When the purchase has been completed we shall then own the freehold of our head offices and, including our subsidiaries, four factories.

An independent revaluation of land, buildings, plant and machinery, after allowing for subsequent net additions at cost, resulted in a surplus of £277,955, which has been placed to capital reserve.

The value of fixed tangible assets now stands at £749,065, compared with £312,626 a year ago. This figure will be substantially increased as and when new plant and machinery are delivered and we are permitted to proceed with the additional buildings required.

Shareholdings in subsidiary companies now total £257,351. Each of our main subsidiaries had a record year and made great contributions to our total trade.

Trade Investments.—These consist of a leasehold redemption policy and our interest in a foreign related company. Owing to currency depreciation your board has now deemed it prudent to utilise part of the investments and contingencies reserve, which had been specifically earmarked for this purpose, to reduce this asset to a more conservative value.

Current assets amount to £2,056,478, compared with £1,639,858, from which it will be seen that we have ample funds to provide for our programme of capital expenditure.

Stock in trade is increased by £28,000, which is mainly a reflection of our greater output.

Sundry debtors, after provision for bad debts, are £82,000 more than last year, largely as a result of the substantial increase in turnover.

Investments in British Government securities total £805,033—an increase of

£253,000 over last year's figure. The accounts reveal that we made a loss of £4,599 on switching to our present investments.

Cash at banks and in hand is £136,000 down, but holdings of tax reserve certificates are £189,500 more than last year.

Reserves.—General reserve has been increased to £550,000 by a transfer of £46,866 from profit and loss account. We have also made an initial allocation of £50,000 to a reserve to meet the increased cost of plant and machinery replacement.

Capital reserves now total £497,955 and revenue reserves £996,455. An aggregate of £1,494,410.

Creditors, including provision for the purchase of the Greatham freehold, to which I have already referred, are £332,736, compared with £173,230 a year ago.

PROFIT AND LOSS ACCOUNT

Under the provisions of the Companies Act, 1948, it is no longer necessary to publish a profit and loss account of the parent company provided a consolidated account is produced for the group as a whole. Your directors have decided to avail themselves of these provisions, as all material information is disclosed in the consolidated profit and loss account.

The total fixed assets for the group on revaluation, which affected both the parent company and its principal subsidiaries, amount to £1,472,488. Current assets total £2,379,466 against current liabilities of £966,187, an excess of £1,413,279.

The aggregate of the capital and revenue reserves is £1,954,116.

It will be noted that £382,000 has been provided for future taxation in addition to a provision of £318,758 in respect of current liability.

CONSOLIDATED RESULTS

The group trading profit, before charging taxation, depreciation and directors' remuneration, is £973,331, compared with £764,423 for the previous year. After providing for taxation £516,196 and other charges referred to in the accounts the net profit of the group for the year is £395,774, an increase of £98,569 over last year.

The balance available for distribution after transferring £46,866 to general reserve and £50,000 to reserve for plant replacement, and including £133,102 brought forward from last year, is £432,010.

The payment of a final dividend of 30 per cent., less tax, which, with the interim dividend paid in November last, makes 40 per cent., less tax for the year (£220,000), leaving a balance of £212,010 to be carried forward, was approved.

The report and accounts were adopted.

Mr. R. V. Townsend, the director retiring by rotation, was re-elected and a vote of thanks to the chairman terminated the proceedings.

INDUSTRIAL AND GENERAL TRUST, LIMITED

"SORRY STORY OF NATIONALISATION"

The sixty-first annual general meeting of The Industrial and General Trust, Limited, was held in London on June 23.

Mr. L. A. Stride, the chairman, in the course of his speech, said: Our gross income from investments has, this year, reached new heights and at £673,595 is about £23,000 greater than the year before. We are recommending that the dividend and bonus on the Ordinary Stock shall be 16 per cent. for the third year in succession.

I have had occasion in the past to criticise the interference of the Government in in-

ENGLISH AND CALEDONIAN INVESTMENT

MR HENRY LOEBL'S REVIEW

The twenty-second annual general meeting of the English and Caledonian Investment Company, Ltd., was held on June 24 in London, Mr Henry S. Loebel, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to March 31, 1949:—

The investments at March 31, 1949, stood in the balance-sheet at £1,025,381 compared with £909,987 at the end of the previous year. The value of the investments, however, was £1,350,069, showing an appreciation over the book figure of £324,688, or of 31.66 per cent. compared with 41.39 per cent. at March 31, 1948. This fall in the appreciation reflects the general decline in security values during the past year, although it is rather less than the decline in security values disclosed by the *Investors' Chronicle Securities Index*.

While our permanent investment in our subsidiary company remains unaltered at £30,000, the loan to that company which a year ago stood at £33,000 has been repaid. This repayment has been made out of the proceeds from the sale of one of that company's properties, which realised a profit of £3,969, and which, being a capital profit, has been placed to capital reserve, as will be seen from the accounts of Encafe Estates, Ltd. Against the reserve there has been written off the preliminary expenses of that company amounting to £305.

Current assets consist almost entirely of a balance at the bank of £44,683, some £20,000 less than last year. This reduced liquidity is, however, more than counterbalanced by increased holdings of British Government dated stocks, a very desirable feature, it is considered, in view of present conditions.

LARGER INCOME

Income from investments including that from the subsidiary company, amounts to £69,163, which is almost £6,000 more than the income for the previous year. This increase is due chiefly to a higher average invested fund during the year, and also to a slightly higher yield on that fund. When it is remembered that we have a fair sum in the bank uninvested, and large holdings of low yielding gilt-edged stocks, the increase in income for the past year can be regarded as satisfactory.

After deducting administrative and sundry expenses, directors' fees, and debenture stock interest, the net revenue for the year was £46,941, compared with £40,778 for the previous year. After charging the sum of £21,199 for taxation, and providing for the year's dividend on the Preference stock, the amount earned on the ordinary stock was £17,492, equivalent to 15.90 per cent., which compares with 13.64 per cent. for the previous year. An interim dividend of 1½ per cent. has been paid on the ordinary stock, and your directors now recommend the payment of a final dividend of 6 per cent., making 7½ per cent. for the year. The sum of £10,000 has been transferred to general reserve, leaving a sum of £9,420 to be carried forward.

As to the expected results for the current year, I feel reluctant to make any forecast, confronted as we are with so many uncertainties. I may say, however, that at the present time we see no reason to suppose that the revenue for the current year will differ appreciably from that of the year under review.

The report was adopted.

BRITISH INSULATED CALLENDER'S CABLES

DIRECT EXPORTS £10,000,000

The fourth annual general meeting of British Insulated Callender's Cables, Limited, will be held on July 22nd at Liverpool.

The following is an extract from the circulated statement of the chairman, Sir Alexander Roger, K.C.I.E.:—

Profit on trading, investment income and special receipts amount to £4,517,882, the substantial improvement on 1947 being due to the considerably higher turnover achieved. Several factors contributed to this higher turnover, an easier supply position in certain raw materials, increased efficiency, expansion of manufacturing facilities, and last but by no means least, the splendid effort by personnel in all sections of the organisation.

The crippling burden of taxation absorbs in the Parent Company £2,015,886, or some 53 per cent. of profits. (In the group as a whole the charge is the enormous figure of £3,577,527.)

There continues to be a widespread misunderstanding, sometimes deliberate, about the margin of profit available to those who venture their capital in industrial enterprises. A table showing how each £1 of the company's sales has been absorbed shows that almost 25 per cent. of every £1 goes to our employees in salaries, wages, pension funds, etc., and that the amount required for taxation is almost twice the sum available for dividends and reserves.

INCREASED TURNOVER

The turnover of B.I.C.C. for 1948 showed an increase in value of 41.5 per cent.—home sales being up by some 29 per cent., and export sales by the quite remarkable figure of 86 per cent. over the corresponding figures of 1947. These achievements were largely due to the great increase in the volume of production, although the higher prices ruling during part of the year for copper, lead and other constituents were a contributory factor in the higher value of turnover.

In our home business, which covers a wide field, we have continued to obtain our full share of orders. Dealing particularly with overseas business, our direct exports for 1948 amounted to practically £10,000,000. Our overseas business is world wide, but our most substantial markets are still in Australia, New Zealand, India, Pakistan, South Africa, Argentina and Brazil, together with those countries or territories in which the telephone companies with which we are connected operate. We are again endeavouring to increase our business with North America, but the difficulties are very considerable, especially in view of the advantages possessed by certain manufacturers there in the supply of base metals.

THE OUTLOOK

Although the demand for some of our products is lower than a year ago, the demand for many others remains at a high level, and our total orders outstanding both for home and export are still very substantial. There has, however, been a marked change in the general position since I addressed stockholders in 1948. With increasingly rigid import restrictions being applied by more and more countries overseas, and the definite change from a seller's to a buyer's market, in consumer goods in particular, both home and export business is becoming more difficult.

This is a challenge to industry on which the exports of this country largely depend. Its past record, achieved by the energy, resourcefulness and long years of experience of both management and workpeople, is one of which we can all be justly proud. But industry must be allowed to get on with the job.

PHILIP HILL INVESTMENT TRUST, LIMITED

SIR BRIAN MOUNTAIN ON THE OUTLOOK

The seventeenth ordinary general meeting of the Philip Hill Investment Trust, Limited, was held on June 28 in London, Sir Brian Mountain, Bt., chairman of the company, presiding.

The following is an extract from the chairman's circulated statement.

Your board has limited the dividends paid by our subsidiary companies to the investment trust to an amount which is just sufficient to enable the parent company to pay the dividend on its preference share capital and a dividend of 25 per cent. on its ordinary shares.

In view of the continued limitation of dividends and the inactive condition of the stock markets for a great portion of the year, your directors consider this result satisfactory. The profits of the group represent approximately 31 per cent. on the issued Ordinary share capital, as against the recommended distribution of 25 per cent.

Your wholly-owned subsidiary, Philip Hill and Partners, Limited, has during the year made several very successful issues and has consistently maintained its selective policy as regards the issues it sponsors. The board believes this policy to be in the real interest of both the company's shareholders and of investors generally.

With regard to the current year, I cannot foresee any material change for the better in financial conditions; while the change-over from a sellers' market to a buyers' market, now generally accepted in most industries, coupled with the limitation of dividends, may tend to reduce our investment income. Your directors are satisfied with the progress which has been made by the company's South African interests to which reference was made last year.

The report was adopted.

LONDON ELECTRIC WIRE AND SMITHS, LIMITED

RECORD TURNOVER

The fortieth annual general meeting of this Company was held in London on June 28.

Mr W. J. Terry, chairman and managing director, in the course of his speech said:

The balance profit for the year subject to taxation is £530,760, an increase of £61,715 over the previous year. At the beginning of 1948 the company had a full order book, representing an exceptionally large volume of business which was gradually reduced during the year, resulting in a record turnover, which is reflected in the profits as reported. The position as regards export sales remained much the same as in the previous year.

The improvement in the profits is entirely due to the turnover having been maintained at a high level throughout the year, and is not the result of increased selling prices.

During last year there were very heavy demands for our products, but the position has quite recently changed and there are decided signs of a general recession.

Our views in regard to nationalisation of industry, previously expressed, remain unchanged. It is difficult to understand why the present government has made such a fetish of nationalisation when under private enterprise industry is already providing so much in the form of taxation.

With regard to the future our prospects depend entirely upon the future of electrical industry, which has a full programme before it. Our balance sheet shows a strong financial position, and we are therefore able and ready to take full advantage of any opportunities which the future may provide.

The report was adopted and a final dividend of 6 per cent., making 10 per cent. for the year was approved.

ARMY AND NAVY STORES, LIMITED

DIFFICULT TRADING YEAR

The seventy-seventh annual general meeting of Army and Navy Stores, Limited, was held on June 29 in London.

Major General Guy Dawnay, C.B., C.M.G., D.S.O., M.V.O. (the chairman), presided, and in the course of his speech said:—The results of the year's working show a considerable falling off in the gross profit from trading and all other sources, amounting in all to £139,888, whilst expenses were up by £40,850 to a total figure of £733,243, leaving a balance of net profit of £277,460, or £180,738 less than for the previous year. While sales up to July were better than for the previous year, there was a considerable falling off during the autumn. Gross profit margins, subject to control, continued and still continue to decrease. Taking all these factors into account I think you will agree that we have come not too badly through a year of difficult trading.

It will be seen that provision has been made for £70,000 to be placed to reserves, compared with £55,000 last year. It was thought advisable to increase the figure of £15,000 in contingencies reserve by a further £40,000. Whilst conditions remain as uncertain as at present, with the knowledge that any reductions in purchase tax fall directly on the retailer, your directors consider it prudent to maintain a substantial sum in reserve. The directors recommend the payment of a dividend of 10 per cent. and a 10 per cent. bonus, being the same as last year.

STOCK POSITION

In the balance sheet, stock in trade at £1,061,258 shows a decrease on last year's figure of £71,233. In normal times and provided that the rate of turnover of all stock is satisfactorily maintained, it has been and will be our policy to keep stocks at a high level. But the times in which we live are times of uncertainty as to the future. Prices of raw materials are falling, the export drive in many directions shows signs of slowing up, which, with other factors, may mean more and cheaper goods becoming available for the home market. There is also the old bugbear of the purchase tax which at any time can be reduced by the Government by a stroke of the pen. Taking everything into consideration, while we are determined to maintain our standards of service and quality, it is considered prudent at the present time to reduce the stock figure.

CURRENT YEAR'S PROSPECTS

The current year is sufficiently advanced for me to be able to give you some indication of how things are going, and I do not think you will be surprised or unduly disappointed to learn that for the first four months of this year trading results showed a decline on those for the comparative period of 1948-49. Our company has never—at least not since I have known it—been inclined to favour a policy of excessive distribution of profits. We have aimed rather at building up and maintaining a strong financial position. The financial strength of the company, as shown by the excess of current assets over current liabilities in the balance sheet, is excellent. Your directors feel that the company is in a good position to weather any storm which seems likely to break upon us.

The report was unanimously adopted.

THE "SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

ANNUAL GENERAL MEETING

The annual general meeting of The "Shell" Transport and Trading Company, Limited, was held on June 30th at Winchester House, Old Broad Street, London, E.C., Sir Frederick Godber (chairman of the company) presiding.

The secretary (Mr P. B. Brown) having read the notice convening the meeting and the report of the auditors,

The chairman moved the adoption of the report and accounts and the payment of a final dividend for the year 1948 of 1s. per share or £1 stock unit free of income tax.

Sir Robert Waley Cohen, K.B.E., seconded the resolution.

The chairman said: Mr Troughon, who is a shareholder, has written to me to ask whether I can give any information as to the production and prospects of the newly developed New Guinea field, which, as mentioned in my statement, is a joint venture with two American companies and in which the group owns a 40 per cent. interest.

THE NEW GUINEA FIELD

As shareholders will appreciate, despite the tremendous advances in the science of oil exploration, or is still not an exact science, and it has not been our policy in the past to prophesy too much regarding the prospects of newly discovered fields. I would say, however, that there are a number of structures in New Guinea within the concession of this joint venture still remaining to be tested, and several structures which have been proved oilbearing, but which have not yet been brought into regular production. We are satisfied that the investment that we have made to date will be justified. With a field which only came into regular production in December last, it is too early to give a reliable figure of production, but I may say that our forward estimates, which naturally are based on today's expectation of world consumption, do allow of a steady increase in production from this area.

The resolution was carried unanimously. The retiring directors, Col. Sir W. Charles Wright, G.B.E., C.B., the Hon. Francis Hopwood, Mr Harold Wilkinson, C.M.G., and Mr James Westlake Platt, were re-elected.

On the motion of the chairman, seconded by Mr George Legh-Jones, it was resolved that the vacancy caused by the retirement of Sir Henry McMahon, G.C.M.G., G.C.V.O., K.C.I.E., C.S.I., be left unfilled and that the number of directors at this time in office be accordingly reduced by one.

The remuneration of the auditors, Messrs. Turquand, Youngs, McAuliffe and Co., was fixed.

SHAREHOLDER'S THANKS

The Rt. Hon. Lord Rennell of Rodd proposed a vote of thanks to the chairman, directors and staff and congratulated them all on the results achieved and on the figures in the report and accounts. It was refreshing, he said, in these days of difficulty, and especially in these days when so much emphasis was put on the nationalisation of industries, to see what had been done in the past by enterprise, from initiative and courage and what would be done in the future by those same qualities so long as they were allowed to reign and have the freedom to exercise them. At present they were restricted by the attempt to force so many people into a theoretical mould.

The vote was unanimously accorded, and the chairman having acknowledged the compliment the proceedings terminated.

R. H. AND S. ROGERS, LIMITED

MR LEONARD ROGERS'S SPEECH

The 51st annual ordinary general meeting of this Company was held on June 29th in London, Mr Leonard S. Rogers, J.P., F.R.I.C.S. (chairman of the company), presiding.

The chairman said: Gentlemen, Before we commence our business I would remind you that last year I presided in the absence, through illness, of Mr Octavius Pullum, and I am sorry to say he has since died. For nearly forty-six years he was associated with the company, being mainly responsible for the management and success of the London factories.

The firm have lost a faithful servant and the directors a firm friend. He had many friends in the trade, all of whom will share our loss. Shall we stand in silence for a moment or two in his memory?

The meeting having stood, the chairman continued:

The directors met in February last to consider the appointment of a chairman to succeed Mr Pullum and I had the honour of being appointed.

The report and accounts, having been in your hands for some time, may I assume that they be taken as read? (Agreed.)

The year under review has been one of continued difficulty in many directions particularly with regard to export trade. Owing to short supplies of home-produced raw materials, we entered into contracts to purchase foreign raw materials in our endeavour to comply with the Government's cry for exports, but in the meantime our export markets had been closed to us as our customers could not obtain the necessary import permits. Because these goods were purchased specifically for the export market, the material must remain on our shelves, as the Board of Trade will not allow us to make it up for the home market although the trader is crying out for more goods. This freezing of raw material stock has a temporary effect upon the company's liquid cash.

THE ACCOUNTS

Turning to the accounts, you will notice the stock is much increased from £141,210 to £271,483, an increase of £130,273, as also are the sundry creditors £107,432 as against £77,510, an increase of £29,922. These increases are attributable to enhanced prices, increased liability for taxation and, of course, the frozen export material I have already mentioned. After providing for directors' remuneration, depreciation, taxation and all charges the net profit is £16,114, to which must be added £14,853 balance of the Profit and Loss account at December 31, 1947, making £30,967 available for distribution. You will notice a slight reduction in the net profits, but an increase in the carry forward to profit and loss account after providing for the dividends recommended by the directors.

Your directors have under consideration revision of the company's Articles of Association. They have received little amendment for many years and it is thought desirable to bring them more into conformity with present day company practice. Unfortunately it was not possible to have the revised Articles ready in time to submit them for consideration at this annual general meeting and we may therefore call the shareholders together again before the next annual general meeting for that purpose.

I therefore beg to move the adoption of the report and accounts and the payment of dividends as recommended.

Mr Frank J. Lees (one of the joint managing directors) seconded the resolution and it was carried unanimously.

The retiring director, Mr Edwin E. Allen, was re-elected, and the remuneration of the auditors, Messrs Harvey, Preen & Co., having been fixed, the proceedings terminated with a vote of thanks to the directors and staff.

Investment Statistics

Company Notes

Patons and Baldwins.—After the deduction of £211,351 net compared with £28,770 net for writing down wool and top stocks to market values, the net surplus of Patons and Baldwins was increased from £712,106 to £726,669 in the year to April 30, 1949. A dividend of 20 per cent (same) has been paid on the old capital.

British Insulated Callender's Cables.—Consolidated trading profit of British Insulated Callender's Cables increased from £4,525,389 (adjusted) to £6,565,195 and group net profit from £1,448,923 to £2,669,734 in 1948. Stocks have risen from £11,628,291 to £14,157,748. The bank overdraft of £798,376 at December 31, 1947, has been eliminated. Net current assets have increased from £11,492,804 to £15,361,133.

English Sewing Cotton.—Group profit of English Sewing Cotton rose by £505,081 to £1,287,908 in 1948. Stocks increased from £1,819,561 to £2,369,149 and cash from £249,471 to £889,174. Net current assets were £2,775,948 at December 31, 1948.

Anglo-Iranian.—Net profit after taxation of Anglo-Iranian increased from £18,564,857 to £24,064,920 in 1948. The dividend of 30 per cent is the same as for 1947. The allocation to general reserve has been raised from £10,500,000 to £16,000,000.

Richard Thomas and Baldwins.—The consolidated profit of Richard Thomas and Baldwins for the 53 weeks ended April 2, 1949, amounted to £5,018,208, compared with £5,791,541 for the previous 52 weeks. Extraneous and non-recurring profits of £255,864 against £506,605 are included in these figures. Net profit declined from £2,220,657 to £1,744,952.

British Cocoa and Chocolate.—The consolidated balance on trading account of British Cocoa and Chocolate amounted to £2,493,985 in the year to January 1, 1949. Total group profit was £2,675,907 of which £2,569,079 was attributable to the Cadbury Brothers' group. Net current assets at January 1, 1949, were £11,167,686.

Selection Trust.—No bonus is to be paid by Selection Trust for the year to March

31, 1949, compared with 5 per cent paid for the previous year; the dividend of 20 per cent is repeated. Total income is up from £828,528 to £956,809.

Anglo-Egyptian Oilfields.—Net profit of Anglo-Egyptian Oilfields increased from £194,877 to £241,474 in 1948. The latest figure is struck after the allocation of £200,000 to exploration and general reserve compared with £350,000 in 1947. The dividend of 12½ per cent on the "B" ordinary shares is unchanged.

Carpet Trades.—Group profit of Carpet Trades before taxation in 1948 was £466,211 against £507,639. The ordinary dividend of 20 per cent is the same as for the previous year.

British Plaster Board.—Consolidated profit of British Plaster Board before taxation increased from £813,665 to £1,119,704 in the year to March 31, 1949. The dividend is again 25 per cent.

Express Dairy.—A dividend of 12½ per cent, tax free (same), is to be paid on the "A" ordinary stock of Express Dairy for the year to March 31, 1949. Net profit after taxation has risen from £175,163 to £315,722.

Trust Houses.—Net profit of Trust Houses declined from £250,856 to £146,965 in the year to March 31, 1949. The 8 per cent dividend is repeated.

Associated British Picture.—The dividend of Associated British Picture has been reduced from 22½ per cent to 20 per cent for the year to March 31, 1949. Trading profit is up from £2,026,110 to £2,038,762 but net profit has been reduced from £513,901 to £450,613.

Capital Issues

OFFER TO SHAREHOLDERS

Trinidad Petroleum Development.—Of 700,000 5½ per cent cumulative redeemable £1 preference shares offered at 22s. per share, shareholders have taken up 635,000 shares.

Liebig's Extract of Meat.—Preference and ordinary shareholders registered on June 20th are offered 1,000,000 4½ per cent cumulative

redeemable £1 second preference shares at par.

Babcock and Wilcox.—Underwriting has been complete for an issue to preference and ordinary stockholders registered on June 20th of 2,000,000 4 per cent £1 cumulative redeemable preference shares at par. Ordinary stockholders registered on that date are offered 716,609 £1 ordinary shares at 57s. 6d. per share.

John Smith (Field Head), wool combers.—Application has been made for permission to deal in the capital of £440,000, made up of £220,000 in 5½ per cent cumulative £1 preference shares and £220,000 in £1 ordinary shares.

Grayson Rollo and Clover Docks.—Shareholders registered on June 28th will receive 157,650 five per cent cumulative £1 preference shares in the proportion of one bonus preference share for every eight 2s. 6d. ordinary shares held.

Brightside Foundry and Engineering.—Approval of the Capital Issues Committee has been obtained to issue one 5s. bonus share for each existing 5s. ordinary share held.

Statistical Summary

EXCHEQUER RETURNS

For the 12 days ended June 30, 1949, total ordinary revenue was £106,185,000, against ordinary expenditure of £89,512,000 and issues to sinking funds £10,000. Thus, including sinking fund allocations of £2,467,000 the surplus accrued since April 1st is £15,550,000 against £178,644,000 for the corresponding period a year ago.

Is the pound sterling overvalued? Then let us have several different values of the pound, so that we can continue to buy cheap and sell dear. And if other people dislike selling cheap and buying dear, let us use our bargaining power on them.

At the centre of Labour Socialism lies a deep distrust of the price mechanism and a refusal to accept as final the verdict of an open market. Within a country, markets can be controlled or abolished and the shape of demand can be altered by taxes and subsidies. Within this country these methods have achieved considerable technical successes in the past ten years (though with what further consequences we are only just beginning to realise), and if the balance-of-payments problem is to be given a socialist solution, it is presumably this order of ideas that is to be further exploited in the international field. Hence the unwillingness to drop bulk buying, the belief in quantitative barter deals and the talk of export subsidies.

But how can these ideas be applied to a market where the writ of the British Government does not run? How can the foreigner's demand be controlled or his supplies be allocated? With whom is this system of trade to be carried on? There will always be some barter bargains that can be struck, and it may even be possible to strike some of them on favourable terms of trade. There will always be some other high-cost economies which will join in such deals. If international trade were for Britain a matter of marginal indifference, worth entering into only if it did not interfere with domestic arrangements, then such a system might have something to be said for it. But Britain's problem is that a certain large volume of trade must be done, on favourable terms if they can be arranged, but in the last analysis on any terms that can be secured. If that volume of trade is not done, the country goes without food or raw materials or both. Whatever the system on which it conducts its trade, this country cannot ever hope to reach the indispensable minimum volume unless the other parties are as freely willing to trade as we are. Barter would work if British goods were attractive, on a combination of price and quality, relatively to the other alternatives open to our trading partners, but there is no magic in barter by which, beyond a certain point, countries can be forced to take dear goods when they would prefer to take cheap goods. In short, the basic condition upon which a bulk-buying-bulk-selling system would work is the same as that upon which a convertible currency system would work, namely that British prices are competitive. There is no magic in a socialist system of international trade (if this is the meaning to be attributed to the phrase) that will enable us to buy without selling, or to sell without being competitive.

★

The second recognisable school of thought exists on the Right and finds its graven idol not in bulk trading but in the sterling area. It is the school of thought that would find the solution of the problem in the creation of a third trading area, distinct both from the barter economies of eastern Europe and from the unapproachable dollar area, an area

The table of figures in last week's leading article, illustrating the equivalent in terms of a week's wages of various standard articles, was inadvertently printed without a footnote to indicate that the figures for "cheapest man's suit" were days not weeks. The radio set should also have been described as "average" not "cheapest." The point of the table, which lay in the comparison between the figures in the two columns, is not affected by these corrections.

founded upon, but not restricted to, the British Commonwealth of Nations. There is more than a grain of sense and necessity in this conception. As has very often been argued in these columns, the problem of the American balance of payments is a very intractable one indeed. Yet so long as there is a shortage of dollars, it follows quite inescapably that trade and payments must be allowed to be freer and easier as between the non-dollar countries among themselves than as between any of them and the dollar area. In any long-term plans, account must be taken of this.

But it does not follow in the least from this that the organisation of a Third Force in international trade provides some mechanism of escape from the immediate dilemma in which the country finds itself. The sterling area, as at present constituted, can provide neither the markets nor the supplies to replace the dollar area. And if the argument is that other countries—indeed, the whole non-dollar, non-Soviet world—are to be attracted into such a system, the answer must be to ask how they are to be attracted if it is not attractive? Who will enter—who will freely stay in—a sterling area of which the subscription is the obligation to buy dear British goods instead of cheap goods from other suppliers? Nor does "other suppliers" mean the United States alone. It is not only in terms of American goods that British goods are, or soon will be, uncompetitive. The industrial power of Europe, and especially of Western Germany, is rising fast, and is not obstructed by nearly as many rigidities as exist here.

Finally, there is the "dash for freedom" school. Not all of the talk about the necessity for an immediate return to competitive conditions sufficiently distinguishes between what can be done at home and what can be done abroad. Within the over-planned and over-controlled and over-protected domestic British economy, a return to competitive conditions is not only desirable in itself, and the only effective way of getting costs down and economic efficiency up, but would also do no harm to the structure of the national life. But an immediate "dash for freedom" in international commerce, an immediate removal of the restrictions and protections that at present hem in the British economy, would exhaust the reserves and bring on the disaster that all policy must try to avert. Some day—and some day quite soon—there will have to be a dash for freedom in world trade, but Britain must first see that it is not trampled under foot as soon as the race starts.

★

Thus from whatever ideological standpoint—socialist, imperialist or liberal—the argument starts and by whatever system it proceeds it arrives at the same immediate necessity. The arguments may diverge again after the present crisis is past, but they must all go together through the same painful present defile. There is no room for dispute about the immediate necessity for a reduction in the costs of the British economy—that is, for an alteration in the present ratio between efforts and rewards. The root of the matter is that the world puts a lower value on the services of the British people than they do themselves. There is no point in denouncing the verdict, or ignoring it, or attempting to evade it. It will have to be accepted. The British people individually as well as collectively, will either have to increase the services they render for their present real remuneration, or else accept a lower real reward.

The crisis will go on until the British people—all of them, including the railwaymen and the dockers—individually recognise this necessity and agree upon the methods of meeting it. And that is to say that it will get a great deal worse before it has any chance of getting better.

New Start in the Middle East?

FOUR years have passed since Mr Bevin summoned his Middle Eastern officials into conference—four eventful years during which the political geography of the area has undergone a cataclysm and many of the old landmarks have vanished for good. No doubt the broad aims of British diplomacy have not changed. When the ambassadors and ministers from the Middle East meet with Mr Bevin and his London staff this week, their primary preoccupations will not be very different from those of 1945. The Middle East is strategically vital as the link between Europe and Asia. Nothing has changed that fact. It is economically vital as a source of oil. This factor has if anything become more important. Great Britain must therefore attempt to defend the whole region against attack from without—which at present could only come from its giant neighbour, Russia—and from disintegration within. These were the two main objectives of 1945. They remain so today. The difference lies in the political background against which these objectives have to be pursued.

In 1945, Mr Bevin's thinking was strongly influenced by two legacies of the war years—the Arab League and the Middle East Supply Centre. British officials tended to look to a continuation of the League, reinforced by treaties between Great Britain and Egypt, Iraq and Transjordan, as the political and military basis of stability. The success of the Middle East Supply Centre in bringing about economic conferences between all the states in the area and initiating research into projects for agricultural and industrial development encouraged the belief that British guidance and economic assistance could still be channelled through a central Middle East agency—a British Middle East office was established in Cairo—and would be one means of raising the living standards of the people and of bringing them to a state of political development in which popular government could replace the rule of "the princes and the pashas." At that time, the chief obstacle to the programme seemed to be the clamour of Jewry to admit the hundreds of thousands of Jewish displaced persons into Palestine and it was the British hope that the numbers could be kept to manageable proportions and Palestine transformed into a federal community.

★

When Mr Bevin meets his officials this week, the first fact they are likely to reach in their *tour d'horizon* is the disappearance of most of the pre-suppositions upon which British

policy rested in 1945. The Arab League, defeated in the war against Israel, has virtually disintegrated. King Abdullah of Jordan is isolated, apart from a tenuous link with the present premier of Iraq. Both are accused by Egypt of being British puppets. Saudi Arabia holds itself on the sidelines of the quarrelling group, but traditional dislike of the Hashimite Abdullah provides a certain basis for understanding between Ibn Saud and the Egyptian King. The mutual hostility between the Arab countries may be accentuated by the emergence in the last three months of a new figure in Middle Eastern politics. Hosni el Zaim, who has made himself by plebiscite the dictator of Syria, has in a couple of months of power already suggested that he may possibly have the germs of an Ataturk in him. His policy as so far revealed suggests that he will confirm the rift which the Palestine war opened in the Arab League. In all this there is not much comfort for British diplomacy. The League which Britain backed so hopefully is broken. Egypt has refused so far to review its treaty or reach a final settlement on the Canal Zone or the Sudan. Iraq, too, has rejected a revised and modernised alliance. Jordan is an ally; but the alliance is one of the causes of King Abdullah's isolation from his neighbours. Among many Israelis, considerable hatred of the British still remains. Altogether, the political balance sheet of the last four years seems to be ending with a heavy deficit. Nor is the economic accounting much more hopeful. The possibility of centralised planning on a western model vanished with the war. As the British Middle East Office has had good reason to realise, even plans tendered to individual states have been difficult to put into operation because of the state of local finances, because the British economy has been far too strained to undertake any big local development projects and because, even if the resources had been available, a series of xenophobic governments has been shy of accepting the trammels that go with foreign aid.

Such then is the unpromising outcome of four years of hard work in the Middle East. It would be as well to admit that the result is equivalent to the bankruptcy of British policy, and that the best thing that can be done now is not to make do and mend with whatever remains of the old ideas but to see if there is not some entirely new approach open to Britain. The objectives of its Middle Eastern policy are, after all, as urgent as ever. The integrity and stability of the Middle East are not less but more important after

four years of cold war and doubtful peace. But past methods have failed. Is any sort of new line possible? Perhaps the safest starting point is with the two objectives themselves. What in fact is entailed in any policy which attempts on the one hand to discourage Russia from intervening beyond its southern frontiers and on the other to create a more stable social and economic atmosphere in the Arab states and Iran? The question has only to be asked and one answer immediately springs to mind. Neither objective can be realised without the support and interest of the United States. If the Russian attitude towards the Middle East should become adventurous, the resistance of local armies, even in alliance with Britain, is not likely to deter them. In fact, the defence of the Middle East will not be decided in Teheran or Baghdad or Cairo or Tel Aviv. It turns upon the general relationships of the great Powers. If Russia should, some day when not busy elsewhere, be tempted to exploit the social maladjustments which exist in the countries of its southern neighbours, and to take advantage of their military weakness, it would be restrained only by the risk of provoking a general war. It follows that American interest in the Middle East is the real deterrent to such an act.

Similarly the physical resources that are required if the popular basis of non-Communist Governments in the Middle East is to be strengthened can only come, in the main, from the United States. The great oil companies might be expected to contribute in their own self-interest. The area is going to get at least a quarter share of such concrete assistance as may emerge under President Truman's fourth point. The World Bank is ready to interest itself in certain projects provided that states will accept its conditions for seeing how these are carried out. But, in each case, the resources are American resources and the pre-condition of their availability is a well rooted interest in the Middle East. On both counts therefore the new starting point of British interest in the Middle East must be a close Anglo-American understanding. No attempt to achieve such agreement was made in 1945, since understanding with America was not at that time the first objective of British policy in the Middle East. On the contrary there was an undercurrent of feeling in favour of excluding America from an area in which Britain had been dominant for the last eighty years. But the results have hardly been auspicious. The attempt, avoided in 1945, must be made today.

Fortunately, the outlook for agreement is much better than might have been thought possible only a year ago. On the British side, the existence of Israel as a sovereign state recognised by the British Government has removed the worst stumbling block in the way of a close Anglo-American working agreement. But on the American side, too, a considerable change has taken place. In the first place, American realisation and dependence upon Middle Eastern oil is

steadily growing. In the next, there is a wider acceptance of the fact that programmes of military aid to Greece and Turkey need, to be effective, a stable hinterland. Again the collapse of the nationalist regime in China has been a grim warning of how quickly a decrepit regime can crumble once its people comes under the sway of a revolutionary movement. Even those most concerned with Israel and least concerned about the wider Middle East problem are beginning to see that a stable Israel cannot come into existence unless the country has peace with its neighbours and is part of a stable trading area. These factors have converged to create in the State Department an awareness of the wider implications of Middle Eastern policy that makes a full Anglo-American understanding possible for the first time. This then is the basis for a new and hopeful start in the Middle East.

Close Anglo-American understanding is, however, only the starting point of a new approach. It is no magic wand that can be waved over the Middle East with the certainty that all vexations will vanish away. In many ways, America is as compromised a figure in Arab eyes as is Britain itself. As the backers of Israel, the Americans rouse as much suspicion as do the guardians of the Canal Zone or the sponsors of King Abdullah. If Anglo-American policy is to be effective in its dual aim of securing the Middle East strategically and creating its social stability, it must work—and work fast—on the immediate centres of acute disturbance. It is on these that a clear Anglo-American working agreement must be secured now.

All devolve—inevitably—from the Palestine war. Three-quarters of a million Arab refugees have to be resettled. Until a strategy is agreed to solve this problem, every Arab state harbouring them will be a prey to violent agitation. But the problem cannot be tackled without some help from Israel, and the second issue upon which immediate Anglo-American agreement is vital is the best method of shaking Israel out of its warlike mood; of bringing home to its leaders their need to achieve, in their own interests, fixed frontiers and a settled neighbourhood; and of convincing them that continued government support, diplomatic as well as financial, will be conditional on more co-operative behaviour on their side. And the test of their readiness to cease the attempt on the one hand to boast of their good behaviour as members of the United Nations, and on the other to grab all they can get, will be the question of Jerusalem, where Israeli and United Nations policy are in direct conflict, the Israelis claiming it for Israel, the United Nations reserving it for an international regime.

These then are the first priorities for an agreed Anglo-American policy. Unless they can be solved equitably, there is little hope of tackling constructively the wider issue—of persuading Arab and Iranian that their genuine interests demand a measure of military security of the type extended to Greece and Turkey and a measure of direct economic

assistance to raise their peoples above the level at which social revolution is a recurring threat. American official opinion is alive to the need both for strategic commitments—already made in the case of Turkey—and for greatly extended economic development. It is true that the battle with Congress for funds has not been engaged, and that it will be a tough struggle. But the important point for this week's discussions in London is not the extent of the aid to be given,

The Right to Strike?

ALMOST exactly twelve months after their last major strike, the London dockers have again brought the world's greatest port to a standstill. There is evidence that this year's dispute will prove far more difficult to solve, and will not yield as easily as it did last time to the appeals of the Government. For the first time since the General Strike of 1926, the Government is administering the bitter medicine of the Emergency Powers Act—which it invoked, but did not have to use, last year. The dock labour scheme is virtually in abeyance, certain civil rights of the dockland community are suspended, and the port is ruled by an emergency committee with strong powers. The 14,000 dockers, whose action has precipitated this emergency, stand watching the efforts of the community's personal employees, the armed forces, to prevent their action from causing enormous and irreparable damage to the country at large.

That a parliament with a large Labour majority should have acquiesced in the assumption of these sweeping powers by the Government is recognition not only of the seriousness of the harm that the dockers are doing to the national economy but of the gulf which now divides the thinking of the official trade union world from the sentiments of the average transport worker. The strike is not a demand for higher wages: it arises out of a dispute which has been going on intermittently for months between two rival Canadian trade unions. In the course of this the Communist-led Canadian Seamen's Union, by cleverly fomenting a dispute with the shipowners, has succeeded in persuading most of the London dockers that two Canadian ships in the Port of London are "black" and that any docker who goes near them would be betraying the basic canons of working-class loyalty. A perfectly legal attempt on the part of the port employers to break the deadlock thus created by demanding that the Canadian ships be cleared before any fresh calls for dock labour were made, was ably exploited by the Communists as "a bosses' lockout." The dockers, warned by Cabinet Ministers, by trade union leaders and by the press that they were being duped by the Communists, preferred to believe the latter. The memory of "old, unhappy, far off things and battles long ago" has had a far more potent influence than all the efforts of exhortation and propaganda which in the past four years have tried to convince the ordinary manual worker of the true nature of his own and of the national interest.

After a great deal of commercial damage has been done, the Government's measures will, it is to be presumed, eventually persuade the dockers that their action is not only quixotic but anti-social. But whether this happens sooner or later it would be a great mistake for the Government or anyone else to suppose that the problems aroused by the events of this month can be shelved—until the next dock strike. It would be a tragic mistake if public thinking were to be limited to finding in this unofficial strike merely the result of fortuitous circumstances of which the Communists

but the creation of conditions in which any form of aid can be made acceptable to the local peoples. The first task is, therefore, in full collaboration with America, to clear up the tragic legacy of the war in Palestine. When, and only when, such a settlement has been achieved, can the Anglo-American partners move into the more constructive field of economic and social development on which the long-term success of their Middle Eastern policy will turn.

★

The prevalence of strikes all over the western world, in particular among the vital industries of transport and coal, raises a problem which no one can now ignore. The way in which the Australian miners, the American longshoremen or the British dockers can hold their countries up to ransom is something which even doctrinaire Socialists do not find edifying. As each major outbreak occurs, more and more people of liberal opinions begin to ask themselves a question "Ought there to be a limit to the right to strike?" To ask this, of course, is to question one of the basic tenets of liberal democracy, that labour has the same freedom as any other section of the community to organise and take action for its own protection and advancement. But the irresponsible way in which that freedom is sometimes used compels consideration of whether certain limits should not be set upon it, the more so as in Britain today there is no margin of wealth with which to pay for the damage which irresponsible strike action inflicts upon the national economy.

This is not a mere panic reaction. The assumption which over the past forty years has enabled most of the restrictive labour legislation to be abolished, including the repeal of the Trade Disputes Act in 1946, was that labour was organised into recognisable and responsible trade unions which could be trusted to use the machinery for conciliation before resorting to direct action. That is still the case in so far as most of the unions are concerned. But the growth of unofficial strikes since the war has shown that the control of certain unions over their rank and file is no longer to be taken for granted. It has broken down repeatedly in mining, in the docks, and in road transport. This gap between the leadership and the rank and file of a union has never been more clearly demonstrated than at the biennial conference of the Transport and General Workers' Union, which is taking place this week. While the conference was passing a resolution banning Communists from holding office in the union, and while their general secretary was making a highly responsible speech about the necessity for wage stabilisation, many of the union's members in the London docks were stubbornly resisting all exhortations to return to work.

The logical conclusion to be drawn from such a state of affairs is that strike action should be made illegal in essential industries—at least until the resources of conciliation and arbitration are exhausted, and perhaps in any circumstances. (It would perhaps be legally more accurate to say that the existing prohibition on strikes, which was continued from the wartime regulations by the Supplies and Services (Transitional Powers) Act of 1945, should be enforced; but since this prohibition is not enforced it may be regarded as a dead letter). Among trade union officials, there would be

support for a legal prohibition on unofficial strikes; but the community can hardly accept this. The officials of unions in essential industries do not always act responsibly (as witness Mr Figgins of the National Union of Railwaymen) and even if they did, the state could not allow the invocation of its legal powers to rest upon the decisions of private individuals. If there is to be legal prohibition of strikes in essential industries, it must be of all strikes, and a man who foments them, whether he be an official of a union or a member of an *ad hoc* strike committee must be "liable in damages to the uttermost farthing of his personal possessions."

★

This is the lawyer's answer, and a great many laymen are coming to hold that there is adequate justification for it. But is justification enough? Would it work? Would it prevent stoppages and secure regular, efficient working—specifically at the docks? In the present mood of the dockers, almost certainly not. That mood is shown just as clearly, and just as alarmingly, by what they do when they are supposed to be at work as by their readiness to come out on strike over footling or wholly imaginary grievances. Until there is among the dockers—or a sufficient number of them—a real desire to give good service, and a real rejection of irresponsibility, it will remain doubtful whether any purely legal sanctions will have much effect.

This is, of course, merely a facet of the general moral and psychological problem that underlies the whole of British economic policy. The philosophy of the Labour movement (distinguishing it, for the moment, from the Socialist doctrine) is that while other sections of the community, and specifically the employers, must be hedged about with legal prohibitions to assist them in distinguishing right from wrong, the wage-earners, when organised in trade unions, can be trusted to have instincts of responsibility and respect for the common good. The Labour Government, which

Spies

THE business of spying goes back to very ancient times. In the Biblical narrative of the first Israeli conquest of Palestine it is recorded how Joshua sent two spies to explore the defences of Jericho, and how they were saved from the clutches of the local M15 by a lady of imperfect patriotism, who let them down over the city wall with a rope. In all ages states have had secrets which they have wished to conceal and other states have employed agents to find them out. Spying, indeed, is, and always has been, one of the functions of the sovereign state as an institution—for knowledge about other states is a condition of effective foreign policy or war-preparedness.

It is this need that creates the profession; but it is a profession only for modest men, who are prepared to renounce the limelight of fame and hide their merits from the public gaze. It is a profession about which social surveys, census statistics and analyses of employment reveal very little. The spy's calling is as secret as the forbidden knowledge which he seeks. No state will admit employing him. He is, like a prostitute in the Soviet Union, "one of those of whom we know there are none." But while he himself leads a ghostly life in the ranks of the non-existent, high officials of Governments in every country of the world pay much attention either to promoting or to circumventing his activities.

regulates in great detail every other aspect of economic activity and administration, allows the wildest system of *laissez faire* to govern the relationship of labour to the nation. The unions devote their efforts to seeing that the worker gets his standard income regardless of the efforts he puts out, and this must involve an assumption that when he is relieved of the ordinary pressures that bear upon the individual in a cruel world—in particular, the threat that he who will not work neither shall he eat—he will react in the way that an idealist would hope rather than in the way that a realist would expect.

The docks provide a very clear laboratory experiment in the application of these principles. Countless social investigators, writing over several decades, have described the horrors of the system of casual labour in the docks, with the cruel pressure that it put on the workers. Humanitarians rejoiced when it was replaced by the Dock Labour Scheme, which guarantees a living wage to every docker presenting himself for work. No section of the wage-earners has had its conditions of work more radically improved, at the community's expense, than the dockers. Yet what is the result? A most marked decline both in efficiency and in responsibility. Who was right, the idealist or the realist? And why should the result be any different in industry at large?

The Labour movement cannot now dodge these wide issues any longer. Nobody wants to go back to casual labour in the docks and to a code of anti-strike legislation throughout industry. Non-Labour public opinion, whose view will be decisive in the end, is no doubt willing to wait a little longer for the emergence of some alternative method for ensuring that the improvement of the conditions of labour does not impose on the community, including the wage-earners, a cost in economic inefficiency that it cannot possibly afford. It is for the Labour movement to produce the proof that there is an alternative to a mere retreat to the bad old days. And they have little time left in which to produce it.

The business of spying goes on at all times, in all weathers, in peace and in war. But normally it is only in war-time that it becomes a matter of urgent importance or that the general public becomes spy-conscious. In periods of peaceful peace the spies and counter-spies play out their little game in the shadows, with the ordinary citizen unaware of the scoring except on the rare occasions when an espionage case is brought in a court of law. But today spies are news and each nation in the grip of the cold war looks round anxiously for the hidden thieves of its security. When suspicions are sufficiently strong and widespread, they can produce the state of mind known as "spy mania," in which human reason suffers a complete collapse and terrible injustice can be done to innocent individuals.

There are several reasons why espionage has recently become more important for international relations than it used to be, and also more significant for the internal politics of nations. There is first of all the fact that the increasing dependence of armed forces on "scientific" armaments makes secrecy more and more essential in defence preparations, and the incentive for rival powers to penetrate this secrecy becomes correspondingly greater. There has never been a time when the military authorities of a state could have so little certainty, without successful espionage, about the weapons which would be used against them in a future war,

and the surprise use of new or improved weapons may be decisive at the outset of any armed conflict. In the days of Sherlock Holmes the spy could only steal the plans of the latest type of submarine; now the range of his aspiration includes atomic bombs, stratosphere rockets, the more miraculous uses of electronics and formulae for bacterial and meteorological warfare.

This military need for secrecy in scientific and technical matters affecting armaments runs counter to the demand for complete freedom of discussion and publicity which has been characteristic of modern science. The extension of security measures tends to blot out from public view whole fields of scientific research, the worker in which formerly gave no thought to the warlike implications of his discoveries. Scientists in the West have shown great unwillingness to accept broad security controls imposed by their Governments, even when they have not been influenced by loyalty to a country other than their own.

A similar conflict has arisen with regard to another field in which states have always considered secrecy a necessity, namely diplomacy. In the old days it was taken for granted that no player at the international table showed his cards more than he had to. With the rise of democracy and of public and parliamentary criticism of foreign policy, Governments were increasingly embarrassed by the need for choosing between disclosures required for domestic self-justification and precautions for not letting cats inconveniently out of bags in the sight of other nations. Then, with the first World War, came the campaign against secret treaties and the Wilsonian slogan of "open covenants openly arrived at." In this country the cult of diplomatic nudism never made much progress, and there has always been the Official Secrets Act to restrain members of the Foreign Service with a taste for publicity. But in the United States the law has been much looser, and many Americans have held the view that there ought not to be any secrets in the State Department; it is argued that the Press has a right to find out whatever it can about national policy and every official remains a citizen with a responsibility for telling the American people what is being done in their name. Hence the astonishing career of Mr Drew Pearson, who has made a highly profitable industry of publishing and commenting on confidential documents from Government departments without ever landing himself in serious trouble.

During the last war the State Department leaked like a sieve and, when President Roosevelt really wished to keep anything secret, he did not communicate it to the office at all. Recently, however, public opinion has been deeply shocked by the famous pumpkin which was found to be full of copies of secret State Department documents handed over, according to Mr Chambers, by American Communists in high places for transmission to Russia. But what is most striking in all the hullabaloo arising from this fantastic episode is that Americans who are horrified at the idea of documents being sent to Moscow, would have invoked the principle of freedom of journalism if the same documents had been published by Mr Drew Pearson.

★

It is fundamentally to the credit of the Americans that they are so little secrecy-minded; their instinct in favour of the utmost publicity in all fields of state action is part of their democracy and stands in the sharpest contrast to the concealment and mystery natural to despotic government. But the needs of national defence and diplomacy in an era of acute international tension require a certain minimum of secrecy even in Washington.

A period of religious or revolutionary warfare which creates loyalties transcending those of national patriotism, naturally intensifies the dangers of espionage for each state. Numbers of persons are known to exist who, for ideological reasons, are willing to help a foreign power at the expense of their own country. Moreover, such conditions entirely alter the normal task of counter-espionage detection. Spying always involves two elements—the alien agent who collects the information and the citizen of the spyee country who holds some confidential post or has facilities for observation and transmits the secrets to the alien agent. The two types differ widely from an ethical point of view. The agent sent abroad to spy on behalf of his own country is a patriot—if a mercenary one. But the man or woman in a position of trust who sells for money secrets of his or her own country is universally despised as a criminal of the lowest type. The very nature of the crime, however, makes it relatively easy for the counter-espionage branches of the armed forces or police to deal with it; wherever there is reason to suspect a leakage of confidential information, there are usually signs enough of personal weaknesses to give clues to the investigator. But when someone betrays his country from political conviction there are no such telltale traces. The revolutionary traitor-spy is usually a person of the highest moral character, who takes no money for his service and acts from what he believes to be the loftiest motives of political idealism. The only clues, apart from direct proof of transmission, lie in the record of his political life, and this is a field which most policemen and military intelligence officers are totally incompetent to explore.

Nevertheless, the issue has to be faced, because in espionage prevention is far more important than cure; there is indeed no cure when a leakage of vital information has once occurred. It is, therefore, desirable that persons whose political principles require them to betray their country to a foreign power when opportunity offers should not be placed, or allowed to remain, in positions where they can do serious harm. Communists may be compared to a religious sect, whose tenets make it the highest virtue for the believer to offer human sacrifices to his deity. In accordance with the principle of freedom of thought, it would be wrong in a democratic country to suppress such a sect; but people would be justified in refusing to employ its members as cooks or surgeons. Similarly, we may respect the sincerity of the Communist's belief in his right to rule the world and murder his opponents; he should have liberty to expound his doctrine and preach his gospel; but as long as his party has not yet seized power, a democratic Government must regretfully keep him out of jobs in which he can betray his country in a dangerous manner.

It has to be recognised that the purging of Government departments by a system of political tests is in itself an undesirable step in a democratic country, however necessary it may be in the circumstances imposed by the world-wide menace of the new Assassins. The range within which the discrimination operates must be kept as small as possible; within it the purge must be as thorough as well-informed detective work can make it, but outside these limits there should be a firm resistance to any kind of political witch-hunting. The harm done by the extension of methods of secret political inquisition over wide sections of the community will far outweigh any advantage to be obtained. In the long run a morbid and noxious political growth can only be overcome in a democratic society by the vital forces of a healthy national life reacting against it. It is only where spying can make deadly havoc with the safety of the state that special measures of protection can be justified.

NOTES OF THE WEEK

Docks and Dollars

The dock crisis and the dollar crisis have trodden insistently on each other's heels in Westminster throughout a week that culminated in two successive full-dress debates in the House of Commons. On Wednesday the House set aside its other business to debate the proclamation of the State of Emergency, and the regulations made under it. On Thursday it embarked on a two-day debate on the economic situation which will be continued next Monday. Of the two the immediate, local and comprehensible issue of the dock strike gained the most attention, particularly on the Labour benches, where the questions involved have stirred up deep feelings. The debate on the strike was of a high quality: it was one of the rare occasions on which members were aware that their words could directly influence events, and they responded accordingly. Had a debate of this character been held a week earlier, dragging the facts of the dispute into the clear daylight, the proclamation which occasioned it might possibly have been unnecessary.

If Thursday's economic debate did not elicit the same high quality, Sir Stafford Cripps's announcement of a cut of 25 per cent in British imports from the dollar area made it unexpectedly dramatic. Although the Chancellor attempted to palliate the gravity of this decision and its effect upon the public by reaffirming his intention to cling to the present value of sterling, full employment and the housing programme, the cuts in sugar, timber, paper and tobacco will make the public at least dimly aware—in spite of the increase in meat, butter and bacon—that something is amiss.

* * *

Two Sisters

This week, while Mr Strachey was heckled once more in the House of Commons about the prospects of the Overseas Food Corporation's groundnut scheme, the first report of its sister corporation was being presented to Parliament. The sisters are twins, for they both originated in the Overseas Resources Development Act; but they are not identical twins, and the different temperament of the Colonial Development Corporation is clearly brought out in this report.

On growing groundnuts in Tanganyika, Mr Strachey informed the House this week, the Overseas Food Corporation has spent

between £20 million and £25 million of capital to date—and the result so far has been 45,000 acres planted at Kongwa, with a yield, from the crop so far harvested, of 245 lb. per acre for groundnuts and 99 lb. for sunflower; shortly the first small shipment of oilseed to the United Kingdom will be made.

The Colonial Development Corporation, whose borrowing powers of £110 million are twice as big as those of the Overseas Food Corporation, had, by the end of last year, spent £128,667 on development expenditure; its total capital commitment in respect of the undertakings in operation is £3,734,000 (including £700,000 for rebuilding Castries); and the prospective capital commitment of all the projects which have been accepted in principle is £35 million.

Even without the evidence of these figures, it is clear from the report that whereas, on its Tanganyika performance, the Overseas Food Corporation is the manic, impulsive type, so fond of power that it tried to run the groundnut scheme direct from London, the Colonial Development Corporation is cautious, hesitant and introverted. The one rushed at a large tract of Africa with a second-hand tractor, and when it was broken discarded it for another. The other, when establishing a poultry and general farm in the Gambia, provided adequate repair and maintenance facilities before it began clearing the bush, and is taking the opportunity of testing different techniques for clearing and the different equipment available while the project is being carried out. Its slightly schizoid personality is apparent in the paragraph of its report dealing with its relations with other bodies—Departments and Colonial Governments; it obviously has not found it easy to get on with them and it inclines to resent the controls on its activities.

It is too early to say which corporation will, in the long run, be more successful, or less unsuccessful, in developing Africa. The cautious method seems preferable; but it carries with it the danger that before any fruitful development is carried out, political events in the colonies will have outrun it. This much, however, can be said at once: the Colonial Development Corporation is far less free with the British taxpayer's money. And that, at the moment, is of supreme importance.

* * *

Transport Workers' Purge

The decision of the Transport and General Workers' Union to debar any Communist from holding office is bound to have far-reaching effects in the labour movement, quite apart from its immediate internal effects within the union. The union can certainly claim that it is carrying out the letter and the spirit of the TUC's anti-Communist circular in a way which no other union has so far had the courage to follow. Mr Arthur Deakin, whose hatred of the Communists amounts almost to a mania, is undoubtedly immensely pleased by the size of the majority which the conference gave to this step.

The practical and psychological effects of the decision are somewhat difficult to gauge. There are, it is believed, eight known Communists on the union's Executive Council. Some of the area and group officials are believed to be Communists, particularly in the London bus and docks groups, and the number of Communist-inclined branch secretaries may be considerable, whether or no they are actually members of the party. It will be difficult to identify those who ought, by the terms of the resolution, to be purged, and in any case identification may be dangerous. It may tend either to turn the Communists into martyrs or to drive them underground. Freed from any responsibility for union policy, the Communist element may become more truculent and act as a "fifth column," agitating and provoking strikes on a wage scale, as indeed they are already doing in the London docks.

In the context of the London dock strike, however, the Transport Workers' action is very understandable. Mr Deakin certainly swept all before him at his union's biennial conference. In addition to the anti-Communist motion, he secured overwhelming support for the TUC's policy with regard to wages and towards the World Federation of Trade

Unions. Indeed, the absence of any effective critical opposition, apart from the vociferous Communist minority, is not altogether healthy in a union of the size of the Transport Workers. The trouble is that the unofficial critics are "voting with their feet," and if Mr Deakin could exercise the same restraining influence unofficially as he does officially, the prospects of industrial peace would be enormously improved.

The wisdom of a similar decision on Communism in the case of the miners would be open to doubt. Mr Arthur Horner, since his row with Sir William Lawther last autumn, has abided loyally by official union policy, whatever his personal inclinations might be. His defeat in the nominations for the TUC General Council indicates, without the need for any formal ban, the contempt the miners are requiring for Communist policy.

* * *

Tito's Tit-for-Tat

Marshal Tito clearly believes in tit-for-tat as well as in the dictum that a stitch in time saves nine. In Paris this time last month Mr Vyshinsky was quietly withdrawing his support for the Yugoslav territorial claims against Austria, thereby mollifying the western Foreign Ministers while further enraging the much affronted Marshal. Now Tito has announced that he will "completely close" the Yugoslav frontier with northern Greece, thereby cutting off some of the Greek Communist rebels from valuable lines of retreat and supply. This further weakening of the Communist cause should stimulate morale in Greece and throw most of the burden of intervention there on Bulgaria, which has troubles of its own described in an article on page 139.

It would, of course, be surprising if the American and British representatives in Belgrade had not hinted in the last year that they could hardly give Tito the credits and goods he now wants if assistance to the Greek Communists continued to force Athens to look to London and Washington for more military and financial aid. The cold war is costly enough without indulging in extravagance of this kind. Tito may have anticipated formal representations from the western governments, and so made it possible to claim—as he did at Pola last Sunday—that loans from that quarter will secure from him no political concessions, especially over Trieste.

Jugoslavia is busy negotiating official and unofficial credits and trade arrangements both in America and London, though hardly in the astronomical figures of dollars and pounds mentioned recently in the press. The International Bank has been asked for a loan; a five-year trade agreement with this country seems probable, in spite of the difficulty of ensuring delivery of capital equipment and complete plants that the Yugoslavs want; both American and British business men are busy with schemes of oil and steel production; and France and western Germany have come into the field as suppliers of machinery.

In short, Tito is making fairly rapid progress in getting from the west those vital things for the industrialisation of his country which the Russians and their allies now deny him;

but he has yet fairly to face the problem of what he is going to send in return. Can the metals be mined, the timber cut, and the maize diverted from the countryside in sufficient quantities to foot the bill for industrialisation. And, strategy and politics apart, is it good business for the west to encourage the kind of plan to which Jugoslavia is working, a plan in which there is no real planning of foreign trade and only eight per cent of the investment programme is earmarked for agriculture?

* * *

Prospects of the Greek Rebels

If Tito's speech at Pola is to be interpreted as a declaration of new policy rather than as a public acknowledgement of the less active interest he has lately shown in Greece, then there should be deep sighs of relief in Athens. If Yugoslav frontiers with Albania and Bulgaria are to be effectively controlled, especially where they abut on Greece, then effective rebel activity along 150 miles of the northern frontier should be gradually paralysed. During the coming months the main operations of the Greek army will indeed be concentrated on this area and the much disputed Grammos Mountains. For the Peloponnese is said to be clear of rebels, Thrace no longer counts for much strategically, and central Greece has been suffering nothing worse than intermittent mine-laying.

The divisions and uncertainties among the Greek Communist rebels since they lost the leadership of Markos have played right into the hands of their opponents. Their tactics have been disastrously clumsy. Within four days last week their radio accused Tito of infiltrating the Macedonian national front, of allowing Greek Government forces to cross in and out of his territory in pursuit of rebels, and of acting as the tool of the Americans. It was natural enough that the rebels should pursue the vendetta of their Cominform employers against Tito, but the timing of these accusations was unwise. They have given Tito an excuse for breaking with them publicly just at the time when he is complaining strongly to the United Nations of frontier violations by Greek Government troops and aircraft. In fact, the rebels have enabled him to threaten the "monarcho-fascist" government in Athens with one hand and to do it a signal service with the other.

The pattern of postwar relations in south-eastern Europe is very slowly changing under the impact of economic needs and political rivalries. The time may yet come when statesmen, both in Athens and Belgrade, can be induced to recognise the lesson of Balkan history: that when they are threatened by Albania and Bulgaria as satellites of a Great Power they must stand together.

* * *

Australian Strikes

The general coal strike in Australia shows no sign of ending. Indeed, each day produces more evidence of the miners' determination not to surrender. The imprisonment of the Communist leaders on charges of contempt of court and the dramatic search by the Federal police for the hidden strike funds have made no difference. If anything, the court sentences, the police action and the legislation at Canberra prohibiting the use of trade union funds for the strike, have merely stiffened resistance, and there now seems every prospect that the strike will continue for several weeks at least.

As our Melbourne correspondent points out on page 140, the grievances of the miners are deep-seated. They bear little relation to the causes of the present strike, but the violence of public reaction against them during the past few weeks seems to have aroused old emotions and the idea of revenge for the eighteen months "lock-out" in 1929 is not far absent from their thoughts. The miners have always believed that everyone outside their ranks regards them as social outcasts;

the more politicians, press and public rail against them in the present crisis, the more determined do they become to stick together like a band of medieval outlaws. It is, of course, an ideal situation for Communists to exploit, but it would be a mistake to credit Communism with being the chief inspiration for the strike.

In such exceptional circumstances, is the Federal Government's policy the right one? Is it not possible that Mr Chifley has played into the Communists' hands by exclaiming so vehemently against the miners? The flouting of the arbitration tribunal could not have been allowed to go unpunished, but were the extraordinary police raids, which went on simultaneously with the legal proceedings, really necessary? It may be that the miners are now so embittered that nothing the Government can do will have any effect, but if a Labour Government will not promote conciliation, it is difficult to see who else can.

* * *

Miners' Wages

Although the National Union of Mineworkers decided at their conference last week to press for a "substantial increase" in the minimum wages of lower-paid men, it is by no means clear exactly what this decision will amount to nor how it will be implemented. Communist speakers, such as Mr Moffat and Mr Pearson of Scotland and Mr Davies of South Wales, left the delegates in no doubt about how they interpreted the resolution. But from the attitude of the Executive's speakers, including Mr Arthur Horner, it appears that what the union will aim at is a limited adjustment.

The miners' leaders know very well that even if they were to press a claim on the lines of the resolution submitted by Cumberland, calling for £1 a week increase in the minimum rate of surface and underground workers, it would stand no chance. Mr Horner's remark that it was harder to get a few thousands out of the Coal Board today than it was to get millions two years ago was very significant. Rather than risk a flat rejection of the claim, and be accused of ignoring the TUC and Sir Stafford Cripps, the union will probably try to secure a revision of the cost of living arrangement (still under discussion) in such a way as to benefit the lower paid men alone.

In the meantime the union is gradually proceeding with its plans for the overhaul of the industry's wage structure. One interesting feature which emerges is that, unlike the railwaymen and many craft unions, the miners are thinking along the lines of reducing, instead of maintaining, the "differential" between the lower and the higher paid men. Not the least of the anomalies in the existing wage structure arises from the practice of payment in kind, especially by concessionary coal. How this will eventually be solved is not known, but Mr Horner hopes that the districts will agree to an immediate temporary arrangement so that the Lancashire and Cumberland problem can be settled. This involves sharing out supplies, and some of the more favoured districts, for instance, Durham and Northumberland, will have a chance to show whether in this respect they can place the national interest above their own particular advantage.

* * *

Britain's Forests

The annual report of the Forestry Commissioners for the year ending September 30, 1948, draws attention to the heavy overdraft that is being made upon the country's stocks of standing timber. The quantity of timber licensed for felling during the year covered by the report amounted to 67 million cubic feet, an increase of 12 million cubic feet over the previous year. This has been estimated (not by the Commission) as a rate of felling about three times as high as in a

prewar year, and about five times as high as the current rate of growth. This of course is due on the one hand to the requirements of the housing and mining programmes, and on the other to the necessity of limiting timber imports from hard currency countries. But it can not go on for very much farther without danger to the security of the country. Over 65 per cent of the woodlands in Scotland, 45 per cent in Wales, and over 30 per cent in England are now classified as felled, devastated or scrub.

In 1945 the Forestry Commission recommended that within fifty years Britain should have 5,000,000 acres of woodland. According to a preliminary survey there are now about 3,400,000 acres of woodland, of which the Government estimate at least 2,000,000 are suitable for the economic production of timber. Various targets have been laid down for planting both by the Forestry Commission and by private owners. Both have so far fallen short of their targets by about twenty per cent although the pace of planting, which was delayed by damage to seedlings in the spring of 1948, is now increasing. A debate in the House of Lords on Wednesday produced a gentle chiding from the Government on the reluctance of private owners to fall in with the Government's scheme by which woodlands are dedicated to timber production in perpetuity in exchange for a modest amount of assistance. This produced a sharp chorus of protest from noble Lords (both "backwoods" and front bench) against the meagreness of the official assistance in undertaking large schemes of capital development on which no return could be expected for two or three generations. The attack was pressed further to show how little incentive the present controlled price of timber provides to the participants in forestry. It is doubtful whether the incentive to efficient replanting in this country can be provided without either extending the system of capital grants or rearranging the price controls.

* * *

Report on Romney Marsh

The Agricultural Land Commission has completed its investigation of Romney Marsh, the first large area referred to it by the Government. The object of the inquiry was to determine what type of farming should be carried on in the Marsh, what capital equipment would be required, and whether public ownership was necessary for efficient farming. To the

last of these questions the Commission has returned an emphatic negative. Romney Marsh, most of which lies below sea level, contains a great variety of soils, some of which are poor but others highly productive. It is the home of the famous Romney Marsh breed of sheep and the better pastures, the object of local veneration and something of a mystery, can fatten from 6 to 10 or even more sheep per acre in summer. Before the war the Marsh was given over to sheep farming,

but wartime pressures—which included the compulsory evacuation of large numbers of sheep—resulted in the ploughing up of a large part of the Marsh, with good results. The Commission has now decided that most of the Marsh is so inherently fertile that this policy, instead of being reversed, should be further extended; it suggests that the tillage acreage should be increased to 20,000—40 per cent of the total area—and believes that this is compatible with stopping any further decline in the sheep population. The adoption of ley farming is strongly recommended.

These proposals are of more than technical interest. The Commission believes that local owners and farmers are capable of making the Marsh fully productive without further state intervention, so long as the necessary houses and other services are made available. It does, it is true, frown at the use of parts of the Marsh as no more than summer grazing grounds for upland farms. It also stresses the suitability of the Marsh for mechanical farming and the advantage of large units for this purpose—an advantage that is not fully realised by the present layout of farms. Nevertheless, no changes in land tenure are thought necessary despite the increase of production and permanent change of farming system which is recommended. This conclusion should dispel any suspicions that the Commission is a catspaw of the Government, and its activities a first step towards land nationalisation. Such suspicions were never warranted by the facts or by the Commission's composition. Nevertheless, it must be remembered that Romney Marsh is reasonably fertile and prosperous. It is with regard to much poorer and under-equipped farmlands that a case for public ownership may possibly be made out.

* * *

Initiative from the Philippines

The conversations between President Quirino of the Philippines and General Chiang Kai-shek at the holiday

resort of Baguio, near Manila, have produced one of the most surprising of recent political developments in the Far East in the shape of a proposal for a conference of "Far Eastern countries" for the purpose of forming an anti-Communist union. On General Chiang's side the motives behind this move are obvious enough. He went to Baguio not, it seems, as the representative of the Chinese Nationalist Government in Canton, but as leader of the Kuomintang, so his visit had only a semi-official character. His gesture is well calculated to provide a tonic to the depressed Nationalist morale, and General Chiang personally gains in prestige by being received with so much honour in the Philippines. It is worthwhile for him to grasp at any straw of hope for his cause. But it is more interesting to inquire why President Quirino decided to take this bold initiative. There can be little doubt that the act of policy was more or less prearranged, for it would have been most unwise of President Quirino to have encouraged China's ex-President to visit him unless there was a prospect of something being accomplished by their meeting, nor would Chiang have been ready to risk the humiliation of going to the Philippines and getting a snub for his pains. It is evident that President Quirino has been actively promoting the project which the two leaders have now publicly proclaimed. One reason is probably his growing alarm at the possible repercussions of a complete Communist victory in China on his own country, where there is an active Communist movement. Another is perhaps his desire to show his independence of the policy of the United States, a desire which has been strong among the Filipinos since Washington so markedly disregarded their interests in unilaterally terminating reparations deliveries from Japan. Thirdly, it may be that President Quirino has conceived the idea of gaining for the Philippines a position of leadership in South-east Asia, east of Singapore.

Apart from Nationalist China, the countries most likely to respond to such a lead are Indonesia and Siam. The Filipinos have been very sympathetic to Indonesian nationalism and

★ FOR AIR-MINDED CHAIRMEN AND DIRECTORS

South Americans like to do business with men they know

YOU KNOW from your own experience in South America what a vast influence the "personal touch" has on business there. That's why it's so desirable that not only you, but also senior members of your staff, should as often as possible pay flying visits to your South American markets. British South American Airways operate the most frequent — and therefore the most time-saving — air-service to principal cities in South America. B.S.A.A. aircrews — which include a steward and a stewardess — are among the most highly trained and experienced in the world.

SPECIMEN FARES

From London to	Single	Return
Rio de Janeiro	£173. 14	£312. 13
São Paulo	£177. 8	£319. 6
Montevideo	£192. 11	£346. 12
Buenos Aires	£194. 16	£350. 13

Subject to alteration

Fast services also to the West Indies, Natal, Panama, Lima and Santiago.

It's often cheaper to ship by air

Lower insurance, packing and warehousing costs — and also, in shipping to countries that assess Customs Duties by gross weight, the lighter packaging — mean that air freight to South America is often actually cheaper than sea freight.

Business by Air - by

BRITISH SOUTH AMERICAN AIRWAYS

Information and Reservations, at no extra charge, from travel or freight agents, or from British South American Airways Corporation, 9, 11, Abchurch Lane, London, W.C.1. (Telephone: REGENT 4141)

a vague "Pan-Malaysian" sentiment serves to create a sense of solidarity between the two archipelagos, while the Indonesian Republic's own feud with Communism may draw it towards the idea of a regional anti-Communist grouping which would not be planned or underpinned by the Dutch. Siam, with its large Chinese immigrant population, is very apprehensive of the present course of events and might be disposed to support the Filipino initiative. Some skilful diplomacy will be needed if anything solid is to emerge from President Quirino's project, but it is a move in the right direction, for the western nations will be badly handicapped in their efforts to check the advance of Communism in south-east Asia unless the independent and quasi-independent nations of the area themselves undertake a measure of political co-ordination.

* * *

The Future of Formosa

General Chiang's journey from his stronghold in Formosa to the Philippines has made more urgent than before the question of the future of Formosa, which until a peace treaty is signed with Japan remains in international law Chinese-occupied Japanese territory. At present the island serves as a refuge for Kuomintang officials and their families from northern and central China, as a dumping-ground for Nationalist troops, said to number 300,000, brought there from the mainland, and as a base for the Nationalist naval blockade of Shanghai and Tientsin which is being operated to the considerable discomfort of the Communists and the serious detriment of British and American trade. So far Chiang and his lieutenants who rule Formosa can claim to be there as adherents

of the Nationalist Government in Canton, and in accordance with the original agreement for a Chinese occupation of Formosa in advance of a Japanese peace treaty. But the Chiang regime in Formosa is largely independent of any external authority, and if the Communists were to capture Canton, thus bringing about the collapse of the Nationalist Government on the mainland of China, the Nationalist position in Formosa would become dubious in law and precarious in fact. The island, which was developed economically by the Japanese to standards far above those of the Chinese mainland, normally has a flourishing export trade, but it probably cannot sustain for long, at least without foreign aid, the load of non-productive officials and soldiers which has now been piled upon it. There is no immediate prospect of the Communists being able to launch a serious overseas invasion of Formosa, but if the Nationalist command ceased to be able to pay and feed its troops (whose homes are on the mainland), mutiny

would certainly not be long in breaking out. The situation is further complicated by the tensions which have existed between the Formosans and the intruders from the mainland since the capitulation of Japan. The Formosans rose in revolt in 1947, but were suppressed with great severity. This was not a Communist but a provincial autonomist insurrection, and a strong desire for at any rate temporary independence is reported to exist among the Formosans. They were always an unruly element in the Chinese state and after fifty years of separation from China under an oppressive, but efficient, alien administration, they have no desire to be exploited by "liberators" from the continent, whether Kuomintang or Communist.

Nobody so far has paid any attention to the wishes of Formosa's inhabitants, but it is arguable that they should be considered. The agreements made with the Nationalist Government about the provisional postwar occupation of Formosa would lapse if recognition were at any time to be withdrawn from it, unless these agreements were specifically to be renewed in favour of a Communist China; meanwhile, ultimate authority would revert to the Supreme Commander of the Allied Powers as part of his responsibility for all Japanese territory. The Americans, if they wished to do so, could provide sufficient protection for a Uno Commission to hold a plebiscite of Formosans on their future. But there is so far no indication that Washington now contemplates any Far Eastern policy involving new activity. If there are any misgivings about Formosa, however, they may emerge in the expected State Department White Paper on the Far East.

Benelux in Peril

No one is anxious to rush in with an obituary notice on the Benelux Union so long as there exists any hope of breathing life into the invalid. Unfortunately that hope is very fragile. Benelux seems destined to become the latest victim of the growing cleavage between the dollar and the non-dollar worlds.

From the start it was recognised by the members of the projected union—Holland, Belgium and Luxemburg—that the chief obstacle to their efforts was Holland's large trade deficit, both with Belgium and the western hemisphere. Although it was plain that no cure was in sight for this deficit, the three partners issued a brave statement last spring, declaring a state of "pre-union" to take effect on July 1st of this year and postponing the date of final union until July, 1950.

The deadline for the "pre-union" has now passed with no sign of agreement on the gradual decontrol of Belgian imports into Holland which was supposed to accompany this introductory step. The immediate difficulty is the question of Belgian credits. To effect even a modest step forward, it is essential that Belgium grant additional credits to Holland beyond those extended under the intra-European payments scheme. This it is willing to do, provided the bulk of the money is spent on such "inessential" Belgian goods as textiles. Holland hesitates because it would prefer to use the credits for "essentials."

A compromise on this relatively narrow issue may well be reached, but the larger problem remains. No amount of officially voiced enthusiasm and determination can erase the dollar line that runs through the heart of the potential union. To one side lies Holland, now closely associated with the sterling area and on the other are Belgium and Luxemburg, for all economic intents and purposes part of the dollar world. This division has recently become even more marked with the growing disparity between prices in the dollar and sterling zones; and the Dutch say that the necessity to buy expensively in the sterling area has put their industry at a competitive disadvantage with the Belgians, who are free to buy in the cheaper dollar markets.

In present circumstances no one can blame the Belgians for their mounting scepticism toward Benelux. Marshall aid now finances directly most of Holland's dollar deficit and indirectly a substantial portion of its trade gap with Belgium. If this help tapers off and vanishes before Holland is able to pay its own way, then Belgium would have to shoulder the entire burden. It looks very much, therefore, as if complete union awaits a solution to the whole economic dilemma of the western world.

How Many Women to Teach?

Two points stand out from the Ministry of Education's Working Party Report on "The Supply of Women Teachers."* The first is the growth in the number of girls who must stay on at school till 17 in order to provide recruits for teaching. The second is the evidence of the inequality of treatment accorded to men and women teachers.

On the first point the report states that by 1952 the schools will want 11,000 women to enter the teaching profession each year. In 1948 there were only 14,000 girls aged 17 to 18 in secondary schools (beside a small number in independent schools), out of a total age group of 293,000. To meet the demand it is hoped that the numbers staying on at school will rise to 20,000 in the 17-18 age group. This compares with 6,000 in 1938 and 10,000 in 1946. The present rate of growth is rapid, but will it be possible to sustain it? The Minister of Education has already urged all the education authorities to encourage boys and girls to stay on longer at school, but without making a corresponding provision for receiving them. To double the numbers who stay on at school after the age of compulsory schooling between 1946 and 1952 would mean some 170,000 more places. Having progressed about half-way to this goal the schools are bursting. Quantitatively these demands are small compared to the million places which will be required by 1953 to meet the demands of the higher birth-rate, but qualitatively they are very important.

As far as sex discrimination is concerned the ghosts of the suffragettes could stage another battle. Not only is pay still unequal for an equal job, but the prospects of promotion are much lower for women than for men. Many authorities will not allow women to become the heads of mixed schools, nor allow them access to the ladders of educational administration. It is doubtful if many girls at 18 look this far ahead at their prospects of advancement, but the contentment of those who are working in the schools must affect the attitude of those who are considering entering this profession.

* * *

State Holidays?

No; not exactly State Holidays. Mr Chapman, author of the Fabian Society's new pamphlet on the subject,* is aware that there are limits to what can or should be provided free by the state, that holidays are "probably" well outside them and that regimentation is the ruin of the holiday spirit. He is, however, in favour of state intervention without "really major" expenditure and "with only a more subtle assistance to personal effort and initiative"; for while holidays, through the holidays-with-pay movement, are conceded as a right to the majority of the working-class population, they remain out of the reach of many of them. It might seem hard to reason from the proposition that certain persons have achieved the right to stay away from work for a given period without loss of pay, to the proposition that they have thereby gained the right to a subsidy for their chosen activities during that period.

Given this proposition, Mr Chapman's proposals are sensible enough, and the statistics on which he bases them—of holidays taken and forgone, of types of holiday preferred, of costs in

* "Holidays and the State," by Donald Chapman. Fabian Society. 24 pages. 1s.

guest-houses, hotels, hostels and camps of various kinds—would be interesting in any context. The state should content itself with shouldering (through a Holiday Council) the capital cost of holiday accommodation, mainly in the form of camps which should then be leased to non-profit-making bodies like the Workers' Travel Association and the Holiday Fellowship, and left to pay their own way. Alternatively, or in addition, there could be cheap family rail fares and a special holiday family allowance. Five to ten million pounds a year, it is estimated, would cover the cost; and the entire foreseeable excess of potential demand for holidays would be safely covered.

One must admire the neatness with which so much extra happiness is conjured out of thin air. But the conjuring act will not bear analysis. Mr Chapman rightly states that "it is no longer possible to plan for expanded social services out of taxation of the rich." Collectively financed amenities, then, must be paid for out of taxation of the masses. He demonstrates that the masses are unable to extract from their pockets, as individuals, the whole price of an annual holiday; so he proposes to remedy this inability by extracting the difference in taxation and returning it as a holiday subsidy. He sees no difficulty in sparing for the Exchequer the identical sum which a working family cannot afford to pay Mr Butlin. "No collective expense is a burden" is his underlying assumption and it is a typical assumption of Fabian Socialism. It is writ small in "Holidays and the State." In the recent history of the social services it is writ large.

* * *

Semi-blockade of Berlin?

The Paris meetings of the four Foreign Ministers ended in a palpable though fairly rosy fog. The communiqués tended to speak of readiness to co-operate in order to restore a situation in which contacts might be re-established with a view to etc., etc., . . . but it was nowhere defined very precisely what the really specific aims of the *détente* would be.

It is now beginning to become clearer, however, that the Russians had some pattern of procedure in view. Their general aim appears to be, as Mr Vyshinsky underlined in his account of the conference, to give the impression that the Paris meetings were a great triumph for Soviet commonsense over "the hysteria and warmongering of the Western Powers." Specifically, they regard the Paris agreements as the first step towards pulling the two halves of Germany together, to increasing East-West trade—on their own terms, naturally—and to persuading the authorities in both zones and in the Berlin sectors to fuse with each other. Accordingly, they have attended meetings of the Deputy-Governors, and have urged meetings of the four Berlin Commandants, while Herr Rau, the President of the Economic Commission in the Soviet Zone, has invited Dr Pünder, the Director of the Economic Council in the West, to join with him in setting up an Economic Commission for all Germany "in accordance with the Paris agreements."

Why, then, was this love feast interrupted by the Russian decision to concentrate all German road traffic on Helmstedt, and to permit only four lorries an hour to pass the check point? No explanation has come from Berlin, where there is the customary bland ignorance of events outside the Soviet Zone. The Western Powers must, as usual, present their protests and make their own guess. It may well be that the partial restoration of the blockade—removed as suddenly as it was imposed—was a Russian reminder that they still hold the whip, and are prepared to use it if the Western Powers do not hurry along with them on the new path of sweetness and light. The American controlled radio in Berlin has begun a new attack on Russian police and spy methods, and the British have circulated a derogatory account of the Soviet Zone economy. This departure from "the spirit of Paris and Potsdam" which runs like a refrain through Russian propaganda may account for the new turn of the screw at Helmstedt.

Splinter Parties in Germany

In a month's time the candidates will be elected for the Assembly of the new Federal Republic of Germany. The first round of the election campaign has already opened. One of the most important questions to be answered on August 14th will be the extent to which the numerous, small independent "parties" succeed in securing representation in the *Bundestag*. The scales have been heavily weighted against them by the electoral law, which was framed to prevent the new government from being weakened by a large number of splinter parties. Military Government law, too, has always hindered small, neo-Nazi "parties" from organising themselves. Before a party can obtain a licence, the law demands from it a specific programme and democratic elections to the executive committees. Few of the neo-Nazi groups can qualify in this respect; almost without exception they are formed by a self-elected chairman, who proclaims a programme denouncing the wrongs done by the Allies to the Germans. Most appeal particularly to the refugees, the ex-soldiers and the ex-officers.

Last month an attempt was made to overcome the handicap of the electoral law by organising support for "independent" candidates put up by any of the various nationalist groups. At the invitation of Joachim von Ostau, a well-known would-be organiser of neo-Nazi parties, about thirty individuals met at Bad Godesberg and issued an appeal to Germans not to allow themselves to be splintered into refugees and residents, have and have-nots, "those who are affected by the denazification laws and those not affected," or any of the other existing divisions. They were asked to vote for the "Independents" as the champions of German unity, honour and rights "to which they are entitled as a decent and illustrious and highly-civilised people." The supreme right thus claimed is the restoration of a united Reich "within its old-established frontiers."

Such appeals meet with widespread response. It was symptomatic that the *Deutsche Rechtspartei*, a small neo-Nazi party which was banned by the British in Lower Saxony,

succeeded shortly afterwards in having its candidates elected under the sponsorship of the only slightly more democratic *Deutsche Partei*. A similar portent showed itself when a moderate Christian-Democrat Minister was recently howled down at a meeting in Hesse.

Not all these vague "parties of the partyless," as they were once called, have a clear-cut, neo-Nazi composition. The *Deutsche Union*, for example, one of the largest "super-party" groupings, is a conglomeration of different views, ranging from Nazis to idealistic cranks. And the individuals concerned are constantly shifting in a kaleidoscope of small, highly personal "Circles."

The political mass in Germany has, in fact, not yet solidified; but the prospect that it will show a preference for a truly democratic shape cannot be said to be good. It is a regrettable fact that, in the past four years, the big political parties—the Christian Democrats, Socialists and Liberals—have failed to win a hold on the German public.

* * *

Tired of Refugees?

"The world is tired of the refugee problem." This comment by an observer at the meeting of the general council of the International Refugee Organisation in Geneva last week seems unfortunately to be completely justified. The council decided to taper off its activities gradually until by June 30, 1950 (when its three-year mandate ends) they will be almost entirely closed down. The refugee problem is hardly within sight of a solution, yet it appears that in less than a year there will be no international organisation responsible for it.

When the preparatory commission of the IRO began operations on July 1, 1947, it took over the direct care of about 704,000 refugees and displaced persons in Europe, the Middle and the Far East, and assumed responsibility for protecting the interests of about 900,000 others. With its limited financial resources it has done a great deal. But it can neither compel unwilling governments to accept larger numbers of immigrants, nor can it prevent the steady influx of new refugees from behind the Iron Curtain as well as of older ones who for one reason or another are no longer able to support themselves independently. The result is that on June 30, 1950, there will still be about 304,000 persons registered with the IRO of whom about 172,000 will be receiving care and maintenance.

These 172,000 represent the "hard core" of refugees but only about 11,000 of them are so sick, aged, or handicapped that they must remain permanently dependent on charity. The remainder have been rejected as immigrants for a variety of reasons, but most of them are not permanently unemployable and if governments will not follow the good example of Australia, New Zealand, the Netherlands and Norway and accept a "fair share" of them, much could still be done through training and rehabilitation courses to make them into more desirable immigrants. But if they are thrown on to the local economy, which in the majority of cases will be western Germany, their future is indeed black. The record of the Germans with their own refugees from the eastern provinces leaves much to be desired.

Mr Hallam Tuck, the retiring Director-General of the IRO, has never made any secret of his belief that some international organisation will be needed to carry on where the IRO leaves off; to co-ordinate voluntary relief work even if it does not carry out any itself; to stimulate, even if it does not operate, resettlement programmes; above all to provide the legal and political protection which only an international organisation can provide for stateless refugees. If governments will not help them in the most obvious and practical way—by relaxing their immigration laws—it is all the more incumbent on them to make what other provision they can. It is to be hoped that the delegates to the consultative assembly of the Council of Europe will give their governments a sharp nudge to see to it that the Western world sets up its own "Nausen office."

Aluminium gets a bodyguard

Whether it is milk churns or chairs—boats or beer barrels—aluminium is just the thing. The normal manner of joining aluminium however by gas welding necessitates time and labour being spent on post weld flux removal. The British Oxygen Company has overcome this problem by developing the ARGONARC welding process which is completely "fluxless". The ARGONARC torch is a simple, efficient tool in which the source of heat, a tungsten arc, is given a "bodyguard" of the inert gas ARGON. This protects the molten weld metal from atmospheric corrosion and gives perfect results—not only with aluminium but with certain other light alloys too. Just another B.O.C. contribution to modern production techniques.

COMPLETE ACCOUNTING CONTROL when accounts are in PERPETUAL BALANCE

"Perpetual Balance" comes automatically with Underwood Elliott Fisher Sundstrand Accounting Equipment. Instead of a hectic end-of-the-month rush, all accounting routine is balanced and proved each day with mechanical control over accuracy. All related records are posted simultaneously by one simple operation, vital figures always to hand. Statements go out promptly, get paid quicker. Applicable to any type of business these versatile machines are an investment in efficiency.

UNDERWOOD SUNDSTRAND CLASS 'D' ACCOUNTING MACHINE. An all-purpose, fully automatic Accounting machine.

Smoke Abatement

Looking over Manchester on a calm morning, and marking one tall chimney after another belching forth its dark grey smoke, till the town is enveloped in a dull, leaden-like cloud, hiding even the sources of the pollution, it is impossible not to regret that the face of nature should be so obscured, and not to wish that the bread-winning operations of millions could be successfully carried on without imprisoning us all in their dense atmosphere of smoke. No one who has seen this can feel the least surprise that the legislature, which has received from the people a commission to banish evil from creation... should resolve to put an end to the smoke nuisance...

We are quite aware of the many ingenious contrivances that have been announced to put a stop to smoke rising in the atmosphere. All kinds of industrial furnaces can be made, it is supposed, to consume their own smoke; and, as visible smoke is only unconsumed coal, it would be a saving of fuel, an increase of heat at a diminished cost, were the smoke to be consumed... But if it be such a saving to consume the smoke, and the new contrivances for effecting it are so ingenious, why do the owners of furnaces not adopt them?... If the matter be so easy as it is represented by the inventors of smoke-consuming apparatus and their patrons, it would no doubt be done without the interference of Parliament. It is only required to interfere to make people do what they are averse from: it is never required to make laws to compel men to eat, or acquire riches. These come of course: so would burning smoke if it were practicable and advantageous. The presumption, therefore, is that it is not, and the best friends to the consumption of smoke must be anxious that the Parliament should not weaken its authority by requiring that to be done which is not practicable.

The Economist

July 14, 1849

The fable of the logical leopard

A Young Leopard came back to his forest from a tour of the civilised world. "Mankind," he declared, "is restless, bald, unhealthy, obstinate, short-sighted, spindle-shanked, intemperate, verbose and inquisitive, forever troubling its brains and fingers. I saw nobody as beautiful as myself."

"And what did you learn?" asked his friends.

"Nothing whatever!" said he. "After all, I'm only a leopard."

Man, whatever his defects, has resources denied to every other creature. When he neglects them, he fails: when he uses them, he has a chance to flourish. And the things that TI make, from huge pressure vessels to complex precision tubes, from parts of aeroplanes to complete bicycles, from paints to wrought aluminium alloys, electric cookers to metal furniture, are tokens of British leadership in the realm of human ability.

Letters to the Editor

Terminus or Turning Point?

SIR,—Whatever may be true of the Government's handling of this "moment of supreme crisis" it is clear that *The Economist* has itself reached a terminus in its thinking—a terminus with no turning except backward along a demolished track.

Surely it is obvious that the world has moved on since 1931, and that to offer nothing but deflation and removal of controls in promise of a return to "normal" methods of trading is merely to re-prescribe the cure that did not save the patient?

Two facts in the present situation stand out. First, that everywhere private or free enterprise is being superseded by state controlled economies. A process not initiated by the present Government, and which will continue if this Government are defeated at the next general election. Marshall Aid and the policies of European integration it promotes are excellent examples of the process at work in the United States as well as here.

From this it follows that solutions to trading problems must be sought that will utilise the prevailing tendency and not seek to run directly counter to it. It is more intelligent control that is required, not more abandonment to the haphazards of speculation.

Second, there is the transformation in the social status of the wage-worker. For good or ill, he has moved towards equality, and the balance of political power has shifted heavily in his favour. Because of this, successful economic policies must secure far wider willing co-operation than ever before. The alternative is not controlled unemployment, but destruction of democratic institutions and the growth of government by secret and open terror.—Yours faithfully,

GEORGE LAWSON

West of Scotland Labour College

SIR,—In your Leader of July 9th entitled "Terminus or Turning Point" you suggested a number of measures which the Government might adopt in the present crisis, among which were (a) a slashing of the Budget with a consequent relief in taxation, and (b) an abandonment of cheap money.

These two proposals appear to be inconsistent, for by allowing interest rates to rise you thereby place a heavier burden on the budget, by increasing the interest payments on the National Debt. This is not an unimportant factor. In 1948 the Consolidated Fund Services accounted for about 15 per cent of the total Government Expenditure, and this proportion would have been much greater if interest rates had not been kept low. With the debt at its present figure even a small increase in the rate of interest would raise the charge considerably, thereby nullifying reductions say in Civil Supply expenditure. Moreover, the debt interest could not be financed by borrowing without adding to the inflationary pressure, but would have to be met out of further taxation, which is what we are trying to avoid.—Yours faithfully,

M. FISHWICK

10 Ogden Road, Bramhall, Cheshire

[It is true that higher interest rates would increase the debt charge, but the effect can easily be exaggerated. The cost of the floating debt is the only part of the total debt charge that would go up at once; every one per cent increase in money market rates (and one per cent would be a big increase) would cost something less than £60 million a year gross. The rest of the debt charge would rise only gradually as the various stocks fell due for redemption—and even then only if interest rates moved to a permanently higher level—which is no part of the argument that they should occa-

sionally be used to correct an unbalanced situation. Moreover, almost all debt interest is taxed, so that the net increase might not be much more than half the gross. If low interest rates ceased to be a rigid fetish and became once again a general objective, to be pursued with variations according to circumstances, it is most unlikely that the change in policy would add more than 1 per cent net to the present total of the budget. It cannot really be held to impede the general policy of economy even in its direct effects—let alone its indirect repercussions.—EDITOR.]

Yes or No?

SIR,—My simple faith in *The Economist* is shaken. On the front page of *The Economist* of July 9th you say—with some emphasis—that "it is not true that the American economy is slumping." To suggest it is, is in your editorial view, a left-wing smokescreen of poison gas. But the poison seems to percolate into the same article two pages farther on—on page 59.

There I find that there is an American recession "which will turn into a world depression" if every country cuts down imports from the United States and seeks by every means to undercut its competitors. The existence of a recession seems here rather more than implied.

Farther on, on page 68, your editorial note on East-West Trade removes any doubts. "As the year wore on and the prospect of an American recession became a reality," you write in your accustomed incisive style, and on page 79 you discuss whether the President will follow Mr Keyserling's policies or "allow the recession to find its own bottom."—Yours faithfully,

JON KIMCHE

Overseas News Agency, 72-78, Fleet Street, E.C.4

[The explanation is even simpler than Mr Kimche's faith in *The Economist*. It is partly a matter of degree, partly one of tense. There is a recession in American business—that is, some slight falling away from the very high levels reached in the latter half of 1948. But there is no slump. Mr Kimche can, presumably, tell the difference between the end of a heat wave and a sharp frost. Several of the phrases that Mr Kimche quotes are in the future tense, while the extract from our first leader is in the present. There may be a slump next year—nobody can foresee what will then happen—but that does not mean there is one today. There is no scapegoat to be found in American conditions for Britain's present difficulty. If Socialist Britain was even half as prosperous as capitalist America is today—recession included—there would be no crisis.—EDITOR.]

Pedigree Breeding

SIR,—British agriculture, one of our high cost industries, is being subjected to a critical scrutiny from many angles. The quality of our livestock largely determines whether the stock farmer can produce milk, eggs, meat, etc., at an economic price. This factor of quality is largely dependent upon the degree of efficiency with which our pedigree breeders conduct their business. It is the role of the pedigree breeder to produce those superior strains of livestock which, in the hands of the farmer, improve the general level of production and lower the cost of the unit.

Very little critical work has been undertaken on the methods adopted by pedigree breeders. However, startling results have been published by the Milk Marketing Board in an analysis of the milk production record of half a million cows in 1948, comparing the yield of pedigree with non-pedigree cattle. The average pedigree Dairy Shorthorn cow gives 40 gallons more milk per annum than her non-pedigree counterpart. The

average pedigree Friesian cow in the same period averages 100 gallons more milk than the non-pedigree Friesian.

All this small increase in yield can be attributed to the better standards of cowmanship, better feeding, and housing devoted to our pedigree cattle, and the evidence is that the average pedigree cow is no more productive of milk from a hereditary standpoint than the non-pedigree. In fact, many farmers believe that these figures show that the use of an average pedigree Dairy Shorthorn bull in an average herd is likely to depress the milk yields of the progeny.

It would appear, therefore, that the average pedigree breeder of dairy cattle, after thirty years of consistent pedigree breeding, after the vast expenditure over the years on the showing of cattle and the whole expensive pedigree breeding set-up, has failed to produce cattle which in the hands of the average farmer improve his herd. Scientists have little difficulty in explaining this phenomena. They believe the methods of selection used by pedigree breeders to be largely fallacious. Pedigree breeders select their breeding animals by a combination of many different factors. The main emphasis is on the appearance and conformation of their animals, and in dairy cattle on the milk production of the dam and sire's dam. No correlation has yet been discovered between the appearance and conformation of the parents and the milk production of the progeny. The correlation between the pedigree of a bull or cow (mainly the dam and sire's dam's milk production) and the milking capacity of the progeny is well under 5 per cent, a poor basis for selection.

By and large these irrational methods of livestock selection hold true through the whole livestock industry, though to a lesser extent in the animals bred for meat production. In this field the United States is showing the way. This hatching season, Mr Henry Wallace, jun., in Iowa, has produced 15 million chicks, "tailor made" for high egg production which will lay an average of about 220 eggs per pullet. Such an average egg production is at least a 30 per cent improvement on the ordinary poultry in the United States, and all this increase can be attributed to the use of sound breeding methods.

In Britain the main bright spot is the usurpation by the Milk Marketing Board of the function of the breeders. The Board through their rapid expansion of artificial insemination has probably done more for stock improvement during the last 12 months than the pedigree breeders have achieved during the last 30 years.—Yours truly,

GEOFFREY SYKES.

Queen Manor Farm, Laverstock, Salisbury

Oppression in South Africa

SIR,—Your article "Oppression in South Africa" deserves to be widely read throughout British Africa but will you allow me to correct one error and to point out one omission?

The coloured vote in the Cape has not yet been abolished, as suggested by you. It is threatened in just the same way as the special representation of the Natives by three Europeans is threatened, but these two aspects of the franchise are protected by the entrenched clauses of the South Africa Act, which demand a majority of two-thirds of both Houses sitting together before they can be amended; a majority which the Government have not got.

They have endeavoured to show that this proviso no longer holds good, but Mr Havenga, leader of the Afrikaner party (General Hertzog's party), who holds the balance of power in the House of Assembly, has yet to be convinced of the validity of this view. But popular opinion is that he is weakening on this issue, in which case the Natives and the Coloureds will indeed be thrown overboard.

What you omitted was any reference to a particularly bare-faced piece of gerrymandering: the representation of South-West Africa, with 15,000 to 18,000 voters, by 6 members of Parliament and four Senators. For this purpose it is proposed

to renaturalise some 6,000 Germans who were deprived of South African (or British) nationality during the war, for very good reasons.

The net effect of this is that 3,000 South West African voters, or thereabouts, will return one Member of Parliament, about a third of the number required in the average South African constituency. One vote in S.W. Africa will be the equivalent of three in the Union. While 30 or more thousand British immigrants who arrived in the Union after July, 1947, will now have to wait three or more years to get their vote, and then only if the Minister of the Interior agrees, South African citizenship is being pressed on the Germans of SW Africa in time for them to vote in October.

As a matter of fact, many of these Germans proved unexpectedly reluctant to avail themselves of the Government's offer, when the status of British subject was linked with that of Union National. This is one of the reasons why the Government, in the teeth of United Party and English-speaking opposition, left out any reference to British subjecthood or Commonwealth citizenship in the Act just passed.

But it is quite possible that this Act may be a boomerang to Dr Malan. You are right in saying that in last year's General Election he gained quite an appreciable amount of British support, while in Kenya and Rhodesia not a few European settlers looked nostalgically towards what they called the Union's "realist" native policy.

Now by his action in forcing this Act through Parliament, he has united the whole English-speaking vote against him: while he may have disfranchised some 30,000 British immigrants at the next General Election, he has antagonised a far greater number of normally apathetic British South Africans: and the issue in South West Africa is anybody's guess. Not only has he mis-timed his action, but he has forfeited any right he may have had to be the spokesman for European opinion in British Africa generally, as his roving Ambassador, Mr de Water, has doubtless by now found out.—Yours faithfully,

Sunrising, Bulawayo.

ALFRED BEIT

South Africa's Finance Corporation

SIR,—In your comments on South Africa's Finance Corporation in your issue of June 11, 1949, additional criticism is levelled at the project on the grounds that, as the Union's present financial difficulties are due to a deep-seated excess of demand for capital in real terms—manpower, productive capacity and scarce imported materials—this disability cannot be remedied by the Corporation, which is a purely mechanical device. In fact, as the Corporation is inflationary in character, you believe that if it is successful in mobilising "idle" funds, it will exacerbate present difficulties by increasing the current pressure on limited and overstrained real capital resources.

It is true that the Union needs real capital in terms of your definition—it also needs at least £60 million per annum of overseas investment capital!—but it is misleading to imply that the present straitened real capital position is due to the basic excess demand for real capital.

Part of the present scarcity of real resources is the result of enforced expansion in secondary industries during the war and of a consequent unwholesome development which has been further fostered since 1945 by "easy" money, facile optimism and a sellers' market. Industry (and commerce) have grown at a rate and into a variety of occupations that would have been difficult to justify even if our home market—the only sound base for diversified industrialism—had been normally broad and reasonably homogeneous in its modes of living and shopping requirements. The local market is, in fact, as you know, narrow, and uniquely multi-racial both in its proportions and its heterogeneity of living standards and customs and, for the most part, poor.

Substantial gains in real capital elements, and in new investment capital, have been made by industry (and commerce)

at the expense of mining and farming. These capital elements have, however, not been lost, and even now manpower and productive capacity are trickling out of unduly distended sections of the Union's economy: this corrective trend would have developed in due course under stress of external competition, but it is probable that under pressure of the more precipitate deflation conjured up by the heavy decline in overseas money capital investment, the present trickle of real capital elements will become stronger.

It is just in this field and precisely at the present time that the Corporation with its investment emphasis on Government and Municipal, mining and industrial projects (in that order) may be unexpectedly useful in guiding displaced real capital elements into more prosaic but much-needed development in such items as roads, soil conservation, irrigation, railways, regional development, heavy and national industries and multi-racial national health.

The Corporation was designed to mobilise "idle" money resources; in that specific capacity in present circumstances it is open to criticism only on technical grounds as money capital is scarce and reserves are low.

If, on the other hand, the Corporation could be built into a dominant magnet for real capital resources, it need not be harmful; properly used, its competition with other capital users and seekers must add to investment stability in the Union by insistence upon greater selectivity in the use of both real and money capital resources.—Yours faithfully,

R. S. B. ROBINSON

King's Lyn, Llandudno, South Africa

[The diagnosis here is not in principle different from ours. The excessive development of "secondary" activities is a major cause of the disequilibrium in the "real" capital market, both through its demands for capital and for its encouragement to consumption. If the new corporation could in fact be so powerful a magnet as to stop the savings flowing towards the essential projects while reserving them for priority objectives, it might exert a constructive influence. But the first need is to curtail the aggregate demand, and we fear that the corporation will not only fail to assist this curtailment, but will actually intensify the real pressure.—EDITOR.]

The Late George Dimitrov

SIR,—There is an addition to your note on the late George Dimitrov which I think should be made, as I have not seen it mentioned in most obituaries published in this country. On one occasion Dimitrov denied complicity in the explosion in Sofia Cathedral (1925) for which 2,000 people were killed. Dimitrov is on record as saying:

"I remind you of the outrage in the Sofia Cathedral. This outrage was not organised by the Communist Party. Because of it the Communist Party was persecuted. Two thousand workers, peasants and intellectuals were savagely murdered on the assumption that the blowing up of the Sofia Cathedral was done by the Communists. This provocation was organised by the Bulgarian Police." ("Brown Book" on the Reichstag Trial, official publication of the Bulgarian Communist Party, 1946, Sofia, Volume 1, page 173, Bulgarian Text.)

As recently as last December, however, Dimitrov felt himself strong enough to admit indirectly a part in this outrage. I feel the reference is worth quoting as an instance of how history can be first falsified and then inadequately corrected. "The blowing up of the Sofia Cathedral was an ultra-Leftish mistake of the Military Leadership of the Communist Party. . . ." "The Fascist Bulgarian government continued its terroristic policy, exploiting the act of despair organised by the Military Leadership of the Communist Party in blowing up the Sofia Cathedral." (Official Communist Text of Dimitrov's speech published on December 20, 1948, page 3, column 3 and 4 of "Otechestven Front.")—Yours faithfully,

MICHAEL PADEV.

5 Lancaster Terrace, London, W.2

A Liberal Revival?

SIR,—Really, Sir, what next? If Sir Andrew MacFadyen is correct in saying that the Liberal Party has "never lost seats for want of a policy," can one draw any conclusion from the eclipse of the Liberal Party other than that the British public does not trust Liberal candidates, if elected to Parliament, to put their policy into effect? To conclude this is surely less generous than to say that it is the Liberals' lack of policy which accounts for their eclipse.

Since March, 1948, when Air Vice-Marshal Bennett lost his deposit at North Croydon, the Liberals have not dared to put up a candidate in any of the ten by-elections that have taken place. Why? Have they no policy at present? Do they not think that the public will trust them to carry out their policy? Or is Sir Andrew correct in saying that the Party is grievously hampered by want of the money which its rivals can obtain by sectional appeals?

My constituency of Lewes, in Sussex, is typical of four or five hundred others. We have 9,000 paying members of the Tory Association. The average person subscribes about half a crown, and several thousand subscribe as little as one shilling a year. Not only are we able to finance the Association, but we, like more than 200 other constituencies, are paying a considerable annual sum to help less well-off constituencies which must be won back if we are not to live in a Socialist State. I am not called upon, nor are my friends in the House, to pay anything towards election expenses or the annual budget of the constituency. At the last election in Lewes, 6,374 people voted for my Liberal opponent. He lost his deposit by half a dozen votes. He is standing again. Yet I do not know any principle which matters in politics which he and I do not share with equal sincerity.

If Liberal Members of Parliament after the next general election cannot be carried to the House of Commons in two London taxis without overcrowding, it will come as a great surprise to me.—Yours faithfully,

House of Commons, London, S.W.1 TUFTON BEAMISH

Working Party for Tin

SIR,—Forgive me if I encroach once more on your valuable space, but I cannot allow your footnote to my letter to go unchallenged.

Economists have always recognised that the demand for tin is, in its main uses, inelastic. The price of tin, for example, does not affect the world demand for tinplate. A shortage of steel can, on the other hand, limit the rate of tinplate production.

It appears that I did not word my argument regarding inefficient mining methods well enough to avoid ambiguity. When I stated that "low-cost production is in itself inefficient," I sought to imply that the production of tin by hand-washing of superficial ore deposits does not yield satisfactory results compared with mechanical methods of dredging. The former method, while apparently a low-cost one, is expensive by comparison. The theory that a fall in the price of tin would react against the large mining concerns to the benefit of the small ones is entirely erroneous.

As for lode-mining, this has always been a high-cost method of production. Bolivia is a case in point; and purchasers of Bolivian tin have recognised the need for an adequate remuneration to the miner.

Finally, you ask the cause of current over-production. I suggest three reasons. First: the pressing demands of the US stockpile. Second: the absence (as yet) of an international policy for tin. As a wasting asset, vital alike to industry and national defence, it assuredly requires one. Third: as a contributing factor, the harmful effects of prolonged US Government controls preventing full tin consumption in that country.—Yours faithfully,

ALDRIDGE CALDWELL, Editor

Books and Publications

The Rise of Tito

"Whirlwind." By Stephen Clissold. The Cresset Press. 245 pages. 15s.

THIS account of Tito's rise to power comes at a very appropriate moment, and provides an interesting and illuminating background to the present-day phenomenon of "Titoism." The book contains excellent and often detailed accounts of the Partisan movement as it grew up in Yugoslavia during the war and its development under Tito's expert guidance into a Communist dominated government for Yugoslavia after the war. The story of the many problems that Tito had to deal with in the different regions of Yugoslavia is particularly interesting. Owing to his methods of working the author has given uneven treatment to the different areas of the country; he has relied to a large extent on his own experience in Yugoslavia and on the information that came his way through personal contact with the Partisan movement and with its leaders both during and after the war. As the result, this leaves certain gaps in the story, particularly in relation to Macedonia and Slovenia.

The descriptions of Tito and the most important members of his entourage have the vividness of first-hand information, and the verbatim account of Tito's meeting with Churchill (which is authentic) is interesting in the picture it gives of the simple talk between important personalities on vital issues in wartime. The account of Tito's relations with Mihailovich is a contribution to public knowledge which is long overdue. The whole treatment of the unhappy story of Mihailovich and his Chetniks is factual, understanding and non-partisan in both senses of the word.

It is a pity that this book, which in many ways is a valuable contribution to the recorded history of World War II should have been written in a semi-fictional form and in a style which occasionally borders on the melodramatic. The trick of quoting Tito's thoughts as if they could be known to the author is a mistake, since it throws doubt on the value of other obviously authentic material on which the book is based. A number of interesting documents are quoted and many of them appear to be authentic although internal evidence seems to throw doubt on the document quoted on pages 238-241. If this document and that quoted on page 27 are to be taken as reliable, the reader would like to know their origin. In spite of the occasional highly-coloured style, the book is packed with detailed information and will appeal most to serious readers. If there should be a further edition perhaps Mr Clissold will favour this section of the public by giving more detailed reference to his sources.

The Russian Machine

"Political Power in the U.S.S.R., 1917-1947." By Julian Towster. Geoffrey Cumberlege, Oxford University Press. 443 pages. 28s. 6d.

MR TOWSTER'S book is probably the most complete analysis of the theory and structure of Soviet government. It is a kind of constitutional dictionary which should be very helpful to anyone concerned with Soviet affairs; to a foreign correspondent in Moscow, for instance. There are chapters on the concept of State and Law, the Class-principle, the Nationality principle, the Party, the Soviets and the Judicial System. There are also four useful charts.

Mr Towster writes with the impartial solemnity characteristic of American mammoth research. He has certainly succeeded in his three declared aims: (1) to offer ample detail and documentation; (2) to treat the topics in evolutionary fashion; and (3) to give adequate emphasis to theory. But there is a limit beyond which objectivity defeats itself, beyond which a full personal interpretation is absolutely necessary in order to give life to the subject treated. For, after all, a book about the Soviet Union remains, however specialised its field, a book about Russians.

Mr Towster's book is not about Russians; it is about the huge clanking and grinding state-machine which a group of revolutionaries contrived from German theory and tried to operate in Russia. Yet the interesting thing about Soviet Communism is certainly not its theory, which is in itself a meaningless jargon; but rather the actual psychological environment upon which it has been imposed; not, again, the portentous administrative machinery, but its impact and results. As to the psychological-racial origins of Soviet Communism, Mr Towster has no remarks to make. (His bibliography does not, for instance, contain Fülöp-Miller's "The mind and face of Bolshevism," which discusses the topic with great circumstantial detail.) As to the results of the whole gigantic business, the author contents himself with a few mild comments about the necessarily slow development of a "backward people."

The truth surely is that Soviet Communism cannot be discussed as an economico-political phenomenon. That error has already cost Europe dear. Russian Communism is rather the neurotic convulsions of a people which in the quest of technology and "modernism" has abandoned its own tradition, root and branch. That the Russia of 1917 was politically and technically backward cannot, of course, be denied. Whether her present leaders will finally secure for her a real advance in human civilisation seems altogether doubtful. In the meantime the study of Soviet institutions is something of an academic

pursuit for those who are not professionally connected with Soviet Russia. For when a great nation lives for a generation in either the experience or the anticipation of catastrophe, it is more profitable for the general public to speculate on the catastrophe's human implications than to smooth over its existence by rationalist hair-splitting.

The section in Mr Towster's book of most interest to the layman is that on the nationality principle; the one field, perhaps, in which Soviet thinkers have had truly creative ideas.

Clarity About Money

"Money, Debt and Economic Activity." By Albert G. Hart. Prentice-Hall, Inc. 558 pages. \$6.65.

PROFESSOR HART'S students at Columbia University are lucky. Money is notoriously a subject on which it is easy for an author to get the balance wrong; to overweight the institutional, the dull but necessary enumeration and description of financial mechanisms and their legal status, or to lose oneself in an intellectual web of abstract concepts, or (according to taste) to drown one's readers in statistics; or, even given an ideal balance of facts, figures, and theoretical interpretation, to be incomprehensibly obscure or unreadably heavy. Professor Hart's book is avowedly "institutionalist," and since the institutions with which he deals are those of America, as are, naturally, the statistics he supplies, the British reader is faced with an added difficulty and has to do a certain amount of mental translation. This matters, however, extraordinarily little. Professor Hart does not mind being extremely elementary; on the other hand, he takes his readers as far, so he modestly puts it, as he can go himself. And at no step does he fail to build the necessary bridges and put up on them the necessary guard-rails. This combination of consideration for the student and trust in his mental powers is surely one of the most valuable qualities of a teacher.

The book falls into five parts, preceded by a brief but pregnant Introduction on the nature of money and debt. The first deals, in considerable detail, with the structure and workings of the bank system; commercial banks, their control by government (matters which in an English book would come under the heading of central bank policy) the nature of financial assets and their inter-relations. The second, entitled "Liquid Holdings, Money Payments, and Prices," deals with price levels and their determinants, approaching the problem (after a brief survey of other methods) by way of cash balances and the motives of their holders. This leads him to the theoretical core of his subject, the role of uncertainty—of "anticipations and surprises"—and the study of inflation and deflation; thence to Part III, a mainly factual study of fluctuations, Part IV, on international monetary relations, and Part V, a study and critique of stabilisation policy.

To summarise the closely-knit argument in a paragraph is impossible. It may be said that Professor Hart, while no Keynesian, shares none of the optimistic convictions of his

orthodox compatriots that prosperity is automatic but for specific economic errors; and that he is sceptical of the ability of any compensatory fiscal or other devices to do away entirely with fluctuations. His scepticism, however, is that of a modest man open to conviction; indeed, not the least of the lessons to be learned from his book is the proper attitude of the enquiring mind, whether in the field of social studies or elsewhere.

Ceylon in Difficulties

"A Short Economic Survey of Ceylon." By Professor B. B. Das Gupta. Associated Newspapers of Ceylon, Colombo, 1949. 94 pages. No price given.

THIS concise report was originally prepared for submission to the "Economic Commission for Asia and the Far East," and has since been brought up to date. It deals mainly with economic trends since 1945 (with incidental references to war-time developments) and forms a useful sequel to Sir Ivor Jennings's book on "The Economy of Ceylon," which was based largely upon prewar data.

Professor Das Gupta has produced an illuminating survey which reveals the nature of the present economic crisis in Ceylon, and the difficulty of remedying the situation by independent action. Ceylon is "helplessly at the mercy of foreign economic winds." This is because she obtains the major part of her national income, directly or indirectly, from a small number of mainly agricultural industries, whose products are exported in return for foodstuffs and other necessities. Since 1945 there has been a large relative rise in the price of imports, and a great weakening in foreign demand for her specialties, especially for rubber. The ensuing gap in her balance of payments not only threatens her standard of life in the short run, but prevents the import of "development" goods, which might improve productive capacity and the longer term outlook. The sterling assets accumulated during the war, at the cost of serious inflation, have already been largely dissipated, whilst during the war the productive equipment of the country was "recklessly and destructively used."

There is little hope of improvement along traditional lines in the foreseeable future. Like England, Ceylon must import to live. Unlike England, she has no manufacturing industries which, when reconstructed, might provide the means to purchase her food. Like India, she has been hard hit by inflation and scarcities; unlike India she can hardly hope to achieve self-sufficiency in foodstuffs and appears to have no promising infant industries. A greater degree of self-sufficiency seems to be the only cure, but this cannot be secured without substantial additional imports of fertilisers, capital goods for irrigation and other public works and technicians. In the meantime rationings exchange control, and various prices and trade controls have been retained (or reimposed) and in some cases even extended since 1945, whilst taxation remains at a high level and is more regressive now than in 1938. The out-

When in London . . .

The Economists' Bookshop would welcome a visit from any of its clients who will be in London this summer. The range of the Bookshop's interests is not confined to British publications, or to books on economics and the social sciences although it specialises in these subjects. At The Economists' Bookshop you will also find the world's leading books on art, geography, history and many other topics.

look is, indeed, grim. Professor Das Gupta can only recommend increased self-sufficiency, with the warning that, for some time to come, this will increase, rather than reduce, dependence upon imports.

Norwegian History

"A History of Norway." By Karen Larsen. Princeton University Press. 591 pages and two maps. 32s. 6d.

IT was one of the ironies of war that an article of the Norwegian Constitution of 1814, formulated to meet a completely different contingency, provided in 1940 an incontestable legal basis for the Norwegian Government in exile. Yet, as a few pages of Professor Larsen's history will show, this was very Norwegian. For it provided one more illustration of the continuity, flexibility and, above all, the respect for the law which have characterised Norwegian institutions as far back as they can be traced. Even the Vikings—among themselves—were intensely law-abiding. The section dealing with the rise and fall of their violent, exuberant civilisation is one of the most interesting in the book, which covers the history of Norway from the first human settlements to the election, in February, 1946, of the Norwegian Foreign Minister, Trygve Lie, to be the first Secretary-General of the United Nations.

In handling this long and complicated story—she deals with the economic and cultural aspects as well as the political—Professor Larsen shows sound judgment and great knowledge of her subject. Unfortunately, her literary gifts are less in evidence. The style is too episodic, the narrative too bald. The treatment of the various topics in each part, of which there are five—The Early Ages, The Viking Age, The Middle Ages, The Danish Period, Modern Norway—in a set order and the lack of any attempt to break up the solid pages by sub-headings or other relief, tax the reader's power of concentration. The two maps are poor and, in a book of this size and scope, room should have been found for a few good plates—of the Oseberg

ship, for instance, of Bergen's Hanseatic warehouses or even of Oslo's new Town Hall, each in its way so illustrative of a vital phase in Norway's history.

What the book lacks in attractiveness, however, it makes up for in solid merit. It is comprehensive, fair and reliable. There are a few irrelevancies and occasional slips: in the section on Modern Norway, for instance, it is stated that the *Tirpitz* was sunk by submarine. Yet this section is the best in the book. The description of the development of the Constitution is excellent and the postwar spirit of Norway is well brought out. By contrast the medieval section is the worst.

The Disinherited Family

"Family Allowances." By Eleanor Rathbone. Allen and Unwin. 288 pages. 15s.

SELDOM can a reformer have been more completely vindicated by events than Eleanor Rathbone. Her "Disinherited Family," which first appeared in 1924, is now republished under "a more self-explanatory title" (as Professor Gilbert Murray says in his Foreword) almost simultaneously with the Report of the Royal Commission on Population; and every argument in the original plea of this free-lance champion finds itself documented, underlined, and hammered home by the full weight of expert authority drawing on the experience of thirty-five years. And what excellent, human, solid stuff Eleanor Rathbone wrote! She was not, as she was careful to explain, a professional economist; but she had in full measure the logic and the sense of evidence which are the economist's most essential qualities. She was not herself a wife and mother; but she had at once a power of sympathy, and a capacity for mental perspective, which enabled her to enter into the individual experience of those whom she championed without ever losing hold on the total situation.

Tygan

WOVEN FABRIC
is unequalled for
durability

Tygan is probably the nearest approach to an everlasting fabric which has yet been devised. Its resilience, toughness and abrasion resistance ensure excellent wearing qualities, where treatment is particularly severe. It can be used out-of-doors as it has excellent weathering properties. It can be cleaned by sponging with water. It is unaffected by a wide range of chemicals, and is smart and colourful.

Tygan is suggested for the upholstery of seats in cars, buses and trains; for theatre and cinema seats; for garden furniture; for chairs in cafés, bars, hotels; for fly screens in the tropics, and for larder windows and meat safes.

AMERICAN SURVEY

The American Economy

(From Our American Staff)

"THE whole world is watching developments in the American economy," said President Truman in the message accompanying the mid-year economic report sent to Congress last Monday. Mr Truman admitted that that economy had been going downhill during the first half of the year, but to him the striking thing about this descent is not that it is taking place, but that it is so moderate. By implication, therefore, the President was telling Congress that it was being punished very lightly for its failure to enact the anti-inflation controls which he has repeatedly advocated as an antidote to "boom and bust." Unemployment, becoming acute in some places, is probably the most serious effect

of the present drop in economic activity, but even this was only 6 per cent of the total labour force in June; in June last year the figure was 3.4 per cent. The fall of 1.5 per cent in gross national production since the second half of 1948 is concentrated in industry; agricultural output is running at last year's level. Price declines, of nine per cent in wholesale and only three per cent in retail prices since last August, were orderly. Profits and credit requirements naturally reflected the fall in prices and production and personal incomes of consumers decreased by nearly three per cent after taxes.

Herblock in the Washington Post

Thus far, the chief feature of the business decline has been the change from large-scale inventory accumulation to small inventory reductions. The volume of construction, of capital formation and of sales for consumption has been well maintained. Liquid assets of individuals and business firms are about \$235 million and government expenditures, federal, state and local, are running at nearly \$60 billion a year. During the last sixteen years, the national economy has been protected against depression by social security measures, by the housing and farm price support programmes and by the strengthening of the Federal Reserve system. All this, in Mr Truman's opinion, shows that the kind of government action that would be called for in a serious economic emergency is not now appropriate. But he considers that there is an opportunity, not simply for halting the downward trend, but also for achieving that steady expansion of production and consumption on which the life and spirit of America depend. "We cannot have prosperity by getting adjusted to the idea of a depression." The goal set by the President is

an annual output, within a few years, of over \$300 billion. He regards it as folly and defeatism to meet the present situation by restricting production, reducing wages or curtailing programmes vital to the international security and domestic welfare of the American people.

But of the recommendations for achieving this ambitious objective, six reiterated previous proposals and the other five hardly constitute a major programme. The President had already asked for improved supports for farm income, for increased minimum wages, for more assistance for the unemployed and the old, for the restoration of the Reciprocal Trade Agreements Act and for authority to carry out his plans for undeveloped areas. The new proposals are for certain tax adjustments, for longer duration of Reconstruction Finance Corporation loans, for an extension of readjustment allowances for veterans, for legislation to assist the advance planning of public works and for a study of the investment and development needs of an expanding economy. The outstanding difference between these recommendations and those which the President made to Congress last January lies not in what they contain, but in what is now left out. He no longer asks for authority to impose controls over prices, raw materials and so on and, more important, increased taxation, demanded then, is now specifically rejected.

This atonement, for what they regard as Mr Truman's past obstinacy, has been gratefully received by business men, even though it will involve more deficit financing. They may not, however, be so ready to agree with the President that there are economic and social deficits far more serious than a temporary deficit in the federal budget. Liberals, and especially labour leaders, believe that depression is already coming round the corner and that the President's proposals are much less drastic and urgent than conditions demand. His report, reassuring rather than ominous in tone, will hardly inspire Congressmen with that sense of crisis which alone could keep them in Washington long enough to enact any of his major recommendations, except those on which action is already well advanced, such as the Reciprocal Trade Agreements Act and a modified form of minimum wage legislation.

Mr Truman's report will, therefore, do little to speed the formation of an economic policy to meet a situation which is admittedly unclear. Even his Council of Economic Advisers finds it impossible to forecast the direction of future developments with any certainty and further complications arise from the interaction between the domestic business decline and

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

the difficulties which have appeared abroad. At present, except in a few borderline cases, the two are being considered separately; when they meet, as they must eventually do, new and interrelated economic and political problems are likely to emerge.

The process of working out a policy is made even more tedious and arduous by the variety of remedies advanced by special interests and doctrinaire groups—businessmen, labour, farmers, advocates of public planning, of foreign currency devaluation, and so on, who can always find good reasons why their particular prescription will remedy any economic condition. Economic policy, therefore, seems likely to develop slowly for some time and, even if the situation should look better during the next few weeks, it would not be prudent to assume that the major test has been passed, either at home or abroad.

So far, two separate lines of action on the domestic situation have emerged. One is the most aggressive easy money policy which the United States has yet seen. The monetary authorities, after much delay, finally took extremely modest steps against the boom in August last year, by reimposing controls on consumer credit and, shortly afterwards, by increasing the reserve requirements for the Federal Reserve's member banks. But they began to reverse themselves with alacrity as early as last March, even before many observers were convinced that a business adjustment was under way; they relaxed controls on consumer credit, reduced margin requirements for member banks and finally, at the end of

* June 23, 1948 - November 10, 1948. Federal Reserve Banks acquired on balance \$4,221 millions of long-term governments.
** November 10, 1948 - June 29, 1949. Federal Reserve Banks reduced holdings of long-term governments by \$3,609 millions to prevent price from rising.
† Close July 5, 1949.

June when the authority for increased reserve requirements expired, the Federal Reserve also announced the end of its open market operations to hold down government security prices. The accompanying charts give the background of production, prices, unemployment and long-term bond prices against which these steps have been taken. Whatever happens, this time the central bank cannot be accused of lethargy or timidity.

The second line of action has been the acceleration of optional expenditure by the government and this, too, is likely to be carried still further. Authority exists to lend money fairly broadly. Authority exists, or will exist shortly, to spend more on stockpiles of strategic materials, to accelerate some military expenditures and, under the omnibus Housing Bill just passed, to begin to contract extensively for housing. Outlays for European recovery might be

speeded even if they cannot be increased. Military and other expenditures abroad can be manoeuvred to some extent to suit economic policy, as is being done in Germany. In addition, the automatic compensatory spending, built into the budget through social security and the like, is already in operation.

On foreign economic problems, no new ideas have appeared, but very many thoughtful and attentive observers are becoming increasingly concerned. The President's report recognised the familiar danger that "further reduction of economic activity may give rise to pressure to restrain imports" and argued strongly against it. There is ample realisation that the European recovery programme, like earlier loans and advances, is in the long, and probably also in the short, run likely to prove disappointing. With this realisation even many of the most friendly are trying to avoid impatience, and sometimes annoyance, at what seems to be a refusal on the part of the recipients of aid, especially the United Kingdom, to face the most obvious requirement—to get down to work. For without really hard work and realism, there seems to be no solution to the difficulty, though momentary relief can, of course, be achieved.

This impatience has no relation to older ideological criticisms, but centres on specific points; costs of production and the consequent sales prices are the essential focus, but attention is also given to the consequences of long-term bulk buying, the human effort being made, the seemingly almost supercilious attitude towards scientific development and technology, the amount of unnecessary consumption and the failure to let economic pressure supply the drive towards improved efficiency and effort. And, as the debate in the Senate on the North Atlantic pact has shown, these economic considerations inevitably affect views on the provision of arms and these in turn have their political ramifications. (The small number of voices actually raised in the Senate on this subject should not be taken as an accurate count of the critics.)

The difficulty of developing a policy in the face of these considerations, however heavily or lightly they are weighed, seems tremendous. Can the American people be convinced that the European recovery programme must be enlarged and carried on for ever? Can the United States be persuaded to buy foreign goods when similar domestic ones are cheaper and better? The Council of Economic Advisers says cautiously, what many businessmen say more harshly:

The decline of imports in the first half of this year indicates that the US market demand for foreign goods was being substantially met at the going prices and exchange rates. This situation suggests that a continuation of recent declines in domestic demand and production would, with present relations between foreign and American prices and present exchange rates, result quite promptly in a further decline in the dollar value of our imports.

Some anticipate that this will happen even if domestic demand and production do not decline further.

The amount of good will and desire to help is enormous in America and has been, and is being, repeatedly demonstrated on a large scale. But it does not need a prophet either to foretell that any effort to convince the people and the Congress that foreign aid must be continued indefinitely on a large scale will meet very great difficulty, or to have the strongest doubts whether they can be convinced at all without the clearest evidence that the facts of life are being faced abroad.

American Notes

Pact Without Arms?

Long postponed and now overshadowed by economic questions, the debate in the Senate on the Atlantic Pact was expected to be little more than a formality. Ratification by the necessary two-thirds majority was, and is still, regarded as a certainty, but hopes of a short debate were dashed by the fears of those Senators who regard, or profess to regard, the Pact as a long step down the road to the third world war. They rendered futile the attempt to postpone discussion of the military assistance programme until the Pact had been ratified, since they could hardly make up their minds in silence whether a vote for the Pact would constitute a commitment to vote for military aid. Senator Taft, to his discomfort, has been driven by his conscience to vote against the Pact, unless an assurance is written into it that it carries no legal or moral obligation to give arms to all the other signatories. He is "absolutely opposed" to such aid, not, for the present at least, because of its cost, but because he is convinced that, by giving Russia reason to fear aggression, it will promote war rather than peace.

Senator Vandenberg's suggestion that ratification of the Pact should be followed by a world peace crusade is an attempt to show that the military aspect of the Pact is not being exaggerated at the expense of its "social and spiritual" aspects. But his efforts to prove that the Pact and the arms programme are not Siamese twins have led the Senator to belittle the importance of the latter, and even to hint that it will not have his wholehearted support. He has just been joined in the Senate by the other Republican elder statesman who shares his responsibility for the bipartisan foreign policy, Mr John Foster Dulles, who is now holding political office for the first time; Governor Dewey has given him an interim appointment until December, as Senator from New York, in consequence of Mr Wagner's retirement. Senator Dulles has at once announced that he supports military aid in principle, but that too much money is being asked for it. Until this, those who were worried about the dangerous strain to which military aid might subject the American economy were thinking not so much about the \$1.13 billion asked for this fiscal year, but about the very expensive wedge of which it might be the thin end.

* * *

Foreign Aid in Congress

The prospects for the military assistance programme are not therefore very bright, but the Administration is well aware that even if arms aid can be separated from the Atlantic Pact in theory, in practice it cannot. The necessary legislation is to be introduced into both Houses as soon as the Pact is ratified and the Administration maintains, on little or no evidence, that the authorisation will go through before Congress adjourns. It is expected to include a Reconstruction Finance Corporation loan, to start the programme, so that appropriations will not be necessary until the next session of Congress.

The final stage has now arrived in the long drawn-out process of providing new appropriations for the European recovery programme, which, even if it is passing through a difficult phase, is nevertheless the foundation upon which the whole foreign aid policy rests. The Senate Appropriations Committee has voted \$3,778 billion for the Economic Co-operation Administration for the 1950 fiscal year. This is 10 per cent less than was originally requested, but the cut is only half as large as Senator McKellar, the Committee's frugal chairman, had hoped for. The Committee's figure was based on the belief that this was all the foreign economic aid which America could afford during the coming year, on the continuing fall in prices and on the "obvious recovery" of many European nations.

It remains to be seen whether the Senate will sustain the Committee's reduction, which is about what had been expected,

and also whether it will approve the earmarking of \$50 million for a loan to Spain, just in case that country should be admitted to the Marshall club during the coming year. This special consideration is not unconnected with the belief that Spain is anxious, if the dollars were available, to buy American farm products. The Committee made another undisguised attempt to dispose of agricultural surpluses by passing an amendment which appears to reserve perhaps as much as \$1.5 billion of the appropriation for the purchase of such commodities.

* * *

The Ordeal of Alger Hiss

The defence counsel who, during his summing up, melodramatically assured Mr Alger Hiss that his long nightmare was drawing to a close, could not have been more mistaken. The jury charged with deciding between the credibility of Mr Hiss and of Mr Chambers found itself, like so many other groups of average Americans, unable to agree, and has been discharged. It can hardly be easy to find another twelve jurors who, at this stage, have not made up their minds. A place on the docket for a new trial probably will not be found until October, and even then, if Mr Hiss's innocence is established, there will still remain the \$75,000 libel suit which he has instituted in Baltimore against Mr Chambers. Mr Chambers is a poor man and, even if he were not \$75,000 would hardly meet the costs which the friends of the defence have already incurred.

The charge which Mr Hiss has so far been unable to throw off is that he perjured himself when he denied to the Grand Jury that he had transferred confidential state papers to Mr Chambers in the spring of 1938, and when he denied seeing his present accuser after January 1, 1937. According to the press, the jury very early in its 28-hour deadlock divided 8 to 4, the majority convinced of Mr Hiss's guilt, the stubborn minority of his innocence. The eight found overwhelming the expert testimony that the papers in Mr Chambers's possession had been typed on the Hisses' old Woodstock typewriter. The four did not consider this evidence sufficient to shake their distrust in Mr Chambers as a witness.

*

It is Mr Hiss's misfortune that, though he was a relatively humble government official in 1937 and 1938, he has become a stalking-horse for the whole New Deal. This explains why three Republican members of the Un-American Activities Committee sought to resume the investigation of the case which they reluctantly abandoned when it was transferred to the courts, and why, perhaps, the Democratic majority has rallied to restrain them, at least—ominous condition—until a final legal judgment is reached. It explains why Mr Nixon, the most energetic member of the committee, has broadcast publicly what has been whispered privately, that Judge Kaufman was biased in favour of the defence throughout and showed this partiality when he refused to allow the government to call Mrs Hede Massing, the former wife of Gerhart Eisler, said to be the head of the Communist underground in America. It is Mrs Massing that four committee members are itching to hear. Mr Nixon's wider thesis is that the Administration is most unenthusiastic about securing a conviction which would suggest that over a long period Democratic Administrations had tolerated Communist activity in high places.

The suggestion that a Congressional committee might investigate a judge, whenever it disliked his rulings, has been deplored at once by Mr Robert Patterson, president of the New York Bar Association, as a threat to the independence of the judiciary. Mr Patterson roundly defended the fairness of Judge Kaufman's rulings and charge to the jury. The implacable venom with which Mr Hiss is being pursued does a disservice, not only to the discovery of the truth, but even to those who honestly believe him to be guilty. It lends plausibility to the view that in Republican eyes his case is primarily only one more episode in the long trial of Mr Roosevelt and perhaps the closest there is likely to be to a Transatlantic Dreyfus case.

Showdown in Steel

If a steel strike begins this Saturday, it will be the first since the ravaging disputes of 1946, and will disappoint the Administration's fervent hopes for a peaceful settlement likely to deter stoppages in other basic industries. Mr Truman has, of course, power under the still very much alive Taft-Hartley Act to require an 80-day truce, appoint a fact-finding board, and apply for an injunction if the union persists in striking. But to resort to this power against his friends would cast certain doubts on Mr Truman's battle against Taft-Hartley; it would be as damaging to the President as to the union. Instead, Mr Truman has proposed to both sides a 60-day truce, during which time a fact-finding board would investigate and make recommendations; he has emphasised that the offer has no connection with the Taft-Hartley procedure. It has been accepted by the union, which is limiting the stoppage to those companies, five out of the six involved, which have rejected the offer. These firms insist that it is inconsistent with the Labour Act; they perhaps also have a shrewd suspicion that the recommendations might require more concessions to union demands than might otherwise be necessary.

Like Mr Reuther, now displaying a firm hand and fiery oratory to the Automobile Workers' convention in Detroit, Mr Murray, of the Steelworkers, seeks a wage increase, non-contributory retirement pensions of \$150 a month, and further insurance benefits. A victory of this order by two such important industrial groups would set a pattern for the mass production industries and even outshine the prize won by Mr Lewis last year for his miners, when the footing was less slippery. But the steel companies have rejected all three proposals, though they are willing to negotiate on wages and insurance matters. Pensions, they continue to insist, with some apparent justification, are not one of the subjects on which the steelworkers' contract can be reopened at this time.

Like Mr Reuther, too, Mr Murray believes that profits are so excessive that present wage claims would "hardly dent them" and that increases in purchasing power are needed to sustain demand. The argument from profits has a truer ring in Detroit, today, than in Pittsburgh. In the week ending July 8th, steel operations, partly because of vacations and Independence Day, but also because of the continued decline in demand and deferred buying, fell to 61 per cent of capacity. Few observers believe that the industry in the third quarter of the year will average more than 75 per cent of capacity. This is not far above the rate necessary for most companies to break even, and spokesmen for the steel companies insist that higher wages would raise prices, further reduce sales, and thus cause unemployment. Were it not for the orders of the automobile companies, which are still riding high, the steel industry would be much idler—a factor which may account for the decision to let Mr Murray try his fortune before the automobile workers seek their own show-down.

* * *

Guardian of Civil Liberty

The Supreme Court has just ended its 1948 term with a series of decisions, showing a special care for individual liberties, which are particularly reassuring at a time when Communist alarms could so easily lead to a narrowing of those liberties. The Court, meticulously guarding the forms and methods of justice, reversed the conviction for perjury of Mr Harold Christoffel, a labour leader who had denied his Communist affiliations before a Congressional Committee. The Court ruled that the false testimony was given at a time when the Committee was not in legal existence, since a full quorum was not present. This decision of the Court is already causing much indignation in Congress, which is unwilling to see the Court regulate the proceedings of the legislative branch. With the same emphasis on the forms of justice, the Supreme Court decided a few weeks ago that the Reverend Arthur Terminiello, who made a speech inflaming racial hatred and inciting mob violence in Chicago, should

not have been convicted of breaking the peace because freedom of speech had been defined too narrowly in the judge's summing-up. Again in a number of criminal cases, three of them charges of murder involving Negroes, the sentences given in lower courts were reversed on the grounds that the defendants had been subjected to undue pressure in preliminary inquiries.

In nearly all these decisions, the Supreme Court was divided and the majority of them were given by five votes to four. Lawyers regret such narrow votes, which weaken the force and authority of the Court's ruling. In recent years, however, the Court's decisions have seldom been unanimous, as they were in some 80 per cent of cases between 1919 and 1935. But although the Justices today can be divided into conservative and liberal groups, particularly in cases involving civil rights, their alignment is much less consistent in the field of labour and big business than it was in the second half of the nineteen-thirties, when the Court was rent by constant differences on political issues.

* * *

Battle of the Platters

The "flying saucers," that not long ago were mysteriously troubling the North American continent, soon gave way to "platters" spinning between the New York tower defended by the Radio Corporation of America and the rival fortress of the Columbia Broadcasting System. Each corporation has a subsidiary making these platters or discs (gramophone records to the uninitiated) and these task forces have now taken up the war between the two main armies, confined to the radio arena until last summer. Then CES opened a new phase of the campaign by putting on the market its long-playing (LP) disc, which turns at the rate of 33½ revolutions a minute instead of the conventional 78 and has its grooves more narrowly spaced, so that twenty minutes of playing time (a short symphony) will go on one side of a record.

RCA's secret weapon appeared in the shops in April. It is a disc seven inches in diameter, which turns at 45 r.p.m. and therefore plays as long as the conventional ten and twelve inch records; it is not only lighter in weight but also unbreakable. Furthermore, the new records come in seven colours, one for each major type of subject: heavenly blue is particularly suitable for "internationals," and lemon drop yellow for children (although some might prefer candy stripes).

Each side naturally protests its lack of aggressive intention. RCA's new discs are simply the best that its engineers could devise. They sell at 65 and 95 cents each, well below the prices of its regular records. When CBS at once put the price of its seventy-eights still lower, and brought out a seven-inch version of its LP record, this was, of course, nothing more than a step in its long-standing policy of bringing more music to the people at lower cost.

Not only do both sides follow the modern fashion in warfare by fighting for the highest ideals, but non-combatants are also as usual, the chief sufferers. Each of the three types of record now on the market needs a different kind of equipment to play it; both corporations have produced adapters so that their new inventions can be played on existing machines. But gramophone manufacturers, forced either to make machines capable of playing all three or to guess which kind the consumer will eventually prefer, are faced with as hard a choice as are the independent record makers. Last year the postwar disc boom burst (though sales remained well above prewar) and CBS and RCA both presumably hoped to reinflate it with their novelties. In fact they have only accentuated the collapse. Consumers will not buy records which involve changing their gramophones until they know whether the change is to be permanent. Retailers refuse to fill their shelves with discs which will almost certainly be unsaleable once peace has been negotiated. This is now understood to be on the way, with the Decca Company, one of the leading independent firms, playing the benevolent neutral's traditional part of mediator.

THE WORLD OVERSEAS

Western Union at Sea

(From Our Special Correspondent with the Fleet)

A COMBINED fleet of British, French, Dutch and Belgian ships, amounting to more than 100 in all, dispersed last week from Weymouth Bay after eight days of continuous exercises at sea and in harbour. The stated object of the exercises, to which the code name "Verity" was given, was "to accustom Western Union naval forces to working together especially in defence of a convoy against submarine and air attacks and in minesweeping." To this end the main forces assembled in Mounts Bay off Penzance, and the minesweeping and minelaying forces at Portland. A large part of the three days in harbour was taken up with the firing of national salutes, with formal exchanges of calls between Flag Officers, and with calls of a less formal nature between officers of less exalted rank. At the same time intensive signalling and communications exercises were carried out between ships.

The main fleet was then divided into two forces. Blue Force under the command of the Commander-in-Chief Home Fleet, Admiral Sir Rhoderick McGrigor in HMS *Implacable*; and White Force under the command of Amiral Croiseurs, Rear Admiral Peries, in the French cruiser *Georges Leygues*. Blue Force, representing a convoy and escort, sailed to the southward (as shown in the diagram) and exercised simple manoeuvres, on completion of which it was subjected to successive submarine attacks by French, Dutch and British submarines. Meanwhile, White Force, comprising three French, three British and one Dutch cruiser with two light fleet carriers, proceeded eastward. After carrying out a complicated practice bombardment with aircraft spotting in the vicinity of the Scilly Islands, it turned south so as to reach a position to the eastward of Blue Force from which practice air attacks could be made. After a morning spent in launching and repelling air attacks, the two forces joined up and turned northwards amicably together to face further submarine attacks of a more complicated nature. These attacks were followed by others from every quarter and of every kind: Bomber Command attacked twice at high level, shore-based naval aircraft attacked at low level; motor torpedo boats executed a night attack and on the following morning a further spasm of submarine attacks developed. Finally, the hard-pressed fleet passed through a minefield and anchored off Portland

having borne its many trials with exemplary composure. What sort of verdict, if any, can be passed on this ambitious programme? At any rate in part it can be regarded as a kind of glorified Navy Week, greatly elaborated, and put on for the public—in this case the Western Union public. Great care was taken with press arrangements and Admiral McGrigor at his preliminary press conference addressed a gathering which appeared to be scarcely less numerous and was certainly far more cosmopolitan than his fleet. It must certainly

be admitted that the fleet, whether anchored in serried lines in harbour or manœuvring with something surprisingly near precision at sea, never ceased to appear impressive and if Western Union can produce an impressive looking fleet it is no doubt good that the fact should be known as widely as possible. As part, therefore, of a Western Union advertisement campaign, Exercise Verity can be said to have been a well-deserved and well planned success.

If, however, the exercises are to be regarded as a serious attempt at co-operation, of a kind unprecedented in peacetime between the navies of four nations, then it immediately becomes more difficult to reach a satisfactory judgment. Exercises on so large a scale and of so complicated a nature are very difficult to carry through successfully. On the one hand, there is a danger of too little planning, with resultant possibilities of sudden and embarrassing disorganisation; on the other hand, there is the danger of too much planning, which can very easily produce, in naval exercises as in other spheres, a state of splendid unreality.

For these exercises, conducted as it were in public and with national and Western Union naval prestige at stake, it was obviously felt to be essential that even the possibility of muddle should be avoided at all costs. This is just what happened; and the clear, concise and detailed planning which made it possible reflect the greatest credit on the Commander-in-Chief Home Fleet, and his staff. Exercise Verity was splendidly produced, and no expense of time or thought can have been spared in its preparation. But the result was stilted and unreal, beyond what peace time exercises usually are—and that is saying a good deal. For the great majority of the actors this was an exercise without tears. From a strictly naval point

of view it attempted to do too much too quickly. Exercise Verity then had very little real significance in itself; though as an earnest of things to come it may have considerable significance.

Waiting for the Atlantic Pact

It is certainly too early to form any very precise ideas about the form which the structure of Western Union naval co-operation should take. During the recent exercises, Field-Marshal Montgomery expressed the personal opinion that the main function of the naval forces should be confined to the protection of ports and harbours and to the provision of adequate anti-submarine and mine-sweeping forces; he thought, however, that the control of ocean sea lanes should be the responsibility of the Atlantic Pact powers. Western Union must, in fact, be fitted into the framework of the Atlantic Pact and, until more is known about the latter too much long term planning should not be expended on the former. This is not to say that nothing should be done—far from it; but the work that needs to be done is of the kind that will be valuable in any case, to produce bricks which can be fitted into either structure.

The armed forces of a state are the epitome of its sovereignty; and the navies of the states comprising Western Union have behind them hundreds of years of different customs and traditions. Moreover, they have fought more wars against each other than they have ever fought against anyone else. Such a background does not vanish in a week's exercises. Friendship needs to be built up slowly and over a longer period; and for this reason it is not altogether to be wondered at that the effect of the very close daily co-operation during the war, more particularly between the British and the Dutch Navies, should have shown clearly in the ease with which the officers and men of these two nations worked together during the recent exercises. The moral is clear. Daily and detailed co-operation on a small scale is of infinitely more value than intermittent and unreal co-operation on a large scale and the need is greatest where no common tradition exists.

Security and Standardisation

Hardly less important, however, is the need for progressive standardisation of equipment. This is already being tackled by a sub-committee of the Military Committee of Western Union in London. It is on the simple and non confidential items of equipment, which alone must run into formidable figures, that attention should be concentrated and standard patterns agreed. Production of individual items need in the first place only be made for the routine replacement of existing non-standard equipment. Later on, standardisation of such complicated equipment as radar, asdics and wireless will have to be attempted; and it may be hoped that by that time the experience of co-operation and of difficulties surmounted will ease the problem of security which will undoubtedly arise and which can only be overcome when trust is complete.

Perhaps the most obviously essential feature of naval co-operation is communications, and here real and most encouraging progress has already been made. Standardisation on the flags of the international code, made last November, has been an immense step forward. The result has been that during the recent exercises communication between ships was certainly the outstanding success—a little to everyone's surprise. No difficulties need, therefore, arise in the early stages, though security problems will get progressively more difficult. In the meantime, the considerations of national prestige must not be permitted to complicate what is after all essentially a practical matter. Day to day wartime co-operation produced, as far as the Dutch are concerned, a large number of men who speak fluent English, and amongst the French there are many more who speak English than there are French-speaking Englishmen. It is a pity that one should have to advance British linguistic failings as an argument for the adoption of English as the combined fleet language, but the clinching argument lies in the fact that Western Union is, or soon will be, only a part of the Atlantic Pact defence organisation.

There are many other aspects of Western Union naval co-operation, but a study of the three that have been discussed—personnel, standardisation of equipment and communications—serves to show that co-operation, to be effective, must become the daily round, the common task of the navies of Western Union, and must not be confined to an annual jamboree carefully prepared and soon forgotten.

Peasants and Planning in Bulgaria

[FROM OUR SPECIAL CORRESPONDENT]

BULGARIA'S transformation into a Communist state is proving a difficult task. The Communist dominated Fatherland Front has by now, after a bitter struggle, eliminated all active political opposition outside its ranks, but it is still facing other complex and pressing problems. It is known that there have been differences between Bulgarian Communists in the party hierarchy as well as difficulties with Russia. It is admitted, too, that there has been a lot of dissatisfaction among the peasants, and that economic development has not gone according to plan.

Bulgaria is a small country—the census of December, 1947, gave its population as 7,020,000—and its natural resources are the poorest of any country in eastern Europe. There are small quantities of lead, coal, bauxite and chrome, and a lot of timber. Otherwise the greater part of the country is given over to agriculture, most of which is still at a very primitive level. Over 80 per cent of the people make a living from small holdings which are getting smaller and smaller with the prevailing custom of sub-division of inheritance. Yet the tobacco timber and food from these smallholdings still constitute Bulgaria's main source of wealth.

Since the war a main object of policy has been to find markets for these products to take the place of Germany, which monopolised Bulgaria's foreign trade in the nineteen thirties. Trade treaties have been made with twenty countries, including the two zones of Germany, Switzerland, Sweden and the USSR, of which the most important is that with the Soviet Union (\$90 million in 5 years). The Russians bought almost the whole of Bulgaria's tobacco crop last year and nearly all its production of attar of roses (which they are alleged to have sold again to the USA at a price well in excess of that paid to Bulgaria). Food produce has not been difficult to sell, but three successive years of drought coming at the end of the war during a period of political upheaval have meant that harvests have been small. Exports of food have, in fact, only been maintained by cutting down supplies to the home market, and the Bulgarian people in the past three years have had to endure scarcity of food on top of a dearth of water, electricity and houses.

The two-year economic plan launched in April, 1947, came to an end two months ago. It was claimed that its aims of restoring industrial and agricultural production to prewar levels had been realised "in their main lines." In fact, whilst industry is now producing well above the 1939 level, agriculture was still below prewar production at the end of 1948. The following table gives a general indication of production levels during the two-year plan:

PRODUCTION IN BULGARIA (1939=100)				
	1946	1947 (target)	1947 (actual)	1948 (target)
Industry	137(122)	148	123(145)	167
Agriculture . . .	80(67)	151	80(71)	128

(Figures in brackets are taken from the report of the Economic Commission for Europe and are based on 1934-1938=100 in the case of agriculture and on 1938=100 in the case of industry.)

Three years of drought have played havoc with the harvests, and the targets of the plan had to be altered after the harvests of 1947. As agriculture accounts for 70 per cent of the economy

of the whole country, this was a serious matter. One of the results has been that Bulgaria's trade has fallen considerably short of what was planned.

FOREIGN TRADE IN BULGARIA
(thousand millions of levas)

	1947			1948		
	Planned	Actual	Actual as per cent. of Planned	Planned	Actual	Actual as per cent. of Planned
Exports..	29.2	24.5	84%	41.7	26.2	63%
Imports..	36.0	21.4	60%	34.2	32.0	94%
Balance..	-6.8	+3.1		+7.5	-5.18	

(From the report of the Economic Commission for Europe.)

In spite of this, a new five-year economic plan (1949-53) of a much more ambitious scope, and conforming broadly to the economic plans of the other Cominform countries, has just been begun. It aims to change the ratio of industry to agriculture from the 1948 figure of 30:70 to 47:53 by 1953; this change is to include "a considerable increase" in agricultural production, with special emphasis on industrial crops. The relation between light and heavy industry is to change from 70:30 in 1948 to 55:45 in 1953. The principal new industries will be machine construction, metallurgy, production of fertilisers and textiles, as well as timber processing and food preserving. This programme includes a complete reconstruction of communications system and the construction of a hydro-electric power network. These big projects can not be financed by Bulgaria alone, and considerable credit will have to be given by the Soviet Union, whence will come—it is hoped—the capital equipment for the new industries as well as machines for the modernisation of agriculture. All this will have to be paid for by the hard work of the Bulgarian people—which means in the early stages of the plan by the work of the peasants.

Trouble in the Villages

This probably explains why the Bulgarian Government is at the moment paying special attention to agrarian problems, and is making great efforts to gain the support of the peasants for its programme for agriculture. There are now 1,542 co-operative farms in the country, comprising 12 per cent of the arable land. The aim is to have 60 per cent of all farming done in co-operative farms by 1953.

It is clear that the idea of co-operative farms has not been well received by many of the peasants. The methods used to farm them and the reactions in the villages were disclosed on June 11th in a speech made by Vassil Kolarov, acting premier, to the executive committee of the Communist party. He said that both medium and small peasants (the Bulgarian peasantry is roughly divided into eight per cent kulaks, 42 per cent medium peasants, 50 per cent small peasants) had been alienated from the Government's policy by "clearly unreasonable and unfair measures"; that many peasants had been forced to join co-operatives against their will; that others who refused had seen good land taken and given to the co-operative and poor land given in exchange. He spoke of serious "weaknesses and abuses" in the villages, and said that peasants were losing interest in production because the quota of produce to be sold to the state at a fixed low price was too high—in many cases it comprised their total harvest.

Kolarov put the blame for these happenings on to Kostov, the recently disgraced Minister of Planning; but he added that these "substantial mistakes" must be rectified. Land unfairly confiscated must be given back, co-operatives must be formed on a genuinely voluntary basis, and changes must be made in the system of state purchase of agricultural produce. He said that more produce should be left to the peasants to sell on the free market and in any case the state must pay a fair price for what it bought. Kolarov emphasised that the Government would take into consideration the wishes of the individual farmers who "constitute the overwhelming majority" of Bulgaria's peasant producers.

How these measures will be put into effect—and for how long—is yet to be seen. The Government cannot afford really large-scale opposition from the peasantry—the great majority of the population—in the early stages of the new plan. The election campaign in May revealed a lot of dissatisfaction in the villages; in some places indeed resentment against the Government was so strong that, in spite of a heavy propaganda campaign, peasants refused to vote in the local elections. It has now been announced that in areas where less than 50 per cent of people voted a new election must be held.

Of all the countries in eastern Europe Bulgaria is closest to the Soviet Union, not only geographically but through race, language and history. It is particularly important to its great neighbour for strategic reasons and its internal policy is probably more closely controlled from Moscow than that of the other small Communist states. All the outstanding Communists in Sofia have been Moscow trained, yet it is clear that recent developments have not been entirely to Moscow's satisfaction. Kostov—now removed from political life—evidently attempted to retain some economic independence for his country; whether Dimitrov supported this policy will probably never be known. It has now to be seen whether the new men who succeed Dimitrov will be able to reconcile a policy loyal to Moscow with measures that will be more successful in gaining the support of the Bulgarian people for the new economic plans.

General Coal Strike in Australia

[BY OUR MELBOURNE CORRESPONDENT]

BEHIND the decision of Australian coal miners to engage in a general strike from June 27th is a feeling of victimisation and social isolation going back particularly to 1929, when they suffered sorely from a lockout extending for 18 months. At that time the existence of large reserves of coal at the pitheads took from the miners the power that they now possess to paralyse the industrial life of the nation by direct action. Since then they have always followed a firm policy never to allow reserves of coal to accumulate, with the result that a coal strike now affects the whole community within a few days.

The miner in Australia labours under a number of grievances, some real, some imaginary. The present generation of miners have not forgotten the "lockout" when, to quote a timber-cutter of the Richmond (NSW) Main Colliery a few days after the outbreak of the present strike, "we had to stick it out for 18 months with the soles out of our boots and our belts almost cutting us in two. What makes them think we can't stick it out now? The bosses made us suffer then for their own purposes—surely we can take a bit of punishment for our own."

And this comment is a reflection of part, at least, of the historic grievances which lie behind the present dispute in the Australian coalfields. The grievances are also largely the cause of the recurring series of lesser disputes which have crippled production for years. The miner, rightly or wrongly, considers himself a pariah in the community. He sees himself vilified and lampooned at every point outside his cramped mining world. He lives in an environment of his own, in many cases sullen and resentful of the attitude toward him of a society which is in such vital need of the coal he produces.

In particular, the miners in Australia resent what they consider the "continued misrepresentation of their case by managements, Governments and the Press." They consider, further, that an attempt is being made to influence people against them by the universal insistence that the strike is another manifestation of Communist revolutionary activity. They justify direct action on the grounds of the ineffectiveness of the Coal Board and the Coal Tribunal.

for easier
cleaning

Shell Chemicals are concerned today with making life not only easier but brighter and healthier. Wherever there is cleaning to be done—in the home, in the canteen, in hotels, in fact wherever food is prepared and served—the new cleaners, based on Shell detergents, play a vital role. As well as saving valuable fats, they are making possible higher standards of hygiene and cleaning efficiency. For a great achievement in the public interest,

thank Shell Chemicals

Used to be a long journey

It's a big hill; steep, curving. No chance to take a run at it. Lorries block you to a crawl. Throttle. Brakes. Throttle. It takes the guts out of a car. And out of a driver, too.

But not this car; not this driver. A clear patch and you put your foot down in 3rd. In a flash the needle says 50—you're away.

How long have you been travelling now? Two hours? Three hours? Travelling fast—60, 65, 70, 75. But there's no strain. You're fresh; relaxed.

A corner comes and goes; and another and another. A surprising absence of roll. You work out your average. It's high. Somehow this car grips a bend and straightens it out; comes to a hill and flattens it down. You sit enjoying it.

It's a good road now. But there have been bad patches; they got lost in the torsion bar suspension, and not a kick in the steering. Only your eyes noticed.

Two hours to go. The light fades. You snap on the head lights; brightly reassuring in the dusk.

This used to be a long journey. But this car conquers distance.

And what about space? Plenty. You can take up to six with luggage—and still have driving fun.

This car is a waste of money if you don't care what a car does. There's such a lot built into it that doesn't really show until you have it in your hands. Once tried, you'll say 'I'd rather go by Javelin!'

Top speed 78 m.p.h. Acceleration 0-50 in 13½ secs.
Horizontally opposed flat-four 50 B.H.P. engine.

Chronic Shortage of Coal

Before the present strike developed, the coal industry in Australia had enjoyed a period of comparative freedom from serious disputes since December, 1945. But there has been nevertheless, a chronic shortage of black coal. Production was 14,831,000 tons in 1947 and 14,815,000 tons in 1948. These amounts fell short by at least two million tons of the minimum quantities to enable Australian industry, expanded greatly under stimulus of war, to meet minimum demands. In 1939 production amounted to 13,535,000 tons.

There has been a great reluctance on the part of younger men to go into the mines, with the result that the average age in the industry has been rising steadily. Buoyant economic conditions have enabled men to quit underground work for more congenial occupations in the cities, which has been an important factor in preventing any significant expansion of output. There has been a fall in the numbers employed in underground mining since 1943.

The immediate issues leading to strike action are relatively clear-cut. The Miners' Federation sought a 35-hour week, long service leave and a 30s. a week wage rise. The claim for the 30s. wage rise was withdrawn by the Federation almost immediately after it was lodged. The claims for a 35-hour week and long service leave were referred to the Coal Industry Tribunal, the appropriate arbitration body in the coal industry. Hearing of the leave claim was adjourned at the request of miners' leaders on May 18th, and the Tribunal intimated it would announce a draft award for long service leave on June 14th. Before then, however, the mining unions decided to hold a stop-work meeting on June 16th, when a general strike was decided upon. Both the president of the Miners' Federation, Mr I. Williams, and the general secretary, Mr G. W. S. Grant, are active Communists. The Prime Minister, Mr Chifley, said that the strike would have ended after five days but for the pressure by the Communist Party on the miners' leaders.

Dislike of Anti-Strike Action

Mr Chifley, and Mr Curtin before him, have always held strong views on "crucifying the workers." Mr Chifley has frequently said in Parliament that he would never be a party to victimising strikers, bearing always in mind his own victimisation 30 years ago for his part in a railway strike. The Federal Government has always shown the greatest reluctance to prosecute miners, and in the present *impasse* has introduced legislation to prevent financial assistance going to strikers rather than directly to prosecute the miners or their leaders. The Parliamentary Labour Party is clearly not unanimous on the taking of discriminatory action against a striking union, as was shown by the bitter attack on the legislation freezing union funds by the Minister for External Territories, Mr Ward, a member of the industrial left wing of the party. The Prime Minister, however, is conditioned in his attitude towards the strike by his belief that it has been precipitated by direct action of the Communists. His reference to the "unnecessary and callous war on the community" reflects the mood of the Federal Government towards the present crisis, and for once Mr Chifley is completely supported by the members of the Liberal-Country Party opposition.

In the meantime, "the whole economic and social life of the nation is approaching complete disruption," again to quote Mr Chifley. More than 500,000 persons are estimated to be out of work, heavy industry is virtually at a standstill, use of gas restricted to an hour a day in Sydney and Melbourne, electricity severely rationed, and electric trains and trams drastically curtailed.

But the miners say they are prepared for a long fight. They do not believe that the Communists could lead them into a strike without the wholehearted support of the moderate labour membership of the Miners' Federation. Rightly or wrongly, they feel that arbitration is no effective substitute for the strike

weapon. They feel that they have won what they have by direct action, and their mood after a week's idleness is to see the present fight through to the end.

Kashmir Deadlock

[FROM OUR KARACHI CORRESPONDENT]

"WORLD peace," said the Pakistan Prime Minister recently, "and the solution of the Kashmir problem are interlinked." To Western eyes the statement may at first sight appear exaggerated, for no major questions of power politics are involved at present. Yet in many observers' minds the conviction grows that, if the present drift is permitted to continue, the consequences may be incalculably serious.

So long as present conditions prevail, any casual incident, whether accidental or deliberately provoked, may touch off an explosion on the Kashmir front; if a shooting war breaks out again it will not remain localised. We are unlikely ever again to see the tragicomic spectacle of fighting in the valleys and hills of Kashmir proceeding according to certain unwritten rules, while the Governments of New Delhi and Karachi continue to meet at conference tables with outward amicability to settle their economic and other problems. India is physically the stronger of the two Dominions, and it would be too much to expect that it would again be prepared to undertake expensive and futile operations restricted to an area at the end of slender and difficult lines of communication. Next time the bases from which Pakistan supplies its regular troops and the Azad forces would be attacked, and this means an attack on Pakistan itself.

With the big power blocs in no way involved in the dispute, the United Nations surely has a unique chance to give a more decisive character to its intervention and to stop the rot without treading on any important toes. Should it fail, and should the Commonwealth feel unable to intervene, there will be a fight to a finish, which will benefit nobody but Russian-inspired Communism. Seen in the context of world politics, the Kashmir dispute, therefore, carries a terrible potential danger. The Indo-Pakistan sub-continent is like a nut firmly wedged in the jaws of the nut-crackers. Pressure has already been felt from the eastern arm of the instrument, and renewal of the Kashmir struggle—practically on the Russian border—will start the other arm moving. This is no time for the two halves of the walnut to allow themselves to be divided.

There is another important aspect of this affair. The Commonwealth, in its new shape, is on trial. The world in general, as well as certain members of it, will want to know whether the new formula of Commonwealth membership embodied something genuine, or was no more than a device for evading difficult practical issues. If the Commonwealth cannot prevent two members dedicated to "co-operation in the pursuit of peace, liberty and progress" engaging in internecine strife, it is inviting ridicule and is in danger of being written off by the realists who require practical evidence of its worth.

Questions of Interpretation

What are the causes and possible effects of the present deadlock? The framework of the Kashmir settlement is embodied in the UNCIP resolutions of August 13, 1948, and January 4, 1949. The truce negotiations form the second stage of the settlement, leading up to the ultimate stage of the plebiscite, and these negotiations have now bogged down in questions of interpretation—not so much interpretation of the Resolutions themselves as of various rulings given from time to time by the Uno Commission. Indeed, it is hardly too much to say that the negotiations have from the start been vitiated by the Commission's regrettable tendency (happily no longer in evidence) to issue "elucidations and clarifications" to one side, on request, without communicating them to the other. The main obstacle lies in the procedure for the withdrawal of the regular troops on either side. There has been a dispute as to what "synchronisation" means in this connection, and the

Commission has, so far, failed to produce an agreed plan for the withdrawal. Disbandment of the Azad forces is another bone of contention. In September, 1948, the Commission gave Pakistan an assurance in writing that it did not contemplate the disbanding or withdrawal of these forces; yet shortly afterwards Dr Lozano, acting for the Commission, appears to have given Pandit Nehru an equally categorical assurance that there would be large-scale disarming of the Azad troops. To clear up this discrepancy has taken a long time, but it is now agreed that the disbanding of the Azad forces is to come at a later stage and does not form part of the truce terms.

Demarcation of the cease-fire lines has also caused serious difficulties. The agreement was that the lines were to be based on the actual position of the two forces on the date of the cease-fire. Except for a small gap near Tithwal, there is no dispute about the north-south line running from Keran to Manawar; but arguments about the east-west line have taken an astonishing turn. Pakistan, at the time of the cease-fire, was established on the line of the hills and the passes dominating, from the north, the main valley of Kashmir. India is now claiming the right to occupy all the territory north of this line up to the boundary of the Gilgit agency and Gilgit subdivision. The Uno Commission has not accepted this

claim for the area is, and always has been, firmly held by Azad troops and the population is entirely Muslim; but it has made some concession to the Indian viewpoint by suggesting a compromise: in the event of defence of this area (against what is not made clear) becoming necessary India may be permitted to post garrisons at selected points in the area. It may be added that, when India raised this claim in August, 1948, the Commission had only replied that the matter "could be considered" at the stage of implementation, and it was later agreed that this would not be a condition to India's acceptance of the resolution. Pakistan now holds that the compromise proposed by the Commission is a breach of a clause of the August Resolution, which lays down that India can retain troops only within the lines existing at the moment of the cease-fire.

Failure to agree on the truce terms is, however, more a symptom than a cause. In recent months the statements of the Indian leaders have made it quite clear to your correspondent that India does not wish the future of the state to be decided by a plebiscite. Speaking at Srinagar, Pandit Nehru affirmed that Kashmir was part of India and no power on earth could separate it from India. This defiant statement might be explained by the fact that the Pandit was speaking for local consumption and was carried away by the warmth of his own feelings in the country of his birth; but in fact the public relations department of the High Commissioner for India in London has prominently published the statement, which is therefore presumably, to be taken seriously. Moreover, the allotment of four seats in the Indian Legislative Assembly to representatives of Kashmir seems to imply that Kashmir is already taken to be part of India.

It is commonly said in India that a plebiscite is impracticable, and that the solution of the dispute can only lie in the partition of the state, or possibly, in the recognition of Kashmir

as an independent state, internationally guaranteed. This is being said so frequently that many people are coming to believe it, and Pakistan regards this as a form of subtle propaganda against settlement on the lines decided by the United Nations. Pakistan's own attitude is that the United Nations has decided that there is to be a plebiscite and that Pakistan asks nothing more and will be content with nothing less. The feeling here on the point is vehement and universal and should not be underestimated. It is, indeed, far stronger than in India, where little interest is shown in the fate of Kashmir outside Government circles in New Delhi.

"Cominform Journal"

FOR eighteen months now the main European organ of the Communist Party's policy has been the so-called *The Cominform Journal*. Entitled "For a Lasting Peace, for a People's Democracy," it relies for its appeal entirely on its contents. It makes no attempt to attract readers by a pleasant lay-out, good type and good paper; on the contrary it demands close reading and a Marxist digestion. The opponents of Communism are always and inevitably agents of the Anglo-American imperialists, war-mongers, hirelings of the bourgeois imperialist robbers, or Titoist Trotskyites. In fact the contents are such that it is impossible to believe that any except those whose minds are completely and irrevocably delivered to Communism could go on doggedly reading it fortnight after fortnight.

The first issue of this six-page journal was published in Belgrade on November 13, 1947, and it has appeared once a fortnight ever since in Russian, French and English, and—since last November—in German as well. At a meeting of the Cominform in January, 1948, it was decided to set up a permanent editorial staff in Belgrade with Mr Yudin, a member of the Russian Communist Party executive, as chief editor. After the split with Tito the headquarters of the paper moved to Bucharest.

The journal is exclusively concerned on the one hand with the affairs of individual Communist parties throughout the world, and on the other with lengthy comments on the progress of the general struggle of Communism versus capitalism. News items are included only for the evidence they can be made to provide of the political and economic achievements of the "people's democracies" and of Communist parties everywhere, or of the decline and growing disintegration of the bourgeois economies of the west. Since one number is very like another a description of the principal contents of the latest issue will give as good idea as any of what the journal is like.

The chief features include the text of Mao Tse-Tung's speech on foreign policy in Peking on June 15th; an account—or rather interpretation—of the Labour Party's Blackpool conference by Harry Pollitt; a description of producer co-operatives in Hungary by a member of the central committee of the Hungarian Workers' Party; a warning "Against turning Norway into an American Imperialist Base" by a Norwegian Communist; and a section entitled "Party Life," which contains short descriptions of various party activities. The unsigned three-column leader on the front page is devoted to the anniversary of Tito's expulsion from the Cominform.

Tito the Trotskyite

This leader paints a lurid picture of the regime of terror and the economic decay now said to be prevailing in Yugoslavia, describes with self-righteous horror the extent to which Tito has gone over to the imperialist camp, and points out how right the Cominform was to expel him. No one could possibly guess from the article the extent to which the Cominform is itself responsible for what it condemns in Yugoslavia. On the next page Anna Pauker, the Rumania Foreign Minister, contributes an article called "Traitors to Socialism," in which she says the same things about Tito all over again, only in even more unbridled language. She sums up the whole situation as she sees it in the following picturesque sentence.

PRODUCTIVITY

The worst thing to do with manpower is to waste it in wheeling things to and fro or carrying them here and there. Higher productivity demands the immense savings in man-hours and money rendered possible by scientific mechanisation. Simon mechanical and pneumatic systems for automatic handling, weighing, blending, storage and transport have been applied to materials as diverse as grain, coal, chemicals, phosphates, workshop components, nails, foundry sand, letters and laundry packages, to name but a few. For more than half a century Simon Handling Engineers Ltd. have been solving problems of mechanisation and setting labour free for productive work.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

HENRY SIMON LTD
SIMON-CARVES LTD
SIMON HANDLING
ENGINEERS LTD

TYRESOLES LTD
TURBINE GEARS LTD
DUDLEY FOUNDRY CO. LTD
SANDHOLME IRON CO. LTD

Steadily slithering down the slippery slope of their choice, the political forgers of the Tito gang have so frayed their Trotskyite false revolutionary jackets, that they have become out and out bourgeois nationalists, lackeys of the imperialists and murderers of Communists.

As if even this were not enough, Jacques Duclos, secretary of the central committee of the French Communist Party, contributes yet another article, designed to set forth the "facts" which make "it possible to gauge the depths to which Tito and his associates have descended a year after the publication of the Information Bureau's resolution."

The Cominform Journal is a great believer in the proper celebration of anniversaries. Every party date provides text for a sermon or diatribe. Such occasions as May Day and the anniversary of the "great October Socialist revolution" form very convenient pegs on which to hang the endless repetitions of what might be called the basic Cominform themes. The latest issue of the journal contains an article called "Unparalleled Exploit of the Soviet People" to commemorate the eighth anniversary of Hitler's attack on the Soviet Union. The opportunity is taken to sing the praises of the Soviet people who, by their resistance to Hitler, "brought freedom to the peoples of Europe." This is said to be an "undisputed historical fact," and the reader is left to infer that no one else had a hand in Europe's liberation. The well-worn themes of "the intensified machinations of imperialist reaction," especially in the United States, which is engaged in "suppressing the national industries of Britain, France, Italy, Belgium and other countries"; the "oncoming economic crisis in the United States and other capitalist countries," which they are trying to avert by whipping up a war hysteria; and "the world peace camp at whose head marches the mighty land of Socialism"—these all make their appearance in turn. The results of the Council of Foreign Ministers (of which no factual account is given) are mentioned in passing, to show that "the resolute and consistent peace policy of the Soviet Union" is beginning to bear fruit.

Elections are one of the specialities of *The Cominform Journal*. Those in the "people's democracies" give very little trouble; but to present those in the western democracies as triumphs for Communism generally calls for no little ingenuity by the apologists. The favourite gambit is to attribute to the western authorities all the terrorist methods and electioneering tricks of which the Communists themselves know the value.

Education of the Party

To an outsider the most interesting parts of the *Journal* are those which describe the activities of individual Communist parties. In its first issue one of the functions of the *Journal* was described as being to "help the Communist parties in an exchange of experience," and this task of helping the different parties to learn from each other's successes and mistakes is conscientiously undertaken. For instance, in one issue a whole page, devoted to an "Exchange in Experience in Party Work," contains three articles by leading local Communists in Hungary, Bulgaria and Czechoslovakia.

Nowhere in these reports is any attempt made to cover up failings and mistakes. The low standards of some of the lecturers in Prague is admitted just as frankly as the laziness of the Hungarian workers. Of the Workers' Party in Staro-Zagorsk it is said that "serious failures and shortcomings could be observed in its work which have now been eliminated by criticism and self-criticism." The errors and shortcomings are undoubtedly flaunted quite openly because there is never the slightest doubt that they will be rapidly eliminated. The prevailing note of *The Cominform Journal*, in fact, is a most incurable and unshakable optimism in the eventual triumph of Communism. Its pages provide the most remarkable evidence of what happens when individuality of thought and style are completely sacrificed to slogans and a uniform doctrine.

THE BUSINESS WORLD

Base Metal Prices and Policy

THE Minister of Supply's refusal last Monday to reopen the London Metal Exchange was the more disappointing because of its air of finality. This time there was no temporising, despite the Minister's use of the phrase "... I am at present unable to agree. ..." It was clear from the key of his remarks that "at present" might mean much longer than a period of months. If he is "unable to agree" now, he is never likely to be able to agree. So, after a year's deliberations on whether the market should be reopened, the Government has decided not to give substance to its oft-repeated claim that controls are not being maintained for their own sake. When base metals were extremely scarce after the war, it might have been argued that Government buying was a necessary policy to ensure supplies for British industry. But these conditions of acute scarcity no longer obtain. On that ground, at least, the time could hardly be more propitious for a resumption of private trading—under suitable safeguards, of course. That opportunity, however, has not been accepted.

The only acceptable reasons for refusing to allow the metal market to reopen—or for not stopping Government purchasing, which is the same thing—would be neither an overriding case on grounds of public policy or a conclusive demonstration that Government buying was cheaper. Neither case has been made out. Mr Strauss gave two reasons to Parliament. First, he claimed that a free market in non-ferrous metals would have to be so severely circumscribed in order to prevent a loss of dollars that any benefits which might be expected to accrue from a metal market would be nullified. The second (which he regarded as "even more important") was that the abandonment of bulk buying of non-ferrous metals from Commonwealth sources would seriously endanger Britain's supplies and make this country more dependent on purchases from dollar sources. "For these reasons," the Minister concluded, "I am at present unable to agree to the reopening of the Metal Exchange for the purchase and sale of copper, lead and zinc." Tin is excluded from his injunction; in the first place, it is purchased from sterling sources; and secondly there is still the possibility that an international tin agreement might be negotiated. In other and cruder words, if the resumption of private trading in tin might cause its price to rise and thereby secure more dollars, the Government would perhaps agree to a free market. But it is by no means certain that the United States would agree to the abolition of international allocation for tin or to an agreement which does not provide for an expansion in tin production and therefore a check to any raising of prices.

The more the Minister's arguments are examined, the less convincing they seem. To a large extent, they turn on the sources of supply of copper, lead and zinc for British consumers. Britain's annual consumption of virgin copper is about 360,000 tons, of which about two-fifths comes from the dollar area—Canada, Chile and the United States. Supplies from the United States largely consist of Rhodesian copper re-exported to Britain after electrolytic refining. Britain also consumes 210,000 tons of refined lead a year,

about a quarter of which comes from dollar sources, mainly Canada, while of the 225,000 tons of virgin zinc used each year in Britain, about one half comes from dollar countries. These imports from dollar sources are clearly necessary, whether they are purchased by the Government or through the metal market. If the exchange control were efficient, there would be no reason to fear any greater expenditure of dollars to pay for private purchases than has to be provided to pay for Government purchases. This is a point of principle which remains quite unaffected by the cuts in imports of dollar metals which the Chancellor announced on Thursday. It is difficult to believe that the exchange control need be so complicated as to nullify the many advantages which would result from the reopening of the London metal market. There are free dealings in wool, but the fact that a limited quantity of wool has to be purchased each year for hard currencies has not destroyed the advantages of the free market. There might be, of course, some risk that metals bought for sterling by non-dollar countries could be re-exported to the United States at a cut rate of exchange. This sort of trading has been common enough in wool, though not apparently to any great extent in rubber. Here again it is difficult to believe that, with the help of British merchants, this risk could not be reduced to a minimum, though it is bound to arise so long as exchange rates are artificial and bear no real relation to internal price levels. Even so, we merely have the Minister's *obiter dictum* that the dollar risk is of sufficient importance to justify the continuation of Government purchase of metals. It is not, quite frankly, a convincing answer.

*

Mr Strauss's second argument seems even weaker than the first. If a free London market existed for metals, there would be some semblance of a world price. If demand was large in relation to the available supply, the price would rise. How would such a rise endanger supplies of base metals for Britain and make it more dependent on dollar purchases? If the United States was the main buyer, Britain and the sterling area would earn additional dollars; if the large demand originated in non-dollar countries, British manufacturers could secure adequate supplies by bidding up the price. Was there ever an occasion, when the free metal market was open, of unemployment being created in a period of rising prices because manufacturers could not secure adequate supplies of raw materials? This argument can be accepted on only one assumption—that the Government is reconciled to the British economy remaining permanently out of equilibrium with other countries. If the decision not to reopen the London Metal Exchange was in fact based on these two principal reasons, then the Ministry of Supply must be convicted of having taken an unimaginative and doctrinaire line, and of ignoring the clear demonstration that bulk purchase of metals has imposed a serious burden on consumers in this country which ill accords with the campaign to increase exports.

As if to lend point to these criticisms of price policy under bulk purchase, the Minister's announcement was followed by

the publication of a new schedule of prices for copper, lead and zinc. It has at last been decided, now that a free market is not to be re-instituted, to bring prices in Britain to parity with American metal prices, and to make them conform to movements in the New York market. Copper was reduced on Tuesday by £13 10s. to £104 a ton compared with the equivalent of £98 a ton in New York. The Ministry, however, was quick to raise the price by £3 10s. a ton on Wednesday following a similar rise in America. Lead was reduced by £6 10s. to £75 10s. compared with £72 5s. in New York, but on Thursday it, too, was raised by £5 10s. a ton to conform with an equivalent rise in New York. Zinc has been reduced by £20 to £58 a ton, compared with £50 in New York. The Ministry of Supply has thus followed the Raw Cotton Commission into phase two of the development of centralised purchase, by which prices charged to British consumers are equated to "world prices," and not to the prices paid by the purchasing organisation. The parallel is the more complete, because British metal users will in future have the chance of participating in a type of cover scheme; they will be able to book forward supplies of copper, lead and zinc on payment of a premium as an insurance against a rise in prices. Some facilities, though very limited ones, for hedging against a rise will therefore be available in future. Apparently, there is no need, in Mr. Strauss' view, for hedging facilities against falling prices, on the peculiar ground that "we do not expect manufacturers to gamble with raw commodities." That will be scant consolation for the manufacturer who, for entirely good reasons, has to hold stocks.

★

How far do these changes meet the general criticisms levelled against central purchase? Of all the disadvantages accruing to Government trading, two are vital. First, prices tend to lag behind those on the "world market"—such as it is in base metals. The new intention to keep the two sets of prices in line introduces yet another artificial element, for it can be done, in a falling market at least, only by meeting the Ministry's trading loss out of an Exchequer subsidy. Secondly, prices in a free market, reflect many people's appreciation of present and future trends in supply and demand. If one person's assessment is wrong the consequences need be of little concern. Under Government trading, however, decisions are made by a very small group of officials who may be right in their judgments, or wrong.

But the consequences of error may be serious because they affect total supplies of base metals for Britain, and because they may also have repercussions on the rest of the

trading world. In metals, there really is no proper world market to look to for guidance. Since the war, American prices for the three main non-ferrous metals have been taken as an index to world prices, but the New York market is dominated by a few large custom smelters and by integrated firms interested both in mining and in manufacture; it is far from being a satisfactory commodity market, in the same sense as the London Metal Exchange was. Price movements in New York tend to be rigid; and when supplies are short consumers are quite accustomed to paying premiums above the official quotations. Hence the Ministry of Supply's assessment of the "world market" must be largely in the nature of conjecture.

If, under their new price policy, the Ministry of Supply can, like the Raw Cotton Commission, keep the time-lag between the movement of its own prices and those ruling in the rest of the world down to a minimum period, then British manufacturers would no longer have to pay more for their raw materials, when the price trend is falling, than their competitors have to pay. But the losses which the Ministry will incur when prices fall will have to be met by the taxpayer. There will not be much chance of recouping these losses when prices are rising, because manufacturers can now buy forward at premiums of £2 10s. a ton for the second and third months for copper and £5 for four to six months, and £2 a ton for lead and zinc, with £4 for four to six months for zinc, but not lead. If the premium is higher than the prospective price rise, manufacturers are not likely to buy forward. If the premium promises to be smaller than the expected rise, the Ministry will make a reduced profit, and perhaps a loss.

If the new system of price fixing removes from manufacturers the burden of paying more for base metals than their competitors abroad, the cost will have to be borne by the Exchequer. It would seem that this week's price reductions might involve an Exchequer loss of at least £10 million, which will be hard to square with the Chancellor's undertaking that departmental expenditure would not be allowed to rise during this financial year. At June 30th, the Ministry of Supply held 170,000 tons of copper and was under contract for the delivery of a further 150,000 tons. The greater part of this copper was bought at a price "related to the New York export price of £130 12s 5d. a ton," compared with the new price of £107 10s. Losses of this character are inseparable from Government purchases when prices are falling. The loss to the Exchequer may be somewhat reduced if the Ministry raises prices quickly to match any rise in the United States, and reduces them only after an appreciable time-lag. But "economy" of this kind would merely ensure that metal users would get the worst of both worlds.

The new scheme offers the pretence of elasticity, which perhaps makes it preferable to the old system by which the Ministry charged "average prices" (whatever that concept may have meant), subsidising manufacturers when prices were rising and penalising them when prices were falling. But it does so at the cost of providing one more subsidy for a government trading organisation. If the manufacturer escapes the inevitable consequences of bulk buying on a

Gas Turbines for Industry—II

Gas Turbine Costs

DESPITE their imperfections, gas turbines have an extraordinary flexibility of size and arrangement, and they should have a comparably wide field of application. Most attention has been given to their use as a prime mover, in which they compete directly with highly developed steam turbines and diesel engines. But some technicians believe that it would be more useful to concentrate on applying gas turbines in process operations; they see big opportunities in using gas turbines in completely new production techniques. Some process uses are being developed. One large engineering concern is designing a gas turbine for use by Imperial Chemical Industries in a nitric acid production process which is expected to save between £10,000 and £15,000 a year in fuel costs. The Consett Iron Company is providing blast furnace gas for use by C. A. Parsons in evolving the design of a turbine to be powered by blast furnace gas; this may have applications in iron and steel smelting. By re-arranging the components, the gas turbine may eventually become the cheapest and most efficient producer of bulk oxygen yet known.

There are many other possibilities in using varying combinations of the four gas turbine components—compressor, combustion chamber, turbine and heat exchanger—for refrigeration, in oil pumping and cracking, and in drying operations, to name only a few. Their development ought to make a big contribution to industrial efficiency. The difficulty is to make their design and manufacture equally attractive to the engineering firms. Too often the potential market does not look large enough to repay the cost of development. Moreover, it is the public services—in search of a prime mover—

falling market, it is only because the taxpayer makes up the difference on the Ministry's trading account. To reopen the Metal Exchange would have been difficult; but nothing has been put forward to prove that it was impossible. The dollar shortage has once again been made the excuse for not restoring a more or less free and flexible market. If this is to be taken as an earnest of official policy in the next few months, it is to be deplored.

which have apparently taken the initiative in commissioning the first gas turbines. Of even greater significance than the money cost is the scarcity of engineers able to design a gas turbine. The Government-owned firm of Power Jets (Research and Development), Ltd., have done what they can to overcome the shortage by acting as consultants on gas turbine technology and by providing training facilities. But even given the training, engineers of sufficiently high calibre are rare, as some firms have found to their cost. To set any one of these men to develop an individual process may be to keep him from work of greater value to the firm.

The first British-built industrial gas turbines will be used to generate electricity. The case for their use in power stations is not strong. It is true that gas turbines have a lower capital cost than steam turbines, for they need smaller buildings and no boilers. But so long as they burn any fuel but coal, or until their efficiency is raised to 40 per cent, the overall cost per kilowatt will be higher than steam-generated power. To this, there is one exception. A steam turbine is not efficient as a small unit—a unit of less than, say, 15,000 kw generating capacity. Therefore, a gas turbine has advantages as a stand-by generator for peak loads, and it is with this object that the British Electricity Authority has placed its orders. If the gas turbine generator operates for, say, only 600 hours per annum, the fuel cost per kw generated by a steam turbine then falls so far that it offsets the difference in capital cost per kw of the two sets. Gas turbines might make an equal showing with steam for base load use were it possible to use their hot exhaust gases, for example in district heating. In areas of

limited water supply, gas turbines have an obvious advantage. There are also technical reasons for supposing that a gas turbine may be more suitable than a steam turbine for using heat produced by nuclear fission. The small nuclear power plant operating in the United States is not, however, believed to be using a gas turbine.

It would be a mistake to regard gas turbines and steam turbines as direct competitors in the race for technical advance. Improvements can be made in steam turbine efficiency simultaneously with advances in gas turbine

COMPARATIVE ESTIMATES OF ELECTRICITY GENERATION BY GAS OR STEAM TURBINE (Turbine-Alternator Set of 10,000 kw capacity)

technique. Many of the aerodynamic devices essential to a gas turbine and much of the work on high temperature operation have their value in steam turbine design. They have not been used hitherto because the gain in performance was not sufficient to cover the cost of development.

★

Comparison between diesel engines and gas turbines shows the error of basing any case entirely on thermal efficiency. Diesel locomotives, for example, have a thermal efficiency of over 30 per cent. Nevertheless, some engineers are confident that gas turbine locomotives will supersede them with an 18 per cent thermal efficiency. Their chief argument is that a diesel engine spends one quarter of its working life undergoing maintenance, whereas a gas turbine locomotive might spend 2 per cent. On this point, it can be asserted with confidence that American railroads do not spend anything like 25 per cent of the working time of diesel-electric locomotives on maintenance, and secondly that the 2 per cent allowance for gas turbines must be largely a guess, as yet unsupported by much working experience. One Swiss-built gas turbine locomotive has been used by the French for some years quite successfully, and an open-cycle gas turbine built for locomotive work in America by the General Electric Company has completed its bench tests. The locomotive is expected to operate experimentally this summer on Union Pacific routes.

Lower capital cost, lower maintenance and smaller size weigh in favour of gas turbines for marine use, though there will not be much scope for their general application until they burn fuels cheaper than those used by diesel engines. Doubts about their reliability are a further deterrent. If a gas turbine goes wrong, nothing short of dismantling will set it right. The Admiralty is in a position to take this chance

and has commissioned a gas turbine frigate; in doing so, the Admiralty should provide valuable data for marine engineers. Few shipowners can take such a risk and it will be a long time before the engineer can promise that some risk is not present. Altogether, four marine plants are on order.

These deductions are based on present costs with gas turbines burning diesel fuel. If they could burn a cruder, cheaper oil—preferably a non-distillate—they would be able to compete with diesel engines on running costs alone. If they could burn coal, they could compete against steam turbines. There is no problem at all in getting a gas turbine to burn a coarser fuel and to raise adequate power from it. But coarser fuels contain a fractional proportion of ash which forms deposits on the turbine blades and eventually leads to breakdowns. If the constituent of the ash which causes sticking could be identified and isolated, it could be removed before the fuel was injected. The shape and spacing of the blades is also believed to have a connection with the formation of deposits. In America the General Electric Company's locomotive gas-turbine was run for part of its test on untreated bunker oil, and results were encouraging. Deposits formed only when the fuel was poorly atomised in the combustion chamber. In Switzerland, a non-distillate has been burnt for well over 1,000 hours without any ash formation at all, though there is a slight doubt whether it was using a comparable fuel. The Swiss success is believed to be wholly due to the shape and positioning of the blades. British experiments with crude fuels have not been conspicuously successful, but some of them were tried in conjunction with an unconventional turbine design and may, therefore, have failed for other reasons.

The burning of non-distillates is only a matter of time.

The need for it is very urgent. If the process so successfully developed by the Anglo-Saxon Petroleum Company for using heavy oils in diesel engines becomes general, diesel running costs will be so reduced that it may be very difficult to make out an argument for the use of a gas turbine in any field which could be as well served by a diesel engine.

Coal-fired turbines are more remote and may indeed not even be technically possible. American experiments with coal-fired gas turbines for locomotives met so many difficulties that research came to a standstill and only now is a fresh start being made. The British Coal Utilisation Research Association is working on the problem in this country. Devices to remove the ash from the combustion gases before they reach the turbine blades are now recognised as impracticable, but it is hoped that the rate at which ash deposits accumulate on the blades might be retarded to give reasonable running periods between overhauls. The prizes of success would be substantial. A coal-fired gas turbine, burning pulverised fuel, would be of particular interest to the National Coal Board. Gas turbines could be used at the

pithead to drive pit machinery and to generate bulk power, using fuel which might otherwise be unmarketable.

The choice of fuel depends ultimately on the standards of reliability which are required. There is some tendency to look on a gas turbine as a gas-driven version of a steam turbine; because of this association, plant engineers are inclined to demand 100,000 hours running from gas turbines, and they regard the necessity of blade cleaning as an unconquerable obstacle. If the mental association with steam turbines is discarded, then the prospect of regular cleaning and replacement of blades becomes no more formidable than normal maintenance and replacement for any piece of capital equipment; and the cost need be no higher in relation to first cost. If this new attitude towards the gas turbine were adopted, operating temperatures could straight away be raised without further development of design or materials. Equally, the objections to coarser fuels would disappear. An immediate gain in operating efficiencies and an immediate fall in operating costs would result. It now rests with industry to begin to exploit these promising advantages.

Business Notes

Dollar Import Cuts Now

The Government's assumption that the new programme of imports from dollar sources could wait until September has been quickly belied. With a speed which plainly suggested a sudden change of policy, the Chancellor announced to a gravely attentive House of Commons on Thursday a new programme of dollar imports for the year to June, 1950. That this action has been taken so quickly, when ten days ago it seemed to have been deferred, strongly suggests that the Government has no hope of something turning up by the autumn. Indeed, the fact that the Chancellor found it necessary to announce new cuts before the meeting of Commonwealth finance ministers had really got down to business may also lend itself to the interpretation that these discussions, too, offered no way out of the immediate dollar crisis unless Britain itself was prepared to make the first contribution.

Sir Stafford's new programme calls for a reduction in dollar imports to the United Kingdom from £400 million for 1948 to £300 million for 1949-50. The quota of dollars for tobacco is to be pruned from \$110 million to \$90 million, which is expected to entail a 5 per cent reduction in consumption. Reduced sugar rations and the reimposition of sweet rationing will together save 180,000 tons of sugar costing \$17 million. These cuts in consumption are, however, to be offset by increases in other foods "of a perishable character," including butter, meat and bacon. The rest of the cuts are in dollar raw materials. Timber will be reduced, though the housing programme is to be maintained. Paper and pulp from dollar sources is to be cut by one-third, though "the effect will not be great"—presumably the effect on total supplies rather than on average prices. A reduction of 25 per cent in non-ferrous metals from dollar sources is proposed, but here again it is thought that total consumption will not be affected—presumably because of increased supplies from other sources and of lower prices. No change is proposed at present for petrol, on the ground that this involves complicated international questions. Dollar steel is to be reduced, and the Chancellor was ungracious enough to charge the British steel industry to maintain its high rate of output "under the spur of nationalisation."

The nation has not yet heard the worst. For the revised programme involves a saving of only £100 million on dollar account, whereas the deficit is running at the rate of £600 million, before bringing Marshall aid into the account. Nor

are the cuts likely to be so painless in practice as the Chancellor appeared to go out of his way to suggest. They will, at the very least, further increase the sterling cost of the raw materials of British industry, and increase by so much the already severe difficulties which British exports are meeting in foreign markets. They may be—indeed they are—quite inescapable; but they will not be taken in overseas countries as any contribution to the aims of freer trade which the Chancellor still professes.

★ ★ ★

First Round in Dollar Talks

As for longer-term measures, no dependable evidence has emerged from the vital international discussions of the past week to show even the broad lines upon which the solutions may eventually be sought. This apparent inconclusiveness was to be expected. The scope of the tripartite talks of last week-end—between Sir Stafford Cripps, Mr Snyder and Mr Abbott—was, as intended, mainly exploratory; and, at least so far as the longer-term problems are concerned, the same has evidently also been true of the early stages of the conference of Commonwealth Finance Ministers. In the City, as in the Press, attempts have been made to extract firm conclusions by a microscopic scrutiny of the communique issued after the tripartite meeting; but at this stage it would be wise not to try to read too much into this text—if only because of the contradictions both within it and between it, and Sir Stafford Cripps's statement in Parliament ten days ago.

Outstanding among the matters on which the three Governments declared their agreement was the reaffirmation of the objectives of the International Monetary Fund agreement and of the Havana Charter—a statement of faith which was amplified by the "particular stress" laid upon the need for such solutions of the present problem as would maintain high levels of employment and enable world trade and payments to develop multilaterally. Significantly the first of these objectives was reiterated even more firmly by the Chancellor on Thursday. For Britain, however, the hard truth is that in the short run these are conflicting ideals—as Mr Harold Wilson's statement nine days ago, discussed in a later note, in effect admitted. The conflict becomes even sharper if the further conditions are added that living standards should be maintained (which Sir Stafford Cripps has done his best to reaffirm) and that there would be no currency devaluation (which was stated not to have been suggested among the unspecified

For Export

At the quay-side, the import-export procedure is reaching its final stages, but the earlier steps were equally important. Markets had to be found, references exchanged, restrictions complied with, payment arranged and documentation completed. At each of these steps the services of the Westminster Bank can usefully be employed. To help those who are engaged in foreign trade, the Bank has issued a booklet which may be obtained without charge at any branch. Ask for *The Foreign Business Service of the Westminster Bank*.

WESTMINSTER BANK LIMITED

Do you trade with

AUSTRALIA

As a market for British manufactures and as a source of food and raw materials, Australia plays an important part in Britain's economy. Whether your interest is in imports or exports, the services of the Commonwealth Bank of Australia can be of considerable assistance. With over 400 Branches in the Commonwealth and New Guinea, and guaranteed by the Australian Government, the Bank can provide the British trader with up-to-date, authoritative information on every aspect of Australian commerce.

short-term remedies discussed during the three-Power talks). The most that seems to be deducible at this stage is that Britain has certainly not rejected the multilateral approach to a solution; it has further agreed that "all parties" must review their policies to make a single multilateral system eventually possible—but it is too soon to assume that this signifies a readiness to make the drastic changes which will be needed to achieve the requisite reduction in British costs. Indeed, the Chancellor on Thursday merely repeated the hortatory comments which he made a week ago.

For the rest, it seems that, at least on the international plane, no major decisions are likely to be taken before the critical meetings in Washington which will precede the annual assembly of the IMF and International Bank governors in September. It has been arranged that in the meantime "technical and fact-finding" discussions shall continue between the three Governments in preparation for the September meeting. It has been agreed, too, to explore remedies "other than financial assistance such as that provided by the United States and Canada"—a statement which has been construed as implying that measures such as aid from the International Bank and accelerated stock-piling purchases by the United States may be among the short-term possibilities to be studied. Hopes of action by the second of these means have also been encouraged by President Truman's half-yearly message to Congress this week. Apart from possible short-term by-products such as these, it is clear that the prime importance of the meeting lies in the fact that from the outset the whole problem has been firmly put into its proper international setting. This is a real gain—though it carries with it the disadvantage that emphasis upon the international causes of the disequilibrium may divert attention, in Britain, from its need for making other unpalatable changes at home.

* * *

Family Crisis

More immediate consequences may perhaps flow from the Commonwealth talks, since their first objective is to ensure a curtailment of the volume of dollar expenditure by the sterling area as a whole. But, carefully though most of the assembling delegates guarded their tongues in public before the conference opened, it is certain that they have been outspoken behind closed doors since. It would be naive to suppose this to be another peaceful family gathering, demonstrating anew the solidarity of the sterling area. Even diplomatic language has been unable to conceal a general awareness of the extent of this latest threat to the material basis of family harmony. Still less should this meeting be conceived as a rallying of overseas members to the support of the senior member in its moment of stress. The ebbing away of the common pool of hard cash menaces them all, and the primary—though not necessarily the overriding—interest of each must be for its own livelihood. When the available resources are so slender, solidarity in the sterling club has perforce become a matter, not of family sentiment, but of hard calculation of the extent to which it serves the individual interest.

For example, India's Finance Minister, Dr Matthai, emphasised on his arrival that it was to India's interest, as the largest single holder of sterling balances, to see the position of sterling strengthened; India would therefore do its best to co-operate in finding a generally acceptable solution to the problem. But he added, inevitably and significantly, that there was a limit in dollar economy beyond which India could not go without jeopardising its own economy. Both India and Pakistan are acutely aware of the gulf which separates the standard of living in their countries from the standard in Britain. And it is becoming increasingly difficult to impress dollar economies upon them when the consequence is that they must rely still further upon sterling goods made more costly by Britain's social outlays. To judge from press com-

ments, the most violent reaction has come from Malaya, which, like other colonial areas, has been asked to suspend for the time being all licences for dollar imports which are not absolutely imperative. Malaya's retort, that rubber and tin are among the sterling area's principal dollar earners, and yet the country is not directly represented at the conference, is one which commands sympathy. It is perhaps significant that Mr Creech Jones, Secretary of State for the Colonies, was not included in the first list of delegates to the conference; that omission was corrected on the eve of its opening, and the importance of colonial produce was emphasised simultaneously. Finally, it may be noted that South Africa—which is no longer a member of the dollar pool—has remarked that if Britain could compete with American prices it could command a share of the gold which South Africa is at present expending on dollar imports. There is a lesson here for Britain, but one also for South Africa itself. At present, a diversion of gold-financed purchases from the United States to Britain would still leave the Union seriously short of sterling.

* * *

Sterling Area Balance of Payments

The hurriedly-assembled estimates of the balance of payments between the sterling area and the dollar area for the first half of this year which the Chancellor quoted in the House of Commons on Thursday plainly reveal the extent to which the intensified strain upon reserves has arisen from the transactions of the United Kingdom itself. The table reproduced below—other tables from the statement are reproduced in a subsequent Note—shows that the United Kingdom deficit with the dollar area accounted for £160 million, or two-thirds of the total net gold and dollar deficit of £239 million for the sterling area as a whole.

STERLING AREA GOLD AND DOLLAR DEFICIT: FIRST HALF 1949
(£ mil.)

	Jan.-June Provisional	Economic Survey	Difference
I. United Kingdom:			
Imports.....	- 207	- 207	—
Exports.....	+ 88	+ 100	- 12
Other payments and receipts (net).....	- 41	- 25	- 16
United Kingdom deficit with dollar area.....	- 160	- 132	- 28
II. R.S.A. deficit with dollar area.....	- 37	- 15	- 22
III. Gold and dollar payments to non-dollar countries.....	- 42	- 50	+ 8
IV. Total net gold and dollar deficit.....	- 239	- 195	- 44

The United Kingdom dollar deficit proved to be £30 million larger than was envisaged in the Economic Survey, a deterioration which is attributable to a shortfall of £12 million in the value of dollar exports and to an even larger deterioration in the invisible account, which involved a net expenditure of £41 million in contrast with an original estimate of £23 million.

The increase in the deficit of the rest of the sterling area with the dollar area was proportionately larger than that for the United Kingdom but, even so, represented only two-thirds of the additional strain imposed by the deterioration in Britain's account. Rather unexpectedly, the aggregate payments made in gold and dollars to non-dollar countries were £8,000,000 less than had been expected. These payments, which absorbed £42 million, cannot be apportioned between the United Kingdom and the rest of the sterling area.

Pause in Markets

Though the news has been no better—indeed, with the proclamation of a state of emergency last Monday, it might reasonably be considered to be worse—selling has at least temporarily been more easily accommodated on the Stock Exchange this week. This fact must be largely attributed to technical factors. Last Sunday's communiqué from Chequers,

Eastern Enterprise

For over three hundred years men of enterprise and initiative have engaged in trade with the East. For nearly a century The Chartered Bank of India, Australia and China has supplied them with the specialised banking services that this trade demands. Today, in addition to these services, the Bank's wide network of branches ensures that a wealth of information on local needs for products and services is readily available to customers. Those planning to enter the markets of the East are cordially invited to discuss their problems with the Managers of the Bank in London, Manchester or Liverpool.

replete with its multilateral platitudes, was hardly the signal for confidence; nothing but a reversal of the drain on gold and dollar reserves would produce that. Yet it did prompt enough bear covering early in the week, and jobbers apparently had some difficulty in finding stock to match. But despite this appearance of steadiness, investors remain only too conscious of the fact that an uneasy period faces the markets for the next month or two. This may be relieved by stout-hearted firmness in gold shares with periodic revelations of borehole results such as those provided by "Geoffries" this week. Occasional sallies towards a higher level of equity prices may also occur, given the present oversold condition of the industrial share market. Yet there can be no abiding confidence, either there or in the gilt-edged market in its present touchy state, that a rebound from present prices would get very far.

In these circumstances it might be regarded as optimistic to launch a new Colonial issue, and even daring, perhaps, for a foreign Government to attempt to raise new money in the London market on reasonable terms. But the uncertainties have not deterred the Northern Rhodesian Government from proceeding with the underwriting of a loan of £3,540,000 for a cash offer on Friday. The terms of this issue—3 per cent stock, dated 1963-65 at 97 per cent—have been given a good reception. The market has welcomed the closer redemption dates of the new loan compared with recent gilt-edged issues, and has noted that in order to hold the 3 per cent interest line even with dates in the middle 'sixties, it has been thought necessary to fix the issue price well below par. Part of the loan is offered for conversion to holders of the outstanding £1,250,000 Northern Rhodesia Government 5 per cent inscribed stock 1950-70 for which six months' notice of redemption is given and £100,000 is also being reserved, following the precedent of the recent Nairobi loan, for local residents in Northern Rhodesia.

If the conditions of the new Iceland loan, which is the first postwar issue to be made in London by a foreign Government, appear unusual, they present a good match for the security offered. The lists will open next Monday for £1,250,000 4½ per cent Iceland Government registered stock 1960-69 at 99 per cent. The issue itself is secured on ten trawlers which are at present on order to be built in this country for the Iceland Government, while the service of the loan will be at least partly furnished from the proceeds of the sale of Iceland's fish in this country.

Trade and Payments

Freeing European Commerce

The President of the Board of Trade, at the end of last week, made a long statement in the House of Commons on the British Government's proposals for relaxing restrictions on intra-European trade. These proposals were made to Britain's partners in the European Recovery Programme and form part of the general contribution to the debate centreing in the revision of the intra-European Payments agreement. Even after Mr Harold Wilson's statement, however, it is difficult to assess the real substance in these proposals. Mr Wilson described them as "a substantial step forward towards closer and more efficient economic integration in western Europe and towards a removal of obstacles from intra-European trade." The main intention is to remove or relax import licensing restrictions originally imposed to safeguard balances of payments but in many cases enduring well beyond the point at which they could be justified on this ground.

The proposals are for a "progressive freeing of European trade on a competitive and multilateral basis." The scheme remains a mere enunciation of principles which have yet to be supplemented by tangible proposals. Moreover, it is abundantly and painfully clear from Mr Harold Wilson's statement that escape clauses are provided for any country which refuses to take any action on the recommended lines. The measures

which are to be taken to relax restrictions on imports will only apply to sources outside the hard currency areas, and will only apply "to the fullest extent consistent with safeguarding the balance of payments" of the participating countries. Mr Wilson went out of his way to give the utmost precision to this point and to declare that Britain's payments arrangements with countries to which these relaxations might apply "must be such as to avoid any spending of gold and dollars by the United Kingdom."

Mr Wilson was also careful to point out that "in deciding upon the list of goods to be freed from import restrictions we shall have to bear in mind the legitimate interests of our own industries." The many reservations in the scheme hardly promise that it will be very effective in loosening European trade. And it was surprising that Mr Wilson, confronted by a supplementary question, was unable to name a single commodity, or a single country, to which this greater freedom of imports might be extended.

The Trade Spectre

The drain on Britain's gold and dollar reserves during the first half of the year revealed that all is not well with Britain's trade. Exports have been none too buoyant in recent months, although to judge from the preliminary figures for June the export drive as a whole is maintaining fair momentum. The total value of exports, it is true, fell by £8,000,000 to £143 million. But June was a short month with only 24 working days. The daily rate of exports, which can be taken as some measure of the effort made by the export industries,

BRITISH EXPORTS, JANUARY-JUNE, 1949						
	Jan.	Feb.	Mar.	April	May	June†
Total (£mn.)	159	141	160	137	151	143
Adjusted total* (£mn.)	159	152‡	154	149	151‡	155
Volume Index (1938=100)	162	143	162	140	153	144

* Total of each month adjusted to a standard 26 working days. † provisional.

was 2½ per cent higher than in May and 4 per cent higher than the low figure for April. Apart from January, the June rate was the highest attained since the war. But during the next six months, it will be difficult to maintain the current rate. To some extent, the closing of certain markets such as South Africa may be offset by the projected expansion in exports to Argentina, but only if British goods are competitive in design, quality and price. At least the volume of exports for the first half of the year (150½ per cent of the 1938 level) has equalled the target published in the Economic Survey.

The table showing British exports by destination for the first five months of the year provides part of the answer to Britain's gold loss. The monthly average was above that given in the Economic Survey, but exports to the western hemisphere

BRITISH EXPORTS BY DESTINATION: JANUARY-MAY, 1949 (£ mn.)			
	Jan.-May, 1949*	Monthly Average*	Economic Survey, Jan.-June Monthly Average†
Western hemisphere	113	23	27
Sterling area	395	79	73
EEC countries	193	38	36
Other countries	74	13	16
	775	155	152

* Based on export shipments.

† Based on export receipts.

were decidedly below expectations. And when the June figures for the destination of British exports are available, this discrepancy is certain to be even greater. The export figures published in the Trade and Navigation returns relate to export

shipments, whereas those in the Economic Survey refer to receipts. Thus there is more reason to suppose that the gap between actual and planned exports to the western hemisphere, will prove to be even larger than that shown in the table. It will also be interesting to see whether imports from dollar sources were larger than those planned for the first half of the year. In June, imports rose to a new record level of £201½ million making the total since January (valued c.i.f.) £1,120 million. The Treasury, however, has calculated the f.o.b. value of imports for the first half of the year at £950 million or £10 million less than the figure given in the Economic Survey, though these figures were marked "very provisional."

Anglo-Argentine Agreement—

Examination of the full text of the new five year trade agreement with Argentina shows that, on paper at least, it is more watertight than any early contracts. The five-year contract for meat is to be negotiated in London and, to prevent a repetition of what happened earlier this year, not only have the quantities been stipulated, but Britain is also to receive in any case not less than 85 per cent of the total quantity exported from the Argentine Republic to all destinations in any three monthly period. Experience of the Andes agreement evidently taught the British negotiators a lesson. Dr Ares, the Argentine Minister of Economics, has stated that the Argentine Government is to develop domestic agriculture and stock breeding. This is certainly a reversal of the Miranda policy. If the agreement works, then the British meat ration should increase and British farmers will get more feed for their stock.

The second signal feature of the agreement is the opening of the Argentine market to British goods. The accompanying table shows British exports to Argentina in 1947 and 1948 and the scale of exports anticipated in the first year of the new agreement. In addition to these manufactures, which are listed in considerable detail in schedule 3 of the agreement, Britain is to sell Argentina £29 million worth of petroleum and petroleum products. All categories of exports show a substantial prospective increase. The most notable, perhaps, is in textiles. Although before the war, Argentina was an important market for both Lancashire and Yorkshire, since the war

BRITISH EXPORTS TO ARGENTINA (£000's)			
	1947	1948	Under the New Agreement
Coal	3,453	3,755	8,500
Iron and steel manufactures	5,510	5,267	7,400
Machinery	11,778	8,949	14,000
Transport and equipment	1,346	13,103	24,000
Electrical goods	2,480	2,797	4,500
Chemicals, dyes, etc.	1,852	3,451	5,500
Cotton yarns and manufactures	1,361	3,184	4,000
Wool yarns and manufactures	1,419	1,860	2,875
Silk, rayon and other textiles	949	1,737	3,200
Textiles, glassware, etc.	978	1,772	2,500
Cutlery and instruments	602	1,161	2,000
Non-ferrous metals and manufactures	3,313	4,529	5,800
Other goods	34,801	52,541	92,575

* Excluding yarns.

Britain has been ousted by Italy, Belgium and France. To a large extent, this has been due to the Argentine Government's system of import licensing. Now British textiles are to be given their chance. There is no suggestion of a preferred market; the agreement merely provides that import licences will be freely granted up to the amounts stated. Exports of cotton goods from Britain have been set at £6,800,000 compared with £3,184,000 in 1948 and £1,860,000 in 1947 (the value of cotton exports to Argentina for these two years was wrongly given in the table on page 38 of the issue of July 2nd). Wool textile exports are also expected to be more than double last year's figure, while exports of other textiles are expected

to increase nearly fourfold. Coal exports will also be more than double last year's value while transport equipment (mainly ships, rolling stock and aircraft) will be nearly double and machinery exports 60 per cent higher than in 1948.

In the past, agreements with Argentina have resulted in disappointment, and this new agreement will therefore be welcomed, but with caution. If trade can be developed along these lines, both countries will benefit materially. Britain will get foodstuffs and raw materials without having to pay dollars, and Argentina will get petroleum, coal, capital equipment and consumer goods—an increased supply of the latter may play an important part in curbing Argentina's internal inflation. The agreement gives the opportunity to develop once more Anglo-Argentine trade. It now rests with exporters in both countries to make full use of it and with the two governments to keep the lines of trade clear.

—And Sterling Guarantees

Argentina has again succeeded in ensuring that any sterling it accumulates will be fully insured against the risks of devaluation. Yet another type of sterling has been created—Argentine "C" account sterling. Any surplus of sterling earned by Argentina since April 1st, when the last agreement ended, will be paid into the "C" account, and will carry a "revaluation" guarantee. Thus if sterling is devalued, but not the peso, or both currencies are devalued but sterling more than the peso, the loss to Argentina, calculated on the new sterling-dollar-peso rate, would be made good to Argentina in sterling.

At the same time, the exchange guarantees attached to Argentina's "A" and "B" account sterling are maintained. Sterling in the "A" account remains covered by a gold guarantee and the "B" account sterling by the existing revaluation guarantee similar to the new "C" account guarantee. Quite properly—since it is currently earned sterling—"A" account sterling can be used by Argentina to overcome any shortages that may arise in the new "C" account. But, rather surprisingly, it would seem that the "B" account sterling (which in the case of other countries holding "B" sterling is blocked and as a rule released only by fixed and published amounts) can be drawn on to replenish the "A" account and the new "C" account. Thus Argentina would still have plenty of reserves to fall back upon, should payments go in favour of Britain, before a sterling shortage would call forth a higher rate of Argentinian exports.

Anglo-Russian Negotiations

Trade negotiations between Britain and Russia are continuing, though not without difficulty. A contract has been signed with the Soviet Union covering coarse grains (mainly oats and barley with some maize) and, it is believed, wheat as well. Russia made it quite clear at the international wheat conference earlier this year that it had developed its transportation system and its harbour equipment to handle large quantities of grain, and that it was interested in exporting—at its own prices. No statement has been made about quantities or prices—indeed the existence of the contract has not been officially admitted. Prices in the contract made 18 months ago for coarse grains were claimed to be based on Chicago prices—when wheat was selling for \$3 a bushel. It is possible that the new contract involves prices higher than those currently ruling in Chicago. The Russians appear to have made the contract conditional on the signing of a general trade agreement similar to the earlier one. This is somewhat surprising, because most if not all of the sterling which Russia acquired from the previous sale of grain has been spent on buying rubber and wool, and Russia will apparently need sterling to meet the con-

tracts for British manufactures placed under the agreement of 1948. It was therefore thought that Russia might on this occasion prefer a straight sale of grain to a form of barter agreement. Russia could, of course, pay in gold, but would be more likely to convert gold into cheap sterling rather than use it for direct payment.

The implementation of the grain contract must await the second instalment of negotiations which are to be conducted in London and are likely to be prolonged. Meanwhile, trade negotiations with Yugoslavia are well advanced; both sides know the other's requirements, but detailed lists have yet to be drawn up, and a payments agreement will have to be settled first. Financial problems are also the stumbling block in negotiations with both Czechoslovakia and Hungary, but these are still in a very early stage. Development of east-west trade in Europe is important for countries on both sides of the iron curtain. Whether it can be put on a sufficiently sound footing depends less on economics than on politics. These new trade relations will have to rest on something firmer than the present unstable foundations if permanent benefit is to be derived from them.

Payment Talks with Pakistan and India

Since the assembly of Commonwealth Finance Ministers in London, it has become impossible to distinguish from the wider discussions the separate talks which had been planned between Britain and individual members of the sterling area. This is especially true of the negotiations with Pakistan and India. The Pakistan officials who have been discussing in London the new dominion's sterling requirements for the year from July 1st, have this week been joined by Mr Ghulam Mohammed, the Pakistan Finance Minister. Similarly, the Indian delegation which had been in London for many weeks but had participated only in exploratory talks, has now been joined by the Indian Finance Minister, Dr John Matthai. The difficult problems which confronted the separate negotiations at the outset have now been aggravated by the sharper evidence of strain upon the sterling area as a whole. Within the general negotiations for short-term remedies, there is likely to be some tough bargaining.

Pakistan's sterling needs are largely governed by its payment arrangements with India, and these arrangements have themselves to be reformulated for the coming year. Under an agreement which has just expired, Pakistan was prepared to hold the equivalent of £9,750,000 in Indian rupees but was entitled to demand sterling for any rupees accumulating beyond that level. Any excess accumulation up to £7,500,000 was convertible into sterling from India's No. 1 sterling account, but beyond that amount would be convertible only from the blocked No. 2 sterling account. Actually, India's deficit with Pakistan has not deteriorated to the point at which payments would be made from the No. 2 account, but India has been an important source of sterling for Pakistan. Hence Pakistan's arrangements with Britain are closely dependent on its own arrangements with India.

Last year Britain agreed to release £12 million from the Pakistan No. 2 account to its No. 1 account; of this total, £5,000,000 was an unqualified release, £2,000,000 was to replenish working balances, and £5,000,000 was intended to cover special expenditure upon refugees. Twelve months ago, after these releases, the Pakistan No. 1 account stood at some £25 million, but it has recently fallen to little more than £10 million. Pakistan has thus exceeded last year's sterling releases by some £3,000,000. While Pakistan has not run down its sterling holdings to anything like the same extent as India has done, its drawings have appreciably exceeded last year's agreed release, and there are expectations that it will press for higher sterling releases for the next twelve months. Furthermore, Pakistan is known to consider the £5,750,000 of dollars made available last year as inadequate to cover its prospective 1949-50 hard currency deficit.

Industry and Investment

Austin-Nuffield Broken Engagement

There were many who thought last October, when the technical collaboration between the Austin and Nuffield organisations was announced, that the two companies would have to go to a considerable way towards some pooling of financial interests if the plan was to succeed. Whether this conjecture has proved to be true, there is no means of telling. But certainly the pooling of information on technical matters, like production methods, costs and design, has now ceased, and "no further steps will be taken towards the pooling of production resources." The projected collaboration was never very clear in its details; it could have meant a complete merger; or it could have meant mutual agreement on the types of cars to be produced by the two concerns; or it might have represented nothing more than a promising idea which seemed worth trying. Now, it has been disclosed, "after preliminary investigations" the engagement has been broken off by mutual consent.

Perhaps this is not a matter for undue regret. Whatever the reasons may have been—personal issues, the prospect of greater competition abroad and perhaps before long at home, or the inadequate benefits which pooling may have promised to yield—there is probably more advantage to the country and to consumers in Austin and Nuffield being at arm's length, rather than arm in arm. The important question of greater standardisation of accessories and components is already covered by arrangements made by the industry's standardisation committee. Standardisation of detailed components, coupled with free competition in engine design, is likely to serve the export and home trades better than close co-ordination among the giants of the industry.

End of the Electricity Surcharge

The Minister of Fuel and Power announced in the House of Commons on Monday that last winter's surcharge on domestic consumption of electricity would not be repeated. This decision was to some extent foreshadowed by the report of the electricity sub-committee of the National Joint Advisory Council on the spreading of electric power loads next winter. The sub-committee found no evidence that the domestic peak load was at any time reduced by the imposition of last winter's surcharge. The proof can hardly be conclusive, for last winter was exceptionally mild. Equally, there is no proof that in a hard winter an extra charge on electricity would do much to limit domestic consumption in the peak hours. A surcharge spread over all hours is no substitute for a system of charges based on peak demand. And such a system is impossible without heavy capital expenditure on meters.

Mr Gaitskell stated that both the British Electricity Authority and the area supply boards were opposed to a second winter of surcharges and that most of the electricity consultative councils supported this view. The electricity supply industry lost goodwill among consumers as a result of last winter's experiment, and it may also have lost revenue. There was never any need to reduce domestic consumption of electricity outside the peak hours, which amount to only four hours out of the twenty-four. But a surcharge acts as deterrent throughout the day, and is likely to reduce consumption at times when the householder finds it easiest to economise; broadly speaking, this is not during the peak hours, but in the evening, when the supply undertakings have available capacity and are anxious to stimulate consumption. These arguments, coupled with some political pressure arising from the unpopularity and occasional inequity of the surcharge, have carried the day. Next winter, the electricity supply industry will once again rely on publicity to reduce domestic consumption in the peak hours. Exhortation, however, has proved less effective than economic pressure in the past.

Rayon in your bedroom

You can rely on rayon to add new beauty and comfort to your bedroom. Rayon may go to make your sheets and pillowslips, your bedcovers, chaircovers, carpets and curtains. And—of course!—rayon goes to make the most attractive and practical pyjamas, nightdresses, bedjackets and dressing gowns. In the furnishings of your home and in your wardrobe, the number of fabrics made with rayon, either by itself or used with wool, cotton or silk, is very high indeed. And the list is growing longer, as more and more the beauty of rayon becomes appreciated and its versatility realised.

Over the year, domestic consumption takes 35 per cent of the total electricity generated. The domestic proportion of peak load demand on a really cold morning is probably above this average. Moreover, there are signs of strong and probably successful pressure to revoke the Electricity Supplies (Relaxation of Obligations) Order of February, 1948, which prevents electricity suppliers from installing any new service or apparatus for domestic purposes. This Order inconveniences householders by removing their free choice of equipment but if its revocation means the installation of more electric fires, water heaters and radiators, an increase in peak demand must inevitably follow. There is no possibility of sufficient generating capacity to meet maximum demand for several years. Unless there is mild weather or remarkable restraint in domestic consumption, industry must expect power cuts when winter comes.

Wheat Agreement in Force

The international wheat agreement has at last come into force. Twenty-two out of the forty-two countries which signed the agreement have so far ratified it and the new Wheat Council was formally constituted in Washington last week. Articles of ratification had to be deposited in Washington before July 1st when the agreement came into force, but subsequent ratification is permitted in certain circumstances. Italy has since joined, and Egypt is expected to come in shortly. The countries which have not yet ratified the agreement are mainly those of Latin America, whose legislative assemblies are not in session.

The Council has chosen London as its permanent headquarters and Mr F. Sheed Anderson, the head of the British delegation, as chairman for the first crop-year 1949-50. Both the Food and Agriculture Organisation and the United Nations suggested that Washington might be a preferable site. There are, however, some advantages in housing the Wheat Council in a consuming country, particularly as its most thorny problems are likely to be those relating to domestic support price policies. The maximum price of \$1.80 a bushel under the agreement is well below the American domestic support price and a subsidy will have to be paid by the American Government on export sales so long as this disparity exists. It is difficult to see how the price of wheat can move very freely under such conditions. Presumably the price will stay at its maximum level until large stocks have accumulated or price support policy is changed.

Deadlock over Development Councils

Last week produced another draft order for a development council—this time for the clothing industry. Last Monday was the final day for representations about the draft proposals for a development council for the wool textile industry. At meetings held in Bradford, Bristol and Edinburgh woollen manufacturers voted against these proposals, on grounds outlined in *The Economist* three weeks ago. A further appeal has been made by the industry to the President of the Board of Trade to modify the plan. Proposals for a development council for hosiery were published nearly a year ago, but there has been no further action. Discussions are still taking place between employers and unions in the pottery and cutlery industries; and the Board of Trade has had preliminary talks with the jute and the china clay industries.

Three councils have already been set up, for cotton (though this industry is a special case), for furniture and for jewellery and silverware. Broadly similar schemes for the wool and clothing industries have proved unacceptable, because these industries are not prepared to accept a statutory body of Government nominees, though the wool industry is prepared to work on voluntary lines to achieve the same objects. The clothing industry has rejected the Board of Trade's plans without putting forward any suggestions of its own.

Mr Harold Wilson has put the general case for the statutory form of development council in distinctly forthright terms:—

A statutory central body has, in my view, the advantages of being consistent with the machinery which Parliament has provided for this purpose, of ensuring greater continuity and security in the provision of funds for all required purposes and greater flexibility in their administration and use and, generally, of ensuring that the recommendations of the Wool Working Party's Report can be more fully secured, both now and in the future. . . . We have agreed to a number of voluntary organisations, but I am not prepared in every case to bow to the wishes of the employers and say there shall not be a development council in a certain industry.

This attitude, with its implication that there is no alternative to the statutory form of development council, is causing concern among employers' organisations. The value of development councils for some industries is accepted in principle. But they are peculiarly dependent on the co-operation of management. As the proposals stand at present, members of development councils will be nominated by the Board of Trade. Industry fears that a body so chosen will occupy an independent position between the industry and the Government—and nearer the Government than the industry. Ultimately it rests with individual managements whether the councils can do useful work or not. If there is a good prospect of securing voluntary co-operation, what is to be gained by imposing a statutory form of development council on an industry reluctant to receive it and unlikely to co-operate with it?

Unilever's Unidentical Twins

The preview of the provisional 1948 trading experience of the Unilever group given at the time of the new issue of convertible notes by N.V. in February threatened to dilute the news value of the preliminary profits statement. The prospectus stated that the consolidated results of both N.V. and Limited would together be approximately the same as for 1947. But the rise in the consolidated profits of the British company Limited from £17,508,356 to £19,378,852, and the offsetting decline from Fl.94,215,592 to Fl.66,065,984 in the corresponding profit of NV are distinctly remarkable. In the case of Limited these figures have been struck after providing £2,650,000 for fixed assets replacements reserve (against £2,000,000) and £2,265,000 for reserve against stocks, which is £970,000 less than in 1947. On the other hand, NV has provided Fl.15.2 million for replacement of fixed assets (against Fl.17.5 million) and Fl.20 million (against Fl.10 million) as reserve against stocks. These contrasts are of distinct interest, since they might be interpreted as reflecting the relatively greater problem presented to Limited in the replacement of fixed assets replacement. The concession of doubling the initial allowances in the Budget has in fact failed to resolve the dilemma posed by Sir Geoffrey Heyworth in his statement with the 1947 accounts.

The reduction in the profits of the Dutch company is partly accounted for by the heavier scale on which funds have been set aside for stock reserves, since the allocation has been doubled in the past year at Fl.20 million. Perhaps the fall in profits and the increase in the reserve may be associated with NV's exposure to falling prices in the United States.

Shortage of Oils and Fats

Despite warnings by various eminent authorities twelve months ago that a world food shortage was still to be feared, food prices have been falling. In dollar markets the falls have been quite sharp; in sterling markets they have been less marked, but they are sufficient to show that the postwar peak in prices has been passed. Prices of oils and fats have followed this general trend, even though the forecasts of available supplies for the next three years suggest that world exports of oils and fats may still be appreciably below the 1938 quanti-

ties. In a recent address to the Congress of the International Association of Seed Crushers, Mr J. C. A. Faure, of Messrs Lever Bros. and Unilever, Limited, has estimated that world exports of the principal oil-bearing materials and oils and fats (excluding butter, shortening, margarine and lesser drying oils) will amount to 3,214,000 tons this year compared with a preliminary figure of 2,933,000 tons for last year and 4,500,000 tons for 1938. Mr Faure's estimate for world exports in 1951 is no higher than 3,564,000 tons—an increase of little more than 10 per cent.

The gap between dollar and sterling prices for oils and fats is widening. Such a gap is common to many commodities, and it reflects the disequilibrium between the price and cost structures of the two areas. But the output of oils and fats (like that of other commodities) in the United States and the Western Hemisphere has expanded considerably during and since the war, whereas supplies from sterling and other non-dollar sources have yet to regain their prewar levels. Mr Faure pointed out that soya beans are no longer available from Manchuria or groundnuts from India. Exports of groundnuts from West Africa are hindered by the lack of transport, while in East Africa the harvest from the small area brought into cultivation has been disappointing, quite apart from the more fundamental causes of the slow development of this area as a large-scale producer of groundnuts and sunflower seed. Marshall aid helps to make up in part the deficiencies in oils and fats in western Europe through purchases from the dollar area. But until conditions of world trade become more normal, differential prices are likely to persist.

If this were the whole story, the prospects for future supplies of oils and fats to Britain and western Europe would seem bleak. There are, however, two mitigating factors which ought to be taken into account in any long-term assessment. The first, not referred to in detail by Mr Faure, is that production of oils and fats in many non-dollar countries has increased proportionately more than their exports. There is some reason to believe that as the world enters a period of price deflation, exports of oils and fats might expand more rapidly than output, except where shipment is hindered by transport difficulties. The second factor is the development of synthetic detergents. Expansion in output during and since the war has been greatest in the United States, though considerable progress has been made in Britain and other countries. Synthetic detergents offer definite advantages over soap in hard water districts, and they have also proved more satisfactory in certain industrial processes involving wetting and washing. Mr Faure conceded the importance of detergents, but he holds that "the tonnage of oils and fats that will be replaced by synthetics has been over-estimated." That may be so. But it may also be true that the relative shortage in oils and fats may be overcome more quickly than present forecasts of world exports might suggest.

* * *

Butlin's Hotels

Further information was provided at Monday's annual meeting of Butlin's, Limited, on the renting to the company of two hotels in which Mr William Butlin, the managing director, has a controlling interest. The statement of the chairman, Mr Ian Anderson, accompanying the report for 1948, had given only meagre news about them:

Your managing director has a controlling interest in companies owning two large hotels, namely, the Princess Hotel, Bermuda and the Fort Montagne Beach Hotel, Nassau. These hotels which are now in full operation, are leased furnished and equipped to your company for a period of 21 years.

It now transpires that the rent payable by Butlin's, Limited, amounts to £22,500 a year for the duration of the lease for each hotel. The total sum invested in the hotels by Mr Butlin and his associates was given as £1,250,000, so that the rent represents 3½ per cent on the capital outlay. Mr Butlin ex-

pressed the view that Butlin's, Limited, had made a good bargain by renting these hotels. Already they had brought in \$1,000,000; they represented a spreading of risks and were a valuable potential source of dollars for the country. A majority of shareholders at the crowded meeting were prepared to accept these arguments at their face value and leave the matter there.

Despite the increase from £772,410 to £784,078 in the consolidated trading profit of Butlin's in 1948, there was obvious apprehension that this level of profit cannot be maintained. Mr Anderson explained the reason for the much criticised cut in the final dividend for 1948 from 50 per cent to 10 per cent after the declaration of a 50 per cent interim. There had, in fact, been an increase from £51,841 to £127,712 in the amounts necessary for repairs, replacements and incidental expenditure at the holiday camps, while running expenses were also higher than expected. The dividend was only barely covered by earnings of 67½ per cent, and the company's liquid resources require strengthening. The policy of paying high interim dividends is rightly to be reviewed by the board. In future it is the intention of Mr Butlin to give his undivided attention to the affairs of Butlin's, Limited. He is resigning forthwith from the boards of Margate Estates and Belle Vue, Manchester. Moreover, he has offered to forgo his salary from Butlin's, Limited, until the company again pays a dividend of 100 per cent. It is therefore at least possible that his services will go unrewarded for some length of time.

* * *

Depletion Allowances for Overseas Mines

This week's publication of the report of the Departmental Committee on Taxation and Overseas Minerals (Cmd 7728) comes as something of an anti-climax since it is dated March 8th last and its main recommendations have already been embodied in the Finance Bill and were debated in the Commons a fortnight ago. It was indeed in response to pressure at the Committee stage that it has seen the light of day at all for Departmental Committees, without justification in this case, like to hide their lights under bushels. The report is a worthwhile document for it sets out with precision the considerations which have moved the Government to give taxation allowances to United Kingdom concerns in respect of capital outlay on mineral deposits which they acquire overseas. Once again, it has been shown that capital outlay is merely long-term deferred revenue expenditure and that, if true profits only are to be taxed, full allowance for the amortisation of the wasting assets should be granted. The 1945 Income Tax Act took an important step in this direction by granting to mining concerns depreciation allowances in respect of exploration, development and construction, but as Sir John Anderson then admitted, there was a hiatus in that Act because he was not able at that time to propose any relief in respect of the cost of the source itself. He added, however, that he would be willing to enter into discussions on this subject of depletion allowances with representatives of the overseas mining and oil industries; this invitation led to submissions by the British Overseas Mining Association, the Oil Industry Taxation Committee, and the Malayan Chamber of Mines (which are published with the report) and to the setting up of a small but powerful departmental committee.

The case for depletion allowances, as the representations show, hinged, on two main arguments—first, that the lack of depletion allowances has handicapped United Kingdom concerns in obtaining new concessions overseas in competition with foreign mineral companies operating under more liberal taxation codes; the latter were able to outbid British concerns since they were able sooner or later to charge depletion against taxable profits. Secondly, the mining spokesmen contended that minerals in the ground were the raw material of the mining concern extracting them, and that their cost should be a cost of manufacture just as the consumption of raw materials by a manufacturing concern; therefore, a depletion allowance

Abridged Particulars

Application has been made to the Council of The Stock Exchange, London, for permission to deal in and for quotation for the £150,000 4½ per cent. First Debenture Stock, 1970, about to be issued.

JEREMIAH AMBLER & SONS LIMITED

Authorised	SHARE CAPITAL	Issued
£300,000	in 300,000 5½ per cent. Redeemable Cumulative Preference Shares of £1 each ...	£300,000
£275,272	in 1,101,088 Ordinary Stock Units of 5s. each ...	275,272
£24,728	in Ordinary Shares of £1 each ...	—
£600,000		£575,272

Created **LOAN CAPITAL** *About to be issued*
£300,000 4½ per cent. First Debenture Stock, 1970 £150,000

The full advertisement shows (*inter alia*) that:

- REDEMPTION.**—The Debenture Stock now being issued will be redeemable (a) after the 31st December, 1954, at £103 per cent.; (b) by an annual sinking fund of 2 per cent. at £102 per cent. The Stock will ultimately be redeemed on the 31st December, 1970, at £102 per cent.
- BUSINESS.**—The Company and its subsidiaries are spinners of merino and cross-bred yarns, and the Company specialises in the spinning of yarns from mohair, alpaca, camel hair and goat hair. The spinning of these additional animal fibres is confined to relatively few firms, among which the Company is one of the leaders. The group are owners of four freehold mills in Bradford and a leasehold mill in Northern Ireland, which employs approximately 1,500 persons.
- ASSETS.**—The combined net assets of the group at 31st December, 1948, after taking into account the estimated net proceeds of the First Debenture Stock about to be issued amounted to £964,315, which is sufficient to cover the nominal amount of such Stock more than six times. In the Directors' opinion the amounts included in the above figure of net assets for Freehold and Leasehold Properties, £174,427, and for Plant and Machinery, £102,631, are appreciably below present values. The Freehold and Leasehold Properties are insured for £684,126 and the Plant and Machinery for £1,240,909, a total of £1,925,035.
- PROFITS.**—The combined trading profits before taxation were as follows:—

	£
31st March, 1940 ...	52,218
31st March, 1941 ...	67,555
31st March, 1942 ...	72,358
31st March, 1943 ...	88,979
31st March, 1944 ...	108,775
31st March, 1945 ...	134,967
31st December, 1945 ...	144,269
31st December, 1946 ...	153,951
31st December, 1947 ...	200,721
31st December, 1948 ...	200,619

The average combined profits before taxation for the ten years ended 31st December, 1948, amount to £122,441. These profits would be sufficient to cover the annual interest on the First Debenture Stock now being issued, requiring £6,375, NINETEEN TIMES. Adding to this interest the annual sinking fund provision of 2 per cent. and an allowance for taxation thereon, which together amount to £6,060 (taking Profits Tax at 10 per cent. and Income Tax at 9s. in the £), the total sum required for the service of the Stock now being issued is £12,435 in the first year in which the sinking fund operates. This figure is covered more than NINE TIMES by the average profit for the past 10 years.

The Full Particulars as required to be advertised in connection with the Application made to the Council of The Stock Exchange, London, for permission to deal in and for quotation for the £150,000 4½ per cent. First Debenture Stock, 1970, of the Company to be issued, may be had upon application to:—

Not so funny for Mr. Nash!

Mr. Nash's sudden transformation from a dignified business man to a sprawling figure of waving arms and legs struck some passers-by as funny. But when he was helped to an ambulance with an injured back and head, Mr. Nash could hardly be blamed if he did not share the joke. He was unable to work for many months, while expenses mounted. Yet he was able to convalesce with an easy mind, for under his 'General' Personal Accident Policy he received £10 a week until he was fit.

Peace of mind costs very little

£4 a year covers you for £10 a week accident benefit. Are you wise to face the risk — and all that it means to your dependants — without this cover? It's worth while finding out more about this and other benefits of the 'General's' Personal Accident Policies — just send the coupon.

Please send me full particulars of 'General' Personal Accident Policies.

should be granted by way of natural justice. On the first point the committee finds that although—rather surprisingly—there is no concrete evidence that British mining concerns have in fact suffered from foreign pre-emption in recent years.

On the question of natural justice, the committee goes back to the cogent findings of the Royal Commission of 1920—that overseas, but not domestic, mining concerns have a case provided that there is no “unjustified loss” to the Revenue. There would be an “unjustified loss” if the cost to be amortised yielded an untaxable capital profit to a United Kingdom resident—this is the old difficulty of allowing as a revenue expense to Peter a payment which is a capital receipt to Paul. The committee's solution, so far as the cost of mining rights is concerned, is to grant a depletion allowance, neatly dovetailed into Part III of the Income Tax Act, 1945, on the capital expended on the acquisition of the rights by the first United Kingdom resident acquiring them. Although this conclusion (which is estimated to cost £1,000,000 a year) is to some extent disappointing to the industry, which hoped to obtain the allowance of the total cost to the operating concern, it must be recognised as inevitable unless capital profits on intermediate deals between United Kingdom concerns were to be chargeable for tax purposes. The committee has recommended and Parliament has granted depletion allowances on capital appropriately dehydrated. The decision will be welcomed by all who wish to see London retain its place as a great mining centre.

Shorter Notes

In reply to a Parliamentary question the Chancellor has stated that since the removal of the tax on bonus issues the Capital Issues Committee has sanctioned 115 applications with a nominal amount of £43,381,021; one application for a bonus issue involving £150,000 has so far been refused. But for these

bonus issue operations the capital issue market should lately have proved quiet indeed. Yet despite unfavourable market conditions recent new issues have gone relatively well, not, however, without requiring some adjustment in issue terms to suit the changed yield pattern. The Liebig Meat Extract offer, for instance, of 1,000,000 4½ per cent £1 preference shares has been over-subscribed and dealings opened at 1s. premium; the Associated Fisheries issue of 45,000 ordinary shares was over-subscribed. And the result of the Union Corporation offer to shareholders—made before the revived interest in mining shares—is not unsatisfactory, although underwriters had to take up 13½ per cent of their commitments.

Compensation values have been published for a further 116 securities of gas undertakings as determined under Part II of the Gas Act 1948 to be satisfied by the issue of British Gas 3 per cent 1990-95 stock at par.

In accordance with provisions under the Anglo-Polish Trade agreement a Polish delegation has arrived in London to continue talks on compensation due to UK residents for British property in Poland, nationalised by the Polish Government, and to arrive at a settlement of prewar Polish government debt held in this country.

Steel production in June was at the annual rate of 15,645,000 tons, the highest rate recorded for any previous June. In the first six months of the year a total of 7,949,000 tons of steel was produced compared with 7,565,000 for the first half of 1948. After allowing for the effect on production of holidays in July and August, the British Iron and Steel Federation considers that the official target of 15¼ to 15½ million tons for 1949 is likely to be hit.

COMPANY MEETINGS

ROLLS-ROYCE, LIMITED

SUCCESS OF MARKETING EFFORTS

STEADY PROGRESS

MR ERIC SMITH ON AERO-ENGINE DEVELOPMENT

The forty-second annual general meeting of Rolls-Royce, Limited, was held on July 15th at the Midland Hotel, Derby, Mr E. C. Eric Smith, M.C. (Chairman of the company) presiding.

The Secretary (Mr G. D. L. Carnegie) read the notice convening the meeting and the report of the auditors.

The following is the Chairman's statement, which had been circulated with the report and accounts and was taken as read:—

The accounts which accompany this report cover your company's operations for the year 1948. The figures reflect the success which has followed the energetic marketing of your company's products throughout the world.

In the aero-engine field the careful spade-work of previous years has borne fruit in a substantial increase in export business of both piston and jet engines.

In the motor-car business we have to be satisfied with maintaining the level of the previous year, but this is no mean achievement in the face of the many restrictions both at home and abroad, restrictions which still show no signs of improvement. The contribution made by the motor-car business to our profits does, however, benefit from the fact that during this year we have not incurred any further substantial expenditure on new tools.

Our aero-engine division has made steady progress over a wide field of technical development. Every effort continues to be made to assist the civil operators by achieving a greater reliability for our piston engines, with consequent economies in operation.

THE MERLIN

The Merlin installation in Canadair IV aircraft continues to be the only British power plant in civil operation on Transatlantic routes, where it is giving a good account of itself in the hands of Trans-Canada Air Lines. B.O.A.C. have already taken delivery of the first of their new fleet of similar aircraft, which will add to the number of Merlins already in use by them and other operators throughout the world. Needless to say, the Merlin has taken its full share of work throughout the period of the Berlin airlift.

The Derwent jet engine has come into use in increasing numbers, both at home and abroad, and still offers scope for further development.

This year has seen the advent of the Dart gas turbine propeller engine which has been installed in the Viscount. This is the first aircraft of its kind in the world, and there are indications that this combination of engine installation and aircraft will set an entirely new standard in passenger comfort.

Much useful information is being gained by the flying of the Nene jet engine as the power plant of both Viking and Tudor aircraft.

THE AVON ENGINE

The Avon engine made its first public appearance at the S.B.A.C. Flying Display in September, 1948, and takes its place in the front rank of engines of its type which will be coming into use in increasing numbers.

In all fields of engine development the company, of its own initiative, continues to anticipate future requirements, both civil and military.

Our motor-car division has actively continued development work on the range of petrol engines, and these have now been specified by Government Departments for installation in a variety of prototype vehicles.

I have referred to the considerable expansion

which has taken place in the export sales of the aero division. In this field it gives me particular pleasure to refer to the good relations which are being built up with those who are operating our products and also with those to whom we have granted manufacturing licences. In particular, I would refer to our American friends, Pratt and Whitney Aircraft, with whom we have been working closely on a programme of development work shared between our two companies.

MANUFACTURING RIGHTS

The Belgian Government is now among those who have acquired manufacturing rights, while other Governments are interested in extending existing arrangements. You will no doubt have read in the press that since the end of the financial year under review we have invested some £50,000 in the Commonwealth Aircraft Corporation Proprietary, Limited, Australia—a token of our confidence in the future technical development of that country.

Our Canadian subsidiary company has traded successfully, and our associated company, Rotol, Limited, has also had a satisfactory year.

Park Ward and Company, Limited, has continued to meet the difficulties which I enumerated last year and which have seriously curtailed output of all coach-built bodies.

Renfrew Foundries, Limited, has shown some improvement in trading, and it has not been considered necessary to make any further provision against the value of your company's investment.

IMPROVED CASH POSITION

The accounts themselves appear in the same form as last year, and I therefore propose to refer specifically only to one or two points. As a result of successful trading, the cash position has improved. The need for more funds will depend on the rate at which it is possible to incur some of the expenditure for which reserves have been specifically created, such as deferred repairs, and the purchase of the capital equipment necessary to maintain the company's facilities in line with its up-to-date products.

Your directors have given considerable thought as to the manner in which the balance remaining at the credit of profit and loss account should be dealt with. In view of the present economic situation and the uncertainties of the future, they recommend the payment of a dividend at the same rate as that for last year and the carrying forward at the credit of profit and loss account of the balance of undistributed profits, rather than the appropriation of such profits to any specific purpose.

CALL FOR LONG-TERM PLANNING

Both branches of our business call for long-term planning, but it becomes increasingly difficult to foresee the conditions which we should be preparing to meet, particularly in connection with motor-cars where the continued existence of artificial restrictions of unknown duration still prevails. Whatever the future may hold, however, your Board is steadily pursuing the policy of ever improving the technical excellence of the company's products.

The report and accounts were unanimously adopted, and the dividend of 20 per cent, less tax, was approved.

The retiring directors, Mr E. C. Eric Smith and Mr W. T. Gill, were re-elected; and the remuneration of the auditors, Messrs George A. Touche and Company, having been fixed, the proceedings terminated.

TAYLOR WOODROW, LIMITED

A YEAR OF PROGRESS

The annual general meeting of Taylor Woodrow, Limited, was held on July 15, 1949.

The chairman Mr. Frank Taylor, announced that the gross profit for the year ended December 31, 1948, was £404,960. To this figure should be added £29,971 (making a total of £434,931) representing the profit on sales in 1948 of houses owned by the subsidiary company, I.W. Properties, Ltd. (now in voluntary liquidation). The gross profits for the year, therefore, had increased by £172,645. He said that the board recommended a final dividend on the ordinary shares of 12½ per cent, (less tax). This together with the interim dividend of 7½ per cent, already declared and paid made 20 per cent (less tax) for the year.

CONTRACTS IN THIS COUNTRY

Mr. Taylor gave details of some of the work undertaken during the year. This included the building of factories, power stations, gasworks, open-cast coal production and other important projects in the scheme of National Development. He declared that the construction company was now amongst the foremost civil engineering concerns in the country. He said the board appreciated the increasing mechanical factor in civil engineering plant, both at home and abroad, and explained some of the steps being taken to strengthen the plant companies accordingly. He also mentioned that reconditioned contractors' equipment was being exported by the plant disposal company to the five continents of the world.

Turning to estate development and house-building, Mr. Taylor regretted that there had been no change in Government policy. He said that the company was staffed and equipped to erect and complete at least 4,000 houses per annum to meet the needs of would-be owner-occupiers. The supply of houses could be satisfactorily undertaken by building contractors at no cost to the taxpayer and a change of heart in responsible quarters would do much to reduce the large number of house-seekers, many of whom were in urgent need of and willing to pay for accommodation.

WORK OVERSEAS

Reporting on his visits during the year to associated and subsidiary companies overseas, Mr. Frank Taylor said that he had observed excellent progress in housing and flat development by the associated company in New York. He had also carried out an extensive tour and survey of contracts in West, South, and East Africa.

In both West and East Africa the subsidiary companies were making good progress and had sufficient work on hand to keep them fully occupied for many months. Two particular contracts he mentioned were the laying of 127 miles of oil pipeline through virgin territory in the Mikindani area—an undertaking just completed—and a contract in Tanganyika in connection with the Groundnut Scheme. The magnitude of the latter was such that before commencing to prepare the ground for growing, a township ultimately capable of housing 22,000 people has to be built and equipped.

The chairman concluded his statement by thanking, on behalf of the shareholders, all the members of the staff, particularly those directors, executives and workmen who had uprooted their homes and gone abroad for the welfare of the company. He also thanked the company's employers and the employers' architects, consulting civil engineers and surveyors without whose kind co-operation, he said, the wheel of the organisation could not revolve so smoothly.

The report and accounts were adopted.

AMALGAMATED ROADSTONE CORPN., LTD.

SATISFACTORY IMPROVEMENT MR J. S. KILLICK'S STATEMENT

The thirteenth annual general meeting of the Amalgamated Roadstone Corporation, Ltd., was held on July 13th, in London, Mr. J. S. Killick, C.B.E., M.Inst.C.E., the chairman, presiding.

The following is a summary from the chairman's circulated statement and directors' report.

It is with very sincere regret that my colleagues and I have to report the death, in August last, of your late chairman, Mr G. F. Nalder. Mr Nalder had been your chairman since the company's inception.

The accounts and reports of the directors and auditors have been drawn in conformity with the provisions of the Companies Act, 1948, and clearly show the company's position.

The result of the year's trading, as shown in the accounts, was £256,016, and the net profit, after taxation, amounted to £94,016, revealing a reasonably satisfactory improvement over the figure of £54,879 for the previous 12 months. Your board feels that they are entitled to recommend that at any rate a modicum of this increased profit should be passed on to the owners of the company in the form of a slightly increased dividend, and they propose a final dividend of 6 per cent. on the ordinary shares, making, with the interim dividend already paid, a total of 10 per cent., against 9 per cent. for the previous year. It should be pointed out that this increase in profit was earned notwithstanding an increase in wages rates of approximately 12 per cent. during the year under review.

THE INCREASED CAPITAL

During the year the issued capital of your company has been increased by £1,000,000 Five per Cent. Cumulative Second Preference shares and £93,357 ordinary stock fully paid, which now rank for dividend. Part of this increased capital has and is being employed in modernising and mechanising the various units of your undertaking. It is not too much to say that when this essential work has been completed there will be no quarry undertaking better equipped to meet the demands of the highway authorities of the country.

You will notice that the provision for income-tax has increased apparently out of proportion to the earned profits, but this arises from the incidence of taxation consequent upon the liquidation of the British Quarrying Company and its subsidiary Quarries, St. Keverne and Associated Quarries.

"REASONABLY OPTIMISTIC"

Another point which perhaps should be referred to, and one which may be remembered, is that during the year the Ministry of Transport instructed highway authorities to make considerable reductions in both men and money to be spent on roads. This naturally affected your company in the last six months of the year in question, and will undoubtedly affect prospects for the first six months of the current year, but in spite of this your directors take a reasonably optimistic view and are of the opinion that, unless anything unforeseen occurs, the 1948-49 results will compare favourably with those of the preceding twelve months.

May I conclude by expressing my thanks and, I hope, yours to the whole of the staff and employees of the company, who have contributed and continue to contribute to the success of your undertaking.

The report was adopted.

BRITISH TIMKEN, LIMITED

MOST MODERN BEARING MANUFACTURING METHODS IN THE WORLD

At the twenty-ninth annual general meeting of British Timken, Limited, in Birmingham, Mr. Michael Dewar, chairman, said: Our total sales for the year 1948 actually increased by some 30 per cent. over those for the year 1947. Our bearings were incorporated to a greater extent than ever before in new designs of all types of mechanical equipment.

Particularly was there a very gratifying increase in the number of roller bearing axle boxes delivered to railways in many different countries throughout the world. A large number of our rolling mill bearings will be used in the new hot and cold strip mills being erected in South Wales.

We repeat our claim that nowhere in the world in any roller bearing factory can be found more modern, or more efficient machine tools and equipment than exist in the factories of this organisation, British Timken, Limited, and its subsidiary Fischer Bearings Company, Limited.

Increased profits are a reflection of the increased turnover, and the increasing efficiency of manufacture through modern and enterprising management.

Although your company's factories are still fully occupied, day and night, signs of a trade recession have undoubtedly multiplied, and we look to the immediate economic future with some apprehension.

Nevertheless, we have decided to continue our policy of expanding your company's manufacturing facilities in order that we may look beyond immediate difficulties to the time when we shall fight in the world's buyers' markets, unhampered by the stranglehold of Government controls and the overwhelming burden of taxation.

We look forward to a world of greater and freer trade, but with some knowledge that such freer trade is impossible under Socialism and under a system of managed currencies.

In this so-called "planned" economy, in spite of the scarcity of dollars in Europe, our associated French company is forced to purchase steel and bearings and machinery from the United States rather than England, and the French farmer, in spite of short time being worked in English tractor factories, has to purchase tractors from the United States.

In this so-called welfare state, managed currencies, and planned economies seem only to enable Governments to postpone the day of reckoning for their extravagances. Until the nations of the world again tie their currencies to some form of gold standard, thus requiring even Governments to count the cost, we feel little confidence in that expansion of world trade which alone will enable this country to support 50,000,000 people at a standard of living higher than their present output can really purchase from the rest of the world.

Free enterprise, of which your company is a part, is at present not only sustaining the country's economic effort, but carrying the growing inefficiency of nationalised industries. Remembering over the past few years that whenever our opinion has been in conflict with that held officially in Government Departments on matters appertaining strictly to our business, we have always been right, and the Government Departments have always been wrong, we look forward still more eagerly to a period when manufacture is left in the hands of those who have spent their lives in industry, and whose claim to conduct industry is not based on one victory at the polls.

The report and accounts were adopted.

ODHAMS PRESS, LIMITED

FURTHER PROGRESS

The twenty-ninth annual general meeting of Odhams Press, Limited, was held on July 8th in London.

Mr. Arthur G. Cousins, C.B.E., the chairman, in the course of his speech, said: Our total gross revenue amounted to the substantial sum of £13,188,674. Notwithstanding the effect of a ten days' stoppage at our Manchester works, which seriously affected the production of newspapers, the revenue for the year was half a million pounds up on the previous year. This rise in turnover was mainly due to the necessity of increasing our printing charges, to the increase in our advertisement rates, and to increased sales of our periodicals. The trading profit is slightly down by £42,501. In view of the difficult conditions experienced in 1948, this must be considered satisfactory. The net profit after taxation shows an increase of £107,364.

I think you will agree that the financial position of the company is strong and sound and that the year under review has been a successful and progressive one. I am optimistic as to the future of our great business. In the first half of the current year we have made satisfactory progress and I am hopeful that 1949 will be as successful as 1948.

Our chief periodicals continue to make progress. Among them I would mention *John Bull*, with a sale in excess of a million copies each week, *Illustrated*, also over a million each week, and *Woman* with a million and a quarter each week.

As to newspapers, *The Daily Herald* has a sale in excess of two million copies, and *The People*, our weekly newspaper, has a sale of well over four-and-a-half million copies, *The Sporting Life* also has a large and influential circulation.

The report was adopted.

FORSTER'S GLASS COMPANY, LIMITED

SATISFACTORY SALES

The thirtieth annual general meeting of this company was held on July 8th in London, Col. Charles E. Ponsonby, T.D., D.L., M.P., the chairman, presiding.

The following is an extract from the chairman's circulated statement:

There is a decline in trading profit from last year's level. The two principal factors contributing to this decline have been the continuing tendency of costs, both of wages, and materials, to rise and the large increase in our repairs and maintenance expenditure.

After providing £31,039 for depreciation, as against £27,960, and after making provisions to meet the estimated taxation liabilities, the net profit is £49,107, as against £77,828. Your directors recommend a dividend of 10 per cent. and a cash bonus of 6½ per cent. on the ordinary shares—a total distribution of 16½ per cent.

The increased costs which have had to be met during the year have been considerable; coal, gas, electricity and transport have all advanced in price, and there have been increases in wages.

We have been able to carry these costs without any increase in selling prices, but our capacity to absorb continued increased costs in this way must be limited.

It will be remembered that after the fuel crisis of 1947 your directors decided to convert a portion of our plant to oil firing. We have experienced considerable delay on this project, due partly to the restriction of expenditure on oil-firing conversion schemes generally, and the restriction on dollar imports.

As far as the present year is concerned, production and sales are continuing at satisfactory levels.

The report was adopted.

AMALGAMATED METAL

EXTENSION OF ACTIVITIES

The twentieth ordinary general meeting of the Amalgamated Metal Corporation, Limited, will be held on August 8th, in London.

The following is an extract from the circulated statement of the chairman, Mr Walter Gardner:—

As you are aware, our group is seeking to extend its activities in directions other than metals, including the export trade, and the progress of affairs made by Drew Brown (Canada) and Sandilands Buttery and Company (Malaya), as well as the associates of the British Metal Corporation in Canada and India, has been encouraging, though naturally, in the current state of world trade, gradual. The British Metal Corporation (India), Limited, has just taken a new step in the opening of a branch office in Bombay. A further associate, the British Metal Corporation (South Africa) (Proprietary), Limited, has recently been formed in Johannesburg. The main business initially is that of sole licensees in the Union of South Africa and the Rhodesias of our subsidiaries, Colliery Engineering, Limited, and Aerex, Limited. With regard to C. Tennant, Sons and Company, of New York, business with them proceeds satisfactorily.

During last year the British Metal Corporation acquired the old-established business of Norman Hill and Company (Pty.), Limited, of Sydney, and the name of that company has been changed to the British Metal Corporation (Australia) Pty., Limited.

At home the business of Forest Hardwoods, Limited, shows satisfactory progress, though the possible limitation of felling of timber in this country may give rise to difficulties. Forest Hardwoods has acquired the old-established business of dealers and importers of timber owned by Mr Richard H. Keeping.

Colliery Engineering, Limited, has secured a contract with the Union Free State Coal and Gold Mines, Limited, of South Africa for the design and supply of a large coal-handling and preparation plant. I am glad to report that Huntington Heberlein and Company, Limited, metallurgical and chemical engineers, continues to be fully employed.

RUBBER POSITION

The rubber business of Henry Gardner and Company has been active in a reasonably free market. This freedom, however, has been overshadowed by legislation in the United States governing the compulsory use of synthetic rubber on grounds of national security. This legislation comes up for reconsideration in the first half of next year, and we hope that circumstances will enable the United States Government to remove or modify the legislation in a manner that would enable the natural and synthetic commodities to compete on a free basis.

The international Rubber Study Group estimates for 1949 a production of natural rubber of 1,575,000 tons and a consumption of 1,450,000 tons, indicating a surplus of 125,000 tons available for stock-pile purchases. This surplus should prove no greater than the requirements of national stock piles, and provided there is no great change in conditions either in Malaya or Indonesia, we are hopeful of a continuance of a satisfactory market during the current year.

At home there is a perceptible decrease of spending by the public. The world market is not expanding, but rather, consequent on the unending difficulties in the convertibility of international currencies, continues to contract. In any event, our conservative policy of building up substantial reserves puts us in a good position.

METAL BOX COMPANY, LIMITED

RECORD TURNOVER

SIR ROBERT BARLOW'S REVIEW

The twenty-eighth annual ordinary general meeting of the Metal Box Company, Limited, was held in London on July 14th. The year's results showed turnover reaching a new high level of £21,932,000 (£20,723,000), but profits (after taxation) at £653,372 were £16,367 less than in the previous year. The ordinary dividend was maintained at 20 per cent.

In the chairman's review which accompanied the statement of accounts, Sir Robert Barlow, after commenting on the accounts, proceeded with a general survey of the present situation. Tinplate shortage, he said, continued to impede development in this country. The company's policy had been to increase production efficiency, to reduce costs, and to stabilise prices. These efforts had, however, been submerged by the increase in steel prices, authorised on April 1, 1949, when tinplate had become subject to the largest rise in the company's history, and indeed to the greatest increase of any item in the whole steel range.

OVERSEAS DEVELOPMENTS

Overseas developments had again received full and active attention, and overseas prospects in general were most encouraging. The Metal Box Company of India had continued to do well. In South Africa, sales were increased and profits maintained. In East Africa, progress had been disappointingly slow, but the other assembly plants in Israel and Malaya continued to operate satisfactorily. A service station and supply depot was to be set up in the West Indies. In Australia, the company's associate, the Southern Can Company, continued to progress, and new factories were planned in New South Wales and Victoria. In co-operation with them technical help had been extended to the Union Can and Dominion Can Companies, while in New Zealand closer association had been arranged with Messrs. Alex. Harvey & Son. The Metal Box Company Overseas, Limited, had recently been formed for the better prosecution of the company's overseas interests, which were forming an increasingly high proportion of the Group's activities as a whole.

NATIONALISATION OF IRON AND STEEL

After referring to the opportunities for economy offered by standardisation, Sir Robert then dealt with the proposed nationalisation of the iron and steel industries.

We were moving rapidly back into a highly competitive phase of world trade, in which the paramount need would be to reduce costs and find markets, which required above all the freedom and the ability to make quick decisions and to take risks, neither of which could be said to be attributes of Governmental control.

"We are learning," concluded Sir Robert, "that it takes a long while before the organisation of a nationalised industry even begins to work smoothly and satisfactorily. The government already has great powers of control over the development and price structure of this industry, which has repeatedly declared its readiness to co-operate. This is not a moment to experiment on an industry so fundamental to our existence. Nothing should be done to distract the attention of those responsible for its management. The sellers' market is at an end. In my opinion, it would be folly to attempt nationalisation at the present time, the economic problems of which will require our utmost and united efforts to withstand."

The report and accounts were adopted. Complete copies are available on request from the secretary, Metal Box Company, Limited, The Langham, Portland Place, W.1.

TIMOTHY WHITES AND TAYLORS

INCREASED SALES

The twentieth ordinary general meeting of this company was held on July 14th, in London, Mr Louis Nicholas, J.P., F.C.A., the chairman, presiding.

The following are extracts from his circulated statement:—

The total sales of the company and its Retail Subsidiaries for the 53 weeks ending 1st January, 1949, showed an increase over those for the year ending 27th December, 1947, but the gross profit margin on sales as compared with the previous year has further decreased, mainly owing to the incidence of purchase tax.

The combined effects of increased costs and lower returns is reflected in the reduced Trading Profits of the company and its Subsidiaries which were £1,183,519 as compared with £1,490,201 for 1947.

Retailers are in an unfortunate position when purchase tax is reduced as customers expect to be given the immediate benefit and although retailers are not legally compelled to give effect to this reduction in the case of existing stocks, upon which they have paid tax at the higher rate, in practice competition forces them to do so. On the other hand, when tax is increased a larger sum for tax cannot be charged on any article sold than the purchase tax actually paid thereon by the retailer. Thus, under no circumstances can a retailer make a profit when the tax is increased, but may make a substantial loss when tax is reduced against which loss he can make no claim for refund of purchase tax paid. Discussions are proceeding with a view to devising a scheme to remove this injustice.

The dividend on the Ordinary shares has again been restricted to 32½ per cent.

The report was adopted.

VIROL, LIMITED

SATISFACTORY RESULTS

The forty-ninth annual general meeting of Virol Limited was held on the 12th July in London, Lord Luke (the chairman) who presided, said in the course of his speech:—

I am sure you will agree the results show that the company has had a very satisfactory year's trading. It will be very gratifying to the shareholders to know that in this our forty-ninth year of continuous trading our sales have shown—not only a record increase—but also the highest turnover in the history of the company.

We have obtained a very satisfactory increase in our overseas sales during the past year, but we begin to see signs that in spite of the foreign markets' desire for increased supplies they are having to cut down their demands on account of their internal economic difficulties.

The Profit on Trading of £80,646 reflects the increase in turnover offset to some extent by increased expenses.

After adding the net income from Investments and deducting Depreciation and Directors' Remuneration there is left a balance of £75,407 against £50,022 last year. Taxation absorbs £42,000 and after payment of the Preference Dividend the directors recommend an appropriation to General Reserve of £20,000 against £15,000 last year, and a dividend of 17½ per cent. on the Ordinary Shares being the same as that paid in 1948. The balance carried forward on the Profit and Loss Account will then be increased by £1,376 to £46,954.

The report and accounts were unanimously adopted.

The retiring director (Mr W. F. Lawson Johnston) having been re-elected, the proceedings terminated with a hearty vote of thanks to the chairman.

MINING TRUST, LIMITED

LORD CASTLE STEWART'S STATEMENT

The first annual general meeting of the Mining Trust, Limited, was held on July 12th, at Winchester House, London, E.C.2. Rt. Hon. The Earl Castle Stewart, M.C., chairman of the company, presided.

The following is an extract from the statement of the chairman which was circulated with the report and accounts:—

The balance-sheet covers a period from February 24, 1948 to December 31, 1948. The item "Other investments" totalling £1,113,883 comprises a holding of £916,632 Eight per Cent. First "B" Redeemable debenture stock of Mount Isa Mines, Limited, £480 Mount Isa Four and a Half per cent. debentures, and 843,147 shares in New Guinea Goldfields, Limited, all of which were acquired from the old company. It also includes £71,000 stock of Mount Isa Mines, Limited, which was purchased during the period under review. Unquoted investments of £120,118 include a holding of 397,520 shares in Saudi Arabian Mining Syndicate, Limited, 20,000 shares in Big Bell Mines, Limited, and 7,250 shares in Anglo-Westralian Mining Proprietary, Limited.

The profit and loss account showed a gross income for the period amounting to £208,995 and included a full year's income on the company's holding of Mount Isa debenture stock, two dividends totalling 17 per cent. on stock of Mount Isa Mines, Limited, and four dividends of 10 cents U.S. currency each from Saudi Arabian Mining Syndicate, Limited. After deducting expenses and providing for profits tax amounting to £28,310 and U.K. income-tax amounting to £78,897, there remained a net profit of £78,625 which was carried down to the appropriation account.

In the appropriation account a sum of £4,868 has been written off in respect of reconstruction and preliminary expenses. The proposed dividend of 4d. per share will absorb £54,505 net after providing for income-tax at 9s. in the £. The balance of profit carried forward in the balance-sheet is £14,761.

BRITANNIA LEAD COMPANY, LTD.

For the twelve months ended December 31, 1948, the company made a net profit of £51,791, after charging £50,795 in respect of taxation. £27,500 net was distributed as dividend to The Mining Trust, Limited.

Mount Isa Mines made a net profit for the twelve months ending June 30, 1948, of £A.872,921, after providing a reserve for taxation and debiting gross profit with £A.155,299 for interest on debentures and £A.240,000 to cover depreciation on buildings, plant, machinery. An interim dividend of 10 per cent. was paid on June 29, 1948, and a final dividend of 7 per cent. was declared at the annual general meeting held on December 1, 1948.

NEW GUINEA GOLDFIELDS, LTD.

During the year ended September 30, 1948, the company received the greater part of £A.411,724 in settlement of claims for war damage and the only amount outstanding was the sum of £A.5,810 in respect of work done in repairing roads. In addition, the company received £A.41,404 interest on deferred payments from the War Damage Commission and this sum (which is, of course, of a non-recurring nature) was credited to profit and loss account, bringing the net profit for the year to £A.27,503.

Other interests of the company are covered in the directors' report.

Your directors are of the opinion that the revenue of the company in this coming year will not differ very greatly from that which has been received during the year under review.

The report and accounts were adopted.

CENTRAL MINING AND INVESTMENT CORPORATION, LIMITED

CAPITAL INCREASE APPROVED

The forty-fourth annual general meeting of this company was held, on July 4th, in London, Sir Clive Baillieu, K.B.E., C.M.G. (the chairman), in the course of his speech, said:—

In the course of an admirable memorandum lately submitted to the "Commission on Conditions of Employment" in the industry, the Government Mining Engineer has discussed impartially the moot question of diverting labour from the poorer mines to the richer, wherever they may be, and has made out what appears to me to be an incontestable case for maintaining gold production from any mine so long as operations can be continued economically. New conditions and demands have not shaken the Government Mining Engineer in his belief that the closure of a mine for the purpose of diverting labour and plant to work in other properties, would be detrimental to the best interests of the State.

Particularly grave would be the responsibility of closing down and stripping, prematurely, a deep-level mine liable to benefit in life and profits from an increased price of gold. The loss to shareholders, the local community and the State would be irreparable. With the heavy call for fresh capital and other resources involved in the establishment of a new deep-level mine today, it would appear to be all the more important to win the utmost gold from the old mines whose capital expenditures are almost wholly behind them and to gain the maximum benefit from the shafts and equipment and buildings that exist.

ERFDEEL ASSAY RESULTS

Wide public interest has been aroused by the assay results reported recently for the third deflection in borehole E.D.5, on the farm Erfdeel No. 188, which lies some miles to the west of the proven field. The mineral rights of Erfdeel are held by the Free State Gold Areas, Limited. We have, at no time, held any shareholding in that company, but, in accordance with our policy to extend our interests in the Free State we engaged in intermittent negotiations during April and May with the controlling company, Union Free State Mining and Finance Corporation, Limited, with a view to acquiring the mineral rights of Erfdeel and certain adjoining properties. The Erfdeel negotiations followed those, with the same corporation and associates, which led to our acquisition of the control of the Union Free State Coal and Gold Mines, Limited, in March last.

At this stage I would only emphasise that these Erfdeel results can have no important bearing upon the prospects of the large area to the west, now under development, the favourable outlook of which I have already mentioned.

Your company, in common with many others engaged in diverse activities, has become conscious of a need for further capital. It seemed appropriate that the authorised capital should now be restored to the figure of £6,000,000, which was the authorised capital at the time the corporation was founded in 1905. By raising the authorised capital to £6,000,000 we shall have £1,600,000 of capital in reserve and the board will be able to arrange for the issue of the whole or some portion of that sum in accordance with the Corporation's needs from time to time.

The report was adopted and the increase of capital approved.

WALKER CAIN, LIMITED

LORD BROCKET ON BEER PRICES

The adjourned twenty-seventh ordinary annual general meeting of Walker Cain, Limited, was held on July 12th, in London. Sir Ernest Cain, Bt., deputy chairman, presided in the absence of Lord Brocket, the chairman, and read his speech, from which the following is an extract:—

The trading profit of £2,928,163 comprises 15 months of this company, 18 months of our principal subsidiary, Peter Walker (Warrington) Limited, and 21 months of our trading subsidiaries of Peter Walker (Warrington) Limited. Other sundry items bring the gross profit up to £2,968,674. From this are deducted various items, including taxation and debenture service, giving a net profit of £1,026,243. So far we have paid two interim dividends, totalling 15 per cent., and it is proposed to pay a final dividend of 7½ per cent. A highly satisfactory liquid position is disclosed in the consolidated balance-sheet.

Some few months after the beer duty was increased in the Budget of April, 1948, it was evident that the peak of production had been reached. The purchasing power of the public gradually reflected itself in the reduction in sales, which was noticeable in varying degree in all parts of the country. It is fairly obvious that even the present price of beer—reduced a penny a pint in the last Budget—is still too high.

The Licensing Bill, which came in like a lion, is going out like a lamb. The public have shown themselves in no uncertain manner to be opposed to the Licensing Bill because it appeared to them to be the first step towards nationalising the industry. It is gratifying to note that Government spokesmen have unequivocally stated that they do not intend to nationalise our industry.

The report was adopted.

NEW BROKEN HILL CONSOLIDATED, LIMITED

SUBSTANTIAL PROGRESS

The thirteenth annual general meeting of this company will be held on July 28th at 37 Dover Street, London, W.

The following are extracts from the statement of the chairman, Mr John R. Govett, circulated with the report and accounts:—

The year 1948 has seen a substantial measure of progress in the development and equipment of your property. Although in some respects the work is behind our original schedule, this has been due to causes which have been very generally experienced and were beyond the control of the management, who again deserve congratulation on the results that have been achieved. Throughout the year the prices of lead and zinc remained at high levels. This has added to our costs of development and construction, but on the other hand it has resulted, at the present stage of development, in a higher level of operating profit than we had reason to expect when our programme was originally planned. In these circumstances your directors feel they will have your full support in the substantial allocation of £200,000 that has been made to general reserve from the year's taxed profits.

In my statement at the end of May last year to members of the Zinc Corporation, Limited, I stated that a reaction in the prices then ruling was bound to occur sooner or later. We remain confident of a world level of prices which will return a reasonable reward to all concerned. The developments in the mine have at least fulfilled our expectations. There is no reason to doubt that the leases of New Broken Hill Consolidated enclose a mine that will be a worthy successor to the great past and present producers.

WIGGINS AND COMPANY (HAMMERSMITH), LIMITED

TURNOVER MAINTAINED

The twenty-first annual general meeting of this company was held on July 7th, at the Café Royal, Regent Street, London, W., Mr J. P. Evans, A.C.A., chairman and managing director, presiding.

The following is an extract from the chairman's circulated statement.

When submitting my report to you a year ago, I mentioned that, with a restricted building programme, it would not be easy to step up our sales for the year now under review. I am, however, pleased to report that, in spite of all trading difficulties, we have maintained our turnover, and we have made several improvements in your company's organisation which will enable it to cater for a greatly increased turnover immediately the building industry is given an opportunity of unrestricted and untrammelled trading. In the meantime, the extra costs have somewhat reduced the trading profit.

To forecast the future is unwise, as well as extremely difficult, but I can only feel that as time goes on large sums of money will have to be spent on schools, hospitals and roads, and there is, in addition, a large unsatisfied demand for new houses and the improvement of older properties.

Your company has some £120,000 invested in the Binfield Brick and Tile Company, Limited, and until these works are able to produce at an efficient level the investment cannot be remunerative.

We are passing through difficult and somewhat depressing times, but I can assure you that your company's staff are doing all in their power to achieve satisfactory results, and I should like to thank them most warmly for their co-operation.

The report was adopted.

HUDSON BAY CO.

A PROFITABLE YEAR

The two hundred and eightieth annual general Court of the Governor and Company of Adventurers of England trading into Hudson's Bay was held in London on July 15th, Sir Patrick Ashley Cooper, the governor, presiding.

The following is an extract from his circulated statement.

It is with much satisfaction that your directors report another successful and profitable year of trade. As your company enters its 280th year the financial position is

NOTICES

LEEDS COLLEGE OF COMMERCE

Principal—E. V. Roberts, B.Com., A.C.A.

Applications are invited for the post of Lecturer in Statistics and Marketing, duties to start in September, 1949, or as soon as possible thereafter.

Candidates should possess a good honours degree; business experience is desirable. Salary according to the Burnham Scale (Men £300 x £15—£555; women, £270 x £12—£444) plus degree and training allowances and a special allowance of not less than £125 in the case of men and £100 in the case of women. The post may later be recognised as of senior assistant status, with a salary of £700—£800 for men and £560—£640 for women plus degree and training allowances. Starting salary according to approved experience.

Application form and further particulars may be obtained by sending a stamped addressed foolscap envelope to the Director of Education, Education Offices, Leeds, 1.

APPLICATIONS are invited from men graduates in History, Geography or Science, for appointment as a lecturer on various aspects of Wool, in all types of schools, training colleges, adult clubs and retail stores throughout the country. Lectures are illustrated with filmstrips and the work entails considerable mid-week travelling. Training will be given after appointment. Salary £400 by £20 to £600, with superannuation (after qualifying period), subsistence allowance and travelling expenses.—Applications should be made to the Secretary, International Wool Secretariat, Dorland House, 18-20 Regent Street, S.W.1.

PROGRESSIVE post in London required by Ex-Servicé University Graduate (26) with proved flair for efficient administration and organisation and good business sense. Possibility of rising according to merit more important than immediate remuneration.—Box 156.

BUSINESS MAN (43), with accountancy, secretarial and managerial experience seeks executive, administrative or secretarial position. Box 153.

sound, and at no time in our long history has it been stronger. The past year saw a further expansion of your company's business, the working capital employed in our various departments having again increased by nearly \$3 million. The financial policy which has been adopted over the past ten years has been fully justified.

An analysis of the composition of every \$100 of sales and other earnings is given below.

	Jan. 31, 1949	Jan. 31, 1948
Purchase of merchandise and cost of services	76.4	76.4
Salaries, wages, etc.	11.0	9.7
Advertising	1.0	0.7
Insurance	0.3	0.3
Repairs	1.1	1.4
General expenses (including rents)	4.4	4.9
Depreciation, etc.	1.9	2.0
Taxation, U.K. and Canada ...	2.5	3.3
Reinvested in the company.....	1.1	0.9
Dividends	0.3	0.4

The accounts reflect further progress and your board have every confidence in the competitive strength of your organisation and in its future.

The report was adopted.

SENA SUGAR ESTATES, LIMITED

LARGER PROFIT

The annual general meeting of Sena Sugar Estates, Limited, will be held in London on August 4th. The following is an extract from the statement by the chairman, Sir Francis O. Lindley, circulated with the report and accounts:—

Last year I foreshadowed some reduction in the sugar crop due to unfavourable rainfall, and the crop actually amounted to 52,403 tons, or 4,134 tons less than in 1947. This reduction in tonnage was offset by sales of sugar at more favourable prices than anticipated. The factories operated satisfactorily throughout the season. The quota of raw sugar allotted to our Lisbon refinery by the authorities was rather less than in the previous year, but we were permitted to import into Portugal a quantity of plantation whites at a higher price which improved our results in the Lisbon market. Once again our production was insufficient to meet the demands of the various markets which we have supplied in the past, and costs have continued to rise.

The profit on trading for the year amounts to £301,000 compared to £265,445 in the previous year, and the net profit comes out at £119,518 compared to £102,397. We propose to repeat the dividend of 12 per cent. on the ordinary stock which is the same as we have paid for the last five years.

As to future prospects, given adequate rainfall, the area under cultivation and our factory capacity should in future years give us some appreciable increase on our past production, but any large increase requires considerable capital expenditure and we cannot consider this until the Portuguese authorities give us some guarantee of their policy for a term of years.

MABIE, TODD AND COMPANY, LIMITED

RECORD TURNOVER

The first annual general meeting of Mabie, Todd and Company, Limited, was held on July 7th, in London.

Mr Harold Carey, chairman and managing director, presided and, in the course of his speech, said: The turnover for the year under review is the highest yet realised. The profit for the year shows an increase over the previous year of £15,046 before charging taxation, and £27,991 after that burden.

A satisfactory proportion of the improved turnover was provided by export trade. Apart from the work of our overseas subsidiaries, we have been active in some ten overseas countries, with satisfactory results. This business was the first fountain pen business established in this country and all evidence points to the fact that our products are still well to the forefront of the industry.

During the year the progressive policy of your company has been maintained. New models have been produced that live up to our manufacturing creed. These and further new products were exhibited at the recent British Industries Fair where they received favourable comment from those most knowledgeable men—the home and overseas buyers.

Since the war it has been extremely difficult, as you may imagine, to obtain sufficient materials to build up stocks to anything like the amount required to enable us to give a satisfactory service to our customers. This we have now been able to rectify.

Talking of the future, we cannot tell what is in store for us, but I do feel that we, in common with all other businesses, cannot expect in the near future to improve on the figures of the last two years.

The report was adopted.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Lecturer in Accounting in the Department of Commerce at a salary within the range £550/£50—£900/£50 £1,100 per annum; the initial salary to be fixed according to qualifications and experience. Applications, stating age, academic qualifications and experience, together with the names of three referees, should be received not later than August 6, 1949, by the undersigned, from whom further particulars of the conditions of appointment may be obtained.

STANLEY DUMBELL, Registrar.

June 15, 1949.

HIS MAJESTY'S COLONIAL SERVICE

Applications are invited for the post of Assistant Controller of Foreign Exchange, Singapore. Candidates, who should preferably be over 35 years of age, should be capable of taking charge of dealing, authorisations (including imports), credits and exports. The appointment is on agreement for three years, at a starting salary of £1,050 a year rising to £1,120 a year.

Cost of living allowance and expatriation pay plus a special Singapore allowance are payable. Quarters or a rent allowance in lieu are provided, and free passages for the officer, his wife and children (under 10 years). The salaries paid in Singapore are subject to local taxation only.

Forms of application should be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Great Smith Street, Westminster, S.W.1, within two weeks of the appearance of this advertisement.

EX-RAF man, 28, M.A. (Hons.) Oxon., some commercial and administrative experience, finding no scope for initiative or originality in family business, seeks industrial post where enthusiasm and hard work will be rewarded with good prospects.—Box 151.

COMPANY representative (30), two years with Colonial Company in London desires change to responsible post with oil or similar corporation as area representative or manager.—Box 157.

Statistical Summary

EXCHEQUER RETURNS

For the 9 days ended July 9, 1949, total ordinary revenue was £62,479,000, against ordinary expenditure of £60,709,000 and issues to sinking funds £31,000. Thus, including sinking fund allocations of £2,744,000, the surplus accrued since April 1st is £1,767,000 against £199,495,000 for the corresponding period a year ago.

Britain in the Pillory

THE decision of His Majesty's Government to put the dollar crisis into cold storage for the time being has been successful in so far as they themselves and the country at large are concerned. Ministers have dispersed to various centres of rest and recuperation and John Bull has gone to the seaside. But the decision to leave the country apparently without a policy to utter or spokesmen to utter it has had much less success abroad. In Europe and in the United States the silence has been filled by a steadily swelling chorus of criticism and attack. Britain's partners in the Marshall Plan have been quick to pin upon their neighbour sole responsibility for the refusal of Europe's trading deficit to shrink. It is British bilateralism, British non-convertibility, the overvaluation of British sterling that has brought Europe to its present plight, and these policies in their turn—here the criticisms are taken up with even greater emphasis in the United States—spring not from any economic necessity but from a blind doctrinaire preference for socialism, planning and control.

The change in the climate of opinion has been sudden enough to disturb the British. Only six months ago they were taking their bow for a balanced budget, both at home and in trade overseas, and were using the occasion for a little lecturing to their more frivolous neighbours on the virtues of thrift and planning. Today, the roles are reversed and the British have shot to the bottom of the Marshall class. This in itself is not a cause for serious alarm. Gusts of irritation and criticism have swept across the Atlantic partnership before now without doing it irreparable damage. On the contrary, past criticism has often provided healthy reminders of the way in which the nation should not go. There is, indeed, plenty to criticise in the policies of His Majesty's Government and there would be no possible course for complaint, if it were not that the critics seem, with some consistency, to be laying hold of the wrong end of the stick. They say (the American critics in particular) that Britain's woes have a simple origin in the socialist doctrines of the Labour Government—which is untrue. They say (the European critics in particular) that the British people are making less effort to get out of their troubles than the other peoples of western Europe—which is not only untrue, but unfair and grossly insulting.

One difficulty in countering the anti-socialist type of criticism lies in finding exactly what the critics have in mind. Some mean socialism in the narrow sense of particular socialist policies practised by the Labour Government. For instance, Senator Kem and those who join with him mean that Britain's balance of payments difficulties—or, more accurately perhaps, Britain's slowness in emerging from them—are due in large part to the specifically socialist measures that the present Government has taken and that a non-socialist government would not have taken. This is not true. The most clearly "socialist" of the Labour Government's measures are the nationalisation

schemes, and whatever they may do to the national economy in the long run, they have certainly not yet had time to exert any effect on the ratio between imports and exports. Indeed, in the two largest cases it may even be that things would have been worse without nationalisation. Coal would have been scarcer and quite possibly dearer; and it is almost certain that railway rates would be higher than they are now.

The doctrinaire socialism of the present government is also sometimes said to show itself in the trade policies pursued in Britain, the careful control of commodities by licensing, the bilateralism dominating all commercial exchanges save those in the sterling area. These policies are certainly unpleasant; but they are not the avoidable aberrations of doctrinaire socialists. British commercial policies, with a few exceptions, are imposed by the facts of the case. Perhaps the best proof of that is to point out that when the United States Government comes up against comparable problems, as in Germany and Austria, it reacts in much the same way. The Joint Export-Import Agency—which is virtually western Germany's Board of Trade—has been under predominantly American influence for the last two and a half years. No agency has pursued a more rigorous bilateralism. The various "offset agreements" which regulated German trade have proved to be as near barter deals as any made since Dr Schacht and American policy in relation to "non-essential imports" has made Mr Harold Wilson look an apostle of liberalism, and American insistence upon the exact balancing of accounts has been complicated by the fact that the currency used for settling trade deficits has been the scarcest of all currencies, the dollar. If this is socialism, it can only be said that the United States has been as much its practitioner as Britain.

*

It may be, however, that when they speak of "socialism," the critics have in mind, more vaguely, the policies of the welfare state. If so, their criticisms have much more substance. Not that there is anything wrong in principle with the welfare state. It is a universal and praiseworthy humanitarian ambition to protect individual human beings against suffering caused by economic misfortunes. Every modern state is a welfare state; as Mr Bevin said the other day, there are few clearer examples than the way American legislation has protected the farmers of the United States against the rigours of the economic climate. What can justly be held against the British welfare state is only that it has chosen the wrong time to take such long strides forward. Every manifestation of the welfare state—both by the benefits it confers and by the taxation it levies to pay for them—necessarily weakens the link between a man's own output and the material reward he receives and therefore has repercussions on the efficiency of the national economy. What can be alleged against the British welfare state is that it has ignored these repercussions just at a time when the situation of the country required that more attention than usual should be paid to them.

If this is the criticism, then it is justified. But this is not "socialism"—not, at least, in any sense in which "socialism" is a controversial term. The welfare state is not controversial; it is accepted by everybody, including the United States Senate. There is no disagreement between the political parties in Britain on it—as the Conservatives are at great pains to insist. If a retreat is now obviously necessary in Britain, it is only a retreat, and a temporary one at that, and not an abandonment.

It is not merely misleading to use language suggestive of some cardinal difference of principle when what is meant

is only a difference of judgment about degree—it is also dangerous and obstructive. What is necessary for the full restoration of economic health to Britain is nothing as simple as the mere supersession of one political party by another; it requires the re-shaping of a national frame of mind that governs all parties. This task is not impossible, and has already made some progress. The facts of the case are so cogent and so compelling that once they are allowed to emerge clearly, a sensible, level-headed people like the British will certainly pay them heed. There is a distinct possibility of the whole British people, with some unanimity, turning on to a new course and pursuing it in agreement—provided that the argument is logically based upon concrete facts. After all, there is nothing in what is needed that would be impossible for a far-sighted and realist Labour Party to swallow. But if the attempt is made to put all the blame on one party to the exclusion of others—which is not true—and to find the remedy in a complete abandonment and reversal of everything that it has ever stood for—which is not necessary—then the only result will be to solidify in resentful opposition what is bound, at the lowest, to be a large minority of the British people.

It is reported that the critics of Britain sometimes use quotations from *The Economist*—which has certainly been critical enough of His Majesty's Government—to support their arguments. It is always flattering to find oneself quoted abroad. But those who pay this journal the compliment of setting any store by its views might care to note that, in its opinion, Britain's present difficulties are not due to anything that can properly be called socialism; they are not due, save in a minor degree, to policies of the Labour Government that would have been substantially differently applied if another party had been in power; and to make the present crisis the excuse for an anti-socialist campaign will hinder rather than help towards its solution.

The second fashionable line of criticism suffers from as much loose use of words as the first. This is the criticism which is being heard with such emphasis in the Organisation for European Economic Co-operation in Paris and taken up with such enthusiasm in Belgium, Italy and France. Britain, so the line of argument runs, has by its low production, its rigid controls, its bilateralism and its overvalued sterling ruined the expansion of either European or world trade and is thus primarily responsible for the fact that the Marshall countries cannot cover their dollar deficits and that the shadow of the dollar shortage lies darkly across all hopes of further European recovery. The best answer to this is to quote the facts, as set out, for example, in the *Economic Bulletin for Europe*, published by the United Nations' Economic Commission for Europe. The figures of industrial production in the chief Marshall Plan countries are as follows:

I—INDICES OF INDUSTRIAL PRODUCTION.

First Quarter of 1949, as Percentage of 1938

Belgium	122	Netherlands.....	122
Denmark	135	Norway	130
France	124	Sweden	147
Italy	90	United Kingdom.....	131

There is nothing here of which Britain need be ashamed. But total industrial production, though it is a fair measure of aggregate "effort," is only indirectly relevant to the major problem of postwar Europe, which is the balance of payments. The best way of testing what has been done to overcome that is to set out the figures of exports and of imports by volume. That country might perhaps be thought to have done most to master its problems which had most sharply reduced imports and most sharply increased exports. The

third column of the following table therefore shows the ratio of exports to imports:

2—EXPORTS AND IMPORTS BY VOLUME First Quarter of 1949

	Exports	Imports	Export Index divided by Import Index
Belgium-Luxbg.	114	97	118
Denmark	84	107	79
France	127	106	118
Norway	91	109	84
Sweden	65	103	63
Switzerland	113	121	94
United Kingdom ...	156	82	190

Does this look like slacking? Or perhaps an even closer test is to show what percentage of its dollar requirements each country is earning by its own exports to dollar markets. Not every country, of course, should be expected to cover the whole, or even the same proportion, of its dollar requirements. But each country might reasonably be expected to show some improvement in the ratio since the prewar position; the last column of the following table is therefore the most significant:

3—IMPORTS FROM AND EXPORTS TO THE DOLLAR AREA

	Trade with Canada and USA, April, 1948-March, 1949		Proportion of Imports Covered by Exports		Change from 1938 to 1948-49
	Imports	Exports	1948-9	1938	
Belgium-Luxbg.	\$ 355	\$ 138	39	55	-16
Denmark	125	15	12	18	-6
France	594	82	14	39	-25
Italy	595	95	16	73	-57
Netherlands	355	39	11	42	-31
Norway	120	35	29	46	-17
Sweden	160	74	46	64	-18
Switzerland	231	114	49	80	-31
United Kingdom ...	1,565	559	36	27	+9

There could hardly be a more triumphant statistical vindication of the commercial efforts that Britain has been making. So far from "dragging its feet," Britain is the only one of the Marshall countries that is earning a higher proportion of its dollar requirements than before the war. Nor has the relative position changed significantly since March; the fall in European exports to the dollar area has been as universal as it has been severe. The pound sterling may, indeed, be overvalued, and British prices may be too high; but it is very difficult, in the light of these figures, to believe that other

European countries are any less at fault in this respect.

Why, then, does the British crisis appear to be so much more severe than that of other countries? Part of the reason is simply that it is more fully discussed. The practice of economic analysis and criticism has been carried much further in Britain than in other European countries, and if anything is wrong here, it emerges very quickly into a very bright light of publicity. In point of fact, there are very few criticisms about the economic position of this country that could not be made, if the materials for criticism were equally available, of many, if not of all, the other western European nations. Another part of the reason is to be found in the fact that Britain is far more dependent on international trade than most other nations, and any sickness in international commerce therefore has a more immediate and profound effect here than elsewhere. Again, Britain is affected by the fact that it is banker to the whole sterling area, a function whose value is beginning to be appreciated even in Washington. And finally, since frank speaking is the order of the day, it may be mentioned that Britain for six years spent its financial and commercial assets in the common cause. Other European nations, though they suffered in other ways, were able through neutrality or occupation to preserve their assets.

The economic difficulties which are besetting the Atlantic world and which threaten, if they are left unchecked, to undermine all the work of political and economic consolidation achieved in the first year of the Marshall Plan, cannot be solved by the action of any one power. To concentrate so great a barrage of criticism on Britain may leave in government and business circles in the United States and in Europe the illusion that all that needs to be done is to modify this or that defect of British policy and then once again all the pieces on the economic chessboard will fall back into place. Nothing could be further from the truth. The change in the relationship between the old industrial nations of Europe and the new industrial giant in the New World has been on the way for the last thirty years. The wars have accentuated but not caused the trend. It has been masked since the end of the conflict in part by American generosity, in part by the world's desire to buy anything it could at whatever price. Now, in 1949, the underlying maladjustment between Europe and America is emerging like a reef hidden for a time under a spring tide. To choose this moment to pin all blame for a vast shift in the world's economic surface to the actions of one power not only shows a quite distorted sense of proportion. It makes virtually certain that none of the right solutions will be applied. There is a month to go before Sir Stafford Cripps and Mr Bevin pay their fateful visit to Washington. It is to be hoped that in the interval calmer tempers and saner judgments will prevail.

BONUS YEAR

With-Profit Policies effected now will be entitled to share in the

Bonus distribution due to be made as at 31st December this year.

OUTSTANDING VALUE IN LIFE ASSURANCE

Diplomacy under Strain

IN a more civilised age the arrest of the Chargé d'Affaires of a British Legation in the streets of the capital city where he was posted, the endeavour of the police to get him to sign a paper admitting a criminal act, and the subsequent demand by the Government concerned for his recall on the basis of totally unsubstantiated allegations circulated in an officially controlled press, would have seemed a serious matter, even amounting, in the language of diplomacy, to an "unfriendly act." But today, so accustomed has the British public become to such incidents, that the affair of Mr Sarell's arrest by the Rumanian security police on July 7th has barely evoked comment in this country. It is nevertheless the most outrageous in a series of direct and indirect attacks on British missions in several countries which have not only created a very unpleasant atmosphere for members of the Foreign Service serving in them, but have raised the question whether the code under which diplomatic relations have been carried on between civilised sovereign states for the last three centuries is not in danger of breaking down over a large part of the world.

This is a matter of more importance than is perhaps generally appreciated. The conventional usages of diplomacy and the niceties of protocol may often appear to the layman unduly fussy and trivial, and productive of conflicts which could easily be settled with a little common sense. Yet their maintenance is essential to the successful conduct of relations between states, just because the "sovereigns" who deal with one another through the channels of formal diplomacy are heavily armed beings living in a state of anarchy, with strong desires and short tempers—even when these passions of national egoism are not further inflamed by hate-forming ideologies. In regular diplomatic intercourse according to fixed rules of etiquette lies such hope as there is of restraint and co-operation among nations; without it neither occasional conferences of Foreign Ministers nor emergency "gesture" missions nor participation through delegates in public international councils and assemblies can have any foundation on which to achieve success.

The lynch-pin of the system of international diplomacy, as it has been evolved in modern European history, and extended to the whole world, is the principle of the personal immunity of diplomats from arrest or legal proceedings in the country in which they are stationed. All other aliens, whether residents or temporary visitors, are subject to the laws of the state within whose frontiers they are found; they can be arrested by the police, brought to trial in a court of law, and, if found guilty, sentenced according to the law, just as if they were natives of the country. But the diplomat is subject only to the laws and police of his own country; he has a special extra-territorial status which is designed to safeguard him from any possibility of violence or persecution in the performance of his duties as the representative of his Government. It has not always been so; there have been times when an envoy risked his life if his message was not to the liking of those to whom it was addressed. But gradually the code of diplomatic immunity was built up and accepted as the rule of intercourse between the principal nations of Europe. It came to be so much taken for granted that professional diplomats were hardly able to imagine a different state of affairs.

It was always, of course, recognised that the system was liable to abuse. It was not designed to enable diplomats to go about committing theft or murder nor yet to take

part in conspiracies and rebellions against the Governments to which they were accredited. A Government, however, which considered that it had evidence of such acts by a foreign diplomat, had always a remedy, even though it could not arrest and try the offender; it could present the evidence to the latter's own Government and ask for his recall. In such cases, for an adequate reason, recall was the normal course, for each diplomatic service had its discipline and standards of behaviour, which made a real breach of the law—or at least discovery of it—a serious matter for the offender with his own superiors. But it was the convention that these matters were dealt with privately between Governments; what was not done was to take police action against diplomatic staffs and fill the newspapers with public accusations without even an attempt to prove the charges in diplomatic correspondence.

The scope of diplomatic immunity has never, in the past, been defined in a way acceptable to all nations, and the practice varies considerably with regard to what are called the "minor personnel" of embassies, including clerks, typists and telephonists. The British practice has been to extend immunity widely to embassy staffs in London, but some nations have always insisted on confining immunity to diplomats in the full sense of the word. The issue has grown in importance with the increasing range of official relations between states, which now attaches to diplomatic missions commercial, publicity and other representatives unknown in the days of Castlereagh. The minor personnel of embassies are not exclusively nationals of the country to whom the embassy belongs; they may be natives of the country in which it is situated. All these people, if not covered by immunity, are subject to the police and judiciary of the country in which they are residing. But it has hitherto been customary for a Government to notify a foreign embassy at once of a warrant for the arrest of any one of its employees, with details of the charges, and to enable members of the embassy to see the accused and arrange for his or her legal defence, particularly in any case which may affect relations between the two Governments.

The partial contemporary breakdown of this system of international law and custom has been due to the nature of modern totalitarian regimes and especially that of the Communist party-state which now prevails in several European countries. In these states it is natural to the temper of the revolutionary ruling party to regard the established conventions of international intercourse as merely paraphernalia of the *ancien régime* which should never be allowed to stand in the way when the interests of the party are at stake. A Czech Communist newspaper recently informed its readers that diplomats of the Western nations did not represent their peoples, but were merely "spies sent by the ruling classes." Such an attitude is hardly conducive to a willing observance of the customs by which friction in diplomatic relations was formerly kept to a minimum. Moreover, the Communist state relies for the maintenance of its power on a secret police which is placed above the law and is permitted to use for the extraction of "confessions" from its prisoners, techniques of interrogation almost certain to produce sooner or later any results deemed politically desirable. As the party in its propaganda to the masses is continually harping on the theme that all

political dissidents of whatever party or opinion are merely agents of imperialist foreign powers bent on the destruction of the peace-loving peoples, there is a strong incentive for promotion-seeking policemen to provide suitable evidence in support of these theses, even if they are not actually directed by higher authority to do so. Such a situation inevitably produces incidents which impose a severe strain on diplomatic relations in any case none too easy to conduct.

In the Wildash case last March the British Military Permit Officer in Prague (whose task was to issue permits to Czechs for passage through the British Zone of Germany) was arrested by the Security Police and held for seven hours for interrogation. Four Czech employees of the office were arrested at the same time. Mr Wildash was not covered by diplomatic immunity, but he was a British official with consular rank. All the conventions governing such a case were violated by the Czech authorities. The British Embassy was not notified of his arrest, and Mr Wildash was never told with what offence he was charged, but was informed that unless he answered all questions put to him, his wife would be arrested as well. In the end he was released on the intervention of the British Ambassador, but was ordered to leave the country within 24 hours, and the Czech Foreign Minister refused to see the Ambassador who wanted to discuss the matter with him. An official statement was then published in the Czech press declaring as a fact that Mr Wildash had been engaged in plotting against the Government with a Czech terrorist organisation, although no particulars or proofs of this serious charge had ever been submitted, as usage required, to the British Government.

In the case of Mrs Firth in May, a Polish-born woman, married to a British subject and employed by the British Embassy in Warsaw, was arrested by the Polish Security Police, without any notification to the Embassy, and has been held in prison ever since, despite protests made by the Ambassador after it was discovered what had happened to her. She had no diplomatic immunity, but there was a plain violation of diplomatic custom.

In the more recent Sarell case in Bucharest there was a direct infringement of immunity for Mr Sarell, the British Chargé d'Affaires, was held for over two hours by the police,

Murder

THERE is no such thing," said Sir Hartley Shawcross at the trial of John George Haigh, "as a nice murder." Few statements could be more obvious. Yet, in any discussion of the merits of setting up different degrees of murder, the truism is often forgotten. Some murders are patently less heinous than others, but that does not alter the fact that, even when the motive is most easily comprehended and circumstances provide every excuse, murder remains the most horrifying of all crimes. The first public inquiry of the Royal Commission on Capital Punishment, under Sir Ernest Gowers, was held last week in a necessarily detached atmosphere which tended to conceal much of the horror of the subject. Similarly, Sir Frank Newsam, in giving evidence to the Commission on behalf of the Home Office, described murderers as "broadly speaking, not people of bad character," presumably meaning only that they were guilty of no other crimes. But, no matter what the cause, the killing of any individual by another is a crime which no civilised society can tolerate, and the effects of which are far more damaging than those

of any other crime. All murders are sordid, most are violent and bloody, none can be condoned.

What purpose, therefore, is served by trying to distinguish one murder from another? The simple answer is that, although the question of abolishing capital punishment has been shelved, society nevertheless feels that the law which prescribes punishment by death as the only sentence for murder needs to be modified. The present attempt to define degrees of murder is thus merely another way of attempting to set up alternative forms of punishment to that of death by hanging. Hitherto the punishment has been mitigated by the exercise of the royal prerogative of mercy in special cases. The work of the Royal Commission boils down to an attempt to translate the rules which guide the use of the royal prerogative into criminal law and so give the courts some of the latitude now only enjoyed by the Home Secretary. It will examine the practicability of setting up two degrees of murder and it will review the Macnaghten Rules which embody the law with regard to pleas of insanity.

It is well that the British public should be aware of the conditions under which the nation's diplomacy now has to work in the countries of eastern Europe and understand how far the new tyrannies have gone in breaking down not only all respect for human rights within their own domain, but also the conventions of international intercourse which formerly seemed secure even amid the greatest strains and stresses of power politics. It is not the British way to work up petty incidents into great international issues or to act in such matters on quick emotional impulse. It is the policy of the Foreign Office to maintain diplomatic relations wherever it is possible, both in the hope that they may soften the acerbities of conflict which threaten the peace of the world and in order to retain the means of getting some small knowledge of what is going on in countries virtually closed to normal independent inquiry. But there are limits to what it is right for representatives of His Majesty's Government to endure, and perhaps it might be well to give some indication that there is a point at which diplomatic relations would be broken off if there were to be no improvement in the attitude of certain totalitarian regimes towards envoys in their capitals.

"Not even the Devil knows what's in a man's mind." This sums up the chief difficulty in classifying the degree of evil of a murder. A police officer investigating a murder case can usually determine how, when and where it was committed. He sometimes knows with reasonable certainty the extent to which it has been premeditated, but the motive more often than not remains the dark secret of the murderer. Moreover, motives, even when they are known, are extremely difficult to prove, and no court can ever be certain that it has heard the whole truth. Haigh's last victim was killed apparently for the sake of furs and jewels worth little more than £100; Cummings, who killed three women and attempted to kill two others in London in 1942, did so for an even smaller sum of money. It is difficult to believe that gain was the only motive in each case, but the medical advisers to the Home Secretary could find no sign of insanity in either man and there was no evidence to show any other motive. No detective worth his salt ever bases a case against a murderer on motive alone. At best, an overwhelming motive for committing a particular murder is but one pointer among many to the identity of the murderer; at worst, the motive can be so improbable as to make even established facts appear doubtful.

*

Yet, if a jury is ever to be asked to assess the degree of evil in a murder, the motive for the crime will inevitably weigh heavily in their deliberations. There are, however, almost as many different motives for murder as there are murderers, and it is extremely difficult to draw up a guide like the Macnaghten Rules by which motives could be classified into one or other of the two broad categories necessary. The Home Office has made an analysis of all murders since 1900, showing among other things the victims of murderers divided into 18 different groups. This analysis, with some amalgamation of categories, is shown in the following table:

MOTIVES OF MURDERERS, 1900-1948		
No. of Murderers Sentenced to Death for Murder of:—	By Men	By Women
(a) Wives and husbands.....	206	11
(b) Parents.....	18	1
(c) Sweethearts, mistresses or lovers.....	290	4
(d) Children over 1 year of age in sexual assaults.....	30	0
(e) Other children over 1 year of age.....	43	40
(f) Women, other than those above, in sexual assaults.....	41	0
(g) Men and women during robberies.....	150	7
(h) Men and women, other than those above, in quarrels or for revenge or jealousy.....	105	2
(i) After drink.....	26	0
(j) Police and prison officers.....	19	0
(k) Miscellaneous.....	74	1

From this table it is possible to come to some very rough general conclusions about the more usual motives for murder, but that is all. If anything, the table emphasises the difficulty of separating, empirically, one set of motives from another.

Figures like these, of course, do not tell the whole story; the relation between murderer and victim is only a guide to what the motive of the murder might have been, it is in no way conclusive evidence. Yet the table shows some surprising facts. The *crime passionnel* appears to account for more than half the murders; murders committed during robberies account for less than a quarter, while murders as the result of taking drink amount to little more than 3 per cent of the total. Women, on the whole, show up far better than men; the majority are guilty of the murder of children which in most cases, if not in all, are probably covered by the infanticide acts and which are committed during an

abnormal state of mind. The value of the table, however, is sociological rather than legal. It does not simplify the task of defining degrees of murder other than to show that if motive were to be the touchstone, very few murders in England would qualify for classification in the second degree.

It is as difficult to determine the extent of premeditation as to decide upon the motive. In some murders, where there have been extensive preparations beforehand, premeditation can be clearly established, but in most the murderer simply takes advantage of a favourable opportunity. If there is no evidence of previous preparation, it is almost impossible to prove how long, if at all, a murderer has brooded over his crime. Even the evidence of a quarrel with the victim—days, weeks or months before the crime—is not conclusive. The murderer can claim that the quarrel was patched up and nobody but the victim can prove otherwise. Moreover, some murders, such as those committed in the course of a robbery, are definitely unpremeditated, but they are often the most reprehensible of all.

If, indeed, there is a case for establishing a second degree of murder, it can only be done with regard to the objective circumstances of each case. The law, as it stands today, recognises two forms of homicide—murder and manslaughter. Generally, murder is killing with intent to kill; manslaughter is killing by accident. Where there has been extreme provocation, the charge of murder is sometimes reduced to one of manslaughter; but the extent of provocation is always a matter of fact and not of opinion, and as such it can be proved or disproved with comparative ease. It would therefore be a simple matter to classify as second degree murders all those which, because of extreme provocation, would normally be reduced to manslaughter. The only reason for making the change, however, would be to make the law appear more tidy; the result, in terms of punishments, would be the same as it is now.

*

If the question of capital punishment is to be left in abeyance for the time being, the only other major change which is worth discussing is the amendment of the law relating to pleas of insanity. The present law was laid down in a set of judges' answers to questions by the House of Lords in the appeal of Macnaghten in 1843. (Macnaghten was a madman who attempted to assassinate Sir Robert Peel but killed his servant instead.) The Rules which were then established confirmed previous decisions that the burden of proof of insanity rests with the defence, and stated that the jury should be told that a plea of insanity could only be upheld if it was proved that, at the time of the crime, either the accused did not know what he was doing or that he did not know that what he was doing was wrong. In theory a plea of insanity can be made to any crime, but in practice, since the success of the plea means an indefinite stay in the criminal asylum at Broadmoor, the plea is normally only put forward in cases of murder.

Where the insanity is obvious, the Macnaghten Rules are perfectly satisfactory. They are clear, they are simple and they can be easily applied. But sanity shades off into insanity by an infinite number of gradations, and the time is long overdue for the law in England to recognise, as the law in Scotland has done for some decades, that between murderers who are completely responsible and those who are completely irresponsible there is a third class of those who are only partially responsible. In Scotland, this third class are found guilty of "culpable homicide," which is not punishable by death. The state of mind to be proved in a plea of diminished responsibility is not clearly defined, but

it has been put by the Lord Justice Clerk (Lord Alness) in a case in 1923:

that there must be aberration or weakness of mind; that there must be some form of mental unsoundness; that there must be a state of mind which is bordering on, though not amounting to, insanity; that there must be a mind so affected that responsibility is diminished from full responsibility to partial responsibility.

The extension of the Macnaghten Rules to take in this third class of murderers may involve a number of difficulties in the initial stages, but experience in Scotland has shown that the application of the plea of diminished responsibility is not beyond the wit of most juries. There will, in any event, still be the royal prerogative to remedy injustices if they occur.

India's Economy

THE new Anglo-Indian Financial Agreement, providing for increased sterling releases in Delhi's favour (on which some comment is made in a Business Note on page 368) has focused attention on India's economic difficulties. The two years since partition have served to consolidate the political structure of the new Republican Dominion of India in a way that is almost miraculous. They have not, however, seen the same progress made in building up the new India's economy. And, as Mr G. D. Birla, the Indian industrialist, pointed out last week, this contrast now threatens to become so strong that if not checked, economic deterioration bids fair to undermine a great deal of the political success so far achieved. The full extent of India's economic setback has not yet emerged. But, even before the sterling area's critical dollar shortage, events had moved far enough to upset, perhaps irrevocably, many of the delicate balances so carefully preserved for so long by India's two dominant leaders, Pandit Nehru and Sardar Patel.

Themselves mutually opposed on economic principles, Nehru and Patel have moved continuously between apparently irreconcilable forces. They have already become the heroes of a revolution of independence—without ever quite keeping their promise to their followers that independence would constitute the millennium. They have had to live up to Nehru's socialism without ever quite abandoning the practical capitalism of Patel. They have had to keep alive the hopes of worker and peasant for a higher standard of living, without ever finally destroying the confidence of the industrial capitalist or the loyalty of the small landowner. They have had to be ruthless with the Communists without ever giving way to Right-wing extremists like the Hindu Mahasabha. They have had to assert India's new place in the outside world, without ever really having the military force or the money or the political message with which to back it up. All these things they have done by means of consistent compromise, and with such skill that they have reached a position where they are widely regarded as the natural future leaders of non-Communist Asia.

But it now seems likely that the first stage in India's development is in fact over—in three respects. First, on the home political field, as the inauguration of a new constitution draws nearer, democracy must either establish itself or go under. And the forces now at work behind the rifts between Congress leaders and their rank and file, on the one hand, and between Congress itself and public opinion on the other, seriously threaten to make much further political compro-

The question of degrees of murder or of degrees of responsibility is, in the end, a question of punishment. So long as death is the only form of sentence, so long will the law appear unjust. The brutal killing of a prostitute in the North of England at the end of 1948 resulted, for instance, in a verdict of manslaughter; the jury held that the assailant was provoked because his victim had stolen some of his money. The more or less accidental killing of a well-known artist in London by a terrified thief at about the same time resulted in a verdict of murder and the thief was sentenced to death. If there were no capital punishment, such discrepancies might still exist, but they would not disturb public opinion so much. At least there would be a better chance of securing more uniformity in administering the law than there is at present.

*

Mahatma Gandhi always tried to avoid undue discussion of economic subjects by those around him; he felt—perhaps rightly—that inevitably bred disagreement. The effect of his influence, reaching down to the present, explains in some degree how it is that matters have gone as far as they have, without more being done to tackle them. Reduced to the level of personal problems, the economic stringency consists of the fact that, although he has safely emerged from the first anxious days of independence, the ordinary Indian is basically short of food and cloth, his two primary needs. Prices have risen threefold since 1939. Industrial production has declined. Agricultural output has not kept pace with the rise in the population. And conditions are such that new enterprises, which might bring the ordinary Indian more food and cloth he needs, are not pressed ahead because neither the money nor the necessary capital equipment is forthcoming to implement them.

The nature of India's economic troubles may be summarised under four headings—the budget, the balance of payments, costs, and capital investment. In the current year there is an estimated deficit on combined capital and revenue account of Rs.130 crores out of an expenditure of Rs.519 crores (about £390 million). Taking the budget as a whole, this is mostly due to heavy defence and capital expenditure. The present army of 300,000 is just twice the size of the old British-run Indian army; and in the 1948-49 budget, defence expenditure was no less than 47 per cent of total outgoings.

India has an intractable and rising payments deficit. In 1947-48 it was Rs.37 crores and in 1948-49 about Rs.95 crores—although unofficial estimates reckon it was really more. Food imports now cost about eight times what they did before the war and amount to a seemingly irreducible minimum of 3 to 4 million tons of grain a year. Delhi considers that it cannot afford to cut them whatever happens

—not least because food prices account for 60 per cent of the cost-of-living index, and any drop in imports would push prices, and so wages, up at once. But the only alternatives are either to cut other imports or to increase exports. Delhi is now anxiously pruning its import plans, with the professed objectives of reducing dollar purchases by 25 per cent and of limiting to the agreed £150 million over the next two years the sterling purchases to be financed out of India's accumulated balances in London. But any cuts in imports are necessarily inflationary in effect.

On the export side it is again inflation which has already added to India's problem. Present industrial costs of production have removed the chief competitive weapon of many Indian goods — their cheapness. These extra costs are mainly due to wage awards which have taken little account of industry's capacity to pay, to a multitude of government controls administered by inexperienced officials, to inadequate means of transport as a result of wartime over-use of the railways and their present inefficient management, and to the effects of partition, which have erected artificial fiscal barriers between India's industries and their raw jute and cotton resources in Pakistan. It might be argued that if Indian export prices are too high the right course would be to devalue the rupee. But on export grounds alone this would at present be unwise, since there is an unsatisfied foreign demand for some of India's other products, such as cotton goods, manganese and mica; in the case of the minerals, lack of transport is the bottleneck. After re-examining some of the possible means of correcting its present payments unbalance, Delhi has in fact determined to concentrate on improving transport facilities on the particular railways and at the ports where ores are loaded.

Any such steps, however, are less important than the difficult prospects facing the jute industry—which accounts for some 35 per cent of all foreign exchange earnings and perhaps 60 per cent of the incoming dollars. It is said that nearly every jute mill in India is probably losing money today. Looked at from the national standpoint, the industry is in trouble on the supply side because India now has to import the raw material instead of growing it internally. Looked at from the industrialist's standpoint, partition has pushed up raw jute prices beyond all need, and a high cost structure has completed the damage. Yet on the sales side the prospect is even worse. While the world's use of packages has increased, particularly in the United States, jute has not shared in that increase. More and more consumers have switched to substitutes, until experts predict that, unless the price of jute can be brought down sensationally, jute

products will have lost ground permanently to their rivals.

Lastly, there is India's failure to save and invest. Delhi disputes the current view that India is dis-saving at the rate of 1 per cent per annum, but admits that the domestic capital market is dead. It is characteristic of the depression that the Indian Stock Exchange last year did the smallest volume of business in its history. Private capital is scarce because, among other things, high taxation and the methods of the tax gatherers have frightened crores of savings underground: the Princes, formerly an important source of funds for capital issues, are now pensioners or hoarders; threats of nationalisation by many Congress leaders have frightened investors: the Punjab, an important savings centre in the old days, is

now divided and impoverished: and life insurance business is seriously dwindling. Public investment is being curtailed owing to inflation. A Cabinet Standing Committee, set up to determine priorities, recently slashed Provincial authorisations by a third.

These, then, are the signs of fundamental economic disequilibrium in India. And they are certainly easier to define than remedy. But if the Indian leaders really mean to hold back the Communists in their own country and to go on to assume the leadership of anti-Communist Asia, there must be at least three minimum objectives of policy. First, they must obviously come to terms with Pakistan. News from Kashmir has lately improved; but only by ending once and for all the odious tension between

the two Dominions can India's leaders go through with the severe cut in defence expenditure, which is absolutely essential to a properly balanced budget. Better blood with Pakistan would also promote a better handling of the jute question by both Dominions.

Secondly, of course, food production must be increased. A 10 per cent rise would do the trick: it could eliminate the payments deficit by 1952, even allowing for population increases. But it will never be effected without better and more honest administration in the lower civil service. Pandit Nehru's latest scheme for growing new types of crops like sweet potatoes would be excellent if every village could be made to do it. Much also turns on tightening up methods of grain procurement and providing incentives for the farmer.

Thirdly, India must win more foreign capital. The experts well know the need, and even public opinion is at last dropping some of the slogans of nationalism and nationalisation with which it hailed the dawn of independence. But foreign confidence must be established both in India's stability and its fairness. And this can only be done by the Indian leaders themselves coming off the fence, and making their programmes and their terms plain to all.

* Average for first seven months only. † Average for nine months April to December. These statistics are, of course, complicated by the partition of India. In July 1948, a part of the foreign exchange reserves—which are practically all sterling and include some long-term assets—were transferred to the State Bank of Pakistan. Beginning August 1947, trade figures cover the Dominion of India only, excluding Pakistan; beginning March 1948 trade with Pakistan as a foreign country is included and from June 1948 the trade of Kutch.

NOTES OF THE WEEK

Europe at Strasbourg

The Consultative Assembly of the Council of Europe opened in Strasbourg with dignity and effect. M. Herriot's inaugural speech managed to be considerably less platitudinous than might have been expected on such an occasion. He may have seemed to the more cautious delegates a little over-courageous in the tasks he set the Assembly. Can it envisage at its first session the task of planning and organising a common economic policy for Europe and giving that policy the political backing which alone will make it successful? But M. Herriot was right to seize the nettle of German participation at this first session and to declare, with tact but with realism, that the full entry of Germany into the community of Europe must wait upon some evidence that its government and people accept the ideals of freedom and law and international solidarity upon which the Council and Assembly of Europe are based. The rabid nationalism and the political irresponsibility evident in the political campaign for Sunday's elections in western Germany are hardly reassuring.

M. Herriot also did well to stress the peaceable intentions of the Assembly. "We are not declaring war on anyone," he said, "all the doors are open towards the east, towards all those who today refrain from taking their place among us." Such is undoubtedly the sentiment of the gathering. They have come together to find better ways of living together themselves, not of resisting other states' activities. It is therefore a pity that the first decision of the Council should have been to admit Greece and Turkey along with Iceland. If there is to be genuine economic consolidation, it must have reasonable geographic limits and the inclusion of Greece and Turkey, in spite of all M. Herriot's declarations, can only suggest that opposition to Russian expansion is a more important function of the Council than the realisation of common economic and social policies. This is not the case, but it would have been wiser, surely, if the western European nations, while maintaining close and friendly links with Greece and Turkey, had not included them in this first attempt to achieve closer political union.

United Nations Record

In the course of the last twelve months, four international conflicts have been either resolved or adjourned. In Kashmir, the dispute between India and Pakistan has so far been kept from a violent solution and a plebiscite in the disputed area is nearly in sight. In Indonesia, the Dutch after an attempt to solve the problem by force have returned to the path of negotiation, and a round table conference in The Hague between Dutch and Indonesian representatives is shortly to take place. In Palestine, the Jews have won the war but have been restrained by outside pressure from making at least some of the conquests their armed superiority might have encouraged them to attempt. In Berlin, the Russians have acknowledged defeat and raised the blockade of the city. In theory, each of these conflicts might have led to general war, although in practice no great power is ready at the moment to take such a risk. Even in Greece where the Russians back the rebels and the Anglo-Americans the Greek Government—an unresolved conflict incidentally barely mentioned in the Secretary General's report—there has been little risk of a wider war, since no great Power seeks to precipitate it.

For all four resolved conflicts, Mr Trygve Lie claims the credit in his annual report on the activities of the United Nations. The United Nations has helped "to end or prevent wars involving 500,000,000 people" and the report describes the establishment of the State of Israel without general war

as "one of the epic events of history." Mr Lie could perhaps be more modest in his claims. The part played by the United Nations has in each conflict been determined by the attitude of the Powers involved. The United Nations machinery has been used with considerable usefulness, but in no case has it been decisive. Kashmir is its best achievement—so far. In Indonesia, American pressure and physical necessity brought the Dutch back to the conference table. In Palestine, the Jews secured their aims by war, tempered only by American restraint. In Berlin, the Russians were defeated in a straight trial of strength and used the United Nations as a meeting place only when the triumph of the airlift over the winter had shown the uselessness of the blockade to extort concessions from the west.

★

Nobody denies that the United Nations has in each case performed some function. It has kept full publicity on each danger point. It has saved face. It provided the Russians last April with a discreet back door to the statesmen of the west. But Mr Lie has pitched his report on a much higher key. From the claim that the United Nations has prevented these conflicts, he passes on to denounce—even if obliquely—attempts to organise security in any fashion exterior to the United Nations and to declare that regional pacts are not necessarily in accordance with the United Nations Charter. Then, not content with raising his opposition to regional organisations in his report, the Secretary General pressed home his attack in a speech given last Monday in Bergen in the course of which he again appears to have attacked the regional basis of the Atlantic Pact.

It cannot have escaped Mr Lie's attention that the implications of the Atlantic Pact in the shape of the Arms Bill were at the time of his speech under discussion in the American Senate and that one of the arguments used by hostile Senators against the whole conception of American aid to Europe was precisely the claim that the Atlantic Pact was inconsistent with the Charter of the United Nations. One can pass over without comments the Secretary General's determination to lump Russia and the west together as equally responsible for such conflicts as the Berlin blockade. "Impartiality" must, it appears, be purchased at such a price. But surely to intervene in the efforts of the western Powers to organise their own defence in perfect conformity with Article 51 of the Charter lays the Secretary General open to criticism which will damage not only his own reputation but the reliability of the organisation he represents.

* * *

Malaise at the Docks

When the recent strike at the London docks came to an end, it was not by reason of a solution of the points at issue, and the statements of the strike leaders made it clear that it would be only a question of time before trouble broke out again. Last Sunday, only two weeks after the resumption of work, the committee which conducted the strike in July began to show the hand that it intends to play. At what the *Daily Worker* calls "a representative gathering of several hundred stevedores"—actually a meeting of 300 out of the 2,700 dockers—Mr Timothy and the other strike leaders resolved to constitute themselves a permanent London Port Workers Committee. Their objectives are to remove Lord Ammon and his colleagues from the Dock Labour Board, and to secure the ejection of Mr Arthur Deakin as general secretary of the Transport and General Workers' Union. Fortune has also presented them with an excellent bone to worry in the shape of the dismissal by the Port of London Authority of six men for absenting themselves without good cause during the strike.

PLA employees are on a quite different basis of employment from the dockers, and the PLA regards itself as fully entitled to discharge men for breach of contract, a view that the Ministry of Labour is bound to support.

The threat of a withdrawal of labour unless the six men are reinstated is probably an empty one, since about half the London dockers have lost anything up to four weeks' pay (a loss softened by PAYE rebates and holiday money). The strike committee is unlikely to release a damp squib and to issue a strike call which would not be answered by the men. More probably their tactics are to keep themselves in the public eye, and to gain strength from the gratuitous publicity which the London evening newspapers seem only too ready to afford them. In the meanwhile thoughtful people of all parties are pondering upon the action that can be taken to prevent recurrent trouble in the docks. One Labour Member of Parliament in a letter to *The Times* has suggested that the best way to restore the authority of the established unions would be to go back to direct negotiation between employers and the unions instead of having them jointly represented on the Dock Labour Board, thus restoring to the union leaders their proper function. In view of the ambition of the unofficial strike committee to wrest the leadership of the dockers from the official unions and to carve out a new union of dockers, it is ironical to note that the International Labour Office this week announced that Britain is the first country to ratify its convention on Freedom of Association and the Right to Organise.

Crime in London

The criminal statistics for the whole of England and Wales in 1948, which were commented on in *The Economist* of July 30th (page 234), have been followed by the publication of the report of the Metropolitan Police Commissioner for the same year. From the accompanying chart it will be noted that although, for the country as a whole, there has been a steady increase since the war in the number of indictable offences, the peak year for London was 1945 and since then its yearly total has slowly fallen. In other respects, it has had the same experience as the rest of the country. Offences against the person, a category which includes crimes of violence and sexual offences, rose from 2,493 in 1947, to 2,595 last year. And London, like the rest of the country, shows another rise in crimes by children and young people.

The Police Commissioner's comments on this rise in juvenile crime have provoked more discussion than anything else in his report. He declared that almost all experienced police officers are agreed that

some children's courts entirely fail to impress on the young offenders brought before them the seriousness of their acts, and that repeated bindings over or probation orders only serve to engender a contempt for the law.

To this the magistrates concerned have a ready retort in asking what they are expected to do. To send a child away from home to an approved school for two or three years is no light step, especially if it is the lack of a stable home in the war years that is a factor in its delinquency. Moreover, approved schools could not take in greatly increased numbers of children without diminishing their usefulness to those who need their treatment most. Sending a child to a remand home for a short period is never regarded as satisfactory. There is no corrective treatment, and the child may be contaminated by more serious offenders. There remains binding over and placing on probation, combined with a reprimand. But the very large numbers that are dealt with in this way, particularly if the same child is so treated more than once (a serious omission in the report is statistics of how many children commit more than one offence), tend to produce a familiarity that breeds contempt. A more effective method of correction may be the attendance centres, to be introduced experimentally under the new Criminal Justice Act. "Keeping in" a child for a few hours once a week, when it would normally be going to the

cinema, may well have a more restraining influence than repeated magisterial wiggings.

It is still not certain, however, that there is cause for excitement in the statistics of juvenile delinquency. It ought to be remembered that in 1948 every child in the age group concerned—8 to 16 inclusive—had lived over five years of its life

during the unsettlement of war. If one considers what this entailed—the separation and absence of parents, air-raids, evacuation and the very scanty education that many of the children were given—it is a matter for congratulation that the postwar figures for juvenile delinquency are not a great deal higher.

Inquest on a Policy

The long-promised White Paper on United States relations with China—called by some the State Department's "alibi"—has now been published in Washington together with a covering letter from Mr Acheson to the President. It is a two-edged document, as might be gathered from the variation in the news headlines in the British press; thus the *Daily Mail* headlined it, "America Drops Chiang," while the *Daily Express* announced, "US Hits at China Reds." The *Daily Worker* found the report so little to its liking that it relegated it to a back page. The report, indeed, gives no support to those who hold that the Chinese Communists are "different" or that their victory brings no detriment to the United States; they are declared to have "forsworn their Chinese heritage and publicly announced their subservience to a foreign Power." Nevertheless, the main burden of the report is the exposure of the sins of the Nationalists, who are charged with most culpable failure to make proper use of the American aid which has been given to them, and it is plainly indicated that they must expect nothing more from their former patron.

The White Paper is essentially an attempt at accounting to the American people for very large sums of money expended in support of a policy which has ended in disaster. Since VJ Day the American Government has authorised grants and credits to China to a total of some \$2,000 million, an amount "of proportionately greater magnitude in relation to the budget of that government [the Chinese] than the United States has provided to any nation of western Europe since the end of the war." In addition the United States has sold to China surplus war supplies of a procurement cost of over \$1,000 million for \$232 million. Americans naturally ask why so great an expenditure has produced so little result, and the Secretary of State answers: "Nothing that this country did or could have done within the reasonable limits of its capabilities could have

changed that result; nothing that was left undone by this country has contributed to it."

Undoubtedly the apathy, corruption and inefficiency of the Kuomintang and its military forces have been major factors in the defeat which has overtaken their cause; they have been a sore headache to those who tried to help them. But the State Department's disclaimer of responsibility goes too far. No serious effort has ever been made to control expenditure or to see that American supplies actually reached the armies in the field. It has always been held that any kind of inspection would infringe China's sovereignty and discredit the Nationalist Government in the eyes of the Chinese people. But the fact of American aid was not concealed, and Chinese national pride was not spared in the patronising public statements made by Generals Marshall and Wedemeyer after their missions to China. The Americans acquired the reputation in China of unlimited intervention, while in reality they did not interfere even to the extent of preventing their supplies from being sold for private profit by government officials. For the anti-Communist the story should serve as a classic example of how not to do it.

* * *

President Quirino in Washington

The publication of the American White Paper on China just preceded the arrival of President Quirino of the Philippines on a visit to the United States. In accordance with the custom which allows occasional addresses to Congress by foreign statesmen, President Quirino has made speeches to both the Senate and the House of Representatives and has expressed his views on the need for a Pacific Pact, thus making a direct appeal to the American legislature and public opinion and to some extent by-passing the Administration.

The political situation involved in his visit is a complicated one and must be somewhat embarrassing to President Truman and Mr Acheson. There is no doubt that they would like to see some kind of combination to resist the spread of Communism in the Far East and are anxious to maintain the best of relations with the Philippine Republic, which has not only a special sentimental hold on Americans as an ex-American territory and war-time ally, but also provides the sites of the American naval bases nearest to the Asiatic continent. On the other hand, the White Paper appears to imply a repudiation of General Chiang Kai-shek and the Chinese Nationalist regime by the Truman Administration, whereas President Quirino's Pacific Pact scheme includes Nationalist China and has in fact arisen from his recent conversations with General Chiang. President Quirino's political outlook is thus nearer to that of the Administration's Republican critics than to that of Mr Acheson, and his arrival in Washington appears to have been a reinforcement to those Americans who hold that the President must definitely make up his mind whether he is opposing Communism in China or not.

So far the Administration has made no clear statement of the policy it intends to pursue in China in future; the five "basic principles" enunciated by Mr Acheson at his press conference on August 5 are too vague to commit the United States to any specific course of action. It is known that there is now as there has been ever since 1945, a group in the State Department which holds that America can make friends with a Communist China and detach it from the Russian orbit. But Mr Acheson's letter to the President has at least verbally denounced the Chinese Communists, and it will not be too easy to persuade the American public that Communism in the Far East is a menace which must be vigorously resisted by the United States and yet that no material or moral support may be given to the only organised force which is still holding out against it in China. The Presidents of the Philippines and Korea—with it is rumoured, the approval of the Japanese Government and General MacArthur—want to keep General Chiang Kai-shek in the

picture, and pushing him out of the picture may prove to be a difficult task for the American Government, even after all that has happened to disappoint the hopes originally placed in him. The trouble is that he exists, whereas the prospective Chinese Tito is still merely a dream. A bird in the hand is worth two in the bush, even though it may be only a very bedraggled specimen.

* * *

Indonesian Republic in Sight

Two main steps have now been taken towards holding a joint Dutch and Indonesian conference at The Hague. The first of these is agreement between the Indonesian Republicans and Federalists on the shape of the provisional government which they want for their new Federation—to be called *Republik Indonesia Serikat* (the Republic of the United States of Indonesia). Secondly, both Dutch and Republicans have at last agreed on the precise measures to be adopted to implement the cease-fire; this now takes effect in Java from midnight on August 10th and in Sumatra from midnight on August 14th.

Events in Indonesia have proved often enough that it is usually useless to prophesy from one week to another what will happen next. But at this point certain facts are clear. One is that there is now more chance than ever before of bringing the United States of Indonesia into being within the next few months. Another, however, is that there is still no fixed date by which this can be expected to happen. The likely course of events is that, if the cease-fire is effectively observed, the conference at The Hague will begin in about two or three weeks. It is expected to last about two months; then another six weeks would probably be needed to ratify its conclusions. That will be the moment at which the actual transfer of sovereignty to the new federation would take place.

A flag is nothing if not a symbol. When the red and white of the old Indonesian Republic floats over the government buildings of the new federation—perhaps in a few months' time—it will be hard not to regard it as the symbol of Jogyakarta's success. For the agreement reached on August 2nd between Republicans and Federalists for a provisional government to take over eventual sovereignty from the Dutch, implies acceptance of the Republic as the main basis of the new state. Furthermore, the provisional government itself is to consist of a president elected by the delegates recently assembled at Jogyakarta, together with a five-man cabinet, of whom three members will be appointed by the president, and two elected by the three already appointed. Clearly, much will depend on who is chosen as president. The chances are that although the Federalist delegates are in the majority, this advantage will be outweighed by the personalities of the Republicans. In that case, it would be surprising if the president turned out to be other than Dr Soekarno.

* * *

The Nation's Health

The Ministry of Health's annual reports for England and Wales suffer from being out of date by the time they are published; for instance, the latest [Cmd. 7734] ends its story on March 31, 1948, and its statistics only cover the calendar year 1947. Since then, a new low record has been achieved for the infant mortality rate, which puts the already good result for 1947 in the shade. Moreover, the national health service, which has now been in operation for over a year, is not discussed in the report except for the preparations for its introduction.

Yet there is still a great deal of interest even in the figures for 1947. It will be remembered that, so far as climate—an important factor in the national health—is concerned, it was a year of extremes. It began with a period of severe and prolonged cold and went on into a prolonged and unusually hot summer. It was also a year of economic crisis, which, together with the drought, made food restrictions more rigorous than at any time during the war. Bread had already been

rationed when the year opened; in September the meat ration was reduced; in October the bacon ration was halved; and in November potato rationing was introduced. In spite of all this, in spite, too, of the highest birth rate since 1921, the infant mortality rate, usually regarded as the most sensitive index of a country's well-being, fell from 42.9 in 1946 to 41.4. The severe winter was probably responsible for the slight rise in the crude civilian death rate, 12.3 per thousand of the population against 12 in 1946, and for the small increase in deaths from tuberculosis. The death rate from tuberculosis, however, still compared very favourably with the prewar rate. The only disquieting features of the history of epidemic disease in 1947 were an outbreak of smallpox with 78 cases and 15 deaths—which is chiefly interesting because since then compulsory vaccination of infants has been abolished—and the first big outbreak of poliomyelitis (infantile paralysis) that this country had had. The course of this epidemic in 1947, described in the report, is of topical interest because of the fears of another

poliomyelitis epidemic this year. The weekly notifications for the two years beginning in the middle of May are shown in the second chart, from which it will be seen that so far this year's weekly rise is not so steep or so consistent as in 1947.

On the whole, however, the picture of the national health, presented by the statistics of this report, is extremely good. But it leaves one wondering why, now that the health of the average individual is better than it has ever been, he should find it so difficult to do a hard day's work.

Benefits of Hospital Patients

The National Insurance Advisory Committee has issued a report on what sounds a most abstruse subject—the preliminary draft of the national insurance (overlapping benefits) regulations—but which happens to be of general concern. The point at issue is whether the insurance benefits of people receiving treatment in hospital should be reduced and if so at what point in their stay in hospital.

The preliminary regulations that are now in force have caused much indignation among those who have had their benefits reduced in accordance with them. Why, they say, should this happen when the health service is a free service? Are we not, by this reduction, being charged for our maintenance in hospital? The principle, however, behind the main social security scheme is that people should not be provided for twice for the same contingency. The ordinary sickness benefit of 26s. a week is intended to contribute towards a person's normal needs, including his board and lodging. If his board and lodging are being provided by another of the social services—that is, the hospital service—there is a clear case for a reduction in the insurance benefit. The strict application of the principle might, of course, create hardships, so the advisory committee recommends that there should be no

reduction in benefit until a person has been in hospital eight weeks. After that, and for the remainder of the first year in hospital, the 26s. weekly benefit should be reduced by 5s. for a person with dependants and 10s. in other cases. At the end of a year, persons without dependants are to have their benefits reduced to 5s. a week, while those with dependants will receive 5s. a week for themselves, the balance of 16s. between this sum and the 21s. which they were receiving formerly being paid straight to their dependants. The committee recommends, however, that persons not receiving benefits for dependants and who, therefore, will probably have no home to return to, should have the second reduction in benefit placed to their credit and paid out on their discharge from hospital to help resettle them in ordinary life.

The saving to the national insurance fund from the preliminary regulation now in force is just over £3,000,000 a year. The committee's recommendations will reduce this to just over £2,000,000. It is a tiny saving when set against the hospitals' expenditure on patients' food of about £18 million a year. But it may have a salutary effect in reminding people that there is a limit to the spending of the welfare state. What is quite wrong is that there is no similar provision for a reduction in benefit under the National Insurance (Industrial Injuries) Act. Thus, of two patients in the same hospital ward, the one suffering from an accident or disease contracted at work will not have his benefit reduced while the other will. The already big anomalies between the two insurance schemes in the amount of benefit are thus made more apparent than ever.

Israeli Diplomacy

A high official of the Israeli Foreign Office is on his way to Moscow and at first glance this trip, which was announced at the end of last week, looks like a snap of the fingers at the western Powers on the Security Council. Only two days previously, their delegates had, despite Israeli protests, supported Dr Ralph Bunche's contention that, now that armistices have been signed with all Israel's neighbours, the arms embargo upon the Middle East should cease. But in fact the visit was planned earlier, and signifies no sudden huff. Its purposes are two: one is to see if direct dealings with Moscow will produce an order to Rumania and Hungary to become more co-operative about permitting the departure of Jews. The other is to display the Government's determination to remain faithful to the foreign policy which it presented to its people in March—a policy of "friendship with all peace-loving states, especially with the United States of America and the Soviet Union." Lately, it has been leaning rather heavily to the American side.

Misunderstanding of the gesture is excusable because, diplomatically speaking, the Israelis have been overplaying their hand about the arms embargo. For one thing, they themselves have made a mockery of it. From being, on the first day of the Palestine war, a Power that was unable to reply when the Egyptians bombed Tel Aviv from Spitfires, they have become, thanks to American dollars spent largely in Czechoslovakia, the best armed Power in the Middle East. For another, they do not scruple to vaunt this fact in the quarters which suit them. For purposes of home morale, they displayed not only their newest tanks but also their Liberators at a recent Army Day parade. For a third, none of their neighbours—except the least likely to attack them, which is Egypt—have a piastre in the Treasury to spend on the "armaments race" that the Israelis say they fear. They are doing themselves more harm than good by pressing for the retention of the embargo, for as long as it lasts traffic and trade of all kinds will not return to normal in the Middle East. In particular, the Israelis will not get what they so greatly need for the benefit of their balance of payments—a normal movement of shipping through the Suez Canal. At present, immigrant ships from the east have to travel via Gibraltar and there is no passage for tankers carrying crude oil to the idle refinery at Haifa.

Journey into paper

Logs, secured in tow-booms at collecting points at the mouths of the rivers of Newfoundland, are towed to Bowaters Corner Brook mills—beginning a journey that may cover thousands of miles before transformation into paper or board is completed. Logs, too, come overland to the mills, transported in giant 50-ton trucks along roads built deep into the forests by Bowater engineers. On the other side of the Atlantic pulps and pulpwood from Canada and Scandinavia are unloaded at Bowaters deep-water docks at Northfleet and Ridham in Kent and at Ellesmere Port on the Merseyside, whence they are taken to the mills over their own railway systems. For delivery inland, eight-wheeled lorries, each capable of carrying a load of fifteen tons of paper in rolls, are familiar sights on the roads throughout Great Britain. Tugs, trucks, ships, railways, lorries . . . all form links in the Bowater transport network designed for the speedy transit of paper in its various stages of manufacture. This realistic planning to the last detail greatly contributes towards the efficiency of the Bowater Organisation in its service to its customers the world over.

Your eye may be caught first by some item, prosaic, mysterious or merely teasing, in the Personal Column. It may linger—in pleasure or pain—over the Sporting News, or with becoming curiosity over the Court Circular. Or you may mark and inwardly digest, if your professional interest lies there, the City Notes, or the Law Reports. But sooner or later you will turn to the Leading Articles for which The Times is well known.

As you read the considered opinion of a Leader in The Times it will perhaps occur to you that the eminent of all sorts may at that moment be reading it too; for The Times' Leader is a barometer which the world taps daily. Administrators here, Senators in Washington, Deputies in Paris, and a dozen other European capitals—all turn to The Times and its Leaders. The world does not always agree with The Times (nor The Times with the world!) but its editorial comment and opinion everywhere command respect.

THE TIMES

At Lausanne, by contrast, the Israeli delegates have made some strenuous efforts to propose, through the medium of the United Nations Conciliation Commission, conditions of peace which the Arab delegations could accept. These last, though in a more conciliatory mood than they were, are still embarrassed by the fact that they have not told their home publics the whole truth about their discomfiture in war. They are, therefore, finding difficulty in signing anything called a peace treaty. The Israelis have suggested that the document shall for the present be called a protocol, and be temporary in nature. They have also said that they are willing to take back 100,000 of the Arab refugees, provided that the Arab states will, firstly, make corresponding offers and, secondly, accept this gesture as an integral part of the peace settlement. The fact that the four Arab delegations accepted these conditions without reservation is the first evidence from the Lausanne front that diplomatic tact, when practised, pays its users.

Rome-Belgrade Rapprochement

The trade agreement that was finally signed by Italy and Yugoslavia on August 4th has political as well as economic significance. The meaning of the agreement is that both countries, while still claiming the territory of Trieste, do not intend to upset the present *modus vivendi*, under which the territory is divided between an Anglo-American and a Yugoslav force of occupation with ERP filling the financial gap in the Anglo-American sector until transit traffic can be revived. The Italians suspended the trade treaty when Marshal Tito introduced the dinar into his zone of Trieste at the beginning of July—presumably as a gesture to offset his loss of Carinthia in the Austrian Treaty negotiations—and followed up this act by a speech at Pola in which he reaffirmed Yugoslav claims to the whole area. However, calm counsels prevailed. The Italians re-examined the Pola speech and found reassuring statements in it, which were confirmed in an interview between the Italian Ambassador and the Marshal.

The trade treaty follows a series of minor agreements between Rome and Belgrade, which have all shown a conciliatory attitude on the part of Tito. Both sides stand to gain considerably from the £17,500,000 trade exchange now arranged, which represents a big increase on the pact of 1947. Italy will receive timber, copper, bauxite, some maize and lead. The American ERP administration is said to be willing to allow the counter-part fund to be used for buying the lead, which is in excess of Italy's needs. From Italy, Yugoslavia will receive machinery, including immediate deliveries of electrical equipment, machine tools, chemicals and textiles, as well as lemons and oranges, which Yugoslavia probably does not need.

Count Sforza said recently that "trade with Yugoslavia is essential to Italy's economy." Tito's needs are at least as great, and certainly more urgent. The American loans which he may receive are not likely to approach the sums which he requires to meet the Cominform blockade, and the International Bank does not move quickly. In the meantime, Yugoslavia's gold reserves are at an exceedingly low ebb.

Who Should Teach the Technologists?

Ever since the Report of the Percy Committee on Higher Technical Education was published in 1944 there has been a continuous argument whether advanced technological studies should be carried on inside or outside the universities. As evidence of the unsatisfactory state of affairs at the present time, the Advisory Council on Scientific Policy in their second report published recently [Cmd. 7755] recommend that 100 men a year should be sent immediately for full courses at the best technological institutions abroad. This is not because variety of training is required, but because this country cannot provide nearly enough of the requisite quality. While this is going on the Council states categorically that the necessary post-graduate education in applied technology—such as is

supplied by the Massachusetts Institute of Technology—can only be met in this country by the universities, and that the encouragement of higher education in the applied sciences should be entrusted to the University Grants Committee instead of to the Ministry of Education and to the local education authorities. To implement this it is recommended that colleges of applied science should be set up with suitable governing bodies of their own "but closely welded into the universities."

Such a form of organisation raises a host of problems of its own, but the Council's proposal reveals its dissatisfaction with the progress now being made in improving higher technical education. The central and regional organisations set up as the result of the Percy report have been labouring painfully into existence, with very little to show for their effort. Hence the impatience of the Advisory Council. It appears that the new proposals are to be accepted to the extent of making immediate provision for advanced work in technology at a small number of universities. The local authorities will be disgruntled, but it is probable that the needs of the nation will be better served.

* * *

Unity, Duality or Trinity in Schools

The doctrine that the second best for the many must always take precedence over the best for the few has been given startling endorsement by the chairman of the London County Council Education Committee, Mrs Helen Bentwich. There has been a good deal of controversy recently over the LCC's proposals to devour the playing fields of three schools, Parliament Hill, Wandsworth and the Strand School, Brixton, by building huge comprehensive schools (combined modern, technical and grammar schools of 1,500-2,000 pupils) upon them and to swallow the grammar schools into them. In defence of the LCC's policy, Mrs Bentwich, writing in *The Times Educational Supplement* of July 23rd, has said that if the space requirements of the comprehensive schools are to be met

... the relatively generous provisions of playing fields which a very few schools have been privileged to enjoy in the past cannot continue. ... The amenities of these schools will be in the future less for the few, but they will be infinitely greater for the larger number.

Could there be a clearer example of the process of levelling down? Sites for new schools are indeed difficult to find in London, but the difficulty becomes a virtual impossibility if they must house up to 2,000 children.

Middlesex County Council, on the other hand, decided recently to reverse its policy on Comprehensive Schools. This arises from the change in the political colour of the Council in the April elections. When in power the Labour Party favoured comprehensive schools, but of a more modest size than the LCC, that is to say, with about 600-900 pupils. While such modesty is admirable in itself it gives rise to great difficulties in keeping the grammar school element in the school large enough to maintain high standards in the sixth form, which is, after all, the crown and glory of a grammar school education. As the result of fears on this score the Ministry of Education would approve of only three experimental comprehensive schools of this size, and the fate of the other secondary schools in the development plan of Middlesex remained in the balance.

Now the Conservative majority on the Middlesex County Council has swept the comprehensive scheme away, except for the schools which are already in operation. They have also swept away one very misbegotten child of the Ministry—the separate technical school. In future a tripartite system will give place to a bipartite system, with the more intellectual children going to the grammar schools, where provision will be made available for the more academic side of technical and scientific education, and with the less intellectual children going to the modern schools. These schools, unlike the old elementary schools will make proper provision for practical courses.

New Government in Bulgaria

The crisis in the leadership of the Bulgarian Communist Party started last April when Dimitrov left on his last journey to Moscow and his most trusted friend and acknowledged successor, the deputy Prime Minister, Traycho Kostov, was arrested for "anti-Soviet activities." From the scramble for power which followed, the Soviet nominee, Valko Chervenkov, has emerged triumphant. He is now a deputy Premier and Secretary-General of the Communist Party. (The actual Premier, Vassil Kolarov, who is seventy-three, has been repeatedly reported ill in the last three months. He did not emerge from his confinement even for Dimitrov's funeral.)

Chervenkov became a member of the Central Committee of the Party only in 1945, on his return from Moscow, where he had been since 1923. His biographers now try to describe him as a Bulgarian Communist leader after World War I, but this is rather a difficult task as Chervenkov was then less than twenty years old. In fact nothing was known about him till he married Dimitrov's sister in Moscow, in the thirties, and became Dimitrov's bodyguard. Bodyguards of Communist leaders living in Moscow are usually the most trusted agents of the NKVD, and Chervenkov appears to have been no exception. At Dimitrov's funeral he gave a solemn oath promising "loyalty to the last breath" to the Soviet Union and "the leader of the whole progressive humanity, the great Stalin."

The choice of the new Foreign Minister is also very significant. Vlado Poptomov is a Macedonian revolutionary who, like Chervenkov, has been a Soviet citizen for the best part of his career as a Communist. He was the assistant head of the Macedonian department of the Comintern. Hitherto, Poptomov has been editor-in-chief of the Sofia Communist paper, *Rabotnichesko Delo*, and chairman of the federation of Macedonian Clubs in Bulgaria—a militant organisation which not only advocates openly "the overthrow of the Tito clique" but has also been sending armed Macedonian bands into Yugoslav Macedonia regularly in the past years. Most of

these bands, however, were quickly caught and liquidated in a true Stalinist fashion by Tito's police.

Chervenkov has dismissed Professor Ivan Stefanov, Minister of Finance in all Dimitrov's Cabinets, and the only financial expert of the Communist party. He was well known for his moderate views. His place is now taken by Petko Kunin, a former tailor's apprentice who has studied "economics" in Moscow. Anton Yugov, the dreaded Minister of the Interior (Police) is elevated to the post of second vice Premier. The Ministry of the Interior goes to the former Police Chief, Russi Hristozov, a fanatical thirty-five-year-old Communist tough, who was responsible for the unofficial mass "executions" of Communist opponents in 1944 and 1945.

This new team, however ruthless, faces some difficult problems. In his first speech before the Communist Central Committee, Chervenkov appears to be really worried about the chaotic economic situation of Bulgaria and particularly the desperate position of the peasants. For instance, he admitted that the government had "fastened the screw too tightly in our relations with the peasants. We have in fact applied methods appropriate for war Communism only. We must unloosen the screw now and switch over to methods which will win the peasant and induce him to improve and to increase his produce."

* * *

Dr Livingstone, I Presume!

The discovery of tigers in Africa by the Public Relations Department of the Colonial Development Corporation has caused some more disrespectful hilarity at the expense of Whitehall's hard-working purveyors of information. They are also criticised for representing a journey along a major road from a port with "a bank, a hotel, a club, a golf course, churches and the other appurtenances of civilisation" as an adventurous plunge "through lion and elephant country over an almost non-existent track into the heart of Africa." But the sentiment of the public will surely warm to these flights of fancy and justify their authors against the censures of their ungenerous critics. If we are going to have a Colonial Development Corporation and to spend our national wealth on the development of Africa, let us at least have some return for our money in poetry and romance.

What does it matter whether *felis tigris* is actually to be found on the soil of Africa or whether it haunts only the remoter East? Let Africa have its tigers; they are more acceptable to the imagination than the "appurtenances of civilisation" now to be found all the way from the Cape to Cairo. Let the Dark Continent be dark once more; let the bold explorer seek again the sources of the Nile or follow the rumour of King Solomon's mines into the unknown lands beyond the mountains. The public relations officers of the Colonial Development Corporation have judged correctly what the public wants; they know that it would hear of elephants and savages and primeval forests, and takes no pleasure in learning that the literacy rate has been raised two per cent among the Banyankole or that the federated trade unions of the Congo Pygmies have applied for membership of the WFTU.

Nor is there any reason why the new romantic vein in Whitehall public relations should be confined to Africa. It might well be extended to home affairs and help to glamorise activities of civil servants which may otherwise seem dull and prosaic. Surely it would increase the news value of our state administration if we were to hear from a hand-out of the Ministry of Health that one of its officials had just completed a journey from Bournemouth into the heart of Wiltshire through the fox and badger country of the New Forest, where garage attendants have to arm themselves with spanners to keep off the bears. The nation pays a lot to its PRO's; it has a right to expect from them occasional peeps through magic casements into fairy lands forlorn.

Letters to the Editor

Comparative Costs

SIR,—I was very much interested in reading the leading article in your issue of July 9, 1949, wherein you pointed out the need to get the cost of production down before any appreciable improvement in the standard of living can occur. You cited figures showing how it takes the average British production worker almost twice as many weeks to buy certain articles at the present time as compared with prewar, and, specifically, that it takes the total wages (minus income tax) of an average British production worker for a period of 55 weeks at the present time to buy the cheapest British automobile as compared with 39 weeks in prewar years.

I became curious as to what the situation was in the United States on that specific point, and made a check. I found that by making the same assumptions as were made in your article, namely, taking the price of the cheapest model, a two-door sedan, of one of the most popular makes of cars in the United States, and comparing the present with prewar prices, and taking the average weekly earnings for all manufacturing industries (assuming income tax payments for a family of four persons) which amounted to \$52.34 per week at the present time as compared with \$23.62 in 1939, I arrived at the following conclusion:

	F.O.B. Retail Price*	All Manufacturing, Net Spendable Weekly Earnings†		Weeks Work Needed to Equal Car Price	
		Single Worker	Family of Four	Single Worker	Family of Four
1939.....	\$ 644	\$ 23.58	\$ 23.62	27.48	27.43
1940.....	699	24.69	24.95	28.31	28.02
1941.....	754	28.05	29.28	26.88	25.75
1946.....	1,152	37.65	43.13	30.60	26.71
1947.....	1,152	42.17	47.65	27.32	24.18
1948.....	1,219			28.91	25.54
1949.....	1,219	46.60	52.34	26.16	23.23
	1,315			28.18	25.09

* Does not include transportation charges or state and local taxes.
† Prices were increased on August 1, 1947 and 1948.
‡ Net spendable weekly earnings are obtained by deducting from gross weekly earnings, social security and income taxes for which the specified workers are liable.

It would take all the wages of the average production worker 25.09 weeks at the present time to pay for a car, as compared with 27.43 weeks to pay for a 1939 car at the then-prevalent wages. This indicates that, even though the prices have increased greatly in the United States as compared to prewar days, salaries and wages have kept pace with the trend, so that as far as purchase of automobiles is concerned the time required to earn the funds to pay for a new car was actually less than in prewar years.—Yours faithfully, O. P. PEARSON

19395 Strathcona Drive, Detroit 3, Michigan

Are Profits Too High?

SIR,—In your article "Are Profits Too High?" the argument is presented that the total income of 2,608 companies, £1,115.1 million (a), is not excessive, bearing in mind what they did with it. In part, they used it to pay tax, £446.7 million (b).

Is not the tax payment a function of the total income? The companies did not "have to find £446.7 million" in the same sense that they were obliged to provide for repairs or depreciation. They had to find (b) partly because their total income was (a). It cannot be claimed, in part, that (a) is not too high because (b) has to be paid out of it. If the total income had been lower, the tax obligation would be less.

The amount of tax paid therefore cannot be used in part

justification of the amount of total income. The companies are not obliged to earn high income in order to pay tax. Indeed, it can conceivably be argued that the payment of a large amount of tax is a necessary corrective to a high level of total income. It might even be claimed that lower total income would permit lower prices and that the benefit to the consumer would outweigh the loss of tax yield.

Your thesis that profits in general are not too high is not invalidated, but the case is overstated unless an adjustment is made for tax.—Yours faithfully, GLYN PICTON

Porthcawl Hotel, Porthcawl

[The article did not attempt to argue that high profits are justified by high taxation. Profits and taxation obviously move together. But critics of the one often forget the impact of the other.—EDITOR.]

Devaluing the Pound

SIR,—Have you ever felt unwell on board a crowded steamer? You are almost sure that sooner or later you have to step up to the rail and you know that afterwards you will be much better, perhaps even quite well. Still, you struggle desperately to postpone the inevitable, especially with all those people looking on. Perhaps they will be sick before you, or the sea may calm down suddenly.

It is a mistake to wait too long, for your prestige may suffer even more if you can't get to the rail in time.—Yours faithfully, ALFRED L. MARK

39 Hill Street, Mayfair, W.1

Television

SIR,—I could wish that in your article in last week's issue on the future of television you had found it possible to devote a little more space to the problems of television and the cinema in relation.

Two facts, I believe, stand out:

(a) In a two-dimensional viewing medium, the prepared film will always have the advantage over the transmitted studio play, if only because it is freer to move both in space and in time.

(b) Neither the film industry nor the television industry alone can produce a film which will recoup its total cost from only one medium of exhibition within the United Kingdom.

What is to be done about that? I doubt if your analogy of the arranged marriage is quite the most appropriate. Rather it is a case of arranging to get both horses harnessed to the one shaft and facing the same direction.

Can the BBC manage this? Or does it not need some more powerful influence than any yet applied?—Yours faithfully,

3 Hans Crescent, London, S.W.1.

ERNEST WATKINS

South-East Asia

SIR,—To your readers in the east, your editorial of May 28th must have come as an agreeable surprise.

To stem Communism in south-east Asia, as elsewhere, it is essential that economic attraction as well as armed defence be both available and publicised. But pride must be considered at every turn. "Remember that the pride is more important than the stomach." One country after another has shown that a leader who appears dependent upon foreign power tends to lose, by the measure of that dependence, his grasp upon his people's support, however substantial may be the economic advantages from the alliance. Chiang Kai-shek

The Loyal Irish

The Queen's visit to Ireland, her affable conduct, and the warm-hearted reception she has received from the Irish, are the all-absorbing topics of the week. Wholly to pass them by without a word might be considered inexcusable, and yet we can add nothing to the elaborate details which have already been perused in all the morning journals. One fact is plain: all doubt of the loyalty of the Irish must now be considered a grievous error. To display more enthusiasm—to crowd with more delight round the Queen—to follow her steps and gaze on her with more admiration than the Irish, is impossible. Her Majesty, and all about her, must be convinced that she has than them no more devotedly loyal subjects. A want of loyalty, in truth, has never been characteristic of them, nor of men in their condition. They see in Her Majesty, the great Chief of all the chiefs they have ever been taught traditionally to admire, and they transfer to her the guarded and hoarded feelings of ages. A want of loyalty is more characteristic of an advanced people, who have compared the influence of individuals with the power of general laws over society, than of men in the condition of the Irish. . . . The loyalty of the Irish is less surprising than the opportunity they have had to exhibit it. Her Majesty's visit will dissipate prejudices in several quarters. A better feeling will be excited towards them in those who share their loyalty, but have suspected the Irish; and the hearts of the Irish will warm towards those who show confidence in them. The visit will carry with it the blessings of removing many suspicions, and of making Her Majesty's subjects know, love, and respect each other.

The Economist

August 11, 1849

was not the first example of this. Mao Tse-tung may not be the last. Heads of military missions will do well to brood upon this if their good intentions are not to become decisive ammunition for subversive minorities.

As regards economic attraction, it would be admirable if substantial public works could be developed by international finance and technology. But it would be well to anticipate whether such projects would be directed by organisations with Oriental experience or fettered by apron strings from Western capitals. South-east Asia cannot afford that substitution of political passion for costs of production which afflicts Socialist England.

Meanwhile, thought might be given to some simpler steps. The word "exploit" has been too loosely used in connection with western investment in Oriental areas. There is no justification for its survival as a Communist lever. How many directors of western projects in south-east Asia have acquainted themselves with the percentages of profits that are expended, on the one hand, in wages and salaries to Asiatics, in local taxes and profits ploughed back to provide further employment, and, on the other hand, the percentage of profits remitted overseas to absentee stockholders? Of these how many have acquainted the public? If figures of this sort were pooled and publicised without disclosure of individual cases, they would furnish a record with which Communism cannot compete.

In this connection, your editorial of May 28th omits all reference to the Philippines, although over 95 per cent of the Philippine population of 19,234,182 are of Malayan origin, and the Islands are a geological extension of Indonesia and less than three flying hours from Hongkong.

Despite the stresses and scandals of an election year, some agrarian discontent and lawlessness on one island, and war damage immeasurably greater than was suffered by Hongkong or Malaya, the people of the predominantly Christian Republic of the Philippines today have a higher percentage of literacy and a higher standard of living than any other in south-east Asia, and, whatever threats may lie ahead, the Philippine Republic is a livelier illustration of partnership with the west and a likelier bulwark against Communism than most of the regions you enumerate.—Yours faithfully,

Ayala Building, Manila.

GERALD WILKINSON.

Czechoslovak Justice

SIR,—You may be interested to hear of a case of judgment passed by the High Court of Prague and the way modern "jurisdiction" in Czechoslovakia is applied to foreign claims.

At the end of 1938 I was entrusted by a reputable Czechoslovak public company of the metal and engineering trade to work out a technical and financial scheme for the establishment of a subsidiary company in Great Britain. The compilation of that scheme was connected with elaborate technical work,

numerous journeys abroad and manifold negotiations. The establishment of the factory did not materialise, owing to the sudden outbreak of war in September, 1939.

After the cessation of hostilities the company for which I worked was nationalised and the payment of the submitted bill was rejected. As a British subject resident in this country, I was compelled to go to court. The court accepted all offered proofs such as my having done some work for the company in this country on account of a special full power of attorney, and my having incurred certain expenses. The court, however, contended that my claim was not to be lodged against the new national enterprise, although the entire property, with all its assets, belonging to my employer, was transferred to the ownership of that new enterprise.

According to the present Czechoslovak law, the new national enterprise, in which the property of the nationalised company has been incorporated, is committed to take over all liabilities of the previous company. Notwithstanding this the court has found that my claim could only be raised against the company, deprived of all its assets by nationalisation. That company may eventually receive compensation, but whether such compensation will ever be paid remains to be seen.

Although this judgment is a travesty of justice, the solicitor representing the case cannot recommend an appeal against this decision due to the fact that, unbelievable though it may seem, the Czechoslovak Supreme Court has confirmed similar decisions since September, 1948.—Yours faithfully,

R. STEIN

7 Rivermead Court, Hurlingham, London, S.W.6

The Role of Pakistan

SIR,—I really cannot understand where the anti-Pakistan policy of Britain and the British press will stop. In the last issue of *The Economist* you have come out with another suggestion that Pakistan should concede a port on the Makran coast as a sea outlet to Afghanistan. All these suggestions which appear in the British press to stabilise the turbulent situation in the Indian sub-continent or on the borders are always at the cost of Pakistan's economy or territory. The attack of India on Kashmir was a blow to the territorial integrity of Pakistan and could easily lead to the collapse of this newly-born state at one stage. But Britain, claiming herself to be the Mother of the Commonwealth, always adopted an indifferent attitude. The release of sterling balances to India while refusing all kinds of material and technical help for the development of Pakistan resources is enough to show the anti-Pakistan attitude of Britain. Pakistan has to find friends—friends not only in name but in actions and relations as well. The forthcoming visit of Mr Liaquat Ali Khan to Moscow will definitely bring something more realistic and will be more appealing to the Pakistan mind than the mere membership of the Commonwealth.—Yours faithfully,

NEW BOBBIN COVERS INCREASE OUTPUT

Quicker, cheaper to make, more practical in use

*Better for their job because
of BAKELITE*

In this textile bobbin you have an excellent example of how BAKELITE materials benefit both the producer and user of an article. Formerly made of metal, bobbin covers moulded in BAKELITE plastics are not only cheaper and quicker to produce, but in use 'keep their seats', resist fracture and wear, reduce thread breakages and consequent stoppages of machines. The exceptionally wide range of special grade BAKELITE materials which are available for immediate use makes possible comparable advantages in connection with many engineering applications, and remedies shortage of other materials. There are possibilities here worth investigating. Just write or telephone us.

Books and Publications

Political Pamphleteering

"Pax Britannica." By F. A. Voigt. Constable. 576 pages. 25s.

THIS book, by one of the most experienced and learned of British commentators on international affairs, is a brilliant piece of political warfare. Whereas the historian, even of recent or current events, is concerned with causes, effects and the course of events, the political warrior is out to prove a case. The enemy must be utterly blackened, and all compatriots of the warrior who have consciously or unconsciously acted to the advantage of the enemy, must be portrayed as contemptible fools or traitors. On the other hand, all who have fought on the warrior's side against the present enemy—though not necessarily against earlier enemies—must be as white as snow.

The enemy is Communism and the Soviet state. Mr Voigt well understands, and skilfully explains, many aspects of both. He analyses the precise and special meanings in Communist terminology of such words as "democracy," "election," and "peace." He shows how the Soviet leaders consider the citizens, and especially the "workers," of all other countries bound by an overriding loyalty to the Soviet Union, the "most advanced" state in the world, the "fatherland of the toilers." All who oppose Soviet policy anywhere in the world, whatever their nation, are guilty of treason. Mr Voigt supports his argument with quotations from Stalin and examples from Comintern history—both subjects of which the British public is still woefully ignorant. Perhaps the only weakness of this section of the book is that the author is too kind to Lenin, in whose career much may be found of the special forms of fraud and violence of which Stalin is the greatest living master.

This part of the book is so good that the defects of the rest are the more regrettable. The chapter on Poland is useful, though one wishes that more had been said of the activities of the Home Army. The treatment of Yugoslavia is much less satisfactory. Tito's propaganda grossly exaggerated the achievements of the Partisans and made many false accusations against Mihailovic. It does not follow from this that the Partisans did not seriously fight the Germans, or that Mihailovic did not for long periods deliberately sanction close military collaboration between his forces and those of both Italian and German invaders. Many British officers and officials were misled by "revolutionary romanticism" and did not understand the true nature of Communism—whose fault was it that this was so little known between the wars in Britain? Some may even have deliberately helped Communism. But policy decisions were taken not by them, but by the War Cabinet, after consulting with its highest military and diplomatic advisers. And Soviet domination of Eastern Europe was decided partly by the American veto on the plan for an invasion of south-east Europe, and partly by the decisive action of King Michael of Rumania—itsself the result of long exhortations by the western Powers. The interplay of military and political factors was much more complicated than Mr Voigt seems to realise.

His chapter on Greece is better but it is also rather one-sided. He too readily accepts the view of the Greek monarchists, and says nothing of the stupid persecution and cruelties which in 1946 and 1947 drove thousands of non-Communist Greeks back under Communist leadership. Altogether he shows little sign of understanding the Balkan background or the economic and social conditions of Eastern Europe, the soil in which the Communist seed struck roots.

In his concluding chapter Mr Voigt has some excellent things to say on the "priority of defence over opulence," and on the folly of refusing to consider war a possibility if war is to be avoided. His book may be warmly recommended to those who already know something of Eastern Europe. It will not fail to stimulate even those who strongly disagree. But beginner students should read it with caution.

Russian Background to the East

"Soviet Russia and the Far East." By David J. Dallin. Hollis and Carter. 398 pages. 30s.

OF all the areas in which Soviet expansionism presents problems, the Far East remains even today the most perplexing. Mr Dallin, a Menshevik émigré whose writings have won him something of a reputation in the USA over the last few years, has attempted to provide a historical background against which these perplexities can be profitably studied. This consists of two works. The present one—originally published in the United States last year—and a more recent one dealing with earlier periods under the title of "The Rise of Russia in Asia," so far unpublished in this country.

"Soviet Russia and the Far East" takes up the story in 1931 and carries it forward to 1948. But the book is unevenly balanced, since the period before World War II is dealt with in a rather summary fashion. As a historian, Mr Dallin has obvious merits which are not in the least outweighed by his equally obvious defects. The latter (as earlier books of his have shown) are concerned mainly with a comparative indifference to the distinction between established historical facts and reasonable probabilities. His writings tend to take the form of a series of categorical statements presented with equal assurance, so that the reader is left to look for the appropriate footnote in order to discover to what extent they may be accepted at their face value. It may, for example, be true that in 1932 the Russians set up a "secret Provisional Government for the (Russian) Far East" in case the Japanese severed connections between that area and Moscow, but we are not told how Mr Dallin got admitted to the secret. It may also be true that in 1939 the Russians tried to get Great Britain and France to extend the contemplated agreement to the Far East, but it would be interesting to know upon what Mr Dallin bases an assertion for which so far there is no supporting evidence. Mr Dallin is probably right in attaching importance in the history of wartime diplomacy to Allied fears of a separate peace between Russia and Germany. But it is not made clear whether he thinks there is evidence now to justify what the Japanese believed at the time, namely that there were secret negotiations between the two countries taking place in Bulgaria in the spring of 1943.

Mr Dallin's merits are his ability to appreciate with critical detachment the foreign policies both of his native and of his adopted country. His hostility to the Soviet regime does not blind him to certain inadequacies in the American response to the Soviet challenge—for example in Korea. His hostility to Chinese Communism does not prevent him from doing justice to the genuine idealism that has in part inspired it, nor does it induce him to pretend that its Chinese opponents are democrats *sans peur et sans reproche*. On the other hand by a convincing accumulation of evidence he does dispose beyond all reasonable doubt of the nonsensical view that Chinese Communism is "an agrarian movement" with little or no connection with Moscow. The over-riding merit of the book is that by taking Soviet policy, and not "China" or the "Far East" as his guiding thread he can juxtapose against a background of world diplomacy, events in China proper, in Japan, Korea, Mongolia, and Sinkiang, and use events in each to illuminate developments elsewhere. This is not to say that the whole thing is one vast well-oiled machine. Mr Dallin shows us occasions both in China and in Korea, where the local Communists have been momentarily out of step (as Mr Pollitt was once out of step); but if they are wise—and they usually are—such leaders are not out of step for long. Whether this state of affairs will continue, whether Communists in government will be as faithful to their Marxist and Muscovite background as Communists in opposition, is not a question for historians. Mr Dallin offers little prophecy and no advice. But he has written a useful book.

In the Steps of Adam Smith

"Price Control: Government Intervention on the Free Market?" By F. R. J. Jervis. Hutchinson's Scientific and Technical Publications. 220 pages. 12s. 6d.

THE energies of economists nowadays—or at all events of such economists as do not devote themselves wholly to speculative exploration—are mostly devoted to matters of high policy; properly enough, in a society bent on achieving control of its economic destinies, they regard themselves as expert advisers to experts, as custodians of general truths to which those experts can refer, as forgers of tools for experts to use, or—to change the metaphor—of compasses for them to steer by. The experts in question, however, are doing their work in a democracy, whose degree of education and of freedom from misconceptions both colours their own views and limits their scope, and it is painfully obvious that in economic matters the democracy is at present not merely uneducated but miseducated; not merely, like the African bushman, unable to count above five, but dogmatically convinced that five is the sum of two and two. There is need for patient statement and re-statement of the very elements of economic common sense, for the reiteration of the forgotten obvious, for indefatigable axe-work on the hydra-heads of fallacy; work which must necessarily lack the path-breaking excitement which it had when Adam Smith did it, and which is therefore uncongenial either to the intellectual explorer or to the practical backroom boy. Not nearly enough of it is being done.

Mr Jervis's "Price Control" embodies such work. It is a comprehensive criticism of government intervention in the pricing process, based on a statement of the elementary principles of value theory; it deals with public utilities and with commodity valorisation schemes, with control of profit margins and of dividends, with maximum and minimum prices, with specific fields such as housing, food subsidies, and the bulk buying of imports. It is a competent, straightforward, logical job; Edwin Cannan, one feels, would have approved of it, so would Adam Smith, whom Mr Jervis quotes often and with effect. Mr Jervis does not, like these, wed economic insight to literary quality, nor does "Price Control" display that human touch, that rich appreciation of the absurd, which made, for instance, Mr A. S. J. Baster's "The Little Less" such a pleasure to read. While never actually heavy, it does not perceptibly attempt to be more than an efficiently constructed textbook. But no other book, whether textbook, treatise or squib, known to the present reviewer, affords so complete, up-to-date, clear and trenchant a statement of the basic case for the competitive economy. A wide circulation for Mr Jervis would be a bull point for economic recovery.

Arousing America's Conscience

"A Man Called White." By Walter White. Victor Gollancz, Limited. 382 pages. 18s.

MR WHITE is as white as his name: since no one can guess that he is by race a Negro, unless he chooses to reveal it, he is a living argument that the only fundamental difference between a white man and a black is the colour of his skin. Mr White is not lazy or irresponsible or cowardly: the highest courage and a great sense of responsibility were needed to make a man, who had experienced the mob fury to which Negroes can be subjected in America, choose a career which would expose him to that fury, and force him to work hard, for the rest of his life. This moving and dramatic book is the history of Mr White's thirty years' work in the National Association for the Advancement of Coloured People, work which has brought him fame far beyond his own country and which failing health has now forced him to curtail.

His book is the story of that Association, which has been so largely responsible for America's growing consciousness of the injustices suffered by its Negro citizens. Except during the war years, when discrimination against Negroes in the Armed Forces was its chief problem, the Association has concentrated much of its energy against discrimination in education. It has

attacked this discrimination consistently on legal grounds and has won a series of victories which have been as important for their enlightenment of public opinion as for their effect on the position of the Negro. There could have been no more telling way of arousing America's conscience than some of the Supreme Court's arguments in these cases.

This concentration on the legal aspects of discrimination has meant steady, but it has also meant slow, progress and for this reason it has often been criticised by less patient workers for Negro equality, both black and white (and even, more often red). America's treatment of its Negroes is one of the sharpest weapons in Russia's propaganda armoury. For this reason the work of the NAACP is especially relevant to the cold war and will become more so if the present economic recession in America deepens into the depression which in the past has meant race riots. Mr White has been one of the leading workers for federal action to protect the Negro's civil rights; indeed, parts of his book are a useful guide for any would-be Washington lobbyist. But real advances in the Negro's position can come only by the sustained efforts of white and black alike, at the local level, to improve his economic and social status. It is surprising, therefore, to find that Mr White's ready and sympathetic understanding fails him whenever he looks at the work Britain has done, and is doing, to achieve such advances in her colonies.

Timber in Wartime

"Home Timber Production (1939-45)." By Russell Meiggs. Crosby Lockwood. 275 pages. 15s.

THE author, a Fellow of Balliol College, and formerly Chief Labour Officer of the Home Timber Production Department, writes here a clear intimate and objective history. For many it should be read in conjunction with "British War Economy," by Professor Hancock. Here one finds the same critical evaluation and analyses of the war's impact on one section of the national economy.

Much of the book is concerned with the administrative developments imposed by the changing fortunes and uncertain duration of the war, and by experience of the previous war. The main tasks were, however, clear from the outset: to control and reduce consumption, to increase the home output and to organise the buying and shipment of imports. The production policy based on the existing trade—with the Department occupying a special balancing function—the fivefold increase in employment, and the statistical analyses and summaries of production are all part of the story. Due consideration is given to the many technical questions without which full appreciation would be lacking of the very solid achievement against increasing difficulties associated with timber supplies, depreciating equipment and labour competition. Of special interest for the economist and the administrator are two final chapters on statistical control and on costs and prices.

American Labour

"Labour Politics in U.S.A." By Mark Starr. Fabian International Bureau. 54 pages. 2s. 6d.

LAST November American labour demonstrated more impressively than ever before how it could bring its political weight to bear without setting up a separate political party. But developments since then, both in Congress and in the State legislatures, have provided an equally impressive demonstration of the need for applying even more weight over a sustained period if labour is to mould the existing political pattern into a shape satisfactory to it. The American labour movement has, however, not yet reached the point where it is driven to establish its own political party, and it is very likely that it never will. This pamphlet, written by a labour educationist who knows the British labour movement as well as the American, explains why a Labour Party has neither been desired nor needed in the United States and why, even if conditions change in the future, it will still be difficult to establish one.

AMERICAN SURVEY

The New Prometheus

(From Our American Staff)

IT is symptomatic of present American thought about the atomic bomb in particular and about atomic energy in general that President Truman, presenting the sixth semi-annual Report of the Atomic Energy Commission to a hot and irritable Congress, stressed the beneficent rather than the awesome aspects. "All the people," said he, "will benefit from the increasing use of the products of atomic energy to further the healing arts, to bring about better food production, and to increase our understanding of the basic forces of life itself." And then, with a touch of that pious-syrup which has flavoured his utterances since last

"I'm Not Isolationist Any More—It's Just That I Don't Trust Anybody"

Herblock in the Washington Post

November, he concluded: "As I review the state of this nation's atomic energy programme, I firmly believe that the people of the United States and all who rely on the strength of this nation have reason for reassurance and faith."

Mr Truman did not touch on what most of those people talk about—the number and types of bombs that may exist, the controversies that have been raging about the Commission's heads, the competition between Britain and the United States for Belgian and Canadian uranium ores, or the complaints of certain Senators that the United States scatters both

information and radioactive isotopes abroad too generously. Neither did the Report. If Senator Hickenlooper's accusations of "unbelievable mismanagement" appear incredible in the light of the work done by the Commission, if charges of carelessness in picking personnel are dimmed by the account of the precautions taken (20 per cent of the 4,700 employees are busy with security rather than research or production), the rebuttals were presented without emphasis. Their effectiveness may be gauged by the fact that, on the day the Report appeared, the chairman of the Joint Congressional Committee which had been listening to Mr Hickenlooper's complaints declared that there would be no more public hearings, as there were no more questions which committee members seemed eager to ask.

The press was more curious. Its interest, spread over many columns of the metropolitan newspapers, mirrors the changes which have taken place in American attitudes since the first bomb was exploded at Hiroshima four years ago. Wonder, doubt and curiosity, eagerness that the bomb shall keep its pre-eminence, and fear lest its secret shall be discovered, all are still there; but with them is a new tendency (born, perhaps, of the tepid currents surrounding the cold war) to inquire into the peacetime promise of atomic energy. With this arises a new appreciation of the cost, in terms of space, risk, men, industrial and scientific activity (money is hardly mentioned in this Report), which America's Promethean invention demands of nations wishing to exploit it.

The Report shows the Atomic Energy Commission still devoting most of its attention to the "development and production of weapons and fissionable material," but with increasing work on reactor development and on research seeking "fundamental new knowledge." The supply of raw materials is more satisfactory than it was earlier and production processes are growing cheaper and better.

For security reasons descriptions of the applications of the new fire are limited to the use made of its by-products in research into its power to harm and its power to help, and to ways of warding off its ill effects from man, animals, plants, and the metals used in its control. Protection must cover its makers every moment they work, and must be extended to the water they drink, the food they eat, the air they breathe. Gaseous wastes at the Hanford plant in Washington State, liquid wastes at Oak Ridge in Tennessee, offered problems which the AEC believes have been solved in fact, if not in men's imaginations. Radioactivity in air and water, it is reported, is kept well below the danger line by protective measures now in operation.

Details of work done mean most to specialists, and the whole Report suffers from the lack of things that had to be left unsaid. Yet even with all the question marks, there are aspects of this "second world" which stir the layman. First of all, there is the size and complexity of the project.

The Commission has three national laboratories widely separated and doing very different work. It has control over eleven "major research centres," and it oversees research in fifty other institutions, industrial and academic, working on contract. It distributes the radioactive isotopes, which are a by-product of nuclear fission, to laboratories and hospitals for the mere cost of production, or for less if they go for cancer treatment or research. It trains scientists and doctors in their use, finances new projects for the discovery of new applications, awards fellowships to win the interest of young scientists. Since 1945 it has set up new towns, populated them, put them to work; for projects so dangerous that they must not be carried on within reach of civilians, it uses the empty western deserts.

★

The work creates a change in scientific attitudes which is little short of revolutionary. Under government auspices men study the reasons why metals "creep," the process by which blood is manufactured, the effect of radiation on corn kernels, cows' hair, and the Japanese who survived the first bomb. They use radioactive isotopes of cobalt, iodine, phosphorus and other metals to light and make visible the most secret processes of life, or to take the place of scarce and expensive radium in curative measures. Their work on nuclear reactors alone calls for simultaneous research in "nuclear physics, health physics, chemistry, biochemistry, radiobiology, metallurgy . . . in chemical, electrical, mechanical, and civil engineering; and in . . . nuclear engineering." Scientists and engineers, locked so short a time ago in their separate cells, must work hand in hand, not only in the abstract interest of developing and exploiting the new discoveries, but in order that they and their fellows may have a chance of survival if atomic war comes. (One minor effect has been to revolutionise the teaching of elementary chemistry.)

Hardly less notable is the admission of things not known, and the gulf thus revealed between the new world of atomic force and the old one of energy from coal or petrol. Avowed ignorance, seldom found in government reports, is in this one the more remarkable because it springs from a level of wisdom which few men share. Three worlds are mirrored here, the everyday world of the streets, the fairly familiar world of scientists using recognised tools and techniques, the new extra-sensory world brought about by nuclear bombardments and dependent on concepts utterly unknown to most citizens.

These factors make the work of the AEC—relying as it does on the continued existence of a few scientists, having at their command a power greater than any ever known, able to continue the production, development and use of synthetic atoms only by intense co-operative effort—seem at once vital and fragile. That a democratic government should spend billions to support it is due, of course, to its war origin and its war potential. Even for a big country this is not an easy prodigy to live with, yet it cannot be abandoned. If men are right who believe that "the discovery of the controlled fission of atomic nuclei and controlled release of atomic energy is the greatest discovery that has been made since the controlled use of fire was discovered by primitive man," the United States has embarked on a road of no return. Given the magnitude of the enterprise and its future importance, can smaller countries with lesser resources afford to duplicate it, or must this new force be shared on an international scale, with the United States becoming a factory of primary energy for the world?

American Notes

Fresh Look at China

There is little that is new in the one hundred years of "US Relations with China," collected last week into a thousand-page White Paper, which has aroused a storm of controversy, seldom based on a detailed study of a volume which would have better served its purpose of informing public opinion had it been shorter. Comments range from "an Oriental Munich" to "a masterpiece of clarity," from "a petition in bankruptcy" to "a realistic appraisal." The last two at least are applicable: America's difficulties in China and misjudgments of the situation there are assessed almost as frankly and relentlessly as is the Nationalist Government's incapacity.

This "sorry record of well-meaning mistakes" shows that over \$3 billion of military and economic aid have been pumped into China since 1945, to the advantage only of the Chinese concerned with its distribution and of the Communists who now control most of the country, and whom the State Department at last recognises officially to be the servants of Soviet imperialism. This would seem to demonstrate conclusively the uselessness of further aid to China. But Senator Knowland and a number of colleagues, who share his one-track mind, have not been deterred from picking up again that well-tried stick for beating the Administration in connection with the Military Assistance Programme: they want \$175 million to be earmarked for non-Communist China and are calling for reinforcement from General MacArthur in person.

A number of Democrats echo the Republican demand for active encouragement to Chinese resistance against Communism, insisting that the Nationalist Government grasped, when the US Government did not, the true meaning of the world-wide Russian conspiracy. On the other hand, Senator Vandenberg's reaction to the White Paper has been a welcome approval of much of it and a declaration that the time has now come for a "fresh look" at the Far East, which he is perhaps not unwilling to make a bipartisan look.

★

The State Department's purpose in publishing the White Paper was to clear the obstructions away so that such a look could be taken. This week, Mr. Philip Jessup of the Department has begun to study the view, in consultation with Mr Raymond Fosdick and Dr Everitt Case, who have been chosen as much for their lack of political connections as for their experience and judgment. The various Government Departments and Congressional Committees concerned will be invited to assist this effort to ensure that Asia is not "lost to Communism by default." These are the words of Washington's latest visitor, Mr Quirino, the President of America's favourite child, the Philippine Republic. But agreement with him does not go so far as to make it likely that practical help will yet be offered to his Pacific Pact. The basis of American Far Eastern policy, as laid down by Mr Acheson, is as yet only friendship for the Chinese people, the encouragement of true independence for China, consultation with other interested powers on measures contributing to the security and welfare of the peoples of the Far East and a promise that, should the Communist régime attack China's neighbours, this will be regarded as a threat to international peace under the United Nations Charter.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Compromise on MAP

Sweltering wearily in Washington but with no additional heat being put on by an unusually quiescent Russia, concerned about America's own budget deficit and suspecting that Europe will never become self-sufficient, Senators have some excuse for going about their foreign aid business resentfully and unenthusiastically. In fact, thanks once again to the hard work of Senator Vandenberg and Senator Dulles and to the Administration's readiness to meet their doubts, the Military Assistance Programme is making very satisfactory progress. At the end of last week, President Truman waived, almost with relief, the request for a "blank cheque" which had been contained in the original draft legislation. He will no longer have power to send arms anywhere in the world, paying for them out of an emergency fund. Now the countries to be aided and the amounts they are to receive will be specifically designated. In the new version of the Bill, \$1,160,990,000 is asked for military aid to the North Atlantic countries, \$211,370,000 for Greece and Turkey, in addition to \$50 million already authorised, and \$27,640,000 for Iran, Korea and the Philippines.

Senators were very gratified at these and other less important limitations and clarifications of the original Bill, but Senator Vandenberg still felt that, if the "calamity" of a Congressional adjournment without adopting MAP was to be avoided, a very substantial cut in the sum requested was necessary. This was borne out by signs that such Democrats as Senator George and Senator Byrd now rate economy before their country's international responsibilities. Mr Acheson, however, maintained emphatically that \$1.45 billion was the absolute minimum, while Mr Johnson, the Secretary of Defence, pointed out that the Atlantic Pact signatories would certainly have developed their military organisation before any substantial flow of arms under MAP began, since only about half the equipment could be delivered before the middle of 1950, even if ordered at once.

* * *

Paying for Foreign Aid

It is this which, in both Mr Johnson's and Mr Acheson's opinions, would make any delay fatal, but it was here that Senator Vandenberg seized upon another possible compromise. Would it not do, he asked, for Congress to appropriate, during the current fiscal year, only half the total sum requested for the Atlantic Treaty countries, if it authorised advance contracts for delivery of the rest of the arms after July 1st, 1950, when they could be charged to next year's budget? And Mr Johnson answered that he would settle for 60 per cent cash and 40 per cent in contract authorisations. The Senate, where the real struggle over MAP will come, still wants more details of the actual arms to be sent to Europe and of their distribution, but there will not be much to complain about if military aid runs the Senate's gauntlet with no more damage than economic aid finally suffered.

Out of the confused debate, this year's funds for European recovery eventually emerged without any of the objectionable riders which had been added by the Senate Appropriations Committee. Nothing is earmarked for Spain or for the purchase of farm commodities. France is not to be penalised for Morocco's treatment of American businessmen nor Britain for its socialism. The Senate is prepared to give the Economic Co-operation Administration the full \$1.074 billion which was authorised for the April-June quarter, which seems to have been spent and for which the Committee offered only \$1 billion. But the total sum allowed by the Senate is ten per cent less than ECA requested to cover its "minimum requirements," a cut which the Administration had already decided was inevitable.

The \$5,647,700,000 voted by the Senate, by 63 to 7, includes \$900 million for occupation costs and \$45 million for aid to Greece and Turkey, both a little less than the House

had allowed. The House had also decided that no funds should be reserved for ECA loans, but the Senate earmarked \$150 million for this purpose. In addition, it appropriated \$3,628,300,000 for ECA itself during the current fiscal year, compared with the \$3,468,470,000 which the House had allowed, but which could be spent in ten and a half months. The differences between the two Appropriation Bills are now being settled in conference committee, where the chief difficulty seems to be the \$344,000 provided by the Senate for a Congressional "watch-dog" committee which the House considers unnecessary, perhaps because itself it is less given to disturbing ECA's peace.

* * *

Turn in the Tide?

All present evidence suggests that American industry is now preparing for a new upward turn in production, incomes and employment, a mood which is in strong contrast to the gloom prevailing no more than a few weeks ago. On Wall Street, the Dow Jones Industrial Average has climbed fairly steadily from the low point of 161.60 reached in mid-June, and was last week within striking distance of the year's best level of 181.54. It seems reasonable to presume that there will be some irregularity after so sustained a recovery; but for the Dow theorists, the Rail and Utility Averages have kept in line sufficiently well to suggest that the market is in bullish mood, and the technical position on Wall Street—with an outstandingly large "short" interest—is good enough to promote hopes that the rally has further to go.

Industrial news too, though still patchy, is far more encouraging today than in mid-June. Production, as measured by the Federal Reserve Board's index, fell by 14 per cent between November and June, and was certainly at a new low point for the month of July. But such basic industries as steel and automobiles are holding a very high rate of output and the dollar volume of construction is now actually above the high levels reached a year ago, while consumer expenditures (measured by preliminary returns for retail trade) have been sustained at a level far higher than would be assumed by a simple comparison of industrial output. In turn, this has brought about a certain amount of restocking by manufacturers and traders. Prices for non-ferrous metals, which went through a drastic process of correction from mid-March onwards, are now regaining some of the ground then lost, and the representative Moody index of spot commodity prices, after a fall of nearly 20 per cent between January and June, has for some weeks now shown a much greater stability.

* * *

Government Intervention

Government policy, moreover, is beginning to shift its emphasis on to the side of expansion. To some extent, this change is no more than the type of automatic correction which follows from lower levels of income and employment. The Treasury's position, for example, has deteriorated simply because tax receipts are falling and because it has been found quite impossible to make sudden reductions in expenditure on a scale sufficiently large to correct the position. And the cost of supporting farm prices will probably be higher than in the budget year to June 30th last. But President Truman and his advisers have also turned away, rather grudgingly at first, from the deflationary plans put forward last January. They are willing now to watch the Treasury position deteriorate at the expense of budget stability, though they are not yet willing to develop "deficit finance" on the largest Roosevelt scale, let alone the scale which would in all probability be necessary to deal with a major setback from the post-war peaks recorded in national income.

The government has also retreated from its earlier decision to let the American farmer realise that bumper crops must ultimately find some reflection in lower farm prices; it is willing to bolster farm incomes at the highest level yet

...the Barclays Group can help

IN THE UNITED STATES
With a coast to coast network of correspondent banks, a New York office of Barclays Bank (Dominion, Colonial and Overseas), and a representative in San Francisco covering the West Coast, we can:

- Get information for you on United States markets;
- Introduce you to agents who can handle your goods;
- Provide all the necessary banking services.

IN CANADA
Barclays Bank (Canada), a Canadian Chartered Bank, with branches in Montreal, Toronto and Vancouver offers the same services in Canada.

IN THE UNITED KINGDOM
Ask any Branch Manager of Barclays Bank Limited to explain to you how easily exporters can make use of these facilities, or write direct to 54 Lombard Street, London, E.C.3.

witnessed—even that is not sufficient for Congress—and it has given a useful lead to labour's wage claims by its intervention in the steel industry dispute. Here, the resistance of the employers to wage demands has been followed by the appointment of a fact-finding board, due to report to the President this month. On the surface, there is reason to presume that the board will advise some concessions on the part of the employers and, if this is the case, the steel industry will be very awkwardly placed indeed. Other substantial wage claims are under negotiation, and since wage advances have proved to be one of the most powerful forces working for inflationary pressure from 1945 onwards, there is at least partial ground for the assumption that inflationary trends could be renewed in the near future.

In the meantime, the Federal Reserve Board has taken more aggressive steps to promote credit expansion. Earlier reductions in cash reserve requirements for the commercial banks were neutralised by open-market operations so as to avoid an unduly strong downward pressure on interest rates, while maintaining relatively cheap and abundant credit. Now, the Reserve Board emphasises that cheaper, and, if necessary, still cheaper money, is the dominant goal, and bond market stability merely incidental to that primary target. To that end it has again cut reserve requirements to the lowest point for eight years, despite an almost unprecedentedly sharp contraction in bank loans to industry. No one of these measures is, by itself, likely to turn the business tide. Together they may add up to a position where manufacturers may reinforce what would otherwise be a normal rebound by a further burst of forward buying. It would be wise to regard such a development, however, as no more than a relatively short-term reversal of a corrective process which still seems far from complete.

* * *

Getting the Byrd

In Virginia, just across the Potomac from the national capital, Senator Byrd, one of the President's most formidable opponents on questions of economy and civil rights, reigns much more supreme than does Mr Truman in Washington. He is the long-time and undisputed czar of the Democratic "organisation," as the Virginians respectfully call what is usually known by the less refined name of "machine." Perhaps because it is both more discreet and more honest than its counterparts elsewhere, the Virginian machine has kept its head above the tide of public disapproval that has engulfed others. But it has just faced the most threatening wave of opposition in a generation and, although it managed to ride this one successfully, there are more piling up.

Since in Virginia the Democratic nomination means election, it was in the Democratic primary at the beginning of this month that a successor was chosen for Governor Tuck, who in November will leave the chair to which he "rose on the wings of the birds." The official machine candidate was Mr James Battle, who had to face three opponents, of whom by far the most threatening was Colonel Francis Pickens Miller, a liberal with a suitably historic southern background. Colonel Miller was finally given 110,000 votes, nearly 30,000 more than the anti-machine candidate obtained two years ago, to Mr Battle's 133,000. Mr Battle's comfortable majority may indicate that the Republicans accepted his invitation to vote for him. Colonel Miller's challenging campaign forced Senator Byrd himself to descend to the hustings and brought a record turnout of voters—20 per cent of those registered and 8 per cent of those of voting age, which shows the effectiveness in Virginia of that poll-tax which Mr Byrd safeguards in the Senate.

The poll-tax and the inadequacy of Virginia's schools were attacked by Colonel Miller, who had Negro and labour support as well as that of at least some of the many Federal civil servants who live in the State. He was also able to point out that between 1940 and 1949, while Senator Byrd unceasingly denounced Federal extravagance and bureaucracy, his Virginia State payroll nearly trebled. But Colonel Miller based his

appeal mainly on the need to free Virginia from the conservative yoke of the machine and to give Virginians a chance to choose their own representatives.

The machine, well aware that the "Old Dominion" is as jealous of its independence as is the late Republic of Texas, made capital out of every sign of foreign interference, whether it was Mr Truman's remark that there were too many Byrds in Congress or the casual endorsement given to Colonel Miller by the head of the Musicians' Union. The national Democratic organisation, although it can have little affection for a State machine which refrained from helping Mr Truman last November, kept carefully aloof from the contest. The national labour organisations tried to do the same, in spite of Mr Battle's insistence that they were making the campaign into a trial run for 1950. If, however, Colonel Miller had won, the Virginia primary would undoubtedly have had national significance, since it would have winged the Byrd that aspires to lead the conservative Democrats who hamper Mr Truman at every vote.

* * *

Cheap Fuel for New York

New York City will this month begin to derive some benefit from the tremendous expansion of the natural (petroleum) gas industry since 1945. More than a century ago, the blessings of natural gas were first discovered (on a modest commercial scale) in the New York State township of Fredonia, where co-operative enterprise brought the product through a wooden pipe-line to a small community at negligible cost. But for generations its commercial possibilities were ignored, while vast quantities were deliberately released, and allowed to run to waste, because of its potential danger to men and equipment on the oilfields.

In the late twenties, however, new fields were discovered, and technicians made revolutionary changes in pipe-line transmission. The only substantial problem at that time seemed to be the assessment of "proved" reserves on a scale sufficient to warrant the formidable capital charges involved. These doubts were resolved by systematic exploration, and marketed production of natural gas over the five years 1936-40 almost trebled the rate from 1921-25. The industry was held back during the war by an acute shortage of manpower and equipment, and was then caught in a first-class political struggle for control, with the oil and tanker industries, and Mr John Lewis and his United Mineworkers, all demanding regulation of the marketing and production of natural gas on terms which would not interfere unduly with competitive sources of power on the eastern seaboard.

That struggle was resolved in favour of the natural gas industry by the Government's decision to permit the Texas Eastern Transmission Corporation to transmit natural gas through the famous "Big Inch" and "Little Inch" pipe-lines which in the war years (when they were used for oil) made so valuable a contribution to the fuel supply in the East. These still remain outstanding examples of large-scale construction, but pipe-lines now stretch for more than 250,000 miles. Output of natural gas has doubled in eight years, and reserves at 174 trillion (million million) cubic feet are equivalent to thirty years' supply.

The attractions of natural gas lie in its abundance, cheapness, and convenience for consumers and merchants. Clean and easy to supply, it is available at the source on terms which heavily undercut such competitors as residual and fuel oils, and bituminous coal. The continued expansion of the industry (which since the war accounts for revenues far higher than those for manufactured gas) may one day present a first-class problem for the other fuel industries. The attractions already outlined have naturally aroused the producers to demand a free hand in marketing natural gas, but so far the Federal Power Commission has maintained a somewhat precarious hold on rates and charges, and this fuel seems likely to preserve a strong competitive advantage for many years to come.

THE WORLD OVERSEAS

Italian Uncertainties

(From Our Rome Correspondent)

THE "precarious recovery" in Italy which was discussed in a midsummer article in these pages is now infected, at least on the psychological level, by images of depression. In 1948, the midsummer date marked a quiet but perceptible regaining of confidence after a troubled spring. In 1949, midsummer has marked the accentuation of anxieties for the future. A mid-year report of the Milan Chamber of Commerce, Industry and Agriculture—incorporating the latest available information—reflects the rather sudden and perhaps exaggerated change of outlook in the markets.

The Milan Chamber's report assembles various symptoms of the changed situation: the loss of rural purchasing power and damage to stock through the recent peasants' strikes (offset, however, by an excellent grain harvest); the cessation of production for stocks in the textile industry; official obstruction in the granting of import licences for wool from the sterling area; the grave consequences of prolonged drought for the production of electrical current. Only the second of these is, properly speaking, a cyclical symptom.

No flourishing overseas market has suddenly thrown back Italy's exports, and no necessary external sources of supply have failed. But even behind the bulkheads of the Italian tariff system and of the elaborate regimentation at least of the country's external trade, Italy's business world feels that—quite apart from such prices as still reflect international market dealings—internal prices ought to bear a relation to dollar prices. Calculations are being made which show, for instance, that Italy's basic product, grain, is becoming seriously overpriced. The theme seems to be a favourite one of the Communists, for whom all this talk of depression is a welcome tonic after the painful refusal of the "bourgeois state" to break down in 1948.

Continued Financial Stability

An optimistic view of Italian economics a few months ago would, after displaying due awareness of the grave problem of the mounting population, have taken encouragement from the improving finances of the nation. It would have been possible to anticipate an inflow of foreign capital and a growth of internal savings sufficient to offset a sharp contraction, if not a cessation, of Marshall Aid after 1951. Economic union with France, the progressive liberation of trade from bilateral confinements and trade agreements with the east would perhaps enable the demand of manpower to catch up to some extent with the growth of the working population. Helped by moderate emigration, it was fervently hoped that even some of the standing army of the unemployed might be absorbed. The financial and currency stabilisation which has been achieved since 1947 is still the Government's proudest boast. Even in the climate of depression, it is not easy to find in North Italian industrial or trading circles any echo of the criticisms of the ECA Country Study (or Hoffman Report, as it is generally called in Italy) that excessive financial caution on the Government's part is worsening prospects by keeping the capital goods industries unnecessarily in check. There is criticism, however, of the refusal to release sterling assets for the use of wool importers.

Currency stability is generally felt to be too precious an achievement to be exposed to the risk of relying on a doctrine of the creation of savings which might not work out in the somewhat unsystematised Italian milieu. The cost of credit

is indeed continually bewailed, but the fact that secured advances cost up to 12 per cent is viewed partly as a true and necessary reflection of the scarcity of savings (the total of bank deposits translated into 1938 money values stand at little over half the prewar level) and partly as the fault of a plethora banking system. The progressive closing of the budgetary gap, however, has been expected to divert an important part of the flow of new savings from the Treasury to the Banks. There has been no drastic worsening of the financial foundations, but in the changed atmosphere the other factors appear weaker and more dubious.

The prospects of a gradual and natural return to profitable conditions in such industries as textiles and engineering are seen to be distressingly dim and distant.

The sector of economic activity most easily susceptible to deliberate re-animation should, it seems, be the building trade. The present rate of house building, notwithstanding recent allegations by a Minister that Italy had built more dwelling rooms than Great Britain since 1945, is regarded by all classes, and throughout the peninsula, as utterly inadequate to the present emergency. The Hoffman Report found the rate of building in 1947 "terribly low" and in 1948 "probably even less satisfactory." It is difficult, however, to see how private enterprise building, other than of luxury dwellings for the large class of war and postwar profiteers, could possibly shake off its lethargy and absorb the energies of a conspicuous number of idle workers until rents have been allowed to rise to double or treble the present figures. The necessary decontrol measures are regularly, when it comes to the point, whittled down under storms of protest from trade unions and middle classes alike to small proportions. While private enterprise holds off house building, the Government's subsidised schemes are insufficient either to placate the indignation of the homeless, numbered by millions if one includes those reduced by the war to family life in a single malodorous chamber, or to communicate a brisk rhythm to the construction industries, which, it is commonly said, would at once change the whole atmosphere.

In short, the precarious recovery of the spring months is slipping backwards. In the small Milan-Turin-Genoa "industrial triangle" which concentrates so great a proportion of the country's wealth, equipment and skill, there is a feeling that temporary advantages enjoyed by the miraculously unscathed industries of the triangle during the postwar period—when German industry was spiked and French industry was lamed by confusions and dissensions—have passed away. The textile industry in particular, which as a going concern spared by the war was able to work briskly in the first years of peace, now feels itself antiquated and helpless.

In a semi-industrialised country like Italy, the land, with which even great numbers of industrial workers maintain a family link, is the traditional shock absorber in conditions of economic depression. But the landless farm labourer (numbering one million heads of families) is a protagonist in contemporary social troubles, and with progressive overpopulation the smiling countryside, dotted with picturesque (but even in Lombardy crowded and tumbledown) homesteads, serves decreasingly to take the edge off the struggles of industrialism. The redemption of the vast areas of the south by irrigation and road building appears a long and hazardous task; according to Milanese contractors each acre would cost four times the corresponding operation in the north.

Eyes on America

In this somewhat gloomy atmosphere the news received late in July that Great Britain was seeking additional dollar aid, translated by Italian publicists immediately into the threat of a \$200 million cut in Italy's own prospective allocation, caused sharp explosions. ERP imports and the internal expenditure of the LIRA fund are a big factor in every development programme. The unquestioned assumption in Italy has been that American aid would be unstinting. Only a few solitary voices have uttered warnings that if the Marshall aid period were not utilised for creating permanent sources of income Italy might, in the fifties, be impoverished to the bone. The notion that Italy's success in narrowing its trade deficit in 1948-49 could furnish a motive for reducing current aid appeared monstrous. The absence of rationing and regulation in the ordinary concerns of life (food, clothing, petrol) which enables urban Italy (at least in the north) to present such a gay appearance is felt to be in itself a gesture of solidarity with "the American way of life," and a title to good treatment.

Anti-British Feeling

By contrast, the American cue for the interpretation of Britain's methods has been followed with some eagerness in Italy. Britain, it has been discovered, is a Happy Hypocrite cloaking the comforts of organised lethargy in the weeds of austerity. Italy is aware of enjoying the particular approval of Washington, and realistic Italian industrialists, who have the date 1951-52 graven in their minds, hope that the goodwill may take on the concrete shape of substantial private American investments in Italian industry. The obstruction encountered by the Minister of Industry, Signor Lombardo—not only from the Communist opposition—in attempting to ease the way for American enterprise in Italian oil research and development, shows that the way is not smooth. American capital is hardly likely to undertake long-term commitments in Italy without feeling much surer of the labour and social situation. Perceptible progress has been made in the last year in restoring factory discipline and in winning a wing of the wage earners for a co-operative outlook in industrial relations. For instance, the unions have now agreed to a general wage settlement with the employers and have given some guarantee of a return to industrial peace. Unfortunately, the present "depression" in Italy is, the Communists claim, already bringing back into their ranks those whom "precarious recovery" had caused to waver. The continuance of Italy's postwar reconstruction may perhaps be regarded as assured; but depression makes it more difficult to achieve the process in an atmosphere of conciliation.

Austria Prepares for Freedom—II

Living on Overdrafts

[FROM OUR SPECIAL CORRESPONDENT]

AUSTRIA differs from most European countries in that its economic prospects are even bleaker and the Austrians worry about them less. True, the present situation is much better than it was. Austria has recovered from its postwar prostration, though not to the same extent as western Germany. Output, productivity, exports and the standard of living have all risen. Under the guidance of conservative Ministers, almost all price controls have been lifted. Distribution controls have also gone except on basic materials, and are in abeyance on these. Food rationing is hardly observed, though it exists in theory.

Goods are in the shops once more; they are very dear and often of miserable quality, but they are there for the citizen to see, and even to buy by dint of saving. The usual inequality, so repugnant to the British observer, prevails; but in Central Europe the alternative is not equal shares for all

under an effective rationing system, but simply bare shops. For this reason, the average Austrian, like the average German, feels better off than he was under rationing and price controls. The Socialist members of the Austrian Government took a realistic view when they agreed recently to a new, deflationary wage-price law, which abolished all food subsidies and raised various other basic expenses, in return for an increase in wages which does not cover all the extra charges. It was realised that there was enough food to meet demand at the existing high prices, and controls were in any case not observed. Further, incentives have been increased by the removal of subsidies; the unskilled worker is now proportionately worse off than he was in relation to the skilled man.

The abolition of food subsidies is one step taken to face a budget deficit of 2½ billion schillings for 1949. For political reasons, the Government is loath to halt reconstruction in order to balance its budget; but its opportunities for inflationary financing are almost at an end. Hitherto occupation costs, amounting to 600 million schillings a year, have been financed by the issue of treasury certificates, which were easily placed with insurance companies and industry. With increasing production calling for all available cash, this door is now closed. Instead, an occupation tax has been raised, and the first public reconstruction loan has just been issued. It may be asked, however, what citizen will dutifully pay a tax so labelled, when he evades other and more obviously patriotic dues? As for the loan, though it is baited with an amnesty for tax-evaders and old German Reich bonds can be used as part payment for subscriptions, it has made slow initial progress. The days of orthodox investment at low interest are not yet at hand in Austria. Quick fortunes are still to be made in other ways. An unknown, but certainly large, amount of "black" money is circulating, out of reach of the banks and taxation authorities. The fact that Austria is still occupied is certainly partly to blame for this situation: for the Russians are running an active export-import trade of their own which is completely outside Austrian law.

Hope from Hydro-Electric Works

Funds for an investment programme covered by Austria's extraordinary budget will come from the local currency counterpart of ERP imports. With the counterpart fund, the Government plans to develop its vast natural resources of water power for the generation of electricity, and so reduce its dependence upon coal imports. Half of the one billion schilling investment programme will go to three hydro-electric schemes, and a minor project to develop power from brown coal in Carinthia. Outside the scope of counterpart fund financing, there is an interesting scheme to produce hydro-electric power at the Lunersee for export only, to Germany, Italy, Switzerland and France. The counterpart fund will also be available for financing Austria's two big heavy industrial plants—the United Steel Works (formerly the Hermann Goeringwerke) at Linz and the Alpine-Montan works at Donawitz. Credits will be granted to these plants for modernisation, and for equalising the present lack of balance in different products within the industry. A new strip mill

has already been approved by the committee of the Organisation for European Economic Co-operation.

So far, so good. But what hope has Austria of balancing its payments even if these projects come to fruition? To oblige the Americans, the Austrians drew up a four-year plan, showing a balance achieved in 1952-53; but it cannot be taken seriously. An unknown factor which makes planning mere guesswork is the effect of the return, after a peace treaty, of the 280 former German factories now held by the Russians. The Austrian Government does not know what is produced by these factories, where the output is sold, and what condition they will be in on return.

There are, however, guides to the future in the past. Austria has never entirely balanced its payments, though it almost achieved this aim in 1938, with the help of important tourist traffic and investments. Since the end of the war, it has been dependent upon various forms of relief—Unrra, post-Unrra, interim aid, ERP, the British £10 million "loan" (which was mainly a gift and was partly converted into dollars for the purchase of Ruhr coal), credits from the Export-Import Bank, and, latterly, a £150,000 gift of wool from the Australian Government. In the first Marshall year, just ended, Austria had more ERP aid per head of population than any other country, amounting to over \$200 million; in addition it received \$63 million in drawing rights, all of which have been utilised. In the second Marshall year, Austria is asking for—but will certainly not get—approximately the same amount of ERP aid (\$209 million). The Government wants larger drawing rights for purchases from western Germany and Belgium, and less from Britain.

No Cushion Against Depression

Austria's export trade has increased considerably, but by no means on the same scale as that of other ERP countries. It is still only about two-thirds of its prewar volume. That is to say, the country has no cushion with which to meet the shock of world market recession. Manufacturers are still producing goods that are often of poor quality, at prices much beyond the British average. They are still in the illusive world of inflation and an uncontrolled, still highly absorptive home market. Instead of tackling production costs, they are intent upon maintaining price rings and presenting a united front to the trade unions. Austria, for instance, is asking £38 per ton for newsprint against £25 paid by Britain to Sweden; and after the wage-price agreement came into force, the paper cartel announced that it was raising its price—in any case on the home market—by 25 per cent for newsprint, and up to 41 per cent for other types of paper. For their part, the workers are protected by generous social legislation.

At present, high prices are partially overcome in the export market by a system of indirect subsidies, the cost of which is borne by the Austrian consumer. The artificial aid has helped Austria to export steel; it is, however, not enough to secure a market in Britain—for instance, for the country's fancy leather goods.

Restricted Trade with Germany

Three basic changes are needed if Austria is ever to be self-supporting. They are, however, all highly-charged with political risks. Firstly, economic barriers between Austria and Germany would have to come down; secondly, trade with eastern Europe would have to revive; and, lastly, Russia would have to give up its grip on the country's oil resources.

Even before the Anschluss, Germany was Austria's biggest trading partner (a position now held by Italy). Apart from the exchange of goods, the middle-class German with his rucksack provided the backbone of Austria's tourist trade. Now, trade is small and shows a wide gap between the amounts that Austria buys and western Germany is willing to take in return. Austria buys Ruhr coal and machinery, but the Anglo-American Joint Export-Import Agency

refuses to allow western Germany to buy from Austria low-quality softwood or books, such as were extensively imported before the war. It is, of course, absurd to suppose that even if all barriers were removed between these two countries, the prewar trade would immediately revive in full measure. And, at present, Russian opposition inside the Allied Council would block any major improvement. Even so, it remains a strange anomaly that the citizens of two countries within the Organisation for European Economic Co-operation are forbidden even to send telegrams to each other.

A revival of trade with eastern Europe would aid Austria's transit traffic as well as its dollar gap; but it does not depend on decisions taken in the west. Before the war, Austria bought 800,000 tons of grain from this source; last year, only 18,000 tons. However, exchanges with Yugoslavia have increased, and a pact just signed with Poland provides for a total trade of \$44 million during the year. This is a larger amount than last year, and was secured under better conditions. But Austria is still forced to pay for half its 1,500,000 tons of Polish coal in dollars, and has to provide Poland with goods almost equal to dollars in bargaining value—special steels, magnesite, sheets, electrical apparatus, tractors and staple fibre. Much the same type of goods will go to Czechoslovakia under the latest trade pact with that country. As yet no eastern European country has come forward with a sizeable offer of grain. Trade between the Soviet Union and Austria is officially non-existent, and will presumably remain so while Moscow draws its requirements from the former German factories, now combined in the Soviet holding company, USIA. Some of these 280 works are key plants, and some are British-owned.

Cost of Appeasing Moscow

For the sake of achieving a *détente* with Moscow, the Foreign Ministers in Paris agreed that Austria should pay \$150 million for the ex-German factories, though no one knows how this sum can ever be raised. In Paris it was also agreed that the Danube Shipping Company should stay in Russian hands; and its ships and ports will presumably be leased at a high rate in hard currency to the Austrian Government.

The agreement on Austria's oil resources was equally damaging to Austria's hopes of economic independence. The Russians have been granted 60 per cent of the Zistersdorf oilfields and the former German oil exploration rights. It is not yet known what these percentages cover, but it seems that the most important producing areas will remain in Russian hands. Zistersdorf is at present producing between 850,000 and 1,000,000 tons of oil a year, over half of which could be exported after satisfying Austrian needs. In addition, the Russians are claiming all the most promising of the known prospecting areas. Only the areas outside the Vienna basin, the exploitation of which has so far never been considered, are to be left for the Austrians and western producers. Moreover, the whole supply of natural gas, on which Vienna relies, comes from areas which the Russians claim. In short, the western Foreign Ministers have made an extremely bad bargain, which leaves the lowering of barriers between Austria and Germany as the sole practical alternative to the continuance of American aid.

(Concluded)

Anglo-Brazilian Trade

[BY OUR CORRESPONDENT IN RIO DE JANEIRO]

ANGLO-BRAZILIAN negotiations lasting more than five months have led to an exchange of notes setting out the products which each country expects to be able to buy from the other during 1949 "subject to agreement on quality and prices." Basically, this extension of the agreement signed in Rio on May 21, 1948, seeks to attain reasonable equilibrium in sterling payments.

STEEL

Steelworks devour huge quantities of coke in the blast furnaces, and of gas in the steel-melting furnaces and soaking pits. The coke and gas are derived from coal carbonisation. Every day Simon-Carves coke ovens produce thousands of tons of coke and millions of cubic feet of gas. Simon-Carves built Britain's first by-product coke ovens in 1881 and led the way in banishing the wasteful old "beehive" oven from the British coking industry. To-day Simon-Carves coking plants are at work in coal and steel centres all over the country, and are in use or under construction for new or existing steelworks in England, Wales, France, Spain, Turkey and India. Coke ovens by Simon-Carves play an important part in producing one of the world's most essential materials.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

Its provisions will run until March 31st next year unless notice is given by November 30th of either party's desire to terminate it on December 31st.

The programme allows for British imports from Brazil totalling £33,349,500 and for British exports to Brazil of £38,261,000. The latter figure includes £7,486,000 for petroleum and petroleum products, an amount which does no more than preserve Shell's present share of the Brazilian market (in the case of petrol rather less than a fifth). Heartburnings in Washington of the kind aroused by the recent Anglo-Argentine treaty are therefore unlikely.

The continuing need for bilateral arrangements in a dollar-short world might be regretted, but there seems to be nothing in the exchanges to which the Americans can legitimately take exception. Cotton, rice (for the Far East) and sugar, which account for £16 million of the Brazilian export programme, find no market in the United States; and the possibility that British motor vehicles may take up a substantial part of the £8,000,000 allotted to "locomotives, ships, aircraft, vehicles and parts" in the Brazilian import schedule would merely point to the British motor trade's growing market in a country whose dollar shortage has forced the suspension of American car imports.

Poor Sugar Crop

The scale of Brazilian exports to Britain has been determined not only by Britain's ability to meet Brazil's import needs, but by other important considerations. Chief among these is that Brazilian supplies of certain staple exports fall far short of British demand for them. Brazil's sugar crop is undoubtedly poorer than usual, and the size of its rice export surplus cannot yet be accurately determined. It is known that Brazil found itself unable to meet the full British requirements put forward at the Rio talks, especially for rice, sugar, maize and oilcake.

Shortfalls in production are, of course, not the only obstacle

When sudden overload or storm damage interrupts the mains, you will see, in any darkened urban area, some few lighted buildings here and there: hospitals, factories, public buildings, stores and cinemas. Places where sudden darkness holds risks too great to be tolerated and a battery stands by against emergency. In buildings such as these, all over Britain, Chloride Batteries are on duty; and the list of new installations increases steadily. The Chloride Electrical Storage Company, originators and makers of the Keopalite automatic emergency lighting system, have over 50 years' experience of battery design and manufacture. Chloride, Exide and Exide-Ironclad Batteries can be trusted: and they are.

to fuller mutual trade. The notes exchanged stipulate that imports on both sides are to be "for internal consumption or processing," a clause which, while it accurately defines the uses to which Brazil puts its imports from Britain, clearly precludes *entrepôt* purchases by Britain from Brazil. The addition of the phrase "unless otherwise agreed," however, appears to leave the door open to negotiations for goods (say, coffee and vegetable oils) which Britain might well be in a favourable position to re-sell in Europe. The stipulation no doubt owes much to the general view here that Brazil should, as far as possible, treat directly with its consumer markets. In fact, efforts to build up a direct coffee trade with certain European consumers have not so far been conspicuously successful. Clearly, too, Britain's inability to secure all it would like from Brazil owes something to Brazil's need for dollars, which obliges it to sell as much as possible to hard currency countries and those which, like Holland and Belgium, might be able to offer dollars for certain products. Finally, higher Brazilian exports to Britain are obviously handicapped by the steadily rising cost of Brazilian foodstuffs and raw materials at a time when world prices are falling.

More British Exports

As for British exports to Brazil, traders here expect to know where they stand now that the trade agreement has been concluded. Pending the publication of its terms, the Brazilian authorities have in recent months been withholding import licences for certain products. Motor vehicle imports have been among those thus affected. They may now rise, and, although opinions here differ, the rate at which they were running early this year, coupled with the suspension of American imports, may raise them to a substantially higher figure than the £2,000,000 registered for 1948. It bears repetition that the scheduled figures are purely notional. If, for instance, the contract for the Paulo Afonso hydro-electric scheme were awarded to a British firm (tenders are to be submitted this month from several countries including Britain) the figure of £7,250,000 allotted in the agreement to general and textile machinery would probably be greatly exceeded. The first stage of this hydro-electric scheme is likely to call for the expenditure of about £6,000,000 spread over three years.

It is known that Brazilian manufacturing interests have brought strong pressure to bear on the Brazilian negotiators to cut down British imports which, they claim, would compete with domestic manufactures. This pressure will undoubtedly continue to exert an influence on the shape of Anglo-Brazilian trade, since it is based, not on currency restrictions but on the desire to protect Brazilian industry. At a recent congress of Brazilian businessmen it was resolved to ask the Government to prevent the entry of any products competing with Brazilian manufactures, and at the same time to undertake an intensive campaign through its commercial offices abroad for the sale of Brazilian exports. British linen is a target of this group. Brazilian linen output is, in fact, negligible and of low quality. Prices of the domestic product are higher than the landed cost of the much better quality imported from Britain. But how far British exporters will be allowed to fill the pronounced local shortage of linen remains to be seen.

Shortage of Sterling

Sooner or later a Brazilian sterling shortage may become an additional factor to be reckoned with. The sterling which Brazil can earn depends, of course, on the level of its agricultural exports, and this at present is not encouraging. Anglo-Brazilian visible trade showed a Brazilian import surplus exceeding £9,000,000 for the first five months of this year. This in itself is not alarming since the normal seasonal rise of Brazilian exports during the second half of the year can be counted on to reduce, though not to eliminate, the deficit. The upswing has already begun, with a consequent easing of Brazil's current sterling position, and authoritative opinion here con-

siders the shortage unlikely to become acute this year. Two other factors support this view. First, releases of blocked sterling, following the recent railway purchases, will strengthen Brazil's current sterling account; secondly, a substantial trade balance in Brazil's favour is to be expected from trade with the rest of the Sterling Area, even though this favourable balance is unlikely to reach the £8,500,000 registered for 1948 because of a considerable decline in Brazil's exportable surpluses of rice and sugar.

If this decline persists, a sterling problem will inevitably arise later. It must also be remembered that Brazil's blocked sterling funds will not always exist as a means to replenish exchange drained by trade deficits. Well-informed forecasts suggest that these funds may dwindle to some £12 or £13 million by the turn of the year, and in the Bank of Brazil's annual report for 1948, recently published, it is estimated that by next June they should be fully liquidated.

So many imponderables are involved that it is impossible to draw any hard and fast conclusions from this analysis. Essentially, however, Brazil's trading problem is its inability to produce enough to earn the means of paying for imports which a rising standard of living has made attractive to its people. It is at least certain that much will depend on the rate at which it can increase its output of staple exports and cut production costs. Plans have been drawn up to this end, but the task of implementing them has barely begun.

Co-operative Farming in Eastern Europe—I

[BY OUR SPECIAL CORRESPONDENT]

CO-OPERATIVE farming, introduced gradually, is the method by which the countries of Eastern Europe hope to get state control over agriculture without antagonising their peasantry. All countries of eastern Europe have undertaken to transform their predominantly agricultural and peasant economies into industrialised states within a short space of time—five years according to most of their plans—and it is essential for them to increase their food production at the same time. Food is necessary for export to pay for the import of the large quantities of capital equipment that they need to fulfil their plans, and at the same time they have to cope with a rising industrialised proletariat with a higher level of feeding. All these countries are also planning to increase their output of industrial crops.

This plan for co-operative farming is not the same as collectivisation, though it is almost certainly a step leading to that ultimate goal. The idea of co-operative farms is that peasant holdings shall be pooled to form large agricultural units which will be controlled by the state. With state aid they will be able to produce greater output per acre with less labour, and the state will be better able to control the crops that are sown as well as the collection of produce. This theory of the co-operative farms is in fact part of the text-book theory of Marxist-Leninism, but in each country its application varies with the character of the people and with the different agrarian heritage.

Three-Year Agreements

Although the principles are the same, the actual farms vary enormously. It is possible to visit farms in Yugoslavia, Bulgaria or Hungary with anything from 30 to 500 families forming the basis of the co-operative. These families have pooled their holdings, which vary as a rule from the smallest holdings of less than 10 acres to the large holdings of middle peasants of about 75 acres, and they have all agreed to share the work and the profits for a minimum of three years. At the

end of that time, in theory, if any peasant wishes to contract out of the arrangement he may do so, though no guarantee is given that he will get back the same land that he originally gave. Land taken away from a co-operative is usually taken from the periphery, and, it is often alleged, is the poorest land. The peasant families retain, or may have built for them, a house, and keep about a quarter of an acre garden for their own use. They are allowed private ownership of two cows, five sheep, one sow and its progeny and as many chickens as they can keep.

The important difference between these co-operative farms and collectives is that in the co-operative farms the peasant receives a rent for his land in proportion to the amount he has contributed to the whole. The rent is not a fixed sum but varies with the profits. In Hungary and Yugoslavia rent appears to be paid up to 30 per cent of the profits, in Bulgaria sometimes up to 40 per cent. In addition every working member of the co-operative receives wages according to the amount and quality of work contributed during the year. It is usual for 10 per cent of the total profits to be re-invested in the farm at the end of the year, and 40 per cent to 50 per cent is used for wages and other running costs. It is obviously an advantage to a peasant family to be able to contribute as many working members as possible to the co-operative. Families who can contribute members from three generations often do very well; those families who have a working husband and a mother unable to work through ill-health or small children are much poorer. This and differences in rent received explain why the visitor to co-operative farms in eastern Europe notices what appears to be wide differences in the prosperity level of the different members of the community.

Workers' Brigades

The work of a co-operative farm is in theory arranged by the general assembly, or, in the larger co-operatives, committees of the members. In fact it seems to vary very much from one farm to another as to how this is done. In some places the farm really seems to be run by the community of peasants on a purely democratic basis, in others the president of the co-operative seems to run it as a paternal despot. In all cases, however, as the co-operatives have to be registered with the Ministry of Agriculture of the country concerned, they receive detailed instructions from headquarters as to what they are to aim at during the year. Work is organised on what is called in all these countries "the brigade system." Workers are assigned to different brigades which deal with the various work to be done, ploughing, hoeing, planting, cows, horses, transport, vegetables, etc., etc. It is possible to find co-operatives in Yugoslavia where the brigades change their work each day. In other cases change is made on a weekly or seasonal basis, and there are some co-operatives where the brigades are specialists who for the most part stick to one kind of job.

As each worker is paid according to the quality and quantity of work done, a very careful day-book has to be kept of what each person has achieved. This means that there is a great deal of book work to be done apart from the ordinary accounting, and most co-operatives have to have a full-time clerk accountant who is a working member of the co-operative and is paid according to the general average of earnings.

Payment of wages varies very much. In some farms payment is made in kind at various intervals during the year. Other co-operatives have a store and members are allowed to buy whatever produce they need up to a certain sum of credit which is deducted from their earnings when the share-out is made at the end of the year—that is, after the harvest. The tendency in all countries seems to be to encourage the co-operatives to go in for as many sidelines as possible: Angora rabbits, rabbits for eating, pigeons, mixed vegetables, in addition to dairy farming, fruit, and even home industries like carpet weaving.

(To be continued)

We'll always accept the challenge

YES, IT'S a challenge to serve the public welfare, to build only essential equipment for essential work. International Harvester accepted that challenge over a century ago and turned it into a business philosophy.

Today that philosophy continues to be the driving force behind development and manufacture of an ever-increasing variety of machines and equipment that help produce the necessities of life.

Comfort, security, plenty—they will come to us in larger measure

when basic industries are able to improve efficiency through purchase of equipment that will increase capacity as well as maintain and replace present units whenever necessary. Accordingly, it is to the interest of every nation to facilitate the supply of such priority items in order to make this essential equipment available to its producers.

Agriculture, industry, transporta-

THE BUSINESS WORLD

Utility Ukase

THE shopkeepers' organisations, in a mood of outrage and perplexity which is itself easy to understand, this week took up a position not unlike that which the master bakers once adopted towards the rationing of bread, and probably as ill-chosen. Just before Parliament dispersed, the President of the Board of Trade announced his intention to reduce the permitted maximum prices of utility textiles and footwear. The President said at the time that the brunt would "at the outset" fall on the retailers' gross margins, and added, somewhat blandly, that he had not had time to consult the trade associations concerned. This week a meeting of representatives of retail trade organisations, called in London by the National Chamber of Trade, recommended traders not to put the proposed cuts into operation until proper consultations had been held between the Government and the trade.

Most people will feel that the meeting which passed the resolution went too far: defiance of this kind is ill-advised, and the retail traders are the last people to be able to make a success of it. Since they will have to climb down, they would have done better not to climb up. They have a grievance; it is true that they should have been consulted. Machinery exists for this very purpose, and Mr Harold Wilson's bald assertion that it would have been "impossible" will convince nobody. If the President had been less high-handed, the public interest, as well as the legitimate interest of the shopkeepers, would have been served, since the President would then have had to explain why he had selected these classes of goods and no others; how he had arrived at the figure of 5 per cent; and by what section of the national economy the cuts (not "at the outset" but in the long run, after the inevitable process of trade adjustment) would be borne. It would be useful to have the Government's answers to these questions. It would also be useful to know whether the cuts are intended to last, or whether they are shortly to be cancelled out by cost-raising tendencies within the productive machine, which the Government is unable or unwilling to restrain.

Up to this point the retailers' case is strong and will evoke sympathy. But if they were really to sit tight and refuse to make the cuts when ordered to do so, they would find themselves playing a different engagement on quite another pitch. Many people will feel that the President of the Board of Trade is right when he suggests that distributive services are in general costing too much, and few will take very seriously the distributors' complaint that these cuts will face them with collective ruin. The public is unlikely to support the shopkeepers in any effort to keep prices up against the Government. Offered something for nothing in the shape of a shilling in the pound off certain prices, it will no doubt accept, and spend the bonus on something else. It may wonder if the bonus is genuine; whether prices can really be brought down at the same time as wages and costs of production are going up; why, if this trick can be performed with utility textiles and footwear, it can be performed with no other commodities.

With these questions in mind, it is opportune to glance at the situation of the two main textile industries, and at the way their utility schemes are working. Both the cotton and wool textile industries have increased their output within the past twelve months, but neither has regained its prewar rate of output. Neither has succeeded in getting back the whole of its prewar labour force, or in bringing the whole of its plant back into employment. In each industry, therefore, the drive to expand exports in the past eighteen months has carried some risk that supplies to the home market, and in particular supplies for the utility programme which meets the bulk of home "civilian" demand, might fall behind what was required. Utility production was reduced in 1948, and is still below the 1947 level in each industry. So far, acute shortages of utility goods have been avoided, but it is still true that most manufacturers of cotton and wool yarn and cloth, believe that if they could produce more, they would have no difficulty in selling it.

*

The deficiency of production is the more marked in the cotton industry, which in order to increase its exports has had to import large quantities of foreign grey cloth for finishing. A large part of the grey cloth imports came from Japan, but the import of Japanese grey cloth was stopped by the Government in July because of the threat of a "dollar commitment" which arose from them. The effects of this reduction in cotton cloth supplies have yet to be fully felt. But it is clear that in Britain, as in most of the world outside North America, there is still a relative scarcity of cotton cloth. In the circumstances, supplies for the utility programme—the least profitable branch of production—have been maintained by a deliberate effort of the industry to meet the wishes of the Government: "This branch of business," the chairman of the Cotton Board observed in the Board's *Trade Letter* for May, "still has in it an element of obligation to the community at large," and the industry has understood that its gradual emancipation from control was to some extent conditional on the obligation being met. The last considerable relaxation of controls in the cotton industry took place in April, when the price controls on yarn and on loom-state cloth for the utility programme were removed, leaving only the price ceiling on the finished cloth. It was this relaxation which caused the chairman of the Cotton Board to publish a reminder in May of the "duty that lies upon the industry to produce and distribute an adequate supply of utility textiles at reasonable prices."

Once the intermediate price controls on utility cotton textiles were removed, there began a process of price adjustment which is not yet concluded. When spinners and manufacturers came to digest the wage increases which were awarded earlier in the year, pressure on the price ceilings for some types of cloth was inevitable; the cost of some other types had fallen in line with the fall in Egyptian cotton, and it became evident that in these the utility price ceilings allowed room for reduction. The industry has, in consequence, been negotiating with the Board of Trade a general

revision of the maximum prices for utility finished cloth, and it was primarily this revision which occupied Mr John Edwards, Parliamentary Secretary to the Board of Trade, on his visit to Manchester this week. The results have not yet been published. There is little doubt that they will show no general reduction of the controlled prices for cotton cloth; the balance, if there is a balance, will probably be the other way. The revision itself is intended not to change the general price level, but to reconcile inconsistencies and remove anomalies that have arisen with the passage of time. No proposals whatever seem to exist for passing on to the spinning, manufacturing, or finishing industries any part of the cut in retail prices on utility cotton and rayon goods which the President of the Board of Trade has announced. These are apparently to be shared, so far as clothing is concerned, by the distributors and the makers-up; so far as household textiles are concerned, the distributors are apparently to bear the whole 5 per cent. Nothing in the trend of costs or the state of trade in the cotton industry suggests any general price reduction at present.

In one other respect the industry is pressing for further emancipation. The production of cotton textiles is at present controlled by a system of allocations and licences. A licence covers each stage of production of any piece of cloth, and must bear a symbol indicating the ultimate use or destination of the cloth. The termination of this system is being discussed and will probably be settled soon; firms will then be permitted to make whatever yarn and cloth they please. The trade's view is that this would not endanger utility production, since purchase tax makes non-utility cloth relatively difficult to sell in the home market, and since the export trade, though it is still on balance expanding, is beginning to show risks and difficulties which have long been unfamiliar.

At the same time, the cotton trade is showing an increasing tendency to question the future of the utility scheme itself. The Cotton and Rayon Merchants' Association, in its last annual report, spoke of the growing demand for less standardised production which (it said) traders should be allowed to meet. It is true that the utility programme tends to keep production for the home market concentrated on certain standard lines of cloth; this concentration tends to make for rigidity and to discourage change or experiment, and if the industry is to have an export future it must not allow itself to become stereotyped. The present tendency is for export and home production to move in separate grooves, with relatively little interchange.

In the wool textile industry also the immediate question is not whether prices can be reduced but to what extent their increase can be restrained. Mr Harold Wilson's announcement of the proposed price reduction was made within three days of the announcement of another relevant fact. By an arbitration award, workers throughout the wool textile industry were to receive a wage increase of 7½ per cent, and this increase came into effect on Monday. Its immediate effect is to offset, and more than offset, any saving which the industry has gained, or can expect, from reductions in wool prices. It is perhaps worth recalling what happened when the industry last had a general wage increase. Time-workers received an increase of 7½ per cent, and piece-workers an increase of 5 per cent on the piece, in April last year. It was not until the following November that the consequent adjustments in the price schedules for woollen and worsted utility cloth came into operation; and the adjustment of yarn prices has not yet officially been made. In the ordinary way, therefore, the present moment would see the opening of negotiations for an increase in the scheduled prices to reflect the

latest wages award. Nobody knows how the cuts in utility prices will affect this position. Since nothing has been said of any reductions in the prices for spinning, manufacturing, and finishing, it is assumed that the cuts are to be borne, as in cotton, by the distributors and makers-up. The cloth manufacturer is unlikely to be called upon to reduce his prices. But can he even keep his prices down to their present levels?

The wool textile industry as a whole has strong reasons for wishing to keep its prices down if it can; it would like to see the removal of the entire price-control system, and clearly it would not obtain this unless it could give some undertaking of price stability. It is disposed, like the cotton industry, to question how long the utility system is to be preserved. But the utility scheme in wool textiles has always been more flexible than in cotton. Instead of the precise and elaborate specifications for cotton cloth, the utility programme for woollen and worsted cloth rests on a series of general descriptions, with a width, weight, and minimum and maximum price added to each description. Quality, design, and characteristics can vary greatly within each utility category. A cloth which costs more than the appropriate maximum for its utility mark can in some circumstances be given a higher utility mark, commanding a higher price. Conversely, if the ceiling price becomes too low for a given standard of quality, the quality can within certain limits be reduced; and this

can be done quite legitimately within the framework of the utility wool textile scheme.

★

Price reductions of the kind announced a fortnight ago by the President of the Board of Trade can be ordered, it is clear, at any time by any Government prepared to use its authority in that way. They are, apparently, a welfare measure or a measure of political expediency. In the present case they reflect no saving through cheaper production and no pruning of economic fat through trading enterprise or competition. If the shopkeepers are right in their complaints, they represent simply a forcible transfer of money from certain distributors to the consumers of certain products. But the consumer's slightly increased purchasing power will probably force the prices of some other products slightly upwards, and the distributor may well recover his loss elsewhere. Contortions of this kind are made possible by the division of the industrial economy into two parts—"essential" and utility goods in one compartment, non-utility and export goods in another, with purchase tax to enforce the separation. Among the drawbacks of this system—drawbacks which arbitrary price manipulation can only exaggerate—is that it robs industry of the capacity to adapt itself to changing consumer demand; that is to say, it unfits industry for competition in international trade.

Industry's Rising Stocks

AN article in *The Economist* last week illustrated the immensely valuable information which can now be extracted from the new form of profit and loss account which the Companies Act requires. It is only in the last decade or two that the paramount importance of the profit and loss account has been recognised. Give a good accountant or a shrewd investor a company's profit and loss account, and he will be able to go most of the way in sizing up its strength. He will certainly require the balance sheet to complete his task, but he will use it largely to fill in the gaps and to make cross-checks in his work on the profit and loss account.

This change of emphasis from the balance sheet to the profit and loss account can be readily explained. The old test which the investor applied was whether his capital was secure. Now his first question is whether his dividend is well covered. Again, as last week's article explained, the size and the allocation of profits have vital bearing on whether industry is maintaining and expanding its capital. The balance sheet is a flashlight photograph of a company's condition at the moment of balancing its books; its profit and loss account, on the other hand, is a narrative record of its trading for the whole period between two balance sheets. The two meet when profits are capitalised or retained in reserves; the appropriate entries are made in the balance sheet; and then shareholders wait for a twelvemonth for the next "true and fair view" of the state of their company's affairs.

All this may be elementary. But it explains why there is no logic in attempting to summarise all the balance sheets which have appeared during the past year, or in comparing the resulting figures with those which appeared a year earlier. A comparison of that kind has some virtue for profits. For balance sheets, it becomes a statistical abstraction. On the other hand, the balance sheet changes which appear from each succeeding quarter's sample of companies have real meaning and importance. Each quarterly batch of reports

differs in number and in composition, but each is likely to be sufficiently representative of industry as a whole to make possible a fairly reliable estimate of balance sheet trends, quarter by quarter.

Earlier articles in this series* have emphasised that changes in current assets and liabilities are more relevant to the inquirer than changes in fixed assets. Among the current items, one of the most important, and most perplexing, is the figure for stocks. The April-June companies, whose balance sheet position is summarised in the accompanying table, are the biggest batch of the year. These 779 companies (they are the same companies whose profits were compared in last week's article) show a great increase in stocks—by over £100 million. It is worth comparing this stocks movement with the increases shown by companies in the three preceding quarters:

INCREASE IN STOCKS, 1948-49

Quarter	No. of Cos.	Previous Stocks	Latest Stocks	Increase in Stocks	Total Current Assets	Stocks as Percentage of Current Assets
July-Sept., 1948.....	326	£ Mn. 170.0	£ Mn. 246.7	76.7	£ Mn. 592.3	12.9%
Oct. 1-Dec., 1948.....	523	129.0	171.4	42.4	551.9	7.7%
Jan.-Mar., 1949.....	467	254.6	294.9	40.3	761.1	5.3%
Apr.-June, 1949.....	779	501.9	608.8	106.9	1,459.9	7.3%
July, 1948-July, 1949	2,095	1,056.5	1,318.5	262.0	3,325.2	7.9%

The April-June group shows an increase in the value of stocks of 21 per cent, from £501.9 million to £608.8 million. This rate of increase reverses a trend which had been conspicuous during the three previous quarters, for which increases in stocks were, respectively, 45, 33 and 16 per cent. It is wise not to make too much of the movement shown by a

It helps both ways

The Westminster Bank provides a service to both exporters and importers that covers all aspects of foreign trade. As the volume of post-war exports increases, a number of people inevitably enter into foreign business for the first time, and it was for such people that the Westminster Bank issued their booklet on *The Foreign Business Service of the Westminster Bank*. The booklet describes some of the problems of overseas trade and gives an account of the services that are provided by the Bank to meet them. Ask for a copy at your local branch.

WESTMINSTER BANK LIMITED

AUSTRALIA

As a market for British manufactures and as a source of food and raw materials, Australia plays an important part in Britain's economy. Whether your interest is in imports or exports, the services of the Commonwealth Bank of Australia can be of considerable assistance. With over 400 Branches in the Commonwealth and New Guinea, and guaranteed by the Australian Government, the Bank can provide the British trader with up-to-date, authoritative information on every aspect of Australian commerce.

COMMONWEALTH BANK OF AUSTRALIA

Also at Australia House, Strand, W.C.2

single quarter, but the figures at any rate do not rebut the suspicion, based on general grounds, that stocks have lately been rising a little too fast for comfort. That point emerged from the General Electric Company's report only last week. Even as late as the end of March last year—which was the average balance sheet date of the companies whose reports appeared three to six months later, between July and September—the building up of normal stocks was perhaps hardly complete; in any case they were bound to show a fairly big relative increase (actually 45 per cent.) because in the previous year they had been seriously depleted as a result of the fuel and power breakdown.

For these reasons, the 45 per cent increase in stocks shown by the July-September companies was probably reasonable, and there was a much slower rate of increase in the two following quarters which was equally natural. But the renewed upturn in the latest quarter seems to call for special explanation. An increase in physical stocks today is much more likely to stem from a slowing down of orders and perhaps an accumulation of unsold output than from any normal requirements for increased circulating capital. Allowance must indeed be made for the rise in wholesale prices during the year covered by these accounts—5 per cent is probably a reasonable estimate—and also for the rather smaller increase in wage rates, since part of these stocks are intermediate products and work in progress which have a wages component. But, when this is done, and the rise in stock values is suitably discounted, a very marked increase in physical stocks still remains to be accounted for.

The rising burden of stocks can be measured in another way, by expressing them as a proportion of total current assets. This total includes also debtors, gilt-edged and other investments, and cash, and it may vary for reasons—such as expenditure on new fixed assets—which have nothing to do with variations in the size of stocks. On broad grounds, however, any consistent tendency for stocks to form a rising proportion of the total of all current assets must be interpreted as a sign of rising inventory pressure and as a potential source of embarrassment in the event of a fall in prices or in consumers' demand. That rise has certainly been taking place during the past three quarters; stocks formed 32 per cent of the total current assets of the companies which reported between October and December last year; for the companies reporting in the quarter ending in June, the proportion had risen to 42 per cent.

There is, in the particular case of stocks, some virtue in comparing the totals shown by all company accounts which

have appeared during the past twelve months with those of the preceding period. Owing to the time-lag in publication, these accounts published in the period July to June, are the nearest approximation to a financial record of what happened in the previous calendar year. That is to say, the movement in the stock figures of these 2,095 companies provide a fair impression of industry's investment in stocks in 1948 itself. The total increased from £1,055.5 million to £1,318.5 million, and the period during which this increase took place can be put very roughly and notionally from November, 1947, to October, 1948. Without stretching the facts too far, therefore, it can be said that industry made a new investment in stocks during the calendar year 1948 of rather more than £250 million and perhaps as much as £275 million.

This figure can be compared with the estimate given in the National Income White Paper for "increase in value of stocks, work in progress and surplus stores transferred to private inventories" which was put at £494 million in 1948. But this estimate was frankly described as "a pure residue"

obtained by a double process of difference, and it is not very precise. On the face of the matter, it looks high, compared with the total increase shown by the 2,095 companies in the past year; but this latter total excludes all private companies and firms, and these are to a large extent occupied in merchandising and retailing business and therefore hold appreciable stocks themselves. This area of unrecorded stock figures limits the deductions which can be made from the movement of the stocks of public companies; it is a gap which

will be closed only when the census of distribution has made the facts known about the private trading sector.

This discussion has emphasised the movement in stocks for two reasons: first, because stocks are measured within close limits of accuracy so that their changes have fairly precise meaning; and, secondly, because movements in stocks have great significance in the causation and sequence of the investment cycle. It would not be true to claim that the rise so far is causing any manifest strain on industry's finances. For the 779 companies whose reports appeared last quarter, net current assets rose from £644.2 million to £703.2 million. Nevertheless, there were some significant changes among the constituent items. Both debtors and creditors were up, by an amount roughly equal and roughly corresponding to the rise in prices during the year. Holdings of gilt-edged securities were reduced, from £77.9 million to £54.8 million—a reduction which was to be expected, in view of the need to finance new capital expenditure and of the growing diffi-

culty of raising new capital in the market towards the end of the period. The setback in gilt-edged prices was being freely attributed a month ago to selling by industrial holders, but if their sales have been only of this order, it is difficult to understand how they could have upset the gilt-edged market so seriously.

These factors, coupled with some increase in bank accommodation—the companies drew about £20 million more from the banks last year—and in reserves (free reserves are up by nearly £65 million) have accounted for the improvement in cash holdings, from £224.6 million to £251.3 million. The idea that industry is running seriously short of cash is not supported by these figures, though it is certainly true for many individual concerns. The current accumulation of cash is a reflection of the current accumulation of retained profits; it leads to precisely the same point that was touched on last week. Ability to earn sufficient profits from which adequate sums can be set aside to reserve is a pre-condition of a reasonable level of industrial investment and a satisfactory state of industrial liquidity. A 10 per cent fall in total profits of this group of companies (the detailed figures for them were given last week) would, after tax adjustments, wipe out four-fifths of the amount they set aside to revenue reserves—which is roughly speaking the amount they were able to accumulate towards new fixed capital last year. Other things being equal, it would result in the loss of one-fifth of their cash resources.

Business Notes

No Resistance Yet

Interrupted temporarily by the closing stages of the old Stock Exchange Account, the fall in gilt-edged stocks has been continued in the opening stages of the new one. The market has ceased, perhaps, to show headlong losses of a point or more a day, and is instead lapsing into an erratic and tetchy condition. Perhaps the most important fact in this week's dealings is that, when the market has occasionally seemed more stable, no substantial new buying has been attracted. The big accumulation of institutional funds which many observers have been expecting almost daily to come into action remain well behind the line.

Friendless and unsupported, the market has remained vulnerable to incidents which under more normal conditions it could take in its stride. Another small helping of Gas Stock has proved indigestible, and the price this week has fallen further to 89. This is the seventh instalment of prices agreed for "unvalued" gas securities, and the process is far from complete. For the average small holder of gas securities—and typically he is a local investor, who has kept his modest holding of stock as an investment over a long period—there is no protection against the continued depreciation of the 3 per cent Gas Stock which he will receive, at a wholly fictitious parity, in return for his gas securities. The big investor may be able to find some partial protection by recourse to covering operations in the gilt-edged market itself, but such operations involve a degree of professional skill and knowledge which is not open to the small man. The Government's haste in fixing the vesting date on May 1st before the technical arrangements for valuing the "unvalued" stocks were anywhere near completion means that the small investor who does not wish to retain a 3 per cent stock with a maximum life of 46 years in the indefinite hope of a fall in interest rates is already faced with a loss of 10 per cent of the capital value of his compensation.

Meanwhile, the yields on the "longs" remain out of gear. Selling of War Loan by holders now disillusioned about the

It remains to comment briefly on the movement in the fixed assets of these 779 companies. Warnings have been given in earlier articles against a direct comparison of the fixed asset figures shown in the latest balance sheets with those for the previous year. For example, the apparent increase in "land, property and plant" for these companies from £875.7 million to £1,059.5 million does not represent a full £184 million of gross new investment during the past year. Some of the increase is real; but a large part of it arises because of changes in the method of presentation required by the Companies Act. The counterpart of the increase in the book value of fixed assets is the rise in accumulated depreciation provisions from £224.2 million to £333.7 million; these provisions now have to be brought out into the open, and may no longer be concealed as hidden reserves. The increase in the net value of fixed assets from £651.4 million to £725.7 million gives a more plausible impression of the extent of new fixed investment by this particular sample of companies last year. But even this comparison is complicated by other factors, among them the impact of the initial allowances and the effect of changes in the composition of group accounts by the inclusion of newly-acquired subsidiaries or by the consolidation of certain subsidiaries which had hitherto been excluded. The Companies Act requires a statement to be given showing the extent of commitments for future capital expenditure; it is a pity that it did not call for a statement of actual gross capital expenditure during the year covered by each balance sheet.

prospect of repayment in 1952 has continued, until the stock new yields 3½ per cent flat. "Daltons" yield 3½ per cent flat, and Old Consols and 3 per cent Treasury Stock a shilling per cent less. Thus these yields span the 3½ rate on which some investors have their eyes fixed as a possible resistance point. Another disparity is to be found between the 3 per cent which is still being charged to local authorities for loans from the Exchequer, and the current 3½ per cent return on thirty- and even forty-year Government stocks. Local authorities can hardly be blamed for borrowing as soon as their loan sanctions are received, though this is often some time before they begin to spend the money. If they reinvest temporarily in 2½ per cent War Bonds, 1949-51 and if (as is now argued) the bonds are allowed to run for the full term, they can get £2 7s. 11d per cent. A premium of about one-half per cent for a couple of years is a cheap insurance against paying an extra one-half per cent over the full term of the loan. The Treasury may make—and certainly ought to make—such an increase in the rate on local borrowing before very long. If the authorities have allowed the rise in interest rates to take place on the ground that it is consonant with the country's economic needs, they should make sure that it is promptly applied to those agencies which are responsible for an important proportion of the country's total investment.

Sharing Marshall Aid

The delicate process of sharing the diminished amount of Marshall aid for the current year between the European beneficiaries seems to have been carried a further stage forward in Paris this week—though the operation is still taking place on the official plane at which all recommendations must be regarded as very tentative. The working party of the Programmes Committee of the OEEC did not, apparently, make sufficient headway to enable it to present its provisional allocations to the meeting of the Council of the OEEC on Thursday, as had been intended. Indeed, only very tentative proposals

can be made at this stage, since the total amount of ECA aid which will be available is still not precisely known. The working party has, however, been working provisionally on a partial figure of £800 million, which is well below the lowest limit of the sum expected to be provided by Congress. Britain's share of this £800 million is reported unofficially to have been put at £190 million. On this basis the British proportion of the total as voted in the Senate version of the Appropriations Bill would be about £225 million, since the total of ECA funds provided in this Bill is \$3,628 million plus \$150 million for ECA loans. It is not certain, however, that the global appropriations will be so large as this, since the Lower House has voted a somewhat smaller sum, and the Committees of the two Houses are now engaged in working out a compromise.

An allocation to Britain of £225 million, compared with £315 million received in the year 1948-49, would be near to the lower limit of Britain's expectations. It would, indeed, be a little less even than the very sanguine estimate of Britain's needs which was put forward in the original programme submitted to the OEEC last autumn. In June last this estimate was raised to £278 million and a few weeks ago was again revised, even more drastically, to £380 million. Even so, the figure may still be optimistic, though it takes no account of the saving which Britain hopes to achieve from the projected 25 per cent emergency cut in dollar expenditure. It should be emphasised that any recommendations by the Programmes Committee and its working party are subject to the approval of OEEC. In view of the fact that other European countries besides Britain have recently put in revised bids, it is by no means certain that the OEEC participants will succeed in agreeing among themselves how the whole sum is to be divided. In the event of disagreement, the ECA authorities themselves would presumably have to take a hand.

Boosting Unrequited Exports

The more closely the new financial arrangements with India (briefly discussed in last week's issue) are examined, the more extraordinary do they appear. In the twelve months to end-June last, India ran through the whole of the sterling which both Governments had agreed would be a sufficient provision for three years, and also overspent the dollar allocation for the year by about one-third. These over-spending were possible because the British authorities allowed India to anticipate the releases of sterling balances to be granted for future years, and also made further dollars available to India from the central pool. Even if Britain's financial plight were no worse now than it appeared twelve months ago, any realistic bargaining with India now surely ought to have required it to make good in future years some part of these overdrawings. As it is, the past excesses are ignored. Worse still, the annual provision of sterling for the current year and next year has been raised from the originally agreed figure of £40 million to £50 million, which the Treasury hopes will be the limit of India's spendings in these two years. But it is not sure; so it gratuitously adds a release of a third £50 million, to be used if necessary to meet "contractual imports" in this current year. Thus is bad management rewarded by inducements to overrun the constable yet again.

The official explanation of this lightheartedness on the part of the British Treasury is that a reduction in the rate of India's imports, including the liquidation of existing commitments, could not be rapidly achieved "without serious dislocation of trading relations." Perhaps this is true; but retrenchment will never be a comfortable process, and it has rarely been more necessary than now. It is hard to avoid the conclusion that the British Government, in its determination to keep Britain's crisis firmly muzzled until after the election, has been inspired mainly by a desire to do nothing which might disturb employment in the export industries which supply the Indian market. These easy exports—easy because they

are unrequited—are to continue to absorb British resources which ought to be employed elsewhere. Their continuance will avoid the "dislocation" which is a euphemism for the re-deployment which might embarrass the Government, and will also help to maintain that spurious "overall" equilibrium to which Government spokesmen still refer with such pride. Will similar arguments presently be used to justify a loan to South Africa on terms more lenient than a major gold-producing economy has any right to expect from Britain in its present extremity? Such policies are as unfair to the British people as they are to other members of the sterling area.

Nor is this the end of the sorry tale of the Indian arrangements. The official communique issued in London was silent on the crucial question of India's dollar allocation—except to say that last year's arrangement whereby India received a specific dollar ration (and duly exceeded it), would not be repeated. But Dr Matthai quickly let the cat out of the bag. In return for India's agreement to accept the request made to all members of the sterling area to endeavour to cut total dollar expenditure by 25 per cent, Britain has readmitted India to full membership of the area, with the right to draw what dollars it needs from the central pool. Presumably this right would be restricted if good progress did not appear likely towards the 25 per cent cut in total dollar expenditure. But Dr Matthai computes that the effect will be to allow India to draw this year the dollar equivalent of £35 million, in contrast with only £15 million specifically allotted last year and £21 million actually drawn. This interpretation was issued from New Delhi within a few hours of the British Treasury's evasive communique. It has not yet been contradicted in London.

* * *

Dollars for Ceylon's Central Bank

It is understandable that Ceylon, having attained dominion status, should wish to replace its local currency board by a central bank. In itself this move is of little concern to Britain, and the change would be mainly a formality. But the Ceylonese financial mission which has just left London is reported to have obtained approval from the authorities in London to retain Ceylon's dollar surplus to accumulate a hard currency reserve for the proposed central bank. If this report proves correct the Singhalese negotiators must have overcome stiff opposition in London. Ceylon is a net dollar-earning country and has hitherto paid into the sterling area pool the dollars it did not require to meet its own needs.

As a country earning more dollars than it spends, Ceylon has doubtless not been under very serious pressure to reduce its fairly high dollar expenditure. But it is quite another matter to allow Ceylon to retain possibly its entire dollar earnings for salting away in its central bank. This move raises questions of principle which eventually could undermine the whole system of the sterling area. The system cannot function if the dollar-losing countries resort to the pool while the surplus areas take steps to retain their dollars. The scheme cannot be finally judged until all the facts become known and this will not happen until the mission from Ceylon has returned home. Nor will it be known until then how much sterling has been released to Ceylon under a new agreement just concluded. The announcement of the details of the agreement with Pakistan is similarly to be deferred until the Pakistani delegation has reached home. Coming so soon after the Indian victory, this withholding of information inevitably arouses a suspicion that these countries, too, have concluded a good bargain for themselves.

* * *

Declining Trend in Exports

The fall in British exports last month by £1,600,000 to £141½ million is the more disagreeable because it conflicts with the experience of the past three years, in each of which

exports in July were higher than in June. It is impossible to estimate how far the fall may have been due to the London dock strike. The Board of Trade suggests that through the use of Service personnel and the diversion of goods to other ports, the effect on exports was probably small. Again, some part of the explanation may be in the virtual closing of the South African market, a fact which may have boosted the volume of exports in June. But the South African ban is a particular feature in the growing dislocation of world trade.

The trend in exports since the beginning of the year is unmistakably deteriorating. In the accompanying table allowance has been made for the different number of working days in each month; exports have been revalued on the basis of a standard month of 26 working days:—

BRITISH EXPORTS. (Calculated on basis of 26 working days.)							
1948	£ mn.	1948	£ mn.	1949	£ mn.	1949	£ mn.
Jan.	115	July	140	Jan.	159	July	141½
Feb.	122	Aug.	135½	Feb.	152½		
Mar.	126	Sept.	151	Mar.	154		
April	126½	Oct.	140	April	149		
May	135	Nov.	147	May	151½		
June	139½	Dec.	151½	June	155		

Apart from a partial recovery in March and again in June, the general trend has been downwards. The July figure was 6½ per cent lower than in June, 11 per cent lower than in January and the lowest since October. Moreover, more export industries are reporting sales resistance in overseas markets.

Imports in July fell by £15 million to £186½ million. They were the lowest for any month so far this year except February, but higher than in any single month in 1948. Because of the smaller imports the adverse balance for July (struck between imports valued c.i.f. and export and re-exports f.o.b.) fell to £41 million, or £13 million less than in June. For the first seven months of the year the adverse balance at

or personal requirement.

DISTRICT BANK
LIMITED
ESTABLISHED 1819

£238 million was also smaller than in the corresponding period of 1948, when it reached £284 million. But the trend this year is moving in the opposite direction. Last year exports rose to peak levels in the closing months; this year the highest figure was attained in January.

* * *

Peak Dis-saving

The sorry performance of National Savings in this current fiscal year went from bad to worse as the holiday season approached its peak. In the week preceding August Bank Holiday encashments exceeded receipts by £5,679,000—a melancholy new record for any week outside the Christmas season. In the corresponding week last year the net demand was £4,547,000. All the precedents suggest, however, that the trough should now have been reached. Although the receipts are often lower immediately after the beginning of August than immediately before it, the period of falling encashments should now have begun.

The cumulative deficit in the National Savings year to date now amounts to £27,929,000 (excluding interest disbursements on encashed Savings Certificates). This is some £15½ million greater than the deficit in the corresponding period of 1948, when gross receipts were just under £5 million higher and gross encashments just over £10½ million lower than they have been this year. The main factor in each case has been the steep rise in the rate of net withdrawals from Post Office Savings Bank accounts. These have amounted to some £27 million so far this fiscal year, against not quite £11 million in the corresponding period of 1948. Analysis of the figures suggests that the mounting cost of day-to-day living rather than reckless vacation spending is mainly to blame for this deterioration. More than half the excess of this year's over last year's deficit occurred in the first 13 weeks of the fiscal

year—before the holiday season was really under way. When Britain is back at work again, and the usual period of autumn surpluses comes round, some of this ground may be recovered, but the National Savings movement is likely to find it difficult to make even as much headway as it did last year.

Trade and Commodities

Unilevers' Assets

Sir Geoffrey Heyworth's review at the Unilever meeting fell into four clear sections. In the first two, he was concerned with the problems of replacing fixed assets and of maintaining stocks in a period of rising prices and high taxation. Sir Geoffrey presented a telling comparison between the traditional—and in this instance belated—British method of appointing a committee and the positive action which has been taken in other European countries to avoid the taxation of capital which appears dressed up as profits because legal or accounting conventions allow insufficient provision to be made for the replacement of fixed assets at higher prices. Holland, Belgium and France have in some measure taken remedial action.

He declared, further, that the impairment of capital by the taxation of so-called profits on stocks has left "only a fraction of the amount necessary to finance the increase in the costs of industry's stocks." At the beginning of the war, the Government took over Unilever's stocks of raw materials for margarine and seed-crushing at the then current price—£1,800,000. Today those same physical stocks would cost £9,500,000. To cover this kind of dissipation of industry's working capital, Sir Geoffrey suggested that profits set aside to stocks reserve should be free from tax—provided that the amount was reasonably proportionate to normal stock cover. France has, in fact, reduced the tax on such allocations to 15 per cent. In Canada, the Government handed back its stocks to industry, when control came to an end, and gave Unilever £300,000 as a reserve against higher price levels. In the United Kingdom, Unilever has been an agent for the Government, and not trading on its own account in margarine and seed-crushing. Therefore, it has made no profits on stocks from which to create reserves. The only complete solution, in this case, Sir Geoffrey urged, is that when the Government hands back its stocks the quantities originally taken over should be transferred at the original prices.

Sterling and Dollar Prices

Sir Geoffrey then turned to bulk-buying. Here he narrowed the issue to a single question. Which is the more satisfactory method to both buyer and seller—many small daily transactions or a few large long-term ones? His view—and it is one which scarcely admits dispute—is that the advantage "is very heavily with having many small ones." If the parties to the contract are governments, any dispute brings in questions of national prestige "so that the maximum of ill-will is generated for the minimum of reason." As for the claim that bulk contracts produce stability, it is most unlikely ever to be true in oils and fats, for they can be substituted for each other on a very large scale. "When the possibilities of obtaining stability are so very limited as they are in the case of oils and fats, they do not justify the risk of increasing international friction, which a continuation of bulk buying would involve."

This brought Sir Geoffrey to his fourth point—the growing division of the world into two separate hard and soft currency markets. Production of oils and fats in the world as a whole is now back to prewar levels, but population has increased, and consumption per head is likely to amount to 19½ lb. per head, compared with 21½ lb. per head before the war. There are wide variations between individual countries—consumption per head in the United States will be about 2 per cent lower than prewar, compared with a fall of about 13 per cent for

the rest of the world. But the most important single fact about oils and fats is that there is no one market. Prices in hard currency countries are markedly lower, because of shortage of dollars, and in soft currency countries markedly higher, because of the concentration of sterling demand upon them. Malayan copra costs £63 10s. a ton c.i.f.; Philippine copra is £46 5s. a ton. Cotton or soya oil is £70 a ton in the United States; the cheapest sterling supplies cost £135. Tallow costs £43 15s. in the United States, but £110 in Australia or New Zealand. Such differences are not wholly due to the distorting effect of British trade policy—there are other factors, such as the cessation of exports from Manchuria and India and the development of synthetic detergents in America which has reduced the demand for tallow. But, in the result, the dollar world has more than enough oils and fats for its own requirements, while the rest of the world is short, and parts of it extremely short. Sir Geoffrey's conclusion was to the point: "Either we and the rest of the soft-currency world will have to go on putting up with shortages and controls, or else some way of unifying the world commercially will have to be found."

* * *

Compulsion or Co-operation for Wool?

The timetable of discussion which had to precede the setting up of a Development Council for the wool textile industry has run its statutory course, and there is—in form, at least—no place for further negotiation before the President of the Board of Trade takes the final step. But the argument is not over; the wool textile industry, which has made a final appeal to the President without any success, is as united and as outspoken as ever in its opposition. Consultation between any major industry and the Government is nowadays elaborate, spreading widely over a number of subjects; and the danger which arises from a deadlock of this kind is that it will poison the whole relationship and impair co-operation over a field wider than that of the deadlock itself.

The chairman of one wool textile firm, Patons and Baldwins Limited, refers to the controversy in his statement circulated with the company's accounts. He recalls that the working party report proposed an advisory body for the industry, and emphasises that the word "advisory" was not merely academically used. This, he said, "would conform to the traditions of the wool textile industry, which has never yet failed to deliver the goods, whatever the emergency." The employers feel that a statutory body, once established—and however circumscribed its initial powers might be—could easily be vested with all the other powers set out in the Act; these include, as Mr Forrester-Paton observes, the power of "undertaking" as well as "promotion," and they imply, therefore, executive action. It is for this reason that the wool textile employers want a voluntary joint advisory committee instead.

Any attempt to impose a statutory body of this kind on the industry will result in forfeiting the good will of one of the parties in a scheme which, if it is going to prove successful, must have the hearty co-operation of all concerned.

Mr. Forrester-Paton's remarks express what appears to be a unanimous view of the employers. They need to be taken seriously because the existing co-operation between the wool textile industry and the Government rests at many vital points on voluntary co-operation; if a fundamental rift is allowed to arise, the consequences will not easily be limited.

"Chartered's" Mineral Rights

Agreement has been reached on the future of the mineral rights of the British South Africa Company, following the discussions at the Colonial Office to which reference was made briefly last week. Subject to the approval both of shareholders in "Chartered" and of the Legislative Council of Northern Rhodesia, the agreement provides for the continued enjoyment

Which of These NEW IDEAS Does YOUR BUSINESS Need?

The One System Will Do One Or ALL Jobs—Using Existing Equipment

FULL DETAILS BY RETURN

Nearly everybody nowadays knows the shannographic method of filing.

But few people realise the many jobs it will do.

What is this system?

It is a series of box-like files suspended metal on metal (in your own cabinets, if you wish). Instead of projecting tabs the box-like top is flat. It goes right across the file. That gives you up to 15 inches of space to utilise VISUALLY.

Each file is colour-coded so that misfiling is impossible. And the eye picks out any file at a glance.

In these 15 inches of space you can type any data you need. Such as, account number of the customers, their name, their address, their telephone number—and so on.

But—and this is especially important—the right-hand side of each file has ready-printed numbers, from "1" to "12" and from "1" to "31." Obviously, this provides a ready means of signalling days of the month and months of the year (Coloured signals slide along a transparent sheath).

But these numbers are also usable as codes. "1," for instance, can mean a component, a product, one of a series of actions, a manufacturing process, any office routine.

Thus, since every file has a record card slotted-in on the front of the file, you have what is virtually a visible record system *plus* the means of correlating both data and associated documents (invoices, orders, delivery notes, blue-prints, samples, etc.).

These are the bare bones of the shannographic system. What you want now are the precise details of how the system operates to do the job you have in mind . . . Because it will do the job—any job.

Below we list a few of the many shannographic specialised applications. Just tick the title of the one (or more) you want to know about, attach to your letter-heading and a full explanation will be sent you by return.

Wrap it up in steel

And the answer is the once-familiar tin of pineapple chunks! A tin, you see, is really steel. Whatever its contents or its shape, over 98% of it is steel.

That sheet steel is coated with tin just as a railway engine is coated with paint, but the can remains just as much steel as the engine.

47% OF OUR EXPORTS. This sort of tin-plate for canning is one of our steel exports to food-producing countries like Australia and Argentina; there is a peculiar satisfaction in the thought that providing the 'wrappers' helps to pay for their contents! You can reckon that a lot of our imported food is paid for by steel in other ways too, since manufactures of steel now account for 47% in value of our total exports.

£240-MILLION SCHEME. Our steel industry is not only working to meet the present great demand for steel—for home use and for export. The 5-year development scheme set afoot by the industry in 1945 is to cost no less than £240 million, to increase capacity and improve production so that we can be confident of keeping our proud place of leadership in face of ever-keener world competition.

A TIN IS BORN

In the immense mills of one of the works now building, a slab of white-hot steel will enter the rolling mills at 200 feet a minute and race out at 2,000 feet a minute one-tenth of an inch thick!

STEEL

is serving you well

by the company of its mineral rights in Northern Rhodesia for a further period of 37 years. On October 1, 1946, the company is to transfer its mineral rights to the Government free of charge. Meanwhile, from October 1, 1949, 20 per cent of the net revenue from its mineral rights in the colony is to be paid by "Chartered" to the Northern Rhodesia Government (such payments to be regarded by the Government as an expense for the purpose of income tax). Further, the Government undertakes not to impose any special tax on royalties during the 37-year period.

Considered in its political setting, this solution appears to be a reasonable compromise. At one time the views of the two principal parties seemed to be irreconcilable. Now "Chartered" has apparently chosen to compromise rather than run the risk of being presented with sterner exactions in the form of exorbitant taxation or even expropriation. There is no denying that the agreement represents an eventual extinction of contractual rights. That point needs to be made, not only because it has become far too easy to use political pressure to push established contracts aside, but also because the company is only now reaping a return for past enterprise. On the other hand, the people of Northern Rhodesia have not found it difficult to enlist sympathy for their claim to participate more fully in the profits of the flourishing mining industry. Their right to impose heavy taxation has undoubtedly been the chief key to the door of "Chartered's" rentier interest in the industry. Sustained pressure for higher taxes has lately been rising to a pitch which would soon have demanded action. Although the proposal for the paying over of 20 per cent of net mineral revenues for each year of "Chartered's" remaining tenure is an onerous charge, it might conceivably have been pushed even higher.

"Chartered's" shareholders will now have to reckon on the fact that their return from the Rhodesian mineral rights will become 80 per cent of a variable but terminable annuity over a 37 years period. The immediate reaction of the Stock Exchange to the agreement was to mark the registered stock units of the company a shade higher; further consideration may perhaps bring a different sort of adjustment. Shareholders may be comforted by the undertaking of the British Government to ensure that the agreement will not be infringed during its projected life; but 37 years is a long time to bind a community which shows every sign of entering a period of vigorous growth.

* * *

Coal Output in the Doldrums

Coal output has entered the holiday period in which the real rate of progress towards the achievement of the year's tasks is difficult to assess; but it is an important period, because at this time of year the stocks for the winter have to be built up. Weekly output in the past two weeks has been depressed by holidays to about the normal extent for the time of year. Output last week was 2,580,700 tons (of which 169,400 was opencast). In the week ended July 30th it was 2,701,900 tons (of which 251,500 was opencast). Absenteeism rose in the last week of July to 14.53 per cent—well above the average of 12.44 per cent for the first 30 weeks of the year, which in turn was well above the level of absenteeism (11.03 per cent) in the first 30 weeks of 1948. "Voluntary" absence, which had fallen below "involuntary" absence since the National Health Scheme came into force, has now for the moment risen above it; health is better at this time of year, but the calls of leisure are stronger. It is worth noting that a rise in absenteeism brings about a fall in productivity among the workers who remain; output per man-shift (all workers) fell in the last week of July to 1.05 tons, compared with an average of 1.15 tons over the year so far and of 1.10 tons in the first 30 weeks of 1948. When all possible allowance has been made for holidays, it is not possible to regard the state of the productivity factors with complacency.

The *Economic Survey* estimated total coal output for this year at between 215 and 220 million tons. The Minister of Fuel and Power said on July 26th that the rate so far was "much nearer the lower of the two figures," and even this appears a little optimistic. Mr Gaitskell added at the time that deep-mined production was at an annual rate of five million or six million tons more than last year. Deep-mined output in the first 31 weeks of this year amounted to 118.4 million tons, which is 3.3 million tons more than in the first 31 weeks of 1948. If opencast figures are added, the picture is not substantially changed; total output in the first 31 weeks, 125.8 million tons, has then to be compared with 122.5 million tons in the first 31 weeks of 1948. The lower of the two figures mentioned in the *Economic Survey* requires an increase of 6½ million tons over last year's total output; even to reach 115 million tons may require, therefore, another production effort in the autumn.

* * *

Shipping and the Argentine Agreement

Little movement of goods between Argentina and the United Kingdom has yet begun under the provisions of the five-year agreement, but the agreement has caused shipowners to hope for some alleviation before long of the paralysis in the Plate trade, which has spread depression into most of the freight market. Owing to the almost complete absence of homeward grain cargoes tramp ships taking occasional outward cargoes of coal had forced up the rate from 25s. to 45s. a ton in recent months. The better prospect of return cargoes since the signing of the agreement has caused the rate to ease again by about 7s. 6d.

But chartering is still slow. Only about 266,000 tons were shipped to Argentina during the first six months of 1949. This was little more than was shipped during the same period of 1948; in the same period of 1947, freight cargoes to Argentina were negligible. During the next eleven months, according to the agreement, 1,500,000 tons are to be shipped, and since plenty of homeward grain cargoes should be available, freight rates for the outward voyage should revert to a more normal level. Much will depend, however, on the ability of the Argentine port authorities to avoid the port congestion which has been experienced before.

All branches of shipping can hope for something from the new agreement, even the tankers, since nearly 6,000,000 tons of petroleum imports are contemplated. The large proportion of tankers now taking oil to Argentina is a notable feature of recent shipping entries in the Plate. It is likely that tankers under the British flag will get some of this trade, although it cannot be assumed that they will get it all. Argentina itself is building up a fleet of ocean-going tankers for the first time. Argentina has, in fact, nearly 250,000 tons gross of merchant ships under construction at the moment, some of them tankers and some of them refrigerated cargo and passenger liners of a high standard. Ships such as the *President Peron*, which entered service last month, will be strong competitors of the British refrigerated cargo liners that have hitherto held almost a monopoly of the meat-carrying trade from the Plate. Difficult problems would certainly arise if the Argentine Government, which has a monopoly of Argentine shipping and port facilities, were to resort to flag discrimination and other restrictive practices in favour of its own new and expensive ships.

Colonial Sugar

Talks on the future of the West Indian sugar industry have been conducted in London between the Colonial Office and representatives of the Jamaican Government and the West Indian Sugar Association. At their conclusion, this week, the Colonial Office announced that the Government intended to give efficient Commonwealth producers an assured market for

The Era of Papyrus

Commerce flourished in the days of ancient Rome. Commercial transactions even included the execution of Wills and the undertaking of trusts. The money changers conducted their business in the Forum, or market place, and set the stage for the growth of the four fundamental aspects of banking: the exchange, loan, custody and transmission of money. Sheets or rolls of papyrus, the paper-like material made from Egyptian sedge, contained the records, and the age of the modern cheque with its fugitive surface as a protection against fraud was many centuries distant.

Nowadays, in addition to the ordinary business of banking Martins Bank has specialised departments which deal with Executor and Trustee work, particulars of which may be obtained at any branch of the Bank.

agreed quantities of sugar at reasonable prices. Prices would be negotiated with the producers, but before these arrangements could be completed, other Commonwealth producers would have to be consulted. This further series of talks is expected to be held in autumn.

Long-term contracts could play an important role in developing sugar production in the sterling area and in assuring economic stability in those colonies which depend on sugar as their main export. Hitherto, the world price for sugar has been dictated by the amount of Cuban supplies available for the "free market," that is, for countries other than the United States, where Cuban sugar enjoyed, and still enjoys, a particularly high preference. Owing to this preference Cuba could afford to sell on the "free market" at a much lower price than would otherwise have been possible, and occasionally caused hardship to other exporters in the West Indies, which did not enjoy a similar advantage.

The agenda for the autumn talks will no doubt include the question of bringing into force the prewar international sugar scheme. But the West Indies could legitimately claim that the marketing of their sugar has social and political implications, as well as its economic aspects. They may feel that, for their purposes, a long-term contract, with suitable safeguards, would be more valuable than an international agreement.

Problems in Rubber

The price of rubber in London continues under 10½d. a lb., much to the consternation of producers in Malaya. The gross trading profit of 104 rubber producing companies which issued their reports in the June quarter rose to £2,826,000 compared with £2,149,000 in the previous year, but the average price for 1948 was a shade under 1s. 1d. a lb. compared with an average of 1s. 0½d. in 1947. For the first six months of 1949 the price of rubber in London has averaged only 11½d. a lb., and at present there is no likely prospect of any sustained rise

—unless the Washington talks next month yield unexpectedly favourable results for Britain. Under present conditions a shilling a pound for rubber could only be maintained artificially, and certainly not for any length of time.

Since April, world production of natural rubber has been below last year's level, and for the first half of 1949 it totalled 700,000 tons compared with 717,500 tons in the corresponding period of 1948. Consumption, however, has apparently increased from 680,000 tons a year ago to 732,000 tons. During the first half of 1948 the price for rubber tended to rise, and the average for June last year on the London market was 1s. 2d. a lb. This year the price has been falling, and the average for June was only 10½d. a lb. This discrepancy between the comparative production and consumption statistics for the two periods and the trends in market prices is probably explained, in part at least, by the fact that the consumption figures do not include American stockpile purchases.

If this is the explanation, it shows very clearly how important stockpiling purchases are for the rubber market. But

rubber producers cannot base their future prosperity on such temporary support. Even though natural rubber is about 1½ cents a lb. cheaper than general purpose synthetic rubber, American manufacturers are apparently not anxious to switch to the natural product. But at what price would they be tempted to make such a switch? Is it true, as Malayan producers claim, that this inflexibility is due to the existence of a legally enforced minimum consumption of synthetic rubber, so that price considerations have little or no effect? Malaya admittedly has urgent political problems on its hands, but before it can convince the world of its case for free competition for natural rubber in the United States, it will have to go further towards reducing its production costs.

Dollars and Tobacco

When Sir Stafford Cripps announced last month a cut of 25 per cent in dollar expenditures, he added that this would mean reducing the \$110 million originally provided for tobacco purchases from the United States by \$20 million. This reduced figure of \$90 million, however, is appreciably larger than the \$76 million spent on American tobacco in 1948. Nevertheless, Sir Stafford stated that in due course this would mean a reduction in supplies of cigarettes of "probably not more than 5 per cent." Consumption last year averaged 17.8 million lb. a month, which was 5 per cent smaller than in 1947 and 15 per cent less than in the peak year of 1946. But during this period although total imports of tobacco declined slightly (supplies from the United States, of course, declined quite sharply), stocks of all growths of tobacco increased; at the end of 1948, they amounted to 391 million lb. compared with 384 million lb. twelve months earlier. During the first five months of this year, there was a seasonal fall in stocks though at the end of May they were still 9,000,000 lb. larger than at the end of May, 1948.

The amount of tobacco which British manufacturers can buy with their allotment of dollars will depend on the level of prices at the auctions which opened towards the end of July. Opening prices this year were slightly higher than in 1948. But even if, as tobacco producers believe, this new level of prices were to be maintained throughout the sales, it would seem that Britain could still buy about 15 per cent more tobacco from the United States than in the previous season. This increase would represent between 20 and 25 million lb., but that would not mean any increase in consumption in this country.

No separate figures for stocks of American leaf held in Britain are published, but it is clear that they must have been seriously depleted during the past year. In 1948 imports of tobacco from the United States fell by nearly 15 per cent whereas tobacco consumption declined by only 5 per cent. Supplies of flue-cured virginia leaf from other sources are not yet large enough, given the current rate of consumption in this country, materially to offset the reduction in American supplies. If in fact an extra 25 million lb. of American leaf is purchased this year, it may just be possible to maintain consumption and to make some slight replenishment of stocks.

Should Minerals be Nationalised?

In 1946, Mr Shinwell appointed a Committee to enquire into the resources of minerals in the United Kingdom (apart from coal, oil and ironstone) and to make recommendations about their future development. Its report shows that production of metalliferous minerals is small, and that prospective resources would generally provide less than ten years' output at the 1947 rate. Supplies of the non-metalliferous minerals cover domestic consumption fully (they also provide in some cases such as china clay and salt an important surplus for export) and resources generally are sufficient to cover more than fifty

years' consumption. This contrast between the two classes of minerals is brought out in detail in the report, which needs, of course, to be read in the light of the intention of the Labour Party, if re-elected, to place "all suitable minerals" under public ownership.

The Committee comes down in favour of nationalisation (subject to reservations by Mr Peter Thorneycroft, M.P.). It reaches this conclusion on several grounds. First the report argues that "exploration in future will have to be planned on thoroughly scientific lines... it will take longer, be more costly, and the risk therefore correspondingly greater." Subsidies or tax concessions are dismissed because they would encourage "a short-term outlook with too much emphasis on production"—a somewhat surprising objection. Secondly, "mining has to face inherent risks" both technical and economic. In principle, it holds, "there should be no conflict between the desire of the nation, having the ownership of the minerals, to secure efficient development and proper utilisation, and of private enterprise to extract the minerals at a profit." But in practice, the report concludes, the Government would need powers to prevent unsound flotations, to approve plans, to secure amalgamations, to provide capital and to contract for the purchase of output.

From this line of argument, the conclusion to nationalise these minerals follows inevitably. They would be under the care of a Mineral Development Commission, in which property in minerals could be vested. The proposed duties of this Commission and its relations with Government departments are outlined in great detail, much of it open to question. There are two broad issues which need to be raised. Would such a Commission do better than private ownership and exploitation? To that, the report provides no conclusive answer, for the risks in mining are present under any form of organisation. Secondly, how much is it worth paying to secure the "co-ordinated, orderly, and economic develop-

ment" of domestic minerals? References to "insurance against the future" and "guaranteed minimum prices" have an ominous ring, for nowhere are they brought down to the crude realities of pounds, shillings and pence. To start with the cushion of a subsidy—which the Report openly proposes—would not be the best way of setting the Commission on the road to efficient production

Softwood and Housing

A month ago Sir Stafford Cripps announced that dollar imports of timber "will have to be cut substantially, but we hope we may be able, by further purchases from non-dollar areas and otherwise, to carry through the housing programme without any substantial alteration." This statement was received with some surprise at the time. Timber imports have been cut "substantially" before to satisfy a dollar crisis, but then the burden of the housing programme could be borne by a reduction of stocks. These have declined drastically since the end of 1947. The accompanying table, taken from the latest housing return, shows the extent of the deterioration in supplies of softwood in the past two years. The figures cover all qualities and dimensions of softwood, though only certain types are used in building.

Total imports of softwood have been sharply cut from 118,000 standards a month in 1947 to 85,000 standards in 1948 and further to 57,000 standards in the first half of this year. North American supplies tend to arrive in Britain between January and June, while European supplies come in the second half of the year. The average monthly import for the whole of 1949 is therefore likely to be larger than 57,000 standards.

The conclusion of the new contract with Russia, announced this week, will mean an additional 100,000 standards, which

"substantial cut" in supplies from dollar sources, the chances that imports will reach last year's figure (which in any case was low) are slender.

At the end of 1947 stocks amounted to 615,000 standards; they declined to 466,000 standards by the end of 1948; by the end of June they amounted to only 183,000 standards. The June figure represents a seasonal minimum, but at the end of June, 1948, stocks totalled 412,000 standards. Thus in twelve months stocks have been more than halved. On the basis of these figures it seems hard to believe that the housing programme can be carried through—at any rate not without a savage reduction in the amount of softwood consumed in other uses.

Realities from the Rand

The enthusiasm of speculators in gold shares, particularly Kafir producing mines, appears to be waning slightly now that hopes of an early devaluation of the pound seem to have receded. Their interest has this week been galvanised largely on "Mid-Wits" and "Geoffries" following the latest outstandingly good assay values from the latter's TV2 borehole. But apart from the absence of devaluation, the Rand itself has recently provided some additional reasons for caution. The omission of the 2½ per cent bonus by "Johnnies" for the year to June 30, 1949, was a reminder that the investment merits of companies operating on the Rand will ultimately be judged on earnings. Though in this case a comparison of profits with the previous year is vitiated by the change made in the method of valuing investments, there appears to have been a true fall in profits from £1,484,331 to £1,138,749. This decline may reflect a deterioration in earnings from the group's property, industrial and diamond interests as well as from share dealings and gold mining. None the less some of the Rand finance houses have been brighter this week than of late.

The fall in revenue from South African gold mines has continued in the first six months of 1949, according to the latest returns of the South African Chamber of Mines. The output of gold fell to 5,738,966 ounces compared with 5,821,649 ounces in the corresponding period of 1948, and costs rose by 2d. per

ton milled. While a higher gold price would certainly stimulate production, the prospect for cost reductions cannot be rated very highly. There have recently been further signs that the Mine Workers' Union will in any case press their claim for substantially higher wages and this move would be

difficult to resist, especially in the event of devaluation. Moreover, the Rand Labour Commission is due to publish its report in the coming months. Its recommendations may well involve additions to gold mining costs, for it is expected to suggest improvements in mining conditions in order to stop the drift of labour from the mines.

Shorter Notes

Steel output in July was restricted by holidays, and was below the average rate of output of the first six months of the year. The average weekly output of steel ingots and castings in July, 244,100 tons, is equivalent to an annual rate of output of 12,695,000 tons; this compares with an annual equivalent of 15.9 million tons in the second quarter of 1949. It does, however, show an improvement over July, 1948, when the weekly average was 232,400 tons. Weekly output of pig-iron in July was 171,300 tons, equivalent to an annual rate of output of 9.2 million tons.

★

During July, Britain transferred £4,495,000 of gold to Belgium and £2,804,000 to Switzerland against £6,790,000 and £1,619,000 respectively in June. Gold losses to Belgium in the first seven months of this year have now reached £21 million and losses to Switzerland £9 million. The Bizone in July transferred £503,000 of gold to Britain, reflecting the first benefits of the various new payments arrangements with western Germany.

★

A new company, Tate and Lyle Investments, has been registered with an initial capital of £100 in 5s. shares. The objects of the company are to acquire from Tate and Lyle certain investments with the intention of carrying on the business of an investment trust. Members of the board of the new company are composed of directors of Tate and Lyle. Further details of the scheme for segregating the investment assets of Tate and Lyle which will require the approval of shareholders are expected shortly. The background to this move was discussed in a note in *The Economist* of July 23rd.

COMPANY MEETINGS

LEVER BROTHERS & UNILEVER LIMITED

HIGH REPLACEMENT COST OF FIXED ASSETS

INADEQUATE GOVERNMENT ALLOWANCE

OIL AND FAT SUPPLIES: WORLD POSITION

SIR GEOFFREY HEYWORTH ON BULK BUYING

The annual general meeting of the members of Lever Brothers & Unilever Limited, was held, on August 11th at The Hall of the Chartered Insurance Institute, 20, Aldermanbury, London, E.C.2. Sir Geoffrey Heyworth presided.

Before commencing the business the members present stood in silence as a tribute to the memory of the late Governor, The Rt. Hon. William Hulme, the Viscount Leverhulme.

Addressing the meeting the chairman said:—

It has been my custom at these meetings to centre my speech on some major question which is of interest both to us as a company and to the wider public outside. This year, however, I have decided not to concentrate on any one point, but to discuss four separate issues.

The first is a review of such action as has been taken by governments to meet the difficulties we are facing in making adequate provision for the replacement of fixed assets.

Second, I should like to discuss the related, and in some ways more difficult, problem of making it possible for industry to replace its stocks at high prices, and to carry the risks of loss involved in those high prices, without dissipating its capital.

Third, I should like to make a few observations on bulk buying in the form in which it is now being conducted.

Fourth, and finally, I should like to bring you up to date on the supply position in oils and fats. This involves a discussion of the problems which are raised for us and for the world at large by the present division of the world into two trading areas with differing price levels, and the urgent necessity of finding some way by which the world can once more be made economically one.

REPLACEMENT OF FIXED ASSETS

Over the last year the realisation has been spreading that if proper allowances are not made for the replacement of fixed assets, the capital of industry is bound to be depleted by being drawn on to provide what is in effect a subsidy to our standards of living.

The argument is now usually accepted, but governments are still reluctant to face the immediate loss of revenue which would be involved in taking effective action. Something has, however, been done.

In Great Britain the Chancellor of the Exchequer has doubled the initial allowance on plant and machinery; of course, this does not in the long run relieve industry of its burden—that of finding the extra money needed to replace existing fixed assets. It is, in effect, only an interest-free loan, whose main importance is that it spares industry the need to find a corresponding amount of finance elsewhere. I consider, therefore, that a more hopeful omen is the Chancellor's appointment of a Committee to inquire into the methods of computing net trade profits for income tax and profits tax purposes. The Committee welcomes recommendations from industry, and I have every hope that it will in due course be recognised that the nation

cannot be economically healthy unless the wear and tear undergone by the nation's assets each year is provided for, enough must be put aside each year to replace them in real terms, and not just in arbitrary money terms based on an original cost of historical interest.

HOLLAND, BELGIUM AND FRANCE

The Dutch Minister of Finance's new Tax Revision Bill is a courageous acceptance of the principle that it is proper to permit the revaluation of assets for depreciation purposes when prices have risen even though there has been no formal devaluation of the currency.

In view of the great importance of the principle of this Bill, it is regrettable that the detailed provisions place so close a limitation in practice on the relief proposed. In particular, buildings are not included, and the only assets whose book value may be doubled are those held before December 31, 1941, where the book value after years of writing down is now very small. Under certain circumstances, moreover, the reserve thus created may be liable to tax in the future. Such limiting provisions obviously greatly reduce the practical effectiveness of the Bill. I hope, therefore, that the Minister may yet see his way to liberalising it still further.

The action taken in Belgium and France has gone nearest to the root of the problem. The need for conserving the resources of industry has long been recognised there. In Belgium in 1947 regulations which were fairly satisfactory were made permitting the revaluation of fixed assets. In France two further measures have been taken in the course of the past year. A revaluation of fixed assets to meet the latest devaluation of the franc has been permitted and tax reliefs have been given to make it easier to incorporate the surplus on the revaluation of fixed assets in a company's share capital.

STOCKS

The basic problem with stocks, as with fixed assets, is the conservation of one's capacity to do a given volume of business; one does not maintain one's business if physical volume goes down, even if monetary value has gone up; and to maintain a given volume of business there is required not only a certain amount of fixed assets, but also a certain cover of stocks. When prices go up, the value of the quantity of stocks held must be adjusted to the new price level, or the money they bring in will not be adequate to provide for their replacement at the new higher prices. Good business practice, which bases the selling price of the finished article on the replacement prices and not on the original cost of raw materials, does in fact provide the money required to permit the quantity of stocks to remain unchanged. This is true both when the market is rising and when it is falling.

In normal times, when taxes were lower, this method enabled industry to overcome most of its difficulty. The balances which accumulated when replacement prices were charged on a rising market enabled an unchanging volume of stocks to be financed

at higher prices, thus satisfying the basic need of industry to keep its working capital intact. These balances also provided a reserve which could be released to meet stock losses were the market to begin to fall.

EFFECT OF GOVERNMENT ACTION

Over the last ten years, however, Government action has prevented this self-correcting system from functioning. Sometimes industry has been compelled to charge prices to the consumer based on original costs of raw materials, thus giving the consumer a subsidy at the expense of industry's working capital. Sometimes, industry was permitted to follow its normal practice of charging replacement prices, but it was not recognised that the resultant profits should be distinguished from ordinary profits in as much as they were necessary to enable industry to finance the same quantities of stocks as before and thus to keep its capital intact. They were instead taxed away at rates so penal, particularly during the period when excess profits tax was in force, that only a fraction of the amount necessary to finance the increase in the costs of industry's stocks remained.

The clearest case of all of the risk of permanent impairment of its capital which industry is being forced to run is where government at the beginning of the war simply took over industry's stocks. The stocks thus taken over were paid for at the then price, but when buying of raw materials is once more handed back to industry—as I assume that one day it will be—governments may wish to be paid for the stocks they hand over at the current price. How large an impairment of real capital this would involve can be shown from what would happen if the United Kingdom Government were to take that line. For our margarine and seed-crushing stocks which the British Government took over at the beginning of the war they paid us £1,800,000. The same stocks would today cost £9,500,000.

CHANGE IN TAX POLICY ESSENTIAL

A change in Governmental taxation policy to prevent the dissipation of industry's capital is therefore just as essential for stocks as for fixed assets. So far as stocks are concerned, the best method might be to free from tax profits put aside to stock reserve, provided the amount is in reasonable proportion to a normal stock cover. France has set an example by reducing the tax on such allocations to reserve to 15 per cent. It is unfortunate that Holland, which since 1947 has permitted the creation of limited reserves tax-free—the size of which is partly dependent on the size of stocks—is now proposing to abolish this concession.

In Canada where industry was not permitted to make stock profits, the Government, when taking off control in 1948 and handing over its stocks to industry, recognised that some reserve must be made against the higher price levels, and in our own case gave us £300,000.

In the United Kingdom, in those cases where industry has not been doing the trading, and has not made the profits on stock from which to create reserves, the only complete solution is that when Government hands back its stocks to industry, the quantities originally taken should be handed back at the original take-over price.

BULK BUYING

I now turn to bulk buying—by which I mean buying through a few vast long-term transactions rather than many small ones. I do not, therefore, include buying by government in the market in the ordinary way, as was the regular practice of the Oils and Fats Division of the British Ministry of Food in the early days of the war, and as is

still the practice of the Dutch Ministry of Food.

It seems to me that the critics of this type of buying have laid too much stress upon the fact that bulk purchases are in many cases today showing losses on existing market prices; that is in fact inevitable since any sort of buying will produce inventory losses on a falling market, just as it will produce profits on a rising market. Doubtless at the beginning of the war governments which bought in bulk made money, and doubtless it was then public opinion in the selling countries which was critical.

The real issue, therefore, is not who has the best of the deal, since normally it is desirable that both parties to a contract should be satisfied. The point to be examined is which is the more satisfactory method for both sides—many small daily transactions or a few large long-term ones—and I think that the advantage is very heavily with having many small ones. Before a large long-term contract is fulfilled, the general market price is almost certain either to go up, thus disconcerting the seller and possibly leading him to default in his contract, or to go down, thus disconcerting the buyer and possibly leading him to try to avoid taking delivery.

GRAVE DISSATISFACTION CAUSED

Bulk buying is therefore inherently liable to lead to grave dissatisfaction—on one side or the other—before the contract is finished, particularly because the very size of the transaction means that any mis-judgment must involve a very large error, and a man's liability to make mistakes is not diminished because he is doing his buying in larger quantities and over a longer time. The resultant disputes can lead to no permanent damage if they occur between private individuals or firms—they can always get their quarrels settled by the appropriate court. But if the parties to the contract are governments no court has jurisdiction and arbitration is unsatisfactory; any dispute brings in questions of national prestige so that the maximum of international ill-will is generated for the minimum of reason. The capacity of bulk buying to produce international friction has indeed now spread even to the preliminary negotiations over the contract's terms. The businessman can change his view of the appropriate price overnight, but a government may feel itself committed by the public statement of a Minister or a well-informed leak in a newspaper, and when the other government does not give way to its views it may feel that its whole position in its own country is imperilled.

QUESTION OF STABILITY

The most powerful argument usually put forward in favour of bulk contracts is that they produce stability, though recent experience, for example with metals in the U.K., suggests that this is by no means always true. It is certainly most unlikely ever to be true in the oils and fats market, since oils and fats can be substituted for each other on a very large scale, so that it would not be enough to have bulk contracts or buffer stocks covering only one or two varieties. It would be very difficult, moreover, so to expand bulk buying that it covered all possible types, since in the case of oils and fats quite large quantities are by-products and not produced primarily for their own sake for example, lard, tallow and cotton seed. Further, many oils and fats are derived from wild crops—for example, the palm products of West Africa and part of the copra from the Far East and South Seas—and here the amounts which any given price will tempt on to the market are somewhat unpredictable. It may be that with other crops where substitution is not so important, e.g., wheat, there is a case for a guarantee to the producer in order to give him the security he desires, but

even then such an arrangement need not be coupled with a bulk buying policy. Certainly when the possibilities of attaining stability are so very limited as they are in the case of oils and fats, they do not justify the risk of increasing international friction, which a continuation of bulk buying would involve.

THE SUPPLY OF OILS AND FATS AND THE UNIFICATION OF MARKETS

I now turn to the supply of oils and fats in general, where the most notable development since I spoke to you two years ago has been the hardening of the division of the market into two—a hard currency market and a soft currency market.

I should like to begin by bringing you up to date on the figures. I said in 1947 that an increase in supplies of oils and fats of 4,000,000 tons would be needed to give the world the same consumption per head as before the war. I estimated that 2,500,000 tons (it turned out to be 2,000,000 tons) were accounted for by the drop in production as against prewar, and the rest was the result of the 8 per cent. increase in population which had occurred.

The main reason for the drop in supplies was the war with its destruction of livestock in Europe and devastation and neglect of some of the main producing areas in the East. Since 1947 there has been a considerable recovery, though it is still by no means complete, and the table gives the main figures.

	Av. of 1934-38	1947	1948	1949
<i>(In metric tons)</i>				
<i>Indonesia:—</i>				
Palm-oil exports	171,000	Negligible	40,000	120,000
Copra & coconut-oil exports (as oil)	318,000	128,000	218,000	240,000
<i>Malaya:—</i>				
Palm oil and coconut oil exports (as oil)	129,000	57,000	76,000	110,000
<i>Europe:—</i>				
Production of butter & lard	2,400,000	1,300,000	1,500,000	1,700,000
Production of rapeseed (as oil)	70,000	80,000	130,000	140,000

GROWTH OF POPULATION

For the world as a whole though production is now back to prewar, it has not yet increased sufficiently to take care of the growth in population since 1939, as the figures of supplies available per capita show. Prewar there were 21½ lb. available per head, in 1947 there were only 18 lb.; last year this had risen to 19 lb.; this year we estimate it will be 19½ lb. These are average figures, and conceal wide variations between individual countries. For example, consumption per person in 1949 in the United States and Canada is likely to be only about 2 per cent. down on prewar, whereas in the rest of the world the drop may be in the region of 13 per cent. And, since most of world production stays in the country where it is produced, there can be no guarantee that increases in supplies will benefit the worst off countries.

Incidentally, there has been a change in world consumption habits which affects us as margarine producers to a very large extent. Owing to full employment, and government schemes for free or subsidised milk, more milk is being drunk liquid instead of being made into butter, and thus the need for margarine has been increased. In the United States, for example, the amount of butter has dropped from 985,000 tons prewar to 678,000 tons in 1948. And the production of margarine has gone up correspondingly

from 169,000 tons to 411,000. However, this increase in margarine production has itself helped to make possible the very large production of milk which has characterised recent years, for it is the margarine industry's need for edible oils which makes available the oil cakes which are one of the great standbys of the milk producer.

NO ONE MARKET

The most important point about the present world oils and fats position, however, is that there is no one market. Prices vary according to the hardness of the country's currency, and according to whether it has a surplus for export or not.

I pointed this out in 1947, but at that time exports from the United States were controlled, and it could be argued that the two prices were the result of the artificial diversion of European demand from the American to other markets. This export control has now been abandoned, and it has thus become clear that the real difficulty is the lack of hard currency of so many of the importing countries. The effect on prices is striking. Malayan copra, which is sterling, is £63 10s. a ton c.i.f.; Philippine copra, which has to be paid for in hard currency, is £46 5s. a ton c.i.f. Soya oil in the U.S. is about £70 a ton; the cheapest liquid oil in the sterling area is £135 a ton. The most striking example is tallow. In the U.S. it costs about £45 a ton; the U.K. pays £110 a ton for Australian and New Zealand tallow.

This position is partly a result of the war which on the one hand induced the U.S. greatly to increase its production since so many outside sources of supply were cut off; while on the other hand, it very heavily reduced the production of the soft currency areas. It is also partly the result of the virtual disappearance as exporting countries of Manchuria and India which prewar exported a million tons of oil equivalent a year.

HARD AND SOFT CURRENCY AREAS

Today, therefore, we have a position where supplies in hard currency areas are ample while those in soft currency areas are not enough to meet needs. In the U.S.A., the Philippines, Belgium and the Belgian Congo, all hard currency areas, the surplus of production over requirements in 1949 is likely to be about ½ million tons. In the rest of the world, by contrast, there will be a deficit of about 2½ million tons.

Up to the present the barrier between soft currency oils and fats and hard currency oils and fats has been prevented from becoming absolute by Marshall Aid, which between April 1948 and May 1949 provided 250 million dollars for oils and fats for Europe. The biggest beneficiary has been western Germany, whose production of margarine and edible oils will in consequence rise to a quarter of a million tons in 1949 against 120,000 tons in 1948. Other countries which have benefited considerably are France, Austria and Holland.

We have, therefore, now reached a stage where the world oils and fats market is divided broadly into two, hard currency and soft currency.

PRESENT POSITION

Tallow provides the best example of the serious results of this division of the market. Tallow in the U.S. is a by-product whose production depends not on the demand for the tallow itself but on the demand for meat. If, therefore, the price of tallow drops, the meat packer makes up by getting rather more for his meat. In the U.S. the drop in the price of tallow has been greater than the general drop in the prices of oils and fats because the main use of tallow is in soap-

making, and one-quarter of the detergents used in the U.S. are now synthetic. Now if Europe had the dollars with which to buy this surplus American tallow, the American market would benefit because the tallow price would come back into line with that of other oils and fats, and Europe would benefit because the tallow thus bought could be used in soap and would release for consumption as food edible oils now being used for soap. Incidentally in the U.K. the increase in supplies might be enough for margarine to come off the ration.

To find a solution for this dis-equilibrium is the first task of economic statesmanship today. For although I have been talking in terms of oils and fats, both because that is our own subject and because it is a particularly valid example, the problem is, as you know, a general one.

UNEVEN DISTRIBUTION

Supplies are not only inadequate, they are also divided up unevenly: one part of the world, the hard currency area, has more than enough for its requirements; the other part, constituting the whole of the rest of the world, has an overall shortage which in some countries is extreme.

This raises problems for both areas. In the dollar area if some way cannot be found by which it can sell its surplus to the rest of the world for acceptable currency, production will have to be cut back; for example, by using for some other purpose the land at present devoted to soya beans. Thus the chief increase in supplies would be lost to the world.

The non-dollar area has an even more difficult problem to face. If it does not want to continue as at present with controls and shortages it must either succeed in selling enough goods and services to the dollar area to be able to buy their surplus or it must increase its own production.

Of these possibilities, the increase of production in the non-dollar area does not hold out much prospect of immediate help. Some further recovery is possible in Indonesia, and some supplies can be expected from the groundnut scheme. Something could be done to increase oilseed production in India and other areas where the application of science to agriculture is still on a limited scale if more fertiliser, pesticides, tractors and so on, were allocated to them for this specific purpose. But the only immediate possibility is of an increase in the production of lard as Europe's pig herds are reconstituted, and even that is partly dependent on the supply of coarse grain from the dollar area. Meanwhile the problem grows steadily more desperate as the amount of Marshall Aid available with which to buy oils and fats gradually dwindles off to nothing.

There is, therefore, in fact only the one alternative. Either we and the rest of the soft-currency world will have to go on putting up with shortages and controls or else some way of unifying the world commercially will have to be found.

The chairman concluded by moving the adoption of the report and accounts.

Sir Herbert Davis, C.B.E., vice-chairman, seconded the resolution and it was carried unanimously.

The proposed dividends of 10 per cent. on the ordinary stock and 6 per cent. on the deferred stock payable on August 19, 1949, were approved, the retiring directors were reappointed and the remuneration of the auditors, Messrs. Cooper Brothers and Co. and Messrs. Price Waterhouse and Co., who had been reappointed under the provisions of the Companies Act 1948, was fixed.

At an extraordinary general meeting held at the conclusion of the annual general meeting a special resolution adopting new articles

of association of the company was passed unanimously.

LEVER BROTHERS & UNILEVER N.V.

The annual general meeting of the members of Lever Brothers and Unilever N.V. was held yesterday at Museumpark, Rotterdam. Mr. P. Rykens presided and made a speech in similar terms to that delivered by Sir Geoffrey Heyworth at the annual meeting of Lever Brothers and Unilever Limited, reported above.

The report and accounts for the year 1948 were adopted. The proposed dividend of 8.9 per cent. (being the equivalent of the dividend for the same year to be paid by Lever Brothers and Unilever, Ltd., to its ordinary stockholders calculated in accordance with the provisions of the equalisation agreement and converted at a rate of exchange of Fl. 10.691 to the £ Sterling) was approved, the retiring directors were reappointed and the auditors, Messrs. Cooper Brothers and Co. and Messrs. Price Waterhouse and Co., were reappointed.

WHITEHALL ELECTRIC INVESTMENTS LIMITED

The twenty-seventh annual general meeting of Whitehall Electric Investments Limited was held on August 10th at Winchester House, London, E.C.2.

Consolidated gross income for the nine months to December, 31, 1948, amounts to £229,036, and after expenses and after charging against revenue the net loss arising from the realisation of investments, there is a net income of £98,301. The valuation of the assets, excluding any valuation of the investment in the Athens companies, is shown at £5,205,842.

The nationalisation last year of the West of England company has had the result that gilt-edged investments and net floating assets amount to some £2,200,000, and since the directors consider that favourable opportunities for the acquisition of other electricity undertakings do not exist, they propose that part of the capital of the company shall be repaid.

The report and accounts were adopted.

An extraordinary general meeting of the company was held to consider resolutions for the reduction of capital of the company. The scheme of arrangement put forward for the repayment of 25 per cent. of the preference stock at 25s. per £1 stock and 25 per cent. of the ordinary stock at its nominal value. These payments will absorb £1,640,625.

After the proposed repayment the issued capital of the company will be:

6 per cent. preference stock	£ 937,500
ordinary stock	£3,671,875
	£4,609,375

compared with assets valued at June 24th last at some £3,250,000, excluding investments in the Athens companies.

Consolidated income from these assets is estimated, after expenses and subject to tax, at £108,000.

In the event of American and foreign power being able to resume the payment in full of dividends on its 1st preferred stocks, consolidated gross income will increase by £110,000.

The resolutions were carried as special resolutions by the requisite majority.

At separate meetings of the preference and ordinary stockholders, the scheme of arrangement was approved.

BOOTS PURE DRUG COMPANY, LIMITED

LORD TRENT'S SPEECH

The sixty-first annual general meeting of Boots Pure Drug Company, Limited, was held on August 9th at Beeston in Nottingham. The Rt. Hon. Lord Trent, chairman, presided, and in the course of his speech said:

The past year has been a record one for sales both at home and abroad, and it has also been a record year for profits for the group. Our export business has increased by over 50 per cent. over the previous year.

The net profit of Boots Pure Drug Company, Limited, however, amounted to £627,662, against £679,428, this profit being arrived at after charging the heavy loss which was involved by at once passing on to the public the benefit of a reduction of purchase tax.

In the circumstances your directors felt that the correct thing to do was to transfer £100,000 from our stock reserve, as it was to meet this type of contingency that this reserve was created.

The outstanding event for your company during the past year was, of course, the inauguration last July of the National Health Service. This has led to a vast increase in dispensing and in the demand for drugs, so that staff in the works has had to be taken off other important work in order to keep the dispensing going. Had the staff been available to fill all our orders, our sales would have been even greater than they were.

When Ministers at the head of various Government departments reiterate so frequently their appeals or demands for a reduction of retail prices, I feel justified in reminding them that it is their own colleagues who are mainly responsible for the high costs of distribution arising from increases in the local rates, in coal prices, gas and electricity charges, transport charges, and above all purchase tax.

I referred last year to the heavy burden of work thrown upon our head office staff by alterations in the rate of purchase tax, and I must again draw attention to the labour which we have been obliged to divert from productive effort to wasteful form-filling, reprinting, and repacking to meet hastily introduced departmental orders.

EXPORTS

Our exports are now about eight times as great as before the war and account for a very considerable proportion of the sales of our manufactured products. The increased sales, coupled with the demands of the new Health Service (to which I have referred), placed our manufacturing departments under great strain, with the result that some delay occurred in the execution of certain orders.

It is to be hoped that in the critical months that lie before us some way will be found of ridding industry of the perpetual pinpricks and petty vexations that exasperate and hamper us in all our activities. So long as British industry is kept in leading strings by politicians and departmental officials we can never hope to see that great resurgence of trade which alone will extricate this old country of ours from the quagmire in which she is floundering.

I have alluded to a few of the many handicaps under which our company, in common with most other companies, is labouring. Some of them are perhaps unavoidable. Many of them could be and ought to be removed. Unless they are removed and industry recovers its freedom of movement and its right to enjoy the rewards it has earned, then we must say goodbye to the high standard of living that we have built up over many generations.

The report was adopted.

HENDERSON'S TRANSVAAL ESTATES

PROGRESS OF SOUTH AFRICAN INTERESTS

The thirty-seventh annual general meeting of this Company was held on August 4th in London.

Sir Joseph Bill, K.B.E., chairman and joint managing director, in the course of his speech, said:—The consolidated balance sheet shows a very strong financial position, while the consolidated cash resources at £271,931 also disclose a very satisfactory state of affairs. The directors recommend a dividend of 15 per cent. less income tax.

During the year under review we have completed the programme of boring on a contiguous block of farms situated to the east of Tweefontein, to which I referred last year. These farms cover an area of 16,280 acres, over which your company holds the mineral rights through its subsidiary Mineral Holdings Limited; and of the 13 boreholes put down, no fewer than eleven intersected the main seam of coal and established the existence of a very large and valuable coalfield of standard quality. It is satisfactory to know that underlying this area we possess for future exploitation a reserve of high-grade steam coal, having, on a conservative estimate, a life of over 30 years, allowing for a saleable output of 1,250,000 tons per annum.

Your company's large interest in the South African coal industry is held through our subsidiary, Tweefontein United Collieries Limited, whose net profit for the year 1948, after allowing for taxation, was £11,714 up at £122,108, dividend totalling 17½ per cent. having been paid on the ordinary share capital and 10 per cent. (maximum) on the preference share capital. The report was adopted.

BATANG CONSOLIDATED RUBBER ESTATES

THE PRICE PROBLEM

The twenty-ninth annual general meeting of the Batang Consolidated Rubber Estates, Limited, was held on August 5th, in London.

Mr E. G. Estall, the chairman, in the course of his speech, said: The crop for the year just ended totalled 1,171,000 lb. This is 79,000 lb. short mainly due to the banditry in the Jus and Kayu areas which makes it a difficult area in which to obtain the maximum yield.

The net selling price is 9.47d. per lb., as against 9.26d. for the preceding year. Irrespective of the low selling price we have made a profit of £5,894, which I think you will agree is satisfactory. The board would like to distribute a dividend but this is impracticable as the Board of Trade stipulated that an amount of just over £8,000 must be maintained in the profit and loss account before any distribution be made to shareholders.

The low price of the commodity is causing much concern as the cost of production on all estates excepting the comparatively few who have large areas replanted with high yielding material is far too close to the selling price. The problem is widespread and is of great importance to the rubber industry. In 1948 Malayan rubber earned about 200 million American dollars, the largest sum produced by the export of any sterling commodity to the United States.

America holds the key to the position as, unless a curtailment of the manufacture of synthetic is made, the financial position of the sterling area will be greatly weakened and the economic and political position become most insecure. Action is certainly needed and without delay.

The report was adopted.

WHITEHEAD IRON AND STEEL COMPANY, LIMITED

SUCCESSFUL PRIVATE ENTERPRISE

NATIONALISATION OPPOSED

MR G. H. LATHAM'S SPEECH

The forty-second annual general meeting of the Whitehead Iron and Steel Co. Limited was held on August 9th at Newport, Mon.

Mr G. H. Latham, chairman and managing director, in the course of his speech said:

The year has been an extremely difficult one; shortages of raw material and labour have affected our outputs. Nevertheless, the company has still been able to play its part in the attainment of excellent outputs, and the financial results give every ground for satisfaction. The trading profit for the year to March 31 last amounted to £651,303, an increase of £23,460 compared with the previous year. Your directors recommend a final dividend of 17½ per cent. less tax, making a total distribution for the year of 30 per cent. less tax.

The total amount distributed in dividend represents 40 per cent. of the net profit, so that 60 per cent. is retained in the business. It is clear that, but for the voluntary limitation of dividends asked for by the Chancellor, stockholders could have enjoyed a higher reward, which would have been shared also by our employees under our profit-sharing scheme.

VARIOUS ACTIVITIES

The demand for all the wire products of Whitehead Hill & Co. Limited remains in excess of our ability to supply. We now are able to operate the plant fully. At our Llandowais brickworks we are reaping full benefit from the further mechanisation of our clay pit and the new crusher plant. The bricks we are producing are of first-class quality and in great demand.

We have now completed the third stage of our development of the Westgate works of W. A. Baker & Co. Limited. We have built up a progressive reputation for quality work during the past three years which has resulted in our becoming firmly established not only in this country but overseas. Our forward order book will ensure full-time operations for a long time ahead. During the year we have concluded an agreement with one of the best known paper machinery manufacturers in the U.S.A. to manufacture all the plant they require both for sale in this country and in other sterling areas.

The main product of Godins factory is cold form sections. I still have abundant faith in the future of this factory, and I am sure it will prove a valuable asset to your company, especially having regard to the fact that its raw material is supplied by the parent company.

At Courtbyella works our total make of re-rolled steel products represents approximately 10 per cent. of those produced in the country at the present time.

In the cold rolling department the demand for our products shows no sign of recession.

RETROSPECT AND PROSPECT

The company had its origin in 1903 when the late chairman, Mr L. D. Whitehead, purchased at scrap price an old discarded mill at Tredegar. We built the old mill and commenced operations by rolling down dis-

carded wagon axles into iron bars. At that time our total employees could be counted on one pair of hands. Mr L. D. Whitehead went to the U.S.A. in 1906 and bought a duplicate of the very few continuous rolling mills then operating in the world.

We found great difficulty in raising money to finance the project because at that time public opinion was opposed to the new method of continuous rolling which was then described as "an impossible proposal." The mill started up in 1907 but our teething troubles were so great that by 1909 we had completely depleted our meagre financial resources. However, by dogged perseverance and hard work we succeeded, after three years, in getting the plant going. It is no exaggeration to say that the many continuous plants now erected all over the world have benefited from our pioneer work which was carried out in close collaboration with the Morgan Construction Co. of the U.S.A. who designed the plant and with whom we have since maintained a close co-operation.

From this very humble beginning your works has been developed into the largest unit of its kind in the country and, to the best of our knowledge and belief, in the world. I have purposely made these details known to help to disprove any suggestion of lack of initiative and enterprise on the part of the steel industry. There are many similar examples of private enterprise taking great risks to lay the foundations of what have now become the most efficient steel plants in the country.

PRODUCTION CONSCIOUS

There is little wonder, therefore, that your board is more than apprehensive at any suggestion of nationalisation which, as far as one can understand, is based upon purely political motives. It is not enough for the supporters of nationalisation to claim that change of ownership can at the worst do no harm; it can only be justified if it can be proved to do good by resulting in the industry being able to increase the production of steel and/or to decrease the cost of production.

The magnificent production figures which have been published from time to time have confirmed quite clearly that the industry is "production conscious" and the complete absence of labour troubles is proof of the harmonious relations which exist with the grand body of men the industry is proud to employ. As regards costs of production, one has only to compare our home prices with those of other countries to see how very favourably we stand. I am satisfied that the cost of production in your own company is equal to, or even lower than, the cost of any similar plant in the world. Your board is therefore unanimously opposed to nationalisation. They consider that any such proposal in these very critical days would have a devastating effect on the economy of the whole country.

A STUPID FALLACY

It has been suggested that nationalisation of the iron and steel industry would ensure full employment for its workers. I am sure it is quite unnecessary for me to say that this is a stupid fallacy which no intelligent person would accept for one moment. The steel industry has never been opposed to govern-

mental control over general policy; but this can be, and indeed has been, exercised without state ownership.

Our relations with labour have been most harmonious throughout the whole history of the company, and the past year has been no exception. Every man has worked well with that loyal team spirit which is so marked a feature throughout the steel industry. It has resulted in excellent outputs and complete freedom from labour troubles.

The report and accounts were adopted, and the recommendation to pay a final dividend of 17½ per cent. (actual) was accepted.

ASSOCIATED BRITISH PICTURE CORPORATION

SIR PHILIP WARTER'S STATEMENT

The twenty-second annual general meeting of the Associated British Picture Corporation, Limited, was held on August 4th in London, Sir Philip Warter, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:—

The trading profit of the group shown by the consolidated profit and loss account amounts for the year to March 31, 1949, to £2,038,762, compared with £2,026,110 for the previous year. This slight increase results from increased revenue from the group's cinemas after providing for production losses.

After providing for a total distribution of 20 per cent. on the ordinary stock, compared with 22½ per cent. for the previous year, requiring in all £409,750, and after transferring £100,000 to general reserve, the balance carried forward on profit and loss account is £157,620.

EXHIBITION AND PRODUCTION

The results of the group's cinemas show an improvement over the previous year, when business was adversely affected by the exceptionally fine summer of 1947. The supply of product during the year under review from both British and American sources was in the main of satisfactory quality.

A comprehensive survey of all aspects of the cost of cinema operation has been carried through during the year, as a result of which economies have been introduced which will help towards meeting the substantial increase in operating expenses.

No less than £7,376,944 entertainments duty was paid on gross takings of £19,675,739 and once again I must stress the serious position into which the industry is drifting owing to this excessive burden.

Under the Cinematograph Films Act, 1948, an Order was in operation for the second half of the financial year which provides that 45 per cent. of the first feature playing time shall be devoted to British pictures, and while every effort has been made to secure sufficient British films of suitable quality to meet this requirement the position in those cinemas which change their pro-

grammes more than once a week is becoming increasingly difficult.

It is to be hoped that the Board of Trade will find it possible to introduce amending legislation to give your corporation the same rights as the smaller circuits and independent cinemas so that we could obtain relief in those situations where we have two or more cinemas and where it is commercially impracticable to play identical programmes.

DISTRIBUTION

During the course of the year your board took the necessary steps to change the name of Pathe Pictures, Limited, to Associated British-Pathe, Limited, in order to emphasise the close relationship between the production and distribution companies. The film laboratories are now in course of reconstruction and re-equipment, involving expenditure of approximately £200,000.

While the trading results of the corporation during the current year are satisfactory, so far, the general tendency has been for costs to rise. On the other hand, short of some assistance from the Chancellor of the Exchequer on the scale of entertainments duty, net receipts cannot be expected to increase, and it must, therefore, be assumed that the trend of theatre earnings will be downwards. Much will depend on the results of the production side of our business and the box office quality of other British films we must exhibit to fulfil the requirements of the Cinematograph Films Act.

The report was adopted.

NOTICES

LANCASHIRE COUNTY COUNCIL COUNTY PLANNING DEPARTMENT

Applications are invited for the following appointments:—
HEADQUARTERS' OFFICE, PRESTON.

(a) *Sectional Planning Officer (Development)*

(A.P.T. Grade VIII)

The commencing salary will be within the range of £685 x £25-£760 per annum, according to qualifications and experience. Candidates for this appointment should possess one or more of the following or equivalent qualifications—a University Degree or Diploma in Architecture, Engineering or Surveying, A.M.T.P.I., A.M.I.C.E., A.R.I.C.S., A.M.I.Mun.E., A.R.I.B.A.

Applicants should have had considerable experience in the preparation of Development Plans under the Town and Country Planning Act, 1947, and the administration of development control. The successful candidate would be expected to supervise the work of staff on lower grades.

(b) *Sectional Planning Officers (Architecture)*

(A.P.T. Grade VIII)

The commencing salary will be within the range of £685 x £25-£700 per annum, according to qualifications and experience. Applicants should possess a University Degree in Architecture and/or be corporate members of the Royal Institute of British Architects. An additional qualification in Town and Country Planning would be an advantage.

Experience is essential in the planning of residential, industrial and central areas and the successful candidates would be expected to supervise the work of staff on lower grades.

(c) *Senior Planning Assistants (Architecture)*

(A.P.T. Grade VI)

The commencing salary will be within the range of £595-£660 per annum according to qualifications and experience.

Candidates for these appointments should possess a University Degree in Architecture and/or be corporate members of the Royal Institute of British Architects. Previous planning experience is not essential, but preference will be given to applicants who also possess a qualification in Town and Country Planning and have had experience in the preparation of detailed plans for residential, industrial and central areas.

(d) *Planning Assistants (Research)*

The commencing salary will be fixed according to experience and qualifications, the maximum not exceeding £525 per annum.

Candidates should be University Honours graduates in Economics, Agricultural Economics or Sociology. The duties attached to the appointment will include the preparation of comprehensive rural, agricultural, industrial and economic surveys and candidates should possess a genuine interest in the problems of the countryside and/or a sound knowledge of the problems of industrial location.

BLACKPOOL DIVISIONAL PLANNING OFFICE

(e) *Sectional Planning Officer (A.P.T. Grade VIII)*

The commencing salary will be within the range of £685 x £25-£760 per annum according to qualifications and experience.

Applicants for this appointment should possess one or more of the following or equivalent qualifications—a University Degree or Diploma in Architecture, Engineering or Surveying, A.M.T.P.I., A.M.I.C.E., A.R.I.C.S., A.M.I.Mun.E., A.R.I.B.A.

The successful candidate will be in charge of the Divisional Planning Office to be established in the vicinity of Kirkham and will be responsible, under the direction of the Divisional Planning Officer, for the planning work of that part of the Administrative County surrounding the County Boroughs of Blackpool and Preston.

(Continued in next column)

Experience in the preparation of Town and Country Planning Schemes and the administration of the relevant Acts and Orders is essential.

LANCASTER, BLACKPOOL, PRESTON, KIRKHAM, WIGAN AND BURY DIVISIONAL PLANNING OFFICES.

(f) *Senior Planning Assistants (A.P.T. Grade VI)*

The commencing salary will be within the range of £595-£660 per annum according to qualifications and experience.

Candidates for these appointments must possess one or more of the following or equivalent qualifications—a University Degree or Diploma in Architecture, Engineering or Surveying, A.M.T.P.I., A.M.I.C.E., A.R.I.C.S., A.M.I.Mun.E., A.R.I.B.A.

Previous planning experience is not essential, but preference will be given to persons who have had a good general experience in the preparation of Town and Country Planning Schemes and the administration of the relevant Acts and Orders.

The appointments will be subject to the Scheme of Conditions of Service of the National Joint Council and to the provisions of the Local Government Superannuation Act, 1937.

Applications stating age, qualifications, experience and present salary, together with the names and addresses of two persons to whom references may be made, should be forwarded to the County Planning Officer, County Office, Preston.

Applicants should state clearly for which appointments they wish to be considered.

R. H. ADCOCK, Clerk of the County Council.
County Office, Preston.

NEWLY-ESTABLISHED firm specialising in textile exports requires active, experienced man with thorough knowledge of foreign markets and textile trade. Only one with established markets need apply. No financial liability but good salary and profit-sharing basis.—Box 183.

ATTENTION all Executives, Young Economist and Engineer: A.M.I.E.E., M.I.R.E., M.A. (Honours Engineering); Assoc. Brit. I.R.E.; just taken final B.Sc. (Economics); full apprenticeship electricity supply industry; Squadron Leader (Tech.) at 22; widely travelled; highest references; seeking appointment where initiative, hard work essential, preferably personal assistant to high executive London area. Box 160.

OLD-ESTABLISHED, British-owned, financial and commercial weekly, published in Calcutta, will have vacancy in the autumn for un married editor's assistant with economic background, who is able to write on trade, industry and finance, preferably with some previous newspaper experience. Usual passage, etc., terms. Engagement will in first place, be on short-term basis and for trial period. Ability to write interestingly, rather than close knowledge of newspaper production, is chief requirement.—Reply, Box 167.

YOUNG MAN (23), public school education, Oxford B.A., London B.Sc. (Econ.), seeks interesting post or traineeship in business. Languages and some administrative experience.—Please write Box 161.

INTEREST 3½ per cent on Shares and 3 per cent on Deposits FREE of EIRE INCOME TAX paid or credited to account twice yearly.—Particulars from PROVIDENT BUILDING SOCIETY, 3, St. Stephen's Green, Dublin.

BOOKCASES, solid and sectional (including the 79/8 solid Mahogany case and Patana book units from 16/8). Write or call for details.—Phoenix Gallery, 38, William IV St., Chancery Place, W.C.2.

FOR SALE, "The Economist," July 19, 1947, to September 18, 1948.—J. O'Reilly, Turlough Road, Castlebar, Eire.

YOUNG lady, good personality, appearance, versatile, University education, Hon. Eng. French, desires interesting situation, willing travel.—Box 178.

THE ROYAL TECHNICAL COLLEGE, GEORGE STREET, GLASGOW, C.I.

DEPARTMENT OF INDUSTRIAL ADMINISTRATION
COURSES IN WORKS MANAGEMENT AND PERSONNEL MANAGEMENT

Full-time courses in Works Management, and Personnel Management, will be held next session, extending from September 19, 1949, to May 26, 1950.

The Works Management Course will be concerned primarily with modern managerial techniques as aids to increased productivity. It is intended for persons of mature years with adequate academic qualifications, and preferably some industrial experience.

The Personnel Management Course, which is run in co-operation with the Glasgow and West of Scotland Commercial College, is intended for persons with similar qualifications who wish to specialise in this branch of management.

Further particulars may be obtained from the Secretary of the College.

UNIVERSITY OF NATAL

Applications are invited for two appointments at Durban: SENIOR LECTURER AND LECTURER IN THE DEPARTMENT OF SOCIOLOGY AND SOCIAL WORK.

Candidates should have post-graduate qualifications in Sociology and research experience.

Salary scales are:

Senior Lecturer	(men)	£600-£25-£900
	(women)	£550-£25-£725
Lecturer	(men)	£550-£25-£725
	(women)	£425-£25-£600

plus cost-of-living allowance.

Further particulars and information as to method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. Closing date for the receipt of applications is October 1, 1949.

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with limited liability).—DIVIDEND NOTICE.—ORDINARY CAPITAL STOCK.—At a meeting of the Board of Directors held today, a dividend of two per cent (fifty cents per share) on the Ordinary Capital Stock in respect of the year 1949 was declared payable in Canadian funds on October 1, 1949, to shareholders of record at 3 p.m. on August 22, 1949. The Directors call the attention of the shareholders to the fact that the heavy disproportion between Railway expenses and revenues still continues and that no relief has yet been given in respect of the application for an increase in freight rates. This interim dividend is paid wholly out of other income of the Company. By order of the Board, FREDERICK BRANTLEY, Secretary. Montreal, August 8, 1949.

SALES MANAGER (Administrator) required for Motor Body Component Manufacturers, situated in Birmingham. Knowledge of motor trade not essential if applicant has sound commercial ability. Excellent salary and commission, and very good prospects. —Box 147.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1844) moderate fees payable by instalments, if desired.

After the German Elections

IT is now certain that the first federal government of Western Germany will be a coalition of the Right. The Christian Democrats have emerged as the largest party, though they have failed to secure an absolute majority. In order to form a government, they must, therefore, enter into a coalition with the Liberals—liberal in the continental sense, extreme Conservative in the British. The Free Democrats, Germany's "liberals," obtained 52 seats, and these, with the Christian Democrats' 139, give the bourgeois bloc a comfortable majority over the 131 seats of the Socialist Democrats, the great party of the Left—in fact, for the time being, virtually the only party of the Left. Although the Communist vote remained above a million and did not fall catastrophically compared with the showing in the earlier elections in the separate *Länder* or provinces, the Communist Party obtained no seats by "direct" vote—even their leader, Max Reimann, was defeated—and only fifteen seats by the indirect form of proportional representation by which 40 per cent of the seats were allotted.

The Christian Democrats and their colleagues do not, however, have to think only of the Socialist opposition. Christians and Liberals together command only 191 out of the Bundestag's 402 seats, and to their right a number of small parties and a group of Independents have between them collected two to three million votes and close on 80 seats. By voting against a coalition of the Moderate Right, they could upset it, and it may be necessary to secure the support of these men by admitting one or two representatives into the Cabinet. Such a move will tend to shift the centre of gravity of the Coalition further to the right, since the smaller parties—the German Party and the German Right Party—are fanatically nationalist. The Bavarian Party is no exception to this save that its nationalism takes the form of separatist pan-Bavarianism.

The only alternative to a government of this kind would be a coalition of Christian Democrats and Social Democrats. Some outside observers, remembering the moderate and effective administration provided by such a team under Dr. Arnold's leadership in North-Rhine Westphalia, have hoped for such an outcome in federal politics, but there appears to be no prospect of it. The Christian Democrat leader, Dr. Adenauer, and the Socialist leader, Dr. Schumacher, have outdone each other in bitter abuse during their electoral contest. The strong support given by the Churches to the Christian Democrats has roused the traditional anti-clerical feeling of the Social Democrats; above all, the two parties have so few issues on which they agree at present that a government based upon their co-operation would be a stalemate, not an administration. But this inability of the Christians and the Socialists to agree may be no bad thing for the development of healthy politics in Germany. The existence of a large democratic and constitutional party in opposition makes it impossible for the Communists to exploit all the difficulties and grievances which are bound to arise as economic conditions grow

less favourable; it also leaves the German people with a constitutional alternative, should the peculiarly naïve brand of *laissez faire* professed by the Right in Germany fail to provide the answer for the country's phenomenal problems of economic readjustment.

The real temper of both government and opposition cannot be fairly tested until both are at work at Bonn, but one fact does emerge clearly from the elections. The Germans took them seriously. Urged by the Communists to show their indifference by abstention, they achieved practically an 80 per cent poll and gave the lie to the Communist contention that they see in the coming into being of a government in western Germany the chief obstacle in the way of German unity. The size of the vote shows that most Germans would rather run their own affairs in two-thirds of Germany than have them run for them in a reunited Reich. The Bonn Government will therefore start work with the solid support of the great mass of Germans if not for all its policies, at least for its existence.

This fact may create new problems for the occupying powers. It is certain that the claims of the Federal Government to increased powers and a more unfettered use of those the Germans now enjoy will grow steadily. Already in the course of the elections promises were made—on food supplies, on taxation, on capital on loans—which are not at the moment within the competence of the German authorities to decide. They will soon wish to do so. Moreover, the existence of a large organised opposition is bound to increase the pressure for greater freedom of action. Dismantling provides an outstanding example. The Socialists made it a central theme in their electoral propaganda. It will be one of the first issues upon which they will urge the government to take action. The government, with public opinion solidly opposed to dismantling, can remain passive only at the risk of losing future votes. Whether it wishes to or no, it will be compelled to press for a drastic reduction of the dismantling programme. In point of fact, since the right wing parties are more nationalist than the Social Democrats, the government is almost certain to take up the question on its own initiative without waiting for the gibes and prods of the opposition. The Allies have, in fact, to realise that the experiment of government which they have initiated in Bonn will now run further and further beyond their control. They will not be able to put constant restraint on anything as dynamic as the determination of an historic European nation to run its own affairs. They have a few months in which to make up their minds what their attitude will be. After that, events will decide their policy for them.

Their immediate reaction may well be a desire to clamp down still further controls on the Germans. The electoral campaign can have given little comfort to genuine demo-

crats anywhere. It was conducted on all sides in an atmosphere of hysteria. All the most unpleasant characteristics of a not very attractive people came to the surface. Germany's repellent record in the international affairs of the last seventy years was forgotten. History began in 1945 and everything was the fault of the occupying powers. All parties, including the solid democratic parties, outdid each other in abuse of the Allies and at times the voices of Dr Adenauer, of Dr Schumacher and of General Loh, who helped Hitler to crush the 1944 revolt, were indistinguishable. If this is the mood behind German politics, can it be wise to transfer more power to a German government? On the contrary, does not the electoral campaign prove that more vigilance, not less, is necessary?

In fact, however, the German government of the Allies' dream—modest, grateful and accommodating—does not

exist and never will. As the memory of defeat fades, each successive German government is likely to become more unmanageable. What the western powers have to remember today is that the present situation in Germany, in which the two largest parties on the Right and the Left are constitutional and democratic parties, is the best political situation they are ever likely to obtain. The transfer of power is not made to these men, the men who come afterwards are likely to be even more unworthy to receive it. The pressure on the Bonn Government will be tremendous. The grievance of the Oder-Neisse line and the presence of the refugees will be quite enough to keep national-

ism in a state of exacerbated fury. If the present administration cannot point to a real attainment of national sovereignty and a real achievement of European status, the nationalist tide may sweep it away to bring in the Remers and the Strassers and the Lörzies in its place. Economic difficulties will, at the other extreme, provide the Communists with admirable weapons of disintegration. Once again, the government will be able to maintain its prestige only if it can point to solid gains, both economic and political, in its relations with the western world.

In a word, the only safe policy for the western powers to pursue at this point is to accept the Bonn Government into their own community and to abolish all save the final essential controls on military rearmament. There are no safe halfway houses in the treatment of a defeated enemy between complete repression and complete equality. In setting up the Bonn Government the Allies have rejected the former; they have no option but to press on with the alternative. The Occupation Statute should be drastically revised, and its functions virtually restricted to the oversight of German civil liberties. Economic controls—that is to say, those im-

* Many varieties, mainly Right-wing.

posed by the occupying powers—should be completely removed and western Germany brought fully into the Organisation for European Economic Co-operation; the restraints on its economic freedom of action should be no greater than those imposed by the ECA on other countries receiving American aid. The task of the Military Security Board should be reduced to preventing the production in Germany of certain vital end products—tanks, guns, atomic energy—without which war cannot be waged. For the rest, all limits on German production should be removed and all save military dismantling programme ended. The German members of the Ruhr Authority should be invited to take office at once and the attempt should then be made to turn the body into an instrument of European economic reconstruction. The Free Democrats are already, in the name of free enterprise, calling for international cartels. The Ruhr Authority might be extended to other countries and made an instrument of international capital planning and expansion instead. Lastly, the Bonn Government should, as Mr Churchill has suggested at Strasbourg, be brought without delay into the Council and Assembly of Europe.

Such a programme, carried through with energy and

vision, might give the new government the backing and prestige it desperately needs to check the ominous increase in nationalist hysteria, to counter the grave economic problems that lie ahead and to hold in check Communist propaganda for the reunion of Germany on Russia's terms. The concessions outlined above will in fact in the long run be made, simply because the western powers have neither the will power nor the desire to sit on the Germans' heads for ever. But the danger is that they will be made slowly and grudgingly, wrung from the occupying powers by increasing onslaughts of nationalist fury, each concession whetting the German appetite for more and convincing it of the invincibility of force in politics. The German government elected last Sunday may be the only government to which it is safe to make any concessions at all, and since they will in any case be made, they should be made at once. Only in this way can German democracy receive the flying start it needs in order to establish itself. Without it, the history of the interwar years may well be repeated in ten years' time. The privileges and powers the Allies do not concede to the Bonn regime may be snatched from them by an aggressive and resurgent Reich.

Currency Unions

THE idea of currency unions is very much in the air. Reports from Strasbourg suggest that there is more talk in the *coulours* there of a European currency union than of a European federation or customs union. Mr Bevin, in his speech in the debate on economic affairs before the House of Commons rose for the recess, applied the same idea, with all his usual vagueness, to the relations between the pound and the dollar. There have been answering voices from Washington—though not from official sources—and the *Wall Street Journal* has openly advocated a "financial union" between Britain and America.

It is, indeed, a very sensible idea, one of those obviously sensible ideas that appeal irresistibly to the ordinary man. Currency difficulties lie at the centre of every economic problem today. And not of economic problems alone, for how can the idea of political unity in western Europe hope to make progress if unofficial Europeans cannot even go calling on each other, except within the limit of an allowance of currency which barely suffices for a short holiday? If so much in commerce and in other forms of intercourse, which would otherwise be perfectly possible, is held up simply by the difficulty encountered in changing one currency into another, surely it is obvious common sense to sweep all these national currencies away and simply have one international currency to serve the whole world.

The purpose of this article is neither to advocate nor to oppose the creation of currency unions, but simply to examine and explain what would be involved in any such proposal. First, perhaps, it is necessary to be quite clear about what is meant. Obviously, any proposal that would leave the different national currencies in separate existence and confine itself to suggesting that they should be freely convertible into each other would be impracticable. The whole present difficulty arises from the fact that sterling cannot be converted into dollars; and it would do nothing to solve the difficulty merely to act as if it did not exist. The only sort of currency union that is worth examining is a complete one, in which two or more countries agree to use identically the same currency. The pieces of paper handed over the counters of shops would be the same in both (or all) countries, and could be carried as freely from one country to the other as Bank of England notes can be carried from London to Edinburgh. Any lesser proposal simply "solves" the problem of convertibility by resurrecting it in a slightly different form. If "currency union" is to make any contribution at all, it will have to sweep away the whole question of convertibility by removing the possibility or necessity of conversion—that is, by using the same form of money in all the participating countries.

To sharpen the argument, it will be assumed in this article

ALLIANCE

The Alliance undertakes the duties of Executor and Trustee and of Trustee for Debenture Issues.

that what is proposed is a currency union between the United Kingdom and the United States, using the dollar. On January 1, 1950, all Bank of England sterling notes would be replaced by dollar notes at some fixed rate of conversion. All bank accounts would simultaneously be translated from pounds shillings and pence into dollars and cents and subsidiary coins would similarly be exchanged. Thereafter, dollars would be used for all purposes in the United Kingdom exactly as they are used in the United States and no problems of exchange or conversion could arise. It makes no difference to the argument whether the dollar currency would be issued, after the union, by the United States authorities or by some joint or international authority. The crucial point is that it would be issued by a body over which the British Government, and British law, did not exercise unquestioned control.

The question for examination is what would be the consequences of such an operation.

Certain technical difficulties would arise at once in the money market. The reason why British Government securities are gilt-edged in the London Money Market is because no doubt whatever exists about the ability of the British Government to pay them off at their due dates in sterling currency, having the privilege of legal tender. Everybody knows that, if the Government cannot possess itself of sterling by any other means, it can arrange for the creation of the necessary credit. And the banking system would acquiesce in the creation of the credit because it knows that the Government can, and would, provide it with enough legal tender currency to enable it to discharge any obligations that might fall upon it as a result of the creation of credit. A currency may rise or fall in real value, but the essential thing for all domestic, commercial and financial transactions is that it should suffice to meet the legal obligations of those who hold it. Experience shows that a currency possessing this privilege of legal tender has to become quite fantastically unstable in real value (that is, in purchasing power) before it begins to be unacceptable to the general public.

What would happen if the British Government suddenly lost the power to create legal tender currency, if that power were transferred to some other government or to an international body? One of the first effects would be that British Government securities would become much more risky investments. Their redemption on maturity could no longer be regarded as a certainty; it would depend on whether the

British Government, at that time, could possess itself of a sufficient number of dollars, which would obviously be a very much less certain proposition. It is true that the incomes of the inhabitants of Great Britain would also be dollar incomes, and that the tax revenue of the British Government would therefore be dollar income. But this raises the further question of how the British people would earn their dollar incomes, to which we must turn in a moment. The immediate point is that Britain's membership of a currency union would remove from the British Government the power to create money either for the payment of its internal debts or for any other purpose. Some people would argue that this might be all for the good. It is a historical fact that most of the political liberties of western

Europe were wrung from the sovereigns of past centuries precisely because they could not create money (which then consisted entirely of gold and silver), and it may be that the power of creating money is too great to be entrusted to any government. And on the economic side, there are those who hold that the deliberate interventions of governments in monetary matters have done more harm than good, and that it would be better if currency and credit were beyond the reach of politicians. These arguments are tenable; but they are certainly not either popular or fashionable. A government that lost its financial sovereignty would be reduced, in matters of high economic policy, to the position of a local authority. Among other things, it would be unable to go to war (by itself, at least), for every war

involves the massive creation of credit. It would also be unable to pursue a full employment policy, as those words are understood nowadays. That, and any other policy involving the use of the credit-creating power, would necessarily have to be left to the political authority that effectively controlled the issue of the legal tender currency. It is no part of the task of this article to argue whether such a surrender of economic policy-making power would be good or bad, but only to insist that it would be an inevitable consequence of any currency union.

We still have not, however, reached the heart of the matter. Why is there a balance-of-payments problem between the United Kingdom and the United States? Because, although Britain has reduced its imports from, and encouraged its exports to, the United States as much as it can, the British people still manage to sell less to the United States, directly

"Wait—Let's Start From The Beginning—If You Have Four Apples—"

Herblock in the Washington Post

or indirectly, than they buy from the United States. If the present impediments to the conversion of pounds into dollars were removed (there are no impediments to the conversion of dollars into pounds) the deficit would be very much larger. If the currency union were accompanied by a customs union, the deficit would be larger still, since the American tariff, high though it is, does not limit British sales to America nearly as much as the British trade restrictions limit American sales to Britain. And if there were freedom of capital movements, the deficit would be still further enlarged.

The immediate effect of a currency union would, therefore, be greatly to increase Britain's deficit in its trading relations with America. The deficit would no longer present itself in the guise of a shortage of dollars for conversion into pounds, for all accounts would be in dollars. But that does not mean that it would not present itself at all. Balances of payments are usually compiled for whole nations treated as units. But every town or county has its balance of payments in the sense that the people who live there must somehow contrive to have as much money coming in from the outside world as they pay out. If the inhabitants of Edinburgh were consistently to pay out to the whole of the rest of the country more than they take in, there would be a steady flow of currency out of Edinburgh and a steady transfer of credit from bank accounts in Edinburgh to bank accounts elsewhere. This is what would happen if the United Kingdom were to enter into a currency union with the United States while still remaining in commercial deficit. The dollars originally provided in exchange for the sterling currency that was withdrawn from circulation would steadily drain away to the United States, and there would be a similar steady transfer of bank credit from banks in Great Britain to banks in the United States.

*

In short, the immediate effect of a currency union would be to impose on the British people a very sharp deflation of the classical type, due to a rapid fall in the quantity of currency and credit in circulation. Moreover, as has already been explained, the British Government would be unable to take any remedial action. Indeed, since it would itself be experiencing a sharp fall in its receipts from taxation, it would be compelled to intensify the deflation. The whole of the United Kingdom would become a depressed area, dependent on such charitable assistance as might be forthcoming from

the more prosperous parts of the currency union, until such time as, by reducing its wage rates and other costs of production or by lowering its standard of living, it once again earned as much as it spent.

It may be, once again, that such draconian methods of restoring the British balance of payments to a healthy condition would turn out, in the long run, to be the best, that a sudden sharp forced adjustment would be better than chronic crisis. But it is not a remedy that is often advocated in public, and those who support currency unions ought to be made aware of exactly what it is they are proposing.

It may be asked why, if the effects of a currency union between two nations would be so startling, they are not more perceptible as between two parts of a nation. Why, for example, is it that the southern states of the American Union do not suffer from a steady drain of currency? The answer is that they have never been allowed to get nearly as far out of alignment with the rest of the country. As soon as a deficit in the balance of payments arises, it is reflected at once in the personal finances of individuals, who are compelled to work harder or to emigrate. Moreover, since the southern states form one taxing unit with the rest of the American republic, they can receive large hidden subventions through the ordinary means of paying less taxes and receiving more benefits of one kind and another.

The moral of this discussion is not that currency unions are bad things. On the contrary, like all other forms of human unity, they are highly desirable. It would be wonderful (once the initial adjustments were made) to have free movement of money across the Atlantic. The moral is the old familiar one that there is no magic in monetary arrangements. So long as the commercial accounts between Britain and America are not balanced, the institution of a currency union would not solve the problem but would rather precipitate it in an aggravated form. It would create a situation in which either Britain would have to endure the sharpest deflation the world has ever seen, or else that the United States would have to provide subsidies far larger than the Marshall Plan.

As the Belgians and the Dutch are discovering, it is not schemes of union that create economic balance, but the attainment of economic balance that alone makes schemes of union—either of currency union or of customs union—feasible. There are no short cuts.

Lost Ally

IN announcing the publication of the White Paper on United States relations with China,* released on August 5, President Truman declared that his primary purpose in having "this frank and factual record" given to the American people was "to ensure that our policy towards China and the Far East as a whole shall be based on informed and intelligent public opinion." The report, which is intended to clear the mind of the man in Main Street, consists of 1054 pages, most of them in small print, and although interest in international affairs is undoubtedly widespread in America, it may be doubted whether many citizens will honestly read such a tome through to the end. For most Americans, indeed, it will probably be Mr. Acheson's covering letter which will be noted, and the rest will be taken as read. The White Paper, nevertheless, repays study, and not only for Americans, since it throws a vivid light on the process of

* United States Relations with China, with Special Reference to the Period 1944-1949. Department of State Publication 3573. Far Eastern Series 30.

events whereby the nation which was in some respects America's favourite wartime ally has been transformed, except for a surviving remnant, into an active enemy.

For two or three years after Pearl Harbour, American official circles accepted a picture of China as a postwar Great Power and main factor of stability in the Far East. It was expected that, after the common victory over Japan, China, with American support, would become strong enough to ward off any future Japanese aggression, and would further, with appropriations of Japanese industrial plant from Manchuria and from Japan itself as reparations, supplemented by American capital goods, replace Japan as the leading industrial nation of Asia. This rôle of China was not intended to be a threat to Russia, though it implied that in future China would be able to hold its own against its mighty northern neighbour no less than against Japan and thus keep a Far Eastern balance of power. So anxious was the United States to avoid any provocation of Russia by the building up of China that Washington was ready to regard Manchuria as

a Russian sphere of influence and to restore to Russia the position there, incompatible with China's full sovereignty, which Tsardom had held in 1904. The White Paper justifies the notorious secret treaty of Yalta on the ground of military necessity; it was Russia's "price" for the entry into the Pacific war, which turned out to be superfluous, but which President Roosevelt's military advisers at the time considered highly desirable. But even without these war-winning calculations, the American purpose was to satisfy, as far as possible, Russia's security requirements, and America's willingness to extort from China a new cession of Port Arthur to Russia was at least a proof that American policy in China at that time was not anti-Russian.

★

Nor, indeed, was it even anti-Communist. While the Pacific war was still going on, the United States made strenuous efforts through its Ambassador in Chungking to reconcile the Kuomintang and the Communists so that they could combine their forces effectively against the Japanese. After the war was over, there was the mediatory mission of General Marshall. In these attempts at a settlement American policy aimed at Chinese national unity and avoidance of civil war, and considerable pressure was put on the Chinese Government to compromise with the Communists. As Mr Acheson puts it:

Both internal peace and constitutional development required that the progress should be rapid from one-party government with a large opposition party in armed rebellion, to the participation of all parties . . . in a truly national system of government.

Far from trying to perpetuate Kuomintang "tutelage" in China, and to eliminate the Communists, the Americans sought to create a political democracy inclusive of the Communists. What they failed to realise was that both the two contending parties in fact aimed at dictatorial power: neither had any real attachment to the concept of parliamentary democracy, of which China had never had any experience or tradition. The American attempts at mediation were foredoomed to failure, and their only result was to help the Communists by putting America into the public role of meddler in Chinese internal affairs. The Nationalists strongly resented the American pressure to make them come to terms with the Communists; they claimed that the Communists had no desire for a settlement except on their own terms and that they merely used the truce period for the purpose of building up their strength.

If the Americans had put into the task of reforming the Chinese Government's civil and military administration a fraction of the energy and resolution that they employed in trying to hold it back from fighting the Communists, the course of events in China might have been very different. But while more than willing to assume responsibility for composing an irreconcilable feud in a foreign country, the United States Government shied away from such interference as might have ensured the application of its economic aid to the purposes for which it was intended.

The explanation of this paradox is to be found in the basic American attitude towards China. The Americans did not want to be involved in a civil war at all; they wanted to help a unified China. In the instructions given to General Marshall in December, 1945, President Truman authorised him to do all he could to bring about the "unification of China by peaceful, democratic methods" and to impress upon all Chinese political leaders that a China "disunited and torn by civil strife" would not be a proper beneficiary of American aid. It was only when mediation finally broke

down that American policy fell back on support of the Chinese Government in warfare against the Communists as a *pis aller*, and the reluctance with which help was given precluded the measures which might have made it effective. The Americans were well aware of the defects of the Kuomintang regime. But this knowledge did not cause them to make their aid conditional on reforms; on the contrary, their fear of being too closely identified with one side in the civil war led them to hand out money and supplies virtually without conditions and to aggravate, instead of curbing, the evils of which they complained.

The Americans gave plenty of good advice, both in the military and economic fields, but it was constantly ignored by President Chiang Kai-shek and his army leaders, and was never imposed upon them because the American Government never made the continuation of assistance definitely dependent on certain decisions being taken. One of the most interesting documents in the White Paper is the report on the military campaigns by General Barr of the United States Advisory Group in China; it leaves no doubt but that acceptance of American advice would have saved the Nationalists from their more serious blunders in strategy and operational planning. But General Barr was only allowed to give advice on "an informal and confidential basis" and was informed in a directive from Mr Marshall as Secretary of State in November, 1947:—

I am, however, not willing that we should accept responsibility for Chinese strategic plans and operations. I think you will agree that implications of our accepting that responsibility would be very far-reaching and grave and that such responsibility is in logic inseparable from authority to make it effective.

As the American Government feared such responsibility, it reduced itself to the role of pouring hundreds of millions of dollars into China while remaining a helpless spectator of the uses to which its aid was put. No Robert Hart, not even a Ward or Gordon, figured in this vast benefaction, which, despite the will to non-involvement, could not be regarded by the Chinese or by the world at large as other than a major political intervention. Any assumption of controlling powers by Americans in China would no doubt have been irritating to Chinese patriotic sentiment, but it would, if plainly directed to measures of reform, have been less unpopular in the long run than aid which merely bolstered up the power, and lined the purses, of a corrupt ruling clique.

★

The Kuomintang since VJ Day has remained essentially such as it had become by the summer of 1944, when an American Foreign Service observer thus described the situation:

China faces economic collapse. This is causing disintegration of the army and the government's administrative apparatus. . . . The governmental and military structure is being permeated and demoralised from top to bottom by corruption, unprecedented in scale and openness. The intellectual and salaried classes, who have suffered the most heavily from inflation, are in danger of liquidation. . . . Peasant resentment of the abuses of conscription, tax collection and other arbitrary impositions has been widespread and is growing. . . . Economically, the Kuomintang rests on the narrow base of the rural gentry-landlords and militarists, the higher ranks of the government bureaucracy, and merchant bankers having intimate connections with the government bureaucrats. This base has actually contracted during the war. The Kuomintang no longer commands, as it once did, the unequivocal support of China's industrialists, who, as a group have been much weakened economically, and hence politically, by the Japanese seizure of the coastal cities.

Such a regime, emerging from eight years of devastating war against a foreign invader, could not, without drastic renovation, prevail over the dynamic revolutionary vigour and fanatical faith of the Communists. Amid the economic and social ruins left by the ebb of the Japanese tidal wave, the Communists snatched from the Kuomintang the initiative both in strategy and political leadership. Already in 1944 an American junior diplomat in China was predicting a Communist victory and advising that

we must limit our involvement with the Kuomintang and must commence some co-operation with the Communists, the force destined to control China, in an effort to influence them further into an independent position friendly to the United States.

Had the Chinese Communists, indeed, been merely Chinese revolutionaries without any fixed international alignments, Washington would not merely have accepted, but might even have welcomed, their rise to power. But the lines of division in China had been too sharply drawn since the Kuomintang-Communist collaboration and subsequent split in 1925-27, so that the only alternative to Kuomintang rule was a leadership thoroughly indoctrinated with Marxism-Leninism, and therefore ideologically committed to the theory of the basic world-wide conflict of imperialist and anti-imperialist camps.

At the end of 1945, when General Marshall was sent to China, there was still a lingering faith in Russia's desire to co-operate with the West in a postwar settlement; there was

also much talk, encouraged by the Communists themselves, about the Chinese Communists being merely agrarian democrats, quite different from the Russian comrades. But by 1947, with the bloc of Soviet satellites in Eastern Europe openly organised in blatant hostility to the United States, Washington found no good ground for assurance that the triumph of Communism in China would have a contrary result. The rebellion of Tito indeed renewed the hopes of those who advocated a switching of American policy from propping up Chiang to seducing Mao. But it was only too evident that Tito's outlawry had been due neither to the skill of western diplomacy nor to Tito's wish to break away from the Soviet bloc, but to a Russian heavy-handedness which it could not be assumed would be repeated in China. In any case the Chinese Communists have so far done everything possible to assert their solidarity with the Cominform against Tito.

The dilemma for American policy remains. No "third force" has emerged in China, the Kuomintang has shown no sign of recovery—though it may still have a considerable nuisance value—and the Communists have shown no sign of backsliding from their dogmatic anti-Americanism. The choice is between supporting last-ditch resistance to the Communists in the hope of preventing the consolidation of their power, and coming to terms with them in the hope of mitigating their hostility. Neither course offers any encouraging prospect in present circumstances. For the time being the United States has to write off China as an ally.

The Nation's Ill-Health

THE nation's health, according to all official reports, is better than it has ever been; yet at the Royal Ordnance Factories absence because of sickness has risen phenomenally in the last twelve months, and in some cases is four to five times higher. For once, nobody is mincing words about this rise in absenteeism; it is put down, quite bluntly, to the introduction a year ago of a sick pay scheme whereby, for the first three months of their illness, the employees have made up to them the difference between their national insurance benefits and their basic wages. It is quite refreshing that nobody is pretending that there is no connection between the two—indeed, Mr Jack Jones, Parliamentary Secretary to the Ministry of Supply, has gone so far as to talk of malingering.

This is not the first time that a rise in sickness absence since the introduction of social security on July 5, 1948, has caused concern. The Ministry of Fuel and Power's weekly statistics show that "involuntary absenteeism" among mine-workers has been on a consistently higher level this year than in the corresponding period of 1948. The fact that voluntary absenteeism in the last week or two has regained its former lead over involuntary absenteeism only means that total absenteeism is higher than ever. What is certain is that since the introduction of higher sickness benefits on July 5, 1948, sickness absence has risen—not so phenomenally as in the Royal Ordnance Factories, simply because the miners are not so fortunate as to be given sick pay as well.

There should be nothing surprising about a rise in sickness absenteeism since July 5th last year. The Government Actuary based his estimate of the cost of social security on the likelihood of a rise of 12½ per cent in sickness rates over those that formed the basis of the former national health insurance scheme. But although the rise, if it does not

exceed 12½ per cent on the average, will consequently throw no unexpected strain on the social security budget, it may well have very serious effects on the national economy, for it is often accompanied, as in the coal mines, by a fall in productivity among those who remain at work. At a time when national recovery depends on a reduction in costs, in other words primarily on a rise in output per £ paid out in labour costs, a rise in sickness absence, which increases costs, cannot be regarded with equanimity.

It ought to be pointed out, however, that there is a long-term factor which adversely affects sickness rates, and that is the ageing of the population. The Chief Medical Officer of the General Post Office has attributed the high sickness rate among postmen since the war, as compared with before the war, to their much higher average age. Similarly, in the Metropolitan Police Force where the sickness rate was 4.45 per cent in 1948, compared with 2.66 per cent in 1938, the rise is attributed to the increase in the average age of the force and to the big increase in the number of men aged over 40. An ageing population is almost inevitably bound to have a rising sickness rate. What one must hope for is that it will be offset by a fall in voluntary absenteeism because of the greater conscientiousness and sense of responsibility which employers tend to find among their older workers.

Such statistics as exist do not show that over the country as a whole there has been an appreciable increase in sickness rates that can be solely ascribed to the introduction of social security. The survey of sickness carried out by the Social Survey each calendar month has now been published for the period covering the first six months of the social security scheme. The number of people who reported having been ill in the latter part of last year was virtually the same as in each of the two previous years, nor was there any

significant change in the prevalence of illness, that is, in the number of illnesses and injuries suffered per hundred persons interviewed. On the other hand, the monthly incapacity rates, that is, the number of days away from work on account of illness or, for those who do not work, the number of days they are confined to home (per hundred persons interviewed), do show a rise for all adults in the last two quarters of 1948 compared with 1947. But it is important to realise, as is clear from the accompanying table, that much of it is accounted for by the retired section of the population. The men of working age showed a much smaller rise, and compared with 1946 their incapacity rate was actually lower.

MONTHLY INCAPACITY RATES

	Ages				
	16-64		65+		All Persons
	Males	Females	Males	Females	
1946 :— Oct.-Dec.	114	86	132	122	102
1947 :— July-Sept. Oct.-Dec.	67 97	54 84	92 165	103 163	65 100
1948 :— July-Sept. Oct.-Dec.	78 100	68 105	102 183	184 344	84 126
1948 as per cent of 1947 :— July-Sept. Oct.-Dec.	116 103	126 125	111 111	179 211	129 126
1948 as per cent of 1946 :— Oct.-Dec.	88	122	139	282	124

These figures do not provide any evidence of a general decline in national morale or deterioration in stamina. There is no reason to believe that people as a whole are behaving irresponsibly and taking days off work for reasons of ill-health too easily. But even if only a small minority behaves like that—as the story of the Royal Ordnance Factories leads one to believe is the case—it may have much greater repercussions than appears in statistics of sickness rates, first, because of the effect on the productivity of those that remain at work and, secondly, because it may become infectious.

★

It is as well to distinguish between different forms of what can perhaps be called "benefititis." Malingering—that is, the deliberate feigning of symptoms—is very rare, and, in spite of Mr Jack Jones's accusations, the number who can obtain medical certificates to back them up is rarer still. Scrimshanking—that is, the deliberate exaggeration of a definite symptom such as a headache or a cough or "my catarrh, doctor"—is much more common, and it probably accounts for most of the trouble at the Royal Ordnance Factories. Scrimshanking, however, may shade off—the boundary line is not clear—into the unconscious or only partly conscious exaggeration and prolongation of symptoms because of the sickness benefits or sick pay the person is receiving while he

has them. Obviously, if a man has only his sickness benefit of 26s. a week to support him, he is not likely to prolong his symptoms indefinitely. But take a man who has contracted dermatitis from his work and is consequently drawing workmen's compensation of, say, 35s. a week plus national insurance of 26s. plus an allowance for his dependants. Is there not every incentive for him to remain at home and look after the house while his wife goes out and by part-time work earns enough to keep the family income at what it was, through much greater effort, before he became ill? How can his dermatitis possibly get better in those circumstances?

It is true that workmen's compensation cases will gradually disappear. Since July 5, 1948, workers contracting an injury or disease arising out of their employment are paid disablement benefit after 26 weeks which, as under the war pensions scheme, is paid whether he is subsequently able to resume his work or not. The concealed fear—"if I go back to work I lose my pension"—will thus be eliminated. Moreover, the rate of disablement benefit, again like war pensions, is based on the degree of disablement, which is assessed by a medical board and is subject to review from time to time. The board thus has a chance gradually to reduce the assessment of disability from, say, 100 per cent to 20 per cent with a corresponding increase in the incentive to return to work.

★

It is not, however, the prolongation of illness over a long period that is so potentially a menace as scrimshanking for odd periods of a week or so. Wages are high enough and the rate of sickness benefit is high enough for most workers to be able to do this without suffering much financial loss even when they do not have their pay made up to them. But what makes some men act like this and not others is as mysterious as what makes some workers strike and not others. After all, the Civil Service, banks, insurance companies and the Post Office, as well as many private employers, have for years had schemes of full pay for sickness, and unlike the workers in the Royal Ordnance Factories, their employees have not—apparently—taken advantage of it. Loosely, the determining factor may be called morale, but the Chief Medical Officer of the Post Office described it more fully a year ago in the monthly bulletin of the Ministry of Health:

If a man is happy at a job, has a team spirit with his mates, a good sense of service to his department and the community, he works off many of his ailments and is usually none the worse for it in health or happiness. On the other hand, if he loathes the sight of a dingy office; doesn't get on with his mates; hates his overseer's face; misguidedly lacks a sense of service to his department and the community, or just can't adjust himself to the essential disciplines in a public service, he escapes into sick absence at the slightest provocation.

Workers in the Royal Ordnance Factories evidently belong to this second category. So do groups of workers in other industries. There is not the slightest reason to think that their numbers are increasing, but what has happened is that the higher insurance benefits have given them the chance to show themselves. It is far less easy, however, to think of a cure than to state the diagnosis. Stricter medical certification would obviously help; but it is not easy to enforce, for a patient, refused a certificate, can change his doctor at will. Pep talks by Parliamentary Secretaries are not likely to have much effect. The only effective means of restraining people from escaping into sick absence is through their pockets, but this cannot be done without causing hardship in genuine cases. In short, the scrimshanker is merely one more burden that the welfare state has to carry along with it.

NOTES OF THE WEEK

To Federate or Not

The first debates at Strasbourg have thrown light on the political mood of western Europe and it is remarkably uniform, from country to country and from party to party. Most delegates are aware that the scale of organisation and scope for action offered by purely national government are no longer adequate to meet the economic and strategic problems of postwar Europe. Most are conscious of the need for pooling some of their activities. Most feel that the old cultural and moral unity of Europe offers a possible political framework within which common ends can be realised. But after that all is confusion. As an article from Strasbourg on page 410 points out, the divisions in method—between planners and anti-planners, between federalists and functionalists—are acute. However widespread the feeling that progress towards unity should be made, a similar unanimity on method is noticeably absent.

Nevertheless, the three chief British delegates, Mr Morrison, Mr Churchill and Lord Layton may, in their first speeches in the debate on "necessary changes in the political structure of Europe," have laid the foundations of a common approach. Each of them, in speeches which were otherwise diverse enough, put their emphasis upon a cautious advance towards greater union, and each warned the Assembly against the danger of believing that an unrepresentative body such as theirs could supersede national parliaments. "We must not," said Mr Churchill, "on our present electoral basis attempt to challenge the powers belonging to duly constituted national parliaments founded on universal suffrage." What, then, could be done? The three delegates put forward various suggestions—that where agreement could be secured in the Assembly, specific proposals should be referred back to national governments, that all kinds of functional co-operation should be examined and recommended and—which is probably at this stage the most important proposal—that a committee should examine the various possibilities of European federation or union, and report back to the Assembly on what each policy would entail. The truth is that a majority of the delegates want "unity," yet an equal majority are not prepared to consider unequivocal sacrifices of sovereignty. It should be the task of the committee to compel the Assembly to look the real decisions in the face. Only then can anything more decisive than sentiment and enthusiasm—both evanescent—emerge from its debates.

"Let's Pretend" in Labour Relations

Two, at least, of the current unresolved industrial disputes draw attention to the anomalous way in which the National Arbitration Order clings to life. It is sheer pretence for the Ministry of Labour to go on claiming that the Order, made under the Defence Regulations to meet the special circumstances of 1940, has much bearing on industrial relations today. The Order makes strikes illegal, and purports to enforce the acceptance of compulsory arbitration as an alternative. But arbitration really becomes meaningless unless there is genuine readiness to abide by its findings, and such goodwill is essentially voluntary; it cannot be imposed. The National Union of Railwaymen obeyed the letter of the law by "accepting" the findings of an arbitration tribunal on its original claim for a flat-rate wage increase of 12s. 6d. a week, but showed complete contempt for its spirit by instantly submitting a new claim rather larger than the one it had just failed to establish. The colliery winders' quarrel, nominally with the Coal Board, but in fact with the National Union of Mineworkers, is simply the latest of a series of disputes which have been bringing the activities of the Ministry of Labour more and more into disrepute. It was, to say the least, undignified of Mr Isaacs,

having allowed any strikers who happen to belong to powerful trade unions to ignore the law for several years, to start threatening the small and unrecognised Colliery Winders' Federation that if its members struck in an attempt to enforce their claim for recognition they would be breaking the law, and (by implication) that they would be prosecuted.

Whether the threat has succeeded in preventing (or postponing) a strike in all districts is still uncertain. After protracted meetings at the Ministry of Labour on Monday and Tuesday a majority of the committee of the Winders' Federation was apparently induced to vote in favour of withdrawing last week's recommendation to strike, but there is some doubt to what extent this decision will be accepted, particularly in Yorkshire and Lancashire. But even if the pit-winders do decide to stay at work for the moment, it is hard to see what has been gained by the Ministry's threat of legal sanctions. Are grievances removed by telling men that they will be fined or sent to prison unless they stop feeling aggrieved? It would be improper to speculate on the findings of the National Arbitration Tribunal which will eventually consider the winders' claim, but one can say that the atmosphere in which the claim has been sent to arbitration makes it unlikely for the most reasonable of settlements to seem reasonable to the parties concerned.

★ ★ ★

Arbitration and the Railway Dispute

The anomalies of the wartime Arbitration Order are at the back of the row between the National Union of Railwaymen and the engineering unions over railway shopmen. This dispute is a new outbreak of the old conflict between industrial trade unionism and craft unions, and it can be settled only by the unions themselves. If outside help is needed, it should properly come from the Disputes Committee of the TUC, which exists to try to settle inter-union wrangles. The squabble is not one in which the Government should take sides, and yet for the Ministry of Labour to intervene without appearing to take sides is difficult. The Ministry has been dragged in because the NUR has invoked the Arbitration Order, which compels the Minister of Labour to take action once a dispute has been formally reported to him. Caught between two powerful pressure groups, Mr Isaacs has seemed to vacillate between trying to placate the NUR and trying to appease the engineering unions in a fashion that has, in fact, pleased neither, and has not added to the prestige of his department.

In April, when the Ministry was complaining that the London stevedores were breaking the law by their strike over the right of aged dockers to remain at work, it issued an official statement justifying the Order which made the strike illegal on the ground that it "had been retained since the war by the desire of the TUC General Council." If this be, in fact, the Ministry's main reason for keeping the Order in force it raises an important question: with whom does responsibility rest for these statutory Orders that control our lives—with the Government and Parliament or with the General Council of the TUC? It is true that a majority of the General Council has been unwilling to see the Order repealed, but its reasons are not necessarily good. The big general workers' unions have found the Order useful in forcing disputes to arbitration in badly-organised trades where there is no effective employers' association prepared to negotiate, and it may be that the leaders of some unions are not sorry to be able to wash their hands of "unofficial" strikes and to throw their troubles into the lap of the Ministry of Labour. But should trade union leaders be able to evade their responsibilities in this way? Whether a strike be technically "unofficial" or "official," "legal" or "illegal," it remains a strike, and no amount of pretence will stop it.

Moreover, it is not the function of the Government to run industry, and if trade union leaders—or employers—can fly to the Ministry of Labour at the first hint of trouble, the common sense which has, on the whole, enabled Britain to enjoy long periods of fairly happy labour relations in the past may tend to die out. If there is a case for compulsory arbitration in industrial disputes the Government should ask Parliament to embody it in permanent legislation. Its implications could then be debated and people would know just where they stood. There is nothing to be said in 1949 for trying to govern the relations between employers and work-people by the Defence Regulations.

* * *

The End of Marshal Zaim

Twice in four months the Syrians have passively watched the removal by armed force of their chosen leaders and have as passively accepted a new regime on the grounds that it cannot be worse than the last. In the small hours of August 14th Marshal Hosni Zaim, their dictator since March 30th, was arrested by a group of army officers under a Colonel Sami Hinnawi, was summarily tried, and then shot. His prime minister was shot with him. Within twenty-four hours, Colonel Hinnawi was back in barracks, his "sacred national mission" ended, and an elder statesman had formed a new cabinet on a party basis. Hashem Atassi, the new premier, was president of the republic from 1936 to 1940; but he is 84, and must be regarded as something of a figurehead. His cabinet, however, includes some experienced men. Khaled el Azm, the painstaking premier whom Zaim ousted in March, is his Finance Minister; his Foreign Minister was Syria's minister in Washington; and a competent former Mayor of Aleppo has gone to the Ministry of Public Works. The team also includes some young politicians who have no experience of administration. But it is broadly based in terms of Syria's rival towns and rival parties. For the first time, it shows a preponderance of men from Aleppo over men from Damascus.

Now that Zaim is dead, his weak points are all coming to light. Power went to his head. It bred overconfidence. He tried to do everything himself. Only second rate men, therefore, stuck to him. He heard no good advice. He was too sure of his capacity as an economist and financier; he removed his enemies with indignity, and prominent men did not know where they stood; he never saw the importance of winning people's personal support; finally, he was unwise enough to make some appointments which alienated the army. But it would be well to remember that, offsetting all this, he performed one or two services of value. The greatest was to show a capacity for hustle and to clinch some economic negotiations that can make a great difference to Syria's balance of payments and that had been hanging fire for months.

On April 20th he ratified the financial agreement with France that afforded some backing to the then unbacked Syrian pound. He ratified Khaled el Azm's agreement to give wayleave to the American Trans-Arabian Pipeline (TAPline) from Saudi Arabia to Lebanon. He signed and ratified similarly profitable agreements with Middle Eastern Pipelines (MEPlne) working on behalf of Anglo-Iranian, and with Maritime Refineries Limited for the construction of refineries within Syria. Last, but not least, he conceded enough points to reach on July 8th a long overdue economic agreement with the Lebanon. For lack of this both countries had for months been suffering a needless degree of commercial and financial stagnation.

* * *

Syria's Finances

It is to be hoped that Zaim's successors will not find it necessary to express their distaste for his ways by undoing his economic reforms. Syria badly needs such revenue as it can

collect from transit traffic in oil, and from steady trade with the prime market for its produce, which is Lebanon. Its finances are in low water. Its revenue, 65 per cent of which is derived from indirect taxation, has fallen off for lack of collection. The unbalance of its foreign trade has lately increased alarmingly, as the following figures for Syria and Lebanon's joint foreign trade illustrate:

	Metric Tons		
	1948	1947	1937-48
Joint exports	123,708	148,018	Average 329,965
Joint imports	758,335*	414,057	578,793

* Includes some goods imported by philanthropic organisations for Arab refugees.

Its prices are too high to permit of sales in a buyers' market; it has been selling its wheat surplus at a figure that does not cover the cost of collection and of administering its wheat office. Its bill for armaments is out of all proportion to its present means; in two successive years its Ministry of Defence has borrowed from the allocation to the Ministry of Public Works. It talks bravely, with every fresh change of Government, of cutting its expenditure but takes few or no steps to increase local revenue other than extorting capital contributions earmarked for army use—a practice tried by Zaim.

Zaim had proffered the nation some grandiose schemes for public works which could, given time, have brought greater

prosperity to the Syrian farmer: irrigation on the Orontes, Euphrates and Khabur rivers; creation of a national railway link with the two latter; and—more questionable, this—creation at Latakia of a Syrian port good enough to rival Beirut. But he had not said where the funds for these plans were to be found. If his successors entertain the same ideas—and these are basically sound—they had best take note of two facts. The first is that such schemes will cost not only every penny they can earn from all available oil companies, but vast sums besides. The second is that these latter, which must be borrowed, will be lent only to a cabinet that can prove that it can run a reasonably good administration.

* * *

Mr Mintoff Tries Shock Tactics

The dramatic resignation of Mr Mintoff, the Maltese deputy Prime Minister, while in London on a mission to the British Government, should make it easier to come to some agreement on measures to alleviate Malta's economic plight. Mr Mintoff's attempt to bounce the British Government into speedy action could not fail to have the opposite effect. Moreover he represented the extreme left wing in Malta's Labour Cabinet, and his anxiety that the ambitious programme of social services to which his Government is committed should not be jeopardised by the present emergency led him to place too much emphasis on immediate short-term financial help,

rather than on the long-term measures of economic rehabilitation which are essential if Malta is ever to become self-supporting. Other members of the Maltese Cabinet, especially Dr Colombo, the Finance Minister, have made no secret of their belief that Malta cannot yet afford all the luxuries associated with the modern welfare state.

The immediate reasons for the talks between representatives of the British and Maltese Governments which have been going on intermittently for several weeks, were the Admiralty's decision, in view of its reduced commitments in the Mediterranean, to dismiss 1,200 of its employees in the Maltese dockyards and the cessation last March of the British contribution to Malta's food subsidies. The dismay with which the Maltese Government greeted the dismissal of the dockworkers throws a vivid light on the instability of the island's economy. But neither the reinstatement of the twelve hundred nor the renewal of the food subsidies would provide any permanent remedy for the present situation. Ever since the end of the war Malta has been struggling not only to repair the colossal war damage which it suffered (to the cost of which the United Kingdom is contributing £30 million) but also to find means of reversing its permanently adverse trade balance and of employing its rapidly increasing population—tasks which the island's almost complete lack of economic resources is rendering exceptionally difficult. Malta will, in fact, never be able to stand properly on its feet until it is possible to organise a very greatly increased flow of emigration. But much could be done if long-term capital were available to finance whatever secondary industries it may be possible and profitable to set up, and if some means could be worked out of freeing and increasing the island's trade.

If the Maltese Government gives evidence of its realisation that first things must come first, and that it is its duty to provide and exact work before it extends social services, then there is every reason why the British Government should either provide some assistance itself or should sponsor Malta's application for a share of Marshall aid. The British will no doubt listen with all the more sympathy to Malta's difficulties in that they are a sort of microcosm of Britain's own plight.

* * *

Control of the Purse

An important principle is raised in the third report of the Committee of Public Accounts for the present session. In fulfilling its function as a Parliamentary watchdog over the public finances, the committee is concerned at the large amounts that are voted each year for independent or semi-independent bodies whose expenditure is in some cases not covered by statutory authority—other than the annual Appropriation Act—and is not subject to strict auditing as is the expenditure of ordinary Government Departments. Examples of such bodies are the Department of Scientific and Industrial Research, whose functions the Treasury agrees should be embodied in a statute, the Medical Research Council, the National Savings Committee and the University Grants Committee. Then there are the corporations—the New Towns Corporations, the Colonial Development Corporation and the Overseas Food Corporation—whose functions are covered by statute and whose capital schemes have to have prior Ministerial approval but whose accounts and statements of advances are singularly lacking in information of the purposes for which particular advances have been made and the commitments that have been entered into.

Experience of the lavish expenditure on the East African groundnut scheme by the Overseas Food Corporation strengthens the committee's pleas for stricter accounting of these semi-official bodies, and there seems no reason why this should not be possible without the corporations losing their semi-independent status. On the other hand, the Treasury is undoubtedly right in insisting that nothing would be gained,

and a great deal might be lost, by converting the National Savings Committee and the University Grants Committee, particularly the latter, into statutory bodies. The need to maintain university autonomy clearly justifies a "departure from the normal rule regarding statutory authority for continuing services."

Yet it is as well that the committee should raise the point, for expenditure on these non-statutory bodies, and the number of the bodies themselves, are growing year by year. The grants-in-aid to universities and colleges are estimated at £17,564,000 in the current year, compared with £6,250,000 in 1946-47. The College of Aeronautics, the Medical Research Council, the Arts Council, the Council for Industrial Design are other examples of independent bodies whose grants continue to rise. In each case there is a strong argument for maintaining their independence, but if the number and amount of grants in aid continue to rise, as they have since the war, it should be realised that eventually there will be a considerable amount of public expenditure that is not subject to strict Treasury control. The committee's recommendations for enabling its own scrutiny of their expenditure to be more effective ought therefore to be given careful consideration.

* * *

Land Board's First Report

The first annual report of the Central Land Board for the year ended March 31, 1949, reviews some of the Board's difficulties in operating the financial provisions of the Town and Country Planning Act. It is important for the Act's success that all land should change hands at its value for existing use, without the element of development value which is now deemed to belong to the state and which is removed by the Board in the form of a development charge. The Board has found, however, that most transactions in land have continued to take place at prices much higher than "existing use" value—thus inflating the cost of building—although the report indicates that "latterly there has been some improvement." The Board is trying to influence the market by using its powers of compulsory purchase, and three compulsory purchase orders have since been made; but the effect of such intervention is necessarily limited. This part of the Planning Act is still working in an unsatisfactory manner, and amending legislation may prove unavoidable.

The complementary part of the Board's work consists in dealing with claims for compensation for loss of development value, which are to be met out of a £300 million fund put aside by the Government. The Board has experienced considerable difficulty in getting owners, especially owners of single plots, to put in their claims, which had to be submitted by June 30th. The Board recently announced that altogether 935,000 claims had been filed by that date, but as many as 780,000 came in the last month before the closing date. Many of these claims have been put in provisionally, and will later be withdrawn or dismissed; but the fairly high total shows that the Board's intensive publicity has had its effect, and most legitimate claimants have filed their claims. It will now take three years to sort out and value the claims, and to submit disputed claims to arbitration. Actual payment will not be forthcoming until 1953. This delay, unavoidable as it is, is embarrassing to some owners. They can find some comfort in the likelihood that compensation will be paid on a more adequate scale than was originally expected.

End of the Australian Coal Strike

Australian coal miners resumed work on Monday after a strike lasting for seven weeks. The ban on power for industry has been lifted, and the great number of industrial workers who were forcibly unemployed by the strike have returned to their factories. Moreover, reports from Australia indicate

that the miners are willing to reverse their policy of the past fifteen years and to allow all states to build up reserves of coal.

The rejection by the miners themselves of the plans of their Communist leaders is a welcome sign of good sense among the rank and file of Australian labour. It is difficult to say to what extent this is due to the uncompromising stand of the Federal Government or whether it was brought about by the overwhelming opposition of the Australian public as a whole. The strike was irresponsible from the start, and there was never any justification for throwing several hundred thousand other workers out of work as well. But if a repetition of the strike is to be avoided, the Federal Government would do well to overhaul the legislation controlling trade union ballots and so eliminate the gerrymandering at which Communists excel.

The link between Communism in Australia and the strategy of world Communism was emphasised in an article in the *Cominform Journal* of August 1st. Written by Mr R. Dixon, the chairman of the Australian Communist Party, the article reveals that the strike was deliberately promoted in order to weaken the Australian economy at a time of crisis and in order to prevent "preparations for war." The article clashes oddly with the humble pie which the five Communist officials of the Miners' Federation are now eating in an attempt to secure their early release from prison where they were sent for contempt of court.

* * *

Belgian Government at Last

After an interregnum of fifty-one days, Belgium has a Government again. After a prolonged effort to secure agreement between the three parties—Catholics, Socialists and Liberals—on the return of the King, the attempt at compromise was abandoned. All were agreed on a popular consultation, but the Socialists wished to ensure that the King would abdicate if less than two-thirds voted for his return. This the Catholics could not accept, and the effort to form a tripartite government came to an end. The Catholics and the Liberals then formed a coalition under M. Eyskens, the Finance Minister in the outgoing Spaak Cabinet.

It had been expected that this new team, representing very strongly the business interests of Belgium, would take quick steps to abolish what remain of economic controls and subsidies in Belgium. But this may not, after all, be the Government's strategy. In its first statement of policy, it talked only of submitting all controls to a thorough review; meanwhile, a higher priority appears to be given to steps designed to revise the deflationary policy of the last eighteen months. There is talk of relaxing high interest rates, the Extraordinary Budget is to be increased in order to make funds available for combating unemployment, housing is to be tackled more vigorously and at last more will be done for war-damaged communities. Private saving, it is hoped, will be stimulated both by lower interest rates and reduced taxation. All in all, there are signs that Belgium's version of austerity will be somewhat mitigated by the new team.

It is this rather unexpected twist of policy that has led many observers to ask whether the Catholics are preparing not for a long-term attack upon Belgium's economic problems, but for a short-term preparation for fresh elections. The settlement of the Royal question remains the first item on their agenda. They cannot settle it to their own satisfaction until they have a majority in both houses. This they already enjoy in the Senate, but they lack it by two seats in the Chamber. Their leaders may now argue that fresh elections, conducted after some months of economic expansion, might tip the balance in their favour. Possibly they are right. Certainly, however, it would take more than a little mild inflation to make King Leopold what a constitutional monarch must be—a universally revered figure, standing above all party strife.

Help for Berlin

When the lights went up in the western sectors of Berlin and the railways began to run and the lorries to move, a mood of triumph buoyed up its people, coupled with the belief that better days were on the way. The months have passed and today the optimism is evaporating. Light and food and coal may be back. What is lacking now is the money to buy them and the work with which to earn the money.

During the blockade, industry in western Berlin was drastically interrupted. Established markets were lost. Many firms moved out, taking their equipment with them. Now the attempt to recover lost trade meets stiff competition from the western zones and faces the growing world-wide buyers' market. Currency differences between the sectors handicap many trades and services. The Soviet mark is worth one quarter to one-fifth the western mark and rent, labour, and some prices tend to be lower in the Soviet sector. As a result, some activities have been moved out of the western sectors and some people are shopping in the Soviet shops. And behind the stagnation in trade lies the old problem that Berlin was built as the administrative capital of a big Reich and is still, in spite of the reduction of population caused by the war, the home of many redundant state employees. Altogether of the 2,000,000 people living in the western sectors, about 30 per cent are without work.

This weight of unemployed and unproductive citizens inevitably increases the expenses of the municipal authorities. During the airlift, the budget deficit was covered by subsidies from the western zones, but now the Military Governors have insisted on a reduction in the city budget and a proposed deficit of 600 million marks on a budget of 1,719 million has been reduced to 250 million. This cut, however, involves the dismissal of more employees and what is gained on the budget may be lost again through increased doles.

In these conditions, the Berlin authorities have very naturally turned to the western powers and to the Germans at Bonn for more help. The German government they ask to maintain ministries in Berlin both to assert its western character and to absorb some of its surplus bureaucracy; they also ask for more orders for Berlin firms and continued financial subsidies. The Allied authorities they ask for Marshall aid. Mr McCloy is clearly ready to listen to this plea and, as a first instalment, 55 million marks are to be made available for the Berlin power station, partly in dollars and partly in marks from the counterpart fund.

* * *

The Hospitable Government

The Select Committee on the Estimates has chosen for its ninth report the expenditure on government hospitality and official entertainment. There are three ways in which the taxpayers' money is employed to enable public servants to fulfil the role of mine host, through the Government Hospitality Fund, through separate entertainment funds of the Civil Departments, and through the entertainment allowances traditionally granted to certain ranks and positions in the Armed Forces. The Departmental Funds are a postwar innovation, accounting for about £24,000, to enable civil servants to offer those with whom they do business some modest entertainment. In view of the striking disparity in perquisites as between the modern civil servant and the modern business man this seems reasonable.

The Government Hospitality Fund, on the other hand, dates back to 1908, but its expense has multiplied nearly tenfold in the last ten years. Before the war £12,000 a year was considered a reasonable appropriation except in a festival year such as the Coronation of 1937; for 1949-50 the estimate is £110,000. This is attributable both to a much larger number of official visitors and to greatly increased costs. The floating international population of conference delegates has nearly doubled the numbers of His Majesty's Government's official

guests, and the cost of a reception has risen from 4s. 4d. a head in 1938 to 16s. 6d. today. In addition, the Government, faced with a sudden emergency in 1948, decided to convert a block of Mayfair flats which it held under requisition into an official hotel, managed by a catering firm on a cost-plus basis, where on a correct calculation, including overhead costs before amortization, it spends £18 5s. 3d. per night on a guest.

The main point that emerges is not that the Government is extravagant in the total amount it spends on entertaining (although when the inevitable reduction in government expenditure comes, entertainment expenditure must obviously be drastically reduced) as that it gets very poor value for money. The money spent did not go on *bals masqués* or *fêtes champêtres* but on extremely humdrum functions. British taxpayers may draw some satisfaction from the Committee's assurance that the proportion of British guests at official parties "is lower than before the war, and that there is no longer in use a list of persons who might be invited to fill up a party." (This must elucidate a mystery that has long puzzled the recipients of hastily delivered paste-board cards.) But no habitué of official functions can readily believe that by sipping a weak Martini or grasping a flabby canape he or the foreign guests have got 16s. 6d. worth of entertainment—nor that even the most pleasure-loving of bilateral bargain-hunters has had eighteen pounds' worth out of the government hotel. The Government, it would seem, is as much the victim of the Catering Wages Act as anyone else.

* * *

IATA Anniversary

Next week fall the thirtieth anniversaries of two significant, although not very exciting, events. On August 25, 1919, the first British civil air line began to operate. On the same day, as representatives of the six international air lines then in existence, twelve men met at The Hague to found the Inter-

national Air Transport Association "with a view to co-operate to mutual advantage in preparing and organising international air traffic." There will be another meeting of IATA at The Hague next month, but instead of six companies, sixty-four will be represented as members and six as associates. The development of the Association to its present size and influence is a history in miniature of civil aviation.

Unlike many international organisations, IATA is private, practical and non-political. Its public and official counterpart between the wars was the International Commission for Air Navigation, established by the Paris Convention of 1919 as a subordinate body of the League of Nations, and now continued as the International Civil Aviation Organisation, a specialised agency of the United Nations. Both ICAO and IATA have functions which are roughly parallel, but it is with the less grandiose matter of common organisation that IATA has been most successful. Agreement on complicated and conflicting legal liabilities incurred by companies operating in many countries, technical standardisation—the first such rule adopted was that throttle controls should be so arranged that a given movement always produced the same result—the creation of a common operating procedure, all these were steps on the road to later and more extensive measures. Of postwar developments the most important are the production of a standard rules tariff of worldwide application, a uniform system of form-filling which will greatly simplify the paper work which clutters up air travel, and the establishment over two years ago of the IATA clearing house in London. The turnover of the clearing house was nearly \$124 million last year, compared with some \$52 million in 1947; and it handled \$75 million in the first six months of 1949.

It is, of course, a pity that none of the Russian or eastern European air lines are members of IATA; but if they were, it would be difficult to imagine the organisation making the progress it has. And if this progress cannot guarantee to all airlines the commercial profits that so few make, that is not

How to bring back the bacon from Canada

Business men — here is a service that brings the competitive hard-currency market of Canada to your very doorstep!

Did you know that Trans-Canada Air Lines now operate two fast services daily (one from London and one from Prestwick) to all the large business centres of Canada? Travelling in the luxury of one of T.C.A.'s pressurised North Star Skyliners, you are linked direct with 32 important cities throughout Canada and the U.S.A., and there are connections with every major U.S.

airline. What is more, U.K. passengers save dollars by booking T.C.A. right through to their final destination. Wherever your Canadian business lies, T.C.A. will see that you are on the spot and on time!

BERMUDA AND WEST INDIES

You can make through bookings at special rates to enjoy dollar-free holidays in Bermuda and the West Indies! "North Star" service, via Montreal to Nassau, Jamaica and Trinidad. T.C.A. pay overnight expenses in Montreal (no dollars necessary).

IT'S ONLY A DAY BY TCA

TRANS-CANADA Air Lines.

IATA's fault. The Association can at least pride itself on the example it has consistently provided of the solution of international problems by tackling points of detail until they grow into a complete code of common procedure.

* * *

"Britain in the Pillory"

A leading article last week included three tables designed to compare the postwar performance of British recovery with that of the other nations of western Europe and thereby to rebut the accusation that British failures are dragging down the Marshall Plan. To complete the story another set of figures can be given comparing Marshall aid received with the need for it, as measured either by the imports of the receiving countries or by their populations. The first table below shows this calculation on a strict dollar basis—that is, comparing dollars received with purchases from the dollar area. (Statistical exigencies make it necessary to compare aid received in the twelve months July to June with imports of the twelve months April to March, but it is unlikely that the comparison is greatly disturbed thereby.)

	Imports from U.S.A. and Canada, April, 1948 to Mar., 1949	Dollars Allotted by ECA, July, 1948 to June, 1949	Column (2) as % of Column (1)	Dollars Allotted per Head of Population
	(1) (\$ mn.)	(2) (\$ mn.)	(3) %	(4) \$
Belgium-Luxemburg...	496.9	241.4	49	27
Denmark.....	124.8	106.2	85	25
France.....	593.6	978.4	165	23
Italy.....	595.0	510.0	86	11
Netherlands	355.1	456.1	128	47
Norway	119.9	81.1	68	25
Sweden	160.3	45.4	28	7
United Kingdom	1564.8	1219.7	78	24

The British figures are not the lowest, either in column (3) or in column (4); but equally they are not the highest. There is no evidence in this table for the charge of excessive generosity to, or insufficient self-help by, Britain.

In addition to dollars received from the United States, however, the Marshall countries make "drawing rights" in their own currencies available to each other. The net total of assistance received by each country is therefore the dollars received in the first place plus (or minus) the net total of "drawing rights" received from (or granted to) the other participants. The second table accordingly shows these net totals in comparison with the total imports of each country. By this test, the British figures are distinctly on the low side.

	Total Imports, April, 1948 to Mar., 1949	Net Marshall Aid (\$ allotted + or - Drawing Rights) July, 1948 to June, 1949	Column (2) as % of Column (1)	Net Marshall Aid per Head of Population
	(1) (\$ mn.)	(2) (\$ mn.)	(3) %	(4) \$
Belgium-Luxemburg...	1944.0	34.2	2	4
Denmark.....	791.7	186.2	24	44
France.....	3355.9	1258.0	37	30
Italy.....	1545.9	471.7	31	10
Netherlands	1945.4	528.0	27	54
Norway	784.4	124.5	16	39
Sweden	1336.3	23.3	2	3
United Kingdom	8467.0	1001.7	12	20

Britain is financing a smaller proportion of its imports out of grants from other countries than all but two countries in the table, and is receiving less net aid per head than any but three.

All these figures, and those in last week's leading article, make the tacit assumption that the United Kingdom has to meet only its own needs of dollars and other scarce currencies. If the size and needs of the whole sterling area were brought into the calculation it could easily be shown that Britain is carrying a heavier burden, with less assistance, than any other nation. It is as well that criticism of British policies should bear this in mind.

* * *

The Haifa Refinery

Of the economic legacies of the Palestine war, the most worldwide in its effect is the enforced idleness of the Haifa oil refinery. As at present constituted, this great plant, which is owned half by Anglo-Iranian and half by Shell, has a refinery capacity of 4,000,000 tons of crude oil per annum. Its planned potential capacity is much higher. It was until 1948 fed half by the Iraq Petroleum Company's pipe-line from Kirkuk and half by tanker carrying crude oil either from the Tripoli terminal of the same company's pipe, or from the Persian Gulf via the Suez Canal. Before the outbreak of the Palestine war, a second pipe from Iraq to Haifa was complete but for a sector inside Palestine and this, with additional refining plant under construction, was to yield a refining capacity of 8,000,000 tons annually by the end of 1951. But it has lain idle save for one brief interval since April, 1948, because, while British-managed and largely British-owned, it is situated in territory that has become Israel, and because it handles oil coming from an Arab source in Iraq or through an Egyptian bottleneck at the Suez Canal.

As a result of the prejudices involved, Iraq, which is all but bankrupt, is losing much needed oil royalties that were due to increase very rapidly, Israel is losing the material and psychological advantages offered by the active working of a great industry, and the sterling area, which spent from mid-1948 to mid-1949 some \$400 million on the purchase of oil fuels and refining equipment from hard currency areas, is losing an asset the output of which, at present capacity and current oil prices, is estimated to be worth \$50 million per annum.

Is the deadlock unbreakable? The oil company, the British Government, Israel and Iraq would all profit, materially, by breaking it. But the Iraqis are led by die-hards who would far rather administer pricks to Israel than explain to their own people that to pump oil means more work and more royalties today, and therefore more watered land and cheaper bread tomorrow. But even if supplies by pipe-line are cut of the question, there is nothing to stop supplies by tanker. The Suez Canal is, by one article of its Convention, "in time of war as in time of peace" open to the ships of all nations, and, by another article never to be used for purposes of blockade. During the Palestinian war, the Egyptians, disregarding protests from many powers, inspected and questioned cargoes. Their motive was understandable. But Egypt is not at war now. Further, now that the arms embargo upon the Middle East has been raised by the Security Council, there is no possible reason for the questioning by anyone of cargoes and destinations. Daily oil tankers from the Persian Gulf laden to the waterline pass northward through the Canal to some refinery or other. The Saudi Arabians, questioned, say that it is none of their business where the companies concerned choose to refine the oil that started from their territory. Why not send some to Haifa?

So long as there is a chance of doing this, Israel is unwise to murmur, as it is now doing, threats to confiscate the refinery and to operate it with crude oil from outside the Middle East.

Woodman,
spare
that
tree!

Fencing, in these days of timber shortage, is a big problem for the farmer. Solutions can be found, however. One farmer bought scrap steel tubing from an Air Ministry dump. With the help of a B.O.C welding process, this tubing was made into gates and fencing for the farm, with excellent results. When it comes to "making-do," fabrication can work wonders. The B.O.C have lots of advice to give on this subject, if you would care to get in touch with them.

The British Oxygen Co Ltd
London and Branches

Monsanto makes nearly two hundred chemicals of vital importance to British Industry. If you have a chemical problem it is highly probable that Monsanto will be able to assist you

MONSANTO CHEMICALS LIMITED 8 WATERLOO PLACE • LONDON • SW1

Like water off a duck's back

The feathers of a duck are naturally water resistant; paper, on the other hand, needs artificial treatment to render it waterproof. It is for this purpose that Unemul-wax in the form of an emulsion has been developed. Unemul-wax emulsion is an inert form of gelatinous Alumina—insoluble in acid or alkali, and unaffected by bacteria or fungi. These qualities, and its high degree of purity, make it eminently suitable for use in all types of food wrappings and containers. Its compatibility with all types of binders and adhesives makes possible the manufacture of water-resistant coated papers which retain a good emboss. In better sizing the emulsion can be added direct to the beater to increase water resistance and lay surface fuzz.

Unemul-Wax EMULSION

PETER SPENCE & SONS LTD • NATIONAL BUILDINGS • MANCHESTER 8
LONDON • MIDDLSEX • DOOLE • BRISTOL

ALEC DUNCAN raises wool in the South Island of New Zealand. He hasn't much to grumble about on wool prices today; but he realises that, in the long run, his destiny is in other people's hands. Weaving, dyeing and finishing will determine whether woollen goods are chosen by the couturiers, demanded by the public

Monsanto has evolved new textile chemicals which will have a remarkable effect on worsted spinning techniques, and may materially increase the value of Britain's exports of woollen goods. At the same time, Monsanto is directly helping Duncan maintain his livelihood, and is helping to provide you with the goods you need. Just one more example of the way Monsanto is 'serving industry, which serves mankind'

Of course it could impound the plant. No doubt it could get crude oil from Rumania. But to suggest this abnormal step while normal steps are possible is undiplomatic if Israel, as it elsewhere avers, seeks normal relations with its Middle Eastern neighbours.

* * *

Hongkong and Beyond

British reinforcements have now put Hongkong into a state of readiness to meet any Chinese Communist attack and have thus rendered it unlikely that any attack will be made, whatever verbal offensives against British imperialist tyranny may be launched from Peiping. Hongkong may even be a point of contact for the commercial relations between British trading firms and the Chinese Communists which have been so far thwarted at Shanghai by the Nationalist naval blockade, for the Communists, once in possession of Canton, would be able to break the blockade by direct communication with Hongkong. With regard to the internal politics of Hongkong, the local authorities have had to tighten up control over political agitation and have even warned newspapers of Communist sympathies against printing the more slanderous anti-British outbursts of the New China News Agency. But a number of Kuomintang refugees have been free to issue a manifesto calling on members of the Kuomintang in all parts of China to repudiate the Nationalist Government and collaborate with the Communists. The spectacle of these tardily converted Vicars of Bray trying to ingratiate themselves with the victorious "anti-imperialist" faction from the safe shelter of a British Colony has its comic aspect, but the manifesto is not without

Town and Gown

A recent case in the Insolvent Debtors' Court has received much attention from the press. A Mr. Charles Throsby applied to be discharged from his debts, which together amounted to about £750, the greater portion of which was due to tradesmen in Oxford, contracted by the insolvent while a student at the University. . . .

At Oxford there is a warrant for credit which is frequently wanted in other places. The young men sent there must be of good standing in society, and of tolerable expectations. They are accredited to the tradesmen by being placed on the college books. They are at once, if without exhibitions or benefits from their college, stamped as gentlemen who have the means, or whose friends have the means, and are willing, as the tradesmen have learned from experience, to pay their expenses. So far as supplying them with necessities goes, tradesmen who trust them within reasonable bounds are not to blame. . . . If there be any system to blame, it is not the credit given at Oxford. . . . but the system of giving young men very considerable incomes to spend, or franking them there as gentlemen having considerable incomes, and exercising no control over them. . . . To send young men to college with the means of obtaining credit, without any person to watch their conduct closely, is the error, and the running into debt is the necessary consequence. Fond or indolent papas, who are anxious to find an excuse for their own negligence or their sons' folly, are very glad to throw all the blame of that on the trusting tradesmen; but they ought not to be screened at the expense of the latter. . . . There prevails a great deal of loose morality on this subject. "Who suffers?"—it is only a shabby fellow of a tradesman, are common phrases. Gentlemen think it good sport very often to bilk such a person, and profligacy is encouraged until it finds its way . . . into the insolvent court. To express sympathy with such proceedings is to encourage them. Neither the young men nor their parents should be exonerated at the expense of the Oxford shopkeepers.

The Economist

August 18, 1849

importance, as one of its signatories is Lung Yun, the ex-Governor of Yunnan, who may try to regain control of his former province with Communist backing. Yunnan would be a key area in any attempt at anti-Communist resistance in western China.

The Nationalist Government in Canton appears to be resigned to the fall of the city within a short time and to be preparing for evacuation. A Communist occupation of Canton would cut the remaining Nationalist forces into two parts—one headed by Chiang Kai-shek himself in the island of Formosa, and the other, with a prospective rallying-point at Chungking, holding out in the mountainous provinces of western China without any direct access to the sea. The former sector of resistance, involving the problem of the dubious status of Formosa, may well involve international complications; General Chiang will certainly do his best to exploit both his insular strategic position and the political support he has obtained from the Government of the Philippines. The resistance in the interior of China would be geographically in the same situation as Free China was at the height of the Japanese invasion, and it would have similar problems of communications with the outside world. We may soon hear again, as ten years ago, of the railway and road to Kunming.

* * *

Bramuglia Steps Down

The resignation of Señor Juan Bramuglia, Argentina's Foreign Minister, has—at least temporarily—removed the country's most widely respected statesman from the political scene. By all accounts the hard core of supporters round President and Señora Perón had been determined to get rid of him for some time. But the circumstances in which they have now done so have given foreign observers yet another argument for distrusting the personal and fractious nature of Argentina's present nationalistic mood. For three years Señor Bramuglia has represented a stable, common-sense attitude in a country subject to swift and hot-tempered change. Abroad, he will be remembered for his distinguished and dignified presidency of the United Nations Security Council last autumn. At home, his resignation represents to some extent a tit for tat over the part he played in ousting Señor Miranda from his aggressive and unfortunate control of Argentine economic affairs last January.

Some of the events which have led up to Señor Bramuglia's resignation are still shrouded in mystery. But it is known that the quarrel which broke out between him and Señor Remorino, the Argentine Ambassador in Washington, was so violent that honour very nearly demanded satisfaction in a duel. Señor Remorino had returned suddenly to Buenos Aires at President Perón's request. When he confronted Señor Bramuglia at a cabinet meeting, he taxed him with undermining his position as ambassador. Judging by reports earlier this year, that efforts were being made by high Peronista leaders to secure the Foreign Ministry for Señor Remorino himself, the boot would appear to be on the other foot.

Argentina's new Foreign Minister is a youthful Right-Wing Nationalist, Dr Hipolito Jesus Paz, whose political experience has been gained exclusively in the Peronista movement. He is a lawyer by profession and is reported to have been among those who most strongly opposed any question of Argentina entering the war against Germany. Other cabinet changes have not yet been confirmed, but there have been reports that at least three other ministers would resign in sympathy with Señor Bramuglia; this is in fact, probably, the biggest cabinet upset that President Perón has faced since he came to power. There is little likelihood from Britain's point of view, however, that any new blood in the cabinet will improve the chances of greater Anglo-Argentine friendship—or favour an improvement in the execution of the recent trade agreement. Señor Bramuglia always stood for more international collaboration than most of his colleagues were prepared to accept.

Books and Publications

American Foreign Policy

"The Evolution of American Foreign Policy." By Dexter Perkins. Home University Library. Oxford University Press. 187 pages. 5s.

"To many persons," says Professor Perkins, "not least to the scholar, it is a pity that ideologies should matter so much." Just as there are ideologies and ideologies, so there are scholars and scholars, and not all of them will echo with approval Professor Perkins's preference for low temperature historiography. However, for those who do, here is a pocket-size deep-freeze as compact, as well arranged, and as likely to resist the corroding influences of time and further research as any diplomatic history of comparable scale. Moreover even for those who might take issue with the author's philosophy, there are great compensations in his method. If they are distressed to find the critics of Roosevelt's Vichy policy dismissed as "the ill-informed and the emotional," or a belief that the Austrians and the Germans began the first World War regarded as the mark of "the untrained mind," they will also find due meed of censure poured on opposite schools; Senator Nye becomes a figure "of whose intellectual qualifications and capacity to weigh evidence it is charitable not to speak" and the Kellogg Pact "a signal example of the reluctance of the American mind to face the fact that physical power is an incident, a necessary if unpleasant incident, to the conduct of international affairs." Judgments like these crop up in the text as reminders that extreme cold, no less than heat, has as its property the power to burn. They are also evidence that Professor Perkins's distaste for enthusiasm applies to American flag-waving as much as to that of other nations. This is a history very free from chauvinism, very ready to acknowledge the errors and short-sightedness of American policy, while at the same time innocent of false modesty about its real achievements.

This does not make the author over-optimistic about the future. It remains to be seen, he says in effect, whether the Americans, catapulted into fabulous power, are "adequate" for the part they have to play. One thing in particular worries him, and naturally, as a student of the American diplomatic process—the American disposition to reduce the complexity of the problem of peace to over-simple terms. In particular he criticises the national disposition to rely overmuch on moral exhortation and to ignore the economic and geophysical elements in the conduct of foreign relations. It is perhaps his anxiety on this last score that has led him, in a book designed for American as well as British readers, to dwell at disproportionate length on the economic, strategic and technological sources of the national power—disproportionate, that is, to the exposition he provides of the psychological and moral components of American action. If there is a serious criticism of the book as an introduction for British readers it lies here. Above all, there is nothing that will make really comprehensible to the puzzled European that persistent and sometimes naïve moral swell that so worries Professor Perkins as he looks out over the waters of American diplomacy. In the last resort the transatlantic roll may mean more to Europe than all the geopoliticians' pin-pointing, and it is still far from being comprehensible to the average recipient of Marshall Aid.

Were the Women Wonderful?

"Daughters of Britain." By Vera Douie. Published by the author, 12, Charlbury Road, Oxford. 159 pages. 7s. 6d.

It is unusual for a book privately published by its author to be factual, authoritative, and of lasting value; but this little book is all three. Presumably Miss Douie's manuscript was rejected by at least one publisher before she decided to issue it herself. One has no difficulty in divining the publishers'

reasons. Firstly, this is a book about war; secondly, although it is all about women, and women behaving remarkably in remarkable circumstances, it is wholly lacking in the fashionable pseudo-psychological jargon. What publisher of today would embark his money in such an unconventional craft?

This is the story of British women in war. Not only the uniformed women's services—though the ack-ack girls, the Wren boat-crews, the WAAF mechanics get the attention they deserve—but the whole range of war duties are covered. Miss Douie shuns the flamboyant phrase like the plague; whether she is recording the heroism of Army nurses, the ration scales of the ATS or the Government's power to direct "mobile women" to the other end of the country, she sticks to the facts and uses only an occasional anecdote or quotation to recall the courage, the bitterness and the humour of those years.

They are all here, the QA's, the Wasbees, the clippies, the WVS, the landgirls, and others of whom one does not think so readily—the mistresses at Public Schools, the stokers in the retort house of a gas works, women on Joint Production Committees, women repairing telephones, women in the Observer Corps, in bus garages, in shipyards, in the BBC's monitoring services, in the Royal Mint. Miss Douie tells us how they got there, what problems they and their new employers had to overcome, how their work turned out, and how they lived in barracks, hostel, farm or troopship.

She has no illusions about women's share in the war, and states frankly the limitations which, even in Britain, were found to be inevitable in mobilising woman-power. But she rightly points out that women's leaders, and particularly the women Members of Parliament, had to struggle against an often misplaced protective instinct on the part of their male colleagues. On the whole this was a victorious struggle; never have so many sacred precincts been invaded by the gentle sex. This battle between the two halves of Britain provides a less violent, often a humorous, undertone in Miss Douie's narrative.

Labour in Norway

"Labour in Norway." By Walter Galenson. Harvard University Press. (Geoffrey Cumberledge.) 363 pages. 27s. 6d.

THIS is a thorough, accurate and up-to-date study of the organised development of industrial relations in Norway, of the political role of the trade unions, which is especially important in the present period of Labour Government, and of the guidance Norwegian experience may afford for the solution of similar problems in other countries. As such, it is the first book in English on the subject; and it is likely to remain one of the best. The author, who is Assistant Professor of Economics at Harvard, was Labour Attaché to the US Embassy in Oslo for two years immediately after the war. He is to be congratulated on using to the full the opportunities thus presented, as is the Wertheim Fellowship for supporting this particular item of original research in the field of industrial co-operation.

It is, of course, a limited field. Not everybody is interested in the history and machinery of industrial co-operation. But anyone who is, may read this book with profit. Norwegian experience of compulsory arbitration, of the enforcement of contracts between unions and employers, of boycotts (and of the unique "Boycott Court") and of mediation in labour disputes is of value beyond the boundaries of Norway. Less specialised but equally valuable is the analysis of the effect of power on the trade unions and the Labour Party—an account which rightly stresses the good sense and moderation of both organisations. These, together, with a great traditional respect for the law, are the three supports on which the whole structure of labour relations rests. The timeliness of this book is enhanced by the fact that, as in the early 1920s, the Communists are again challenging this attitude.

Letters to the Editor

Britain in the Pillory

SIR,—In your leading article "Britain in the Pillory" you say, "The economic difficulties which are besetting the Atlantic World . . . cannot be solved by the action of any one power." I suggest this is not borne out by Table 3, which shows that no nation listed there is exporting as much to the Dollar Area as it imports, that excepting Great Britain every nation is exporting less to the Dollar Area in 1949 in relation to its imports than it did in 1938, and that we export only 36 per cent of our imports.

The remedy for much of the difficulty would therefore seem to lie in one nation's hands, namely the United States. Whatever the arguments against putting it into practice, that problem is not more difficult than the task set the other Atlantic Nations which appears well-nigh impossible. Marshall Aid not merely dodges, it confuses the issue. "Charity" usually does, for both parties concerned.—Yours faithfully,

J. FORDHAM SADLER

33 Torrington Place, London, W.C.1

SIR,—Whilst agreeing that criticism abroad—especially in the USA—of Britain's postwar industrial efforts is largely unjust and unfair, there are a few points in your article "Britain in the Pillory" which need elucidation and call for some additional comment.

(1) When comparing Imports from and Exports to the Dollar Area of the principal Marshall Aid countries, you summarise the respective trade figures "with Canada and USA." This summarising method does not give an accurate picture in so far as Britain, through Empire preference, is, of course, at a huge advantage over her Marshall Aid partners. It can, in fact, be seen from the *Monthly Digest of Statistics* (July, 1949) that, during the first five months of the current year, Britain's dollar exports went 60 per cent to Canada and only 40 per cent to the USA—the respective actual figures being £33.6 million for Canada and £22.7 million for the USA. Considering, therefore, that almost all other European countries—save Britain—are virtually excluded from doing appreciable business with Canada, Britain's dollar earning efforts appear, proportionally, by no means larger than the respective endeavour by France or Italy, and certainly considerably smaller and weaker than the exertions by Belgium, Luxembourg, Sweden, and Switzerland.

(2) It will be observed that the United Kingdom's dollar deficit is equivalent to the combined deficit of France, Belgium, Luxembourg, Denmark, Sweden, and Switzerland—an area whose combined industrial potential is certainly considerably larger than the United Kingdom's. May it not be assumed that at least part of the British deficit—say \$100-150 million—is due to the unfavourable prices which Britain has to pay as a consequence of the extremely tedious, costly, and rigid method of bulk-buying?

(3) Your table 2—Exports and Imports by Volume, First Quarter of 1949—does not actually mean anything so far as this country's dollar crisis is concerned, because the relative figures refer to overall trade and not specifically to dollar trade. We know only too well that the United Kingdom's trade with non-dollar countries is a very different matter from its trade relations with the Dollar Area.

(4) Your survey does not, of course, include the "invisible" figures for tourist-trade which, so far as France, Italy and Switzerland are concerned, must be very considerable—proportionally much larger than the figures for Britain. (The Bank of France is said to be earning now, during the peak tourist season, \$2,000,000 per day in notes only, and to be seriously embarrassed by shortage of French bank notes

(especially of the smaller types, 500, 100, and 50 francs) to give in exchange for dollar notes.) I believe—as I am sure you must, too—that through these tourist-trade figures, Britain's dollar deficit is bound to become proportionately larger (at least not smaller) than the respective deficit of France, Italy and Switzerland.—I am, sir, yours truly,

FREDERICK JELLINEK

705 Carrington House, Hertford Street, London, W.1

[The figures for Canada and the United States were combined, not by *The Economist* but by the Bulletin of the Economic Commission for Europe from which (as stated) all the figures were taken. (This also applies to Mr Jellinek's point (3).) The addition of Canadian figures might explain why Britain's exports to the dollar area are a higher proportion of its dollar imports than is the case in other countries. It could hardly explain why the British rate is the only one to show improvement since 1938.—EDITOR.]

SIR,—To the catalogue of Britain's economic achievements your article "Britain in the Pillory" might well have added the contribution we are making to the development of undeveloped countries. Firstly, there are unrequited exports to India, Pakistan and other holders of sterling balances, which are running at the rate of £200 million a year according to unofficial estimates; secondly, commitments to the ten-year Colonial Development Plan, involving some £60 million in grants and another £60 million in loans; thirdly, a continuing flow of miscellaneous payments for special purposes.

For all this we seem to get small thanks from the recipients and little credit from America, partly because of a failure to reveal the extent of our liberality. But the government policy of secrecy cannot continue much longer, since the facts and figures are sure to leak out at Washington next month.

A full statement of what we have already done and what we propose to do is the best card we can play at the conference. Generosity to backward countries beyond what we can afford is one of the major causes of our economic difficulties and partly responsible for the deterioration in the position of sterling as an international currency. We must put it to the American Government that an appropriation of \$35 million to provide technical help to undeveloped countries does not meet the case; what is needed is a comprehensive, long-term development plan and an equitable apportionment of the financial liabilities. One possible line of approach is the institution of an international Development Fund to which America, Britain, France and other Colonial Powers should make proportionate contributions. For this purpose an international conference of all the interested parties, both the givers and the receivers, will probably be necessary. All this will take time; pending the completion of the master plan some intermediate arrangement must be worked out to ease the strain on our resources which has become intolerable.—Yours faithfully,

GEOFFREY BRACKEN

Larchfield, Churt, Surrey.

Western Defence

SIR,—In the article on this subject in *The Economist* of August 6th it is pointed out that the war would not be over for Britain even if the invader reached the North Sea and the Channel, and therefore Britain should keep some resources in hand. Is it sufficiently realised in Britain that in a war about 1955 enemy occupation of Continental Europe would mean utter destruction of the ports and basic industries of Britain by a massive bombardment of rockets? Moreover in this situation the radar-screen of Britain would have inadequate

depth to be of any real value to air defence under modern conditions. Consequently a future enemy occupation of Continental Europe would deprive even an unoccupied Britain of nearly all military significance. In these circumstances all efforts should be concentrated at the decisive point, i.e., near the Rhine.

Your article also refers to British commitments in other continents. However, this applies in no less degree to the other Western Union countries.

To a recent gathering of the Royal Netherlands Society at The Hague, Field Marshal Viscount Montgomery declared with emphasis that in the defence of Western Europe all Western Union countries sink or swim together. Certainly a real team spirit should inspire all the peoples concerned.—Yours faithfully,

Mauhenesserlaan 426B, Rotterdam

Gas Turbines

SIR,—We have read with great interest the two articles entitled "How Gas Turbines Work" and "Gas Turbine Costs," which appeared in *The Economist* on July 9th and 16th respectively.

May we point out that it is not essential for the air heater of a closed cycle gas turbine to be supercharged? Originally, we and Escher Wyss, who are the originators of the closed cycle gas turbine, were of the opinion that the use of pressurised combustion in the air heater would reduce considerably the overall size of this unit, but our more recent investigations have led us to believe that this may not always be the case, and whilst we are using a pressurised combustion chamber on the air heater of the 12,500 kW plant which we are making for the North of Scotland Hydro-Electric Board, it is doubtful whether we shall use pressurised combustion on any further plants.

You make no reference to the closed cycle in the article on Gas Turbine Costs. We would like to emphasise that your remarks on the difficulties of burning heavy fuel oils and coal in gas turbines refer to open cycle plants only. In closed cycle gas turbines the ash from the coal or heavy fuel oils deposits only on the outside surfaces of the tubes in the air heater and the fouling problems are in effect very similar to those of a steam boiler or, more particularly, of a separately fired superheater.

We cannot agree that coal-fired turbines may not even be technically possible if you mean this statement to refer to closed cycle as well as to open cycle plants. We have for some 12 months or more now been considering a coal-fired gas turbine and we hope to be running an experimental unit within the next 12 months.—Yours faithfully,

JOHN BROWN AND CO., LTD.

Clydebank

United Nations Record

SIR,—Nothing is easier than to discredit a public figure by distorting the sense of what he has said, and then finding fault with the distorted version. If the tone of Mr Trygve Lie's annual report on the United Nations were really as represented in your comment this week, all your criticisms of the report would be justified. You represent Mr Lie as "claiming credit" for the lifting of the Berlin blockade. On the contrary, he gives first place in this matter to "the constructive statesmanship of the Great Powers."

You charge him with attacking the Atlantic Pact. In fact, his concern is simply to make it clear that lasting security from war can only be secured on a universal, not a regional, basis—a point which has been repeatedly made by Mr Bevin, Mr Acheson and all the other founding fathers of the Atlantic Pact. In another reference to regional arrangements he points out that their effect depends on the spirit in which they are made and executed; a truism which it would be difficult to

deny. And this reference is only made in order to avoid giving the impression that regional pacts are necessarily rivals to the United Nations. As regards Mr Lie's Bergen speech, which you also mention, one imagines that *The Economist* went to press too early to know of Mr Lie's immediate denial that he had attacked the Pact in that speech.

When a man in a position of unique responsibility issues a report on some of the world's most vital problems, the present state of our press is such that only a mere glimpse of his actual words gets through to the general public. That same public is, however, pretty thoroughly supplied with comments on the statement which it has not seen. Surely it is all the more essential that such comments should at least start from a fair appreciation of the text concerned?—Yours faithfully,

United Nations Association,
11 Maiden Lane, London, W.C.2

ANDREW BOYD

The Future of Television

SIR,—It appears that paying for expensive programmes, without commercialising them, is one of the main obstacles to the development of television in this country.

I think that television sets should be provided with meters—slot or otherwise—similar to those which record domestic consumption of gas or electricity.

Each meter—and there should be more than one to each set—might be so fitted that a radio signal, inaudibly and invisibly accompanying a particular programme, activates it. Thus the viewer could be appropriately charged for the programme he chooses to view and for the length of time he views it. The charge for viewing the various programmes would be shown in the published time-table.

The agency for collecting viewing money might be farmed out on commission to local radio firms having set-maintenance contracts.

Such a system seems to me to be fair and likely to find favour with the anxious film companies. It would also be a very effective monitor of the popularity of programmes. Needless to say, that if some such system is likely to provide the eventual answer, it should be developed now rather than when viewers are numbered in millions.—Yours faithfully,

RICHARD WIDDRINGTON

Bockmer End, Great Marlow, Bucks

Travel in Spain

SIR,—The Director-General of the Spanish State Tourist Department in his reply to the criticisms of "Viajero" of the obstacles in the way of tourists to Spain shows that although he is well versed in the contents of Spanish Tourist literature, he knows very little of the handling of foreigners by the hotels, police, banks, etc., in that country.

My experience fully bears out the criticisms which appeared in your paper on July 9th. Firstly, although stopping at the principal hotels in five or six of the largest Spanish cities whenever I wished to cash a cheque I was informed that it was not possible and that I must go to a bank. On visiting the nearest bank I was informed that cheques could only be cashed at the Banco de Espana, and on reaching the local branch of that organisation it was necessary to queue up for a considerable time.

On leaving the country I blithely handed over all my pesetas and received a chit informing me that I could obtain the sterling equivalent from the Banco de Espana in London. However, I was there informed that they knew nothing of such arrangement and they refused to repay this money. The matter was argued between my bank and the Banco de Espana for some three months and then handed over to the Bank of England to negotiate. After considerable pressure had been brought to bear by the Bank of England the sterling value of my pesetas was eventually refunded—six months after leaving Spain.—Yours faithfully,

FRUSTRADO

AMERICAN SURVEY

Dixie Democrats

(From a Correspondent in Alabama)

PRESIDENT TRUMAN, like his predecessor, is plagued by rebellious men within his own Democratic Party, most of whom come from the South, and for him this party division is more serious than it was for Roosevelt. Not only does Mr Truman lack the overwhelming personal appeal with which Roosevelt was always able to beat the rebels, but the South's revolt has now been organised under the banner of the "States' Rights Dixiecrats." When, in the 1948 presidential campaign, the arch-conservative and reactionary elements succeeded in taking the states of Alabama, Louisiana, Mississippi and South Carolina away from the national Democratic Party and from Mr Truman, they insisted they were not forming a new party, but were only maintaining the "real" Democratic Party as opposed to Mr Truman's "radical minority groups and big city machines in the North"; but in effect they led a party bolt.

While their immediate hopes were washed out by the Truman tidal wave last November, the States' Rights leaders in city, county and state governments, and in the national Congress, persistently block the Democratic Party's programme and obviously intend to continue their obstruction either as individuals or as a new party.

Economic issues are at the root of the rebellion and of these the chief is fear of the growing labour movement. With the South rapidly becoming industrialised, the region's conservative leaders are haunted by the thought of changes sure to come as workers are educated and organised. They know that they will then lose their tight control of the state legislatures, and their close check on Congressional representatives. Within the last year the relatively well-organised states of Tennessee and North Carolina have sent to the US Senate two men, Mr Estes Kefauver and Dr Frank Graham, who are certainly not conservatives. They, together with liberal Senators like Mr Hill and Mr Sparkman, of Alabama, and, with the difference that makes Florida not quite part of the South, Mr Pepper, of that state, symbolise the pattern of development which is being resisted by the Dixiecrats.

Big landowners in the South are part of the rebellion, for they fear the rise of small farmers, white and black, as a result of the Administration's policies of supporting farm prices and granting long-term agricultural loans. Farm tenancy has declined sharply since 1933 and ownership is rising. The Farm Bureau, which in the South represents chiefly the big farmers and has been more Republican than

Democratic in the nation, had a share in splitting the South's Democratic vote last year. So did the public utility companies, a potent influence over Southern politicians. Frightened by the enormous popularity of the Tennessee Valley Authority, they backed impartially the Republicans and the Dixiecrats in a desperate effort to halt the Democratic programme for rural electrification, the installation of rural telephones, and further schemes on the lines of the TVA. Another small but powerful economic group are the oil men of the states along the Gulf of Mexico, who want the underwater oil properties off the coast opened to private exploitation.

Yet even with the issues of labour, farm policy, public power and tidelands oil all lumped together, it is doubtful whether Dixiecrat leaders could have won enough support

to sustain even a temporary split away from the Democratic Party. They are vitally dependent upon one other issue which they ceaselessly stir up—the Negro. The average Southerner's attitude toward Negroes did not alter radically from the abolition of slavery following the Civil War until the time of Franklin D. Roosevelt and his wife. Their steady pressure for better housing, education, health and political oppor-

tunities for Negroes achieved a definite advance, even though it tended to deepen the animosities of the white die-hards. With the inevitable maladjustments at the end of the war, and President Truman's determined stand for laws to protect the civil rights of Negroes, heightened race tensions in some parts of the South have provided the ideal issue for those politicians who live by demagogic appeals to the masses. They used it as a means of splitting the Democratic Party in 1948, and in a number of states they are using it now to encourage such divisive organisations as the Ku Klux Klan.

This secret, hooded order originated just after the Civil War, when Southern whites were forced outside the law in order to save their government from the control of the illiterate Negro majority. After the first World War the Klan was reorganised under conditions much like those today. Its leadership, then as now, attacked Jews and Catholics and stood for "white supremacy." While the States' Rights leaders today come from a higher social and political stratum than the Klansmen, and deny any connection with them, there is a definite bond of sympathy between them. Each, with close ties to the big corporations, sees danger to the

established pattern in the rise of organised labour and the Negro, and in the possibility of the two groups reaching an understanding with the traditionally conservative farmer.

While the rebellious right-wing Democrats have dangerously confused Southern politics, it may be that from the long view this is merely part of the overdue transition from the one-party system in the South to a more normal and a healthier multi-party system. It should be remembered that, while most of the South since the Civil War has clung stubbornly to the Democratic Party, this one party has been divided into contending liberal and conservative wings. Urban industrial areas have tended to be liberal; rural areas have usually been conservative. The liberals for years have been hinting to the right-wingers that in the South they ought to join the Republican Party, there more or less dormant, so that they could be welcomed into honest conservatism and could help to create the needed two-party system. But the right-wing Democrats have resisted; up to the present, they have been able to swing the Democratic Party in their States, and to profit from Federal patronage and Congressional committee chairmanships while the Democratic Party has been in power nationally.

Yet in the States where their representatives have failed, or been hard pressed, to win the Democratic nomination, they have more incentive to look around for a new place to land. In the recent primary election in Virginia, to select the Democratic nominee for the Governorship of the State, the right-wing candidate for the nomination openly welcomed, and received, support from Republicans, and it has been hinted that there were nominal Democrats in numbers among the 171,000 Virginians who voted for Mr Dewey last November. Since Senator Byrd, cock of the walk in the Virginia organisation, normally votes with the Republicans in the Senate at Washington, this co-operation is logical and, for the time being, effective in producing the necessary number of votes. Liberal Democratic forces, however, feel that open coalition between right-wing Democrats and Republicans can be made a prelude to realignment. They would welcome this development, for while many big Southern names would go to the Republicans under such an arrangement, the big voting boxes would probably remain Democratic. There are more poor folk than rich in the South.

American Notes

Arms for the Pact Only

For at least two days this week such vital government agencies as the Service and Interior Departments have been officially penniless, a state to which they must be becoming accustomed, in consequence of the Senate's inability to get down to work on the outstanding appropriations, amounting to about \$27 billion, for the fiscal year which began seven weeks ago. The House, asked for the third time to give authority for stop-gap spending, could be excused for cocking a snook at the Senate, by proposing soon to take a two weeks' holiday. It is well entitled to do this, since not only did it do its share of the work on the appropriations at an unprecedentedly early date, but it has now also dealt with all major pending legislation except the Military Assistance Bill.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

This its Foreign Affairs Committee has renamed the "Mutual Defence Act" and has reported out with its total of \$1.45 billion intact, although at one point there was danger that it would be halved. The share of the Atlantic treaty countries is divided between cash and contract authorisation; in both cases a proportion will not be available until after March 31st, and then only if the President can certify that the arms it buys are being used in a unified European defence system set up under Article 9 of the Atlantic Pact. Similarly, the series of further amendments to the draft Bill, which have been proposed by Senator Vandenberg and Senator Dulles, are designed to make "certain that what is started now will integrate quickly into the agreed plan for area defence that will emerge from the North Atlantic treaty." With these and other amendments, which would reduce the total sum for the Pact signatories to a round \$1 billion, the Senators believe that the Bill should, and will, receive the support of the Congress.

There seems no doubt both that the basic principles of the Bill are fairly generally accepted and that there is as general a lack of understanding of the need for, and the details of, the measure itself. For this the Administration must take a share of the blame, since in both the original Bill and in the statements made about it, there has been an ineffectiveness and woolliness which cannot entirely be excused by heat and midsummer exhaustion. It is not therefore surprising that the Senate has shown a tendency to run round in circles on this even more than on the rest of the legislation with which it is now trying to deal. The latest gyrations, however, arise from the Administration's desire to speed up the proceedings for the benefit of all concerned. Senator Connally, considering that it was unnecessary to hear evidence that had already been presented to the House, and finding it easy to guess what both Mr Henry Wallace and the Socialist, Mr Norman Thomas, wanted to say, closed the Foreign Relations Committee's hearings without listening to the opposition. He has now been forced to reopen them, and both the Appropriations and the Banking and Currency Committees have also rushed for their guns as the result of a story that, in order to avoid the delay involved in the appropriations procedure, the Bill is to include authority for a loan from the Reconstruction Finance Corporation, large enough to carry the programme until January.

Whitewash for B36's?

This year Washington's annual heat rash of investigations is concerned not with spies but with government contracts, almost as safe a way to the headlines. The House Armed Services Committee is enquiring into the recent and sudden passion of the Air Force for the B36. This long-range bomber is produced by a corporation with which the Secretary of Defence was once connected, the Consolidated Vultee Company, whose officers are said to have subscribed heavily to Democratic funds last autumn. It has been alleged that there was an improper connection between these occurrences, but the highest Air Force Generals, reinforced by a "History of B36 Procurement" which took five hours to read, gave impressive testimony on how their serious doubts and disagreements about the airplane were finally dispelled last summer by its proven merits. They denied indignantly that their professional judgment was subjected to political pressure at any point during the B36's long development. Confidence in the bomber will not, however, be strengthened by one expert's remark that its faults were straightened out "only by one of those lucky freaks."

The B36, twice as large as a Superfortress, able to deliver a 10,000-lb. bomb on a target 10,000 miles away, was first dreamt of in 1941, when Germany would have been the target, but the changing strategy of the war delayed its production,

and now, when the dream is at last coming true in quantity, the target is Russia. It was in 1948, when the Berlin situation made war seem imminent, that the Air Force finally decided to put most of its eggs in the B36 and to halt work on other types of aircraft. There are many, nevertheless, who feel that not only have claims for the B36 been exaggerated—enthusiasts try to make out that it is a plane-of-all-work—but also that the decision to rely on this aircraft committed the United States without sufficient consideration to a long-term policy of strategic bombing from domestic bases.

Those holding this view are concerned at signs that Mr Vinson, the chairman of the Armed Services Committee, would like to postpone, and perhaps abandon, hearing the evidence against the B36, and is diverting the attention of his Committee to hunting down the sources of the apparently unfounded charges against Mr Johnson and the Secretary of the Air Force, who was also implicated. But Representative Van Zandt, who first gave publicity to the allegations, is an ex-naval officer, who is already accusing Mr Vinson of whitewashing the B36. If the Air Force hoped, by the weight of its evidence, to blow sky-high any desire to discuss the general question of its plans for fighting the next war, it is likely to find that it has under-rated the tenacity of the Navy.

Blackballs for Five-percenters

The B36 rumours involved the giants of the industrial and political world, but at the same time a Senate sub-committee is investigating the pygmies, the little businessmen who cannot employ their own Washington representatives, and the hangers-on of government officials who claim to be able to influence the letting of government contracts. The activities of these five-percenters (so-called because that is the sum they charge for their services) have recently been smelling increasingly unsavoury. They were brought to the surface by the Republican *New York Herald Tribune*, whose undeniable devotion to clean government was perhaps stimulated by the opportunity to embarrass the Administration. The newspaper story centred round a Mr Hunt, who naturally reappears in most of the samples which the committee, after a detailed private analysis, is now exhibiting at public hearings. But the name of Major-General Harry Vaughan, the President's blustering military aide, stands out with equal frequency from the morass of deep-freeze units and race-tracks, molasses and perfume, Greek bootblacks and chemical warfare chiefs.

It is doubtful whether any real evidence that government officials have acted illegally will emerge from this inquiry, but it has certainly made it even more desirable, although little more likely, that Mr Truman's indiscreet crony, General Vaughan, should be eased out of the White House. The publicity given to the investigation may, however, show businessmen that the five-percenters are not worth their commission: one of them was quite unable to conceal the hearsay nature of his "private" information or the roundabout route followed by his "direct" contacts. Publicity may also perhaps lead official society to blackball, at least temporarily, the more notorious of the "pedlars of influence."

There are also more concrete remedies available. Other agencies might copy the attempts of the Department of Defence (in any case responsible for a high proportion of government contracts) to make go-betweens unnecessary. Small business liaison officers have been appointed to its local offices and a special information bureau on military procurement has been opened in the Pentagon, its Washington headquarters, where unfortunately the maze of corridors may prove almost as confusing as red-tape. The sale of influence by ex-government employees can be curbed by regulations of the kind which some departments already have, and which are contained in a Bill passed by the Senate in connection with the Reconstruction Finance Corporation. Officials of that agency had been transferring to highly-paid posts with firms which had received RFC loans on their recommendation; the

Senate Bill forbids any RFC employee to accept such a post for two years after leaving government service.

ICI in the Webb-Pomerene

At the close of last week, the US Government won the first decisive round in an action which may clarify the relationship between the Sherman Anti-Trust Act and the Webb-Pomerene Act of 1918 which was designed to legalise the development of export trade associations. The defendants in the case included Imperial Chemical Industries and its New York subsidiary; the United States Alkali Export Association; and many leading chemical producers in North America.

Only the briefest details have so far become available on this side of the Atlantic, and it seems safe to conclude that litigation, in this case as in so many others, will be taken far beyond the Federal District Courts. But the initial judgment is interesting because it is the first occasion on which the US courts have determined that the Webb-Pomerene Act gives no more than a closely circumscribed exemption to the Sherman Act. It is possible to argue that the "intent of Congress" in this respect may be less difficult to recognise than in some other aspects of anti-trust law. But until last week, at least, there was no clear legal ruling that could sustain the now successful government plea that cartel arrangements, embracing the division of world markets, would bring the participants within the boundaries of the Sherman Act, which regulates domestic trade.

Problems raised by this judgment, however, may well offset substantially any benefit arising from a possible clarification of anti-trust law. The Webb-Pomerene Act does permit export associations to limit competition among their members and to act, in some measure, in restraint of trade. But, between the permissible area where such organisations may promote their interests by "price protection," and the twilight zones approaching "unlawful restraint" (i.e. the imposition of barriers against non-members, the restriction of imports, or direct interference with domestic trade), there is a wide field in which the businessman may falter, and the commercial lawyer thrive.

Certainly no single ruling can bring a clear line of demarcation between permissible and "unlawful" restraints of trade. And this conclusion leads to an interesting speculation on the utility of the Webb-Pomerene Act itself in relation to the postwar commercial policy of the United States. The Act was passed on the assumption that American firms engaged in foreign trade should be enabled to battle, on more equal terms, with foreign cartels and export associations, formidably larger, decisively stronger, and buttressed by foreign governments. Few would be prepared to deny that such dangers may in the future exist, or to assert that the dangers attaching to government intervention have diminished, though few, equally, could deny that the intervening years have brought a tremendous accretion of strength to the average American unit engaged in export trade. But if American commercial policy is to triumph, if GATT and ITO are to become recognised trademarks for world exporters, Washington can scarcely sustain a law which establishes for exporters a standard less rigorous than that applied to firms engaged in domestic trade. A recent survey by the Department of Commerce, which noted possible divergences between the ITO Charter and the Webb-Pomerene Act, serves as a somewhat paradoxical comment on the first legal ruling that binds that Act to the Sherman Act.

Republican Teamster

With the start of the 1950 Congressional race only a year away, it is time to prepare the Republican wagon for the victory that is needed to eclipse the memory of last year's catastrophe. The first requirement was to get rid of Mr Hugh

Scott, the Dewey appointee to the chairmanship of the party's National Committee. He had remained insecurely in the driver's seat but had been quite unable to get the wagon rolling, since the various horses in his team refused to pull in the same direction. Even worse, with him as teamster, there were no offers of funds to equip the wagon for the contest. Last month Mr Scott climbed down from a perch that had become too hot to hold him and a miniature national convention, complete with private smoke-filled rooms and public backslapping, was held to choose his successor.

Victory in 1950 depends on reharnessing the midwestern voters who broke away in 1948; for that reason Mr Dewey's friends from the big cities chose, without enthusiasm, a South Dakotan farmer for their candidate. But at the moment organisation and money are needed to get the team into training, therefore Mr Guy Gabrielson from New Jersey, with political experience and excellent Wall Street connections, had the support of both Taftites and Stassenites, whose alliance is becoming such a dependable feature of the Republican landscape that it is permissible to wonder whether it will remain there until the Presidential campaign. The combined boost of conservatives and liberals (in so far as liberalism can be found in the National Committee) pushed Mr Gabrielson into the driver's seat, but his majority was so narrow that he will certainly need all his political talents if he is to keep his pledge of "building a united, driving, progressive organisation."

His first test is likely to come in the group of National Committeemen and members of Congress who are to draft a statement of principles for the 1950 campaign. Mr Hoover, celebrating his seventy-fifth birthday in a glow of polite acclaim, gave them an elder statesman's theme: "The United States is blissfully driving at top speed down the back road to collectivism." But working politicians knew that voters find bliss very alluring. Senator Taft has a more practical formula, which he upholds with sincerity and conviction and which combines moderate progress at home with moderate reaction abroad. He is about to begin a three months' speaking tour, in which he will explain his position to the people of Ohio, in preparation for his campaign for re-election next year. He is setting out in plenty of time on the road which he hopes will lead to a Presidential candidacy in 1952 and along which his advance will certainly not be delayed by the fact that the hand on the Republican Party's reins is that of his friend, Mr Gabrielson.

Rail Rates Rise Again

The latest award by the Interstate Commerce Commission (which becomes effective on September 1st) will enable the railroads to increase their freight charges by a flat 4 per cent on top of a temporary advance of over 5 per cent allowed in January. At the close of last year, the companies were seeking a rise of 13 per cent on the levels then prevailing. Of this, they have now secured rather more than 9 per cent, and rates on goods traffic are almost 60 per cent higher than in mid-1946, when the ICC first began to take a more sympathetic view of the industry's problems.

On estimates submitted by the ICC, increases granted in the postwar period amount to more than \$3 billion yearly. The railroads, however, are now facing much more severe competition from other transport services, and rate increases no longer automatically assure a commensurate improvement in operating revenues. Industrial output is generally lower, and the short working week in the bituminous coal mines is damaging many railroad companies. For most of the present year, the volume of goods traffic has been sharply below the comparable level in 1948 and, over the first six months of 1949, net operating revenues of Class 1 railroads fell by 25 per cent to \$312 million. Higher rates provide a short-term solution, but they do nothing to correct the rigid costs structure from which the railroads are now suffering. Next month, moreover, when the new rates become operative, the industry must adjust itself to a 40-hour week for the so-called "non-operating" workers. The ICC declares that "much more

must be done to increase efficiency and reduce costs." As a somewhat sardonic comment on the award, many companies are seeking permission to reduce rates on particular products in order to meet competition from road transport.

* * *

Foundations of Charity

Britain has good reason to know that, in the first quarter of this century, America's great industrial pioneers, the Carnegies, the Rockefellers, the Harknesses and their companions, discovered a way to ensure that their incredible fortunes should continue pioneering after their deaths. The money they made, by exploring the potentialities of steel, oil, tobacco, retail trade and so on, has been devoted to the advancement of human knowledge and the well-being of mankind by means of the charitable foundations which they established with their millions. It is along the trails blazed by these endowments that America's medical and scientific research, public health, social services and education have travelled to their present high levels. But individual philanthropists and government agencies have now settled most of the country originally opened up by these benevolent funds and, if they are to carry on the pioneering traditions of their founders, they must find new frontiers to cross.

Yet reliable and cautious trustees, presiding over large, well-established organisations, naturally tend to keep to the original tracks, even though they have now become well-marked roads. It is calculated that the foundations are still spending nearly half their appropriations on medical and health research, while another third goes to universities and schools and the rest mainly to social work. Then, too, trustees are under constant pressure to scatter their resources in small amounts over many fields or to put income into reserve in order to safeguard their assets. It was to avoid the dead hand that is closing over so many of them that Julius Rosenwald stipulated that his fund of \$22 million should be spent in a generation, to give new opportunities to all Americans, and especially to Negroes. The Twentieth Century Fund is one of the endowments that has found new lands to chart: it is now concentrating on research and public education on economic questions, with the work being done under its own auspices instead of by grants to other institutions. The Carnegie Corporation is another: it has decided that the time has come to give up its library work; as a result it has been able to finance the new Russian Research Centre at Harvard.

The foundations may have been crowded out of their original fields by the extended scope of governmental activity, but the high taxation which this involves explains the recent increase in the number of such foundations, since charitable and educational organisations are exempt from Federal income tax, and contributions to them from estate and gift taxes; when calculating net income for returns, deductions may also be made for charitable purposes. Out of some 5,000 organisations which use the name of "fund" or "foundation," there are now about 500 which are genuine, charitable and educational trusts, with a capital of \$2 billion and an average annual expenditure of \$100 million.

The largest is the Ford Foundation, with assets of over \$200 million, which include nearly all the non-voting stock of the Ford Company, bequeathed to it by Mr Henry Ford and his son, who thus escaped the danger that death duties might force the family to lose control of the Company. Although in this case the income presumably does go to charity, the Ford Foundation is one of many of the newer foundations which publish no details of their expenditure and who thus lay themselves open to the suspicion that their purpose is not philanthropy but tax avoidance. The most publicised case has been that of the Textron Trusts, which were investigated by Congress last autumn. They were found to have accumulated, by means of their tax-exempt status, large amounts of capital needed for the textile enterprises of which their founder was head, but to have given practically nothing to the organisations which they were set up to aid.

...the Barclays Group can help

IN THE UNITED STATES

With a coast to coast network of correspondent banks, a New York office of Barclays Bank (Dominion, Colonial and Overseas), and a representative in San Francisco covering the West Coast, we can:

- Get information for you on United States markets;
- Introduce you to agents who can handle your goods;
- Provide all the necessary banking services.

IN CANADA

Barclays Bank (Canada), a Canadian Chartered Bank, with branches in Montreal, Toronto and Vancouver offers the same services in Canada.

IN THE UNITED KINGDOM

Ask any Branch Manager of Barclays Bank Limited to explain to you how easily exporters can make use of these facilities, or write direct to 54 Lombard Street, London, E.C.3.

THE BARCLAYS GROUP OF BANKS

★ TO ALL WHO EXPORT TO THE ARGENTINE

Get in first
—and with 'factory-fresh' goods—
on this reopened market

COTTON and woollen textiles and piece-goods, glassware, chinaware and electrical equipment — all these British products which can again be imported into the Argentine are especially suitable for shipment by air. Air freight enables you to forestall competition and avoid dock congestion, and it delivers your goods in 'factory-fresh' condition, free from the effects of manhandling.

Furthermore, the lower insurance, warehousing and packing costs involved mean that it is often actually cheaper to ship by air than by sea. It is worth remembering, too, that shippers by air can enjoy all the commercial facilities—including control of goods until they are paid for—that are available to shippers by sea.

British South American Airways operate the most frequent—and

therefore the most time-saving—air freight service to Buenos Aires and other principal South American cities, and they can carry almost any type of goods: consignments of up to four tons, or even more by special arrangement.

Specimen Freight Charges

London to	Per kilo
Buenos Aires	22s. 1d.
Kingston, Jamaica	13s. 10d.
Rio de Janeiro	19s. 1d.
Santiago	23s. 6d.

Subject to alteration.
Rebates: Shipments of over 45 kilos are subject to 25% quantity discount rebates.

Fast services also to Natal, São Paulo, Montevideo, Lima, Havana, Miami, Panama and the West Indies; and a weekly special freighter service between London, Lisbon, West Indies and Central America.

THE WORLD OVERSEAS

First Week at Strasbourg

(From Our Special Correspondent)

AS the Council of Europe began its second week of existence in Strasbourg (with a day's holiday to recover from the wine festival of Colmar), the ten Foreign Ministers who had watched over its tenderest days departed for their capitals. Although they had seen some of the stripling's protective clothing cast aside, although there had been robust and defiant cries from the Consultative Assembly and more than one Churchillian growl, they probably felt that the 101 new European spokesmen would now be better left alone, to discover for themselves some of the facts of international life. They are, after all, now under the charge of M. Spaak. By a lucky chance he had one day been a leading member of the Committee of Ministers and Belgian Foreign Minister; and the next he had become a parliamentarian out of power and ready to take the chair in the Assembly.

M. Spaak is playing with great skill the role of a stern but judicial uncle, who can also be jovial and argumentative without losing one jot of his authority. With this vigorous and only mildly socialist personality in the chair there will be no nonsense, no disorderly procedure, no serious tampering with the constitutional rules laid down in the Statute that he helped to prepare. If it can learn to begin work punctually and stick to the point, the Assembly has now some chance of getting through its agenda by the end of August—a prospect that seemed hopeless in the debates of last Thursday and Friday.

It is difficult as yet to say anything more about the dignity and prospects of the Consultative Assembly. It has not yet found a style or spirit of its own. Is it the organ of new voices, the medium of new forces in Europe, which give it an irresistible power to force governments towards great acts of European policy? Or is it an amateur advisory body, carefully picked by the men in power and girt around with restrictions which will prevent it developing too much weight and too much voice?

Individuals or Parties?

Clearly, the Assembly is not yet certain on this point. Indeed it hardly can be till it has shown its capacity to define in workable form proposals that can be passed as recommendations to the Committee of Ministers; and before it can do that there are one or two great issues to be thrashed out. It has to be discovered by just how much the anti-planners can out-vote the planners; by what methods the various parties can keep their federalists and impatient visionaries in order; whether Right and Left will allow a centre group to establish itself, in which practical recommendations can be agreed on which will command a two-thirds majority in the Assembly. In theory, of course, everyone here thinks and votes as an individual. In fact one powerful and highly organised international party already exists—that of Mr Churchill—and the second week should show whether an opposition of Socialists and progressive Catholics can or will mobilise itself as well.

By next week the Assembly should have spent five or six days debating the three crucial items of its agenda. One of them only was proposed by the Committee of Ministers; the other two were proposed by the Assembly after some rather irritable debating, in which it seemed to be assumed that the Ministers would be stubborn and suspicious in their attitude to any attempts by the Assembly to change or add to its agenda. (In fact the Ministers were reasonable; and Mr

Churchill, who had been preparing a charge in the spirit of 1789—or perhaps 1911—found he had been shaking his lance at a shadow).

These three items will raise every argument and issue that cuts across the national groupings of the Assembly: first, the changes in political structure needed to get closer unity between members of the Council of Europe; second, the kind of measures needed to achieve the Council's aims and to assure the human rights it claims to defend; third, the role that the Council should play in economic matters. Frank discussion on the first and third of these should bring some clarity of line into the vague Strasbourg atmosphere. For Mr Churchill and his principal followers do not really want the federation of Europe, and they certainly do not want to find themselves advocating here the central economic planning which they denounce so explicitly at home. Likewise, the Socialists are not really ready to make sacrifices of sovereignty to an international body, especially in circumstances which would give the Right the kind of effective majority it has here. It is better that these inhibitions should be dragged out in debate, and that honest criticism should disperse some of the dishonest illusions about European unity which have been created by oratory at social occasions and by journalists anxious to produce a dramatic and hopeful story for the dog days of August.

Need for Practical Proposals

With these fundamental debates out of the way, it might then be possible for a re-grouped Assembly to produce some recommendations on relatively small but practical matters which could be carried out by ministers before the next session next year. On the agenda are proposals for a European passport, for a programme of public works, for co-operation in scientific research and cultural matters, and for arrangements which would enable a European worker to enjoy full rights to social services wherever he may move. Some progress in these matters would make it possible next year for the Assembly to establish its proper relation with the Committee of Ministers: that is to say, the Ministers would report progress and the Assembly would express satisfaction or the opposite with what its masters had done. At that point, too, the Assembly might divide into defenders and critics of the Ministers, a division which would begin to give some reality to its claim to constitute a European parliament—a claim which is already being made most inaccurately and somewhat irresponsibly.

The most striking feature of this first rather disorderly week has been the British predominance in the Assembly. The very first day of debate provoked Mr Morrison into a resentful little speech which exposed him to a statesmanlike but mischievous rebuke from Mr Churchill, who had previously been deprived of the opportunity for a great oration. And so it has gone on. The British have talked more than anyone else: they have provided all the best stories in the coulisses; they have brought a little of the hurly-burly of the House of Commons into the grey and somewhat wagon-lit atmosphere of the Assembly chamber.

Indeed, British manners have not been too good, either on the Right or the Left. There is a tendency for the Left to sulk and for the Right to gloat. Watching the British Labour delegates one feels we really must "educate our masters" in the ways of Europe. Watching the Conservative delegates,

one marvels at the confidence and glibness with which the advocates of Empire are committing the British to leadership in this so far shapeless enterprise. It is something more than the fact that Conservatives are demonstratively at home with coffee and sweetbreads while Socialists look surreptitiously for pots of tea and kippers. It is the fact that they are in power at home and have no mandate to go very far with European union. The men of the Right are in the majority here; to support them may run counter to domestic responsibilities. To oppose them lays the British Socialists open to the charge of being reluctant, unenthusiastic and even cynical.

Pressure Group Lobbying

Doubtless Mr Morrison will try to stop the rot, and will take steps to see that the thirty-four or five votes needed to veto the moves of the Right will be available if necessary. He will also, doubtless, challenge the sincerity and explicitness of the programme of the European Movement, of which Mr Churchill is the main exponent. Unless something like this is done, or unless the French—so far silent and apparently bewildered—oust the British from their dominating position in debates and commissions, it is difficult to see how any recommendation to Ministers can get the two-thirds majority needed.

For a while, then, Strasbourg may look like the talking-shop Mr Bevin first feared, then perhaps hoped, it would become. And in and around the Assembly there will be manoeuvrings and lobbying which will depress the younger enthusiasts. But the hard-hitting talk and the astute manoeuvring will give to the Assembly just the life and vigour it needs. Delegates will learn a lot, the British Labour delegates in particular. The economic arguments of the Right will have to be treated seriously, coming as they will from delegates who are no longer ready to accept at their face value British accounts of Britain's economic achievement. And the Right itself will be obliged to clear its mind. It cannot be allowed to enjoy indefinitely the luxury of advocating free enterprise with one voice and European planning with another. It will have to explain just how it proposes to achieve economic integration—if it really wants it—without cartels, without restrictive practices and without antagonising the whole trade union movement in western Europe. The European Movement, whose lobbying on American pressure group lines is beginning to get on delegates' nerves, may find one or two bluffs called.

Germans at the Polls

[FROM A CORRESPONDENT]

DOCTOR KONRAD ADENAUER has stoutly defended his country against reports in the foreign press that a new wave of nationalism is rampant in Germany. The results of last Sunday's national elections, in which his party, the Christian Democrats, with their Bavarian affiliate, the Christian Social Union, came out at the top of the poll, prove them to be baseless, he maintains. Nevertheless it was the former Nazi element which decisively shaped the final figures. Of the 6,000,000 new voters who have become eligible since the last state elections, the vast majority are Nazis cleansed in the health-giving trough of the denazification laws, or Hitler Youth now of voting age. Three million of these votes went to four blatantly right-wing extremist splinter parties, and another million bolstered the fortunes of the right wing Liberal Democrats. Over a million votes cast for independents and 800,000 spoilt slips certainly did not come from the left.

The vast body of more moderate elements is looking narrowly at the electoral law which has thus disturbed the placidity of their former monopoly. Under the partial proportional representation procedure adopted by the Bonn Assembly, western Germany is divided into 240 constituencies, each electing one member by direct franchise. The remainder of the nominal

total of 400 deputies are chosen from the party reserve lists established in each of the eleven member states. Under the d'Hondt system of counting, the total votes gained by each party in the state are set out at the head of separate columns. Parties with less than five per cent of the votes and the figures for independent candidates are ignored.

Each total is then divided successively by 1, 2, 3, 4, 5 and so on. Starting with the total of the leading party, seats are then allotted to the next lowest figure in succession until the total number of candidates, both indirect and direct, for the state is reached. If each party has elected less candidates by direct vote than it is entitled to proportionately, then it may draw the difference between the two figures from the reserve list. If a party has received more direct mandates than it is entitled to, those candidates remain elected, but the difference is added to the total number of candidates allotted to the state and these extra members are chosen from other parties.

Even a system so perfect in its complexity as this has its anomalies in practice. Independent candidates, with five per cent of the total vote, obtained only two members or one-half per cent. On the other hand, the Communists with 15 members, the leftish catholic Centre party with ten and the German (ultra) Right party with five, owe their representation in the new Federal Parliament entirely to the reserve list, as they did not elect a single candidate by direct suffrage. The Bavarian, German and Reconstruction Parties obtained two-thirds of their members from the reserve list, which also came to the rescue of such party stalwarts as the Communist leader, Max Reimann, the Minister for Food and Agriculture, Hans Schlange-Schoeninger, and Professor Theodor Heuss, leader of the Liberal Democrats and federal president presumptive, none of whom succeeded in their constituencies. It has also provided a back door for several score party hacks who would otherwise be excluded from the active political life they can hardly be said to adorn.

Rise of the Splinter Parties

The campaign provided one of the dullest national elections on record. And when 24 million people heaved themselves out of what was indistinguishable from apathy, to vote along preconceived lines on the grounds that if they were going to have a quasi-government, they might as well have some say in its composition, they surprised themselves as much as they did the outside world. Even violent attacks on the occupying powers by Dr Adenauer and Dr Kurt Schumacher, leader of the Social Democrats, did little to erase the distaste their two parties had caused by the protracted bumbblings and bickerings during the framing of the Bonn Constitution. If they had been a little quicker and shown a little more spirit of compromise, the smaller parties now plaguing them would probably not have had the time or the reasons for organising themselves.

The splinter parties provided every vagary between the waving of red, white and black flags and the singing of the forbidden *Deutschland über Alles* by the German party, the daubing of swastikas and Hitler moustaches and cowlicks on opposition posters, to sporadic efforts by the Bavarian party to enlist the support of 82-year-old Rupert of Wittelsbach, heir to the Bavarian crown. Denigration of the established parties and thinly-disguised appeals to neo-Nazi sympathies provided their chief weapons, with most regrettable success. With loftier phrases and far more genuine idealism, certainly among their leaders, in favour of freedom of enterprise and the individual, the Liberals found in the outcome that they had been catering for the same public.

The two chief protagonists, the Christian Democrats and the Social Democrats, are surveying ruefully the gaggle of minor Frankensteins their violent and vindictive abuse of each other during the election campaign served so largely to bring into existence. It is an open question who is more embarrassed, the Socialists at being kept out of power by the eldritch cacophony of an extreme right wing, or Doctor Adenauer for having to depend on such disturbing elements for his majority.

Ethiopia and Eritrea

[FROM A CORRESPONDENT RECENTLY IN EAST AFRICA]

BY 37 votes to 11, with two abstentions, the May Assembly of the United Nations awarded the whole of Eritrea to Ethiopia. The project failed because the Bevin-Sforza plan for the ex-Italian colonies, which was to stand or fall as a whole, failed on other clauses. The September Assembly is due to tackle the problem again. A clear majority of the inhabitants of Eritrea are now hoping for a different verdict. The bulk of the Unionist party, which is the Christian group representing, at a guess, 40 per cent of the population, which is related by race, religion and language to the Tigray province of Ethiopia, and which lives in the area round Asmara, is faithful to Ethiopia. All the other parties, Moslem and Italian, have now made common cause in their aversion to Ethiopian annexation. They have joined in an Independence Front. They demand what this name implies—"with possibly a limited period of international tutelage." They are sending a "strong delegation" to Lake Success in the hope of reversing the May verdict.

A visit to Ethiopia as well as Eritrea suggests that they have something of a case. The Emperor Haile Selassie claims Eritrea partly for strategic reasons—twice in his lifetime it has served as the base for an Italian attack—but chiefly on economic grounds, and superficially, at least, the latter looks more valid than the former. Possession of the Eritrean coastline would give him an outlet to the sea, while his great hinterland would furnish Asmara and Massawa—a town and port swollen by the traffic of two wars—with a body to match their head. But is Ethiopia in a position to take on a territory that is, administratively speaking, years ahead of it, and that has proved a financial liability even to Britain?

The Emperor has engaged an American economic mission, appointed Britons and Swedes to train his army, air force and police, chosen an American governor for his state bank, given the Russians permission to open a modern hospital in Addis Ababa, and has granted a concession to the American Sinclair company to prospect for oil. Ethiopia today abounds with foreign advisers. There are 17 nationalities on the state bank staff alone. But their advice is not taken. Two modern wars have not really changed the Ethiopian skin. Despite the efforts of the Emperor and of the few minds like his, and of the foreign employees, local pride and conservatism still prevail. Good men who went to Ethiopia full of resolve to do a proper job have therefore tended to resign. Some notable exceptions struggle on in the teeth of Ethiopian masters who cannot keep an appointment or remember to pay over the money for wages and salaries on the right day. But a mixture of ignorance and sheer lack of funds tend to defeat their best efforts. Far too many of the foreigners who remain have therefore become content to draw their salaries and do nothing.

Why is there no money to pay for what the Emperor wants to do? Allied war expenditure was, by standards of the Ethiopian budgets, considerable. A few small but useful loans in hard currency were secured just after the war—\$3,000,000 gold from the United States, Kr. 5,000,000 from Ethiopia's old friend Sweden. But the handsome new American cars in which the aristocracy rolls round the Addis Ababa area symbolise the destination of most of the war earnings. A race accustomed by tradition to trampling on the underdog never questioned the absorption of these loans by a few private pockets. The treasury, therefore, is empty. It is not easy to reveal this fact in figures. The last published budget was for the year 1946. This was balanced at Ethiopian \$38,189,932, or about £3,800,000. Revenue was mainly from customs duties. There is no machinery for the collection of the existing income tax, while the land tax is said to be greatly pilfered on its passage through provincial fingers to those of officials in the capital. In 1946, £167,000 was spent on education and £796,000 on defence. According to the Emperor, 50 per cent of the 1949

budget is being spent on education. If total expenditure is, as is believed, running at around £5,000,000, this percentage is a remarkable figure. Yet ocular evidence of local expenditure on schools is not great. There are said to be 65,000 children (out of a population of 10-12 million) at school at state expense, and some 300 students at higher schools and universities in Britain and elsewhere.

While the sellers' market prevailed throughout the world Ethiopia did well with its hides and grains, coffee and beeswax. But the economics of 1949 are a different story. Sales are hanging fire because Ethiopia's products are dear and of poor quality. Grading is unknown. Transport costs are prohibitive. It is said to cost as much to ship a car from Detroit to Djibouti (in French Somaliland) as to ship it by rail from Djibouti to Addis. It is not surprising that the trade balance is now adverse. Who is going to meet the continuing deficit?

The Emperor hopes, he says, for a loan of \$100 million from a source in America—maybe the World Bank, maybe the Export-Import Bank, maybe the private investor. But will he get it if he stands out—as in British experience he has always done—for his own terms? These are: no guarantees to be asked as to how the money shall be spent and no safeguards to be imposed in the shape of joint development trusts, or any other such devices for ensuring some degree of foreign management. The overseas investor of 1949 is growing chary of loans poured into the sieve of a primitive administration. He is unlikely to swallow the propositions of a country where improvements seldom materialise, where the once good Italian

roads have been allowed to fall into complete disrepair, and where the provinces, for lack of communications, are only under remote control from the capital. He is ready to lend, but only under conditions which most Ethiopians would find unacceptably humiliating.

But it would be wrong to assume from this depressing picture that the country is in any disorder. The Emperor is supreme. There are no more provincial *razes* to question his authority. The church, tough and powerful, is at his back. The "revolt" reported by Rome in May last was only a local brawl about the rights of a dismissed provincial headman. It was put down by the police with traditional brutality. *Shiftas*, who are just ordinary bandits, make raids on most roads, but get summarily dealt with if caught. They do not molest foreigners who can travel anywhere in the rickety cars which still provide a livelihood for some 6,000 Italian beachcombers, and which are the only mechanised means of getting about from province to province.

It is fashionable among the Emperor Haile Selassie's many admirers, African and European, to venerate Ethiopia as a land successfully independent and storiedly noble. Anything that its ruler proposes, whether it be a loan or the acquiring of Eritrea tends to be regarded as due to him in compensation for the raw deal that he suffered at the world's hands when Mussolini attacked him. But is his case in equity the only consideration?

He has no money to maintain Eritrea even in its present state of repair. It is a financial liability to any owner; even under careful and experienced management, it has cost the British tax payer, in the years 1941-48, £1,439,522 in grants in aid to cover budget deficits (or if the large sum of £854,521 spent on the relief and repatriation of Italians be deducted from this figure, £585,000). He would acquire, in addition to 475,000 Christians of his own race, 570,000 Moslems, 23,000

Italians and 25,000 sons of Italian fathers and Eritrean mothers, some of whom are far more politically advanced than his own people, and none of whom want his rule. Massawa is a good port but is a very long road haul from the productive part of the Ethiopian plateau. Would not it be equally accessible, and far less of a charge on Ethiopia's slender means, if it were under international management? In any case, the once fine Italian roads, still not too bad in Eritrea, have in parts of northern Ethiopia practically disappeared. Last but not least, Eritreans are far more accustomed to modern ways of life than are Ethiopians. By comparison with Asmara, Addis Ababa is an untidy village. Might not the tail want to wag the dog? A few Ethiopians see these drawbacks. They are rumoured to include the crown prince. But among most, the idea of more territory, of access to the sea, and of greater grandeur inevitably prevail. Thus evidence collected on the spot all points to the conclusion that a period at least of trusteeship for Eritrea would benefit the Empire of Ethiopia as well as the Eritrean people.

Co-operative Farming in Eastern Europe—II

[FROM OUR SPECIAL CORRESPONDENT]

IN Hungary, Bulgaria and Yugoslavia co-operative farms have been formed ever since the new states came into being at the end of the war, but up to last year there were not very many in existence in any of these countries. During the past year their numbers have increased enormously, and there can be no doubt that this increase is due to a tremendous drive on the part of the governments concerned. In Yugoslavia in July last year there were 800 producer co-operatives; there are now 3,700 (comprising 7.8 per cent of its arable land). Bulgaria, which last year had less than 500, now has 1,342 (comprising 12 per cent of arable land). Hungary has 2,800 this year (comprising 1.1 per cent of arable land). The governments of all three countries insist that this co-operation is on a genuinely voluntary basis, but there is no doubt that during the past year moral pressure and propaganda to the peasants has been very strong, and in some cases it is clear that pressure has not only been of the moral kind. Kolarev's speech to the Bulgarian Communist Party Executive on June 11th and 12th admitted that land had been confiscated from peasants who had been unwilling to join co-operatives, that others had been forced to give up good land to co-operatives and given poor in exchange, and that the voluntary principle had been violated. It would be surprising if this were only true for Bulgaria. But it seems to have been the experience of all three countries that the policy of force does not pay and may be a serious danger in countries that are predominantly agricultural. The official policy today in each of these countries seems to be that reluctant members of a co-operative are a liability rather than an asset. As one Bulgarian official said: "A disgruntled member of a co-operative can poison a whole group; we only

want people who are willing to join"; and in order to persuade the peasants to join the co-operatives the governments are doing everything to make the co-operatives a material success.

Material inducements are quite considerable. The state gives cheap credits to new co-operatives, they can buy improved seed at cheap prices, get priority for machinery, use tractors from the state tractor stations at cheap rates. Members of the co-operatives are also freed from certain taxes and can congratulate themselves on being considered for the time being the most progressive part of the peasantry. Because of these advantages, some co-operative farms last year were able to boast of phenomenal increases in the output per acre, and the governments hope that if this can be extended to other co-operative farmers more peasants will join. In few villages in any of these countries have all the peasants joined the local co-operative, and the feeling of competition between the co-operative group and those outside it is very tense.

As the majority of these co-operative farms are less than a year old, it is still impossible to tell whether this experiment is going to be successful. In the past two years there have been cases of co-operatives that failed, in Bulgaria some have been closed down and reorganised because of inefficient administration. There was a notorious case in Yugoslavia of a co-operative farm in which the members agreed to swindle the government and pretend that they could only produce a gallon of milk a day from each cow; there have been cases in Hungary of financial failure due to the inexperience of the members. All these things can recur under present conditions. But governments are now particularly alive to the danger of too many co-operative farms failing, so that everything is being done to make the co-operatives a success.

Payment of wages varies very much. In some farms payment is made in kind at various intervals during the year. Other co-operatives have a store, and members are allowed to buy whatever produce they need up to a certain sum of credit which is deducted from their earnings when the share-out is made at the end of the year—that is after the harvest.

In all three countries it is clear that the majority of peasants who have joined the co-operative are small peasants, and it is almost certain that if the farm is efficiently run they do better out of the co-operative than they did out of a smallholding farmed on the strip system which was what most of them contributed. The drive that is on at present in all three countries is to try to persuade the middle peasants—the peasants with 40 to 50 acres—to join the co-operatives. In Bulgaria and Hungary kulaks are in no circumstances allowed to join co-operatives; in Yugoslavia they are allowed to join if they are considered politically and socially reliable, in which case they cease to be kulaks.

As long as the governments of these countries are dependent on their peasants to produce food as the lifeblood of their economies, they are not likely to collectivise outright. They cannot afford the fiasco which the Soviet Union experienced during the enforced collectivisation of Russian peasants in the early nineteen thirties. There have been enough failures in

the early stages of co-operative farming in Hungary, Bulgaria and Yugoslavia to show that it can only be successful if introduced gradually, and the lessons of Stalin's famous *Pravda* article, "Dizzy with Success," are now being carefully applied in eastern Europe. It seems almost certain that co-operative farming will become the rule rather than the exception in these countries; the only matters that remain in doubt are how the native opposition to the system of the majority of the peasants will be overcome, whether the system can be introduced without loss in output, and how long the process will take. It will also be interesting to see whether a national form of co-operative farming will be superimposed on the Cominform master pattern by any of the countries as the system evolves.

Perón in Trouble

[FROM A CORRESPONDENT]

THE Perón regime has run into heavy weather. Each of the three principal supports of the regime—the Army, the Catholic Church and the trade unions—has recently shown some signs of weakening. And last week, Dr Bramuglia, the Foreign Minister, resigned after some months of internal disputes.

The root of President Perón's troubles is economic. During the last year and a half the international trade situation has turned against Argentina. The injection of US dollars which President Perón expected to receive from the Marshall Plan has not been forthcoming. (In fact, only about \$200 million was spent in Argentina during the first year of ERP.) Argentine prices have risen so much that, although they meant large revenues for the Perón regime while the food shortage was prevalent, they have now made Argentina's customers eager to purchase elsewhere if they are in a position to do so.

The year 1948 marked the turning point in Perón's economic fortunes. In March of that year the government statistical bulletin ceased publication, while in August, the Bulletin of the Central Bank also stopped appearing. Prices continued to increase rapidly, with the cost of a loaf of bread rising to one peso, whereas President Perón had boasted only a few months earlier that he would never let it reach that height. Meanwhile, much of the 1947-48 crop remained unsold and when the 1948-49 cereals began coming in, the warehouses were already half full. In the middle of July, 1949, the government apparently threw up its hands at any attempt to control prices, at least for the time being, and subsidies on a number of key goods were suddenly ended.

The quickly moving inflation led to increasing pressure on the workers' wages, which the government is now loath to increase. The result has been an increasing number of strikes which the government have regarded as "illegal," and which, in spite of the pro-Perón attitude of the unions concerned, were met with the sternest measures—the officials of the unions being jailed, the leaders of the strikes being dismissed and in many cases submitted to police interrogation, while an increasing number of unions were "intervened" by the General Confederation of Workers (CGT) and run by delegates appointed by the Confederation.

One result of this train of events was shown in the fall in the Peronista Party's vote in the March, 1949, provincial elections as compared with the December, 1948, national poll. Although the drop was not serious enough to lose the President control of any of the provinces, it did indicate a marked falling off in the popularity of the regime.

Quarrels with the Church

In the face of these indications of growing trouble between Perón and his working-class supporters, the other two stalwart supporters of the regime—the Church and the Army—have also become restless. As a result of one of the frankest political deals made by any Catholic Church in Latin America in

recent years, the Argentine hierarchy until recently has given President Perón open support, in return for allowing them to control the educational system. But in recent months, the alliance between President Perón and the Church has given some indications of becoming frayed. It may be because the Church feels that in a period of Perón's declining fortunes there is no point in becoming too closely tied to him, or because they have finally come to realise that their alliance with President Perón has caused the revival of fires of anti-clericalism which all had thought dead in Argentina.

There are probably two sources of discontent in the Army ranks—although no official pronouncement has as yet been made: the effects of the economic crisis on the plans of the military leaders, and the activities of the president's wife, Maria Eva Duarte de Perón.

Although there has been no public disclosure of how much money the armed forces have been receiving from the Perón administration, it is known that the Army and Air Force have been carrying out large rearmament programmes. The illegal opposition press has published information indicating that much of the money for this programme came from the profits of the Argentine Institute of Production and Exchange (IAPI), and with the decline of these profits it seems reasonable to suppose that there has been a certain dropping off in the sums available for the armed forces, in spite of the fact that over 25 per cent of the government's official budget now goes to the maintenance of the Army, Navy and Air Force. Furthermore, since most of the new arms have been coming from the United States (though a fair share has also come from Britain) the dollar crisis has undoubtedly hit the armed forces as well as other groups of the population.

The activities of President Perón's wife undoubtedly have added fuel to discontent which probably had its roots in the economic situation. She has been exceedingly active since becoming the First Lady and has been particularly astute in winning support from among the President's labour followers. In carrying out these activities, Señora de Perón has made many speeches and other public appearances, has bought several newspapers and carried out extensive "social welfare activities" through the Eva Duarte de Perón Fund. Such activities have built her into a rival of her husband for influence among the people and have disturbed high army officers. The Army's resentment against Señora de Perón was the ostensible reason for a near-mutiny in the Army in February, 1949. For a month the Minister of War, General Sosa Molina, refused to leave the army garrison outside the capital, in spite of urgent pleas by President Perón to come into the city and discuss the matter. After a great deal of rumour and speculation, the quarrel was patched up and "peace" was declared at a gala dinner at the army base at which the chief speakers were President Perón, General Sosa Molina—and the President's wife. Only time will tell how complete the reconciliation has been.

Army Delays and Doubts

The final decision concerning the Perón regime must come from the Army. Although some foreign observers have predicted that Perón will be ousted by the Army within the next six months, there are factors which would tend to prevent such a coup from taking place so soon. The principal factor is the personal popularity of President Perón and his wife, and its effect on the Army. The armed forces have always been more feared than loved in Argentina, yet in recent years because of the vast popular appeal which General Perón has had, the popular attitude towards the Army has changed notably. So long as the President and his spouse maintain their admittedly strong hold on the loyalty of the populace the Army will not want to risk possible fighting with the President's working-class followers which would be likely to accompany an Army attempt to oust him. But, although it is doubtful whether President Perón will be overthrown within six months, it does for the first time appear questionable whether he will be able to fill out his full term, which does not expire until 1952.

He's busy... dictating to me!

DICTAPHONE ELECTRONIC DICTATION means that you can speak all of your business into a handy microphone—as fast as you like, whenever you like. Alone and uninterrupted, your thoughts can be as clear and uncluttered as your desk top.

Meanwhile your secretary is outside your office, occupied with other work or dealing with visitors. At her leisure, she transcribes from the perfect recording of your words.

INCENTIVE MEANS BETTER TYRES

Marked man or man of mark
ONLY when this man's trained eye and searching fingers have passed a tyre fit for the road, does he apply his own special mark. At the same time, he is marking himself. A Henley tyre returned for any reason can be traced back to the inspector who allowed it to go.

Henley's make full use of the most modern machinery and production methods. Yet at many stages, quality of the finished tyre rests with eye, hand, and the mind behind them.

The Henley Co operative Award Scheme was introduced to make good workers extra keen. The better the work, the higher the pay.

Since the scheme began, men and women all out to improve their rating have raised the standards of workmanship till today the quality of Henley tyres is higher than ever before.

Extra incentive means finer workmanship. Finer workmanship makes Henley tyres better than the good tyres they have always been. Supplies are good now. Ask your dealer.

THE BUSINESS WORLD

Shipping Earnings and Costs

SHIPPING, except for the passenger liners which benefit from the summer tourist traffic, normally experiences a decline of activity about this time of the year. This summer, however, the freight market has been so quiet, and rates have receded to such a low level, that shipowners have begun to wonder whether they are not experiencing a recession rather than a mere seasonal fluctuation of business. Their uneasiness is heightened by the knowledge that a great many tramp ships are, by contemporary standards, inefficient, and will soon have to be replaced; but while freight rates have fallen the prices of new ships have not.

The general decline of freight rates from the peak of the immediate postwar years is not new; indeed, the average decline between 1946 and 1948 was about 15 per cent. The average rate for grain from North America to Europe in 1946 was about 11s. 1½d. per quarter; by 1948 it had fallen to about 9s. 6d. For some weeks after the abandonment of scheduled rates last December rates as high as 10s. 3d. a quarter were obtained, but recent fixtures have been made at only 7s. This fall of about 30 per cent in six months may not be representative; it would be misleading to make general assumptions from the results of one particular trade. Unfortunately, no reliable freight rate indices are published, unless it is possible to accept the official Danish index of freight rates without knowing the basis of compilation. This index (Jan.-Mar. 1949 = 100) has shown a steady decline from 102 in January to 94 in June. A fall of eight points may or may not, in itself, give cause for alarm, but there is no doubt that business in certain trades has reached a point where some owners have to consider seriously the advisability of laying-up ships. With coal bunkers at their present price levels, no coal-burning ship can be operated profitably on a transatlantic grain voyage at less than about 8s. a quarter, and at 7s. even a motorship may show a loss if it happens to suffer, for any reason, the slightest delay.

Two principal influences can be blamed for the depression in freight rates. First, the absence of employment for tramp ships in the Plate since the end of the Andes Agreement has increased the supply of ships looking for business elsewhere. In the time taken by one round trip to the Plate, a ship can make two round trips across the North Atlantic. Secondly, grain imports to Britain have come practically to a standstill, and most imports lately have gone to the Continent. The Ministry of Food has the monopoly of grain chartering through its chartering committees on the Baltic Exchange and has forced shipowners to cut their rates for grain.

Monopoly chartering, combined with the bulk buying and selling of commodities, puts Government departments in a strong position against the shipowner, but its economic results are sometimes incalculable and not always to the department's advantage. The Timber Control, which is the monopoly charterer for United Kingdom timber imports, has resolutely opposed the terms and conditions for Baltic timber for which British shipowners have asked. In consequence of the prolonged disagreement, Baltic timber imports are being carried almost entirely in foreign ships. The result-

ant condition of freight rates is worth noting. Although the rate for pitprops from British Columbia declined last month by about 10s. from its previous level of 180s. a fathom, the rate from Finland had to be advanced from 105s to 117s. 6d. The only people to benefit are the foreign vessels, mainly Scandinavian and German.

The Plate trade has always been, and is likely to remain, the key to the market for ocean-going dry-cargo tramp freights, and the depressed state of the market (as of the meat ration) is largely due to the inability of the two Governments concerned to come to terms promptly after the lapse of the Andes agreement. So few homeward cargoes have been offering, that it was necessary to raise the rate from 25s. to 45s. to persuade owners to accept outward coal cargoes for the Plate. This rate has eased to about 37s. 6d. now that the new trade agreement has opened up better prospects for return cargoes of grain. The new agreement does provide for renewed exchanges of coal and grain, which will eventually absorb a good deal of tonnage, but so far only the liner section of the industry has gained any advantage. Oilcake has begun to move in liner "parcels," and soon there may be enough meat shipments to justify the building of expensive refrigerated cargo vessels.

The liners, too, have had their difficulties in other trades. The short but sharp freight war in the India, Pakistan and Continental trade was a sign (an expensive sign) of the growing competition for cargoes, which are becoming scarcer in relation to the number of ships available. The South African import restrictions, now that the initial rush of forestalling is over, have begun to affect the liners engaged in trade with the Cape. Meanwhile, with liner fleets now well on their way to prewar strength, tramp ships are being released from time-charter by the liner companies, and the volume of tonnage competing for bulk cargoes is increasing.

Chartering in the tanker section of the industry has been meagre, and there has been a notable increase in the number of American tankers laid up. It is true that the market is always at its weakest at this time of the year; there are already signs of a firmer tendency in forward chartering. But the Norwegians, who are probably the parties most keenly interested, are pessimistic. With so much new tonnage leaving the shipyards, it is unlikely that tanker rates will return to the heights of last winter.

There has been no corresponding decline in operating expenses. The most serious handicaps in this respect are bunker prices, maintenance charges and port disbursements. The costs of stowage, stevedoring and other port services continue at high levels; indeed, shipowners are continually having to resist demands for further increases. But most serious of all is the drain on earnings represented by the cost of unnecessary delays in port. In some ports congestion is the cause, but more commonly it is fair to blame labour difficulties and the entrenched strength of restrictive practices among dock workers. In New Zealand and Australia strikes and "holidays" are almost a matter of routine. In United Kingdom ports the recent strikes have spoilt a record of im-

provement which had been noticeable during the previous twelve months. The faster and more efficient ships are compelled to spend a greater part of their life than ever before idle in port, instead of at sea earning freights. In 1938-39 the vessels of one liner company spent an average of 204 days at sea and 161 days in port. Last year the average for the more modern fleet of the same company was 159 days at sea and 206 in port.

British ship-repairers, though they are no longer under the great pressure of work which was a legacy of the war, have not been able to reduce their charges to any material extent. This means that the repair and maintenance bills for some ships still amount to about £6,000 a year; before the war £1,000 would have been thought a reasonable figure. This does not mean that ship-repairing costs are six times as high as they were, for modern ships, machinery and materials often require more costly maintenance. But instances have occurred of owners finding it cheaper to scrap their ships than to repair them.

Changes in bunker prices in recent years have put the coal-burning ship in an unenviable position. Although the prices of fuel oil and diesel oil have receded from their 1948 peak, the cost of coal bunkers has remained obstinately high. When the National Coal Board increased its prices for bunkers by 25s. a ton in January, 1948, the Ministry of Transport schedule of freight rates was correspondingly adjusted. But freights have since been released from control, and have fallen so low that the coal-burning tramp will be forced to lay up unless the Coal Board can modify its price policy. The differential maintained between domestic and export or bunker prices means that the owner of a coal-burning ship engaged in foreign trade pays a subsidy of about £12,500 a year for the benefit of home consumers of coal. It is no matter for surprise that shipowners are converting many such ships to oil burning, despite the fact that the cost of conversion is rarely much less than £25,000.

It is evident that shipowners are being squeezed between falling freight rates on the one hand and, on the other, high and rigid costs of maintenance and operation—and virtually prohibitive costs of replacement. On a falling market, the owner has to watch for the point at which it becomes cheaper to lay up a ship than to keep it working. For the older and less efficient ship, the point is reached sooner. It follows that the desire to replace some of the less economical tonnage which now forms such a large part of the tramp fleet is widespread. Figures published by the *Shipping World* show that at the beginning of July there were about 3,215,000 tons gross of ocean-going dry-cargo tramp ships in private ownership on the United Kingdom and Colonial register. Of these, 738,500 tons were 20 years

of age or older, while 1,915,000 tons were built during the war (and therefore mainly in the standard 10,000 tons d.w. category) and nearly 422,000 tons gross dated from the decade preceding the war.

Building costs, however, are still an insurmountable obstacle for the majority of tramp companies. The chairman of one company, which was bold enough to order seven vessels more than two years ago, has revealed that already the cost of these has risen to £375,000 above the original estimate, a rise almost equivalent to the cost of another new vessel. That is a fair measure of the rise in shipbuilding prices that has taken place in the period. It is probable that building prices have passed their peak, and as time goes on shipbuilders will be able to quote fixed prices and firm delivery dates. But, even so, it is not easy to see how their prices can be brought down low enough to encourage tramp owners to build unless there is a substantial recovery in the freight market. The deadlock between building costs and freight levels is, in fact, a symptom of the general crisis of production costs in which British industry as a whole is concerned. The customers of the shipbuilding industry have to earn their living in an international sphere, and their customers in turn will not pay prices high enough to support an inflated cost structure in Britain.

Some reductions in the cost of operating ships are not impossible, and would tend to bring in replacement orders for tramp ships. Reductions in the price of fuel, or a marked improvement in the turnaround of ships in port, might increase the margin of profit, even on current freights, sufficiently to enable the high depreciation charges on modern tonnage to be met. Nothing, however, would improve the position so much as a recovery in the international movement of goods.

For the immediate future, there are, in fact some possibilities of improvement which might relieve the gloom that has settled over the freight market. The Argentine trade agreement will provide useful employment for tramp ships as well as for cargo liners. Chartering in accordance with the new Russian trade arrangement has already begun. The transport of materials and equipment to the Persian Gulf for oilfield development continues. The movement of equipment for the colonial development schemes in Africa will eventually, it is hoped, be matched by homeward cargoes of groundnuts and other bulk commodities. But, beyond considerations of this kind, the shipowner has to look for a revival of world trade, for a removal of restrictions and a weakening of the rigid bilateral channels in which trade has tended to set, before he can with confidence estimate what level of costs and what scale of capital expenditure his undertaking will be able to bear.

New Regime for Sugar

THE discussions between the West Indian sugar producers and the Colonial Office ended last week without reaching any conclusive result. The Government intimated that it intended to give Commonwealth producers of sugar a guaranteed market at reasonable prices, but at this stage it was not willing to commit itself to the ten-year contract which the West Indians requested. This is understandable, for the West Indies is only one of the Commonwealth sources of sugar and no general arrangements can be made without discussions not only with the other producers but also with other Commonwealth importers. These further talks are expected to take place in the autumn, most probably after Sir Stafford Cripps's visit to Washington. There is no suggestion at present of a separate marketing scheme for Commonwealth sugar producers; that would not be possible under the terms of the charter of the International Trade Organisation. But Britain has at least the alternatives either of signing a series of long-term contracts with the Commonwealth producers or of participating in an international agreement which would include the other main suppliers and consumers.

Britain's own interest in sugar is twofold. If dollar imports are to be cut and, still more, if rationing of sugar and confectionery is in due course to be effectively abolished in this

country, there is an urgent need to develop production within the sterling area. Secondly, there is the need, equally urgent, to give some form of economic stability to those colonies whose prosperity is primarily dependent on the export of sugar. For example, sugar accounts for more than a third of the total exports of Jamaica, 90 per cent of those from Barbados and the Leeward Islands, more than 50 per cent of those from British Guiana, and is virtually the only export from Mauritius. The problem, then, is to discover a solution which will satisfy both the domestic requirements of the British market and the special interests of these territories. It is not easy to see a solution which will induce an expansion in Commonwealth production—presumably

requiring a higher price—but will avoid the added long-term instability for the producing countries which higher costs and prices may involve.

World production of sugar, including both cane and beet sugar, has shown a remarkable recovery during the past three seasons, and in 1948-49 it reached 30.5 million tons compared with 29.1 million tons in 1937-38 and with the low point of 21.3 million tons touched immediately following the war. Even the current output is not sufficient to permit consumption per head on the prewar level; this would require a world production of the order of 32 million tons. From Table I it can be seen that the production of beet sugar in Europe has not yet regained its 1937-38 level; and the present dry summer is likely to reduce the sugar content of this year's

harvest. The increase in total output beyond the prewar level is attributable to cane sugar, particularly within the dollar area, in which the chief producers are Cuba, Mexico, San Domingo and Puerto Rico. Production in Commonwealth countries has also increased, but not so markedly. In 1948-49 it reached 6,090,000 tons compared with 5,609,000 tons in 1937-38. The largest increase occurred in the British West Indies, followed by Mauritius, South Africa and Australia. But the Commonwealth in general and Britain in particular is still a net importer of sugar, and these imports from non-British sources, which since the war have been running in the region of 1,000,000 tons, have had to be purchased mainly from the dollar area. Some 400,000 tons of this deficit represents Canadian imports which are purchased with dollars, while a further 500,000 tons is imported by Britain as raw sugar and exported after refining.

British consumption of sugar last year amounted to 2,345,000 tons (refined value), of which 1,810,000 tons was consumed domestically either as food or in the manufacture of food. Between 1934 and 1938 annual consumption averaged 2,470,000 tons of which 2,111,000 tons was for domestic consumption. Production of beet sugar, however, has increased from 545,000 tons (raw value), the average for 1934-38, to 615,000 tons in the past season. Imports of unrefined sugar, on the other hand, have declined from 2,173,000 tons in 1938, of which 1,066,000 tons came from Commonwealth sources, to 1,913,000 tons in 1948, of which 729,000 tons came from the Commonwealth. Britain's sugar imports have not, therefore, regained their prewar

pattern; both a larger proportion of imports and a larger total quantity of sugar has to be bought with dollars.

This year, however, some improvement should be evident. In March, before sweets were rationed, Dr Edith Summerskill, the Parliamentary Secretary to the Ministry of Food, put Britain's domestic requirements for 1949 at 2,035,000 tons of refined sugar, of which 544,000 tons were to come from domestically grown beet, 1,150,000 tons from Commonwealth sources, and 90,000 tons from dollar sources. Some 280,000 tons of sugar from the sterling area was, however, to be sold to Canada against dollars, with which Britain would buy a similar quantity from dollar sources. Britain's imports from the dollar area were therefore to be in the region of 400,000 tons, and this quantity was in fact purchased from San Domingo. These figures, however, do not take account of the import of sugar (also from the dollar area) which is required to maintain Britain's overseas trade in raw and refined sugar and which earns dollars. This additional quantity will presumably be again about 500,000 tons.

If the export of sugar from the sterling area could be increased by 100,000 tons a year Britain would not need, on the present scale of consumption, to purchase any sugar for dollars, except to make good supplies sold from the sterling area for dollars. According to Dr Summerskill, however, if sugar were de-rationed, Britain's annual requirement would rise to 2,500,000 tons, in which case a further 500,000 tons would have to be imported. This still takes no account of the import requirements of other Commonwealth countries, such as New Zealand, Ceylon and Malaya, which probably amount to 250,000 tons. The immediate objective must therefore be to raise exports of sugar from the sterling area by at least 100,000 tons a year, and the ultimate objective by between 500,000 and 750,000 tons a year—if the sterling area portion of the Commonwealth is to be self-sufficient and unrationed.

Consider now the second aspect of the problem—the need to ensure some form of economic stability to those colonies whose main export is sugar. The world price of sugar, both before the war and now, is determined by the amount of Cuban supplies available to the "free market," that is, to buyers other than the United States. Because Cuban producers receive a relatively high price for their sugar in the American market (owing to the high preferential treatment which Cuban sugar enjoys there) the market price for Cuban "free" supplies tended to be much lower than that at which other producers could profitably sell. This was one of the causes of the depression in the West Indian sugar industry before the war. Colonial sugar, admittedly, enjoyed a preference on the British market, but it was insufficient to counteract the effects of the lower Cuban price.

More important still is the United States interest in the economic welfare of Cuba. Earlier this year, there was every prospect of a glut of Cuban sugar owing to the shortage of dollar purchasing power outside the United States. American production of beet sugar was smaller than was expected, and the exports from the Philippines to the United States were less than their quota, so that Cuba was allowed to sell a larger quantity to America. Even so, a large stock remained unsold in Cuba. With the help of ECA funds Britain has recently purchased some 600,000 tons of this surplus and the US Commodity Credit Control 400,000 tons, while other western European countries took the remainder. Thus within a period of six months, Cuba, instead of being burdened with an unsaleable surplus, has now only a normal carry-over stock till the end of the year. This interest which the

United States takes in Cuban affairs makes it clear that the Commonwealth, quite apart from the restraints imposed by the ITO charter, could do little to stabilise its own sugar trade except within the framework of an international agreement—because to make the sterling area self-sufficient would in turn create a problem for Cuba.

The international sugar agreement concluded in 1937 is still in force. It was originally intended to operate for five years but has since been extended by a series of annual protocols. The scheme was concerned with regulating supplies of sugar to the "free market" by which was meant that part of the international trade in sugar not regulated by bilateral or other preferential arrangements. Each of the participating countries was allotted a basic export quota which was increased or reduced each year so that total exports should cover world requirements at a reasonable price. Importing countries such as the United Kingdom also undertook not to expand domestic production above a certain level. No quotas have been operative since September, 1944.

Such an arrangement as this, whereby individual producers could not expand their exports at the expense of others without the consent of these others, could hardly promote the necessary expansion in Commonwealth production at the present time, unless Britain induced increased supplies specifically by long-term contracts which would necessarily be outside the scope of the scheme. A more promising solution, it has been suggested, might perhaps be found in applying an arrangement resembling the international wheat agreement, which guarantees sales to producers at prices within fixed limits. The lower limit would be determined at such a level as would enable Cuba to dispose of its "free" supplies, while the upper limit could be sufficiently high to encourage a larger production in Commonwealth areas. An element of stability might thus be assured to the industry without the rigidity of fixed quotas and without the restriction of output. Within the framework of such an agreement the British Government could also, if it wished, enter into long-term contracts with particular colonies where such arrangements were regarded as necessary to their economic stability. If such an agreement allowed importing countries to meet their purchasing obligations (which operate when the price is at its lower limit) in their own currencies there would be no need of an escape clause covering balance of payments difficulties such as the wheat agreement contains.

Within the framework of such an agreement it might well be possible to achieve the short-run object of expanding sugar exports from Commonwealth countries to Britain by the 100,000 tons necessary to avoid dollar imports. There would be few technical difficulties to be surmounted in promoting such an increase. Any effort to expand Commonwealth output by 750,000 tons—the amount needed to avoid both dollar imports and consumer rationing—would, however, encounter difficulties of a wholly different order. It is questionable, in any case, whether it would be wise to try to overcome them or, indeed, whether, when they were overcome, economic stability for the colonial producer could be achieved. Artificial price maintenance schemes or other devices to safeguard producers—within relatively moderate limits—may perhaps be justified by the immediate compulsion of dollar shortage; but limits must be set to the distortions sanctioned—or apparently sanctioned—even by that need. Apart from this, it must be remembered that sugar production, in the colonies at any rate, is not only a matter of a profitable price. Any project for large expansion would raise social problems which could not be solved merely by international agreements assuring price stability.

Business Notes

Fall Resumed

The gilt-edged market this week has staged the first perceptible rally since the collapse began towards the end of last month. Just before the weekend the market had begun to show a steadier tendency, with rises of a quarter or half a point in leading stocks both on the Thursday and the Friday. Weekend reflections about the significance of this minor change of mood seem to have persuaded the bears to close their positions and also induced a little investment buying. In a narrow and uneasy market, these relatively moderate operations produced a wholly disproportionate effect. On Monday the movements in prices upwards were hardly less violent than they had been, in the opposite direction, on the worst days of the slump. Virtually every stock in the gilt-edged list, from the money market "shorts" to the irredeemables, participated in this rally, with net rises on the day extending up to 1½ points. The movement made a little further headway in the early dealings on Tuesday, but the gains then could not be fully held, and the market relapsed, to show only a few rises, and fractional ones, on balance. Since then, the shaky morale has been undermined afresh. On Wednesday, the 2½ per cent "Daltons," which had closed at 73 on Monday, were at one time down to 70½, but recovered a full point of this fall before the close—only to subside again during Thursday. At the moment of writing, prices are little above the worst levels reached last week.

This experience plainly shows how little faith the City has in the possibility of any major rally in the market—at least until after the Washington negotiations next month. Since the collapse has been nurtured upon uncertainty, even those who are now beginning to be attracted by the unfamiliar yields now offered in the market are disposed to defer buying until the course of the coming discussions can be gauged. It is argued that, if the fall which began last month was justified, nothing has happened since then to warrant a different opinion. It is recognised, however, that the technical condition of the market now is such that any real revival of confidence might have a very marked effect upon prices. It is hard to see, however, from what source such a revival could be stimulated. Meanwhile, the effects upon the new issue market of the transformation which has occurred in the yield structure in so short a period have been advertised this week by the fate of the Whitbread issue. Of the £1,750,000 of 3½ debenture stock offered for conversion and cash to holders of the 4 per cent stock, no less than 72½ per cent was left to be taken up by underwriters. The stock has since been quoted in the market at a discount of 4½ per cent, narrowing later to about 3½ per cent.

* * *

Easing Europe's Quotas

The Council of the OEEC on Wednesday made its first full public announcement upon the project for liberalising intra-European trade by eliminating quantitative restrictions. This was listed as an objective in the four-year programme published at the end of last year, and OEEC member countries were invited to submit their own proposals for achieving it. It will be recalled that, at the outset, only Britain submitted a plan—which it did at the meeting of the Consultative Group of Ministers last May, since when the British memorandum has formed the basis of examination of the whole scheme by the individual countries and by the appropriate sub-committee of the OEEC. The resultant proposals have now been approved by the OEEC Council, which has agreed that reduction of quantitative restrictions could be a first step towards freeing intra-European trade, and, in the words of M. Alphand, chairman of the Trade Committee, could give

the proof that the OEEC "is not just a machine for dividing Marshall aid." The main objective is to arrange that import licences for as many commodities as possible would be issued automatically for trade between OEEC countries; but it is recognised that at the outset the most that could be hoped for would be a system of "global quotas" providing freedom for imports into each country for each commodity up to the prescribed total. It is emphasised that the total should not, in any particular case, be less than the sum of the bilateral quotas previously extended by the granting country under its several trade agreements with OEEC members.

The next stage in the effort to launch the scheme will be for member countries to notify to the OEEC—they are asked to do so before October 1st—two lists of commodities on which they are prepared to make relaxations. The first list is to comprise commodities for which the individual countries would be prepared to grant open general licences or global quotas without specific reciprocal action by other members of the OEEC—but on the understanding that the whole group would be acting in the spirit of the plan. The second list is to comprise those further commodities upon which restrictions would be relaxed in return for specific relaxations elsewhere.

As a blueprint of good intentions, the plan looks impressive—much more so than it is likely to appear by October 1st, if one may judge by the terms of Mr Harold Wilson's advocacy when he explained the British proposals in Parliament early last month. At that stage he emphasised so many and such paralysing qualifications upon which Britain would insist that one might have imagined him to be opposing an initiative taken elsewhere instead of supporting, as he purported to do, proposals which Britain had itself made. He emphasised that the relaxations could not be applied if they were likely to cause balance of payments difficulties or involve any loss of gold or dollars; nor could they be permitted to harm the "legitimate interests" of Britain's industries. It is small wonder that, at that stage, Mr Wilson was unable to instance any single commodity which could successfully run this Board of Trade gauntlet. The approach of the Washington discussions may perhaps encourage a little give and take in the formulation of this scheme. But it seems all too plain that it can scarcely provide that "vastly freer movement of goods and peoples" within western Europe for which Mr Paul Hoffmann, the ECA administrator, appealed in Paris this week—and which he hoped might happen within the next three or four months.

* * *

The Utility Price Cuts

The question of the utility price cuts has not been settled as swiftly and simply as the President of the Board of Trade, in his first statement at the end of July, seemed to expect. Neither the Government nor the traders have shown much anxiety to stick to an indefensible position, and the Board this week sent new proposals to the traders' organisations, which may enable the latter to climb down gracefully. The proposals contain some novelties, but how far they contain real concessions remains to be seen. It appears that, in place of the original intention that the full cut, or nearly all of it, should at first be borne by the distributors, there is now talk of spreading it from the outset over manufacturers' ceiling prices as well as wholesalers' and retailers' margins. This may mean that the reduction would take place gradually, and the full five per cent would be attained only when new production reached the shops.

Even so, there is still a good deal of uncertainty about how the cuts will work. The impression persists that manufacturers are expected not to make actual cuts in their margins, but merely to accept reductions in the statutory ceiling prices;

some of these are higher than the present permitted selling price, which is reached by adding a succession of producers' margins on to the starting price of the raw material. If this proves to be so, the real incidence of the cuts will be substantially on the distributors after all, and the quarrel may go on. The public, as well as the manufacturers and traders, are concerned, and a precise statement of what is intended would be welcome.

* * *

How Much Sterling for Pakistan?

The sums involved in the agreement on sterling to be released to Pakistan in the year ending June 30, 1950, may be less startling than those released to India—but then Pakistan is smaller. Under the new agreement Pakistan will, during 1949-50, have £17 million transferred from its blocked No. 2 account at the Bank of England to its free No. 1 account (India may draw £100 million in the same period) to provide £12 million for general spending and £5,000,000 to finance imports for the resettlement and rehabilitation of refugees. These amounts may look moderate, but they are substantially larger than those for 1948-49, for which £12 million was released—£5,000,000 for general spending, £5,000,000 for refugees and £2,000,000 to augment working balances. Moreover it cannot be taken for granted that the £17 million represents Britain's full commitment to Pakistan during 1949-50. Pakistan has indicated it may "need additional releases for the current year in order to meet abnormal expenditure which might have to be incurred during the period on the import of feed grains." The British Government "has taken note of this statement, and agreed to consider such a request if it were made." Evidently, the £17 million may prove to be not the maximum, but the minimum, release. In 1948-49, in addition to the £12 million released from its No. 2 account, Pakistan ran its No. 1 account down by £15 million (to £10 million), thus drawing £27 million in all. Demands for additional releases this year will probably depend largely upon the course of Pakistan's balance of payments with India. Under arrangements between India and Pakistan, each is prepared to hold £9,750,000 of the other's currency. Any deficit up to £7,500,000 in excess of the £9,750,000 has to be settled in sterling. Last year Pakistan received in this way several million pounds sterling from India.

Pakistan, like India, is no longer to be tied—the tie was in any case theoretical—to a fixed dollar allocation from the sterling area's central reserves. Last year Pakistan was allocated £5,000,000 and spent some £6,000,000. Now, in common with other full members of the sterling area, it has the right to call upon the central reserve for its net requirements for dollars, but has agreed to limit its total dollar spending to three-quarters of the amount spent last year. Incidentally, the amount of India's draft on the dollar pool last year was understated here last week; the figure of £21 million represented not its drawings but its over-drawings, so that the total demand was £36 million.

* * *

Sterling and Dollar Oil

Some of the unresolved international questions in the oil trade were outlined in *The Economist* on July 23rd. Their discussion between the countries concerned will soon be resumed. The petroleum committee of OEEC meets shortly in Paris, and the coming talks in Washington cannot avoid the subject of oil.

The controversy over the European refinery programmes has subsided momentarily, the member countries of OEEC having agreed in general terms not to encourage any fresh refinery projects before the autumn. A first step has been taken towards the examination of the European programmes "in terms of an analysis of world oil economics," on which the Economic Co-operation Administration has sought to insist: British,

Dutch and American representatives in Washington last month made the first attempt yet made at a comprehensive survey of world requirements and supplies from the points of view of the three countries mainly engaged in the international oil trade. The survey runs only to 1953, and, even so, much of it must have been tentative; but it may help the OEEC oil specialists to get on with their work with less entanglement than before in world-wide questions.

The agitation in the United States oil trade against the European plans has not died, but it is often (though illogically) a reflection of uneasiness in the United States domestic oil trade. Signs of an improvement in that trade have begun to appear; the accumulation of stocks and the pressure on storage space have begun to ease. To that extent, the task of ECA in getting American agreement to a constructive policy for Europe may have been slightly eased. But it is still difficult. At the end of July, Mr. Walter J. Levy, then chief of the petroleum branch of ECA, spoke to the National Petroleum Council in Washington on "the impact of the European Recovery Programme on the American oil industry," and appealed for a practical and moderate approach on both sides. He made one remarkable suggestion:

Arrangements can, I believe, be made to protect American outlets without retarding European recovery. Such arrangements among others might consist in making it possible for American oil companies to sell their oil to non-sterling areas for sterling, limiting at the same time the convertibility of their sterling income into dollars to an agreed percentage and otherwise establishing the responsibility of the American companies to spend the rest of their sterling income in the sterling or non-dollar currency areas.

If this suggestion has the backing of the United States Government it is obviously of the highest importance. But has it? Mr Levy has resigned from his post in the Economic Co-operation Administration, and may have chosen this moment to speak freely in a personal capacity.

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners—there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

Finance and Investment

Record Treasury Bill Tender

The policy of increasing the supply of Treasury bills offered at the weekly tenders, discussed in these columns at end-July, has since then been pushed a further stage forward. The original increase, from £170 million to £190 million, which occurred at the Treasury bill tender on July 29th, was followed by further increases of £10 million in each of the ensuing weeks. At the end of last week, therefore, the discount market was tendering for £210 million of bills—another record offering. As the Lombard Street syndicate has not yet raised its total of applications to conform with the increased offerings, there was naturally a steep rise in its allotment quota—to no less than 70 per cent. Thus in the past week the discount houses will have taken up nearly £150 million of bills, almost twice the average weekly allotment secured in the second quarter of the current year. As a measure of the expansion which the war period has brought to Lombard Street operations, it may be noted that the average in the last prewar year was only about £13 million.

The total of outstanding tender bills will by the end of this week have been raised by £120 million to £2,230 million, which contrasts with £1,690 million four years ago. It is still too early to guess how far this last move in the supply of bills is likely to be carried, since the offering for yesterday's tender was slightly reduced, to £200 million—which still exceeds the corresponding maturities by £30 million. It seems probable, however, that the object of the authorities is not merely to enlarge the bill supply at the expense (at least temporarily) of the volume of Treasury deposit receipts, but also to restore a little flexibility to the system of borrowing on Treasury bills. Since the introduction of the Treasury deposit receipt, it is this element in the floating debt which has borne the impact of week to week fluctuations in the Government's total requirements. This arrangement was not affected by the large switches made in the past few years from TDRs to bills; but there now seems a possibility that the effect of week to week fluctuations will sometimes be shared between the bill issue and TDRs.

Higher Commercial Bill Rates

In one other respect, too, some unaccustomed flexibility has lately been noticeable in Lombard Street—in a slight increase in discount rates. It should be emphasised, however, that these two tendencies are quite unrelated, since the discount market's move is confined strictly to commercial bills and does not in any way arise from the expanded supply of Treasury bills. A fortnight ago, the largest discount house took the initiative in raising its quoted buying rate for three-months bank paper from a flat $\frac{1}{2}$ per cent to $\frac{1}{2}$ - $\frac{1}{4}$ per cent. The distinguishing feature of this change was that, unlike the small increases in commercial discount rates which have been made in the past eighteen months, it did not result from any agreed action by the Discount Market Association. It was quickly followed, however, by several other houses in Lombard Street and now commands almost general support.

As the houses which were sponsoring the move were prepared also to resell commercial bills to clearing banks at correspondingly higher rates, the move was quickly reinforced by the banks themselves, since several of them promptly declined to buy bills below $\frac{1}{2}$ per cent, instead of at the rate of $\frac{1}{2}$ which had been general previously. There is some reason to believe, also, that the views which prompted the move are regarded sympathetically in official quarters. The argument in Lombard Street is that the growing international uncertainties, and especially those arising from the impending discussions in Washington, create a greater risk of variations in money rates than the market has had to contemplate for a very long time. In consequence, it is felt that some indication of the possibility of change ought to be given in the terms at which the market is prepared to discount commercial paper.

Freer Switching?

It is not often that the Exchange Control authorities specifically invite people to apply for permission to embark on transactions not definitely allowed by the published regulations, so that a good mark should perhaps be given to the authorities for the two notices issued this week on the subject of security switching—even though they do nothing to remove the familiar anomalies in the basic policy. The first notice reminds resident holders of non-sterling securities that they may at any time apply to the Bank in respect of "transactions in foreign currency securities which do not fall strictly within the range of those generally permitted." Nothing is stated that has not been known previously. But the timing of this part of the announcement may be significant. For instance, in recent weeks the Bank has approved a substantial number of applications by British holders of Dutch guilder securities to sell their holdings in Amsterdam provided a Dutch owner of sterling securities could be found willing to sell a similar amount—calculated at the official exchange rate—in London. The second notice concerns dealings by non-residents in sterling securities, and contains a similar reminder. Here, however, the wording denotes some modification of policy, since it specifically mentions transactions "between non-residents living in different countries or monetary areas," whereas the switching regulations, as amended last year, restrained London brokers or bankers from acting as intermediaries on sales involving such transfers of ownership.

Those who have been chafing at the regulations—and at this one in particular—remain unimpressed by this latest hint of greater flexibility, demanding instead that relaxations should be made and announced for general application. It is contended that *ad hoc* scrutiny of transactions tends to work unfairly as between one dealer and another. This is surely a short-sighted attitude. Whether the principles of control are excessively stringent or not, they will always operate more restrictively than is necessary if the authorities can work only to rigid rules which are publicly announced—because the rule could never be extended to cover the marginal case which might be acceptable, on specific application, in the light of the particular circumstances at the time.

Bank of England Report

With the publication of the third annual report of the Bank of England, it seems that those who had hoped that this innovation might provide a valuable and informative commentary on current financial trends must now reconcile themselves to the colourless and formal presentation which is evidently all that the authorities are prepared to offer. The third report follows the same dreary precedent set by its predecessors. The information given is confined strictly to events in the Bank's accounting year, which ends on February 28th, and most of it reproduces material readily available in other official documents and regular series of statistics. It is evident, indeed, that care is taken to exclude from the text anything which might give the slightest hint of official views on matters of policy—with the sole exception of certain aspects of exchange control policy upon which the authorities' views were already well known and had been repeatedly explained officially. Among the slender shreds of information not previously available are those relating to the different denominations of currency which comprise the note circulation, the volume of public debt managed by the Bank, and the activities of its stock transfer department. The most exciting revelation which can be found among these scraps is that in the year 1948-49 the total number of transfers registered at the Bank rose by 206,000 to 900,000, an increase of 29 per cent. Apart from recording baldly a few well-known facts, nothing at all is said about money market or floating debt policy, about credit policy or about trends in the gilt-edged market. There is, however, a summary of the principal redemptions, con-

versions and new issues among stocks managed by the Bank. Excluding floating debt, the total for which it is responsible now amounts to nearly £14,500 million, or rather more than double the prewar total.

A useful section of the report is the appendix, which summarises the payments and financial agreements negotiated during the year; but, owing presumably to the large number of agreements involved—a consequence of the changes necessitated by the abandonment of sterling-dollar convertibility in 1947—the record has been reduced to a bald statement of salient facts. In the main part of the report it is affirmed that these re-negotiations did not

"entail reconversion of the system to a bilateral basis. On the contrary, it was a cardinal point of policy that transferability of sterling should be maintained over as wide an area as possible, the limiting factor being the risk of a further reduction of the central reserves. . . . Even where automatic rights of transfer had to be suspended on account of this risk, arrangements were made for transfers to and from third countries to be continued on an 'administrative' basis. . . . In arriving at an estimate of the balance of payments in any given direction, full allowance was always made for the greatest volume of third-country transfers compatible with the avoidance as far as possible of the loss of gold or dollars."

It is stated that ample use is made of the system for such transfers. The aggregate amount estimated to have been transferred by countries outside the sterling area was £240 million in 1948, excluding transfers to and from American account countries. Of this total, £152 million resulted from the system of "administrative" transferability. In addition, merchanting transactions and payments under the coffee and rubber schemes amounted to £40 million. The most important users of these facilities were the French and Netherlands monetary areas, Norway, Finland and Italy.

Israel's Central Bank

For nearly a year now the Anglo-Palestine Bank has, in addition to transacting its commercial banking business, been acting in effect as the central bank of Israel. Published this time rather later than usual, the bank's latest accounts—for the year ended December 31, 1948—are of double interest, revealing the impact of a turbulent and inflationary year in Israel upon the bank's commercial business, and including for the first time the balance sheet of the newly created issue department. When the bank was approached by the Israeli Government to undertake the issue of the Israeli pound which replaced the Palestine pound—and likewise is maintained at par with sterling—Israel's currency was "controlled by a body [the Palestine Currency Board] which had ceased to function within its own territory and which was controlled by a government which did not recognise the existence of Israel and entertained no diplomatic relation with it." At the year-end the issue department had outstanding £130,655,000, backed as to £16,800,000 of foreign currency (mainly sterling), £118.8 million by currency notes of the Palestine Currency Board which will be redeemed by stages, and by £15,000,000 of Israeli Treasury bills.

The issue department is being run entirely separately from all other transactions of the bank. The bank is not liable to satisfy banknote holders out of any assets other than the assets held in the issue department specifically as backing for the note issue. The department operates on government account and has the sole right to issue notes. The bank was at the same time appointed the only banker and financial agent of the government. This side of its official activities is being carried out by the old commercial part of the bank. It should be an interesting if not always an easy source of business. The agreement appointing the bank to all various public duties

THE IMPERIAL BANK OF IRAN

By virtue of a Supplemental Charter of His Majesty King George VI, dated 18th July, 1949, approved at an Extraordinary General Meeting of The Imperial Bank of Iran convened on the 15th August, the name of the Bank is changed to:

THE BRITISH BANK OF IRAN & THE MIDDLE EAST

HEAD OFFICE:
LONDON, 51 GRACECHURCH STREET, E.C.3.

As before, Branches will be maintained under the new name at:

Branches in Iran:
AHWAZ, HAMADAN, ISFAHAN, KERMAN
SHAH, KHORRAMSHAHR, MESHED, RESHT,
SHIRAZ, TABRIZ, TEHERAN, ZAHEDAN.

Branches in Iraq:
BAGHDAD, BASRA.

Branches on the Persian Gulf:
BAHRAIN, DUBAI, KUWAIT, MUSCAT.

Branch in Syria: DAMASCUS Branches in Lebanon: BEIRUT, TRIPOLI Branch in Jordan: AMMAN

A new Branch will be opened in Saudi Arabia, at JEDDAH.

FACTORIES are growing

in AUSTRALIA

Expanding industrial development creates trade opportunities and an ever-widening field for employment. Informative "Blue Booklets" describing the Australian economy are published by the Bank of New South Wales and may be obtained, free, from your Bankers or direct from—

BANK OF NEW SOUTH WALES

(Incorporated in New South Wales with limited liability)

LONDON OFFICES:
29 Threadneedle Street, E.C.2
47 Berkeley Square, W.1

remains in force until June 30, 1951, unless terminated by the government upon giving six months' notice.

During the year covered by the accounts the bank's balance sheet (expressed in sterling while the issue department figures are in Israeli currency) expanded from a total £55 million to £72 million. British government securities valued at £8,400,000 have been replaced by £18.2 million of Israeli Treasury bills. Cash holdings have fallen from £17.3 million to £14.3 million. Advances, at £26.1 million, are a full £7,000,000 higher, and liability on documentary credits, etc., has risen from £7,500,000 to £10.9 million. During the period of transition the bank's ingenuity was at times hard tested to maintain its liquidity. Holdings of British government securities were disposed of and were at first replaced by Palestine currency notes. A more normal and more profitable form for holding liquid balances was found when Israeli Treasury bills became obtainable. It reflects the high level of activity in Israel that, notwithstanding all these difficulties, the bank's net profit has risen from £198,387 to £255,282. The bank is now regarded as being non-resident in the United Kingdom for taxation purposes, and is relieved from paying United Kingdom tax on profits earned outside Britain.

New Payments Pact with Western Germany

After some delays the new payments agreement between the United Kingdom and the Military Governors of western Germany has been signed. As foreshadowed in these columns a fortnight ago, it provides for a lifting of the "gold point" between the two countries from £1,500,000 to £7,500,000. Either party is now willing to hold up to £7,500,000 of the other's currency before demanding settlement of any deficit in excess of that point in dollars. The agreement is for a period of two years in the first instance, but provision is made to alter the gold point at the request of either party.

Hitherto, short-term fluctuations have led to repeated dollar payments by Britain to western Germany (though the seasonal swings seem never to have gone in favour of this country), and losses of this kind may well be eliminated by the new arrangements. But if the balance of payments between the sterling area and western Germany continues to be adverse, this increase in the gold point will scarcely suffice to stop the gold losses, though it will postpone them. While Britain continues to subsidise western Germany under the revised fusion agreement between this country and the United States at the rate of £17.5 million a year, it will prove difficult enough to attain a balance and harder still to accumulate a surplus.

The agreement is certainly an improvement on the previous arrangements. But its limited usefulness is best seen from the official attitude in this country to the Deutsche Mark, which is still regarded as a hard currency. One of the troubles is German reluctance to buy from Britain and the rest of the sterling area. Doubtless under local American influence, German importers are at present delaying sterling purchases—and are certainly finding that they can often buy more cheaply, in terms of marks, in the United States than in Britain.

Industry

Unemployment's Low Record

The monthly figures published by the Ministry of Labour this week show that on July 11th unemployment reached its lowest figure since the war. The total of unemployed (including "temporarily stopped") on that date was 243,041. A lower figure was last returned in September, 1945, but the basis of computation has since been broadened to include some thousands of persons who were not insured under the old unemployment insurance, but who are insured under the National Insurance Act.

It would be misleading to read into these low unemployment

figures any improvement of the use which the national economy is making of its manpower. A brief examination of the pattern of employment in the different industrial groups will explode any such theory, together with any theory that Government manpower policy is approaching the results which it set out to achieve. The total number in employment increased by 21,000 during June. The group "basic industries" gained 8,000 of these workers, but the gains were seasonal gains in agriculture (4,000) and transport (4,000); the labour force in coal mining fell by 1,300. The manufacturing industries lost, on balance, 5,000 workers. But within that group the industries largely concerned in the export trades appear to have lost still more heavily: "metals, engineering, and vehicles" lost 12,000 and textiles 1,000, while "food, drink, and tobacco" gained 7,000 workers. Public administration lost, on balance, 5,000 workers, which is to the good; but the gain of 14,000 in "professional, financial and miscellaneous services" is explained by the summer increase in tourist activity. The distributive trades gained 2,000. Nothing in this bears out any of the brave words on the use of manpower in this year's or last year's *Economic Survey*.

* * *

Direction of Cotton Exports

The cotton textile industry has done well, by comparison with others, in expanding its exports in the first six months of 1949. Total exports of cotton yarns and manufactures amounted to £84.3 million in the six months; this compares with £55.3 million in the first half of 1948 and £35.8 million in the first half of 1947. The peak month so far was March, when the total of £15.9 million of cotton goods exported passed

the target (a monthly rate of £15.1 million) set for the end of the year in the *Economic Survey*, and earned a letter of congratulation to the industry from the President of the Board of Trade. The figures in April, May, and June were lower (cotton exports in June totalled £13.2 million), but the state of order books and the rate at which export business is coming in are not discouraging. It is true that the proportion of export goods in production which are still unsold has been increasing, but it would probably be erroneous to assume from this that exports as a whole are on the decline. The true significance is, more probably, that more and more foreign importers are insisting on firm—and reasonably short—delivery dates, and will no longer buy goods which are still in the early stages of production. This is healthy enough.

Yet the limitations of the cotton industry's achievement are serious, and illustrate the general difficulty which Britain is

meeting in foreign trade. It is coming to be recognised that total export figures—and official targets which are stated in those terms—are not of decisive importance; at present the destination of the exports matters more. British cotton textiles are being taken readily—more readily than they can be produced—by sterling and soft-currency countries, but there is no sign of any serious impression on the hard-currency markets. The expansion of cotton exports to Canada, on which so many hopes were pinned a year ago, seems to have come to a standstill. Between 1947 and 1948 a fourfold expansion was achieved. But exports of cotton manufactures to Canada in May and June this year, added together, were less than in May and June, 1948, by quantity, and substantially less by value. There are no hopeful market reports from Canada to contradict this apparent trend. Mr F. I. Aickman, director of the export department of the Cotton Board, reporting in the *Cotton Board Trade Letter* on a recent visit to Canada, observes that the Canadian trade buyer has now virtually a free choice of Canadian and American textiles "at prices and deliveries with which our present conditions at home make it extremely difficult to compete."

The chart on the preceding page shows a rough distribution of exports of cotton piece goods in the last three years. It is worth noting that exports in 1938, though so much less in money value, were much more than the present quantity.

* * *

Cotton Industry Faces "Adjustment"

The autumn conferences which the Cotton Board organised for the cotton textile industry in 1947 and 1948 were concerned mainly with questions of production: re-equipment, wages structures, redeployment. The autumn conference this year is to range more widely over the trading position of the British cotton industry in the framework of world trade conditions. Some remarks by the chairman of the Cotton Board, Sir Raymond Streat, in the *Trade Letter* for August draw attention to the implications of this. While the internal production problems of the industry have not ceased to matter, Sir Raymond Streat implies that external trading conditions already threaten to complicate its task. Price resistance and competition have reappeared. American prices (though "not necessarily an accurate measure of long-term competition from that quarter") and some other prices are "definitely below average Manchester quotations."

Sir Raymond Streat is, as always, guarded in his utterance, and does not use the word "slump." Indeed, he does not believe that Lancashire need fear a repetition of what happened to prices after the first world war: "The situation has not this time developed in the same manner." Instead, he would expect "gradual adjustments over a fair period of time." Adjustments have already happened—he points out—in the United States, and it would be well if the British cotton industry "began to think and act rather more positively in the direction of adjustment." If the adjustments are not made in time, there may be a "bump" instead of a gradual process.

The advice is good, but the best advice can only serve if it is followed, and the alarming thing is that the world markets are changing swiftly and openly, while the process of self-adjustment in the British cotton trade is, as yet, barely visible to the naked eye. Costs, which should be falling, are still tending to rise. The bulk of production for export is being drained off into the easy, sheltered markets which pay in soft currencies or in Treasury releases of sterling. In these circumstances it is hard to see any direct inducement to the trader to make those "exceptional efforts in the vital markets" for which the chairman of the Cotton Board calls. Redeployment is proceeding, but not fast enough; the discussion of the reforms in the wage structure which are so urgent drags on. These, as Sir Raymond Streat urges, are the essential measures which would enable the industry to go out and meet its trading problems offensively; the alternative is to sit tight and

wait for the approaching storm to blow over. Up to now, hardship has not applied the spur to reform, and the pace is too slow.

* * *

Profitable Cement Exports

The cement industry is still exporting to a sellers' market. British manufacturers exported 1,102,226 tons of cement in the first seven months of 1949, compared with 896,493 tons in the same period last year. The industry itself calls the prices obtained "remarkably good." The British home price for cement is the lowest in the world, as the accompanying table shows, and it is likely to go still lower in the next few weeks. But British cement exports are sold at the market price in the country of destination.

PRICE OF CEMENT PER TON DELIVERED IN BAGS
London 70s. Od.

	s. d.		s. d.
Auckland	141 0	Madrid	109 10
Brussels	75 6	Mexico City	85 0
Buenos Aires	157 6	New York	121 7
Cairo	91 5	Oslo	94 0
Copenhagen	104 6	Ottawa	106 2
Delhi	127 11	Paris	77 4
Frankfurt	80 2	Rio de Janeiro	153 3
Johannesburg	117 0	Rome	103 10
Karachi	143 1	Santiago	145 1
Lisbon	135 2	Stockholm	106 2
Los Angeles	109 2	Sydney	95 0

The largest markets are in Africa and the Middle East, although Holland continues to import largely, and so do Brazil, Australia and Ceylon. South Africa has been an important buyer, but the present currency difficulties and the anticipated opening of a big cement plant there in October are expected to make the Union self-sufficient; it may, indeed, begin to export.

The discrepancy between British and world prices raises the question of whether the British price is high enough to give an economic return. It covers immediate costs of production, but probably leaves insufficient margin for depreciation since the costs of capital replacement are high. This suggests that British manufacturers are relying largely on their profits from overseas sales to provide the sums which they have to set aside for depreciation. Increasing world production makes it unlikely that the high export prices will persist beyond the end of the year, but it would require a severe fall to cause British manufacturers serious concern.

Analysing Commonwealth Coals

Germany, with its extensive electricity and briquetting industries based on brown coal, is the only highly industrialised country to have exploited on a large scale the "immature" coals with a carbon content below 78 or 80 per cent; in general, industrial development tends to be associated with "mature" coal or with oil. Some of the less developed Commonwealth countries have neither oil nor mature coal, but have considerable resources of immature coal; surveys are being carried out to determine the best use to which those resources can be put. Powell Duffryn Technical Services are at present working on deposits in Nigeria, Pakistan, Queensland, Victoria and Southern Rhodesia. The method adopted is to classify coals according to their hydrogen and carbon content rather than on the conventional method which concerns itself primarily with the proportions of volatile matter. Such a classification is said by its advocates to reflect more exactly the properties of a coal for different purposes. The lower its carbon content, the less valuable a coal is as fuel; but the higher its hydrogen content, the more interesting it becomes as a starting material for chemical processes.

In a paper presented to the recent Empire Mining and Metallurgical Congress, the chairman of Powell Duffryn Technical Services, Mr Robert Foot, discussed the composition

of the coal resources of the Commonwealth countries. He emphasised that it would be mistaken to treat these coals by methods practised with the mature European and American coals. Nigerian coals, for example, have a higher hydrogen content than is normal, and it has been found that by simple chemical processing it would be possible to extract considerable quantities of waxes and resins from the dry coal. These products have a high commercial value, and some of them have up to now, been produced only by laboratory synthesis. While many samples from Queensland have a high hydrogen content which suggests the same possibilities, other samples not only have less hydrogen than is normal, but a disproportionately high oxygen content, suggesting that special attention will have to be paid to the method by which they are burnt. The most valuable fields of all would appear to be in Borneo. Like other hydrogen-rich coals, these are a potential source of chemicals, but some of them have even been found to have good coking properties, although by customary methods they would never have been classed as coking coal. Since there are no other coking coals within an area of four million square miles, this is of vital interest to the potential exploitation of iron ores in India and Pakistan.

The Governments for whom the surveys are being performed are primarily interested in sources of cheap fuel on which to base industrial development. If an immature coal responds well to chemical treatment, the case for converting it into liquid fuel, rather than for devising means of handling and burning it in its existing state, is to that extent strengthened. Big technical improvements are being made in the efficiency of the processes by which oil can be extracted from coal, and since the plants are largely automatic, the problem of finding enough skilled labour would not be severe. The objection to such plants will rather be the burden which their heavy capital cost puts on an undeveloped economy. The less elaborate plant required to extract resins and waxes from the coal before it is burnt as fuel would not present the same difficulty.

Trade and Commodities

One-Way Trade with Argentina?

The new Argentine trade pact has not had a very promising start. Shipments of grain, meat and hides are well up to schedule, but there has been delay in granting import licences for British goods. Indeed, no official announcement of the new regulations, and the procedure to be adopted, has yet been made. The resignation of Dr Bramuglia, the Argentine Foreign Minister, who was instrumental in bringing the recent trade agreement about (and who was more helpful over the Andes agreement than Sr. Miranda) has caused some anxiety to traders.

The new agreement contains an escape clause, or, more accurately, an escape phrase, to the effect that import licences would be freely granted if sufficient sterling were available. Is this to be used as a pretext for hindering the development of trade between the two countries to the level which the agreement envisaged? Argentina's sterling resources, though they are known not to be ample, are believed to be adequate to permit trade to flow in both directions. The Argentine Government may, however, prefer to wait until it has accumulated a large enough balance in its new "C" account. It is also possible that the delay may be due to the usual administrative difficulties in working out a new procedure. In the past, imports into Argentina were strictly controlled, and the new granting of import licences "freely" may be a difficult technique to acquire.

Aluminium Controversy Ended

Six months ago Britain was accused by the deputy administrator of the Economic Co-operation Administration in

Washington of reselling to the United States at a considerable profit aluminium bought with ECA funds. The Ministry of Supply was quick to deny these charges. An ECA mission, however, was appointed to study Europe's requirements of aluminium, and in its report, recently made available, it showed that the original accusation was groundless. There was no evidence that any aluminium bought with ECA funds was re-sold to the United States, although certain European countries which had not received an ECA allocation of dollars for aluminium had sold to America quantities of the metal which these countries had previously purchased from Canada.

The report continued that the shipment of secondary aluminium to the United States, which had in fact taken place, did not contravene any of the conditions laid down by ECA. But the mission suggested that Britain and other European countries could make more extensive use of secondary aluminium in their own manufactures, and thereby economise on the import of virgin metal. It added that the British aluminium industry took prompt action to set up a technical committee to investigate further uses for secondary metal. The mission also estimated that western Europe's essential requirements for 1949 (exclusive of Britain) would be more than covered by its own production of primary aluminium.

This week the Ministry of Supply announced an increase in price of virgin aluminium in ingot form from £90 to £93 a ton delivered into consumer's works. There has been no equivalent rise in the price of aluminium in North America. But since Britain is now using a higher proportion of metal from sterling area producers, whose costs are higher than those in Canada, the average cost of virgin aluminium in this country (home production and imports) has risen correspondingly. This is but a further example of rising costs through the necessity to switch from dollar to sterling supplies. After the war the price of aluminium in Britain fell from £110 a ton to £67 in April, 1946. In the following September the price was adjusted to £72 15s. a ton following the revaluation of the Canadian dollar; since then it has risen fairly steadily to its new level.

* * *

Liquidating Wool Stocks

The strength of the wool market since the end of the war can be gauged by the rapid decline in the stocks of wool held by the Joint Organisation. At the end of hostilities the stock was nearly 10½ million bales. It was reduced to 5,786,000 bales in the first year, and then by about 1,250,000 bales in the two following seasons. At June 30, 1948, the total stock stood at 3,218,000 bales; the quantity of South African wool

'Paludrine' for Malaria

'Paludrine' was the outcome of a programme of research for a more efficient drug than quinine or its synthetic substitutes, mepacrine and pamaquin. This was urgently begun in I.C.I. laboratories in Manchester in 1942, when the Japanese conquest of the quinine-producing East Indies jeopardised the health of Allied armies in the Tropics. The biologist of the team, Dr. D. G. Davey, laid the foundations of success by evolving a swift and positive method of testing compounds for antimalarial activity. Then a group of chemists, headed by Dr. F. L. Rose and the late Dr. F. H. S. Curd, began the chemical part of the investigation, striking out along lines hitherto unexplored in malaria research. Many new compounds were evolved, and tested and rejected, but before the end of 1944 one of altogether exceptional power had been developed. This was given the name of 'Paludrine'.

The achievement of the British chemical industry in respect of 'Paludrine' is threefold. It was accomplished in response to a particular need, it was completed against time, and the result is the safest and most effective drug ever produced for the prophylaxis, suppression and treatment of the disease.

Steel spins you smoothly on your way

Through spinning steel ball bearings and steel-sprung seats you are cushioned from all the natural shocks of travelling. You ride so smoothly that you never think of steel. And the steel industry runs so smoothly that you may never think of it either.

STEEL'S DIVERSITY. One reason why the present organization of the industry works so well is that individual firms can show initiative and drive and apply their specialist knowledge in meeting and anticipating demands for steel of special types.

For example, the most powerful modern air and motor engines would not have been practicable without the special and alloy steels developed by the steel makers to stand exceptional conditions.

GOVERNMENT AND INDUSTRY. At the same time, Government supervision over prices and development ensures that the interests of the public are safeguarded at every turn.

This unique combination of individual initiative and Government supervision has helped to make possible the great increases in steel output by which every one of us benefits to-day.

Exports of steel or made of steel are nearly half the total exports now paying for the food and raw materials we need.

STEEL

is serving you well

held was less than a tenth of its original figure, and stocks of Australian wool were only a third; New Zealand stocks fell by a little more than a half. During the past twelve months demand has been good and the stocks of the Joint Organisation have fallen by 1,500,000 bales, leaving at the end of last month a balance of only 1,700,000 bales.

Two-thirds of the remaining stock consists of Australian wool, and although more than 500,000 bales are of merino types, most of it is of inferior quality containing vegetable matter. The 400,000 bales of New Zealand wool still held are largely coarse crossbreds, while only 10,000 of the 35,000 bales of South African wool are merino. Consumption of the better grades of wool during the coming season will clearly have to be met from the current clip. The accompanying table shows the classification of Joint Organisation stocks and their location.

The Joint Organisation has thus nearly accomplished its task of selling the huge stocks of wool which had accumulated during the war. The scheme is, in any case, due for revision next year, and it now looks as if revision might take the form of winding-up. Producer organisations in the three southern dominions have already put forward proposals for a new type of Commonwealth marketing scheme, when the Joint Organisation comes to an end, incorporating a similar system of reserve prices. The scheme would, in other words, protect the producer but not the consumer. The proposals so far put forward—and none of the producer organisations has yet secured official endorsement of its proposal—all suggest British participation which would virtually mean that the

British taxpayer would help to shoulder the financial burden of ensuring an adequate return to dominion wool growers. Under the ITO charter any marketing agreement must include representatives of both producing and consuming countries; it must, moreover, protect the consumer as well as the producer.

COMPANY MEETINGS

GLOBE TELEGRAPH AND TRUST COMPANY LIMITED

SOUND POSITION

The seventy-sixth annual general meeting of The Globe Telegraph and Trust Company Limited, was held on August 12 in London.

Sir Edward Wilshaw, K.C.M.G., the chairman, in the course of his speech said: For the

first time in our history the capital reserve is over £1,000,000 and now stands at £1,030,567. The balance of the profit and loss account for the year to June 30, 1949, amounts to £193,323 and brings the total capital, reserves and unappropriated profits to £5,557,705. Current liabilities stand at £90,875.

The cost of investments is £5,578,608 and they are worth about £10 million despite the exceptionally low values now prevalent in all stock markets. These investments include our holding of £4,252,668 stock in Cable and Wireless (Holding) Limited, which cost us £2,124,486 and on June 30th last had a market value of £5,787,085.

The holding in Cable and Wireless

Shorter Notes

The existing system of control of production in the cotton industry was simplified this week by the abolition of the symbol system. Spinners and weavers will still need licences to deliver and acquire yarn, but the licences will no longer carry symbols specifying the destination or ultimate user group for which the production is intended. Manufacturers and converters will thus be relieved of some paper work and will have more freedom to change the destination of cloth as trading conditions require. Special arrangements are made, however, to safeguard the Utility scheme; weavers are still required to state in advance their programme of Utility cloth production, and the total Utility programme will continue to be supervised by the Cotton Board.

The ECA mission purchased approximately 21,000 tons of natural rubber in the London market last month. Payment which amounted to £2,100,000 will be made from the sterling counterpart fund. Previously the ECA mission purchased 26,000 tons of rubber from the Board of Trade's stock for America's strategic reserve. In this instance payment was also made with accumulated sterling. So far ECA has bought or contracted for nearly £8,000,000 of goods in the United Kingdom; in addition to rubber they include industrial diamonds, sisal, sperm oil and platinum.

Coal output last week was 3,947,800 tons. Production has recovered from the effect of the Bank Holidays, which reduced the previous week's total to a little over 2½ million tons, but the loss of output through recognised holidays last week is estimated at 244,100 tons. Total output for the first 32 weeks of the year now amounts to 129,783,200, but weekly output shows no indication of reaching the weekly average of 4.3 million tons which Lord Hyndley has said to be essential if the industry is to reach its target for the year.

The civil branch of the Berlin air-lift came to an end this week. British civil aircraft engaged in the operation numbered about 50 at the peak, and carried a total of about 144,500 tons of freight to Berlin; more than half of this consisted of petroleum fuels. They belonged to 16 or 17 different firms, and their operation was co-ordinated by a small staff of British European Airways.

The office of the Narrow Fabrics Control in Manchester will close at the end of August. Much of its work has already come to an end; the remaining functions will be transferred to the Board of Trade in London.

(Holding) Limited represents 38 per cent. of our total invested funds and produced 61 per cent. of our total gross investment income for the year under review. What the future of this stock may be I am unable to say until a scheme of arrangement has been submitted to the company's stockholders.

I think I may say that the capital position of your company after 63 years' working, covering times of great stress and anxiety similar to today's conditions, cannot be considered as anything other than highly satisfactory. The profit for the year is £185,484 and the dividends remain at the same figure as last year.

The report was adopted.

GOODLASS WALL AND LEAD INDUSTRIES LIMITED

CRITICISM OF GOVERNMENT BULK BUYING

EFFECTS OF UNREAL PRICES

MR H. S. TASKER ON THE UNSATISFACTORY POSITION

The eighteenth annual general meeting of Goodlass Wall and Lead Industries Limited was held on August 17th in London, Mr. H. S. Tasker, chairman of the company, presiding. The following is an extract from his circulated statement:

The actual trading results for 1948 include a further exceptional surplus which is substantially less than was realised last year, although it is greater than had been anticipated when I made my last statement. This amount, less the appropriate taxation, has been carried direct to reserve. The trading result on the major side of the business, namely that dealing with metals and their derivatives, was very satisfactory, although towards the end of the year there were indications that a change in business conditions might be expected. During the year, metallic lead—our principal raw material—again rose steeply in price from £90 to £112 a ton, and by a further £11 on January 1, 1949. There is no doubt that the upward movement of raw materials in general, as was the case also in 1947, has again exercised a favourable influence on profits.

On our paint side there was some contraction in profits which were nevertheless, on the whole, satisfactory; the lower profits were, to a large extent, caused by the freezing of prices at a time of increasing costs of raw materials and manufacture. There is no doubt that more competitive conditions are now operating in the paint industry, and for this reason I am glad to say that our new paint factory at Liverpool started production early in 1949. This will be of great importance in assisting to keep costs at a minimum.

PLANT MODERNISATION

We have been carrying out a long-term programme of capital expenditure on plant modernisation and renewal and the progress in overtaking arrears accumulated during the war years has been satisfactory. The rise in costs and the inadequacy of the taxation relief for depreciation, however, have necessitated a continual review of policy, particularly with the cash position in mind, and the recent change in trading outlook, together with further emphasis on dividend limitation, has made it necessary to re-examine projects which, under more favourable economic and political conditions, would have been carried forward without question.

During the year 1948 our plans were completed for the merging of certain of the individual home companies, through which the greater part of our business in metals and their compounds was operated, into one single subsidiary, for which we have revived the previously used name of Associated Lead Manufacturers, Limited. No less than four of these companies go back well into the eighteenth century, one of them actually having been established very nearly 250 years. The ancient brands and the long-established goodwill which are connected with these companies are of considerable value, and every care has been taken to preserve them. The change will make for simplification and efficiency in our internal administration. It became effective on January 1, 1949.

During 1948 and in the current year the directors and staff of your company have been active in visiting the branches of the company abroad and also in examining various markets with the object of reviving or opening up export connections. I myself have been fortunate enough to visit the United States and also Australia and New Zealand; other

directors and senior members of our staff have made valuable visits to the United States and many other countries overseas, both within and outside the Commonwealth. It is unfortunate that we cannot reap the full benefit of some of this work by reason of the conditions in the metal market which have existed during the current year and to which I must now refer.

The price of lead rose on January 1, 1949, to the exceptionally high figure of £123 per ton. In March, 1949, the scene changed and the first reduction in the price of lead in America from 21.50 cents per lb., which was approximately the equivalent of the official price in this country, took place. Further falls followed, and by March 31st, when a revision of the official price was due, the American price was 17 cents per lb., or over £20 per ton below the official price in this country, after allowance for delivery, etc.

DISTRIBUTION OF LEAD

Under the present system the Ministry of Supply purchases all imported lead and controls its distribution. It also fixes the price in this country at intervals which, until very recently, have been quarterly.

The practice of the purchasing authority has been to buy most of the lead from the producers at intervals on forward contracts at fixed prices. With rising markets this has, of course, placed them in a favourable position, and it would have been reasonable, on their part, to suppose that, if and when the market fell, a continuation of this practice would cause them substantial losses. These effects might well have been guarded against by, for instance, changing the official selling price at more frequent intervals and thus following more closely the external market. The ostensible reasons for the delay in bringing the official price up to the external market level while prices were rising were the avoidance of raising building costs in this country and the encouragement of export trade; but the first benefit has, as will be seen, been nullified by the higher price ruling during recent months, and the sacrifice for the second purpose was quite unnecessary, as in the sellers' markets then existing the extra assistance was not required and amounted not only to a gift to the foreign buyer at the expense of the taxpayer but also to a loss of foreign exchange.

The result of this policy was that at the end of the first quarter of 1949, when the price for the next quarter was due to be fixed, a reduction to world parity would presumably have faced the Government with the prospect of serious losses. The position was not faced, and the reduction in the official price actually made on April 4 still left it £13 above the price ruling outside this market. Since that date, the world price has continued to fall and, forced by the pressure of events and by public comment, our authorities have abandoned the practice of fixing prices quarterly and have, in fact, on two arbitrary dates made two further reductions of arbitrary amounts, but they have always lagged behind the outside market by £10 to £15 a ton.

DISTURBANCE TO INDUSTRIES

The disturbance caused by this policy to industries whose products are largely based on lead (and the same applies to the other non-ferrous metals) can be readily anticipated by any commercial man. Every buyer, watching the course of world prices, has

realised that the official price was unreal and was liable to unforeseen reduction at any time. No one has bought, therefore, unless the necessity to buy has been pressing. Every effort has been made by consumers to make do with their existing stocks. This state of affairs has been prolonged over a period of five months. The result is that deliveries of all lead manufactures have been considerably reduced, that output has consequently been curtailed, and in some cases men have actually been laid off. Thus, the problems that are normally associated with a falling market have been greatly increased by the policy of the Government. Although there has undoubtedly been some real recession in the consumption of our products by our customers, owing to a general slackening in trade activity, the effect of this has thus been considerably exaggerated.

Such an unsatisfactory state of affairs seems to make advisable the re-examination of the necessary or otherwise of a Government monopoly of the purchase and importation of lead. In our opinion the time has arrived when buyers of lead should be allowed to renew direct relations with their traditional suppliers and with their agents.

PROFIT AND DIVIDEND

Taking the legal accounts of the holding company it will be seen that the profit for the year, including dividends from subsidiaries, amounted to £500,795. The board recommends that the Preferred Ordinary dividend should be paid, and recommends the same distribution on the Ordinary stock as has been made in respect of the two previous years—namely, 15 per cent.

Note.—The foregoing statement, for practical reasons, was written at the beginning of July. Since then the Ministry of Supply has changed its policy and apparently intends to follow closely world prices.

The report and accounts were adopted.

UNITED DOMINIONS TRUST, LIMITED

AN ALL-TIME RECORD

The twenty-seventh annual general meeting of the United Dominions Trust, Limited, was held in London on August 18.

Mr. J. Gibson Jarvie, the chairman, in the course of his speech, said: The company has had an all-time record year both in turnover and profits earned; the record group profit amounts to £408,557, but we expect the government will require in taxation £195,082. We propose a dividend in the ordinary stock of 15 per cent., less tax. This means that out of the record profit of £408,557, the ordinary stockholders will receive only £82,500 i.e., at present values 5 per cent. on their money, less tax; not an excessive reward to the investor.

The success of your company and its subsidiaries is attributable to the fact that they render essential services to the community. Year by year we have developed and extended our services: No company starting with us in its early stages need at any time in the course of its subsequent career have any need (apart from joint stock banking facilities) to seek capital or financial assistance away from your companies. The organisation is unique in the breadth of its activities and in its many services to British industrial enterprise.

Enterprise in Britain today is stultified and frustrated at every turn by the policy and by the enactments of our present government. But in spite of everything I believe that we still have an opportunity for regaining the position which we held at the beginning of the century and we might improve even on that. All that we require is the will.

COMPANY MEETINGS - - - 475

INVESTMENT STATISTICS - - 478

STATISTICAL SUMMARY - - 479

Both Sides of the Medal

THE Chancellor of the Exchequer and the Foreign Secretary are sailing for America early next week. That both of them are attending the Washington conversations with the representatives of the United States and Canada reflects (among other things) the very great importance that attaches to what is said and done at Washington. These are no mere technical financial discussions; they involve matters of the highest policy. What is at stake is not simply the British balance of payments but the indispensable basis of mutual confidence on which the unwritten Anglo-American alliance, and therewith the political stability of the whole western world, has rested ever since the end of the war.

Unfortunately, it is difficult to believe that any decisions will be reached at Washington next month commensurate with the importance of the occasion. There will, undoubtedly, be some practical results; and if one of these is an abandonment of the present pegged rate of exchange between the dollar and the pound sterling, that can hardly be dismissed as a minor technicality. But though a depreciation of sterling is now necessary and inevitable, and may do good on balance, it is very important that everybody should realise how little it will affect the fundamentals of the unbalance between the eastern and western hemispheres.

It is for action on these fundamental issues that the world will probably look in vain next month. The reason for this pessimistic prognosis is not to be found in the battle of words now going on in the newspapers on both sides of the Atlantic; such duels are disturbing, but they are no more than that. The real reason is to be found in the fact that even the friendly and co-operative sections of opinion in the two countries approach the present crisis from radically different angles. It is easy to find many influential Americans who look at the British crisis with the fullest sympathy and the most tolerant understanding of how matters came to the present pass; but it is difficult to find an American who agrees with even the main outline of the policies that are being followed in Britain with the object of overcoming the crisis. There are many Englishmen who whole-heartedly agree with the American approach to economic problems in general; but few who think American suggestions take nearly enough account of the practical difficulties in the way.

Any large step forward towards a reconciliation of economic policies must, therefore, wait. It must wait until the British people have come to a clearer appreciation than they have today of the realities of their position, and until they have chosen their government for the next five years (and much may turn on the order in which these events occur). It must also wait until the present mood of exasperation has passed in America. Very much hangs on the success that attends the process of mutual accommodation of ideas. If the public minds of America and Britain, which are now apart, are to move together, it follows that they must move in opposite directions. But the whole English-speaking world increasingly tends to be a single forum, and

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for two Research Assistantships in Social Studies at a salary of £450 per annum. Applicants should be graduates in History, Economics or Sociology or Political Science or Philosophy. The appointments will date from October 1, 1949. Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, by whom applications must be received on or before September 3, 1949.

THE Civil Service Commissioners invite applications for permanent appointments as Assistant Experimental Officer to be filled by competitive interview during 1949. Interviews will be held shortly after the receipt of the completed application form and successful candidates may expect early appointment.

The posts are in various Government Departments and cover a wide variety of scientific (including engineering) qualifications. Places of work are spread throughout Great Britain.

Candidates must be at least 17½ years and under 26 years of age on 1st August 1949, time spent on a regular engagement in H.M. Forces may be deducted from actual age. Candidates must have obtained the Higher School Certificate with mathematics or a science subject as a principal subject, or an equivalent qualification. Higher qualifications will be regarded as an advantage to candidates over the age of 20.

The inclusive London salary scale (men) is £220-£490. Salaries for women and for posts in the provinces are somewhat lower. Superannuation provision is made under the Superannuation Act.

Further particulars and forms of application from the Secretary, Civil Service Commission, Scientific Branch, 27, Grosvenor Square, London, W.1, quoting No. 2522. Completed application forms should be returned as soon as possible.

what it is appropriate and useful to say in London is repeated in Washington, where it may arouse fury. This difficulty particularly afflicts a journal which circulates in both countries. If *The Economist* attempts, for home consumption, to expose the ways in which the policies of the British Government have exacerbated the balance-of-payments crisis, the article receives the flattering but embarrassing honour of being quoted with approval in America by those who would write Britain off as a hopeless case. If, for our American readers,

The Politics of the Crisis

For American readers

Not to be read in Britain

1. It is a gross over-simplification to say that Britain's present difficulties are solely due to mistakes in British policy. They are an expression of volcanic upheavals in the economy of the whole world.

2. In particular, it is wrong to associate the socialist programme of the present Government and the shortage of dollars as cause and effect. It is very difficult to trace any connection between the nationalisation schemes and the balance of payments.

3. Much the largest cause of the present situation is to be found in the dislocation produced by two wars. Not only was Britain (apart from Germany) the only country that fought right through both wars, it was also, from its commercial position, the one most liable to suffer from any disturbance of the delicate mechanism of world trade.

4. In so far as deliberate policies of the British Government have contributed to the present crisis, it is not the socialist policies of the Labour Party that are to blame, but the policies to which all parties have contributed. If there is in Britain today no healthy competition and wholly insufficient incentives to efficiency, the major blame cannot fairly be fixed on one party but must be laid upon the cast of mind of a whole generation.

5. The "welfare state" is not a heresy to be derided, it embodies the healthy aspirations of free democracies all over the world. All that is wrong with the British welfare state is that it chose a singularly inappropriate moment to take several very large steps forward.

6. It is quite wrong to suppose that a change in the party in power would, by itself, have any decisive effect on economic policy. What has first to be done is to bring the British people as a whole to an appreciation of reality. Until that has been done, no party could advance very far. When it has been accomplished, either party will be in a position to do what is necessary. Indeed, in many ways, the Labour Party, if it would make-up its mind to face the facts, would be in a stronger position to serve the country.

7. Nothing could well be more disastrous than that America should take sides, or appear to take sides, in the British general election. It would create what does not exist at present, an active anti-American party in Britain, and might well help it to a Parliamentary majority.

we underline the magnitude of the British efforts at recovery, the article receives the hardly less embarrassing honour of being cited by Dr Dalton at Strasbourg as proof of the perfection of the Labour Government. Truth, of course, is truth the world over. But truth is also many-sided, and if there is to be a full understanding between the nations, different facets of the truth need to be stressed in different places.

From this dilemma there is only one escape—and that is, for once, to give both sides of every medal.

For British readers

Not to be read in America

1. For a generation past the British people have been paying far too little attention to their competitive position in the world. It is true that the causes of most of the changes lie in external events. But there has been a tendency to suffer them passively rather than to react vigorously. Now the bitter fruits of a generation's indifference to the ratio between imports and exports have ripened.

2. In general, the doctrines of the Left, with their teaching that the ordinary man can make less effort to produce and yet consume more, have, in the hands of both parties, contributed to a situation in which Britain imports too much and exports too little.

3. No other country is going to recognise any obligation to provide the British people with a living, no matter what their services and sacrifice to the common cause.

4. Though the policies of social security and full employment were agreed upon by the whole nation, the Labour Government, as the bearers of responsibility, are very much to blame for their stubbornness in refusing to remit anything of their plans even when it became quite clear that the assumptions about the economic climate of the postwar years on which they were based were very seriously wrong. It is not enough for a self-respecting Government merely to say that its opponents would have been no better.

5. There is no magic in the actions of the state that can guarantee the ordinary man an income larger than he earns, or that can promise full employment without exacting the price for it. A community can easily have more welfare than it can afford, in the sense that insistence on providing the welfare may impede the earning of the national income on which it depends. When that time comes, it is necessary to *reculer pour mieux sauter*.

6. Whatever may be true in other countries, in Britain courage pays political dividends. Those politicians who refuse to prolong the rosy illusions of the postwar inflation and tell the people soberly what needs to be done would be surprised at the response they would evoke. This would require from the Labour Party a greater effort than from the Tories. But their need to make the effort is the greater, for without it, there is a risk that the British public (or enough of them to be decisive) will conclude that Labour, after all, has too little realism and courage to be capable of governing.

7. The British public should try to be less touchy about what is said in America. The real test is what is done, and by that test the United States Government has leant over backwards to avoid anything that could be construed as interference in British internal concerns. The advice that America gives may be gratuitous; but so are its dollars.

8. Americans should realise that the British people are spiritually exhausted after what they have been through in the last ten years. To accuse them of being unwilling to make efforts to save themselves is insulting. They have made greater efforts than any other people and deserve credit for so doing.

9. There is nothing more difficult for a democracy to accomplish than deliberately to lower its standard of living. American politicians are hardly notorious for the eagerness with which they impose sacrifices on the voters. They should not expect British politicians to do the impossible overnight; it will take a little time.

The Economics of the Crisis

1. American generosity, great as it is, is not the only, or the main, contribution that the United States can make to the solution of the crisis in world trade. The chronic deficit in all other countries' balances of payments is a reflection of the chronic surplus in the American balance. Equilibrium cannot be restored until America buys more from the rest of the world, and this is not a problem that can be solved solely by non-American efforts.

2. If America were to buy less from the outside world, either through trade depression or for any other reason, the results would be disastrous.

3. Much of the gap in the British balance of payments is simply the result of the adverse movement in the terms of trade. This, in its turn, has been due to the long extension into the postwar period of wartime inflation, mainly sustained by the tidal wave of American demand.

4. To have devalued sterling in a sellers' market would have made Britain's position worse, not better. On a strictly economic calculation, the time may not yet have arrived when devaluation will show a clear balance of advantage. In any case, it is only a small contribution to the general problem.

5. The object of any depreciation of sterling will be to flood America with cheap British goods; there must, therefore, be no complaints if that is the result.

6. Economic unity in western Europe is an imperative long-term project. But the economies of western Europe are much more competitive than complementary, and there are no important gains to be secured quickly from closer economic union. The only quick solution to Europe's problem would be a large increase in American purchases of European goods. It would be a great pity if the inevitable gradualness of the approach to economic unity in Europe came to be regarded in America as an alibi for failure to tackle this real problem.

7. So long as dollars are a hard currency, some degree of discrimination in trade is inevitable. To insist on complete non-discrimination is, in these circumstances, to insist that all commercial exchanges shall proceed at the pace of the slowest.

8. So long as the dollars available to the world are below its needs, the world will have no option but to cut its dollar purchases and cut them again. Britain cannot fairly be blamed for refusing to spend dollars it has not got.

9. The British economic position is by no means as bad as it looks at the moment. The balance of payments problem is not the only one; but it is the only one that is immediately dangerous.

8. No efforts and no sacrifices are too great if they restore the pride and independence of Britain. No efforts and no sacrifices, however heavy, are great enough if they leave Britain dependent on the generosity of others.

9. The inescapable condition of escape from the crisis is that there should be a sharp change in the ratio between the efforts that the British people put into their economic activity and the rewards that they expect to get out of it—either an increase in economic efficiency or else a reduction in the standard of living.

1. British policy is still a very long way from being willing to do anything for dollars. There is still, for example, a refusal to grant "unfair" advantages—either in taxation or in allocation of materials or in other ways—to those who earn additional dollars. Until these sacrifices of policy are made, it cannot be claimed that everything possible is being done.

2. The American "recession," as experienced to date, is a quite minor affair. Unless an economy is to be absolutely rigid, it would be difficult to experience a milder "recession" than this. Those who blame it for the British crisis should take a course in economic history.

3. It is foolish simply to sit down and wait for the prewar relationship between British and overseas prices to return. Though the sellers' market cannot go on for ever, the buyer of food and raw materials may never recapture the dominant position he held in the 1930s.

4. As soon as the world made up its mind that sterling should be devalued, devaluation became inevitable. This point was reached months ago and action should have been taken then. Every day's delay costs £1,000,000 of the sterling area's ultimate reserves.

5. Cheapness by itself will not sell enough British goods. But it will provide the opportunity for a real merchandising effort.

6. It is impossible for Britain to buy unessential goods from Europe and pay for them in convertible sterling. But there is suspicion that this argument is being used as an excuse for doing nothing in cases where something could be done. The recent proposals for the grant of open general licences for a wide range of goods from a number of European countries will provide a test of sincerity. It is essential that the British offer, when the blanks come to be filled in, should be found to have real substance.

7. Britain can never hope to do a sufficient volume of trade except in the widest possible market. This means that British exports must be able to hold their own in competition with any others in the world. There is no possibility whatever of solving the British problem by bilateral dealings in an ever-narrowing circle of high-cost economies.

8. Import cuts are no long-term solution. Austerity will be as suicidal in the long run as it is necessary in the short. The aim of policy should be to get into a position where British imports can be increased.

9. Every other object of economic policy must, if necessary, be subordinated to the problem of the balance of payments—if only for the reason that, if it is not solved, no other object of economic policy will be attainable.

Doves Over Yugoslavia

A NEW phase has opened in the year-old struggle between the Communist heresiarch, Tito, and the high priests of the one true Marxist-Leninist faith in Moscow. Hitherto, the dispute has been carried on within the framework of the Cominform. The Communist parties in Russia and its satellites have attacked the misdoings of Tito and his ministers not as leaders of a state but as dissentient members of an international movement. Now, however, the Soviet Government has launched an attack upon the Yugoslav Government. It is no longer an internal dispute in an international political movement that is at stake. It is a clash between nation-states.

It is probable that the Soviet Government did not intend to move out of the cover provided by the Cominform, but in the event their bluff was called. At the Paris Conference last May, Mr Vyshinsky withdrew Russian support from the Yugoslav claims on Carinthia. Marshal Tito responded by sending an official Note to Russia protesting at this capitulation to western imperialism. It was a shrewd move. Russia was convicted of deserting the Slav cause and treating with the west, and the loss of Carinthia, which could have done the Tito regime some harm inside Yugoslavia, was used to feed the country's growing resentment against the Soviet Union. At about the same time, Tito began to cover his own discreet withdrawal from the Greek adventure—the Greek-Yugoslav frontier was effectively closed soon after—by accusing the Russians of sacrificing the Greek cause to the Macedonian ambitions of Bulgaria. Once again he succeeded in turning the tables on Russia. It is now clear that sometime last winter the Russians decided that it was more important to oust Tito than to win the struggle in Greece. They therefore compelled the Greek Communists to swallow the idea of Macedonian autonomy, presumably under Bulgarian tutelage. The change was designed to unseat Tito in Yugoslav Macedonia. In fact, it split the Greek Communist movement, since its realisation would have entailed the separation of Greek Macedonia from Greece. Now that the civil war in Greece is going badly for the Communists, Tito has forestalled the Russian accusation, that in closing his frontier he has abandoned the Communist cause, by laying the blame for the Greek reverses on Russia's own Macedonian machinations.

The Russian reaction to these shrewd attacks has been one of outrage and revengeful fury. The propaganda war against Marshal Tito has been intensified and a stream of insult and abuse has filled the Balkan radios. Against this background, a series of official Soviet Notes has denounced Tito as an enemy of the Soviet Union and threatened violent action to remove him from power. Two Notes, one dispatched in the middle of July, the other last week, covered the charge that Russia had betrayed Yugoslavia's claims on Carinthia at the Paris Conference. The Russians sought to counter this point by accusing Tito himself of negotiating with the west and of having offered, as far back as 1947, to abandon all claims on Carinthia, save for special treatment for the Slav minority. The second Note not only repeated the charge but ended with the ominous words that the Yugoslav people should

know that the Soviet Government does not regard the present Yugoslav Government as a friend and ally but as an enemy and a foe of the Soviet Union.

Even more ominous, particularly to those who recall Hitler's tactics, was a further Note dispatched a week ago protesting against the arrest and imprisonment of Soviet

citizens by the Yugoslav Government. There is no secret about these people. They are in the main White Russian émigrés—"White guardists" in Yugoslav parlance—who, after a twenty-year residence in Yugoslavia, were caught by the Russian advance in 1944. Some were shot as fascists. Others purchased citizenship by consenting to stay behind in Yugoslavia as agents of the MVD, the Russian secret police. Since one of the factors which first created the breach between Tito and Russia was the Russians' habit of spying extensively on their supposed friends, there can be little doubt that the "Soviet citizens" in question are White émigrés in prison for espionage. The Yugoslavs have shrewdly replied to the Russian Note by offering to consent to their extradition to the Soviet Union. The importance of the issue lies, however, not with the substance of the new dispute but with the oddly reminiscent wording of the Soviet Note, in which it is stated that

the Soviet Government . . . will not tolerate such a situation and will have to resort to other more effective means to protect the rights and interest of Soviet citizens in Yugoslavia and to bring to order the unrestrained fascist offenders.

Is Mr Stalin's patience then exhausted? Memories of Hitler's march into Poland in 1939 have been aroused by the conduct of the dispute, but it is difficult to believe that the Red Army will openly march in. However, there are more ways of invading a country than by the dispatch of national armies. The MVD has its own shock troops, and Yugoslavs opposed to Tito are being organised and drilled by Tito's neighbours—there is an "Arso Jovanovich" brigade in Bulgaria. The Russians may also hope that local discontent in such traditionally unruly areas as Macedonia and Montenegro can be fanned into rebellion. Marshal Voroshilov has arrived in Bucharest, where Mrs Anna Pauker recently announced that "the day is not far off when the Tito bandits will render account to the people of Yugoslavia." He may well have come to preside over the next phase in the struggle against Tito and, to judge by the tone of Communist propaganda, it could take the form of a concerted move into Yugoslavia by international brigades dispatched by all the Cominform countries, with Russian participation and with the backing of the "proletarians of the world." Such a development is still a matter for speculation, but what is certain is that by one means or another, the Russians are determined to be rid of Tito. Their campaign against him has been so rancorous, their denunciations of his treachery so violent, their predictions of his overthrow by "loyal Yugoslav Communists" so confident, that his mere existence is a blasphemous challenge to the whole Soviet dogma of invincibility and infallibility.

He cannot be left, cocking snooks at the monolith. Even if open invasion does not take place, it is simply because the Russians still hope against hope that anti-Tito Communists inside Yugoslavia may yet pull off the "liquidation" of Tito they have so far failed to achieve.

But why the violence, why the fury? The western mind is left bewildered not only by the intensity of the Cominform campaign but by the form and language in which it is cast. There is more here than mere disagreement, or even treachery. Underneath it all is the outrage reserved for the tremendous sins—for heresy, for blasphemy, for the sin against the Holy Ghost. Yet if the issue is at the deeper level of dogma and belief, in what has Tito transgressed?

By all practical tests, he is a Communist. His programme for collectivisation has gone farther than that of any other people's republic. Socialisation of industry is complete. Marxist-Leninism is his official ideology. No other eastern European government equalled his in baiting the west—what other government shot down an American B47?—until economic necessity in the shape of the Cominform blockade drove him to look westwards. What, then, is the deep ideological guilt staining his regime?

The answer explains both the depth of his sin and the unreasoning fury of the Soviet reaction to it. Tito has picked on the one crime not included in the Marxist-Leninist decalogue, the one crime added by the unaided infallibility of Stalin, the one crime capable of unmasking the largest internal contradiction in the Soviet system. Whatever else they were, Marx and Lenin were internationalists. It is perhaps open to question whether they would have remained so if they had had an empire to run on the scale of Russia. Nevertheless, the freedom and equality of Communist peoples are undoubtedly written into the Marxist canons. Stalin, however, is not an internationalist. He is an aggressive believer in the absolute and total predominance of Russia. Tito's crime has been from the very start simply to refuse the absolute domination which in Stalin's view inheres essentially in the majesty of Russia. This view may be dressed up in Marxist trappings, but in essence it is the old adoration

of the nation-state. The challenge offered by Tito is that he strips off the trappings. He is as complete a Communist as his neighbours. The only difference is his rejection of total Russian control. The fact that Russia seeks to destroy him shows that control, not Communism, is the Soviet Union's chief aim and with that admission, the ideological bluff is called. Russia cannot indefinitely preach internationalism to its satellites and practise nationalism at home. Capitalism itself has no deeper contradiction to offer. So Tito, who makes the contradiction a daily spectacle and probably a daily temptation to his neighbours, must go.

The dispute has, however, wider implications than heresy and schism within the Communist world. Tito calls Stalin's bluff not only as an internationalist but also as a man of peace. It is a strange irony that at this moment, under Soviet directions, Communist parties all over the world should be staging demonstrations, congresses and petitions for peace. Permanent peace committees are set up, prominent if simple-minded citizens pledge themselves to support Russia's "fight for peace," and Soviet ambassadors appear in Paris and Washington with pockets full of doves.

But what sort of doves are flying over Yugoslavia? Here, where a "vital" Soviet issue is at stake, is the talk of peace or of war? The same government that parades its peaceful intentions at Lake Success or Foggy Bottom uses the language and the technique of Hitler in its dealings with a near neighbour and fellow-member of the United Nations. The western powers have no reason to support Tito's regime. They find his ideology, even if heretical, as unpalatable as the more orthodox sort. But at least they can be grateful to him for calling the bluff of the biggest confidence trick in the postwar world. If the Russians genuinely prefer peace to the total achievement of their national aims, they can begin the demonstration practically by calling off the dogs of war in the Balkans. If, on the other hand, they persevere in the present gangster campaign of violence and pressure against Yugoslavia, the western powers will know what value to place on their peace offensives and how seriously to take their protestations of pacific intent.

Workers' Participation

TRADE UNION discontent with the working of the nationalised industries is not likely to be allayed by the report, conscientious but anæmic, which the General Council will place before the Trades Union Congress at Bridlington. No doubt too many hazy hopes were reposed on nationalisation from the start. Old trade union workers who have based a lifetime of work on assumptions about the class struggle are upset when a public board shows itself no less capable of hard bargaining than a private employer. Evangelists of workers' control find themselves fobbed off with the reservation of a seat or two on each public board for trade union dignitaries—on condition that the dignitary thereupon becomes the servant of the public and ceases to represent his union. The employer himself has changed, and though in his new form he is politically more vulnerable than his predecessors, industrially he is more powerful than they were. It is true that the new employer is accountable to the Government and feels the duty of enlightened behaviour towards his workpeople to be enjoined upon him. But the essential relationship between employer and workpeople remains, while the established technique for conducting the relationship has ceased to be fully applicable.

As experience of the working of nationalised industries accumulates, these facts and the hard feelings that they

engender come to the surface. At a time when full employment and sheltered market conditions have kept commercial industry singularly untroubled, the nationalised boards are harassed and beset by industrial disputes. The endemic crisis of authority on the railways and the blatantly unsatisfactory labour relations of the National Coal Board should by themselves be enough to provoke a reassessment of the place of the trade union in a state-owned section of the economy. Certain unions have in any case been explicit. The National Union of Mineworkers has complained to the TUC of "a growing sense of frustration and cynicism." The railwaymen have been "extremely disappointed at not being brought into consultation on matters of major importance," and complain that since the railways were taken over "no noticeable change in the relationships between management and staff has taken place." While questions of this kind will be debated at Bridlington, they will probably be overshadowed by the acute issue of wage and price policy. But the two subjects are connected. Disillusionment with socialism as a form of industrial organisation breeds obstinacy over wages and prices. On each issue the trade unions have to decide how far they are the guardians of the public interest and how far they are the workers' pressure group. On each the tendency is for the national executive to play the one

part and the area, branch or lodge to play the other; thus the unions' own cohesion and authority are threatened.

The threat bears not only upon each of the great industrial unions individually, but also upon the collective trade union movement as represented by the TUC. It may have been this which caused the TUC this week to perform a miracle of split personality, urging the Minister of Labour to raise the wages of shop assistants at the same time that it was pressing the President of the Board of Trade to cut the shopkeepers' trading margins. Essentially it is the same dilemma which obliged the TUC, even while it continued to support the principles on which the Labour Government has organised the nationalised industries, to press for "greater workers' participation" in their control.

★

It was in the compromise resolution which it passed a year ago that the TUC expressed its "concern" at the composition of the boards of the nationalised industries and its anxiety that there should be greater workers' participation, "which can only be obtained from trade union ranks," on these boards. The resolution asked for extensive training schemes within the industries "in order to develop administrative ability of a type which will ensure the success of nationalisation." It affirmed that "at all levels" administrators should be chosen "on the basis of proved ability and belief in the policy of nationalisation." Nobody, at the time this resolution was passed, seems to have known what it meant. A spokesman of the General Council explained that there was no thought of imposing a political test on appointments, though what else the words about "belief in the policy of nationalisation" could mean it is really impossible to say. The General Council continued to hold that "workers' participation" on a board meant "at least one full-time trade union appointment in addition to any part-time trade union appointments that may be made." It continued to hold that the board must be independent of the trade union and the trade union must be independent of the board: therefore, the trade unionist members should, on appointment, sever their formal connection with any union in the industries concerned. This is the majority view of the trade union movement at its articulate levels; and it is based on good sense. The Bank of England has not been taken over by the clerks, British Overseas Airways by the pilots, or the railways by the locomotive engineers and firemen—though this last point is perhaps not readily apparent at the moment.

What, then, is meant by "greater workers' participation"? To appoint a few more retired trade union officials would have no effect whatever beyond limiting further the range of choice open to a Minister in doing his duty, which is to find the most effective board of management he can. It might be supposed to ensure that the board believed firmly in the wisdom and usefulness of its task, but even that is speculative. It would not ensure a competent board. Would it even create the atmosphere of goodwill and mutual trust which, by the trade unions' own statements set out in the TUC report, is lacking? No one who knows the state of feeling within the trade union movement is likely to maintain seriously that it would. Not only trust and confidence between the board and the union are needed, but trust and confidence between the union national executives and their members, and—not much less important—between the different unions themselves. Unofficial strikes at the docks, demarcation disputes on the railways, attempts by the National Union of Mineworkers to crush the Colliery Winders' Federation out of existence as a "breakaway" organisation—these depres-

sing portents at least show that the cure for malaise will not be found on the boards of the basic industries.

The TUC has tacitly recognised this fact, and in making proposals to the Government last month appears to have said nothing about its dissatisfaction with the composition of the boards themselves. Its proposals related, instead, to consultative machinery, to training and education, and to the procedure for promotion in the industries. But even here they were excessively vague. Managements and trade unions should promote "training in the methods and purposes of joint consultation on an extensive scale." Training and education within the industries "should not be exclusively technical, but should attempt to infuse into officials and workpeople an enthusiasm for the success of nationalised industry." Attention was drawn to the need for "satisfactory procedure" for promotion, and to the Post Office experiment which gives the unions a right to make representations about staff appointments.

It is hard to see in these proposals much more than the old game of passing the buck. About the machinery of consultation there seems to be little specific dissatisfaction; it appears rather that the machinery does not work well enough because neither side shows enough interest in it. How the two insufficiently interested parties can arouse each other's interest, or how in their present mood of disillusion they can infect each other with enthusiasm, is hard to see. A little more machinery, a few more joint sub-committees, a more active right of veto on any administrative change, a new filter through which appointments must pass: what will these do? If anything, they will make for more rigidity where flexibility is wanted. The point is well enough illustrated by the remarks of various unions on promotion. One union remarks with satisfaction that "the general principle of promotion from within the industry is conceded." Another complains of "the importation of people from outside." A third criticises the "class prejudice" which gives certain jobs to men with a university education. Clearly, it is the trade unions themselves—and not merely the executives, but their members—which need to adjust their ideas to a new industrial organisation and a changing society. If the state spends money to produce university graduates, is it "class prejudice" to give them work? Are the railways and the electricity supply industry to be insulated against new branches of engineering which might bring in technically revolutionary ideas? Ought industrial democracy to work in this way?

★

To object to this very restrictive interpretation of industrial democracy, however, is not to object to industrial democracy itself. The rank and file of industry are naturally interested in knowing what is going on, in being helped to better themselves by training, in understanding the methods of promotion. Experience has shown over and over again that those employers who most fully admit their employees' legitimate interest in such things are not only the least troubled by labour disputes but often commercially the most successful as well.

The doubt that must arise in the mind of anyone who reflects on the industrial history of the past few years is not whether workers' participation is desirable, but whether it can best be expressed through the trade unions. Trade unions, after all, are, in origin, fighting bodies. Their duty is to represent their members' interests, certainly against the employers', and if need be against those of the public at large. Are bodies whose main nature is necessarily combative well fitted to engage in the constructive and co-operative tasks of workers' participation?

Moreover, recent events have shown very clearly what dangers for the unions themselves lie in straying from their original purposes. The more the leaders of the unions busy themselves with matters other than the advocacy of their members' immediate interests—whether the distractions are consultation with the Government on public policies or collaboration in the tasks of management—the greater is the likelihood that "unofficial" leaders will spring up who have no other purpose (or at least admit to no other) than to further the immediate claims of the membership. Trade unions cannot take over the management of industry; if they try to do so, they will cease to be trade unions and

a new trade union movement will require to be invented.

The conclusion would seem to be that the trade unions would do well to return to their original job of being trade unions, that is, of representing the workers in the two-sided business of collective bargaining. The attempt to combine combative and collaborative functions appears to be resulting in neither being very adequately performed. If the unions would confine themselves to what they can do effectively, the way would be open for canvassing more promising methods of arranging for the ungrudging and ungrudging participation of the workers in solving the positive problems of industry.

Consolation Prize in Japan?

THE city of Hiroshima has held a three-day "peace festival" to commemorate the fourth anniversary of the dropping of the atomic bomb. The festival included memorial rites for the victims of the bombing, a dedication of the city to the cause of peace and a tennis tournament for a MacArthur Cup.

It seems odd today to recollect that Hiroshima was bombed to win a war against Japan on behalf of China. It is true, of course, that the United States was precipitated into war with Japan by the Japanese attacks on Manila and Pearl Harbour, but it is also a historical fact that Japanese-American tension reached breaking point because of the steadfast American refusal to acquiesce in any settlement imposed on China by Japanese aggression; the evidence available since the war on the prewar balance of political forces in Japan strongly indicates that the extension of the war in China could have been avoided, at any rate for the time being, if Washington in 1940 or 1941 had been ready diplomatically to abandon China's cause. Today, four years after the total defeat of Japan, China has been, for the most part, transformed into a political factor hostile to the United States, while Japan nestles, not unwillingly, under the American eagle's protective wing and submissively hearkens to the voice of Washington. Control over Japan is, in fact, America's consolation prize for having won a war for China.

It is primarily a matter of military occupation. The strength of the American position in Japan has from the beginning resided in the fact that the American military command has had exclusive authority over the whole Japanese homeland without any partition of the country into zones. Japan has been saved from the fate of Germany; Russian outposts in Sakhalin and the Kurils are today within sight of

Japanese shores, but there is no Soviet zone in Japan, so the Russians have not been able to set up a Communist-controlled administration on Japanese soil, and whatever influence they have in Japan has to be exerted from outside.

The international situation being what it has become, the American military occupation of Japan is not confined to the purpose of enforcing the surrender terms on the Japanese. Japan, effectively demilitarised and disarmed, is no longer capable of regular armed resistance or aggression, and a very small, well-equipped military force is sufficient to keep watch over a nation deprived of major weapons of war. But two other functions remain to the American army in Japan. One would be to assist in the suppression of a violent internal revolt against the constitutional Japanese Government, were rebels, lightly armed from small arms dumps which probably survive in many holes and corners of Japan, to prove too strong for the Japanese civilian police. The other would be to repel any invasion of Japan from outside, whether it took the form of an infiltration of irregulars or of regular belligerent operations. For the latter the American forces immediately available in Japan would not be sufficient; they could, nevertheless, undertake the defence of key points until reinforcements arrived. The change in emphasis from the occupation of Japan to the defence of Japan was marked officially in a recent "operational directive" from General MacArthur which spoke of the American army's "responsibilities of friendship and protection" towards the Japanese people. An American officer is reported to have clarified further this directive by referring to a "virtual unofficial alliance with the Japanese."

An "alliance" with Japan cannot at present be more than political, since Japan is unarmed. It might come to have

OUTSTANDING VALUE IN LIFE ASSURANCE

a certain military value as well if Japan were to be permitted to have some kind of "Home Guard" for local defence under American command, but nothing of this sort has so far been instituted. The relation so far is one of a protector to a client incapable of self-defence. But it remains important to ascertain whether the client at least desires to be protected. Do the Japanese, generally speaking, wish to be defended by the Americans or is their alleged will to avail themselves of such protection itself merely an attitude imposed on them by superior American power? Would they, perhaps, prefer to be protected by someone else against the Americans?

★

These are questions which go deeper than any formal official attitude or even than parliamentary election results—in spite of the genuine freedom of electioneering which has been assured by the occupation authorities. It is not easy to estimate how far Japanese national co-operation with America can be described as voluntary and how far it is enforced. No people has more instinctive skill in the concealment of inner feelings than the Japanese, and as long as American occupation forces remain in Japan there will be inhibitions on Japanese freedom of speech even without a formal censorship. It is possible, nevertheless, to draw up a rough balance sheet of American progress in reconciliation with the Japanese ex-enemy and to arrive at certain conclusions with regard to the stability of the present regime in Japan, apart from the factor of direct American control and enforcement.

It must be appreciated, in the first place, that General MacArthur finished his postwar surgical operations on Japan before the patient emerged from the psychological anaesthesia of defeat. Industrial dismantling is now a thing of the past in Japan, and so is the trial of Japanese generals for war crimes. General MacArthur has made his mistakes in dealing with the Japanese, but he is not afflicted by those moonbeams of the larger lunacy which inspire British policy towards Germany in August, 1949. He does not go out of his way to provoke Japanese enmity four years after the surrender. The Japanese have no ground for doubting that America is now genuinely striving to promote their economic revival, even though the deflationary pressure required by the "Dodge Line" may have some harsh social consequences. The Japanese can feel that the period of destruction and punishment is over and that an era of recovery in which America is actively assisting them has begun. On both sides, naturally, calculations of interest prevail over any kind of sentiment. But there is, at any rate, in the new era a minimum of offence to the slowly, but surely, reviving national pride of the Japanese, and economic co-operation can develop without undue disturbance from political tension.

Over and above the political position the United States has gained in Japan by assistance to Japanese economic recovery and consideration for Japanese national sentiments, it holds a great advantage in the eyes of its former enemies from the overwhelming and exclusive character of its victory. In Germany, where Berlin fell to a Russian army and Russia accounted for the bulk of German war casualties, military respect and fear have been necessarily divided in popular estimation between the victor nations. But no Japanese has any doubt that it was the United States Navy which wiped out the Japanese fleet, cut the lifelines of Japan's overseas empire and brought American arms to Okinawa before ever the atomic bomb fell on Hiroshima.

The Japanese give no credit to Russian claims to have won the Pacific war by jumping into the fray when it was already over, and they know even more definitely that, whoever won the war, it was not the Chinese. The Japanese attitude is strongly conditioned by the profound impression American

war power has made on them; they are generally convinced that, if there is a third world war, America will win it, and they want to be on the winning side. In this context it may be noted that Chinese experience has been quite different from the Japanese with regard to American power. The Chinese as a nation never saw any American power during the war except for a small number of American aircraft, whereas all Manchuria saw the might of the Soviet Union when the Stalin tanks rumbled over the plains to Harbin and Mukden. News of naval battles never conveyed much to so continental-minded a people as the Chinese. The idea that Russia is really a more powerful nation than America is easily commended to the Chinese; it does not cut any ice in Japan.

★

A further factor in the situation is the strength of anti-Communism in Japan, quite apart from American pressure. The old social and political structure of Japan was a very strong one, and it was intact at the end of the war; there was neither a revolution to end the war as in Russia in 1917 or in Germany in 1918 nor a dissolution of the state as in Germany in 1945. The emperor ordered the surrender and has remained as an emotional rallying-point for the nation in defeat; the changes brought about by American initiative in postwar Japan have been carried out from above in an orderly constitutional manner. Conditions of life have been hard in postwar Japan, at any rate in the towns, but the political opportunity for Communism has been very restricted. There has not been, as in China, a collapse of a state administration still only half built when the impact of war fell upon it; nor a Communist party in revolt with a twenty-year-old army of its own; nor a currency inflation utterly beyond control and ruinous to all classes except a few large landowners and speculators; nor a peasant *jacquerie*—for the agrarian reform imposed in Japan by American directive has turned some millions of Japanese tenant farmers into proprietors of land without need of a Mao Tse-tung; nor a proletarian field for Communist propaganda immune from political competition—for they have to reckon in Japan with a strong Socialist party.

Communism was virtually non-existent in Japan in 1945; its original leaders were in prison or exile and nobody has ever claimed that it interfered to any appreciable degree with Japan's war effort. Its postwar achievement as an anti-American force in Japan has been made possible by the toleration which the Americans themselves have extended to it. It has had in its favour the postwar economic distress, the pliancy of newly formed trade unions, the prestige of the Communist victories in China, and the absence of any such national antagonism as Communism incurs in Germany by having to justify the Oder-Neisse Line. As a result, Communism in Japan has a larger proportionate parliamentary strength than in western Germany, but still much less than in France or Italy. Since the last elections, the increased unemployment resulting from the deflationary economic policy of the Yoshida Government may have brought the Communists some new recruits; on the other hand, the arrogant and boorish behaviour of the Communist-indoctrinated prisoners of war recently repatriated from Siberia seems to have produced the worst possible impression on Japanese opinion.

In general, the conclusion must be that there are no signs in Japan of any large-scale desire for liberation from the American yoke by saviours from the mainland of Asia. In so far as the great majority of the Japanese people now have a genuine hope for the future within the non-Communist zone of the world, they may be counted as willing supporters of policies designed to preserve their country from Communist conquest.

NOTES OF THE WEEK

Allocating Marshall Aid

The plain fact about the allocation of next year's Marshall aid is that there is not enough to go round. The original estimates of need, made in Paris earlier in the year, set a total of about \$4,300 million. Working on this basis, the Senate and then the House of Representatives each cut the figure to well below \$4,000 million and it is unlikely that their final figure, when it is at last agreed, will exceed \$3,600 million. Meanwhile, all the estimates of Europe's dollar needs have been knocked into a cocked hat by the fall in world trade which set in after the first quarter of this year. Britain increased its estimates from \$900 million to \$1,500 million. Other nations followed suit. An unofficial report puts western Europe's estimated need for dollar aid as high as \$6,000 million. Congress may vote just about half the sum. Clearly in such a situation it could be foreseen that none of the Marshall nations would emerge satisfied.

In the event, the gloomy forecast has been fulfilled. The technical committee of the OEEC, which included representatives of all the major powers and whose task it was to screen the various nations' requests, has not succeeded in making anybody happy. Most of the nations have already expressed their dissatisfaction, but—inevitably—the British figures and the British protest have received the most publicity. The British request has been cut from \$1,500 million to about \$850 million and Sir Edmund Hall-Patch, the chief British delegate, has denounced the allocation as miserly, refused to accept it and accused the screening committee of discrimination. It is this last charge that carries most dynamite politically. All allocations are miserly compared with the original requests. Getting a quart of aid out of Congress's pint pot makes discontent certain. But discontent is one thing, discrimination another. Have the British, in fact, been subjected to particularly unfavourable treatment?

This matter, together with all other allocations, have now been referred to M. Marjolin, Secretary of the OEEC, and to Baron Snoy, the Belgian chairman of its Council. Both men are neutral, the former as an international civil servant, the latter as the representative of a nation whose allocation was fixed in advance—Belgium received a promise of \$312 million in June. It is to be hoped that they can reach some compromise. Otherwise, the OEEC must confess defeat and hand over the task of allocation to the ECA in Washington. And such a step might well be suicide.

★ ★ ★

Discrimination in the OEEC?

The question whether there has been actual intentional discrimination against Great Britain in the technical committee of the OEEC cannot be finally answered until all the figures are available. Only then can it be established whether the cuts imposed on the British programme were greater in size and less reasonable than those imposed on others. The cut sustained by Britain is punitive, but cuts in other programmes are rumoured to have been almost as great. The British certainly confused the situation by announcing earlier in the year that they could make do with 25 per cent less than last year—about \$950 million—and then only six weeks ago increasing their estimate by about \$500 million; nevertheless, there does seem to be some reason for complaint in the atmosphere in which the British difficulties have been discussed.

In the first place, the Europeans, particularly the French, have not forgotten being lectured by Sir Stafford Cripps last Christmas. In the second, the anti-planners are delighted at evidence that *dirigisme* does not reduce deficits any more rapidly than pure liberalism. The result has been a certain unholy delight

in British troubles and this mood may have induced the Technical Committee to skip its examination of the British programme, to lop it unmercifully without proper consultation with the British delegates or other expert committees and to ignore the peculiar difficulties with which Britain is faced. For instance, although Britain is the largest importer of basic food-stuffs and is therefore most dependent upon them, only in Britain's case did the Technical Committee, apparently, cut the import of bread grains.

Nevertheless, in spite of the mischievous mood of some experts and the understandable indignation of the British, the fact remains that Marshall aid is too little by about \$3 billion and that the gap can only be overcome by a concerted effort on the part of all the Marshall nations; the depressing feature of the Paris talks at present is not the evidence of cuts—they are inevitable—but of a declining desire for genuine political collaboration.

★ ★ ★

Economics at Strasbourg

The debate on Europe's economic plight occupied the main attention of the European Assembly at Strasbourg this week and whatever the political leanings or economic philosophies of the delegates, on one thing they were agreed—the really disastrous state of the European economy. Some wisely pointed to the long-standing causes of the disease. Lord Layton, for instance, was able to call on his vast experience of European economics to remind the Assembly that the causes he put forward in 1927 for Europe's economic decline—world-wide industrial changes, growth in European customs barriers, the emergence of the United States as a creditor and Russia's economic autarky—are all present today in an even more acute form. Other delegates—Mr David Eccles among them—pointed to the deterioration of European conditions over the last year when, in spite of Marshall aid and the need to co-operate against Communism, European currencies were no nearer convertibility, trade barriers no lower, the dollar deficit actually larger than in 1948. "Taken as a whole Europe is going downhill."

So much was not denied by any speaker. Most of them were equally agreed that no nation could find a solution in isolation—British Labour delegates were the exception. One or two of them seemed to believe that full employment could be defended in Britain with or without a maintenance and growth of international trade. But as usual, the diagnosis produced more unanimity than the cure. Scattered through all the delegations were supporters of the creation in Europe of a "single unified market," but they are certainly a minority. More support could be mustered for the belief—fully confirmed from experience by the Benelux delegates—that convertibility of currencies must precede any customs union and that tariff changes amount really to little unless the currency problem is solved first. It is difficult to estimate at this stage the amount of support that can be secured for any proposal that contains more than mere platitudes, but the suggestion that the convertibility of currencies, tariff concessions and a joint attack on the dollar deficit should be Europe's first priorities looks at this moment the most likely proposal to secure general support.

Such projects should, in strict logic, already be far advanced in the Organisation for European Economic Co-operation at Paris. Unfortunately, the OEEC has worked to a great extent as the geographical coincidence of nineteen governmental delegations, not as a single European agency. There is, therefore, likely to be considerable support at Strasbourg for the idea that a permanent Economic Commission of the Assembly should be set up to work with the OEEC and to report to the

Council of Ministers. The European Movement has already secured forty supporters for such a move and it may well be the chief outcome of the Assembly's economic deliberations.

* * *

The TUC's Dilemma

It is unfortunate for the prestige of the TUC that at the very moment when its General Council is exhorting the unions to continue their support of wage stabilisation it should be bickering with the Minister of Labour over his reluctance to implement the proposals of certain Wages Councils for increasing the pay of shop assistants. It is equally unfortunate for the Government that the proposals should have come in the very trades in which the Board of Trade is seeking to enforce price cuts.

The difficulty has arisen because Mr Isaacs, the Treasury having forcibly reminded him of the White Paper on Personal Incomes, delayed giving his authorisation to the proposals of eight retail Wages Councils for raising the minimum rates of workers by about 5s. a week in grocery, drapery, furniture and bookselling. Usually, Ministerial approval for the recommendations of a Wages Council is regarded as a formality, but the Minister is not bound to give his sanction, and it is highly undesirable that any such tradition should grow up. The union concerned protested against the delay, and appealed to the TUC to intervene with the Minister. Having failed with Mr Isaacs, the TUC finally appealed to the Prime Minister to resolve the argument, and, on the wider issue, to assure them that there was no intention of departing from the traditional policy of non-interference with collective bargaining.

The proposed increases in the minima are not in themselves exorbitant, and indeed in many cases workers would already be earning considerably more. The new rates would range from £4 13s. 6d. for male shop assistants in the country to £5 4s. in London, with proportionate increases for women and juveniles. For bookshops the proposed rates would be £5 in the country and £5 10s. in London.

There are probably good humane reasons for these increases—shop assistants since the days of Mr Polly have often been casualties in the battle for a decent standard of living. But any increase now would strengthen the arguments of the retail distributors against a lowering of distributive costs—organised labour cannot demand a lowering of retail prices and a raising of distributive costs at one and the same time. Secondly, wage increases for shop assistants may tend to perpetuate the swollen army of labour in the distributive trades at a time when it is urgent to drive labour out of distribution into more productive work.

* * *

The Communist Bid

The newly-published programme of the Communist Party* would make an admirable (though rather elementary) text for a class in civics, logic, or for that matter English. "Comment," the teacher might invite his pupils, "on the proposition that 'the rise in production and profits, while wages are kept down, is speeding up the growth of unemployment in Britain.' (Current unemployment, 1.2 per cent; last month, 1.5 per cent.) Or 'Britain is being dragged in the wake of an America ruled by millionaires.' (Compare American presidential election results.) Or 'The rich were never better off. The tiny handful of capitalists, landlords and coupon clippers in 1948 received £2,922 million after paying tax; this is 4/5ths of the year's earnings, after tax, of the entire British working class.' (Note non-sequiturs; also inclusion, in the term 'tiny handful,' of the whole body of holders of national savings certificates.)"

* "The Socialist Road for Britain" Communist Party, 16, King St., W.C.2. 31 pages. 6d.

So much for the introductory section; to pursue the same method throughout would be tedious. The party demands an all-round increase in wages, equal pay for equal work, and "full freedom for the unions to enforce their just claims upon employers"—including, presumably (as in the new democracies?) those public boards against which most "just claims" are now outstanding. The unconscionable profits of middlemen must be axed to cheapen retail goods; the Co-ops can play a "vital part" here, though given the general identity of their prices with those charged by private enterprise they must presumably be earning unconscionable dividends. Purchase tax, on all but luxuries, must go, food subsidies be maintained or increased, a capital levy imposed, "big" holders of national debt (including, presumably, friendly societies and trade unions) must suffer a 50 per cent cut in interest, and of course military expenses must be drastically reduced. The beards of nationalised industries must be "purged" and restaffed with workers' nominees subject (like Commissars, perhaps) to recall by the rank and file. Building and building materials, the Merchant Navy, the chemical, engineering and food processing industries, banking and insurance, and the land should all be nationalised. The section on foreign policy can be taken as read. That on the social services outbids both Tories and Labour—which takes some doing—and minor items on the agenda include the abolition of the House of Lords, and votes for all at 18.

One would like to see the budget, in terms either of finance or of manpower, corresponding to the economic sections of this programme—a veritable Niagara out of a pint pot—but, of course, it bears no relation whatever to the policies which a Communist (or fellow-travelling) British Government would have to pursue. No one knows better than its framers that it is merely a piece of pie in the sky.

* * *

Lausanne and the Arab Refugees

It is now a full month since the Israeli and Arab delegations re-met the United Nations Conciliation Commissioners at Lausanne, and the eyes of both the Commissioners and the Israelis are on the clock. There is only another month to go before the Assembly meets. By then, the Commissioners must have a report ready. By then, the Israeli representatives are hoping that the concessions which they have offered in the last four weeks will have produced a settlement. For they have a feeling that if matters are once more referred to the delegates of all nations, the Assembly may try to exact from them the acceptance of more refugees, or the making of more territorial adjustments than they would care to have to suggest to the people of Israel.

It was they who set the ball rolling at Lausanne. As soon as they reassembled after the recess, it was clear that they were endowed with wider powers than they had had in June. They let it be known that, if the Arab delegations would commit themselves—as they had not so far done—to an admission that the Lausanne negotiations were worth continuing in the interests of achieving "final settlement" and a "just and permanent peace," they—the Israelis—were ready to accede to the Arab wish to place the refugee question at the top of the agenda. The Arabs agreed to the condition. Meantime, some progress was being made, in sub-committees, towards agreement on technical questions such as the unfreezing of Arab funds blocked in Israeli banks, the means of salvaging Arab orange groves by the return of workers and managers, and the method of handling the re-entry of Arab women and children wishful of accepting the Israeli offer to re-union families.

On August 2nd the Israelis made a firm offer to re-admit 100,000 of the refugees to Israeli territory, subject to two main conditions. The first was that the offer should be part of a plan for refugee settlement in all surrounding countries. The second was that it should be part, also, of a final peace settlement. Lesser stipulations were that they must, for security reasons, screen the persons re-admitted, and that they must,

as with Jewish immigrants, be entitled to dictate the locality of resettlement.

The representatives of the four neighbouring Arab states, though visibly disappointed at the smallness of the figure (for the great majority of the refugees want to go back to where they used to live) expressed readiness to make a corresponding offer. Lebanon, Syria and Jordan suggested the figure of 100,000 each, and Egypt 125,000 for settlement in the Gaza strip. Settlement of 525,000 would not absorb all the destitute, but it would break the back of the problem. But talk with the Arab delegations at once reveals that, their coffers being empty, their offer is contingent upon payment by someone else for the resettlement schemes. "The land and the goodwill," they say, "will be our share." Thanks to broad generalisations about expenditure upon development in the Middle East uttered this year by President Truman, Mr Trygve Lie and others, they are confident that America will pay. Mr Paul A. Porter, the new American Commissioner, thereupon flew to Washington to inquire what moneys would be available. He returned to Lausanne this week. If he is empty-handed, the outlook is black.

But even if the money is forthcoming, all barriers to settlement are not down. Mr Ben Gurion, when he announced the offer to take in 100,000 Arabs to the Israeli Knesset (parliament), met with a degree of opposition that is said to have surprised him. Both left and right were against him. He admitted that the offer had been made under pressure from the United States Government. The murmurs grew, and Dr Sneh, the former head of Haganah, walked out. He explained that the figure would include 25,000 Arabs who had already returned, and perhaps a further 15,000 wives and children already scheduled to rejoin the heads of their families. These parings of the figure are unlikely to satisfy the Arab delegates, who are encountering a like volume of criticism from their home parliaments and publics. Even if adequate funds for resettlement are forthcoming, therefore, the Commissioners still have a long job ahead.

* * *

Arab League Prospects

The Commissioners are not the only people in the doldrums. The Arab League shares their plight. Its political committee was due to meet on August 20th. But the Syrian *coup d'état* upset the plan. The postponed meeting will now take place on August 30th. Marshall Zaim's death will remove one contentious item from its agenda, for his very existence created a deep rift between its Hashimite members—Iraq and Jordan—who hated him, and their rivals, the Egyptians and Saudi Arabians, with whom his relations were good. Nevertheless, there remain several sources of internal friction. One is the Lausanne negotiations; another is an Iraqi proposal that the League's whole charter shall be revised, the purpose being to reduce Egyptian preponderance in its affairs. A third is the prevailing conviction that heads must be made to roll over Palestine. In preparation for this scene, it is said, Assam Pasha, Secretary-General of the League, has already drafted his resignation.

Will the League dissolve into its component parts—one Asiatic, and interested chiefly in a greater Syria of some kind, and one African, more concerned with the Sudan and Libya—or will it find some material with which to patch its cracking fabric? There is one topic only that will serve it for patching purposes, and that is criticism of great Power tutelage of Islamic peoples. The targets for attack are getting fewer, but two still remain. One is the United Nations Assembly's handling of Tripolitania; the other is France, for its treatment of nationalism in French North Africa.

Undoubtedly, there will be capital to be made out of the Tripolitanian situation. As is well known, the British have always favoured Libyan independence after a few years of someone's trusteeship and the French have always opposed it

because of its political repercussions upon their adjoining Moslem dependencies. Out of respect for French and Italian feelings, the Anglo-American partnership has devised several compromises that do not please the Arabs. The latest, it is said, is an agreement that, subject to French retention of the Fezzan, the rest of Libya shall become a federation moving towards independence under British administration and under the "permanent" supervision of a five Power board of guardians. Here is one topic on which Arab unity can be anticipated.

*

It is, for the present, a better one than is sponsorship of the French North African nationalists. For these are out of luck. They were in the ascendant during the first years after the war, when to France's uncertainty over the shape of the French Union was added a disastrous five-year succession of droughts—that of 1945 being the worst the area had known since 1856. Today the scene has changed. Their territories are participating in France's economic recovery. Some of them have served on the new assemblies and councils that the French have devised in order to increase local self government, and they are therefore more divided than they were. Lastly, they are not at one between themselves, since Algeria and Tunisia resent Morocco's assumption that it is—as it were—the Egypt of the west. On balance, therefore, the outlook for next week's Arab League meeting is not bright. The agenda contains more doses than pick-me-ups.

* * *

Imports into the United States

The preliminaries for the Washington financial talks have been marked by much sound advice from Americans to Europeans to fill the dollar gap, not by cutting dollar imports, but by the much more desirable alternative of expanding their exports to the United States. The point will be well taken on this side of the Atlantic. But it may be desirable to remind the Americans that the two-way expansion of trade for which they plead depends on their readiness to receive imports as much as on the capacity of European countries to deliver the goods on competitive terms. Mr Hoffman was guilty of some disingenuousness when, in a recent reiteration of this very sound piece of advice, he pointed out that the American tariff was now no higher than in 1914 and suggested by implication that the tariff provided no bar to the expansion of exports to the United States. It is true that the United States has remedied some of the absurdities of the Hawley-Smoot tariff and has in general reduced the level of import duties approximately to that which prevailed in 1914. But in 1914 the United States was probably the most highly protected country in the world, and today its tariffs are absurdly high, given the position of the United States as the world's greatest exporting and creditor power. A few examples taken at random from the US tariff schedule will suffice. The US rate of duty on imports of machinery is in general 12½ per cent and rises to 40 per cent in certain cases such as textile machinery. On bicycles the duty ranges from 15 to 30 per cent; on clocks the specific duties are equivalent in some cases to *ad valorem* rates of over 200 per cent. Cutlery pays 25 to 35 per cent, glass up to 40 per cent, boots and shoes 20 per cent, hosiery 50 per cent, Wilton carpets 30 per cent, blankets 30 cents per lb. plus 30 per cent *ad valorem* duty.

Superimposed on these high duties is the fact that the American tariff is operated with a perverseness and within the context of a set of regulations which are obviously imbued with a traditional hostility to imports left as a relic from the days of America's high protectionism. Beyond this there are all the restrictions which the United States still places on various types of foreign enterprise attempting to operate in its territory, of which shipping is the most notorious. Everyone

Letters to the Editor

Currency Unions

SIR,—After reading the article in your issue of August 20th under the title "Currency Unions" I am left with the feeling that if one pursues the interesting lines of thought which you open up, one is forced to the conclusion that a discussion of currency union alone is an unreal one, in that such a union without Federal Union would be, if anything, worse than the present state of affairs.

You state, quite rightly, that, after currency union, the redemption of British Government securities at maturity could no longer be regarded as a certainty. I submit that this deficiency, which would represent a very grave and impossible state of affairs, involving the British Government in apparent responsibility without authority, could be repaired if the present obligations of the British Government were assumed by the new authority which would be responsible for the creation of the common US-British currency. This authority would presumably, however, decline to assume such obligations without corresponding powers to determine the method and extent of British taxation.

Your comments regarding the Southern States of the American Union would be equally valid in relation to the hypothetical currency union if this was accompanied by a budgetary union. Budgetary union would not be acceptable, especially to the wealthier partner, without agreement on levels of taxation, general fiscal policy and the desirability or otherwise of the welfare state, agreement in fact on the widest issues of economic and social policy.

Thus, on two counts, budgetary union flows as a consequence of workable currency union.

Given this budgetary union the position would be that this country would, through fiscal channels, receive the equivalent of Marshall Aid, as of right and automatically together (probably) with a complete absence of US tariff walls, in exchange for the granting to a body containing a majority of US members the right to determine our economic and social policy.

I submit that the British people should not be asked to consider currency union as an aid to the solution of their present problems without realising that it is really a half-way solution that produces as many problems as it eliminates. To go the full distance and accept Federal Union as the basis of thought and discussion produces fewer economic difficulties in relation to those which it solves. But is this country or the United States prepared to contemplate Federal Union seriously at the present time? I think not.—Yours faithfully,

57a, Howard's Lane,
London, S.W.15

K. MUIR MCKELVEY

Democracy in West Africa

SIR,—There is a feeling in certain quarters in England that the spread of education in Africa, especially in the Gold Coast, will lead to the creation of a class of frustrated African who will "become the breeding-ground of unrest and subversion," and a reversion to patriarchal government is advocated as a means of avoiding Communism. This feeling may be sincere, but it cannot fail to rouse annoyance in the hearts of most Gold Coasters. First, Africans are treated as children without any discrimination; secondly, they are presumed to have no right of self-determination; and, thirdly, their

eventual emancipation is considered to be solely in the hands of Britain.

Arguments based on the African being "child-like" may be dismissed summarily. The Watson Commission, which was appointed by the Colonial Office to inquire into the riots of 1948, found the average Gold Coaster to be endowed with a "fund of common-sense." They also found that, by past custom democratic, the African here has always been able to influence administration in his native state and see that his will has prevailed. By peaceful removal from office of those who have failed to carry out the duties of state or who have been unprogressive, he has been able to maintain the elasticity of the communal will, forcefulness of communal expression and communal initiative in development. The system fosters equality among men, respects the rights of the individual and places responsibility on the voice of collective opinion. This surely is democracy as it exists anywhere else. But patriarchy, where a head governs a family or group of families by paternal right and is in power for all time unless he is removed by force, grants to the individual citizen, or collection of citizens, none of the rights and obligations enumerated above.

As the Watson Commission discovered, the elements of democratic government are present in the Gold Coast, and they need to be developed to fit the accelerated evolution of society and the economic changes which call for more initiative from the individual and impose heavier responsibility on him. The Commission's recommendations for constitutional reform were made the terms of reference of the all-African Committee which has just concluded its report on them. This has not yet been published, but it is clear that it will have no room for the retention of tribal conclaves either in local or central government. Patriarchy can play no part in progressive national development, and any attempt to introduce it, or pretend that it has ever existed, is futile and rouses considerable doubts on the good faith of Great Britain. The belief that patriarchal government is the opposite of Communism is not true. There is much in common, for in both cases direction of effort and distribution of remuneration or reward is controlled by a "head," be this a single person or a committee. The African family system is "communalism" as distinct from "communism." "Communalism" is the social custom under which the stronger members of each family or families help the weaker; it is an element of the democratic framework, inasmuch as it implies willingness to help another. There may be a certain amount of "communism" in a Communist state, but there cannot be any Communism in a family.

What Gold Coast Africans want is an enlargement of the accepted political system in which they can be skilfully guided to build up fully representative social and political institutions capable of assimilating the varied elements in their country; a system which enables the expansion of the democratic way of life and gives free play to the citizen with a genuine sense of civic responsibility.

These requirements are very real. For too long the Gold Coast African has been held in check by artificial barriers and fears of arbitrary repercussions. Enterprise and initiative have been hedged about by economic conditions, mainly propelled by "foreign" firms, over which he has little control. He now feels that these forces can be controlled under a government of his own making.—Yours faithfully,

Accra, Gold Coast

J. E. S. DE GRAFT-HAYFORD

Profits

SIR,—The article "Are Profits Too High?" in *The Economist* of August 6th demonstrates that profits in general are not too high when it is borne in mind that they are the source from which industry has "to try and keep its productive capital in good condition, to maintain its stocks and to set something aside, if possible, for further expansion." In view, however, of the illuminating articles on the subject

that have appeared in your columns from time to time, it is disappointing that no reference is made to the inadequacy, in a period of inflation, of the conventional accounting methods on which this conclusion is based.

From the standpoint of "economic reality," the ratio of earnings to capital invested is surely overstated in at least three directions—viz.:—

(1) Net assets are seriously understated in terms of monetary units of current value. (You rightly point out the fallacy of relating earnings to the nominal capital, but you appear to overlook or ignore the fact that in comparing earnings stated in current £'s with what you call the "real equity," you are not comparing like with like.)

(2) Net earnings are generally arrived at before proper provision has been made for the maintenance of productive capacity. (To achieve this, approximately, fixed assets would have to be re-stated in current £'s for the purpose of computing depreciation.)

(3) In many cases an appreciable proportion of published profits in the last year or two merely reflects a rise in the cost of raw materials and does not represent any addition to physical resources.

Unfortunately, the information at our disposal does not permit the determination of the "economic reality"; since, however, as you rightly stated a few months ago, "there is more misconception and downright prejudice about profits than any other economic question," it is, I suggest, dangerously misleading to use, without qualification, such terms as "net worth," "true earnings" and "real equity" in relation to an edifice erected on crazy foundations.—Yours faithfully,

E. L. WRIGHT

22, Shakespeare Road, Bedford

SIR,—In your excellent article, "Are Profits Too High?" there is one point which I am sure must have puzzled many of your readers besides myself.

You say that the 2,608 companies "set aside £131.7 million for depreciation, as they were entitled to do under the income tax Acts," and later you refer to "additional provisions for depreciation beyond the amounts allowed by the tax authorities" as being included in "other charges and provisions."

I suggest that such additional provisions will, for the most part, be included in the depreciation item of £131.7 million. The Income Tax Acts do not state how much depreciation a company is entitled to write off in its accounts. The Companies Acts, of course, require adequate provision for depreciation; but for this purpose the amounts allowed for tax purposes would normally be quite inappropriate—if only for the fact that certain assets, e.g., non-industrial buildings, receive no tax allowance at all.—Yours faithfully,

St. James Road, Purley, Surrey

M. G. SPRIGGS

The Nation's Ill Health

SIR,—You quote, page 392 in your issue of August 20, with apparent approval, the view of the Chief Medical Officer of the Post Office, that

if a man is happy at a job, has a team spirit with his mates . . . he works off many of his ailments and is usually none the worse for it . . .

A few lines later you go on to say that

the only effective means of restraining people from escaping into sick absence is through their pockets.

Your picture of Economic Man may be correct (though no one working on the human problems of industry would agree with you), but hardly your logic.—Yours faithfully,

PHYSICIAN.

["Physician's" logic may be correct, but hardly his judgment of what is practicable. The most ardent practitioner of social medicine would surely not contend that every scrimshanker who, to continue the quotation from the Chief Medical Officer, "just can't adjust himself to essential disciplines," can be turned into the Happy Worker.—EDITOR.]

We help to make colours brighter

WE CLAIM the credit for the bright colours of such things as lacquer and linoleum, plastics and printing inks. That's because we make lithopone.

Lithopone is a most widely used white pigment, and white pigments are the most important of all pigments. For they're the base, the 'body' that makes white paint white and opaque, and makes brilliant colours possible in paints and many other materials.

Our illustration shows an early stage in the production of ORR'S ZINC WHITE LITHOPONE at our Widnes works—the roasting of one of the raw materials in a revolving furnace.

Besides lithopone and other zinc pigments, our products include zinc metal and alloys, zinc dust, cadmium, metallic arsenic, sulphuric acid, catalysts, fungicides and fluorides: all basic materials for Britain's home and export trade.

India, Pakistan and the West

"India, Pakistan and the West." By T. P. Spear. Home University Library. Oxford University Press. 232 pages. 5s.

DR SPEAR's interest is in the impact of western civilisation on the Hindu and Muslim way of life. He realises that the greatest conflict in India and Pakistan is a conflict in men's minds; a conflict which has to be resolved by each educated person for, and to a large extent by, himself. Hinduism and Islam have in the past been challenged by heresies and by each other. But the heresies, even Buddhism, challenged details rather than the basic outlook; and although there has been a considerable amount of conversion from Hinduism to Islam, at no stage did the two religions influence each other very much.

Western ideas, by contrast, have made no direct converts, but they have sapped the very basis of traditional belief. Western idealism abhors untouchability, so the modern Hindu proves that untouchability is no part of true Hinduism. The west believes in the equality of women; so the modern Muslim proves that purdah is not in the Koran.

Since in India and Pakistan religion has provided the rules for the whole of life, the change in the educated man's interpretation of his religion means a change in the whole conduct of his life. But both the urgency with which this change is being effected and the break with the past which it entails are much greater for the Hindu than for the Muslim. The Muslim's religion has the same basis in the Bible as Christianity, and an emphasis on the brotherhood of all believers which fits in easily enough with western ideas of democracy. The adaptations he has to make are quite minor—the acceptance of the taking of interest or the abolition of polygamy.

For the Hindu it is more difficult. For him this life is but one in a chain of lives. The position into which a man is born is the inevitable result of behaviour in a previous life; the eventual reward is re-absorption into the godhead, and to attain that reward he must free himself of all desire. Into such concepts caste fits more easily than equality, asceticism more easily than the western emphasis on hard work, thrift and material incentive. The difference between Gandhi's philosophy and Henry Ford's was no accident. The Hindu educated classes who have themselves absorbed to so astounding an extent western standards of values, have now to synthesise them with traditional ideas for the half-educated and the uneducated. If the Hindu has thus the harder task, he has also so far made the greater effort, partly because he took to western education more quickly than the Muslim, partly because he did not need to use his religion as a symbol of his difference from the majority as did the Muslims when they were a minority in United India. It is the foundation of Pakistan which has at last brought the Muslim up against the problem of reconciling his traditional outlook with the needs of a modern State.

Dr Spear's discussion of this key problem is the best which has so far appeared in English, though it may be doubted whether he does not over-estimate the strength and vitality of traditional Hinduism. One other, and rather rare, gift his book displays in full measure. His descriptive passages catch to perfection that special sight and smell and feel of India, which those who have once been there will never forget.

Proto-Money

"A Survey of Primitive Money." By A. Hingston Quiggin. Methuen. 344 pages + 32 plates. 45s.

It is only a few months since the publication of Dr Paul Einzig's study of primitive money, an economist's venture

into the anthropological field; and here is another, more ambitiously conceived and executed, work on the same theme, whose author approaches the frontier from the other side as an ethnologist with a curiosity about economics. Dr Einzig was concerned with the fundamental assumptions of monetary theory and with the light cast on them by primitive monetary arrangements; Mrs Quiggin's interest is more in the users of primitive money, in the customs, the trade routes and migrations, the racial beliefs which can be deduced from the study of their "currency." Her "Survey" is profusely illustrated. Cowries and aggrs beads, "coppers" and dogs' teeth, mats, feathers, squirrel skins and the stones of Yap appear in photographs and drawings, black-and-white and full colour, offering an unparalleled treasure to the student.

From the characteristics of these "currencies" and from what is known of their use (there are gaps and contradictions in the information available) Mrs Quiggin reaches conclusions reassuringly consonant with those of Dr Einzig. "The evidence," she writes, "suggests that barter—in its usual sense of exchange of commodities—was not the main factor in the evolution of money. The objects commonly exchanged in barter do not develop naturally into money and the more important objects used as money seldom appear in ordinary everyday barter. Moreover, the inconveniences of barter do not disturb simple societies." Money appears to enter the economic system, as it were, from the outside, beginning its career as an adjunct to religion, to marriage rites, to legal and social procedures; serving originally as bride-price, as ransom, as ceremonial gift, or as pure means of ostentation, and only later, in more developed societies and particularly under the impact of external trade needs, filling its modern role of universal means of exchange. Money meant power and status long before it meant comfort and good living.

One should be able to find some moral in this for the modern world; less ambitiously, one may draw attention to the beliefs of the Yoruk Indians of the Pacific coast. "Saying a thing with sufficient intensity and frequency was a means towards bringing it about." A man often kept calling "I want to be rich" or "I wish for *deutalia*," perhaps weeping at the same time. . . . Considering how remarkably similar is the British approach to the dollar problem, it is pleasant to record that the authority quoted concludes "The practical efficacy of the custom is unquestionable."

Lessons from Experience

"The Building of Satellite Towns." By C. S. Purdom. Dent. 532 pages. 50s.

FIRST published in 1925 and now rewritten, this book contains detailed records of the development of the two garden cities, Letchworth and Welwyn, preceded by a sketch of the history of the principles they embody, and followed by a study of the application of their experience to the new towns of the future. Beautifully printed, illustrated by a wealth of pictures and plans, and copiously indexed, the book is a valuable collection of material for students of the notable achievements it describes. Mr Purdom saw the inside working of the Letchworth company, as its accountant, for the first dozen years and of Welwyn as its finance director from 1920 to 1928. If his history is at times coloured by personal bias, it has the authenticity of personal contact with events.

The practical utility of the book, however, is lamed by a lax and wordy style. Its structure involves triple, sometimes quadruple, reference to each element of town building, and the author is often hard put to it to think of different ways of saying the same thing. Despite its apparent exhaustiveness, many things a town-developer will want to know are not

discoverable, and there are some serious inconsistencies. For example, though pages of figures are given, there is no clear analysis of the expenditure of the two companies as between land, land development, houses, other buildings, administrative overheads, and interest. Tables of revenue do not show whether administrative costs have been deducted or not, Mr Purdom criticises both companies because at different periods they did not capitalise interest and administrative charges; but he gives no estimate of the year-by-year appreciation of values that alone could justify such a course. For another example, he is vague and inconsistent in his figures of neighbourhood and overall town density—a vital matter in determining sites for new towns.

In seizing on shopping and commercial values as one of the keys to new-town finance, Mr Purdom is clearly right. But he puts rather much emphasis on the Welwyn expedient of a departmental store run by the estate company, seeing that he considers it unlikely to be practicable in state-financed towns. And though he mistakenly classes Henry George as a land-nationaliser, he follows him in an exaggerated view as to the revenues derivable from land rent. He implies that, by the skillful conservation of land values, a new town could pay for public buildings and communal facilities on a scale hitherto undreamed of—a hope not supported by the fact that the total rateable value of property in this country (including buildings) is about £8 a head per annum. The economic basis of the garden city is that an ultimate "rent" of the order of £2 to £4 a head per annum could be diverted from inert landowners to pay for the process of planning. The social benefit is thus the amenity and efficiency produced by considered development rather than a capital surplus. A subsidy to new towns may also be justified by the even greater cost of any other form of urban development or re-development. But either the increment or a subsidy might be dissipated in extravagant overheads, and this is the real danger facing the New Town Corporations. On this crucial point Mr Purdom is very unsatisfactory. He quotes £15,000 a year as the administrative cost of Welwyn before the war. No one would quarrel with that. But for each new town he wants fifteen highly paid executives in parallel, each with a department, as well as a director-general and a well-paid board. If at a sufficiently high speed of development a town of 50,000 or so could carry such an overhead, no figures are given to support that view. In this and in other respects the final section of the book has an apocalyptic flavour surprising after the attention given to business details in the earlier sections.

A Scot at Uncle Sam's Court

"Of True Experience." By Sir Gerald Campbell. GCMG. Hutchinson. 183 pages. 18s.

AMERICANS, even today, often have a preconceived notion of what the British are like, and are disappointed if a representative of Britain does not live up to their expectations. Perhaps that explains Sir Gerald Campbell's popularity as a British spokesman in the United States in the years between the wars and during the second war, when thousands of Americans heard him speak all across the country from Philadelphia, where he began his consular work in America, to San Francisco, where he continued it, and back to New York and Washington, where it ended. From his book, partly an account of his career, partly his rather meandering conclusions on America, Britain and the future, Sir Gerald appears as that mixture of naïveté and hard-headedness, discursiveness and one-track-mindedness, which many consider typically British.

Sir Gerald is, of course, a Scot, and this, with its natural accompaniment of a love of golf and its less natural one of being a good mixer, must have had much to do with his success in getting to know, and to be liked by, Americans. His conversations and his speeches presumably did not suffer as much as does his book from what he calls his "disconcertingly disjointed style," but which others would call no style at all.

Involved and ungrammatical sentences, frequent overapt quotations, a mixture of flowery language and unsuitable slang (which he blames rather unfairly on his years in America), all make it somewhat unsatisfactory reading. But out of it there emerges an honest and a modest man, an idealist and a servant of his country, who has worked hard over many years to cement what he believes to be the natural alliance between Britain and America.

Shorter Notices

"The Use and Abuse of Statistics." By F. R. E. Mauldon. The University of Western Australia Text Books Board. 129 pages. 8s. 6d.

ORIGINATING from a series of popular broadcasts sixteen years ago, Professor Mauldon's statistical child has been groomed to adult stature in this third edition, which tells something, but not a great deal, of Australian statistics in the war and postwar periods. In such a small book it has evidently not been possible to cover the bare bones of the Commonwealth's statistical framework with more than a modicum of solid flesh, so that the reader may suffer many jolts before the end. Australia's development of national income statistics, quarterly business surveys and statistics of new capital expenditure by industries, mark the country's big strides in recent years towards a full statistical background to its economy. Professor Mauldon's close touch with this development places him in an ideal position to depict its limitations.

"Russell on Arbitration." Fourteenth Edition. By Ernest Wetton. Stevens. 510 pages. 70s.

THE first edition of this book was published exactly a century ago. Since then it has been revised by eight different hands—the last edition being in 1935. It is a classic book on the Law of arbitration, dealing with both case law and statute.

"The South African Financial Year Book 1949." Edited by E. Landsberg, D.Econ. R. Beerman, Cape Town. Thomas Skinner & Co., Ltd., (London Agent). 1,456 pages. 50s.

THE 1949 edition of this invaluable reference book to some 1,000 companies in Southern Africa and to existing Government and financial practice in this wide area, incorporates for the first time an alphabetical index of the directors of companies.

"Modern Political Constitutions." By C. F. Strong. Third Edition. Sidgwick and Jackson. 383 pages. 25s.

THIS new edition of Dr Strong's work on modern constitutions, first published in 1930, is timely and welcome. Much rewriting and revision have been made necessary by the changes for which the war has been responsible, and Dr Strong has striven valiantly to record them all, to analyse their significance and to fit them into a coherent pattern. It is the measure of Dr Strong's achievement, that while taking the postwar experiments in national and international constitutional government into full account, he never loses his grip on realities or gets lost in a welter of detail. As a result there is to be derived from his compact survey not only the facts, but also a sense of the direction in which modern constitutional thought is moving.

"Statistical Year Book of Finance and Economy of Japan." Ministry of Finance and Bank of Japan. 847 pages, and "Japanese Year Book, 1946-48." Foreign Affairs Association of Japan. 900 pages. No prices given.

TWO substantial and reliable reference works on Japan have now made their appearance. The first is the Japanese Year Book, 1946-48, published by the Foreign Affairs Association of Japan. It includes facts and figures on all phases of Japanese life and includes useful documentary material on Allied policy toward Japan since the end of the war. The second volume is the Statistical Year Book of Finance and Economy of Japan, 1948, issued jointly by the Ministry of Finance and the Bank of Japan. Very complete statistics are given for the period before and during the war, but after 1946 the information is still sketchy. It is written in Japanese with an English translation.

"The Law for Printers and Publishers." By Brett Cloutman, KC and F. W. Luck. Edited by E. H. Hale. Staples. 340 pages. 30s.

THE first edition of this book was published in 1929. A number of important changes in the law have taken place since and these have been incorporated in the new edition. It is a valuable book of reference, not only for printers and publishers, but for authors and all who may be concerned with questions relating to copyright, libel and defamation in the written word.

authority, it has thus far laid down no roads on its own account except in places under Federal jurisdiction such as the District of Columbia or the National Parks.

The United States now boasts 3,009,000 miles of road, half of it surfaced, and 317,000 miles in cities, of which most is concrete. In some sections the roads are spectacularly good, in others they are surprisingly poor. Britons often remark that the small English roads are much better than their American equivalents. Most Americans take the goodness for granted and deplore the badness as an instance of governmental inefficiency, forgetting that the existence of good roads represents an industrial miracle.

*

Unlike Great Britain and France, the United States had no heritage of roads laid down by a Julius Caesar or a Napoleon. The people who flowed across the country and settled the greater part of it in the nineteenth century had only rivers, Indian trails, and the rumours of riches ahead to guide their wagons. Beyond the well-developed eastern seaboard the railways, driven across the empty land in the wake of wagon trails, served the needs of the new settlers, but their building absorbed the brains and the venture capital that had just begun to build stone roads for the convenience of horse-drawn traffic; as a result these roads were neglected for more than half a century.

The present American highway system came into existence largely by way of the motor car. Magazine files and private photograph albums are filled with pictures of what the country roads looked like when motor cars first ventured beyond city limits. The farmer who charged high prices

for pulling cars out of the mud with his team of stout horses had long been pulling his produce to market through the same mud.

The motor car forced modern road building on a large scale, set its standards, furnished the power and the machines that made it possible. And this the motor car did, not as the railways had done, by forming private companies to secure government lands for their tracks, but by direct pressure on local, State and Federal governments for the building of roads that everyone might use without buying a ticket. One of its strongest arguments was that it furnished the funds for constructing those roads—first through registration fees and then by petrol taxes. No previous methods of transportation had been so accommodating. These State imposts on road users now pay 60 per cent of highway costs, and in 1947 they amounted to \$1,800 million. The other 40 per cent comes from local property taxes, and from Federal funds supplied

to States. But once the maintenance of existing roads has been provided for, very little remains to pay for new highways, which may cost as much as \$1,000,000 a mile, even outside the cities.

If the miracle of the American highway was produced for the machine, it was also, after a slow start, produced by the machine. Throughout the whole country only 327,000 men are required to keep these three million miles of road in order. None of them sit by the roadside cracking stones to small bits for the filling of small holes in the European manner, or sweeping gutters clean with a twig broom. Highways might be neater if they did, and the small roads more parklike, but there would not be so many miles of them. The human labour of these men is multiplied many times by the almost equal number of machines they operate (one equipment unit per 24 miles is a good average)—the diesel-powered dozers, mixers, rollers, sweepers, spreaders of concrete, of road metal, of bituminous binders mixed according to laboratory formula. Science has to a large extent taken the guesswork out of road-building and, if surfaces do not wear as expected, it is not because their builders were tied to tradition.

In 1912, when the Federal government first offered aid to the States, engineers were sent to Europe to find out how the then best highways in the world were built. In 1948 the Public Roads Administration returned the compliment by inviting road engineers from Europe and the other continents to see how American highway practice had developed. Fifty-five of them arrived in May this year, and they are seeing big roads and little ones, clover-leaf entrances and railroad level-crossings not yet eliminated, machines building the New York Thruway (486 miles of six-lane express highway between New York City and Buffalo, with hardly a road intersection or a traffic light) and machines painting white lines down the middle of a lane to make it safer. It is also to be hoped that they will learn that highway science in the United States has far outstripped the ability of cities to provide space for their motor population. The forty million motor cars in the United States (one for every 3.6 persons) travel at an average speed of 49 miles an hour on roads, but when they get to cities they bog down and turn streets into a mechanical morass. Thus far neither engineers, politicians, economists nor city planners have solved that problem.

American Notes

Arms on Approval?

The Atlantic Pact was declared in force this week, but the programme of military assistance to its signatories has already run into the long expected Congressional storm. This blew up, however, from the unexpected quarter of the House of Representatives, which, by cutting a two-year programme down to one, showed how threadbare the sails of the bipartisan foreign policy are becoming. All the funds requested for assistance to nations outside the Pact were authorised, to a total (including \$50 million already authorised) of \$289 million. But under the leadership of a rebellious Democrat, and with the votes of most Republicans, the cash authorisation for western Europe for the first year was cut by \$75 million, while authorisations for contracts of over \$500 million, to be placed this year and paid for out of next year's budget, were eliminated altogether. (Appropriation must come later, probably after a loan from the Reconstruction Finance Corporation has set the programme in motion.)

The rebels, in some cases, may have wished merely to take the credit for an economy, the severity of which they thought the Senate could be relied upon to soften. They are full of

assurances that, if the programme goes to the satisfaction of Congress, the rest of the money can be authorised later. Both the House and the Senate committees now drawing up their recommendations have provided, however, that the programme may be brought to an end at any time by concurrent resolution of both Houses, as well as at the discretion of the President. And there is a clear disposition (arising from suspicions that economic unification in Europe under the Marshall plan might have gone much faster) to adopt the arms plan only on approval, to insist on the right to take a "second look" and to require western Europe to produce a convincing defence plan before Congress embarks on another costly venture of uncertain duration. This view is disputed by the State Department, which believes that the co-operation of the Brussels powers provides both an adequate foundation and an assurance that military aid will accomplish its ends.

Both the President and Senator Connolly have urged the Senate not to concur in reducing funds which the Chiefs of Staff have called an "absolute minimum." There are however, in the Senate, in addition to Senator Vandenberg and Senator Duiles, who propose a token cut of \$161 million, a number of thrifty Democrats who have taken heart from the modest proposals of the House. Even if the Senate proves more generous, or far-sighted, than the House over military aid, the deadlock in conference over Marshall money suggests it may not be easy to reconcile the two Bills. Over ECA, the stubborn refusal of the House to approve funds for a watchdog committee, which it considers little more than a private patronage pool of Senator McCarran, seems to have blocked even discussion of the major money difference. And the immediate pressure for a settlement has been relaxed by the adoption of yet a third stop-gap spending authorisation for ECA and government departments suspended in financial limbo by the Senate's tardiness.

* * *

Mr Hoover's Monument

Congress is acting on the blueprint for government reorganisation furnished by the Hoover Commission—thanks, in great part, to the harsh necessity of an all-summer session—with a speed which seemed highly unlikely last June. Efficiency's latest victory is the acceptance of six of the seven reorganisation plans submitted by the President. Four, in the absence of any opposition, became effective on August 19th, when the 60-day waiting period expired. Of the two brought to a successful vote in the Senate, one transferred the Bureau of Employment Security to the Department of Labour, which was stripped of so many of its functions when the Republicans held Congress as to become only a shadow of its former self.

The Republican opposition to this transfer was based on the fear that the Department's influence on State compensation systems would run counter to the interests of management. Somewhat similar suspicions accounted for the defeat of the first plan, which would have created a Department of Welfare in place of the Federal Security Agency, which administers health, education, and social security programmes. The creation of a Welfare Department was originally proposed by no greater a radical than President Harding; and the opposition, made up of 23 Democrats and 37 Republicans, was at pains to claim that the defeat was no repudiation of Mr Hoover's work, but demonstrated a loyalty to it exceeding even his own. He had given a cautious and qualified endorsement to the Administration's plan, although it failed to provide for the independent United Medical Administration which the Hoover Commission had recommended to eliminate present overlapping, competition, and duplication in government health services. *Plus royaliste que le roi*, Senator Taft suggested that Mr Hoover had been misled into acquiescence by an Administration determined to accept the Hoover prescriptions when they taste sweet, and reject them when nasty, however wholesome.

The chief factor in the defeat of the plan was, however, the

suspicion that the transfer of the Public Health Service to the Department of Welfare, where it probably would continue under the control of Mr Oscar Ewing, now Federal Security Administrator, would constitute an opening wedge for "socialised medicine." That is one term for the federal health insurance scheme of which Mr Ewing is so strong a supporter and the American Medical Association so fanatical an opponent. The AMA's successful lobbying is given much of the credit—or blame—for the Administration's defeat, though it was also feared, probably with some justice, that once the Health Service was incorporated in the Department of Welfare, it would prove almost impossible to persuade the Department to relinquish its hold to a United Medical Administration.

Several of the Hoover recommendations yet to be implemented suggest transfers of powers likely to arouse quite as much antagonism, such as that of raiding the Army Engineers to consolidate all reclamation projects in the Department of the Interior. Thus, although Mr Hoover's most enduring monument already includes the reorganisation of the State Department, defence unification, and the consolidation of government housekeeping functions, further construction may prove much slower.

* * *

Money for Jam

When the Voice of America, the State Department's overseas information service, could be heard clearly, Congress kept it small by starving it of funds. Now that for nearly four months the USSR has been justifying the Voice's existence by extravagant and unflagging efforts to keep Russians, and occasionally Hungarians, Greeks and Chinese, from hearing it, the House of Representatives has rushed to reward the Voice with a bonus of \$11.5 million, which is more than the original appropriation for overseas broadcasting this year. The money, if approved by the Senate, will buy more and better American wireless transmitters, which should at least "strain the Russian jamming system"; as long as the Soviet barrage goes on, there seems little hope of reaching Russian ears except with an occasional sentence, moving from wavelength to wavelength a few words in advance of the jammers, or a hardly intelligible shout against a background of whistles and airplane engines. Not even "cuddling" the Soviet domestic wavelengths has been successful, since the jammers would rather drown their own voices than permit the Voice to be heard.

A victim of censorship abroad, American radio is now threatened with what the industry insists is censorship at home. The Federal Communications Commission has just announced, after more than a year's consideration, that after October 1st it will refuse to renew the licence of any wireless station broadcasting a programme in which prizes can be won by "lot or chance." The FCC considers that such programmes fall under the ban on lotteries in the US Criminal Code. The radio industry contends that, if this is the case, it is a matter for the Department of Justice and that the FCC is not only exceeding its powers but making an attempt to control wireless programmes.

The industry's determination to nip this attempt in the bud is encouraged by the fact that it means the end of "give-away" programmes. In these, listeners, as well as the studio audience, by "Spinning to Win" or by "Singing it Again," have been able to win prizes which in one recent case amounted to \$52,000, half in cash, half in goods which often resemble white elephants. There are 38 give-away programmes now on the national networks and hundreds on local stations, bringing the radio industry an annual income of \$10 million. This is far from a negligible sum, especially when advertising revenue is falling and television costs are rising; it explains why the wireless stations are so anxious to give their listeners money for jam.

Shortage of funds has made the advertising of spirits seem

less reprehensible to the radio industry, which has traditionally been a total abstainer on the air. An experimental programme is now being considered, in which a distiller may be allowed to point out the merits of savings bonds—at midnight when the children are in bed. The FCC does not consider that it has authority to forbid alcoholic advertising, since it agrees that in this case such a veto would amount to censorship.

* * *

Patchwork in the North-east

Even though America's economic fabric is looking brighter, for the moment at least, there are still holes in it, places where serious unemployment seems to be becoming permanent. Plans for mending these holes have been in preparation for some weeks and the President's adviser, Dr John Steelman, has now asked the ten chief government spending agencies—the Department of Defence, the Economic Co-operation Administration and so on—to shift their procurement activities, whenever possible, to the eleven areas which are in most urgent need of repair; other smaller ones will probably soon be added to the list. These are all places where twelve per cent, or more, of the labour force is out of work, compared with a national average of less than six per cent. All but two of the places involved—Knoxville, Tennessee, and

DEPRESSED AREAS IN THE NORTH-EAST

Muskegon, Michigan—are in the north-eastern corner of the United States and six of them are in New England.

This is not surprising, since the proportion of manufacturing to total employment in the north-east is well above the national average and the recent steady increase in unemployment, which in July exceeded 4,000,000 for the first time in seven years, is largely explained by the decline in non-farm employment (2,400,000 over the last year). The chief industries in the eleven depressed areas are consumer goods—textiles, shoes, jewellery and so on—and machine tools and electrical goods, all of which were early victims of the recession. In Lawrence, Massachusetts, probably the worst hit, 37 per cent of the labour force is out of work; in the Providence area, which means the whole State of Rhode Island, one in every five workers is unemployed. Until now, unemployment compensation has acted as a buffer for the local economy, but from September onwards benefit rights will begin to run out steadily.

*

It will probably be the end of the year, if then, before the Federal patchwork becomes noticeable. It is to take three forms: special attention will be given to requests from the depressed areas for Reconstruction Finance Corporation loans; public works and other government activities, already planned for these areas, will be speeded up; and efforts will be made to see that businessmen know what government contracts are available. Little more than this can be done without new

legislation, since public works authorisations are usually very specific and nearly all government contracts must go to the lowest bidder. The present difficulties of the eleven areas arise in part from the small size and high costs of their industrial units, which have prevented local manufacturers from obtaining what they consider to be their fair share of recent government contracts. Nevertheless the government's attempts to patch up the holes will probably be adequately successful, especially since the improvement in the nation's economic prospects has already been very helpful to the textile and leather goods industries. But only about five per cent of the country's unemployed are actually involved in the present efforts; if, later on, the whole national fabric should begin to look threadbare, robbing Peter to patch Paul will no longer be enough.

* * *

Federation Sometime?

The Daughters of the American Revolution, warned by two signal lights hung out on Capitol Hill, have called their Minute Women to arms to defend their country against Congressional resolutions aiming at an eventual world government. One resolution calls upon the signatories of the Atlantic Treaty to hold a convention and explore the possibilities of a federation of the world's democracies; the other would make it a fundamental objective of American foreign policy to develop the United Nations gradually into a world federation open to all countries. The sponsors of the first compare it with the Constitutional Convention in 1787 at which the thirteen separate colonies became the United States. To the advocates of both resolutions, the DAR seem to be straying from the Founding Fathers' footsteps when they decide to "spearhead" the campaign against those who would "sell our American sovereignty."

The two carefully-phrased resolutions now before both Houses of Congress should not be confused with past attempts to reform the United Nations by means that could only disrupt it. The sponsors of both resolutions want, in their different ways, to strengthen the UN ideal and both owe much of their support to the widespread belief that, if the Marshall plan and the Atlantic Pact are to succeed, they must in the long run lead to permanent economic and political integration. No one expects the resolutions to be passed this year, but it is hoped that they will put the present emergency foreign policy into perspective and will draw attention to the heights of world federation which, it is believed can, and one day must, be scaled.

*

Senator Kefauver is responsible for the Atlantic Union resolution and, since his climb can begin without Russian co-operation, it is more practicable than Senator Tobey's proposals for a federation of all nations. Mr Kefauver's ascent has been mapped by the Atlantic Union Committee, which is linked with Mr Clarence Streit's group, is led by Mr Justice Roberts and has the support of such respected statesmen as Mr Will Clayton and Mr Robert Patterson. In Congress there are many seekers for lasting peace who approve both resolutions, but Mr Tobey considers that Mr Kefauver's "piecemeal" federation would aggravate the dangerous divisions that already exist in the world. This is the view of the United World Federalists, headed by Mr Cord Meyer, a young ex-soldier, and drawing most of its support from his contemporaries. They have induced fourteen State Legislatures to vote in favour of world federation. This approval has admittedly been in vague terms and seldom accompanied by serious debate; nor do State Legislatures have any responsibility in foreign affairs. Nevertheless, these votes, and the very substantial support which the two Congressional resolutions have received from members of both Houses, show that the idea of world federation has, in the opinion of the politicians, lasting appeal for their constituents.

THE WORLD OVERSEAS

Third Party at the Washington Talks

(From Our Ottawa Correspondent)

IF there is anything at all in the old, and sometimes tiresome, Canadian claim to be an interpreter between Britain and the United States, the Washington talks provide the opportunity to prove it. In one sense there is little that Canada can contribute except brains and good offices, as a moderating and mediating third party. Considerable as Canadian resources are, they are small compared with the United States. The Canadian contribution to Britain in the postwar era of gifts and loans was higher per head than the United States contribution but still a small fraction of the total. The Canadian market takes more exports from Britain than the United States; but it is after all only one-tenth of the size.

Nevertheless Canada's influence at Washington may go far beyond its size. If the Canadians join with the Americans in looking to Britain to initiate certain measures, there is a strong presumption that the joint North American case is more than a peculiar prejudice of dyed-in-the-wool American capitalists. If Canadians join with Britons in suggesting measures that the United States might adopt, the case for those measures immediately becomes very much stronger than if it were presented only by the main beneficiary. The moral strength of the Canadian position is that Canada should be able to talk to Britain without suspicion that it is being dominating, and to the United States without suspicion of begging.

It is this intermediate "third party" position which gives the Canadian position at Washington its particular importance. A strong delegation of officials will attend the preliminary talks. It will be headed by Mr Norman Robertson, formerly Under-Secretary of State for External Affairs and High Commissioner in London, now Clerk to the Privy Council. For the ministers' meetings, Mr Douglas Abbott, the Finance Minister, will be accompanied by Mr L. B. Pearson, Secretary of State for External Affairs, who has a long record of successful negotiation and mediation at international meetings, and very likely by Mr C. D. Howe, Minister of Trade and Commerce, whose strength is that he was a businessman, talks the businessman's language and has wide contacts in the United States as well as in the Canadian business world.

Reluctance to Give More Aid

Preparations for the talks have been thorough and exacting. Every kind of remedial measure has been examined, but there is no expectation that Washington can pull rabbits from hats. No one expects either an easy or a final answer. But in one crucial respect the forthcoming talks seem here to be a critical turning-point. Throughout government circles there is a firm conviction that neither Canada nor the United States can do any more to help Britain unless Britain takes some drastic steps to help itself. The Government believes that British prices have got to come down, that British trade has got to start untangling itself from the web of bilateralism, and that Britain has got to start exposing itself to the cold winds of a competitive world. The attitude of the early postwar days when loans were agreed to gladly and easily has changed. Reluctance to stretch Canadian capacity to help Britain any further has grown steadily as Canadian officials became more and more convinced that United Kingdom policies were leading away from multilateralism into a dead-end net of bilateralism.

If the Canadians think that the British Ministers are still inclined to blame North America rather than their own policies

for the plight of Britain's balances, they will be just as adamant as the Americans in refusing to try to devise international measures as substitutes for what they consider necessary British domestic measures. If they feel that British ministers are courageously and fundamentally tackling the weaknesses of the British position they will be ready to try themselves and to urge on the Americans consideration of every possible way in which international measures could help the British to turn the corner. That is why the meeting at Washington will be a crisis of confidence, with the primary responsibility placed on the British ministers.

Canadian opinion is convinced that the reasons for this standpoint attitude on the part of Canadians as well as Americans should be understood on the other side of the Atlantic. It does not arise from mulishness, nor from pique. It arises from a complete conviction that nothing North America can do, short of a permanent subsidy, can even help at this stage towards a solution of the British problem unless British measures of both internal and external policy can get prices down and at least start the sterling area moving towards a competitive basis with the rest of the world.

No Political Interference

This genuine economic view has become entangled with the supposed political view that socialism is at the root of the trouble, and it is not easy now to disentangle them. The supposed determination to end British socialism is not nearly as widespread even in the United States as headlines have suggested. In Canada it certainly is not a factor in determining policy. Most Canadians, as the last election showed, do not like socialism; but it is inconceivable that any Canadian government should try to overthrow, or even "play tough with," any British government merely because it was socialist. The case for a change of policy which the Canadians believe in is based on economic, not political, grounds. It has been said in official circles (ministers for obvious reasons would be less ready to say it), that the policies which are pushing Britain into its present non-competitive position have nothing to do with socialism. Bilateral trade is, it is understood here, no part of the pure milk of socialist dogma, though the high taxation of the welfare state and the problem of providing incentives to industry may be another matter.

But if British ministers are being challenged—as they are—to initiate a drastic change of direction in economic policy, they are not being asked to repudiate their socialist faith. It does not matter to Canada what their political faith may be. What does matter is that they should restore confidence in Britain's willingness and ability to work its way back into a competitive world. If the British Government, Socialist, Conservative or Liberal, can produce evidence that the British economy is going to face this painful reorientation, the Canadians will do everything in their power to create a favourable international atmosphere for the United Kingdom. If not, the Canadian Government does not believe there is anything that it or the United States Government can do. Whatever influence Canada can wield at Washington will be used in the first place to support the United States in demanding British action as a prerequisite to any international action. Once that condition is fulfilled it will be used to encourage the United States to help in every possible way. But the British ministers must face the first responsibility.

The Finnish Communists Strike

[BY OUR SPECIAL CORRESPONDENT]

FINLAND is in the grip of vicious Communist strikes. The third phase of what the Prime Minister, Mr Fagerholm, calls the Communists' "greatest and best-planned attack against the community in Finnish history" seems about to begin. It is likely to continue until the Assembly of the Diet next Wednesday provides an opportunity to exert direct parliamentary pressure. Serious trouble began on August 18th when three key Communist unions—dockers, builders and food-workers—struck in support of a strike of cellulose workers which had been going on for nearly a month at the northern timber port of Kemi. Although due notice had been given of this new move, it was not sanctioned by the Finnish Federation of Trade Unions (SAK, *Suomen Ammattiyhdistysten Keskusliitto*) and was therefore illegal. The riots with which the Kemi strikers chose to celebrate this manifestation of their comrades' support and in which one man was killed and others wounded raised the matter on to quite a different legal level.

The Social Democrat Government, which had been patient under provocation, responded firmly and quickly. Troops were sent to Kemi and the local Communist leaders were arrested. To counter the threat to the country's economy which a total stoppage of work at all docks would have represented, Hangoe, in the south-west, was declared an open port. All ships were directed there, the local dockers were forbidden to strike and troops were despatched to handle cargoes, if necessary. The country responded to this resolute lead. Within a few days it became clear that the first phase of the Communist offensive was failing. Socialist workers and others—plain, stubborn, patriotic Finns who refused to be intimidated by the strong-arm methods of a party they felt to be alien to their true interests—returned to work in increasing numbers. The country, though shaken, was by no means paralysed, and the Government was as firmly in control as ever.

Tactics of French Communists

Then came the second wave of the Communist attack. This outburst was something new in Finland—a sample of the "rolling strike," imported from France via Moscow. The Finnish Communists had not previously employed these tactics, being content to suffer one defeat at a time rather than to court another immediately. So, last Monday, a strike began of the Timberworkers' Union. It was ordered by the Communist executive in defiance of an 80 per cent vote for continuing work. The same day the Transportworkers' Union struck. The combined effects of this action by such powerful and strategic unions could well have gained the objectives which the dockers failed to reach in the first phase of the campaign. But the indications are that the new move is meeting with little success and probably not more than a quarter of the members of the two unions have heeded their leaders' call. One result, however, has been to split the Federation of Trade Unions which, since its orders to call off the strike by last Tuesday night were not obeyed, is now to expel the rebel unions whose combined membership amounts to about 88,000 of a total registered union membership of some 300,000 for all Finland.

It would nevertheless be premature to conclude that the Communists have shot their bolt. But there is little doubt that their efforts have not met with the success they hoped for. Several more Communist-dominated unions, however, in the textile and leather industries, for example, have yet to implement their strike notices, and the third phase may, indeed,

be marked by increased violence as continued failure prompts the Communists to desperate efforts. But even so there are no good grounds for believing that they will unseat the Government.

They have, of course, done considerable damage, and can yet do more. For Finland, like other countries of western Europe, is at present particularly vulnerable to sustained strikes, a weakness which is enhanced by the seasonal nature of work in its main industry, timber. That being so, the Communists were curiously slow in seizing the opportunity for mischief afforded by the devaluation of the Finnmark at the beginning of July—particularly when, according to all reports, they have been hatching a major strike for the best part of a year and have, indeed, produced one or two somewhat addled eggs. True, within a few days of the new rate of exchange being announced, there were the usual attacks in the Communist press and by Communist spokesmen on the Government's economic policy. But these were merely routine.

The strike of cellulose workers at Kemi, however, gave the Communists their opportunity. The cause of the strike was a genuine grievance—an arbitrary cut in wages—but the Communists were able to exploit what was a local dispute on a national scale and to open a major strike offensive.

The primary aim of the strike is to overthrow the present minority government of the Social Democrats and to replace it by one in which the Communists would participate. Since they would have been chiefly responsible for ousting the old regime, they would, on this and other grounds, have claimed a representation disproportionate to their Parliamentary following in the new government. They would also have undoubtedly insisted on holding several key posts and would rapidly have undone the good work of the last eighteen months or so during which their influence and activities have been restricted to within more acceptable limits.

The result of the strike, however, is likely to be a further decline in their fortunes and a hardening of opinion against them. Conversely, the Social Democrats will gain support by their resolute and skilful handling of the situation. A decline in Communist support would not be of great importance in itself. Not only is the Finnish Social Democrat Party perhaps the toughest and one of the most alert and best organised Labour parties in the world, but it is determined, as its leaders' recent words and actions have shown, to do its utmost to maintain democracy in Finland. The Finnish Communists may, therefore, in present circumstances, be considered to have no more chance of success by illegal and extra-Parliamentary measures than they have had by constitutional methods.

Cat and Dog in Korea

THE Russian and American occupation forces in Korea, after having built up two antagonistic Korean Governments in their respective zones, have now both been withdrawn, and have left the rival Korean authorities confronting each other across the purely artificial frontier formed by the thirty-eighth parallel of latitude—the boundary adopted for convenience by the General Staffs just before the end of the war as a line of demarcation between the Russian and American military zones. The situation today is one of great tension, and there has been sporadic fighting on the border, but so far no all-out civil war. The American evacuation—leaving behind a small military mission for further training of the South Korean army—has been a risky proceeding, even if it is the opinion of the War Department in Washington that the South Korean army is now strong enough to hold its own against attack from North Korea. As long as American units remained on the demarcation line, a Communist invasion of South Korea would involve a direct attack on American forces, whereas it now only means a civil war between Koreans, though one in which Russian and American interests and prestige are very much at stake.

The American withdrawal appears to have been really due, less to confidence in the prospects of tranquillity in Korea, than to the moral effect of the prior Russian withdrawal. It was relatively safe for the Russians to withdraw their troops because they could be fairly certain that South Korea would not attack the North; the aggressive propaganda for "unity" comes from the Communists, and the Seoul Government is essentially on the defensive. With Korea cleared of all foreign troops, the Pijongyang Government (Communist North Korea) can try its hand at subduing the South, and always fall back on its own territory if it fails. It is just as safe as blockading Berlin.

The Communist incursions into South Korea have so far been mere local trials of strength, large-scale raids rather than a military invasion, and the Seoul military authorities claim to have repelled them without great difficulty. But more serious attacks may be launched at any time. A state of war undoubtedly exists, even though no active operations are in progress, for the supporters of the Korean Republic, set up under the auspices of the United Nations and recognised by Britain and the United States, are regarded by the Korean Communists as "traitors" who ought to be exterminated. No normal peaceful life is possible in South Korea, for the threatened state must be ready to withstand invasion without warning at any moment. The Pijongyang Government has given peremptory notice to both the United Nations Commission and the American Military Mission to leave Korea, and the recent victories of the Chinese Communists have greatly increased the arrogance of tone in its pronouncements. If the Chinese Communists complete their conquest of South

China, the position of South Korea as a solitary anti-Communist enclave on the East Asian mainland will become more precarious than ever, and China may lend enough active support to the Pijongyang regime; a Korean contingent fought with the Chinese Communists in Manchuria, and the loan might in future be repaid.

That America has not meant to abandon South Korea is indicated by the fact that it figures along with Iran and the Philippines among countries outside the Atlantic Pact which

are listed for arms aid in bills now before Congress. A warning to the Chinese Communists not to intervene in Korea may also have been intended in Mr Acheson's declaration on August 5th that, if the Chinese Communist regime were

to lend itself to the aims of Soviet Russian imperialism and attempt to engage in aggression against China's neighbours, we and other members of the United Nations would be confronted by a situation violative of the principles of the United Nations Charter and threatening international peace and security.

But Chinese aid to the Korean Communists might be hard to prove, and even if it were manifest, the Russian veto would protect China against any action by Uno. The real issue is whether in a crisis the United States would take any active steps to protect the Korean Republic. Without such an intention mere aid in supplies to the Seoul Government might be no more effective than was similar aid to Kuomintang China, where, as the American White Paper states, large quantities of American arms and equipment have passed into the hands of the Communists "through the military ineptitude of the Nationalist leaders, their defections and surrenders and the absence among their forces of the will to fight."

The Americans expect a better performance of the Korean leaders, who have had three years of American administrative guidance to prepare them for political responsibility—and the

Spotlighting Waste

Administrative costs rise imperceptibly, but steadily. Every unnecessary record, every needless clerical operation pushes costs up. Our new booklet "500 Unnecessary Miles" tells how we can help you to get them down. Why not write for a copy? Consultancy Division, Remington Rand Ltd., Dept. 3, Commonwealth House, 1-19 New Oxford Street, London, W.C.1.

President, Dr Syngman Rhee, lived for many years in the United States; South Korea can also qualify, as Kuomintang China could not, as a real democracy, having had free elections under the supervision of a Uno commission. But it is by no means certain that the South Korean regime under heavy attack from its totalitarian rival would show as much stability as the election figures might suggest; the political freedom which may add strength in war to a nation of mature democratic tradition may be a serious handicap to a government fighting for its life in a country whose whole political background is one of despotism and violence. No political opposition is tolerated in North Korea where the Communists have imposed the unanimity at which they always aim; but in the South the government is seriously embarrassed by the activities of opposition parties which engage in intrigues with Pijongyang. The campaign in the South for "unification" of Korea—actually a scheme for a Communist-sponsored coalition against President Rhee—has been met with violence from the government side, reaching its climax in a young army officer's assassination of Kim Koo. The latter was head of the Korean "Provisional Government" in exile in China before and during the war, when Syngman Rhee was representing the Korean cause in Washington, and was bitterly jealous of Rhee's postwar ascendancy—which has been at any rate in part due to Rhee's better American connections; this rivalry caused Kim Koo to incline towards the Communists.

There is no reason to believe that President Rhee himself instigated the assassination, but the army authorities gave the assassin every facility for defence at his trial, and his condemnation, not to execution, but to life imprisonment means that he can be released at any time. Whatever its political ideals, the Seoul Government is being driven to become a dictatorship; it is wholly dependent on its army which has elementary ideas about the rights of political opposition. Nor is it likely that President Rhee's recent conversations with ex-President Chiang Kai-shek for the making of an anti-Communist Pacific Pact reinforced his aspirations for political democracy. But Rhee is at least a leader of some calibre who appears determined to hold on to power and defend his territory as long as he can.

National Enterprise in Spain

At the end of last month General Franco visited the province of Burgos and other northern areas to open several new industrial ventures. One was a cellophane factory; two others were electric power stations. Some of the new enterprises of this kind are the work of the *Instituto Nacional de Industria* (INI). Founded on September 25, 1941, INI represents the most serious step taken by the Franco regime to promote the country's economic development. Consequently, it is one of the most controversial organisations in Spain. The idea behind it was a good one—to start or enlarge those enterprises which, although insufficiently attractive to private capital, are essential to Spain if it is ever to make the fullest use of its own resources. But the execution of the idea has come in for much criticism.

Like Britain's groundnuts scheme, however, Spain's INI has now had so much capital poured into it that no Spaniard can really afford to see it fail entirely. INI operates through six different grades of control. The first consists of eight companies in which INI holds all the shares. The biggest of these is the *Empresa Nacional "Calvo Sotelo" de Combustibles Líquidos y Lubricantes*, formed in 1942 to explore and exploit all possible means of producing liquid fuels in Spanish territory. "Calvo Sotelo"—named after the Right-wing opposition leader who was shot three days before the civil war broke out—owns lignite deposits on the Ebro and at García Rodríguez, the refinery at Cartagena and—probably the most important enterprise in which INI is at present engaged—the installations still being constructed at Puertollano in the southern province of Ciudad Real to distil oil from shale. The second category consists of companies in which INI holds the con-

trolling interest in the shares, the rest being in private hands. The biggest of these is a company, formed in 1947, to build Diesel motor-lorries, and which has taken over the Hispano-Suiza works at Barcelona. The third category, a minor one, is that in which INI has an indirect control through other companies. The fourth covers companies in which the state has a half share—at present only two, one for mining development and the other for civil engineering. The fifth category covers companies in which the state has a minority share. They are Spanish Marconi, an aeroplane construction firm, the *Banco Exterior de España*, and five others turning out nitrogenous products, ball-bearings and steel in Asturias. The sixth category covers firms which have received government loans for national reasons, notably in the Spanish film industry, and a company importing minerals of military value such as manganese, aluminium, copper and chrome.

INI has not set out to take over whole industries in the sense of nationalising them on the French or British model. Nor is it saddled with a collection of major industrial concerns which have already been financial failures but which have to be kept going—as is the *Istituto per la Ricostruzione Industriale* (IRI) in Italy. The most important part of INI's work is concentrated in the first and second categories of companies which, in most cases, the state has promoted for purposes of planned national economic development. The intention is to sell them to private owners if and when they can be put on a paying basis. However, in the case of "Calvo Sotelo," for instance, this may not be for many years, if ever. The big installation at Puertollano is aimed at providing 60 per cent of Spain's requirements in lubricating oil by 1953, together with a considerable but lesser proportion of its petrol. But the chances of achieving this objective by that date are slim. And even if the calculated production proves possible, it may be a long step to making it profitable for private holders.

Other businesses in the first two categories include a big hydro-electric scheme on the Ribagorzana in the Pyrenees, and two companies engaged in shipbuilding, one for the merchant marine, another for the navy. INI also owns "Iberia," the Spanish air lines, a company carrying out a new mineral survey of the whole of Spain and a telecommunications company. It has controlling interests in the Almagrera mines, an aluminium factory and various chemical, textile and small engineering works.

The main criticisms directed against INI are that it is slow, wasteful and corrupt, that through the Minister of Industry, Señor Suanzes, who is also President of INI, it secures for itself far too high a proportion of the limited capital equipment that Spain can afford to import and that, rather than

In the export factories, where speed in handling, as surely as speed in production, can write the next few chapters of British history; at the Docks, where the speed of unloading and loading directly affects our day-to-day lives, manpower has an ally. The electric truck, economical, simple, speedy, rugged and easily maintained, is saving time and man-hours where saving counts most. Batteries power these trucks: and the hard worked 'electric's' reputation for freedom from breakdown is a measure of what its battery can take. The Chloride Electrical Storage Company has played an outstanding part in the swing to 'electrics'. Three out of four British electric truck manufacturers fit Exide-Ironclad. Behind each Exide-Ironclad, Chloride and Exide Battery lie the experience and progressive improvements of over 50 years of battery manufacture.

For an industry
behind industries...

Many great industries use chemicals, such as solvents, in the processing and preparation of their products. Today, with the opening of the new Shell plant at Stanlow, these chemicals are now being derived from petroleum from sterling sources instead of from raw materials in short supply or costly in dollars. The vast scale of Shell scientific research and skill in chemical engineering make possible this new British industry. For which—

thank Shell Chemicals

being interested in selling any profitable enterprise to private buyers, it has taken over perfectly satisfactory businesses and squeezed the original owners out by illegal means.

Such accusations are almost certainly not based on a full account of the facts. While it is probably true that INI has not yet shown much disposition to release any profitable enterprises, it defends itself with the claim that the eight years which have elapsed since 1941 are too short to bring many of its projects to fruition. Plans to execute the idea of INI were originally based on securing German capital equipment; since Germany's collapse some plans have had to be shelved for several years. Furthermore, the long-term nature of many INI projects is such that even if more equipment had been available they could not, in all fairness, be expected to have come into full operation yet.

The accusation that INI takes too large a part of the available imports of capital equipment has stirred the *Instituto* to work out some figures which claim to prove that in six main categories of disputed goods, imported from 1944 to 1947, its companies only took an average of 6.6 per cent of the total available. But however correct this may be statistically, the impression that private industry has been made to suffer unfairly inevitably remains; and there is probably a good deal of truth in it. Yet the essence of INI is that it must justify itself by results. And while it is in the Spanish character to be impatient, it is also a national characteristic to start something and never finish it. That INI should not yet have produced enough striking results may really mean that too much is being expected of it. On the other hand, it could—and perhaps should—become in due course a startling and dominant feature of Spanish economic life.

Education in France

[FROM OUR PARIS CORRESPONDENT]

A CERTAIN stir has been caused in French public opinion in so far as it may be said to exist during the holiday season, by the failure of 61 per cent of this year's very numerous candidates for the *baccalauréat*. M. Etienne Gilson, distinguished mediaevalist and keeper of the nation's conscience recalling the saying that the *baccalauréat* and alcoholism are the twin scourges of the French people, has attributed this disappointing result to the displacement of the *baccalauréat* from its true role of gateway to the higher education of the universities and its consequent misrepresentation as a common or garden diploma or certificate of proficiency for Jean, Pierre et Henri when they leave school. Another commentator, M. Michel Chrestien, insists that passing the *bachot* has become nothing but a "quasi-religious enthronement, a snobbish social rite of admittance to the palace of culture." He quotes the devastating aphorism of Bersot: "*En France on fait sa première communion pour en finir avec la religion, on passe son baccalauréat pour en finir avec la science, et l'on se marie pour en finir avec l'amour.*"

The fear that the *bachot* may become a kind of School Certificate is the motive of most of its present critics. M. Etienne Gilson remarks that, while there is a case for awarding a diploma to those eighteen-year olds who have proved their ability to read, write and count, this topic has nothing whatever to do with the *baccalauréat*. Indeed, the Ministry of Education, in a brochure which discusses what to do with your *baccalauréat* when you have got it, says, "*Bacheliers* are young people of 18 provided with what is called 'general culture.' The young person having studied for his *baccalauréat* for seven years (usually from 11 to 18), has touched on many fields, but explored none. Enriched, refined, possessing the knowledge how to distinguish between different methods of intellectual work and to think for himself, he is now well-armed to approach whatever branch of studies

he wishes to specialise in. . . ." This is the classical definition of "*culture de base*," of that intellectual training which the Humanities alone are supposed to instil. It is a principle which has been pushed to its utmost in France where language and literature, even aesthetics, are taught systematically and explicitly. Presumably this literary education is in great part responsible for the Frenchman's natural armour against Hollywood whose products he tends to regard as barbarous concoctions from another planet.

At the present time the *baccalauréat* consists of two parts, each of which offers a choice of subjects. The first part contains 5 *séries*, each with its special orientation within a scheme of general education common to all *séries*. The *séries* are: A. (Latin and Greek.) B. (Living languages.) C. (Latin and Science.) Modern. (Latin, Science, and Living languages) and Technical. The second part of the examination has also five *séries*, which do not necessarily follow the *séries* taken by the pupils in the first part. They are: philosophy and literature; philosophy and science; experimental science; elementary mathematics; and mathematics and technics. Part I cannot be taken before the age of 16.

Science and the Humanities

The *baccalauréat technique* is, of course, the nigger in the woodpile. Introduced in June, 1946, it was conceived as a challenge to classical education. Its aim was to demonstrate that the applied sciences, industrial design, technology, and manual work were equally capable of imparting a human culture in the broad sense of the term. With the exception of classical higher education (no Latin is taught in the *série technique*) the award of the *baccalauréat technique* secures admittance to any university faculty. In practice, however, the *bacheliers* of the technical series usually go on to the higher engineering schools and technical institutes, whence they may emerge, for instance, as industrial, railway or naval engineers. In 1947 just over three-eighths of the candidates for the *baccalauréat technique* (second part) were successful; in 1948 just over three sevenths.

It is, of course, not primarily against the percentage of failures that the critics are protesting—it is not especially high this year—but at the number of candidates, many of whom in their view, should never have been trained for the *bachot* at all. Between 1910 and 1928 the number of candidates for both parts of the *baccalauréat* was doubled. Ten years later the 1928 figures (43,260 and 26,328) had risen to 75,546 and 45,330 respectively. Again in 1947 the total had increased to 106,240 and 72,385. In face of this influx of candidates there was a diminution in the percentage of the successful, which fell from 42 per cent in 1910 (first part) to 32 per cent in 1947. There are two other interesting facts: the percentage of successful candidates for the first part between the years 1938 and 1947 was only 27 in Paris and Poitiers against over 40 in Besançon, Toulouse and Strasbourg; the number of women candidates (first part) rose in the same period from 30 per cent to 41 per cent of the total. (This phenomenon had the rather startling corollary that feminine successes were at the rate of 40 per cent against only 37 per cent masculine ones.)

In France, as in other countries, it seems inevitable that there should come into being a type of education which, while it does not bear the stamp of *études supérieures*, nevertheless extracts from the humanities something of their essential worth. It is not, however, obvious that an overcrowding of the ranks of candidates necessarily reduces the intrinsic value of the examination itself. Moreover, even if the contention that the *baccalauréat technique* is no true *baccalauréat* is justified, the inarticulate foreigner is inclined to ask whether that really matters so very much. For no conclusive arguments have been advanced to prove that the original virtues of the system are threatened by its alleged excrescences. But then curates' eggs were never very dear to the Gallic palate.

THE BUSINESS WORLD

Interest Rates Now

FOR the first time since demoralisation set in at the end of July, the gilt-edged market has lately shown some sign of recovering its poise. It has been almost free this week of the acute nerviness which pervaded it until the latter part of last week, and prices have improved on successive days. This is a more healthy symptom than the violent but brief rebound of ten days ago. Those who have believed all through that a yield basis of around 3½ per cent for the irredeemable and longest dated stocks would provide a resistance point can now find some tangible evidence in support of their thesis. The flat yield on Old Consols, having risen at one time to 3½ per cent, has this week improved to a little under 3½ per cent, which is also approximately the basis for the principal nationalisation stocks, though "Daltons" still yield perceptibly more. Reassuring though this pause may be, the suddenness and momentum of the recent fall so took the market by surprise that no one now can produce convincing reasons for expecting it to stop finally at a 3½ per cent basis, and many people are still envisaging perceptibly higher rates in certain contingencies. Even they, however, are well aware that, in markets so thin and technically vulnerable as at present, any ostensibly favourable news could produce a quite spectacular recovery.

In such conditions, it would be rash to prophesy. The uncertainties which provoked the crack—and it is not clear, even now, what the predominant worry has been—will still be present at least until the outcome of the Washington talks is known. But the change which has already occurred is so striking as to deserve examination in itself. Its significance is not to be measured merely by the extent of the fall in prices. Steep though it was, even at its steepest it was less severe than the collapse during the convertibility crisis of 1947, when Consols dropped nine points in less than three weeks although they had already lost nearly as much in the preceding six months. This latest fall, again measured by Consols, amounted at its worst to four points in just over a fortnight, following a loss of six points from the peak reached during the post-budget boomlet which accompanied the launching of the Gas Stock. Such comparisons certainly understate the implications of the recent movement. The collapse of 1947 started from a yield basis of less than 2½ per cent for the irredeemables, a basis which everyone knew to be untenable, and which had been momentarily established only by the rash inflationary policies of a Chancellor with a misplaced ambition. The extent of the rashness, as well as the impotence of the system of physical control (which alone could make even theoretical sense of such policies), were then being revealed by the fuel crisis. A gigantic bubble was about to burst, and burst it did.

There was no comparable bubble waiting to be pricked in 1949. The Daltonian bubble had been blown up defiantly by huge blasts of new credit which the authorities themselves were pumping in. During 1949, however, those particular pumps have been sealed off, and the inscription on the seal was plain for all to see. It read: "National War Bonds 1949-51 not to be called this year"—a sufficient indication that effective steps had been taken to stop the relatively

minor leakage of air which occurred, perhaps through inadvertence, last summer. Apart from this, the only evident artificiality in the gilt-edged position on the eve of this year's fall came, not from the authorities, but from the market itself. Its spring exuberance puffed up a modest globule which clearly would not survive summer temperatures but seemed equally incapable of creating any noisy disturbance.

Given these contrasts between the market conditions from which the two movements emerged, this year's fall of 10 or 11 points at the worst looks large beside the 17-point fall at the worst in 1947. Moreover, it started at the point at which the 1947 movement stopped—with Consols at roughly 81 in both instances. When one recalls the chaos of the fuel crisis in 1947, the huge dollar drain, and the inflationary excesses in budgetary and credit policy, it seems incongruous that the yield on Consols, at its highest point for the year (a shade under 3.1 per cent), was still appreciably below the average for the last two prewar years and also lower than that for any wartime year save one. If long-term interest rates could be maintained in the year of Daltonian fiasco at an average of well under 3 per cent, why, it may be asked, should they not be sustainable between, say, 3 and 3½ per cent now? These, approximately, were their limits of fluctuation during the year or so before the latest rise; and in that period many people felt that they had reached a level which might be held, given a continuance of the policy of disinflationary budgeting.

★

Those who argued thus were, of course, assuming adherence by the Government to the cheap money policy—not the Daltonian extravaganza, but the principles loosely formulated in the dozen years or so before that. Needless to say, in a free capital market the equilibrium rate now or at any other time in the postwar phase would have been much above even the 3½ per cent which today looks high. Indeed, it is high, by the standards of that policy. In the prewar quinquennium, the highest annual average yield for Consols was 3.38 per cent (average price, 74), for 1938; the lowest was 2.89 per cent (price, 86½), for 1935. In a phase of under-employment such as the nineteen-thirties, the equilibrium rate in a market subjected to a cheap money policy may or may not be below the true equilibrium rate. Then all prospective demands for capital are left free to exert themselves (and additional demands may be deliberately fostered), while the natural supply of savings may or may not be stimulated by credit expansion and other pump-priming devices. But in a phase of full employment and excessive demands upon the nation's productive resources, cheap money policy has to employ a very different strategy. It must rely upon control of new issues, rationing of physical resources and investment planning to curtail the demand for capital, and may or may not take effective steps to sustain or stimulate the deficient supply of real saving. For a time, as Dr Dalton demonstrated, the effects of this deficiency upon interest rates may be concealed by credit inflation which generates additional monetary savings. But when such expedients have collapsed or are ruled out, the only way of maintaining the cheap money

policy in face of deficient private saving is to enforce public saving by budgeting for a surplus.

The fundamental question now, therefore—and so long as the phase of excessive demand lasts—is whether these two instruments of physical control and disinflationary budgeting can be sufficiently strong to equate real demands for capital to its supply at a “cheap money” rate of interest. In the past twelve months or so, there have been increasing doubts about the effectiveness of both instruments, but these questionings have never been raised specifically in the context of interest rates. Indeed, so long as the disequilibrium between the demand for capital and its supply in the controlled market is not large, it may not be necessary to debate this particular issue at all. In that event, the presumption is that the accustomed methods of cheap money policy will suffice to keep the structure of interest rates, and of the gilt-edged market in particular, more or less under control, so that there will be no need to contemplate the possibility of any far-reaching change.

This was, in fact, the assumption upon which the empirical judgments of the market were based three months ago. It was supported, moreover, by an examination of the capital account for the national economy as a whole in the light of Sir Stafford Cripps's second Budget. As an article in these columns on April 16th showed, the prospective savings-investment account for 1949 certainly did not then look securely balanced; but, given the imperfections of the data, there seemed no need to attach undue significance to the moderate disequilibrium which it seemed to show. The estimates upon which the official calculations were based, however, now need substantial revision. In particular, the budget surplus appears likely to be much less than the Chancellor envisaged, and this loss of enforced public saving is certainly not being offset by any expansion of private saving—despite the large provisions which companies are now making for capital replacement. It is conceivable, but not probable, that the effects of the shrinkage of the total flow of savings may be partly neutralised by a decline in demands for investment. In the past few months, apprehension has joined with rising costs to hold back some projects which would otherwise have got under way. There has been no sign, however, of any curtailment of investment within the public sector of the economy and, if private demands for fixed capital have slackened a little, there has certainly been an expansion in its floating capital, through the accumulation of stocks—particularly of goods intended for export. On balance, investment demands are most unlikely to have fallen, and more probably have actually added to the strain which is being imposed by the shrinkage of savings. To the extent that the balance of overseas payments, considered as a whole,

has swung from near-equilibrium into deficit, there will, however, have been some relief for the domestic capital account, because the supply of goods available for use at home will have been correspondingly increased.

In sum, the underlying disequilibrium in the savings-investment account must be greater now than it was expected to be three months ago. But the change has certainly not yet reached any such magnitude as to warrant, of itself alone, so radical an adjustment of the interest structure as has occurred simultaneously. Similarly, if the assumptions about the probable effectiveness of the customary instruments of control were valid three months ago, there is no reason,

on these grounds alone, to reject them now. Since the pressure on the market has evidently far outpaced the deterioration in the savings-investment account, that is another way of saying that the disproportionate fall in prices would be hard to justify unless the whole basis of official policy were likely to alter.

The nerviness of recent selling and the sensitiveness of the market itself are, in fact, the traditional responses to far-reaching uncertainties. They have not fastened upon any particular uncertainty—the fears of investors have ranged over many contingencies, including devaluation, a “dash for freedom” which would open the sluice gates of international competition, a deadlock in Anglo-American economic relationships, and widespread industrial dislocation caused by shortage of vital supplies from abroad. Among the bogies

which have tormented the minds of the imaginative, probably the only one which might, in certain circumstances, undermine the whole foundations of the cheap money policy would be the move towards freedom. In some quarters, indeed, fears based upon this particular possibility have been voiced explicitly. It is one reason, for example, for the fractional rise in commercial bill rates in Lombard Street, to which attention was drawn in *The Economist* last week. It is argued that, if a devaluation were accompanied by some lifting of the shackles upon international trade and by a move towards sterling convertibility, the new regime might need the protection of higher rates of interest than those customary during the cheap money phase. The minor change in Lombard Street is intended as a warning not that such a development is probable, but that it is at least a possibility which ought not to be wholly ignored.

The changes which would have to occur in firmly entrenched policies and methods of control before a system of variable interest rates could play any important part are perhaps more far-reaching than Lombard Street has per-

Business Notes

Curtain Raiser for Washington

The last touches have been put to the brief which Sir Stafford Cripps and Mr Ernest Bevin will be taking with them for the Washington financial talks. These are due to open on Wednesday, September 7th. The basic material from which the final brief has been distilled was voluminous. Every Government Department conceivably interested in the balance of payments situation—and that does not exclude many—has penned its diagnosis. This mass of material has been sifted and concentrated by the Treasury into a final brief which will be considered at the Cabinet meeting which is to be held next Monday specifically for this purpose. The Chancellor of the Exchequer and the Foreign Secretary leave for the United States on Wednesday, and immediately after their arrival will plunge into the triangular Anglo-US-Canadian talks. These will last about a week and will be followed by the annual meetings of governors of the International Monetary Fund and the International Bank for Reconstruction and Development; these will probably take another week. Pending the arrival of the Ministers, preparations for the discussions have been going on in the US capital, where a team of British officials led by Sir Henry Wilson Smith of the Treasury has arrived to reinforce the permanent UK Treasury Delegation in Washington. The British executive director of the International Monetary Fund and director of the Bank of England, Mr G. L. F. Bolton, has also arrived in Washington. The Ministers will, therefore, find the ground for their discussions well prepared. The fact-finding should have been effectively disposed of by the time the talks open and the stage left clear for the “proposals.” But these themselves are still wrapt in mystery. The profuse comments on the coming discussions which have appeared in the American press confirm the assumption—which could safely have been made in any case—that there will be little in the way of precise proposals from the American side. The US representatives will be primarily interested, at the outset at least, in listening to what Britain has to say about the reasons for its misfortune and—with far keener interest—in the manner in which it proposes to overcome them.

Unless a great change of heart and views has occurred since the House of Commons debate on the economic situation—and this week's speech by Dr Dalton in Strasbourg hardly suggests that it has—the British proposals are unlikely to meet with immediate American approval or to condition the Americans for additional assistance. The increased sterling releases to India and other countries, and speeches from the rank and file of the Labour Party, offer no hint of a retreat from the excessive

ceived. But it seems undeniable that some of the stresses to which sterling is subjected might be partially relieved, even now, if the cost of short-term finance in London were brought into more rational relationship with interest rates for medium and longer-term. Given the present cheapness of money market rates, a perceptible increase could occur there without necessarily having more than a momentary effect upon gilt-edged—unless, of course, the change were of such an order as to require an increase in Bank rate.

Despite the jerk which the City imaginations have experienced in such matters in the past few weeks, any such reversion to the now almost forgotten technique of monetary discipline is still regarded as highly improbable. If this is so, the fundamental question for the gilt-edged market is still the one posed earlier in this article—are the techniques of physical control and disinflationary budgeting losing their effectiveness? The answer seems to be that they are bound to do so unless the burden of the disinflationary budget can be lightened by a large reduction, not in the budget surplus, but in the size of the budget itself.

bilateralism in British economic policy—that is, from the aspect of that policy on which the Americans tend to place the principal blame for the increasing difficulties of Britain's balance of payments. Whether, as the negotiations proceed, a reconciliation can be achieved between these basic principles of British policy and the greater elasticity and acceptance of open competition which the Americans will certainly require as a condition of aid, is a matter on which it would be profitless at the moment to make forecasts.

The Gold Drain

Among the factual material with which the Washington negotiators will be presented, the most significant item and that best calculated to spur their efforts will be the rate of the drain on Britain's gold reserve since June 30th. There have been references in responsible organs of the US press to a probable net loss of £100 million of gold from the reserve in the third quarter of 1949 (which would compare with the loss of £65 million in the second quarter). This figure has been widely reproduced here, and is perhaps in danger of becoming accepted as an official forecast of information to be revealed during the Washington talks. The end of the quarter, however, is still too distant for it to be possible to make any serious estimate of the net drain in this period. It is known that the losses of gold to European countries in July, though slightly smaller than in June, were considerably higher than the average for the first half of the year. On the other hand, Britain's overseas trade figures for July—as a subsequent Note points out—showed a modest, though reassuring, recovery in direct exports both to the United States and Canada.

In addition, it can be assumed that technical factors are making it difficult for residents in the non-sterling world to maintain the uncovered “bear” position in sterling which was built up during the first half of the year; there is reason to believe that this position may have been of the order of £200 million. Part of the short position has unquestionably been covered during the past few weeks. In particular, pressure has been put on all non-residents who had been withholding payments of sterling debts in the hope of a devaluation. As against this must be set the probability that the gold and dollar account for the second quarter was “window-dressed” at the last moment in order to show a somewhat smaller gold loss than did in fact occur; some of the effect of this may be reflected in a deterioration in the third quarter figures.

The biggest uncertainty of all probably concerns the dollar expenditure of other members of the sterling area. Some of these expenditures had been getting seriously out of control in the first half of the year and should be capable of substantial contraction by mere tightening up of exchange control—quite apart from the proposed 25 per cent cut in dollar purchases. Allowing for these uncertainties and for the fact that September 30th is some way ahead, no precise estimate of the gold loss in the third quarter can be advanced; but on the basis of such tangible and intangible evidence as is available, it would seem unlikely that the present rate of loss is greater than that incurred in the second quarter of the year.

Ceylon and the Dollar Pool

The latest extension of the financial agreement between the United Kingdom and Ceylon is notable on two counts. The first is that it provides for a further increase in the releases from Ceylon's immobilised sterling balances. These releases amounted to £3,500,000 for the year to June 30, 1949 (apart from £4 million specifically to furnish a working balance). For the subsequent twelve months they have been stepped up to £7,000,000. Provision is also made for additional releases of up to £1,000,000 "in the event of a substantial unforeseen rise in the price of essential foodstuffs unbalanced by other sources of income (to Ceylon)." This increase in releases of sterling balances conforms with the trend revealed by the terms of recent arrangements made with India and Pakistan. In each of these cases convincing special circumstances can no doubt be cited to justify the generosity with which immobilised sterling is being made available to finance additional imports from the rest of the sterling area. If so, the justifying circumstances must be political. In terms of economics, it is sheer folly to inflate still further the burden which Britain is shouldering on behalf of the sterling area.

The second feature which emerges from the new agreement with Ceylon, and one which is scarcely less significant than the increase in the release of sterling balances, is the acceptance of the claim by the Government of Ceylon to build up a separate gold and dollar reserve. This reserve is to be accumulated by the Reserve Bank of Ceylon when it is set up to take over the functions hitherto performed by the Currency Commissioners of Ceylon. It is provided that for the year of the present agreement this separate reserve will not amount to more than \$1,000,000.

It is not, however, the amount that matters but the principle of admitting the growth of new separate reserves within the sterling area. There are, admittedly, many precedents for the maintenance of such reserves outside the centralised holding in the sterling area's gold and dollar pool. But most of these date from the pre-war era, that is before the principle of pooling had acquired its present importance. It must also be admitted that Ceylon is a net dollar-earner, and that the amount which it will put into the pool during the coming year will probably be many times the amount of \$1,000,000 which is to be reserved for Ceylon's separate holding. It should, however, be noted that the new agreement recognises Ceylon's right at all times "to dispose of her current earnings from abroad." The letter of this clause is softened by the undertaking of Ceylon, together with other Commonwealth countries, to do its utmost to reduce its dollar imports in the coming year by 25 per cent. The impression, however, cannot be avoided that Ceylon's decision to set up a separate reserve must appear unfortunate at a time when all the arguments stress the need for the utmost concentration and economy of gold and dollars, and when the pressure on the central reserve is so ominously large.

The Trend of Exports

Despite the sharp fall in the average daily rate of British exports last month, the value of cargoes sent to the United

States and Canada showed a small but welcome increase. This cannot yet be claimed as a reversal of the previous downward trend in exports to the United States and it may in fact only reflect the shipment priority which those exports enjoy. The part played by the dock strike in reducing the total value of exports in July is uncertain. The actual decline last month was £1,700,000, but the daily rate was 8½ per cent less than in June and 6½ per cent less than in May. In previous post-war years exports reached a peak in July.

Machinery exports last month rose to £23.1 million, which was above the average for the second quarter of the year. Shipments to South Africa, the main market, fell from £3,223,000 to £2,138,000, but those to most other countries (especially Egypt and Argentina) increased. Exports of cotton and wool textiles also rose on the month, and they, too, were higher than in the April-June period. The value of iron and steel manufactures shipped abroad reached £11.3 million, the highest figure since October, 1920; particularly large shipments went to Australia, Iran, Argentina and Egypt. Exports of most other manufactured goods also increased during July, and shipments of raw materials were £1,000,000 higher at £6,100,000, with coal and raw wool the main contributors.

The two main declines occurred in vehicles and electrical equipment. Exports of the vehicle group fell by over £2,000,000 to £22.7 million, which was well below the average of the second quarter. Despite fears expressed by motor manufacturers about increasing competition in overseas markets, exports of motor vehicles and tractors were slightly larger on the month. The export of ships, however, was almost halved, falling from £5,000,000 to £2,600,000. These figures are particularly subject to fluctuation from month to month, and it is possible that the decline in July may not be significant; the tonnage of ships building for overseas registration increased during the second quarter of the year. Exports of electrical goods fell by £1,400,000 to £5,500,000, and this decline was spread over most categories; shipments to South Africa and to India were in each case £500,000 smaller than in June.

Some reassurance on specific export groups can be gained from these figures, but the trend of the total still suggests that (unless there is a swift improvement) still further cuts in imports may soon become necessary. Retained imports are now about 20 per cent below the 1938 level. Exports normally fall in August because of summer holidays, and the Board of Trade has suggested that this month's figures may also be affected by the dock dispute. If this proves to be true, and if no substantial recovery takes place in September, the state of the total trade deficit will again be pressing.

Finance and Investment

W. H. Smith Offer for Sale

Stock markets, especially gilt-edged and blue chip industrials, have this week had a distinctly better appearance. But the City had scarcely expected this first evidence of recovered moral to be the signal for a resumption of business in the new issue market. The launching of a major operation—it involves £6,500,000—at such a juncture measures both the courage of its sponsors and the calibre of the issue itself. The undertaking in which the public will next week be asked to participate is W. H. Smith and Son, the old-established and well-known newsagents and booksellers. The operation is in effect the sale of a considerable proportion of the family interest, necessitated by payment of death duties on the estate of the late Viscount Hambleden.

The existing undertaking has been acquired by a newly formed holding company, W. H. Smith and Son (Holdings) Limited, and next week the whole of the 4½ per cent preference capital and two-thirds of the equity of the new holding com-

pany will be offered for sale to the public. The preference issue consists of 2,500,000 4½ per cent £1 cumulative preference shares, to be offered at par; 1,650,000 "A" £1 ordinary shares are to be offered at 40s. per share and 1,650,000 "B" 4s. ordinary shares at 8s. per share. Both classes of ordinary capital, which rank *pari passu* for dividend payment, will on a foreshadowed dividend of 12 per cent yield 6 per cent. Yield fluctuations in the gilt-edged market have on more than one occasion recently upset otherwise highly acceptable issues. Put, on present prices for comparable securities, it seems that the sponsors of the W. H. Smith offer are allowing a little safety margin. A return of 4½ per cent on a first-class preference share is not ungenerous even by present standards and a 6 per cent yield on the ordinary shares compares favourably with yields obtainable on the ordinary shares of other leading enterprises. But then a newcomer to the Stock Exchange, however old-established as a private company, cannot compete for the last shilling with long-quoted "blue chip" shares. In the latest year the net profit of W. H. Smith and Son, subject to taxation, was £1,356,000, giving a tenfold cover on the preference dividend. It will be possible to pass judgment when the prospectus is published on Monday.

"Hiving Off" by Tate and Lyle

Believing that "nothing but harm to workers, consumers and stockholders alike can spring from the nationalisation of the sugar refining industry" the Board of Tate and Lyle is carrying an important stage further its campaign against the nationalisation proposal contained in the Labour party memorandum. So far it has been conducted mainly by speeches and slogans, but now shareholders' approval is shortly to be sought for a plan to transfer to a separate company the non-refining interests of the group. A new company, Tate and Lyle Investments, is to receive £82,800 preference shares and 1,333,745 £1 ordinary shares in the West Indian Sugar Company, £13,030 preference stock and £217,000 ordinary stock in Caroni Ltd.,

110,000 £1 ordinary shares in John Walker (sugar refiners) and 726,335 £1 ordinary shares in British Sugar Corporation. In return for these investments, Tate and Lyle Ltd. will receive 450,000 four per cent cumulative £1 preference shares and 7,000,000 5s. ordinary shares in the new investment company. The issued ordinary capital of Tate and Lyle Ltd. will be reduced by £1,750,000—equal to 5s. per £1 ordinary share—and one 5s. share in the new company will be vested in shareholders of Tate and Lyle Ltd. for each old £1 ordinary share held. Shareholders will further receive for each £4 of Tate and Lyle ordinary stock one 1s. share in Silvertown Services, a Tate and Lyle subsidiary providing most of the group's transport services. Thus, for every £1 nominal in Tate and Lyle, shareholders will be holding one 15s. ordinary share in the company, one 5s. share in the investment company and one-quarter of one 1s. share in Silvertown Services.

These proposed changes do not, of course, affect the intrinsic worth of the group, since the operating structure—as distinct from the capital structure—remains unaffected. But the scheme should serve to segregate effectively a substantial part of the Tate and Lyle assets in the event of nationalisation. And it is of immediate interest to shareholders that it is evidently proposed to pay the same gross amount of dividend on the reduced Tate and Lyle ordinary capital in addition to any distribution by the Investment Company or Silvertown Services.

It is a matter for regret that the threat of nationalisation should make measures desirable which cost so much time and energy. In the light of this threat, the scheme is understandable and even welcome. There is little in its proposed execution to provoke criticism at this stage, though it would be interesting to know the basis of calculating what is apparently compensation for resultant loss of security to debenture holders and preference shareholders. These, respectively, are to receive a cash payment of £2 10s. per £100 debenture stock and one new 6½ per cent cumulative £1 preference share for each £25 of preference stock.

Machines to Europe

In shipping goods from one country to another both Exporters and Importers encounter continually changing problems and varying regulations. We have a highly-developed organisation handling the financial problems connected with international trade and serving important mercantile interests. Merchants seeking guidance are invited to consult us.

Contrasts in Rhodesian Copper

The expansion in Rhodesian copper production is not yielding a uniform increase in profits to the various mines. The provisional statement of revenue and expenditure for Mufulira Copper Mines shows a rise in profits (before tax and "any transfer to reserves which the Board may decide") to £4,310,500 for the year ending June 30th, compared with £2,745,166 in the previous twelve months. Roan Antelope, however, estimated its profit for the same period at £2,239,000 (also before tax and transfers to reserves) compared with £2,281,465 in the previous year. The output of blister copper from Mufulira amounted to 70,966 tons, the highest the company has so far achieved and representing a substantial increase on the previous year's figure of 53,360 tons. All the output was sold to the Ministry of Supply and realised £3,618,000, or an average price of £120 a ton against an average price of £117 15s. in the twelve months ending June 30, 1948. Operating expenditure also rose, but only by 26 per cent, whereas output rose by nearly 33 per cent. The opening stock of blister copper has been valued at £56 a ton and closing stock at £52 a ton.

The output of Roan Antelope increased less spectacularly, from 51,757 tons of blister copper to 56,162 tons, and its sales of 54,662 tons realised £6,580,500—also an average price of £120 a ton. Operating costs rose to £3,952,800, or much more sharply than the expansion in output. Stocks of blister copper increased by 1,500 tons on the year and they have been revalued at a higher average price—£68 15s. compared with £63 15s. a ton. In calculating the above profit figures Mufulira provisionally allowed £400,000 for obsolescence and Roan Antelope £450,000. Both these amounts were the same as in the preceding years.

Up to last June, Rhodesian copper producers benefited from the high prices for non-ferrous metals ruling in the world markets. Though the Ministry of Supply will no doubt continue to purchase the whole output, the actual method of pricing may be altered now that the Ministry is keeping its selling prices in line with those ruling in the United States. For the near future, there is very little chance of electrolytic copper again reaching its previous level of 23½ cents a lb. (£130 10s. a ton) in New York—unless the United States experiences another bout of inflation. Its present level is 17½ cents (£98 a ton), whilst the Ministry of Supply's selling price in this country is £107 10s. a ton. Copper consumption throughout the world appears to be settling down to a level below the postwar peak, so that the maintenance or expansion of profits in the future will depend mainly on expanding output, unless costs prove to be less frigid than they appear.

* * *

Payments Pact with Czechoslovakia

No details are yet available of the payments agreement just signed with Czechoslovakia, nor will it be possible to measure its practical significance until the protracted trade talks and negotiations to determine compensation for British-owned assets in Czechoslovakia have been concluded. It is known, however, that its broad effect is to continue for three years the arrangements made in the original agreement concluded of 1945. Czechoslovakia thus remains the only country behind the Iron Curtain which is a member of the transferable account group. Since the war the balance of payments between the sterling area and Czechoslovakia has never shown any large swings in either direction, though at the moment Britain is holding rather more Czech kroner than is felt desirable. This accumulation, however, does not reflect a corresponding increase in Czechoslovakia's indebtedness to Britain since the credits granted by the City after the war have been repaid. Their withdrawal reflected, not only political uncertainties, but the inability of the Czechs to export goods of a kind acceptable to Britain. Although the trade talks have been continuing for a long time, Czechoslovakia has been able to offer only a limited

selection of acceptable exports, but is putting forward a very ambitious import programme. There does not seem to be much prospect, therefore, of the trade surplus which is needed to meet the claims of British creditors and British owners of assets now nationalised by the Czech Government.

In the circumstances, Czechoslovakia's retention in the transferable account group should perhaps be regarded rather as a political gesture than as a means of freeing trade. Indeed, Czech traders have abused these sterling facilities on more than one occasion. Czech goods and British goods exported to Czechoslovakia have been sold at a trading loss in Switzerland, but the Czech exporters have still been able to reap a profit by using their Swiss franc proceeds to buy transferable account sterling at a discount. In fact, unless Czechoslovakia is able to offer larger quantities of acceptable exports or unless the Board of Trade is prepared to admit non-essentials, there seems little practical advantage in retaining the sterling facilities.

The difficulty of coming to terms with the Iron Curtain countries, amply illustrated by the Czech talks, is even more apparent in the unending discussions with Poland over compensation payable to Britain for British assets there. The Polish mission which was discussing these matters has now returned to Warsaw, and all that has been achieved is a determination of the particular assets and debts for which the Polish Government accepts liability. It will be even more difficult to reach agreement with the Poles on the actual compensation to be paid.

Rise in Silver

The complete immobility which has been maintained by the market for official silver in London since February of this year has been broken this week by an increase in the price from 43½d. to 44d. per ounce. This movement has been made in response to an equivalent rise in the New York price, which has risen this week from 71½ cents to 72½ cents per ounce. For some time past supplies of silver in the New York market have been dwindling and have failed to keep pace with the heavy seasonal off-take by industrial buyers. Any appreciable rise in the New York price should, however, bring considerable additional offerings from Mexico, where substantial stocks of the metal are known to exist.

The London price which has meekly followed the New York quotation this week is that which applies to silver made available by the Bank of England for certain authorised essential industrial purposes. The turnover in this market is comparatively small. The supply of this silver is assumed to be provided by the Bank of England out of stocks made available by the replacement of silver token coins by the new cupro-nickel tokens. The nearest approach to a really free silver market in London is that for sterling area silver, the quotation for which has recently been sagging. Whereas three weeks ago it was quoted at 57d. to 59d. per ounce, it is now at 56d. to 58d. This is partly due to the reduced buying of silver by the Chinese who, for the time being, have other things to think about. The reduced Chinese purchases have also affected exports of silver from Mexico to China; these had previously been maintained at an exceptionally high level. This factor should in turn prompt the Mexican users to react more quickly to the rise in the New York price than they might otherwise have done.

Trade and Commodities

A Surplus of Cotton?

For the first time since the war, the world stocks of cotton at the end of July have shown an increase on the previous year. On July 31st they were estimated at 15.1 million bales,

or 1,000,000 bales more than twelve months earlier. But this, as the accompanying table shows, is only about two-thirds of the quantity held at the last prewar carry-over date, and it re-

Source: International Cotton Advisory Committee.

presents approximately six months' consumption at the current rate. But trends in world production and consumption are now moving in opposite directions. Production last season amounted to 28.7 million bales which, though still below the prewar figure, was 3,600,000 bales larger than in 1947-48. Consumption reached only 27.7 million bales—1,200,000 less than in 1947-48 and nearly 3,000,000 less than in 1938-39. If these trends continue world stocks may reach 20 million bales by next summer.

In the United States the acreage under cotton this summer was 14 per cent greater than in 1948. But last year's yield of more than 310 lb. an acre was exceptionally high. The average yield for the past four seasons has been 272 lb. an acre, compared with 160 lb. twenty years ago. Nevertheless this year's crop has been estimated at 14.8 million bales, which would mean a total visible supply of over 20 million bales. Last year's exports from the United States, helped by ECA funds, reached 4,700,000 bales; in 1938-39 exports amounted to 3,325,000 bales. Consumption within the United States, however, fell from its previous high level to 7,830,000 bales; this was still 900,000 bales more than before the war. Even if this level of American consumption is maintained, carry-over stocks in the United States next July are likely to be 7,500,000 bales—nearly a year's supply to the American mills.

During the new season American cotton prices will be supported at 90 per cent of parity instead of 92½ per cent, so that the actual support level for Middling 1½ inch cotton will be around 29½ cents a lb. compared with 30½ cents in 1948-49. American cotton, therefore, will not cheapen much despite the larger supplies, and competitive supplies are scarce. Production in Brazil, the main alternative source, has not yet regained its 1938-39 level despite more extensive planting of higher-yielding varieties. Crops in the Belgian Congo, Nigeria and French Equatorial Africa have increased; but these taken together amount to less than 400,000 bales. Egyptian cotton production, which expanded sharply last year, cannot be used as a direct substitute for American supplies.

If adequate ECA funds for cotton are made available to western Europe, there need be no fear of a cotton shortage in the coming season. But if scarcity of dollars should restrict purchases from the United States, European mill activity could only be maintained by an increased use of rayon and synthetic fibres.

* * *

Uncertainties in Wool

Trends in the wool market towards the close of the season were rather confusing. Prices for all types fell quite sharply in March and April; then a partial recovery took place in May and June. At the London sales last month, prices continued firm, but merinos were appreciably below the levels of twelve

months ago, while both merinos and crossbreds were substantially below the prices of last January. The trade is apparently in two minds about the course of prices which is to be expected when the auctions reopen next month. Demand is still strong and stocks in manufacturers' hands are not unduly large. In Britain they reached a low point of 186 million lb. (clean weight) at the end of March, but they have since increased to over 200 million lb., which represents between three and four months' supply in manufacturers' hands. In Europe, stocks are believed to be at about the same level, though in France, where manufacturers have been buying heavily throughout the season, they may be somewhat larger. The fact that stocks are being kept down to normal working requirements may, however, reflect some uncertainty about future prices, or even the expectation that they may fall.

Trends in wool consumption are more disquieting to producers. In the United States the recession has reduced consumption of wool by over a third compared with last year. This fall is hitting South American growers harder than it hits the Dominion wool market; exports from both Argentina and Uruguay have been on a greatly reduced scale this year. In Britain, wool consumption has declined by 2 per cent from last year's level, whereas on the Continent it has been more or less maintained. These facts at least suggest that the sharp expansion in wool consumption in the postwar years is at an end.

Only very provisional estimates of the 1949-50 clip can yet be made. Wool production in Australia is expected to be 5 per cent higher and should include a higher proportion of merino types. Production in New Zealand and South Africa will probably show little change, while a moderate increase is anticipated in South America and in Europe. American production continues to decline, but the rate of the fall has slackened. The stock of wool held by the Joint Organisation has declined considerably and most of what is now held is of inferior quality. The demand at the opening sales may, therefore, be quite strong, but if current trends in wool production and consumption persist, the chances favour lower prices next season.

**'Not old Mac?..
I can't
believe it!'**

The news came like a thunderbolt to everyone in the firm. Old 'Mac' of all people—such a gentlemanly old chap! He had been with the firm for donkey's years—started as an office boy and must have handled untold thousands of pounds as chief cashier. One day an auditor's query led to a thorough-going investigation, and 'Mac' dazed and white-faced, went straight to the Managing Director. He had gone on for a year and more stealing cash and falsifying the books in a desperate attempt to recoup losses on investment deals. Hundreds of such cases are reported every year, and more occur but are not made public. It is part of the duty of wise management to provide against such risks.

**Piece of
mind costs
very little**

For about £5 a year (perhaps less, depending on length of service and other factors) a cashier can be covered up to £1,000 under a 'General' Fidelity Guarantee Policy. Your entire staff, secretaries, clerks, branch managers, travellers and collectors can also be covered individually or collectively. Each case is treated on its merits and no full particulars of duties and degree of responsibility and we will gladly quote a rate for your needs. Get in touch with us today.

Please send me full particulars of 'General' Fidelity Guarantee Policies.

Russian Imports of Rubber

In the past year Russia has become an important purchaser of natural rubber, and in 1948 its net imports, estimated at 100,000 tons, were next in volume after the United States and Britain. In 1947 Soviet imports amounted to 35,200 tons, as against 26,800 tons in 1938. It is not easy to determine how far these imports can be taken to represent current consumption. American consumption of natural rubber amounted to 627,300 tons last year, and British consumption was 193,700 tons. In comparison with these two countries a consumption of 100,000 tons a year is by no means large, but then Russia produces its own synthetic rubber and presumably takes a large part of the output of the Soviet zone of Germany. Since Russian use of motor vehicles on the roads is relatively less than in America or Britain, the sharp rise in imports last year suggests that part of these purchases may have gone to a strategic stockpile.

How far can the rubber market count on this increased Russian demand? Imports in the first seven months of this year have been on a larger scale than in 1948; they totalled 72,150 tons, which is equal to an annual rate of about 123,500 tons. If this quantity is for consumption at least 100,000 tons can be expected to go to the Soviet Union each year. Even if it is for stockpiling, Russia could hardly have accumulated an adequate reserve from only last year's and this year's purchases.

An interesting feature, however, is the changing pattern of Russian imports. These came mainly from Malaya in 1947 and 1948 with the addition of between 4,000 and 6,000 tons from the United Kingdom. In 1938 a larger quantity and a larger proportion of the total came from Britain, 14,000 tons out of a total of 26,800 tons; the remainder came from the Netherlands. But Russia has recently imported some 18,500 tons from the Netherlands, practically all of which was shipped between May and June of this year. Only 10,300 tons of this quantity was Indonesian rubber; the remainder came originally from Malaya and was transhipped through Holland. Last year

the Dutch transit trade cost the sterling area some \$5,000,000 through the sale of nearly 13,500 tons of Malayan rubber to the United States, but those re-exports have been cut, and amounted to only 380 tons between April and June of this year. But the Dutch transit trade in rubber is still increasing. In June it amounted to 20,000 tons, of which 8,500 tons came from Malaya. It seems to reflect the competition for scarce currencies.

Government Control in Oils and Fats

Oils and fats are the category of foodstuffs in shortest supply, and according to the latest estimates of output they are likely to remain so for the next two or three years. An interesting attempt at international comparison of the controls on oils and fats and their important manufactures, margarine and soap, is provided in the accompanying table, from the latest report of Lever Brothers and Unilever. Of the twenty-five countries listed, only eleven enjoy freedom of trade in oils and fats, though in five other countries supplies are only partially controlled. Seven countries continue to ration margarine, but only four countries are still rationing—or partially rationing—

soap. Two of these are Austria and western Germany where the ration is only partial, and the other two are Denmark and Britain. Several countries have decided to abandon the intricacies of the rationing system, but few have restored free prices; only five of the countries listed have decontrolled margarine prices while soap prices are free in twelve.

* Vegetable oils. † Limited production for sale to low-income groups.
Source: Lever Bros. & Unilever. Annual report to stockholders.

There are six countries (Brazil, Canada, Ceylon, Italy, Thailand and USA) where trade in oils and fats, margarine and soap is completely free; three of them are in the western hemisphere, where there is a relative surplus of oils and fats and where prices have fallen recently; two of them are producing areas, while in Italy the trade in margarine is very small. On the other hand there are only three countries where the trade in oils and fats and the finished products is controlled at all stages, wholly or partially, both by rations and prices. These are Austria, western Germany and Britain.

Industry

Utility Price Cuts Defined

The President of the Board of Trade has signed the Orders which will bring into operation on September 26th the "five per cent" cut in the price of utility clothing and textiles to the consumer. Draft proposals were first discussed by the President with the representatives of manufacturers and distributors, and the final form of the Orders shows no great change. As the retailers feared, the heaviest cuts fall on them. The price reduction for clothing and footwear starts at the making-up stage. Cloth manufacturers are outside the scope of the scheme, and indeed the expectation in the trades concerned is that their prices will soon rise. The ceiling prices of the garment makers are reduced by one per cent, or two per cent if the manufacturer sells direct to a retailer. The wholesaler's margin, which is expressed as a percentage of the ceiling price, is reduced from 17½ to 16½ per cent, or proportionately if the margin is lower; this is equivalent to a reduction of 7 per cent in the gross margin. The retailer's margin is reduced

HARVEST HOME

Handling and storing the world's grain crops is an enormous operation, in which Simon engineering plays a prominent part. Simon machinery loads some two million tons of grain a year into ocean-going ships and discharges it at the ports of arrival. Many a British and European loaf is made from wheat that has passed through a Simon granary or handling plant on the other side of the world, and there is a Simon plant at every grain-receiving port in the British Isles. All four of the great port granaries so far built for the Argentine Government's national grain elevator scheme have been equipped by Simon. One of them is the largest in the southern hemisphere, but even this will be eclipsed by the fifth new elevator now under construction in Buenos Aires. This too will be equipped by Simon and will earn nearly two million pounds of valuable foreign currency for Britain.

One of many ways in which the Simon Engineering Group serves the fundamental needs of civilisation.

LONDON • W1

by about 2½ per cent of the retail price, or 14 per cent of the gross margin. The original intention appears to have been to reduce the manufacturer's ceiling prices by 2½ per cent, but the intention was modified when it was pointed out that the total reduction to the consumer would then have exceeded 5 per cent.

For household textiles there is no maker-up's margin available for the President to cut. He has decided to cut the wholesaler's margin on returns from 15 to 14 or from 12½ to 12 per cent, and the retailer's margin by one "conventional step," e.g., from 30 to 27½ per cent of the selling price. This will not produce the full reduction of 5 per cent which was promised, and it appears that on this class of trade the President has been obliged to give way. The impression is confirmed that the cloth manufacturer's prices are regarded as untouchable at present.

The distributors argue that the manufacturers, since more than half of them are selling below their permitted ceiling price already, will largely escape the incidence of the cuts. They submitted alternative proposals to Mr Wilson, who has promised to "consider" them, but with no apparent result. It may be that the Board of Trade is anxious not to make utility production less attractive to the garment manufacturers. But the retailers hold strongly that the cuts will prove intolerably severe on those of their number who handle a large proportion of utility goods, and they expect disturbed trade conditions in the autumn.

* * *

The Colliery Winders

The colliery winding enginemen in Lancashire and Yorkshire, after a strike which in two or three days caused a loss of more than 300,000 tons of coal output, decided on Tuesday and Wednesday to go back to work. They made the decision under persuasion from their leaders, and after receiving assurances from the National Coal Board that there would be no victimisation if normal working were resumed at once. The dispute, so far as it concerns the wages of the winding enginemen, now goes to arbitration. But their dispute with the National Union of Mineworkers, which underlies the whole episode, shows every prospect of continuing to smoulder. It was noted in *The Economist* last week that the Minister of Labour, who threatened the winders with the rigour of the law if they persevered in their intention to strike, was displaying towards a small craft union a degree of sternness which he is unaccustomed to show towards the big industrial unions. The National Coal Board, concerned first of all to keep the coal-fields working, was more conciliatory. For this it was criticised as "lackadaisical" by the president of the National Union of Mineworkers, Sir William Lawther, who, while the winders' delegates at Barnsley were still trying to come to their decision, demanded the full penalty for their "treason" and protested against "appeasement." No doubt the Coal Board, and the winders themselves, are aware that if every unofficial strike had been treated as "treason" the membership of Sir William's own union would have been a good deal depleted before now.

The winders' action has withheld urgently needed coal, and to defend it would be foolish. There is, however, truth in their contention that their position relatively to other mineworkers has changed greatly for the worse in the last ten years. Further, there is apparent truth in their contention that this is because the National Union of Mineworkers has not adequately represented their interests. They do not enjoy recognition by the Coal Board, which therefore has not negotiated with them in the past. But it seems that the Board will have to consider either giving some degree of recognition or making a new arrangement to ensure that their interests are better represented in the future. The National Union of Mineworkers also needs to reconsider its relations with the winders; otherwise it is hard to believe that there will not be more trouble.

A British View of German Steel

An article in the *Statistical Bulletin* for July of the British Iron and Steel Federation makes a serious attempt to examine two urgent questions relating to the German steel industry: how is it to be owned and controlled, and what relations is it to have with the other steel industries of Europe? The attempt is somewhat clouded by the question of dismantling, which German opinion obstinately refuses to treat as a settled thing. The writer in the *Bulletin* himself describes the agitation over dismantling as a "smoke screen"—by which he means presumably that the Germans are using it to distract attention from economic difficulties and unpleasant questions of reorganisation which they are reluctant to face.

A serious long-term programme for modernising and re-equipping the industry would undoubtedly pull out a great deal more plant than is being removed for reparations under the present plan, and a good deal of the plant now being dismantled would be included.

This thesis is difficult to reconcile with an admission earlier in the same article that the agreed four-Power policy was to remove "the best equipment" for reparations; modernisation and re-equipment do not normally aim at removing the best plant and retaining what is old and inefficient.

The termination of dismantling is, however, only one point of the policy recently outlined by Herr Barich (whom the *Bulletin* quotes) and other leaders of the German iron and steel industry. Other points are a reform of the present irrational cost structure, and a programme of technical improvement which would fit the industry for unsubsidised competition in the export markets. The article clearly anticipates a revival of German export competition in the next few months. But long-term rehabilitation of the industry will require large investments of new capital, which the Germans hope to secure partly from German sources and partly from foreign investors; they are thinking a good deal about inviting foreign participation in ownership.

There is a clear need for an agreed Anglo-American policy which would permit some of these questions to be settled. But such a policy is almost impossible so long as the British and American governments hold completely opposite views on the future ownership and control of the industry. If these opposite views are rigidly maintained, the British Iron and Steel Federation evidently fears a revived Continental steel cartel in which the Germans would participate but from which Britain might be excluded. What it would prefer to see is clearly suggested—"a regime which includes fair competition and a moderate degree of governmental control" for the European steel industry as a whole, and a German industry in the hands of persons who "can and will honestly join with the other European steel industries in accordance with government policies in organising their affairs for the common good." There seems to be no demand at Steel House for unqualified freedom or unrestricted competition.

* * *

Recovery in Radio Sales

The radio industry has done better in the first half of 1949 than its declining output and falling sales in 1948 would have suggested. Home sales fell before the budget, but the recovery was sharp. The prevailing impression in the industry is that business has been better than in the first half of any year since the war; it believes that the improvement represents a genuine increase in demand, and not solely an accumulation of postponed buying. The increase is the more encouraging to the industry since it has taken place at a time of year when activity is usually low. The sales index prepared by the Radio and Television Retailers' Association (which dates, unfortunately, only from last September) shows the average number of sets sold by each retailer in a month. In September the figure was 10.26 sets per retailer. In October the industry ran a "better listening" campaign, and the index jumped to 13.05. Sales in November were back to 10.97; in December, Christmas sales brought them up to 16.11. The monthly

figures for 1949 included in the following table suggest that sales may recover by September to last year's level. The radio exhibition in October will provide a stimulus to sales in that month also. The figures suggest a surprisingly large number of retailers in relation to the volume of business done. But they have improved since before the war, when between 15,000 and 20,000 retailers shared in the distribution of little more than 100,000 sets a month.

Production has remained well below last year's average. Manufacturers were discouraged by the accumulation of retail stocks in the later months of the year, and felt that the peak of demand had been passed. Production in 1948 tended to decline; but this is not a fully reliable guide to activity in the industry generally, since production of television receivers was increasing at the same time. Since a television receiver contains 200 or more components compared with 40 or 50 in an average radio set, it is clear that general activity has declined less than unit production. Measured by a rough

	Total Production	Total Export	S. Africa	Export to India	Egypt	*Index of Home Sales

July	...	22.4	10.0	2.3	1.9	9.48

* Index prepared by the Radio and Television Retailers' Association to show average sales per retailer in England and Wales.

estimate of the number of components, monthly production this year has been 12.5 per cent below the 1948 average. It appears that retailers have been depleting their stocks; the prospects for manufacturers' sales may, therefore, have improved. The industry attributes the recent improvement in sales to a steady price reduction. In the last quarter of 1948, the average price of a radio set was £25 10s. It is now down to £22. In the same period the price of television receivers declined 12 per cent.

Export sales have also been unsteady. The industry's main markets are in the Far and Middle East, in countries which have no radio industries of their own. Several of these countries restricted the issue of import licences at the beginning of the year, but these markets have since reopened. The fluctuations in exports to South Africa reflect some forestalling of the South African import restrictions, but the Union has no domestic radio industry, and licences for the import of the lower-priced sets will still be issued.

* * *

Production Indices Compared

The recent official pamphlet describing the Interim Index of Industrial Production has provided the London and Cambridge Economic Service with an opportunity to compare its own index with the structure and methods employed by the Central Statistical Office. The comparison is made by Messrs. W. B. Reddaway and Arthur Adams in the August issue of the *Bulletin* of the London and Cambridge Economic Service.

The two index numbers have in general moved in a similar way, but between 1946 and 1948 the official index has shown the greater rise—21 per cent against 18 per cent. No single explanation can be given for the divergence. Different weighting systems are used in the two calculations, but—as with many other index numbers—strict accuracy here seems to have less effect than other factors have. The explanation lies rather in the different indicators which are used to represent the output of the same industry. For a variety of reasons the difference between the results lies sometimes one way, sometimes the other; and the surprising thing is not that the two index

numbers have moved differently, but that the divergence has not been greater. In total, the two index numbers are not widely separated; but this masks much larger variations for some individual industries.

In certain respects the official calculation is the more thorough. It includes a more scientific assessment of the work done in merchant shipbuilding and of the output of the building and contracting industry—although, oddly enough, it omitted altogether the production of non-aluminium hulls for temporary houses. But the laws of chance are such that much the same final result for building has been obtained by the cruder methods of the London and Cambridge measure. In only one general principle do the two indices differ—the official one avoids the use of employment figures, except "to extend the index for part of an industry to cover the whole of it." Employment is obviously a poor guide to output since it assumes constant productivity per man, but the London and Cambridge Service may be right in using it as the best available guide to output in a few "difficult" industries. Certainly this may well apply to scientific instruments, where the official index uses, instead, merely the output of ophthalmic lenses and photographic plates, films and sensitised paper. Ophthalmic lenses, in view of the enormous demand for spectacles created by the National Health Scheme, are obviously unrepresentative nowadays; and the photographic materials are in fact included elsewhere in the index. Who is to say whether it is better to represent the output of clothing by the yardage of cloth supplied (the London and Cambridge method) or by the value of sales reported by a panel of makers-up, and deflated by the index of retail clothing prices (the method used by the Central Statistical Office)?

As more comes to be known about the two indices in operation, it does seem that their compilation independently of each other serves a useful purpose. It may be felt that the Government statisticians, with access to fuller material, ought to produce the more accurate measure; but it is not yet possible to demonstrate that they have done so. The comparison draws attention once more to the many difficulties and weaknesses which beset an index of this type. A more detailed statistical analysis of the differences might suggest improvements which could be made in both indices.

Shorter Notes

The President of the Board of Trade, in announcing on Thursday the signing of the Orders which are to give effect to the utility price cuts (discussed on page 470) also announced that he had signed Orders to release a wide range of non-utility goods from price control. They include most non-utility piece goods (except wool fabrics other than hand-woven tweeds), some clothing, non-utility furniture, domestic goods such as hollowware, heaters and electric clocks and many miscellaneous articles.

*

Securities on which capital, dividends or interest is payable or repayable in Belgian Congo or Luxemburg francs have been added by the Treasury to the list of prescribed securities. These may now be purchased only by United Kingdom residents or by non-residents with Belgian account sterling.

*

In the eighth schedule of valuation issued since the gas industry was vested on May 1st, compensation values for 55 stocks in 30 gas companies are given. Three per cent Gas stock, 1990-95, issued in compensation at par, stands currently at 91½.

*

An air transport agreement, which has been signed in Canada between United Kingdom representatives and the Canadian Minister of Transport, gives the United Kingdom five routes across Canadian territory. Canada gets four routes over the British Isles and British colonies.

HOOVER ENTERPRISE BENEFITS ALL

The Housewife

In the manufacture of labour-saving equipment for the housewife, Hoover Ltd. hold a place that is second to none. No two domestic appliances are doing more to reduce arduous labour in the home than the world-famous Hoover Cleaner and the wonderful new Hoover Electric Washing Machine.

The Industrialist

Manufacturers of all types of industrial, agricultural, domestic and commercial appliances have created a large demand for Hoover products — Fractional Horse Power Motors, Shaded Pole Motors, Plastic Commutators and Switches. And new uses for Hoover equipment are being discovered all the time.

The Whole Nation

Since British National prosperity depends on exports, the huge export trade Hoover have built up benefits the whole nation. Even before the War, Hoover had a large trade with many parts of the world, and today their Sterling exports are actually fifteen times the pre-war figure.

THE ANGLO-PALESTINE BANK LIMITED

ISSUE OF NEW CURRENCY

AGREEMENT WITH ISRAEL GOVERNMENT

DIVIDEND OF 13 PER CENT

MR S. HOOFIEN'S STATEMENT

The forty-seventh annual general meeting of the Anglo-Palestine Bank, Limited, was held at the registered offices of the Bank, 6, Gracechurch Street, London, E.C., on August 22nd.

The following is the statement of Mr S. Hoofien, the chairman, which had been circulated with the report and accounts for the year to December 31, 1948:

The report and accounts have been presented somewhat late this year. Your directors had hoped that double taxation arrangements between the United Kingdom and Israel would have been completed, but at the time of issuing this statement the formalities have not been concluded, and the directors did not wish to postpone any further the presentation of the report and accounts.

NEW ISSUE DEPARTMENT

The accounts for 1948 present a new feature of particular interest in that they include the balance sheet of the bank's new issue department. It will be remembered that since 1927 the country's currency was the Palestine pound freely convertible into sterling, and issued by the Palestine Currency Board, whose members are appointed by H.M. Government in the United Kingdom and whose seat is in London. On February 22, 1948, Palestine was placed outside the sterling area. The United Nations' General Assembly, in a resolution of November 29, 1947, decided to partition Palestine into two independent states to be joined in an economic union which was to be administered by a specially constituted economic board. One of the major functions of this board was to deal with currency, and it was contemplated that the Palestine Currency Board would continue to function until the Economic Board had arranged for the setting up of the new currency machinery.

The resolution of November 29, 1947, was, however, not allowed to be peacefully implemented and the Economic Union and Economic Board were not set up. Consequently, the State of Israel, which was established upon the termination of the mandate, found itself with a currency controlled by a body which had ceased to function within its territory and which was controlled by a government which did not recognise the existence of the State and entertained no diplomatic relations with it. In the circumstances the Government of Israel decided to issue a new currency, the unit being the Israel pound, at parity with the pound sterling.

PROVISIONS OF NEW ORDINANCE

The government approached our bank to undertake the issue of this new currency and the bank undertook to do so under an agreement dated August 16, 1948, which is incorporated in the Bank Notes Ordinance No. 18 5708-1948, establishing for the purpose an issue department which functions separately and distinctly from the other departments of the bank. The main provisions of the ordinance and the agreement are:—

- The banknotes are legal tender;
- Existing contracts and liabilities ex-

pressed in Palestine pounds are automatically considered to be expressed in Israel pounds;

- The Anglo-Palestine Bank has the sole right of issuing banknotes in Israel;

- The government is precluded from issuing currency notes except in denominations lower than 500 mils;

- The transactions of the issue department are to be kept entirely separate from all other transactions of the bank;

- The assets of the issue department, but those assets only, are charged in favour of the holders of the banknotes, the bank not being liable to satisfy banknote holders out of its other assets;

- In cover of at least 50 per cent. of the total circulation the issue department shall hold gold, balances in approved foreign currencies and Palestine Currency Board notes (later the Bank Notes Law of 5709-1949 was passed which permits the holding, additionally, of Land Bonds issued by the government);

- In cover of the balance of the circulation, the issue department will hold Treasury bills, short-dated government securities, bank bills rediscounted and secured bank loans;

- The operations of the issue department and its profits and losses are solely on government account;

- The bank shall be the sole banker and financial agent of the government;

- The agreement between the government and the bank is to remain in force until June 30, 1951, but can be terminated earlier at the end of any quarter by giving to the bank prior notice of not less than six months;

- Upon the termination of the agreement all the assets and liabilities of the issue department shall be transferred to the government or such body as will be designated by the government for the purpose.

The exchange of the Palestine Currency Board notes for the new banknotes was carried out smoothly in the course of a few weeks. The redemption of the currency notes by the Palestine Currency Board naturally took a longer period but was effected equally smoothly.

EXTENSION OF BUSINESS

The difficult political and military conditions to which the country was subject in 1948 are well known from the considerable publicity which they have received. The administrative machinery had deteriorated to such an extent during the months preceding the termination of the mandate as to have reached a state of complete breakdown. However, within the territory of Israel it was quickly restored, and the country was able to carry on its business and other activities under fairly orderly administrative conditions. All the bank's branches and its business are within Israel territory, so that we experienced no particular difficulties. The prevailing conditions resulted in a considerable extension of business. Current, deposit and other accounts show an increase of £12.7 million, advances to customers £7 million and confirmed documentary credits £2.1 million.

We feel happy in having been able to assist agricultural and industrial production and to encourage the import trade through credits which have been carefully examined in each case, with a view to reducing their inflationary effect to a minimum, and increasing their useful effect in the direction of stimulating production and supply. The government has invited us to take over the administration of government loans and we have set up a special department for the purpose.

PROBLEM OF LIQUID BALANCES

The cessation of the functioning of the Palestine Currency Board in Palestine confronted us with a grave cash problem, particularly as most of the local banks and co-operative savings societies keep their main liquid balances with us and rely on us for providing them with cash when required. Upon being advised that the Palestine Currency Board would suspend its operations in the country, we had no choice but to liquidate the greater part of our holdings in British government securities and increase our holdings of Palestine currency notes. We kept an unusually high cash balance, incurring a considerable loss of interest and a most unwelcome risk in a troubled period. The issue of the new Israel currency provided us with a solution of this problem. Our liquid balances problem, which had become rather delicate after the exclusion of Palestine from the sterling area, was solved by the issue of Israel Government Treasury bills which now form a large part of our liquid reserves.

The exclusion of Palestine from the sterling area, on February 22, 1948, naturally presented the country with a difficult problem. To cover outstanding commitments an amount of £14.3 million was freed from Palestine balances in London. Negotiations subsequent to May 15, 1948, and until the end of March, 1949, conducted between our bank and the Bank of England resulted in the freeing of a further £6.5 million for food, fuel and general imports. The amount of these releases being based on the requirements of the whole country, an appropriate proportion was placed by us at the disposal of other banks. Releases were also made direct to other banks to an amount of £350,000.

Following upon the de facto recognition of the Government of Israel by H.M. Government, the negotiations for releases and on ancillary matters were transferred to Treasury level. An Israel financial delegation visited London in May, 1949, and the results of the negotiations were further agreed releases to a total amount, under various headings, of £6,950,000, for the period ending October, 1949. Our assistant general manager, Mr David Israeli, served on this delegation. These negotiations, the first official ones between H.M. Government and the new State of Israel, were conducted in a spirit of cordiality and of mutual understanding.

SUBSIDIARIES

The business of our main subsidiary, the General Mortgage Bank of Palestine, Limited, remained stationary during the year. The local capital market was brought into the service of the war effort to such an extent that it could not absorb additional debentures of that bank. The dividend on its preference shares and ordinary shares has been maintained at 6 per cent., subject to tax. The APB Investment Company, Limited, was in a position similar to that of the General Mortgage Bank, but still succeeded in extending the scope of its activities.

Our two subsidiaries, the Otsar La Taasiya, Limited, which grants medium and long-term loans to industry, and the Otsar La Haqla-uth, Limited, which grants similar credits to agriculture, have extended their business to a moderate degree. I am particularly happy to be able to state that neither the bank nor its

subsidiaries have experienced any appreciable losses in consequence of the war conditions.

RESULT OF YEAR'S OPERATIONS

The profit and loss account shows an increase on the profit for the year from £198,387 to £255,282. However, account has to be taken of the fact that the dividends on both the preference shares and the ordinary and "A" ordinary shares have been given gross (as against net last year) so that the actual increase in profit shown is somewhat above £15,000. Your directors, having already made a generous pre-balance-sheet provision for contingencies, have considered it unnecessary to make a further appropriation to contingencies reserve from the profit and loss account. They have appropriated £160,000 to the reserve fund bringing it up to a total of £660,000.

You will be interested to learn that the Inland Revenue authorities in the United Kingdom have agreed to regard the bank as non-resident in the United Kingdom for taxation purposes, with effect from April 6, 1947. This, of course, relieves the bank from the liability to pay United Kingdom tax on profits earned outside the United Kingdom. Your directors recommend a total dividend for the year on the ordinary and "A" ordinary shares of 13 per cent. subject to income tax. On account of this total dividend an interim dividend, free of tax, of 3 per cent. was made on October 21, 1948. It will be noted that the gross dividend now being recommended, as against our customary tax-free dividend, will result, for United Kingdom residents, in a net dividend approximately the same as that paid for the year 1947. I may not close my remarks without paying tribute to the management and staff for their utmost devotion and energy during a difficult year.

The report and accounts were unanimously adopted.

BRITISH MATCH CORPORATION, LIMITED

SATISFACTORY RESULTS

The twenty-second ordinary general meeting of the British Match Corporation, Limited, was held on August 19th, in London.

The following is an extract from the statement by the chairman, Mr Arthur Hacking, O.B.E., for eleven months ended March 31, 1949:—

The average return on the Corporation's investments, including subsidiary and trade investments, is 9.345 per cent., as against 9.029 per cent. In view of the difficult trading throughout the world, we consider this return exceedingly satisfactory.

As I told you last year, there had been no change in the price of matches since July 31, 1940. There have, of course, been very considerable increases in costs of raw materials and wages since that date. This was appreciated by the Chancellor, and in the budget of April last the manufacturers were given 7d. per gross towards their increased costs; at the same time the excise was increased by no less than 5s. 5d. per gross.

Since 1939 it has not been possible to get any timber supplies from the Baltic countries. Almost all our supplies come from Canada. Our allocation of dollars for these purchases has been very severely cut, so much so that we anticipate a reduction in home-produced matches, in spite of all economies which we are able to make.

Your board recommend the same dividend and bonus as last year without withdrawing any sum from dividend reserve and has been able to add approximately £10,000 to the carry forward. It is impossible to foreshadow the results which 1949-50 may bring forth.

The report was adopted.

PINCHIN, JOHNSON AND ASSOCIATES, LIMITED

STRONG CONSOLIDATED POSITION

RECORD HOME AND OVERSEAS SALES

DEVELOPMENT AND EXPANSION CONTINUED

MR C. G. HEYWOOD'S STATEMENT

The annual general meeting of Pinchin, Johnson and Associates, Limited, was held on August 25th at Tigbourne Court, Witley, Surrey. Mr C. G. Heywood (the chairman) presided.

The directors' report stated that the parent company's net profit for the 12 months ended March 31, 1949, was £955,017. Value of sales both home and abroad again established a new high record, but net profit from sales in the United Kingdom showed a decrease owing to increased material and labour costs which were not recoverable owing to fixed selling prices. The decrease was largely counter-balanced by increase in profits of the company's overseas operations. All overseas companies have shown considerable growth of their local business, and during the last two years approximately £600,000 capital has been invested in such companies.

The Chairman's statement was as follows:

The balance sheet of the parent company and the consolidated accounts have been prepared in accordance with the provisions of the Companies Act, 1948. In so far as the balance sheet of the parent company is concerned, comparative figures for the preceding year are shown. For the consolidated balance sheet previous figures are not shown, for the reason that this is the first year of the presentation of a consolidated balance sheet. The same applies to the consolidated profit and loss account. Comparisons will be available with all future accounts.

I desire to draw your attention to certain items as follows:

PARENT COMPANY'S BALANCE SHEET

The issued ordinary share capital was increased during the year by 730,500 shares, and the premium obtained by the company, after deducting all expenses in connection with the issue, is shown in the share premium account.

It will be noticed also that the general reserve account has increased by approximately £58,000. This is due to a reallocation of reserves during the year. A sum approximating this amount, which had been standing in our books as a provision for depreciation of fixed assets and which, in our last accounts, had been deducted before arriving at the balance sheet value of such assets, has been transferred to general reserve. Adequate depreciation has been written off in the past, and this additional provision is in excess of that which, in the opinion of the directors, is reasonably necessary for the purpose. The present value of our fixed assets is considerably higher than the balance sheet figures.

During the year the bank loan of £1,000,000 was repaid.

CONSOLIDATED BALANCE SHEET

Total shareholders' funds, omitting the reserve for future taxation, amount to £5,773,055.

The ordinary capital of £2,191,500 is therefore covered by net assets having a book value of £4,973,055 and of the latter figure only a small proportion, i.e., approximately £41,000, is represented by the intangibles, goodwill, patents, trade marks, and certain capital issue expenses of overseas companies not written off.

It should be explained that, whereas the

balance sheet of the parent company has no goodwill item, this having been written off entirely some time ago, the consolidated balance sheet shows goodwill, patents, and trade marks of £40,737 and capital issue expenses, less amounts written off, of £297. Both these items appear in the balance sheets of overseas subsidiary companies. The small item of capital issue expenses will in future be eliminated, but in the case of goodwill, patents, trade marks at the sum of £40,737 it may be desirable to maintain this to conform to local custom.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

This discloses that the total net profits of the company and its subsidiaries for the year amount to £1,276,435, of which £679,312 is absorbed by total taxation and £78,690 is applicable to outside shareholders, leaving £518,433 as the parent company's proportion of net profit for the year.

Of the latter sum, £28,578 has been transferred to the parent company's portion of reserves in the overseas subsidiaries accounts, £455,017 dealt with in the parent company's own profit and loss account, and the balance of £34,838 added to the parent company's portion of profit carried forward in the accounts of the overseas subsidiary companies.

It is as well to point out that the dividends from associated companies, as distinct from subsidiaries, are included in the item "Income from Trade Investments."

As you will see from the balance sheet, there have been considerable expenditures under the heading of plant and machinery during the year. This is in line with our determination to erect new producing units, or re-arrange existing ones so as to have optimum mechanisation. Part of these expenditures is paid for by compensation for war damage.

GENERAL REVIEW

In last year's statement I made reference to the fact that the authorities were not prepared to permit us to proceed with our rehabilitation in all respects, and that we were by no means satisfied with this situation. It is a matter of some satisfaction to record now that permissions have been granted. As a result of this we intend to proceed with a completely new building in the London area, with the most modern layout, designed for large volumes of highest quality products, and with maximum flexibility of operation.

We have completed a separate small batch factory, sited at the principal group works in London. For works scale experimentation its value is important, besides providing capacity to deal with relatively small order batches to suit the very individualistic needs of a variety of customers, and relieving the bigger producing units of uneconomic loads.

The principal group works suffered great war damage to its medium, processing, and storage departments. We can now announce that a completely new building, very much more spacious than previously provided, is completed, and is now being equipped with its process plant and tankage. The completion of this marks yet another stage in our rehabilitation, and increases the over-all efficiency.

I do not wish you to be under the impression that our rehabilitation is complete or that our factory replanning is finished. It is our intention to proceed with further installations, including bulk resin and medium making plant, notwithstanding the fact that our present installations must be some of the largest in the country.

I am convinced that the investments we have made in improved capacity will pay handsome dividends in increased productivity, increased control of product, and lower over-all labour costs and supervision.

Believing, as we stated last year, that if we motivate increased production by means of incentives, we are good economists, it is proper to tell you that all the company's workers and staff received a bonus on their wages and salaries for 1948. Continuity of bonus depends upon the prosperity, measured by profit, of the company.

DIRECT AND INDIRECT EXPORTS

The over-all volume of production achieved, and the disposal, in terms of sale volume, showed a substantial increase for this period over the preceding one. This is all the more remarkable in view of the fact that some heavy tonnage lines for domestic utilisation suffered considerable declines in volume sales.

Our direct exports were approximately 12 per cent. of the total exports achieved by the industry as a whole.

I made use of the expression "indirect exports" in my statement to you last year, and I consider it desirable now to explain the meaning of this term. To us it means all the sales of industrial coatings to our British customers which are used by them on their exported goods. Excellent examples of these are motor-cars, cycles, refrigerators, etc. Our estimation is that 33 per cent. of our total home sales in the year 1948-49 formed such "indirect exports."

OVERSEAS DEVELOPMENTS

I have referred on previous occasions to the unquestionable trend towards greater industrialisation in many of the overseas markets which were formerly catered for by export from the United Kingdom. It appears to us that political considerations will definitely foster and favour, by protective measures, local enterprise on account of the need to give employment to increased populations in their cities.

It will interest you to know that the

managements of our American, Indian, Australian, and Argentine manufacturing enterprises are in this country to consult with our executives as to the desirability and ways and means of expanding capacity and financing the cost thereof.

I have mentioned before, and I continue to maintain, that it should still be possible to export certain types of highly technical materials of our manufacture to the markets in question in spite of local manufacture, and I have also always hoped that each manufacturing unit we acquired, whose capacity we overhauled and enlarged, would, in itself, be a customer for some of our basic primary and intermediary products, and thus form a continuation of our export volumes from our United Kingdom factories.

I remain convinced that the resources of our Commonwealth and Colonial Empire will, in due course, come into the supply position because, if only development and distribution can be proceeded with, I feel sure that they are rich in resources.

I am still convinced that vegetable oils will continue as indispensable bases for our surface coatings, and that new techniques will make possible the use of many colonial materials, where climate, soil, and labour conditions are all in their favour, and only inspiration and impetus appear to be lacking.

I am stimulated at the prospect of great petroleum refineries being installed in the United Kingdom. The proper utilisation of coal resources, the agricultural developments that I believe are practical in our colonial territories, together with the development of chemical activity arising from petroleum technology established in this country, may profoundly affect our industry's surface coating techniques.

COMPETITIVE INDUSTRY

Reference has been made in the directors' report to the fixing of home trade prices, and its effects on profits. Possibly it is desirable to amplify this. It should be explained that the Board of Trade approached the industry to negotiate an undertaking whereby an over-all reduction of 7½ per cent. of the profits would be aimed at, to be achieved by the reduction of prices in the home market. It is stated in the directors' report that, but for export revenue and revenue from overseas companies, our profit would be more adversely affected by the incidence of this directive.

It should not be forgotten that the paint industry is a highly competitive industry,

and it is obviously the desire of each member to maintain the good will and extended custom of its clientele and to make the best products for each specific purpose, fixing its prices accordingly.

It would be apposite to speak of commodities and commodity values. If confidence is lost in commodity values, buying tends to become hand to mouth, and production follows the same pattern, resulting in high costs in consequence. That is why, in my last statement, I stressed the desirability of stability. But stability out of line with world reality in prices is untenable, as export competition is thus prejudiced. In consequence, the responsibilities of Government in bulk buying are indeed great. Particularly is this true in the history of the linseed oil supply position in our industry.

THE FUTURE

It is my sincere conviction that surface coatings and paint will not be ousted. It may well be that momentarily and on a short term view surface coating activity, in the maintenance field, is temporarily suspended. But suspension in maintenance is only deferment.

One cannot avoid the thought that if it is true that Great Britain itself serves as a valuable dollar earner on account of its tourist traffic, the refurbishing of many areas needing paint might well form a valuable field for the relief of unemployment, if our own essential export industrial effort was in any way jeopardised in such a way as to cause temporary unemployment in industry.

To summarise we look upon the immediate future as full of difficulties and frustrations; but this should not deter us from our ultimate aim and our real confidence in the continued success of our undertaking. We reaffirm our complete confidence in our ability to cater for an expanding need and the diversification of the demand required of us, by reason of the spread of our activities.

In conclusion, I am sure you will join me in thanking all members of the staff and all workers, for their continued co-operation and loyalty.

The report and accounts for the year ended March 31, 1949, were adopted and a final dividend of 17½ per cent. (less tax) was declared on the Ordinary shares, making 25 per cent. (less tax) for the year.

The retiring directors were re-elected and the auditors' remuneration was fixed.

NOTICES

UNIVERSITY OF QUEENSLAND

Applications are invited for the post of Professor of Economics. Salary £A1,350/£A1,600 p.a., plus cost of living allowance (at present £A23 10s. p.a.).

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1. The closing date for the receipt of applications is 15th October, 1949.

CENTRAL OFFICE OF INFORMATION. Government Social Research unit requires Research Officer to assist with Consumer Expenditure inquiries. The post requires a knowledge of statistical methods and involves close contact with field staff. Candidates should be graduates with some experience of the techniques of survey field inquiries, preferably in the expenditure or some allied field. The post is graded Temporary Higher Executive Officer, salary—Male £675 to £860, Female £550 to £675.

Written applications, giving date of birth, full details of qualifications and experience, including dates should be addressed to London Appointments Officer, Ministry of Labour and National Service, 1-6, Tavistock Square, London, W.C.1, quoting reference number BJ 91. Original references must not be forwarded. Only candidates selected for interview will be advised.

B.A. (Aged 28), top 2nd class honours Modern History and Politics, ex-R.A.F., competent lecturer, able writer with specialised journalistic experience involving scrutiny of large volume of printed material, seeks post in which these qualifications, together with ability to make sympathetic personal contacts, may be utilized. Adult education, journalism, publishing, research, etc. Suggestions invited. Box 173.

FOR SALE: "Keesings" Weekly Diary of World Events. Complete July, 1931 to July, 1950, 7 vols., 11,000 pages. 155 or best offer.—Box 164.

RESEARCH in Applied Social Science. The Tavistock Institute of Human Relations invites applications for the post of Social Scientist (male) to join a team engaged on research on the communication and practical application of industrial sociological developments. Candidates, who should have experience in or knowledge of, industry, must be University graduates, preferably in psychology, sociology, anthropology, economics or medicine. Appointment will be for 1 to 2 years. Salary from £1,000 to £1,200, according to qualifications and experience.

Enquiries to The Secretary, Tavistock Institute of Human Relations, 2, Beaumont Street, London, W.1.

SOCIAL Statistics. The Tavistock Institute of Human Relations offers a one year Training Fellowship in Social Statistics, available October 1, 1949.

Candidates should have an Honours Degree in Statistics; or one in Mathematics; or in a Social Science, such as psychology, which includes statistics. Training would be in the practical application of statistics to social problems and there would be some opportunity for practical experience in statistical methods as applied to specific industrial field research. Experience in the general application of statistics to social problems would be desirable.

Training grant: from £400 to £650, according to qualifications and experience. Enquiries to The Secretary, Tavistock Institute of Human Relations, 2, Beaumont Street, London, W.1.

SALES MANAGER required by large and long established firm manufacturing food specialities. This position is in London and offers an excellent opportunity to the right man, who must possess first-class organising ability and provide dynamic leadership to the sales force. Full particulars, please, including age, experience and salary required. Box 355, 11, Grosvenor Hill, London, W.1.

PERSONNEL Manager required by engineering firm, works in Slough area, employing some 1,100 people. Previous experience essential. Salary commensurate with qualifications. Write, Box No. 642, 18-20, Regent Street, S.W.1.

Investment Statistics

Company Notes

Distillers Company.—The full accounts reveal a further rise in group current assets from £36,709,507 to £57,371,735. Net group current assets are £48,693,377 against £47,003,876. Stocks have risen sharply from £24,762,002 to £30,733,676. Investments are lower at £11,295,026 against £15,648,559. Cash is £1,200,000 up at £8,139,660, but tax reserve certificates are down by over £1,000,000. Group profit is down to £11,378,580 against £12,621,665. The ordinary dividend of 12½ per cent is repeated.

Murex.—The full report shows a group trading profit for the year ended April 30, 1949, of £874,268, compared with £695,828 for 10 months only in 1947-48. An adjustment to take account of the longer period is made to the ordinary dividend, which requires £68,750 against £57,292.

United Dairies.—Trading profit has risen from £2,312,709 (9 months for the parent company and 12 months for the subsidiaries) to £3,233,708 in the full year ended March 31, 1949. Net profit after taxation is £352,890, compared with £771,763. The group balance sheet shows reserves, apart from £1,488,201 share premium account, of which £1,482,387 is to be capitalised by a 50 per cent bonus issue, of £6,096,489. Group current assets stand at £10,783,986, of which nearly half is in cash or marketable securities. The ordinary dividend for the year is 15 per cent.

Thomas de la Rue.—The wholly owned operating subsidiaries have been dissolved and their assets transferred to the company. Intangible assets have been eliminated. Property, etc., in Rangoon and Shanghai has been written off entirely.

Henry Boot.—After an interval of nine years ordinary shareholders are to receive a dividend of 10 per cent for 1948 on the ordinary capital of £110,596.

J. B. Broadley.—No interim dividend is to be paid on the ordinary capital of £20,100 in respect of 1949. Last year's interim and

final payments were 75 per cent each. The 1s. ordinary shares were introduced on the Stock Exchange around 23s. in 1946 and are currently quoted at 5s 6d.

Vaux.—The group's trading profit for the year ended April 30 has fallen to £478,390 against £590,250 in the previous 12 months. Group net profit has declined from £257,331 to £175,537 after crediting £189,630 (£150,000) from deferred repairs. Current assets have fallen from £1,475,289 to £872,259. Current liabilities are up from £895,560 to £1,048,232, including a bank overdraft of £225,306 (nil). The ordinary dividend remains unchanged at 12½ per cent.

Swears and Wells.—The ordinary dividend has been cut from 7½ per cent, to 5 per cent for the year ended January 31, 1949. Consolidated profit is £216,640. Net profit is £129,612.

Nitrate Railways.—The issued capital is to be reduced by repayment of £3 per share on each of the 235,586 £10 ordinary shares and on 54,214 £10 preferred converted ordinary shares. The repayment will reduce the issued capital from £3,440,140 to £2,570,740.

Yorkshire Amalgamated Collieries.—Surplus capital of £1,466,609, being about 29 per cent of the issued capital is to be repaid. One quarter of the amounts paid up on the 4½ per cent cumulative redeemable preference shares, the ordinary and deferred capital is to be repaid. Present issued capital is £4,966,438, and after the repayment the issued capital will be £3,499,829.

Scottish Motor Traction.—Holders of £1,000,000 6½ per cent cumulative preference stock are to be repaid at par and a distribution of £4 (nominal) of British Transport (Wagon Stock) 1968-73 will be made for each 5s. ordinary share unit held.

Capital Issues

Laporte Chemicals.—Shareholders are to be issued with one new 5s. ordinary share

for each existing share held. In this way 2,944,400 new shares will be issued capitalising £736,100 from share premium account.

Millford Steam Trawling.—Shareholders are to receive a capital bonus of two 5s. ordinary shares for each 5s. share held, capitalising thus £100,000 from share premium account.

Montague L. Meyer.—Shareholders are to receive three 1s. ordinary shares for each ordinary share held.

Royton Spinning.—Capital is to be restored to its pre-war level by a bonus issue to capitalise £27,000 of reserves.

H. J. Baldwin.—In the offer to shareholders the six per cent £1 cumulative preference shares are now offered on a one for one basis at 22s. 6d. against originally 25s., and the 200,000 2s. ordinary shares offered in the proportion of one new share for each five shares held are priced 5s. 6d. against 6s. previously.

INSTITUTE OF CHARTERED ACCOUNTANTS IN ENGLAND AND WALES

APPOINTMENT OF TWO SECRETARIAL ASSISTANTS
 Applications are invited for two new appointments to the Institute's Secretarial staff, consequent upon the forthcoming retirement of the Secretary. The persons appointed will be required to undertake, under the immediate supervision of the present two Assistant Secretaries, duties in connection with committees, Institute administration and other matters. One appointment is open only to a member of the Institute; the other may be filled by a member, a barrister, a solicitor, or other suitable applicant. In the case of the appointment which is open only to a member of the Institute, the duties will include assistance in respect of the activities of the Finance and Financial Relations Committee. No age limits are specified but the appointments are intended for persons between the ages of 30 and 35. The initial salary in the case of each appointment will be £500-£1,000. There will be contributory pension rights. Applications in writing, giving full particulars of education, qualifications and experience, should be sent to the Secretary of the Institute, Abchurch Place, London, E.C.2. Envelopes should be marked "Secretarial Assistant—Confidential."

CANTERBURY—Suitable for gentleman's town residence. Institution, school, etc. A genuine detached Early Tudor Residence containing a wealth of oak beams, open fireplaces, and other old world features. Comprises 7 bedrooms, 2 bathrooms, 2 W.C.s, lounge, dining room, kitchen all main services, 2 garages, 2 cottages, matured garden of 1 acre. Auction September 21st or privately.—Farquharson & Millard, 8, High Street, Canterbury. Tel. 2819.

STAMPS for Investment—the recent Silver Wedding stamps have already advanced 50 per cent in value in less than 6 months. We are now taking orders for the forthcoming U.P.U. commemoratives for the Colonies at £7 15s. per set of 256 stamps with 29 15s. used. Healey and Wise, Ltd., 14, Wornwood St., London, E.C.2.

BUSINESSMAN, previously resident in England and now settled in Buenos Aires, would represent or act as Agent for any reputable British firm, desirous of developing Argentine trade relations.—Box 165.

Prospects for Washington

THE preliminaries of the Washington talks are now complete. The technical experts of Britain and America have already met; the heads of the ECA, Mr Hoffman, and of the World Bank, Mr Black, have paid their visits to London; and Sir Stafford Cripps and Mr Ernest Bevin are on the high seas en route for Washington. Behind the movements of statesmen, an industrious collecting together of factual information and statistical analysis has been taking place. For weeks, departments have been absorbed in the compiling of facts, the preparing of memoranda, the marshalling of figures. If documentation could ensure the success of a conference, the Washington talks would look promising indeed.

Conferences, however, do not turn on paper work, however well prepared, but on the outlook and convictions of those who attend them. On the American side, President Truman has spoken this week with the utmost sanity and generosity of his own attitude. He welcomes the British delegates as personal friends and fellow workers in the vast effort to create "a sound and expanding world economy," and hopes, with them, to preserve the free world both from the advances of communism and from the tragic economic disasters which between the wars helped to create fascism in Western Europe. From the British side, no clear statement of intention has gone forth. There can have been few periods in British history, in which such urgent problems have met with such unbroken Ministerial silence. True there have been scattered comments and hints about the brief which the British Ministers are taking with them. But they merely add up to a short list of proposals which have become familiar enough in the last month or two—dollar economies, cuts in Government expenditure (this time, perhaps, meant really seriously), commodity schemes for sterling colonial products, encouragement for American investment in the colonies, and cuts in the American tariff. Such isolated comments and attitudes do not reveal a picture of general British policy in the coming talks. The factor which must in the last analysis decide the outcome of the conference—what British Ministers really feel and think—can only be guessed.

The guesses are not reassuring. From hints here and comments there, from the speeches of Labour MPs, and the reticences of Labour Ministers, it is possible to deduce a certain attitude of mind. When Mr Nally at Strasbourg blurts out his party's determination to "defend the British social services against a small group of rich and unscrupulous Americans," he is voicing, though in ludicrous and wildly exaggerated terms, a reaction to be found in saner heads than his. The emphasis is on the word "defend." The task next week, it appears, is to defend various British interests and institutions—among them, the British standard of living, British welfare legislation, the socialist experiment, and the artificial value of sterling. In the same way, the cohesion of the sterling area and even the integrity of the Commonwealth, is also to be "defended." This theme of defensive response runs like a thread through the maze of political

comment and provides a disturbing clue to the attitude which British delegates may assume at Washington. Nor, unfortunately, is it a vague defensiveness. In recent months Government supporters, if not the Government itself, have increasingly argued that all these good things must be defended against the effects of American action and against the impact of American suggestions that British policies—on costs, on productivity, on exchange control, on bilateralism—may have to be re-examined in the light of conditions in 1949.

It is easy to see how this mood has grown. For forty years, socialists have believed that capitalists were bound to seek to destroy a socialist experiment, either purposely or by the contagious instability of their free economy. Ever since 1945, it has been hard for the more dogmatic sections of socialist opinion to accept the idea that the United States was not only prosperous enough to help socialist Britain but also perfectly ready to do so. When in the spring of this year, the slackening of the postwar boom brought a fall in American purchases abroad, this was the sign for which many of the dogmatists had been looking—the sign that their fixed notions were right after all, that capitalism was essentially unstable and that Britain's socialist experiment was "in danger" from the United States. Later, as economic difficulties deepened and as the press of both countries joined in the work of interpreting the crisis to each other, the conviction of American hostility grew apace. Today, although it is not at all a reasoned conviction, it may prove strong enough to create an undercurrent of suspicion at the Washington talks.

Nothing would be more disturbing to the success of the conference, particularly after the President's open disavowal of American criticisms of British politics. Sound results cannot proceed from a faulty diagnosis and if it is in the mind of the British delegates to believe that in some way their task is to "insulate" the welfare state at home and the sterling area abroad from the "unhelpful effects" of American policy, it will be as though they were entering the conference chamber standing on their heads. Far from needing "defence" against the consequences of American policy, the British economy, its economic links with the sterling area and even to some extent its political links with the Commonwealth have all in the last four years been maintained and underpinned by American assistance. Since 1945, even though British exports enjoyed a sellers' market, even though they did not face the competition of either Germany or Japan, even though Britain received over five billion dollars in loans and aid from the United States, the British economy has failed to pay its way. The statistics are familiar, but they are grim enough to deserve repetition. Reserves of gold and dollars which stood at £664 million at the end of 1946 fell to £512 million by the end of 1947, to £457 million in 1948, and by now have fallen well below £400 million. Throughout that period, Britain was not producing or selling enough to pay its own way. In other words, the standard of living, of welfare, of social services which is enjoyed today has been to a considerable extent made possible by American assistance. Confidence in sterling, upon which the sterling area is ultimately based, was maintained by the same means. If in the past four years the British people had been left to spend only what they themselves had provided and at the same time to act as bankers for the sterling area, either their standard of living would have been very much lower or they would have had to adopt the very measures—increased output, lowered costs, a larger volume of more competitive exports—that the Americans are urging on them today.

If this is true of the last four years, it will be so to an even greater degree in the future. The sellers' market has passed, Germany and Japan are re-emerging as competitive exporters. If the British make no change in their policy at this point, it will be only a matter of months before their last reserves are exhausted. Long before that moment, sterling will have virtually devalued itself; after it, unemployment will soon follow because the country will be unable to purchase raw materials. The sterling area will disintegrate, since its central banker will have closed his doors. The Commonwealth itself will be submitted to an economic strain severe enough to disturb the loyalty of even its oldest members. In other words, the disasters of falling living standards, of a collapsing sterling area and a disintegrating Commonwealth, against which the Government wishes to defend the country, are implicit in the policies they are still pursuing. With or without American assistance, they will in the near future be compelled to devalue, to cut costs, to increase output and to tackle the problem of productivity. The choice is not therefore between "accepting American dictation" and the continuance of an independent British line. It is between taking the steps necessary to make the British economy solvent now with America's active co-operation or taking them in six months' time in the middle of economic disaster and with America perhaps contributing no more than a melancholy "I told you so."

The conclusion is inescapable. There is only one way in which the British people can be genuinely "defended" against the economic troubles that lie ahead. It is by the closest and most confident association with the United States. If the British people are prepared to play their part in restoring solvency to their country, there is every reason to believe that the United States administration is still ready to cushion the process, to soften its hardships and to ensure that American policies make the whole process less arduous than it would otherwise be. Purchases of raw materials from the sterling area at guaranteed prices, backing for extensive American private lending, capital developments under the President's Fourth Point—all these are possible means for ensuring that, over and above the remainder of Marshall Aid, more dollars will be pumped out into the world and positive, not restrictive, steps taken to counter the effects of the dollar shortage. Such policies will be pursued, and pursued generously, as part of a joint enterprise to which Britain also contributes its share—though hardly otherwise. And clearly it is only in such an enterprise that there can be any genuine "defence" of British interests, at home, in the sterling area or anywhere else.

If the Washington talks succeed in creating such possibilities of co-operative defence, they will have done much. But is defence, a pale, resigned and uncreative word, to have the last say? Is nothing more at stake than the defence of certain interests, however politically important, and the holding of a line, however economically vital? Underlying the whole British approach, one can detect attitudes of defensiveness, isolationism, and undue concentration on internal problems and difficulties which are unworthy of a great people and may be fatal to the claims they still make to shape the future of free society. At the moment, the British people, irritable and self absorbed, seem incapable of lifting their sights, of thinking beyond the dollar gap of today, of approaching the Americans in anything more than a spirit of expediency and self interest. Yet at this moment a different approach might have incalculable results. The United States stands on the brink of accepting fully the responsibilities of leadership in the free world. The temptations of

economic isolationism are still strong, and the unexplored country of international responsibility and world leadership is new and unfamiliar. But the scene might look very different if at this decisive moment the British people, who in their time have served a similar function, were to show enough generosity and imagination to encourage the American people in their new tasks. They are tasks fully within America's powers. They deserve the undeviating support of the whole British Commonwealth. Now would be the time for British statesmen to declare that in the great efforts the new policy demands, Britain, no less than America, will, in President Truman's homely phrase, be "everlastingly at it."

Recipe for Yesterday

NEXT Monday, when the eighty-first Trades Union Congress opens at Bridlington, the delegates will have before them a special report upon trade union policy and the economic situation. Its main conclusion is that unequivocal support should continue to be given by the TUC to the Government's policy of stabilising wages and prices, because there is no practical alternative which would give results at least as good. This is a commendable statement in view of the uneasy temper of organised labour—there are a dozen resolutions on the agenda of the Congress criticising or rejecting one aspect or another of the Government's policy on prices and wages. Indeed, the economic report, despite its occasional resort to anaemic and involved language, shows a considerable advance in courage and honesty. It shows that the leaders of the trade union movement, at least, have been learning the facts of economic life. It is, on the whole, a fair-minded document, less informed by self-righteousness than some of its predecessors. For example, when it speaks of the less than 100 per cent observance of dividend limitation, it admits, too, that some wage advances could not be brought within the four corners of White Paper policy:

The General Council have been aware that there would be companies which for one reason or another would not adhere to the national policy; but they are similarly conscious of the fact that they themselves are not in a position to guarantee that every wage application put forward or advance obtained by Trade Unions will be within a strict interpretation of the White Paper, or of Congress policy.

There is a touch of humility here which has not been observable in some earlier Simon-pure utterances of the TUC. It is matched by a surprising admission of realism in its remarks on prices: "It is true that prices have risen, partly in consequence of wage and salary increases . . ."

This is the spirit that is lacking on the British side, the spark of generosity, the gleam of vision beyond the preoccupations of each recurrent crisis. There is nothing in their approach to fire the American imagination, yet no people so warmly responds to high ambitions stated honestly and simply as the Americans. Without such an appeal the Washington talks may achieve some alleviation of the present difficulties; with it, they might stand some chance of achieving the wider aim that should be theirs—to strengthen the foundations of international stability and economic expansion and to harness a lasting Anglo-American partnership to build them both.

This new note of candour is not the result of a new policy among the leaders of the trade union movement: it is the result of being confronted with a situation from which there is no escape. The TUC in the past year has still been actively concerned with raising the level of real wages—its leaders would lose their jobs if they permitted themselves any other objective. They have tried all the possibilities (" . . . the General Council felt it was incumbent upon them to raise with the Chancellor of the Exchequer points in regard to purchase tax, cost of living, subsidies, margins, profits and dividends . . .") only to reach the conclusion that there is no short road to a rising standard of living for trade unionists. When they looked at the purchase tax their examination convinced them that it was "from sources other than purchase tax that any real contribution to reducing the cost of living must be found." Having drawn blank here, the TUC turned to the subsidies to see whether they might be used to foster a rise in real wages. But this sacred milch cow also failed them. They concluded that subsidies and reliefs in food duties of £498,000,000 represented the most that could be expected of any Chancellor. They then turned to price control to discover if it could be used to secure price reductions, only to find that price control was "substantially effective" and that mere changes in the machinery of control would not yield "rapid and widespread price reductions."

These are matter of comparatively simple proof. On profit margins, the conclusions are more hesitant and suspicious—and probably rightly so. A policy of controlling prices on the footing that the least efficient firm must be kept in business, enables the more efficient firm to sell at a larger margin of profit. No method of varying margins according to the size or efficiency of firms has been found. Since the whole question was too complicated to examine in a matter of weeks "as a means of solving the immediate problem of

high costs of distribution," the report urges yet another governmental inquiry. The recent cuts in the permitted retail price of utility clothing, footwear and household goods, which were largely inspired by timely pressure by the TUC to secure some result before the Congress met at Bridlington, are noted in the report. But it goes further: "These price reductions will be dependent for complete effectiveness on the availability of utility lines. . . . They (the General Council) have consistently urged that utility goods should be readily available for all would-be purchasers." In other words the pattern of the economy must be so contrived as to minimise the pinch that economic stringency exerts upon the community, without regard to the damage which pre-occupation with utility production inflicts upon the production of high-class goods for export.

★

On profits and industrial capital, light has been let into Transport House. A round platitude declares that close determination of profits before they are made is not practicable. "Excessive profits" are best prevented by control of prices (it would be vain to expect a TUC document to admit that competition would have the same virtue in a more effective measure), not by direct legislation. High profits are evidently regarded as "a good thing" in export trade for they secure for the country "the maximum amount of foreign exchange." The fact that a pound is a pound in the bank account of an exporter, whether it is earned in hard currency markets or in soft option trade with the sterling area, surely dilutes the advantage claimed for high profits in export trade. And there is good and refreshing sense in the report's further emphasis that "the rise in the cost of capital replacement means that an apparent profit is not necessarily available as a real surplus from business activities," and in its demonstration that "the community" takes between 50 and 60 per cent of all profits as taxation.

The report dwells with some satisfaction on the statesmanship of the trade unions in co-operating with the Government in its policy of economic stabilisation. Those participating in it are told to take pride in their achievement, "the more so inasmuch as there has been no 'standstill,' no 'wage-freezing'." Indeed, nearly four million workers obtained wage increases in the past six months of 1949, over five hundred thousand more than in the comparable period of 1948. The report concludes that the policy of wage stabilisation has been a success, and makes what is virtually a challenge to any trade union to put forward any alternative policy which would fit present economic facts—a challenge that is presumably intended to silence the Communists.

The TUC, then, has made up its mind that what Sir Stafford Cripps and others have been saying for two years is not bourgeois prejudice but truth. Every effort has been made to find some loophole through which the British worker could escape from its consequences, and every effort has failed. The General Council of the TUC, after long and patient coaching, has learnt that "at this stage a mere general increase in money wages could not bring idle resources into production, and would, therefore, fail to give a higher standard of living than at present; and, indeed, a substantial increase in money wages would, in fact, intensify both our internal and external difficulties and thereby have an adverse effect upon the general standard of living." This does represent a clear advance in trade union thinking: what was reluctantly accepted last year out of loyalty to the Labour Government is now asserted as triumphant truth.

But it would be a mistake, for two reasons, to place too

much weight upon this recognition of the truth. In the first place, the General Council of the TUC, as it sadly admits, is not designed to control its members' unions, but only to represent their demands. Whether the unions themselves believe these facts to be self-evident will be apparent next week at Bridlington. Even if the majority of Congress accepts them there will remain a broad and widening gap between the views of the trade union officials and the ordinary workman. The TUC has made no progress in resolving the dilemma between its traditional functions as a pressure group and the Government's desire to treat it as a headquarters with powers of command.

★

In the second place, the report might be entitled *Recherche du temps perdu* for it deals only with one fading aspect of economic policy—that of stabilisation. It makes a passing acknowledgment that "in their short-term aspect the country's economic and financial difficulties have worsened in recent months," but it gets no further than suggesting that dollars and the shattering impact of two wars are responsible. There is nowhere any suggestion that something more positive than a policy of stabilisation is needed, because there is no realisation that stabilisation cannot get prices and costs down and productivity up. It is a document which advocates "no change" when changes are urgently needed in almost every basic assumption about postwar economic policy in Britain. The situation in the winter of 1947-48, when the policies of Dr Dalton had actively presented the beginnings of a runaway inflation, demanded severe measures of restraint to halt the rise of prices and wages. It was possible to argue then that if prices and wages could be stabilised the slowly rising level of productivity in British industry would enable Britain to compete effectively in the world market when Marshall aid came to an end in 1952. Time has shown that argument to have been too optimistic. Wage stabilisation is still of major importance, but it is no longer possible to claim that it alone will accomplish the recovery of the British economy. What is needed now is efficient and economic production, cost-cutting on the grand scale, the restoration of flexibility in prices, jobs, and output, which alone will enable Britain to compete effectively in the dollar markets. Such a policy finds no echo in the TUC's report.

Closely analysed, the report shows that the TUC remains wedded to policies of controls, full employment at any cost, and neo-Schachtism abroad which have made the British economy the least resilient of all the industrial nations. The recent accentuation of Britain's export difficulties "cannot be fairly attributed to any action of our Government, or to any slackening of effort on the part of the British people." But are the actions right, and the efforts well-conceived? "The Congress expects that the Government will continue to strive, by every conceivable means . . . to keep prices stable, to finance extensive social services and to improve our capital resources." But what if the means make it impossible to secure the food and raw materials from abroad which alone make these things possible? Confronted with facts, and given enough time, the TUC is capable of reaching the right conclusions and sticking to them with some courage. It has cultivated its hindsight to an impressive degree. But of foresight, there is none. It is satisfied with things as they are—higher wages, stable prices, a reasonable cost of living, valuable social services, and full employment. What it has not faced is the problem of securing all these aims by independent effort and sacrifice—how, in short, to prevent real wages from falling.

Indonesia at The Hague

THE essential fact about the Round Table Conference, now meeting at The Hague to decide the future of Indonesia, is that it represents the last chance for a truly peaceable settlement. It is an opportunity which observers who were in Indonesia when the Dutch police action took place last December, felt could never arise again. That this chance of transferring sovereignty in the atmosphere of reason and quite unexpected goodwill now ruling at The Hague should, in fact, have recurred is little short of a miracle. And it must produce a solution. Neither side has any right to let it fail.

It is clear that the only solution can be a "real, complete and unconditional" transfer of sovereignty to a United States of Indonesia. This was the purpose for which the conference was called. And neither side can afford to achieve less. For Mohammad Hatta and the rest of the Indonesian delegation, sovereignty is the only possible outcome. They regard themselves as their own masters already, and can accept nothing but formal recognition of this fact. Furthermore, they are under pressure from their own followers. In Indonesia trigger-happy forces cannot be kept in suspended animation indefinitely. Nor can it be expected that left-wing Indonesian nationalists will fail to exploit delay.

On the credit side, however, must be placed the fact that Mr Mohammad Hatta and his associates, although their records are by no means stainless, nevertheless represent the most responsible Indonesian leadership available. Experience has sobered them. They have learned to moderate their demands on everything except the fundamental principle of sovereignty. They represent a nationalist movement in which, unlike some others in South-East Asia, the Communists hold no place. This was not always so, but it is now. During the past few months, the Indonesian leaders claim that 30,000 Communists have either been removed from influential positions, put in gaol or kept at bay in minor gangs in the hills.

What the present leaders wish to secure more than anything is the sort of agreement the Indians achieved with the British. It is a measure of the new Indonesian moderation that the example of the British transfer of power haunts the conference tables at The Hague. Pandit Nehru has known Mohammad Hatta for twenty years, and Delhi has taken a close interest in the Indonesian struggle. Many of the delegates to the Round Table Conference stopped in India on the way, in order to study in detail the methods used for Britain's transfer of power. This is far from the revolutionary break feared by so many in Holland. The approach carries the stamp of statesmanship.

A further strengthening of the Republican position has been brought about by the measure of agreement achieved between the Republicans and the Indonesian Federalists. The Federalists represent those autonomous governments set up in agreement with the Dutch in the non-Republican parts

of Indonesia. Hitherto, they have tended to picture a United States of Indonesia in which the Republic could even be omitted altogether if it refused to accept Dutch terms. But today they are responding cordially to Republican leadership. And few realistic observers believe that there can now be any question of by-passing the Republicans in order to set up a new Indonesia with Federalist help; the new state of 76 million people will be built by both groups of Indonesians, acting in agreement and together.

So much for the Indonesian delegation. What of the Dutch? It is indeed no small thing to lose an empire, and the Dutch stake in Indonesia is immense. Without the vast Dutch investments and trading interests in Java and the surrounding islands, the Netherlands standard of living would be cut at least by ten and perhaps even twenty-five per cent. But events have moved against the Netherlands. Six months ago, before the second police action, when the Dutch were threatened with an unruly and potentially Communist Republic, whose leaders appeared to let them down after every agreement, there was a great deal to be said for their efforts to achieve a settlement by firm action. But that

time has passed. The problem now is for the Dutch to recognise the essential facts—that the Japanese occupation put the Indonesians into a new frame of mind from which there is no going back, that the two Dutch police actions have proved that this frame of mind cannot be countered by force, and that Holland, nevertheless, is providentially confronted with a group of Indonesian leaders still ready to do business and who have

turned their backs on Communism. The leading Dutch negotiators understand this. By acting on their understanding, they know that they can help to bring into being a prosperous and contented Indonesia, in which the Netherlands would find a profitable and an honourable place. But it is still an issue of the Conference whether the enlightened Dutch point of view, held particularly by the Prime Minister, Dr Drees, and by Dr van Royen, can carry the day at home.

In a sense this fact cuts across the purpose for which the Conference was called—"to transfer real, complete and unconditional sovereignty to the United States of Indonesia in accordance with the Renville principles." There can be no denying that there lurks just a hint of doubt in the corridors of the *Ridderzaal* about the degree to which the aim of the Conference can be taken for granted. For instance, in the recent debate in the Dutch parliament—watched from the gallery by the first Indonesian arrivals—it was never quite certain until Professor Romme, the Catholic leader, had actually spoken, whether he would try to limit the "concessions" which the Dutch are prepared to make at this Conference.

These hesitations do not necessarily mean that Dutch second thoughts will undermine the success of the Conference. The leadership of statesmen such as Dr Drees and

Dr van Royen should be enough to convince a decisive majority of Netherlands opinion that this conference is, indeed, their last chance of effecting a peaceful transfer and—which is as important—of ensuring for themselves a constructive and influential role in the new Indonesia which, as Indonesian leaders know themselves, will be short of capital and skill, of technicians and administrators. The danger is rather that hesitations in Holland may compel the conference to proceed at too slow a pace. Already the opportunity of opening the conference with a sensational declaration of sovereignty has been missed. It is essential that the fund of good will should not be allowed to trickle away through the interspaces of technical committees.

The agenda of the Conference is long and difficult. It includes the establishment of a provisional constitution for the new Indonesia; this is something which the Republicans and Federalists have yet to work out together, before talking it over with the Dutch—and it is to be hoped that they will not delay, since failure to have it ready could give a dangerous argument to the opposition in Holland. The agenda also covers a proposed charter for the transfer of sovereignty, provision for a Netherlands-Indonesian Union and agreements on Dutch military withdrawal, the handing over of economic and financial administration, the problem of citizenship, the status of Dutch civil servants and other subjects.

Which, if any, of these thorny topics presents the greatest risk of collision? And what hope is there of settling them all in detail within two months, even granted full cordiality on both sides? The way in which each item is tackled will depend on the underlying assumptions in the minds of each side—whether or not “real, complete and unconditional”

sovereignty is, in fact, to be transferred without hesitation. The problem of the Netherlands-Indonesian union is probably the most potentially dangerous since it is here that the scope of the transfer of sovereignty comes starkly into the open. It is clear that, whatever interpretations are entertained in Dutch minds, the Indonesians have only one—a union in which their full sovereignty is unaffected and in which the monarch is no more than a symbol in the same fashion as in India. Closer ties they do not seek unless they can be of proved economic and social advantage. All this, it must be said, is a vast change from the ideas behind previous agreements between the Netherlands and the Indonesian Republicans—agreements to which some Dutch minds still hark back.

In a sense this is conference of details. Yet dealing with them will always raise the fundamental principle on which the settlement is to be based. Is it really to be uninhibited Indonesian sovereignty or not? Further, it is a Dutch characteristic to like the written contract; yet it will be almost impossible to reach written agreements on all the necessary details in the time available. Thus, if the conference is to succeed, a great deal will have to be taken on trust. Step by step in this long dispute, Dutch views have proved to be just behind rather than ahead of events. Every possible attempt to go back to the old Indonesia has now been tried—and has failed. Yet at the eleventh hour, a sense of confidence has returned. The future depends on seizing the goodwill now prevailing at The Hague to build the new Indonesia which both sides need. It can be done—of that there is now no doubt. But it must be done at once. Extremism in Indonesia and reaction in Holland alone profit by delay.

Soldiers of the Rhine

IT is very easy for a visitor to the British Army of the Rhine to be misled by superficial impressions. Observing the off-duty habits of the Regular Army, the clubs, the race meetings, the dances, it is natural to suppose that the army has reverted to the leisurely pattern of prewar years. But such first impressions are wrong. If the Army of the Rhine has a way of life more spacious than its counterpart at home or of the war, and if it is smaller and less well-equipped than it should be, it is even so more effective and more highly trained than any previous peacetime British army. Moreover, if there were no other differences—if the greatly superior knowledge of the realities of war were not evident—the most striking of all differences would still remain, that the majority of the soldiers of the Rhine are not regulars, but civilians in uniform.

Within the framework of conscription, the British Army in Germany is charged with the main responsibility for the training of the national servicemen, and its units contain on an average about sixty per cent of national servicemen. Boys called up for national service spend a minimum of ten weeks in the United Kingdom undergoing first a selective system which extracts the potential officers and technicians and then a short period of basic training. They arrive at a unit of the Rhine Army in batches of about forty every six weeks. In the case of infantry battalions, they spend a further six weeks undergoing “continuation training” in a special cadre company organised for the purpose (the period is longer in the armoured regiments) and thereafter are considered fit to take their place in rifle companies.

A great deal has been said and written about the dangers

of permitting young men to be exposed to the demoralising influence of an occupying army in a disorganised country. The basis for these fears has now almost entirely disappeared. The Rhine Army has in the past two years taken its responsibility for the moral welfare of the National Servicemen very seriously. The boy's officer keeps in touch with his parents, and a great deal of time and resources have been spent in creating amenities superior in quality to anything at home stations or in civil life. The training curriculum is a rigorous one which leaves the national serviceman little time for “fraternisation.” His pocket money, issued in army currency, leaves him—quite unlike his American counterpart—about enough for a daily indulgence of coffee and doughnuts in the canteen. In any case the standard of living of the German civilians in the British zone has now well outstripped the living standards of the British Army, and the occupying army is now in the odd position of being denied access to the ordinary enjoyments of German life by regulations designed to prevent it from consuming scarce German resources. The national servicemen are not the sorely tempted innocents that some observers have attempted to portray. They represent a complete cross-section of the community (with the exception of two of its best elements, farm workers and miners), with all the moral deficiencies to be found among adolescents at home. The Army can and does remove obvious temptations from their path, but since training for war is the purpose for which it exists and for which the taxpayer supports it, it is not organised to cure, although it does curb, such vice, criminality or mere listlessness as are the result of bad upbringing or environment.

The utility of the National Servicemen to the Army in Germany is more questionable. As has been said, the Regular Army makes a commendable effort not only to make life in Germany safe and tolerable for the conscript, but to train him to the highest efficiency that can be achieved in the period of his service. Except that the constant needs of training keep the regular soldier up to the mark and contribute to a certain extent to his own efficiency, the National Serviceman gives very little in return. He spends something over a year in Germany and emerges into civil life with a definite idea that he has discharged for ever his military obligation to the community. It is true that the conscripts who have been called up since the beginning of 1949 must spend four years in the territorials: but in the present state of the Territorial Army, it is doubtful if this will be of any great military value. To this extent the Regular Army is at the present moment spending its time turning out young men who may be slightly better citizens by reason of their period of national service, but who, supposing war were to come in 1955, would by no means be of immediate use to the army.

★

The continuing element in the Army—the regulars—upon whose standards and efficiency depend the quality of National Service training and the preparedness of the whole Army for war present a more complex picture. In a unit of the Rhine Army the regulars provide almost all the non-commissioned officers above the rank of lance-corporal and all the officers above the rank of second lieutenant. In addition the units must find from their regular strength the officers and men to run all the numerous odd employments connected with army administration. Each battalion is at the mercy of the postwar system by which regiments of infantry are grouped by counties or regions and their officers and men regarded as interchangeable. If one or more battalions become alerted for a task of higher priority than Germany, then officers and men from Germany will be creamed off to fill it. In balancing the continued widespread commitments of the British Army with the smallness of available manpower, this is perhaps the best compromise that any Adjutant-General can make, but it creates a shifting and unsettled atmosphere in a unit which militates against efficiency, and acts as a deterrent to regular recruitment.

The difficulties of the Army of the Rhine in girding itself into an operational force while being the main training ground for National Servicemen, reinforce the thesis expressed in *The Economist* and in many other places, that while Britain must for political and diplomatic reasons continue to have conscription, it is extremely difficult to create a mobile army—however small—that is fit for war. What is wrong is not conscription but the size of the Regular Army, and what is needed is to raise the level of the Regular Army from its present level of about 180,000 to somewhere in the region of 250,000 and then gradually to reduce the length of national service until it becomes six to ten months intensive primary training in the United Kingdom before passing the conscripts on to a vastly more efficient Territorial Army. Until that is possible eighteen months represents a far more useful period of National Service than twelve.

But in discussing the methods by which a larger Regular Army can be achieved, it is very easy to be over optimistic about the effect of the various incentives of higher pay, better accommodation, and better conditions of service. For able and responsible young men, the Regular Army competes directly with civil life, and any future revision of the induce-

ments to recruitment must take account of that. Distrust of the future and of the Government's intentions has caused many men, officers and other ranks, to leave the Army who with a little encouragement would gladly have made it their life's profession. Any future attempt to attract good men for the army will be much more costly and laborious than would have been the case if a generous and rational system of pay and conditions of service had been instituted immediately after the war.

★

The British Army of the Rhine has the duty of discharging three irreconcilable tasks. It is still an occupying force and must provide the teeth for the policies of the Control Commission which are unpopular or openly resisted by the Germans. It must transform the bulk of the National Service intake from raw recruits into trained soldiers. And finally, it must train itself to defend the North German plain, the traditional military high road into western Europe.

If the first task, the occupation of Germany, had been as formidable as appeared likely in 1945, the other two would have been impossible. But the collapse of all German resistance, coupled with the course of international politics, has enabled the British Army to accomplish by its presence what it would have found extremely difficult to achieve by *force majeure*. Problems of internal security still exist and will continue to do so at least as long as dismantling goes on, but the wide dispersion of military units throughout the zone, at the expense of their proper tactical disposition, has prevented trouble at a cost to military efficiency which could be quickly redeemed in the event of impending hostilities with the Russians.

As regards the training, the Rhine Army has had to reconcile the needs of the National Servicemen, which require that regiments and battalions should really be instructional camps, with the need to train the units and formations themselves in mobile warfare. A year ago, the needs of the National Servicemen were regarded as paramount, and the Army was losing its feeling for real operations. But now that the period of conscription has been lengthened to eighteen months, the training curriculum for National Servicemen is less strained and it has been possible to make considerable progress in dovetailing the two programmes. This year's training programme culminates in October with divisional exercises, which, though very circumscribed by wartime standards, will give formation commanders in the Rhine Army (including its western European components) a genuine exercise in the realities of war. The British zone, regarded not as a front line but as a vast training ground, an extension of Catterick or Aldershot, has advantages which cannot be found in England. The barrack facilities are far better even in Berlin and the old Wehrmacht training area at Senne Lager is better equipped and laid out than anything in England.

Finally, there is the real operational role which has emerged out of four years of diplomatic controversy—the holding of the most vulnerable sector of the front line of western Europe. Though it is small and hampered by the contradictions in the tasks allotted to it, the Rhine Army is growing more confident that, provided it could obtain, if the need arose, really effective air support, it could provide a very respectable deterrent to any threat from the east. But this feeling of confidence among soldiers that the best could be made of a desperate situation is no substitute for a defence policy based on the realities of the cold war.

NOTES OF THE WEEK

The Age of Anxiety

"The British people, with a quiet and unflurried resolution as strong as anything in their history, have determined that it is better to fight a war than to yield an inch on a principle that has become one of national honour and national safety." So ended the first leader in *The Economist* of Saturday, September 2, 1939, and on the following day, ten years ago today, the population of London put that unflurried resolution to its first test by trooping quietly to their shelters as the unforgettable, unforgotten notes of the air raid siren entered upon their long domination over the lives of the citizenry.

The war has had two curious effects upon the minds of most people. The last decade has involved for almost everyone, except Mr Churchill and a few others, such great periods of boredom, frustration and routine that time has become foreshortened and one war year entangled in the memory with another. But if in one sense 1939 seems yesterday, in another, the distance that divides 1949 from 1939 seems not ten but a hundred years. In retrospect the 1930s—one of the least agreeable, fruitful or honourable decades in British history—becomes too easily invested with the aura of a golden age, the last flicker of the *douceur de vivre*. Both these effects are together present in much of the political, economic and social thought of today, and together they perhaps account for many illusions upon which such thought is apt to build. Now that ten years have passed, now that a generation that were small children in 1939 have grown to manhood, it will perhaps be possible to escape from the thrall of 1939 and to see the past in a more even perspective.

It is as well that the British people had no inkling in September, 1939, of the ardour, the horror and the bitterness of the decade which lay ahead of them, for no people, however great their fortitude, could have braced themselves for an ordeal as great and as prolonged as it in fact became. It is the merciful capacity to live for the moment which has saved the morale of the British nation as well as producing a well-nigh insoluble economic problem for its postwar leaders. In moments of bitterness it is easy to see the past ten years as the rise and fall of one cherished illusion after another: that Hitler would run out of oil or that the Germans would revolt; that the wartime spirit of community would resolve class differences for ever; that the Russians would become a friendly and democratic ally in peace-time; that the United Nations would be different from the League of Nations; or that the American loan and Marshall Aid would overcome the cataclysmic change in Britain's economic position. But there is no panacea and the British people are with infinite slowness becoming aware of what it means to reap the harvest of a timid foreign and a negligent economic policy in the years between the wars—"the long week-end" of their history.

The Assembly Asserts Itself

After three weeks' work, it is clear that the European Assembly at Strasbourg has gained confidence and started to feel its potential strength. M. Spaak has declared that he is more than satisfied with the results achieved so far, and out of this surge of confidence has grown the determination to see that the end of the Assembly does not mean the end of all its activities until it is summoned to meet again next year. The delegates feel that it should provide itself with organs of continuous association which could study, represent and defend European interests all the year round.

It seems clear that at least two permanent bodies will emerge from the Assembly—the first, a Steering Committee composed of the President, the five Vice-Presidents, and representatives of all the nations concerned, will meet regularly throughout the year and exercise continuous oversight over the political problems which in their view deserve European, as opposed

to a purely national, consideration. It is also likely that an economic department will be established, which will be expected among other things to establish close links with the Organisation for European Economic Co-operation in Paris.

The work of the last weeks, described on page 509, has not only brought confidence, it has also brought delegates face to face with the genuine problems, and put squarely before them the question whether there really is a European solution to any of them. The sharpest difficulties have naturally arisen over Europe's disturbing economic plight and although the report of the Economic Committee has not yet been debated, the general aspect of its recommendations is beginning to become clear. The majority of its members genuinely believe that greater unity in Europe is essential to survival. They also believe that the first step in this direction must be to achieve the interchangeability of European currencies, and the next, to create a low tariff area in which the overseas dependencies, and if possible, the British Dominions, would be included. There is also considerable support for the idea that on the basis of this move towards unity, the European nations should negotiate with America, not as separate governments, but as a single organised body.

It is no use pretending that the British Labour delegates do not find these suggestions embarrassing. Strong moves towards devaluation, or the removing of trade barriers can be construed as attacks upon British policy and planning. Feeling ran so high in the discussions on devaluation that one of the Belgian representatives is reported to have stalked out of the session in which the British Labour members refused to have devaluation even discussed. Nor is the proposal of general negotiation with the United States altogether welcome, since the British feel that they are in a special position, *vis-à-vis* the United States, and wish to do nothing to weaken it. Thus, however much Strasbourg may have opened in an atmosphere of academic goodwill, its thorough examination of European problems is bringing to light problems and conflicts which are not academic at all.

* * *

Marshall Aid Allocations

The Organisation for European Economic Co-operation has not had to accept the ignominy of defeat in the task of dividing Marshall Aid for the year 1949-50. The recommendations of the Committee which had previously been charged with this task had been found unacceptable, mainly by the United Kingdom. The responsibility of drawing up a compromise solution was then given to two men, Baron Saoy, the Belgian Chairman of the Council, and M. Marjolin, the Secretary-General of OEEC. Their findings have been accepted by the Council of OEEC. Their decisions on the distribution of aid, for the year to June 30th next, together with comparable figures for 1948-49 are shown in the appended table:—

	ALLOCATION OF MARSHALL AID	
	1948-49	1949-50
	\$	\$
Austria.....	215,200,000	174,000,000
Belgium-Luxembourg.....	247,600,000	312,000,000
Denmark.....	109,100,000	91,000,000
France.....	980,600,000	704,000,000
Germany (Trizone).....	509,600,000	348,000,000
Greece.....	144,800,000	163,000,000
Ireland.....	78,300,000	47,000,000
Iceland.....	5,200,000	7,000,000
Italy.....	555,500,000	407,000,000
Netherlands.....	469,600,000	309,000,000
Norway.....	83,300,000	94,000,000
Portugal.....	None	33,000,000
Sweden.....	46,600,000	48,000,000
Turkey.....	39,700,000	61,000,000
Trieste.....	17,600,000	17,000,000
United Kingdom.....	1,239,000,000	962,000,000

From "New York Herald Tribune" Paris Edition

The allocation to the United Kingdom has been raised from the figure of \$850 million which had previously been suggested and vehemently rejected, to \$962 million. The British share undergoes the biggest cut compared with last year's allocation. The cut is even bigger in relation to the figure of \$1,500 million to which the British request had been pushed following the emergence of the sterling-dollar crisis. Given the fact that most of the ERP countries' dollar deficits have grown and that the amount available for allocation has at the same time been cut from the 1948-49 allocation of \$5,000 million to \$3,377 million, some disappointment was bound to occur. The findings of the "two wise men" would seem to represent as reasonable a compromise as could be secured in the extremely difficult circumstances created by the growth of appetite for dollars and diminution of the total out of which to fill the clamant mouths.

Final judgment on allocations of aid cannot be passed until agreement has been reached on the contributions and drawing rights that will be exchanged between ERP countries for the second year of the Intra-European Payments Scheme. As in the case of the first version of that scheme, the conditional grants which will be made by ECA against contributions to other ERP countries will be taken out of the general allocations which have now been agreed by the OEEC Council. It is, therefore, only after full details of the amounts of these contributions and drawing rights are known that it will be possible to calculate net figures of effective aid which each participant will derive from the Marshall plan in the year 1949-50.

* * *

Soviet "Peace" Campaigning

The Russians are a strange people—or perhaps it would be fairer to say that the Russian Government most obviously lacks a sense of humour. This week, with the tenth anniversary of the German war upon them, their Communist parties are organising peace ballots and peace days all over Europe. In France, for instance, nine million votes for peace are to be collected on the "anniversary of the bloody Hitlerite aggression against world peace in 1939." Do the Russians therefore forget, or, at least, do they hope that everyone else will conveniently forget, that on September 3, 1939, they were Hitler's

partners in a non-aggression pact and were within a few weeks of joining this same "bloody Hitlerite monster" in a joint partition of Poland?

An equal incongruity underlies the peace conferences which are being held for the young in Budapest and for the not-so-young in Moscow. When all these eager people take oaths in defence of peace or pledge themselves to "strike down the warmongers," it can only be assumed that neither they nor the men of Moscow feel the least embarrassment over the fact that at the present moment, there is only one campaign of violent warmongering in progress, and that is the Russian campaign against Yugoslavia. Under the doves and peace

banners of the Cominform, this particular manifestation of the war spirit continues unabated. This week yet another Note, the same in substance, though more abusive in tone, has been dispatched from Moscow to Belgrade, once again accusing Tito of sacrificing Carinthia to "western imperialism," and once again declaring the open hostility of the Soviet Union.

How serious is the threatening tone in the Russian Notes? Does it in fact mean war? It is still not possible to answer the question. Russian policy certainly indicates "all mischief short of war," and there is some evidence that anti-Tito Communists in Istria—they may well be in the main Italian, and affiliated to the Italian Communist Party—have succeeded in dynamiting a number of trains and ships and have dealt a most serious blow to the Yugoslav economy by blowing up the only refinery in the country at Fiume. But violence and internal sabotage, far as they are from the peaceful ways advocated with such ardour from Moscow, do not constitute invasion. An actual physical attack is still in doubt. There are rumours of troop concentrations in southern Hungary and in Rumania, opposite the flat plain of the Vojvodina, which could not easily be defended against strong mechanised forces, but there have been no counter movements of troops in Yugoslavia and for the time being it looks as though Marshal Tito may determine to seek another form of defence—the defence of publicity and world opinion. A strong Yugoslav delegation is to attend the forthcoming United Nations Assembly and Yugoslavia may arraign Soviet Russia before the Security Council.

* * *

Farming Extravagance

The eleventh report—on agricultural services—of the Select Committee on Estimates (HMSO, 9d.) paints a black picture of extravagance and mismanagement. The net cost to the Government of its food production services, initiated during the war and mainly carried out by the county agricultural executive committees, was stated in the Civil Estimates as nearly £40 million for 1948-49, a figure which is expected to decrease to just over £32 million for the current year. This large Government expenditure represents the net cost of assisting food production by the hiring out of machinery, the provision of gang labour, the destruction of pests, and the farming of requisitioned land.

The worst feature disclosed by the report is the chaotic manner in which public bodies have kept their books. The accounts of the various services rendered by county committees have been so muddled together that it must have been difficult for the committees themselves to know what any given service was costing the taxpayer. Again, no separate capital estimates were kept; thus a committee, which let its stock of machinery deteriorate rapidly with no provision for replacement, might nevertheless show an apparent profit. For a Government which is singularly given to lecturing private enterprise on business efficiency to countenance such practices is extraordinary.

The agricultural committees have had, it is true, a difficult task. Their provision of certain services has been vital to the expansion of food production; for instance, many farmers could not have embarked on cereal production without the assistance of machinery and gang labour from a county committee. Much of this work is bound to involve a financial loss, and until recently little pressure was put on the committees to temper their undoubted zeal with a measure of financial discretion.

*

The Select Committee proposes drastic remedies. The machinery and gang labour services should be progressively terminated; pest destruction services should be reduced in scope; and no drainage contract should be accepted which involves a loss. In its right-minded zeal for economy the Select Committee may even have gone too far. The Ministry of

Agriculture believes that large numbers of small farmers are dependent on the machinery service, and that its removal might affect up to one million acres of arable land. Any agricultural committee which is capable—as some may be—of carrying on this service at a low cost should be encouraged to do so.

The agricultural committees are also responsible for farming direct or letting over 400,000 acres of requisitioned land. Since much of this land was taken over because of its poor condition, it is not surprising that considerable losses—put at £1,418,000 for 1947/48—have been incurred in its management. The Government has been much too slow to decide which of this land it means to acquire permanently and which to hand back to its original owners. The Select Committee's verdict is that remarkable results have been produced on marginal or near-marginal land, "but only at an exorbitant cost in fertilisers, manpower and machine power." There is a lesson here for those, including many members of agricultural committees, who are still pressing for the intensive development of unsuitable land, regardless—in this as so many other matters—of the cost.

End of the Beginning in Ulster

"Civil and religious liberty" is an Orange toast and an Orange boast (writes a correspondent in Belfast), yet, since the Northern Ireland Parliament began to function in 1922, Special Powers Acts have been part of its ordinary code of civil law and constituted a genuine threat to the British conception of civil liberty. For many years the basis on which civil liberties could be built did not exist. The Northern Ireland state was born amid bloodshed, and, for long, rioting and terrorism were part of the daily routine of many of its citizens. No government could have been expected to maintain order without special powers.

The fundamental mistake made for many years by the Government of Northern Ireland was not the arrogation of such special powers and the use of them with almost Prussian efficiency; it was the deliberate alienation of the Nationalist minority. Despite the truculence of their one-third minority, tactful administration and generous leadership would have avoided turning the knife in the wound. But such a policy was beyond the powers of the triumphant Unionist Party in the pre-war years. Fear of that large and irreconcilable minority did not allow of wise and generous action on the part of the Unionist Government, a government with a rebel mentality itself—1912 is not a distant date, at any rate in Northern Ireland, where 1690 is still a memory.

Now, in the plenitude of its power and fortified by recent British legislation, the Government of Northern Ireland has revoked many of the Orders made under the Special Powers Act. No doubt some members of the Government are mainly concerned with English, American and world opinion, but this is not the full explanation. The recent election revealed clearly the extent to which a sizeable *bloc* of Northern Ireland Nationalists are mentally detached from the South. Anti-partitionism is not a living issue in Belfast. Bread and butter is. Republicanism is not the creed of the small marginal farmers just north of the border. Subsidies and allowances have become part of their economic and social life. The Government has wisely begun to woo, and perhaps to win, a measure of support from these Nationalist groups.

The bitterness with which some of the Dublin dailies have attacked the revocation of these Orders suggests fear. Not only have anti-Partitionists been robbed of a useful weapon and effective slogans—"The Police State," "The Oppressed Minority"—but in addition the spectre that has long haunted their minds has begun dimly to take shape. A Unionist Party bent on preserving the link with Britain rather than maintaining Protestant supremacy would commend the support of many Northern Nationalists. A broadly-based Commonwealth or Imperial Party in Northern Ireland might in time command the support of a majority of the Irish people. Even in Northern

Ireland politics cannot remain frozen for ever. Perhaps the end of the beginning in the evolution of Northern Ireland as a united country has been reached. Certainly many people—Unionist and Nationalist alike—are aware that a subtle change in the political climate is taking place.

* * *

The BBC and the Unions

The BBC is a large public corporation employing some ten thousand people, engaged in activities as far apart as electrical engineering or catering, on the one hand, and staff producers and announcers on the other. This has always presented a problem from the point of view of staff relations. Should all these multifarious forms of employment be farmed out to the great variety of outside unions—their activities then being co-ordinated by some sort of joint council—or should the BBC be regarded as a branch of industry in itself, and therefore able to form its own union to represent all types of work and activity?

The last report on BBC activities, the Ullswater Report of 1936, decided that the most appropriate form of staff representation would lie in the latter concept, and accordingly recommended the formation of a Staff Association, to cover all people permanently employed by the BBC. After some delays, prolonged by the war, the Staff Association came into being, achieved a membership, it is understood, of over 50 per cent of the BBC staff, and was recognised by the Governors of the BBC as the proper body to represent their employees. In all branches, standard union rates have been paid, but the machinery of negotiation has been with the Staff Association.

Unfortunately, the Trades Union Congress has taken the opposite view, and when the question of staff representation in public corporations has come up, for instance, in civil aviation, it has preferred the splitting of employees among the appropriate unions and the formation of a co-ordinating central body. In parenthesis, it can be said that the National Union of Mine Workers appears to dissent from this view, for their aim is to create a union co-extensive with the industry.

For some time, the trade unions have been pressing the Governors of the BBC to alter their policy, and negotiations have dragged on over two or three years, but no agreement has been reached. On the one hand, the Governors of the BBC have felt that, having set up a Staff Association on a mandate from the Ullswater Report, they could hardly reverse their policy without receiving a fresh mandate. Their view is that the matter should be examined by the Beveridge Commission of Enquiry. On the other hand, the TUC has insisted that the BBC should not expect to be the exception to the general rule now established, as it claims, throughout the whole field of industrial relations.

It does not seem, however, that the TUC is ready to wait until the Beveridge Committee can make its report. The Association of Cinematograph and Allied Technicians, who have members among the television cameramen employed by the BBC, have announced that since there is no machinery for the negotiation of wages within the BBC, they must put their disputed wage claim before the Minister of Labour. There the matter rests. If other unions, also with membership inside the BBC, follow suit, Mr Isaacs may find himself compelled to intervene, not in a matter of wages, but on an issue of principle.

Scotching the Finnish Strikes

Tension is still high in Finland. The task of the Social Democrat Government in controlling the Communist strikes is like the act of squeezing a balloon that has not been completely deflated. A little easing in one place produces increased pressure in another; and there is always the chance that the balloon will go off with a bang. So it is now in Finland. Things are going better in the original areas of dispute among the timber workers at Kemi and the

THREE STAR CORDON BLEU

Entry Ports

As ships' sides became higher the difficulty of boarding them by a rope ladder increased, and 'entry ports' made their appearance. At first entered by means of simple cleat steps, they soon became canopied, balustraded and handsomely carved until, by the time of the Restoration, they were a picturesque feature of the great three-deckers.

dockers. But the strike early this week of the workers in important shipyards at Turku is in some ways a more serious development than the earlier though more violent outbursts of the first phase of the present Communist offensive. Riots and disorder are primarily the internal affair of the state. But the failure of the shipyards, which are now idle, to deliver their quota of reparations to Russia becomes a matter of international concern.

Very severe fines could legally be imposed by the Russians under the Peace Treaty. In the event of continued default, direct intervention in Finnish affairs is conceivable on the pretext of ensuring due deliveries of reparations goods. It is this possibility that responsible opinion in Finland has always feared. The Finnish Communists though a nuisance are by themselves of slight account, being fairly numerous but badly led. It is in the pretext their actions could provide for Russian interference that the danger lies.

It is likely that the Communist strike offensive would have concentrated on the reparations industries in Finland, had it not been precipitated by the labour unrest which followed the sudden and considerable devaluation of the Finnmark early in July. But this very unrest means that, even if the Communists' hands were to some extent forced—and that would explain the surprising delay of nearly a month in mobilising support for the Kemi strike—the prospects of keeping the strike simmering are greater than if it had been a later, but more purely Communist, outbreak. And the split of the Finnish Federation of Trade Unions into non-Communist and Communist unions bodes ill for the future of labour relations in Finland.

* * *

Albania and "Free Albania"

The traveller by air-liner from Rome to Athens can, in present summer weather, enjoy the sensation of munching a western sandwich while gazing without stint into Albania. But he can get no closer. All frontiers except that into Bulgaria are sealed with 20 kilometre "forbidden zones." Of the western powers, only the French and the Italians are diplomatically represented in Tirana. It is therefore difficult to confirm the growing volume of tales about the difficulties of the Albanian premier, Enver Hoxha. Naturally, they reach the outside world via his enemies who have increased in number since the fighting in the Grammos mountains brought the Greeks to his border and increased the chances of interviewing "barefoot, tattered Albanian deserters." But there is a good deal of other evidence that his regime is less secure than it was.

His former dependence upon Yugoslavia and the extent to which he burnt his boats when Moscow broke with Tito, was described in *The Economist* of January 1st. Possibly

he calculated that he could afford the gesture because Tito would not last. Possibly he relied entirely on his belief that supplies of necessities would somehow arrive from Russia pending the establishment, with Russian aid, of industries in Albania. Clearly the Russians wanted him to think them powerful and reliable friends. They took the trouble to release a railway engine from Rumanian stock so as to ensure that Albania's first railway line—the Durazzo-Tirana service—could puff into the capital on the 31st anniversary of the founding of the Red Army, February 23rd. Its Rumanian markings were scarcely noticed by the admiring populace. Moscow was at pains to entertain Albania's large trade mission lavishly, in the highest Moscow circles and for a whole month in March. Shipments of goods are being sent by sea from Russia.

However, there are drawbacks to the Russian programme. The Russians are in a hurry to use the technical knowledge of the 3,000 engineers and other experts whom they supplied to replace the Yugoslav advisers whom Hoxha had sent home. Their deliveries, therefore, have been primarily of machinery in fulfilment of Albania's two-year plan—principally for oil drilling and pumping, but also for a textile factory at Tirana, a second railway line in the north, and a hydro-electric power station. They have not delivered the everyday necessities that Albania used to get from Yugoslavia: notably foodstuffs, clothing and refined oil. The need for these is now immense, and prices for manufactured goods of everyday use are beyond the reach of any peasant purse. Russian shipments fell off in June and July, but perhaps only because less has been sent, lately, from Russia through Albania to the Greek guerrillas.

*

Albanians love success and are quick to change sides if they suspect failure. It is doubtful if, upon empty stomachs, they appreciate the stock success stories of Russian pattern with which they are being fed—prodigious Stakhanovite effort by a soap-worker at Berat, the oil target exceeded by 102 per cent, and the chrome target by 152 per cent in the first half of 1949; increase of sown area in 1948, 180 per cent over that of 1947. Meantime they are hearing siren calls from two directions. One is from the north, where a Tito-type Communism is advocated by elements who do not like the southern preponderance in Hoxha's government, and who are being encouraged by their tribal connexions, the Albanians in Yugoslavia. The other is from Rome, Paris, London and New York, where a Committee for Free Albania has announced its formation. Its chairman is Midhat Frasheri, a former premier with a wide knowledge of world affairs, and it includes another ex-premier Koça Kotta, and Abas Kupa, the guerilla leader who harassed Mussolini. Men of this stamp would not show their hand without money at their back and good connexions inside Albania. But Hoxha holds the capital, and the guns. His chances hang, first, upon the question whether the Albanian will put up with a diet of statistics and promises of jam tomorrow; secondly, upon how much physical help his opponents get from Tito; and thirdly upon the wisdom of the successful Greek army in the Grammos Mountains. No doubt the fugitive rebels will once again bolt into Albanian territory. But if the Greek Government is so foolish as to pursue its victory into southern Albania and to repeat the long-standing Greek claim to that area (called by the Greeks northern Epirus) it will reuse Albanian patriotism and offer Hoxha a gratuitous trump card.

* * *

Studying Soviet Russia

The serious study of contemporary Russia is making slow progress in this country as compared with the United States, where many universities of repute have, or are planning to have, their institutes of Russian studies. It is true that the number of men and women studying Russian language, literature and history is growing rapidly, but those who have the ability to make a career out of their studies find themselves caught in a vicious circle. There are few teaching posts of

distinction and value associated with the study, and this scarcity is sometimes defended by university authorities with the argument that there are insufficient students to justify the founding of new chairs. There are surely powerful arguments of national as well as academic interest for trying to break this circle by devoting more money to Russian studies, especially in the universities of Cambridge, London and Oxford. In the younger universities there have already been signs of enterprise, and a book review in a recent issue drew attention to two promising series of periodical studies in this field which have begun publication, one from Nottingham and the other from Glasgow.

An important, perhaps decisive, difficulty in developing this particular study is its politically delicate character. The student in this country constantly comes up against an attitude which may be described as either *De Russia nil nisi male* or *De Russia nil nisi bene*. Is it possible to view Russia without bias? "Since history is our interpretation of human affairs in the past, it could not exist without bias," says Sir G. M. Trevelyan. How much more true is this of contemporary history and of the Russian part of it, which on all sides is so highly charged with emotion and ideological tension. The fear of being accused of bias leads sometimes the more timid writers on Soviet affairs to a careful concealment of bias or towards over-cautious pedantry. This apprehensive mood is noticeable even among students of Russia, who can hardly be classed as "fellow-travellers." It is therefore essential that the academic atmosphere in this country should remain, as it has been hitherto, completely free from ideological witch-hunting, which rarely does any great harm to the alleged witches but often plays tricks with the minds of the hunters. It seems that the only sensible way out is to encourage in the study of Russian affairs the balanced expression of all sorts of bias—subject, of course, to the requirements of academic standards; for nothing constitutes as great an obstacle to real knowledge as does the monopoly of one bias.

In the senior universities the one-sided linguistic and literary approach to Russian studies is still dominant; too little is being done to organise systematic research in the social, political and economic facts about Soviet—and pre-Soviet—Russia. It is unfortunate, too, that the one or two professors of international relations who have specialised in the Soviet period of Russian history do not at present teach in British universities.

* * *

Growth of the Universities

The first annual statistical returns since 1938-39 from universities and university colleges receiving a Treasury grant illustrates in detail the postwar trends that have been frequently discussed in *The Economist*. The returns cover the academic year 1947-48 and show that in that year the total number of full-time students was 78,507, compared with 50,002 in the year before war broke out. The distribution of these students among the various faculties is also fulfilling the recommendations of the Barlow Committee on Scientific Manpower that the number of graduates in pure science and technology should be doubled as soon as possible. As will be seen from the accompanying chart, the number of students in these two faculties had all but doubled by 1947-48.

The returns also illustrate to some extent how the University Grants Committee is carrying out its declared aim of distributing the money voted by Parliament not solely according to need but also according to merit and according to the principle of helping those who help themselves. To a certain extent the second and third principles conflict with the first. If need were the sole criterion of a grant, obviously the whole grant might be given to some of the provincial universities to the exclusion of Oxford and Cambridge. But unlike some local education authorities the University Grants Committee has always wisely repudiated the principle of uniform standards. The desire to double the total number of university students,

which cannot take place unless there is a big expansion in the smaller and often financially weaker universities, does mean that in its postwar allocation of grants the committee is guided more by the criterion of need than it used to be. But Oxford and Cambridge, with their large endowment income and large college income which does not appear in the statistics, are nevertheless given parliamentary grants that accounted for 17.3 per cent and 23.4 per cent respectively of their total income in 1947-48.

The claims of need versus the claims of achievement are also illustrated by the returns of expenditure on the salaries of the teaching staffs. Ought the financially weak universities to be enabled by grants to pay salaries comparable to those

in the older universities, or ought existing variations to be maintained? The committee adopted a compromise by which standard rates of salaries were recognised but grants allowed, by individual assessment of universities, to enable some of them to supplement the standard rate. The effect, as shown in the returns, is that expenditure on salaries for each full-time student varies among the provincial universities from £125 at Bristol to about £85 at Manchester and Liverpool. At Cambridge the figure for expenditure from university income alone is about £80, but it would be a great deal higher if the expenditure on salaries from college income were taken into account.

* * *

Shortage of Teachers

Can the planned expansion in the number of university students be maintained without a lowering of their average standard of education? Doubts that are sometimes expressed on this point will be strengthened by the results of a questionnaire undertaken by the Incorporated Association of Headmasters to ascertain the extent of the shortage of teachers. The inquiry took place in 780 schools—mainly aided and maintained grammar schools, but including 76 large public schools.

The results of the questionnaire showed no pronounced drift from the profession, although of 913 teachers who had left their posts, 330 had gone to other occupations. They do show, however, great difficulty in filling teaching vacancies in certain subjects, particularly the sciences and mathematics. (The shortages in respect of some of the subjects are shown in the accompanying diagram.) Sometimes this has meant abandoning a subject altogether; sometimes it has meant sending a class to another school for instruction in the subject concerned. Makeshifts like this, the association comments, will inevitably be felt later in a lack of sufficient students. Among other things, this will mean that the Barlow Committee's objective for an increase in scientific manpower may not be achieved.

Under the third heading, the 780 schools show a total increase of 60,000 pupils and the numbers in their sixth forms

have increased by 67 per cent. But there has been a decrease of 3 per cent in the number of graduates with first-class honours, an increase of 25 per cent in those with second-class honours and an increase of 29 per cent in the number of third-class honours, pass men and non-graduates. The association concludes that the growth in sixth form work is not matched by an equal growth in the number of well-

qualified men and that scholarship and advanced work will be handicapped. When it is considered that the questionnaire covered 76 public schools, where salaries are on a higher scale and whose conditions of service are much better than in the aided and maintained grammar schools, the prospects of maintaining high standards of sixth-form work where they exist, and of attaining them where they do not, appear very gloomy.

Cost of Postponement at Lausanne

Mr Paul Porter, the American member of the United Nations Conciliation Commission for Palestine, arrived back from Washington last week not, as some sanguine people had hoped, with the dollars to pay for refugee settlement in his pocket, but instead with another commission of enquiry to propose. (The Americans are now appointing these with that regularity they were so ready to criticise when practised by Britain.) This time, the body is to be called an Economic Survey Group, and Mr Porter was able to announce it is already selected by the United Nations, assembled, packed and ready for despatch. The Israelis and the Arabs have both expressed readiness to see it at work. Ought the two disputants, the unfortunate refugees and beyond them the world at large to be glad or sorry that yet another fresh set of minds is to work at the debatable subject, and that yet another postponement of final decisions has occurred as a result?

The events of this week conclusively prove that no immediate solution was possible and that Mr Porter was justified in using satisfied tones when he told the press that "by the appointment of the Economical Survey Group we have averted a show down." For on August 29th the four Arab delegations jointly submitted a startling reply to the question: what are your territorial demands and how many refugees can you accommodate? Their answer is a measure of the unreality in which they live and dream. They replied that they must ask, in order to settle a number which they did not specify, not only for the lands allotted to them under the partition plan of November, 1947 (about 2,300 square miles of which have, as a result of conquest, since been occupied by Israel), but in addition for considerable parts of what was to be Israel under that same partition plan. By their proposals of May 24th,

1949, at a time when they had been wasted in war, they accepted the 1947 partition line. Now they have asked for more. This is a melancholy repetition of past folly. More than once, they have been in a position to shame the Assembly into standing up for them and for their half-loaf; each time, they have preferred to throw away the chance. Even those most anxious to see them through the trouble that has come upon them repeatedly find the grounds for supporting them swept away.

The new Survey Group is powerfully manned. At its head is Mr Gordon Clapp, chairman of the Tennessee Valley Authority board. He has fifty helpers. Uno, it seems, is to pay. But even his vast experience of causing deserts to bloom will be taxed to the uttermost if he is to fulfil the assignment planned for him by Washington and Lake Success. His Group is to reach Israel next week, to visit Jordan, Syria, Lebanon and Iraq over the following three weeks, to report "first results" to the Conciliation Commission by early October, and to enable the Commission to make recommendations to the Assembly at its current session. Those who know the terrain and the governments concerned are convinced that the schedule demands the impossible. This pleases the Israelis, who are anxious for no voting at the current Assembly and for a further chance to negotiate a settlement between meetings and without a verdict by the voters of 1947. The voiceless people whom it does not suit are the refugees themselves. The funds for their care and maintenance (\$32 million requested by the Assembly in the shape of "voluntary government contributions" for the period December, 1948, to August, 1949) are running out. Only the United States and Great Britain have furnished contributions on any scale. It is reported from Beirut that the relief organisations who are actually handling the camps have been informed that they are likely to have to carry on until the end of March, 1950. If so, the United Nations—either from its working fund or by means of another round robin—will have to find, at the old monthly rate, a further 25 million dollars. The bill to pay for the triumph of "averting a show down" is far from negligible.

ECOSOC at Geneva

A session of the Economic and Social Council has become a depressing event. The topics covered seem to lend themselves even more freely than do politics to an exchange of vituperation between east and west. This has been the daily dose for the last seven weeks at Geneva.

Given the wide differences of interpretation that prevail on every important topic ranging from the causes of unemployment to the right of an accused man to stand trial, it is easy to understand why one western delegate should remark (during the debate on prevention of unemployment) that "no useful purpose is served in attempting to address resolutions on policy to any particular government." "More information," he added, "is necessary." But even in the limited field of security information there are too many delegations who for one reason or another prefer to impart a political flavour to the inquiry and too few who appreciate the worth of dispassionate surveys on a situation's merits. As examples of this last, some of the reports of the Economic Commission for Europe—a subsidiary of ECOSOC, shine almost alone, and it is a pity that their parent commission should have been singled out for attack by Mr Hector McNeil, who could fruitfully and justifiably have attacked so many less worthwhile ECOSOC activities.

As a sample of political bias carried to excess, it is worth citing the defeat of an American motion for ascertaining some hard facts. This was a proposal to sift the wealth of proposals for aid that are now arriving from undeveloped areas through the sieve of an impartial group of technical experts who would rate them on their economic merits. This suggestion was

defeated by a combination of the Soviet bloc with some of the applicants for aid, many of whom fear that projects dear to them for prestige reasons might be thrown out by wholly dispassionate surveyors. As a result of prejudice of one kind and another, therefore, the Assembly is, on the whole, not getting from ECOSOC the technical advice upon which, ideally, it should be able to count.

Now and then it can count on reliable information. The recent session agreed to recommend the establishment of one fact-finding body that may have some worth—a joint ECOSOC cum ILO investigation into the practice of Trade Union Rights. But it was forced, through disagreement, to abandon all hope of a dispassionate investigation of slavery, and to postpone any action upon forced labour, upon provision for refugee rights when the International Refugee Organisation comes to an end in mid-1950, and upon the establishment of an Economic Commission for the Middle East.

For the Middle Eastern countries, and for undeveloped areas in general, by far the most interesting reflection to which the session gives rise is: how far is America willing to invest in schemes which are not economically well conceived, or which the UN Agencies, however keen, have not in fact the powers and means to carry out? It should be noted that the American delegate questioned the size and wisdom of Mr Trygve Lie's programme. He recommended, instead of the \$36 million outlay there proposed, a further sifting of the economic merits of given schemes and a first year's start at, say, \$15 million. Clearly, American thinking has been sobered by revelations, principally from the International Bank, of the questionable economic merits of some of the schemes put up by hopeful applicants. For the boundlessness of these hopes, vague over-expansive speeches both by President Truman and by Mr Lie himself must bear some of the blame.

Chaos Reaches the Milky Way

The National Dairymen's Association has declared that the milk ration of three pints must be cut although the Ministry of Food appears strangely reluctant to do so. In fact, however, the ration has not been generally maintained, and the retail distribution of milk during the last week has exemplified one of the least engaging features of the planned economy—its propensity to crash its gear-changes. Where—under the old dispensation, seasonal or weather induced gluts and shortages were translated into new patterns of consumption by the pre-selective action of price, their counterparts today induce as a matter of course a screeching of outraged administrative cogwheels, a violent jerk on the distribution mechanism, and a more or less vicious shaking-up of the passengers. All summer the weather has been abnormally dry, to the sorrow of dairy farmers. All summer the most casual holidaymakers or outer-suburban season-ticket holders—to say nothing of the disinherited breed of genuine countrymen—have been able to observe the coconut-matting pastures and draw the appropriate conclusions. Yet the best that planned milk-distribution can do, in face of Nature's clearly-phrased notice of impending shortage, is to confront the consumer with a crisis of such arbitrary incidence that the situation of his house on one side or another of the street may determine whether or not he receives, on a given date, any milk whatever. Under the anarchic, wasteful and obsolete price system the achievement of such results would have needed either sudden and universal muttair or an earthquake.

Heads I Win . . .

For forty years, bookmakers have clung, precariously, to a legal decision which gave them some chance of recovering money owed to them by their clients. In 1845, Parliament passed the Gaming Act, which declared that all agreements

by way of gaming or wagering were void and, further, that no proceedings could be brought to recover any money alleged to have been won on a wager. In course of time, bookmakers and their advisers sought a way round these plain prohibitions and they evolved an ingenious plan. The bookmaker said, in effect, to the defaulter, "if you will pay your betting debt, I will refrain from reporting you to Tattersalls Committee; thus you will be enabled to continue betting." That, it was claimed, constituted a new bargain, and one which could be enforced by law. In 1908, the Court of Appeal held, by a majority, that it was a new bargain and outside the limitations imposed by the Gaming Act, 1845. On the last day of the Trinity Sittings, the House of Lords, by a majority of four to three, held that the Court of Appeal in 1908 were wrong. Despite the introduction of the new promise over Tattersalls Committee, the sum claimed, in origin and in fact, remains a sum of money alleged to have been won on a wager, and so due under an unenforceable contract.

It is impossible not to feel some sympathy with the bookmakers. They do not carry on an illegal business, and most of the adult population of Great Britain are their clients at one time or another. The bookmaker depends for his success in business on his readiness to pay out promptly on a contract unenforceable in law. And yet, apparently, his success in the future will be determined by his ability to pick out in time those of his clients who, when they lose, will do the one thing that they know the bookmaker will

Central vs Local Administration

According to the weekly return of the Registrar-General, the cholera is increasing in London and in the country generally. . . . We are old enough to have a vivid recollection, when the pestilence first came to us in 1831, of the meetings that were held in the different parishes of the metropolis, of the scrubbing and scouring and whitewashing that were immediately set about, of the establishment in each parish of separate places for cholera patients, of the appointment of additional medical officers, and of the many precautions that were taken, not scientifically perhaps, nor efficiently, but zealously taken, by the different local authorities. Then the disease did not slay its thousands here as in other metropolitan cities, and it may be that these authorities, far less alarmed now than then, are, therefore, less zealous. . . . We are, however, constrained by these circumstances to remember and to remind our readers that since 1831, legislation . . . has set in with a heady current against all local, and particularly against parish, authorities. It may, we think, therefore, be that the zeal of these authorities has been naturally cooled, by being superseded in many of their functions, and that they may have . . . relied on the Board of Health to order and take all the necessary measures for combating this "great epidemic."

We are not now about to enter into an inquiry as to the utility of the Board, or as to the necessity of extending its powers, though we must own that we prefer a system which calls into operation the active zeal of hundreds of thousands of well-intentioned, though perhaps now over-well informed men scattered over the country, to the system which substitutes for them the science of one or two gentlemen, who cannot possibly govern the whole, though they extinguish all zeal in others,—but we must say, whatever system be adopted, that it behoves the Legislature to carry it completely out, and not tolerate a conflicting jumble of laws and authorities, which paralyze exertions and exhibit a picture of complete anarchy. . . . We have not lately seen anything more disgraceful to the national character . . . than the statement of the Registrar-General, that only now, when the disease seems about to abate, are the authorities beginning to take proper measures to combat and conquer it.

Source of strength

In quarries in the Newfoundland hills limestone is dynamited from the cliff face at the rate of some 50 tons a day. After a short haul to Bowaters Corner Brook Mills the limestone, treated with sulphurous acid, produces a cooking liquor in which wood chips are digested to produce sulphite pulp—a strong pulp with a high cellulose content which is added to mechanically ground pulp to give paper its strength. Limestone is yet another of the raw materials of Newfoundland used by Bowaters to make their organisation self-reliant—an added guarantee to their customers in five continents. It is by such vision and enterprise that the Bowater Organisation is able to build a service exploiting the scope and potentialities of the pulp and paper trade for the benefit of world industry.

not, that is plead the Gaming Act. Still, the House of Lords, which, for this purpose, consists of members of the legal profession, has prudently left the door slightly ajar to further litigious excursions. Lord Greene, in his judgment, said that he was not suggesting that there could never be a case where a promise to pay given by a defaulter in return for a promise not to report him might be enforced. The bookmakers will have to think again. They may in the end find a formula which a different House of Lords may be able to "distinguish" from the mechanism for securing payment of bets examined in the recent case. But, for the moment, bookmakers must be feeling as if three successive favourites had won.

Ashridge

The dispute over the future of the Ashridge College of Citizenship has now become public property with the announcement of the impending dismissal of its principal, General Sir Bernard Paget and his staff. Ashridge, a vast regency gothic house, was before the war a Conservative college, endowed by a fund known as the Bonar Law Memorial Trust. After the war it was converted into a college of Citizenship which, thanks to the intelligence and integrity of its directing staff, has made a great success in providing the kind of simple extramural education for senior schoolchildren and young people in industry which is not within the scope of the Universities. The College now faces financial difficulties which by reason of its charter cannot be met by a Ministry of Education grant, and which industrial firms who have made good use of the services of Ashridge are unable or unwilling to meet in full. The board of governors, bypassing the educa-

tional council which is responsible for the work undertaken at Ashridge, has decided to meet the deficit by taking in a young ladies finishing school which will by cramping the accommodation make it impossible to run the series of short course which is one of the main advantages of Ashridge. Since the board of governors who are irremovable seem set on this course, it rules out the possibility of making Ashridge an extension of either London or Oxford University. It is possible that the governors prefer the safety of being landlord to a seminary than the more courageous course of seeking by every means to preserve the modern value of Ashridge. One of the senior and less nervous academic institutions would be well advised to acquire the services of so able an educational improviser and administrator as Sir Bernard Paget.

Shorter Note

The Saudi Arabian Legation in Cairo has issued an official denial of reports that King Ibn Saud's government is willing to ship oil to Haifa. "The American oil company," the statement says, "has pledged that not a single drop of Saudi Arabian oil should reach any Jewish destination, either directly or indirectly." Simultaneously, Nuri Pasha es Said, upon his return to Baghdad from London, has stated that no oil will be pumped to Haifa "until the question of the refinery is solved." Does this mean "until the refinery is working with other oil, and Iraq is so blatantly a loser by the process that it may be possible to break down Iraqi intransigence"? Or does it mean "until Haifa becomes a free zone"? The vague wording suggests that Nuri himself is not sure. If, therefore, Anglo-Jewish efforts to resume refining are successful, the oil will have to be secured elsewhere.

Letters to the Editor

The Dollar Drain

SIR,—In view of certain developments in South Africa I read "Overseas Banker's" letter in your issue of July 23rd with more than passing interest.

In a Territory, which is about to become a Fifth Province of the Union, the Malan Government recently banned the use of optional and through Bills of Lading (enclosed: Transshipment USA Ports) in a belated attempt to prevent the use of cheap sterling for financing her karakul pelt exports, with a resultant sharp drop in domestic prices occasioned by the disappearance of the exchange premium accruing thereon.

The producers and certain exporters promptly made a political issue of the matter; and Dr Malan, apparently fearing a Nationalist debacle in the forthcoming south-west African elections for the Union Parliament, has been compelled to suspend his Finance Minister's directive.

On a most conservative basis it is estimated that South Africa's potential dollar drain from this source only is in the neighbourhood of \$12 million per annum. Is it surprising therefore that responsible bankers feel a sense of bewilderment and frustration when official policy is so vacillating?—Yours faithfully,
S.W. Africa
"ANOTHER OVERSEAS BANKER"

The Greek War

SIR,—In your Note entitled "New Turn in the Greek War" published in *The Economist* of August 27th you speak of the Greek Government's "atrocious record" of 700 executions "in cold blood," adding that "some of this butchery represents personal vengeance wreaked by minor officials."

This is a fantastic accusation to make against a country the impartiality of whose judiciary has been admitted by a British Legal Mission. Do you seriously suggest that persons are being condemned to death by the Greek Courts and executed merely because they have incurred the displeasure of some petty official? If so, you should cite specific instances instead of making sweeping allegations that are as unfair as they are false.

The Greek Government is the first to deplore the necessity for so severe punitive measures; but at the same time it should be borne in mind that Greece is at war and that thousands of her soldiers, not to mention innocent civilians, are being killed and maimed as the result of direct action, sabotage, etc. Is it surprising that persons who commit or abet such acts should be punished, in extreme cases, with death? You make no mention of the large numbers of misguided rebels who have surrendered or have been captured while fighting with the guerilla bands and who have been allowed to go free. Does that reveal "fascist tendencies" on the part of the Authorities?

There was little protest in this country, if I remember rightly, when Joyce was hanged. You may rest assured that the persons executed in Greece have been found guilty of far more odious crimes than broadcasting for the enemy.—Yours faithfully,

A. A. PALLIS, Minister Plenipotentiary
34 Hyde Park Square, London, W.2

SIR,—If the writer of your Note on Greece were a Greek citizen living abroad he would receive instant proof of the truth of his conclusion: "And until the Greeks' fascist tendencies can be scotched once and for all, the regime may find it impossible to establish the measure of internal political unity necessary for a lasting peace, whatever the outcome of the present fighting."

He would be villified as a "Communist" by the Greek Government. His passport would not be renewed. He would be found guilty of "subversive activities" and would naturally keep away from his country while these "fascist tendencies" were manifested.

A case point is that of the publisher of this modest monthly, Mr E. H. Athanassoglou. His "crime" is that, subscribing to the unchallengeable truth of your conclusion, he has "subversively" advocated mediation as better than the present policy of useless bloodshed to bring tranquillity to his country.

Yours faithfully,
EDITOR, *Greek Outlook*

SIR,—In your issue of August 27th you flagellate the Greek Government for pronouncing 53 death sentences on indictments connected with the Communist war. Have you seen the evidence? I have not, so in justice to an ally I suspend judgment till I have some knowledge of the charge. If you have seen the evidence, will you please publish enough of it to enable your readers to gauge the validity of your strictures? If you have not seen it, will you suspend your judgment too? In any case will you provide chapter and verse for your sweeping affirmations on "the Greeks' fascist tendencies"? That is, of course, what the Iron Curtain radios say; but I hardly expected to hear the echo in a British periodical.

Such blackening affirmations surely require completely solid grounds. Unless these exist, it is a mistake for democracies to show that, while Greece is bearing the burden of the hot war, they have no idea how to fight a cold one. On August 26th, for example, the *New York Herald Tribune* naively allowed those persistent propagandists, Messrs. Athanassoglou and Doganis, almost to monopolise its exiguous correspondence columns with denigration of the Greek Government little stronger than yours. Could anything be better calculated to discourage men fighting in a common cause?—Yours faithfully,

Denham Place, Denham, Bucks

VANSITTART

SIR,—Having been deprived of my Greek citizenship by the present regime in Athens, because of my politics, I wholeheartedly agree with your note of last week on Greece which describes the thousands of executions as "butchery" and an "atrocious record."

May I point out in this connection that it is this "vicious and appalling savagery" which is mainly responsible for the continued civil war. For the past five terrible years, almost continuously, Greek has been killing Greek. And this is mainly because the regime in Athens has built itself up on the basis of a terror which makes civil war inevitable. Peace, and the return of the country to a democratic way of life, would mean the political extinction of the inefficient, corrupt and bankrupt people who rule in Athens today.

As long as these people are in power, supported by the British and American Governments, peace and decency can never return to Greece.

But Greece needs peace and the reconstruction of her shattered homes more than any other country in Europe. The entire nation, irrespective of political creed, longs for peace. But this peace cannot be established by the extermination of the Left by military operations, mass executions, or mass imprisonments. The past four years have proved how criminally wrong and futile such a policy is. Peace will be restored in Greece only by negotiated democratic agreement. The guerrillas will never lay down their arms unless such an agreement is reached.

As regards the latest "final victory" of Athens, it will prove to be another Pyrrhic victory, like previous ones.

That is why, in my opinion, all those in Britain who really wish to see the present ordeal of Greece brought to an end should work for a negotiated and democratic solution of the Greek problem.—Yours faithfully,

12 Mickham Gardens, Twickenham

TH. DOGANIS

Interest Rates Now

SIR,—Last week's timely article "Interest Rates Now" does not appear to give due regard to one of the most important technical market factors which has accentuated the recent fall in gilt-edged stocks. This has been the fairly large selling of War Loan by those in banking circles who held it with a mixed portfolio of short and medium dated stocks; who regarded it, in fact, as a "short." Consequently, any slight digression under par is accelerated by hasty selling of this loan—then irredeemable. In turn, this engenders further weakness.

Quite apart from the general lessening of confidence as the result of a wider realisation of the country's export/import position and the possibility of some ultimate readjustment in exchange rates, one other factor is surely relevant. As shown by your "Consolidated Balance Sheet for Industry" published in a recent issue, not a small proportion of the capital value of physical stocks held by industry has been financed by the gradual sale of Government stocks. This indicates a shortage of working capital, which has occasioned the recent large issues of industrial prior charge stocks. These issues compete with existing stocks (including gilt-edged), and tend to raise interest rates to a moderate extent.

One other point—has the long-term internal credit record of successive British Governments been compromised by the issue of Gas Stock to holders of similar securities at prices varying by as much as 10 per cent?—Yours faithfully,

12 Tokenhouse Yard, E.C.2

G. J. CHANDLER

Utility Price Cuts

SIR,—In describing the new Utility price cuts, you state that "the retailer's margin is reduced by about 2½ per cent of the retail price." It is true that retailers' margins are being reduced, e.g., from 27½ to 25 per cent of the selling price. But this reduction, even if unaccompanied by lower suppliers' prices, cuts retail prices by about 3½ per cent (8d. in the £, not 6d.). Taking into account also the effect upon retail margins of lower suppliers' prices, the retailer will be contributing about 9d. to price cuts totalling just over 1s. in the £.

You also quote the retail margin on household textiles as being cut from 30 to 27½ per cent on returns. In fact, the margin on cotton varieties is cut from 22½ to 20 per cent, and on linen varieties is cut from 25 to 22½ per cent.—Yours faithfully,

DONALD BARBER

London, W.1 Secretary, Retail Distributors' Association

[This subject is discussed in a Business Note on page 523.—EDITOR.]

The Repellent Germans

SIR,—In your article "After the German Elections" in *The Economist* of August 20th, the conclusions of which seem to me to be very reasonable, I find to my regret a sentence which is the reason for my writing to you. In speaking about the electoral campaign you write: "All the most unpleasant characteristics of a not very attractive people came to the surface." Every people have pleasant and unpleasant characteristics, which, according to the circumstances, come to the surface. I would not have taken exception to this statement if it was not followed by the sentence: "Germany's repellent record in the international affairs of the last seventy years was forgotten." Germany's "repellent record" is based on the falsehood of Germany's sole guilt for all the wars in which she was involved during the last 70 years. With regard to Germany's sole guilt for the war 1871 I quote from *The Times* issue of July 16, 1870, as follows:

The greatest national crime that we have had the pain of recording in these columns since the days of the First French Empire has been consummated. War is declared—an unjust, but premeditated war. The dire calamity, which overwhelms Europe

with dismay, is, it is now too clear, the act of France, of one man in France. It is the ultimate result of personal rule.

There can be no doubt as to the side on which the world's sympathies will be enlisted and, whatever may on former occasions have been the offences of Prussia, she will in this instance have on her side all that moral support which is seldom denied to those who take up arms in self-defence.

With regard to Germany's sole guilt for the war 1914/18—the second proof of "Germany's repellent record"—I beg to draw your attention to the chapter in the late Lord Arthur Ponsonby's book, "Falsehood in Wartime," about "Germany's sole responsibility for the war." In this chapter "Germany's repellent record" is refuted by such leading statesmen as the late Lord Lloyd George, the former Prime Minister of Italy, Francesco Nitti, President Wilson, M. Raymond Poincaré, and others. Unquestionably, Germany's record is in fact repellent for those who hold all Germans responsible for Hitler's and his gang's misdeeds, but those who make a difference between the genuine Nazis and the great majority of the German people—and I think that the great majority of the world's public opinion now makes that difference—would, I believe, not speak of "Germany's repellent record" during this period. Unquestionably a very large percentage of the German people was responsible for Hitler's coming to power by voting for him in the year 1933. But for those—about 17,265,000 out of 37,669,000—I can plead extenuating circumstances by quoting from Lord Keynes's book "The Consequences of the Treaty" (1919) as follows:

The clock cannot be set back. You cannot restore Central Europe to 1870 without setting up such strains in the European structure and letting loose such human and spiritual forces as, pushing beyond frontiers and races, will overwhelm not only you and your guarantees, but your institutions and the existing order of society.

Whilst I agree with you that most people in Germany—but the same is true of most people all over the world—have a very short memory and whilst you are undoubtedly right when you

Books and Publications

Agriculture in Perspective

"An Introduction to Agricultural Economics." By Edgar Thomas. Nelson. 295 pages. 10s. 6d.

Few text books deal specifically with the agricultural economy of Britain and some of those previously published have been mainly concerned with historical developments or with rather academic attempts to explain and analyse agricultural problems in terms of simple economic theory. This book is intended primarily for agricultural students: "Its object is to give an interpretation of the economic structure of the agricultural industry in this country which, while being fairly simple, is nevertheless sufficiently systematic to give the student an introduction to the economist's technique of thinking."

In the introduction care is taken to put agriculture in perspective and to make clear, from the economic point of view, that the contrast implied in the phrase "agriculture and industry" is misleading. Nevertheless, much of the book is concerned with essential differences existing between farming and other industries. Following the general introduction, attention is given to the gross and net output of the industry. This is followed by four chapters individually covering the three factors of production and their combination. The size of farms; land tenure; agriculture and the general price level; prices, demand and supply in agriculture; agricultural marketing; and imperfect competition in agriculture are the titles of the remaining chapters. Some of the implications of the very important agricultural legislation of 1947 are discussed under land tenure.

One merit of the "Introduction to Agricultural Economics" is that it systematically provides references to agricultural economics, literature and data. Most of the chapters have

say that for many vote-catching speakers during this electoral campaign "history began in 1945 and everything was the fault of the occupying powers," I do not think that one can justly accuse all the Germans of really having forgotten everything that happened before 1945, including Germany's share in the guilt of the last 70 or 80 years.—Yours faithfully,
Frankfurt Am Main, Reuterweg 14 RICHARD MERTON.

The Communist Programme

SIR,—In your note on the Communist Party Programme, "The Socialist Road for Britain," you refer to our statement that "the rise in production and profits, while wages are kept down, is speeding up the growth of unemployment in Britain," and triumphantly call attention to the fact that "current unemployment"—presumably the last official return of 243,041 in July—shows a slight decrease on the preceding month. This is an excellent example of the fallacy of taking a very short-term total figure as a correct measure of a trend. Even on the basis of the narrow measure of the June and July returns, the significant fact for any intelligent observer of trends to note was the growth of unemployment in the basic industries, engineering and shipbuilding and textiles, and the net decline of employment in the manufacturing industries as a whole by 5,000. It is also worth noting that the inflated figure of the armed forces, at 769,000, or close on double prewar, is equivalent to a considerable figure of concealed unemployment which would more than double the present official figures. Our statement, however, was concerned with the serious long-term factors in present policies making for a "growth of unemployment in Britain." We would ask your readers to make a note of your statement and ours for reference in twelve months' time, to see whether our warning or your complacency was the better justified.—Yours faithfully,

R. PALME DUFF

19 Whitehall Lodge, N.10

bibliographies which, while very far from exhaustive or fully representative, are useful as introductions within the scope set by the author. Agriculture provides very many problems for economic study, and within a book of this size it would be easy to discover omissions or "patchiness" of treatment. In the chapter on the combination of the factors of production, for instance, much more could reasonably be expected on the importance of organisation and the function of the *entrepreneur*. In the discussion on land tenure, the economic history affecting the landowner's functions would have been useful for many purposes. Indeed, the main criticism of the book is perhaps that it does not give a little more of the historical background which is necessary for true appreciation of the existing structure and problems of agriculture. The course of wages and other costs, rents and income of farms; the changes in food consumption habits; the effect of international and overseas developments are all pertinent aspects which might have been included, however briefly, for historical review. Little attention has been given to problems of taxation, although here again, agriculture has had specific treatments both on the national and on the local plane. What historical treatment exists is largely confined to the past quarter century or so, as in the final chapter on imperfect competition. This chapter is a most useful study of agricultural policy, particularly of marketing and of the schemes derived from the Agricultural Marketing Acts of 1931 and 1933 and later of the price support policy. Some reference to overseas developments and situations in the corresponding period would have been instructive as indicating how far the specific arrangements in Britain were or were not unique.

Professor Thomas' book will be most useful for those who seek to be well-informed about the economic problems of

British agriculture, including those who are concerned with the teaching of this applied subject. The Professor of Agricultural Economics at Reading University is singularly well-fitted to write this book. He has also been Honorary Secretary of the Agricultural Economic Society since its foundation. It is clear that the text has benefited directly from these activities and associations.

A Superficial Observer

"Journey Under the Crescent Moon." By Nina Epton. Gollancz. 286 pages. 18s.

FRENCH North Africa is, as Miss Epton says in her preface, strangely little known for a place so near to London and Paris. A book on it, therefore, fills a gap on most shelves. Miss Epton sets out to write on its nationalists—"not so much about its nationalism as about its nationalists as human beings." But she speaks no Arabic; she is therefore confined to the company of townsmen and of the few among their wives who are Frenchwomen or else French-educated. And none of these can talk of anything but politics. She has therefore written, willy nilly, not a social but a political book. She writes readably, and having done the greater part of her journey, from Morocco to Cairo and back via Tunis and Algiers, at the height of summer, is a cheerful and indefatigable traveller. But she has one grave drawback as a political observer. She sees only what she wants to see. Having started out, perhaps mistakenly, by accepting the hospitality of die-hard French army circles in Morocco, she writes off all Frenchmen as tyrants. She makes no attempt to see the French inhabitants—they are few in Tunisia and Morocco, but easy to find in Algeria—who sympathise with the local nationalists but see their weaknesses. It is difficult upon short acquaintance to assess the character of an Arab or a Berber. Miss Epton makes the mistake of accepting them at their own valuation, that is as virile, determined, united people, on the point of revolt. A little probing among their foreign sympathisers would have shown them for what they are: talkative, dreamy, idealistic, but divided among themselves and, at bottom, full of a love for French culture despite their dislike of French tutelage. Nowhere does her story explain, for instance, why, despite all its grumbling, North Africa was loyal to France in 1939-40; why even nationalists like Ferhat Abbas immediately volunteered for service in the French army; why crowds turned out to cheer M. Vincent Auriol when he toured Algeria this year.

The chief value of her book is that it shows the nationalists as they see themselves. Otherwise it presents a distorted picture of the scene. A measure of the author's judgment can be had from her illustrations. She refers frequently to taking photographs of appalling conditions. Why illustrate a flaming indictment of France with photographs of minarets, smiling Berbers and plump babies: suitable for postcards or lids for chocolate boxes?

Wooden Ships of Maine

"The Maritime History of Maine." By William Hutchinson Rowe. New York: W.W. Norton. London: Allen and Unwin. 333 pages. 56.00; 30s.

THE State of Maine, with 2,500 miles of indented coastline and over 1,000 harbours, is the oldest maritime community in the New World, and Mr Rowe gives a vivid account of its ship-building and seafaring history from the launching of a "pretty pinnace" in 1607 to the last gasp of the wooden shipyards in the First World War. But the maritime story of Maine began, long before the seventeenth century, with the discovery of its winter fisheries by European fishermen, and European fishermen are today amongst those who, by their orders for fishing craft, keep the art of wooden shipbuilding alive.

This book draws a detailed picture of the ships themselves, of their building and their crews, of their voyages and their trade. It contains a mass of technical information, which is nevertheless comprehensible, and will therefore be fascinating even to those with no prospects of joining the summer visitors who are now thronging Kennebunkport and Wiscasset and the other charmingly-named places which appear in the book. The timber of Maine, both as the material for the ships and as the cargo they carried, was the basis of the state's maritime industry, but in the middle of the nineteenth century one of the most profitable cargoes was ice, cut from Maine's rivers during the winter and shipped not only to New York, where it embellished the banquets of the era, but as far as Calcutta and Batavia.

Mr Rowe's story begins with the early settlers who supplied Spain and Italy with dried cod and England with tall pines for the masts of the Royal Navy. It was upon that same Royal Navy that Maine waged war during the Revolution and later in 1812, only itself to be preyed upon by the Confederate raiders in the American Civil War. Maine supplied more ships than all the Southern states to carry raw cotton to the mills of Lancashire, and, after the Gold Rush in 1849, the state joined the roaring trade to carry the necessities of life to California. Some of the fastest of the clippers were built to win the race for these markets. But as California became more staid, speed was no longer so important, and Maine concentrated again on slower ships like the square-rigged "down-easters" which carried Californian wheat to Europe and handled the China trade. Then came schooners for the coastwise traffic, until at last the tall wooden ships were ousted by the steamships and ended up dismasted and crippled as barges towed behind tugs.

An American View of Sweden

"Sweden: Champion of Peace." By David Hinshaw. G. P. Putnam, New York. 309 pages and plates. 54.00.

THIS book is an excellent illustration of the dangers of arguing by analogy. Its thesis is that Charles XIV, Sweden's first

Bernadotte King, decided that Sweden would not fight again. This decision having been taken, the Swedes refrained from participation in the two World Wars. *O si sic omnes!* The author's idealism prompts him to over-simplify almost to the point of injustice—injustice to the decent, industrious, ordinary people of the Balkans or of Britain—or America. They desire peace no less than the Swedes, nor do they reckon its victories less dearly.

The long neutrality which has benefited Sweden so greatly is a product of geographical and political factors largely outside Sweden's control. It is true that in that limited sector where the course of events could be influenced, Swedish policy has been extremely adroit. It is also true—and greatly to the credit of the Swedes—that they have used so wisely the opportunities afforded by generations of peace. But they would be the last to accept the author's argument that, because certain institutions have been developed in Sweden in the long years of peace, all that is required to ensure universal peace is to transplant Swedish institutions to other countries. A study of Tibetan customs and organisations would yield the same conclusions.

In its main aim of serving—in the words of the publishers' blurb—"as a useful guide to men and women throughout the world in these fear-ridden, cataclysmic times" the book must be considered a failure. But it has considerable value in that it devotes seven out of its twenty chapters to a factual examination of Swedish foreign policy from about 1914 to 1948. A survey in English of Swedish policy during and after World War II is rare. The author draws at length on the various Scandinavian White Books which bring out in a way that will surprise many readers, whose recollections of the events related are based on partial wartime reports, how much Sweden refused to Germany. The description of the Swedish social and political structure, though a more normal ingredient of books on Sweden, is useful and more up to date than usual. The illustrations are first-rate.

A Swedish View of Russia

Ryssland och var Politik. By Arthur Montgomery. Skoglund's Bokförlag, Stockholm. 211 pages. 8.50 kr.

THIS book is a reprint of selected articles on Russia which Professor Montgomery has contributed to the main Swedish newspapers in the past three years. As one of Sweden's leading economists who is a lifelong student of Russian affairs and who has lived for a considerable time in Finland, the author is particularly well placed to interpret to his countrymen the aims and organisation of the enigmatic Soviet Czars. The ground covered by the work is accordingly very varied. The Russian currency reform, the economy of the Eastern bloc, Marxist music, Bolshevik biology and many similar topics are discussed in a lucid, intelligent and well-informed manner. But the particular interest of the book for non-Swedes, who, after all, have access to many other equally authoritative interpretations of these manifestations of Soviet activity, lies in its discussion of the role of Russia in Scandinavia and, in particular, in the effect on Sweden of Russian policy in Finland.

On this crucial problem of Swedish policy Professor Montgomery is in the main content with exposition. He is too sensible to concoct startling new theories—and too shrewd to accept at its face value the orthodox Swedish view that Russia's comparatively good behaviour in Finland is due mainly to the Kremlin's desire to avoid driving Sweden westwards. He rightly says that not only does "the Soviet Union in the last analysis determine its Finnish policy without regard to us [Swedes]," but also that, in Communist eyes, Sweden is already lined up with the West. The brutal truth is that, at bottom, the international position of Finland—and of Sweden—is what the rivalries of the Great Powers permit it to be.

Flat Geography

"Geography behind Politics." By A. E. Moodie. Hutchinson's University Library. 178 pages. 7s. 6d.

THERE is no doubt that the geographer has, or should have, something of value to contribute to political debate. An objective weighing-up of the material factors which affect the life of states, and some pointers at least to the evaluation of the less material factors. These are the points which Dr Moodie stresses in this little book, which is a concise and clear, but not very stimulating, account of the main content of the subject. There is, however, one glaring omission. It can hardly be denied, even by those who are sceptical of the federal panacea, that consideration of this matter should lie at the very core of any discussion of political geography which is to claim much relevance today. On a lower plane, it is surely a geographical fact of great interest, and worthy of geographical analysis, that, with the exception of Switzerland and some federations forced since World War II, the norm of the federal state is a large area, a relatively or absolutely small population, and generally at least an emergence from colonial status within the last 150 years. Yet there is but one reference to federal states in the index, and the unindexed references are inadequate. However, Dr Moodie errs in good company, for much larger and more authoritative works are equally dumb oracles.

On the whole, Dr Moodie steers a reasonable course in analysing the inter-relations of peoples, territories and organisations. There are a few confusions and *non-sequiturs*, and as a whole the book fails to grip. There are too few maps and concrete examples (apart from passing references), though exception must be made in favour of the very clear summary of Dr Moodie's much larger work on the Italy-Yugoslav boundary.

Altogether this is a sound if uninspiring guide to the layman, the student of geography may find it useful as his first introduction to a specialism. Probably no more would be claimed, and Dr Moodie obviously does not intend to break new ground, which might indeed be considered inappropriate. The general effect is that the old ground has been covered in a manner flat, but faithful.

An Educationist's Biography

"Philip Hartog." A Memoir by Mabel Hartog. Constable. 178 pages, with six half-tone plates. 10s.

SIR PHILIP HARTOG, who had received his education in this country, France and Germany, died in 1947 in his eighty-fourth year, in which year his last book, "Words in Action," was published. This typifies the intellectual ardour which inspired him to the very end of his long life. In this modest volume Lady Hartog has given a concise and intimate account, admirably arranged, of Sir Philip's varied activities. Her book gives a striking portrait of a man, passionately pursuing to successful achievement the purposes to which he was devoted. The narrative is flavoured with much lively reminiscence of people and places, which imparts a vivid personal content to the story.

Sir Philip Hartog's main work was centred in Universities—in Manchester, London and Dacca, where he was the first Vice-Chancellor. He was trained to be a scientist and the list of his many publications shows that his interest in science never deserted him. But the main stream of his life carried him to the field of education, to the theory and practice of which his writings made a powerful contribution. In this context, mention must be made of "The writing of English" of which the theme was developed in "Words in Action" and various works on the examination system, demonstrating their haphazard character. The establishment of the School of Oriental and African Studies, on the governing body of which he served for thirty years as Crown representative, is a permanent symbol of Sir Philip's vision and persistence in bringing to fruition, despite all obstacles, a project from which the Commonwealth will reap lasting benefit.

Right for your lifetime a Crusader Life-Timepiece

Will your profits slip in 1950?

Here's one certainty

*it's going to be a
very tough year
for selling.*

Sales departments have got to excel themselves. Advertising must sell—in every line of copy, in every publication where space is bought.

The 1950 appropriation needs power

As the selling problem grows more acute, wise men are cutting marginal media from their schedules. There is no longer room for publications that "might help". Trim the tail of your advertising schedule. Sharpen its teeth. Spend every penny in publications with real power.

Concentrate on the publication that sells

As the sellers market cracks, more and more important advertisers have come into Picture Post to be certain of hitting hard in their sales drives. Picture Post gives them 9½ million readers spread throughout Britain, of all classes, professions, and income groups—including the shop-keepers, who will be such great allies next year when stock needs an extra effort to shift it from the shelves.

Take a large space

Give your advertising agent the room to put over the full impact of your message. Give the retailer confidence by taking large spaces in the magazine seen by one out of every four adults in the country.

For the maximum effect take the top space in Britain's top magazine—a full colour page in Picture Post.

Ask this at your advertising meeting.

For 1950 you must ask
—not only "Are we in Picture Post?" but "Are we in
Picture Post often enough? with big enough spaces?"

Mandrils or Mechanical Brain?

Amid the mountainous sea of words which the world's presses commit to paper a man might be forgiven for wondering whether a colony of typewriting mandrils was not busily at work somewhere on the banks of the Zambesi or the Limpopo. Or—to leap to the other end of the evolutionary chain—perhaps a giant Mechanical Brain has been set in motion in order to improve upon the works of William Shakespeare. Yet good books are still written. To discover them is the special purpose of The Times Literary Supplement. Informed and experienced, discerning in its critical standards, it has never yet wasted a thinking man's time.

AMERICAN SURVEY

Washington Background

(From an American Correspondent)

THE attitude of the average American to the Washington talks is almost completely negative. There is doubt whether the crisis is as black as it is painted; disbelief in, and irritation at, those British observers who hold that its immediate cause and cure lie in the United States; and fear that the approach of an election will paralyse Britain. Few hopes are therefore entertained for the conference. In their place is concern that the solidarity of the Atlantic community may be shaken by the recriminations which are already being exchanged and which President Truman last Monday relegated to their comparatively unimportant position, when he restated the basic principles of America's foreign economic policy.

The sterling problem since the end of the war has been regarded only from extreme positions of optimism and pessimism. Hopes raised at the time of the Anglo-American loan in 1946 gave way to despair during the 1947 convertibility crisis. The good start of the Marshall Plan then generated a new wave of over-optimism which has been followed once more by an excess of gloom. A sober appraisal of the true sterling position is, in American eyes, one of the essential tasks of the conference.

If the crisis has been exaggerated, a real problem nevertheless exists. The levelling-off of business activity in the United States destroyed any faint hope that the sterling area deficit would be cured by mounting American imports as supplies abroad became available. Similarly, the tapering off of the rise in British productivity suggests that higher output can no longer be relied upon as a short term cure. Increased consumption in the United States and increased production in Britain are still the basic ingredients of a long term solution. The "dollar shortage" has its ultimate roots in over-saving in the United States as well as in over-consumption (and over-investment) in the rest of the world.

If the United States is unwilling to agree that the check to its postwar boom makes it responsible for the crisis, it is equally impatient with some of the remedies which it is asked to apply. There is, for example, no chance that the American Treasury will increase the price of gold. The country has lost its simple faith in the value of gold without having gained enough cynicism to see merit in raising the high price already being paid for something worthless. Nor is it very likely that an economy-minded Congress, which has just slashed ten per cent off the appropriations for European economic assistance and even more off the authority to make purchases for the strategic stockpile, will vote new money for the latter in order to aid one of the recipients of the former. Far from increasing United States imports in the near future, it seems to many Americans that the immediate problem is how to avoid new limitations being put on them. Demands for further restrictions on imports (and for shifting stockpile funds from imports to domestic supplies) are being openly put forward by copper, oil, textiles and knit-gloves interests, and are likely to occur for many other

commodities. Aided by the basic strength of American business, the Administration is successfully resisting these pressures. Its capacity to do so indefinitely, however, is uncertain, as the 1946 Swiss-watch episode revealed.

It seems, therefore, that in the short run, reliance must be placed chiefly on two broad lines of action: a reduction in British consumption and an expansion in British exports on the one hand, and lending by the United States on the other. The first is a question not of the abandonment of nationalisation and social security in Britain, as some opinion in the United States holds, but of a more effective solution of the problem of blocked balances and capital flight, and of the familiar three D's—disinflation, devaluation and discrimination. The second covers the President's Fourth Point for the development of backward areas, the International Bank, and possibly the revival of private American lending in the bond market.

★

To take lending first. If the United States insists on producing more than it consumes, and investing less at home than it saves, then it should lend abroad until a higher level of consumption is attained at home. Investments through the Export-Import Bank and the World Bank, and by other American enterprises, assist foreign development; but these tied loans do not promote multilateral trade. What is needed are untied dollars which, ideally, would be borrowed by the rest of the world and spent in Europe. Changing the law of the Export-Import Bank or the practice of the World Bank, to permit this, would be complex and roundabout, and the most direct means might be to revive the New York market for foreign bond issues. Here is a possible answer for the conference to explore, but it is a long-term solution. A stabilisation loan—or Mr Bevin's variant, involving the redistribution of the gold of Fort Knox by loan—is premature. This device must be kept to provide reserves after the dollar gap has been closed, rather than used to close it. In retrospect, the Marshall Plan and the Anglo-American loan were undertaken in the wrong order. This mistake, and the ineffectiveness of the International Monetary Fund, may have made ultimate Congressional approval of stabilisation loans impossible. Certainly it appears futile to recommend them now.

The only immediate hope of adjustment seems, therefore, to depend on reduced consumption in the United Kingdom

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

of foreign goods, which must be kept off the market by trade restrictions or higher prices, and of British goods, which must then be sold abroad. This requires either competitive pricing or barter, and in this connection the United States continues to favour disinflation and devaluation and to oppose discrimination.

The American Treasury has not distinguished itself on devaluation. Official advice in these matters is normally given to other nations in secret, which the Treasury did not do. Yet, when the subject cropped up in Congressional hearings on European recovery, the Treasury obligingly offered the opinion that devaluation was an ultimate necessity. As a result the holding of sterling was discouraged and its sale encouraged. The American government is believed to have lost some of its early confidence in the efficacy of devaluation, since it was asked to share responsibility for it in the event of failure. In the absence of inflation in the United States, however, Britain must devalue or carry disinflation to great lengths if convertibility, multilateral trade and freedom of consumer choice between domestic and foreign goods are to be achieved. Taking this end for granted, devaluation is probably the less disturbing of the two courses.

To many Americans, Sir Stafford Cripps's refusal to devalue is evidence not so much of a difference in judgment, for which there is room, as of a possible disagreement in principle. This refusal would appear to be based on the view that British consumption and investment can be raised by means of discrimination above the levels which would prevail under multilateralism. This may be the case. Experience with bulk buying, however, shows certain drawbacks and much of the gain would accrue from exploiting countries poorer than Britain. In other cases—oil, for example—a British attempt to capture foreign markets through barter agreements would produce difficulties for the United States which would be certain to lead to retaliation. It is understood that temporary import restrictions and barter agreements may be necessary to reduce consumption and to dispose of exports, but the Argentine Agreement, which carried discrimination beyond the terminal date of the Marshall Plan and beyond the Bretton Woods transition period, made people wonder whether Sir Stafford's alternative to devaluation was discrimination in perpetuity.

Power in the West

[FROM A CORRESPONDENT IN COLORADO]

THE US Government may have opened up a Pandora's box of electric power disputes in the west. It has filed suit against an estimated 3,000 defendants, asserting its right to water that will be needed to operate its new \$144 million Grand Lake-Big Thompson project in Colorado. The private power companies, however, have seized this opportunity to challenge once more the government's plans to distribute power from its western dams over its own lines direct to wholesale customers.

If the companies should be sustained by the courts, the building of government transmission lines in the west, which within a decade may be carrying some six million kilowatts to consumers' organisations, would be halted. Private utilities could buy the power at the generators, or buy the falling water and generate their own power. For this reason the suit is attracting national attention.

Water-rights in the semi-arid west are subject to an exact and complex code, which the government now seeks to

clarify to its own advantage. The Big Thompson or "Big T" project centres around a 13-mile tunnel driven through the Continental Divide in Colorado at an altitude of about 8,200 feet. Through this tunnel would be transported annually some 310,000 acre-feet of water from the Colorado River Basin on the west to the Missouri River Basin on the east (an acre-foot of water is the amount needed to cover one acre a foot deep). This water would generate approximately 170,000 kilowatts of electricity as it tumbled 3,000 feet down the mountain-sides to the Great Plains; and then would be used to irrigate approximately 1,000 square miles of farms. These already have access to some water, but it is alleged to be insufficient. The government would be recompensed in part by revenue from electric power, and by payments from the farmers benefited.

The enterprise does not appear to have been very carefully planned when launched as a semi-relief project in the dry 'thirties. For one thing, the estimated costs have mounted

from \$45 million to \$144 million. Furthermore, it is only now, with the project so near completion that some water is run through the tunnel each spring to supplement existing supplies, that the government is taking formal and final steps to ensure that someone else does not have a prior legal claim to the water.

The new federal suit supersedes a similar suit which has been accumulating briefs and exhibits in a Colorado state court for 12 years. The volume of the evidence testifies to the fact that the issues reach far beyond the bounds of any single state. Colorado, other states, and the federal government are already parties to dozens of agreements. People as far away as the southernmost tip of California and Mexico claim an interest in whatever is done anywhere on the Colorado River. Even as it is said that throwing a stone may alter the balance of the solar system, so the most shadowy of these claims might upset the delicate balance of the Colorado Basin. Its economy is built upon water, and the high hopes which hundreds of its communities share for a great and prosperous future are limited by the available water supply.

The estimate of 3,000 defendants involved in the government's suit include the whole number of claimants that might conceivably have any shadow of right over the water. Actually, the government filed suit against eight defendants, choosing each as representing a class of claimant. Among them is the Public Service Company of Colorado, the private utility company which supplies much of the power used in the region, and views with alarm the government's plans to build transmission lines to transport electricity from the dams to the consumer, ignoring the private utility's grid.

The private power industry as a whole has always fought plans of the government to transport power away from its big western dams, particularly as the law directs the government to serve "public users" first. However, the general right of the government to market electricity developed as a by-product of great water projects seems to have been settled in the Tennessee Valley Authority cases. The new feature of these western projects is that the government would transport power right across territory served by the private utilities, with parallel transmission lines. It would carry electricity in some cases to "public users," such as farmers' rural electrification co-operatives, or cities with municipally-owned power-plants, that are now customers of the private utilities, but are eager for federal power, because it will cost them less.

In scores of instances throughout the west, large private power enterprises are thus confronted with the spectre of government competition on a scale and under conditions that they fear may force them out of business and convert the whole west into a public power province. The most recent Congressional battle has gone against the companies. The Senate last week voted to overrule its Appropriations Committee, which had cut the funds for new government transmission lines out of the appropriation for the Department of the Interior, already approved by the House.

The companies, unable to sue the government in the courts or show anything but prospective damage, welcome the present suit as an opportunity to carry the battle to the courts and challenge the government's right to build competitive transmission lines. The answer filed by the Public Service Company argues that the original Congressional authorisation for the Big Thompson project contemplated only two transmission lines, whose sole function would have been to channel power into the company's system; that the generation, transmission, and commercial distribution of electric power within the company's service area has no reasonable relation to any lawful governmental function and is unconstitutional; and that it would deprive the company of its property without due process of law and without compensation. This case, vitally affecting the future of the whole private power industry, is virtually certain to reach the Supreme Court.

American Notes

Congress on Holiday

The Anglo-American economic talks will, it appears, coincide with the Senate's debate on the Reciprocal Trade Agreements Act which expired two months ago. It is not simply a case of renewing the Act, but of removing the restrictions on the Administration's freedom to negotiate tariff reductions which were added last year by the Republican Congress and which, in the present uncertain state of the national economy, seem very desirable safeguards to many Senators, Democrats as well as Republicans. The week's vacation which they are now taking over a Labour Day holiday, which was once going to end the present session, will give Senators strength for a sharp fight without soothing their resentment at being held in Washington for what, it is now suggested, may be another three months. This resentment has already united both parties in a refusal to allow the House to go officially on the holiday which so many of its members were taking, slipping away from Washington unofficially, that it became difficult to find a quorum. The House, already indignant at being forced to suffer for the Senate's tardiness, then defiantly departed on 26-days' French leave.

Before going the House extended, for the fourth time, until October 1st, the temporary spending authority under which

many government agencies have already been operating for two months. The Senate, at last goaded into activity by the House's jibes, has now passed all the Appropriations Bills, but final action will apparently have to wait until the representatives of the House on the joint conference committee feel refreshed enough to negotiate on the differences between the two versions. Even funds for the Economic Co-operation Administration, which have been in conference for weeks, remain unsettled; it is reported that the House representatives are willing to agree to the Senate's 10 per cent cut in the total, but are still balking at the watch-dog committee.

"One To Squeeze Junction"

Herblock in the Washington Post

Otherwise, however, there is plenty for the Senate to get on with while its lower half is away. The House has been far from a model follower of the Fair Deal; it has, for example, rejected the Administration's farm price support scheme and has not been at all generous to the Military Assistance Programme, with both of which the Senate has still to cope. But months ago it renewed, and amended satisfactorily, the Trade Agreements Act and it has passed the Bill for raising the minimum wage to 75 cents an hour, which the Senate has been debating this week and which is supposed to be a sop to labour for the failure to repeal the Taft-Hartley Act. Finally, the House long since approved an adequate Bill for the admission of displaced persons, which has been blocked in the Senate Judiciary Committee by the chairman's obstinate preference for such matters as spies in the United Nations and the need for Basque immigrants to herd sheep in his own state of Nevada. In a final desperate attempt to force this Bill on to the Senate floor, the Administration leaders have just turned to the Republicans for help.

* * *

Billions for Defence

The rider which Senator McClellan hoped to attach to the defence Appropriation Bill, and which would have required President Truman to wield the economy axe from which

Congress itself recoiled, has failed to secure the necessary two-thirds vote. But the Senate, stung, perhaps, by the cynical reception of this ingenious notion, has cut the billions for defence—by far the largest money Bill—not only below the inflated figure voted by the House, but below the President's request.

Mr Truman's budget estimate, accepted with some heart-burning by the Services, was \$15.3 billion, of which \$2.1 billion was to be in authority to place contracts, rather than cash. The House, dazzled by Air Force manœuvres, not only voted to authorise a 70-group Air Force, a statement of intent to which the Administration did not object, but offered the cash and contract authority needed to begin the expansion. In all, it approved a figure of \$15.9 billion, \$2.6 billion being in contract authority.

The Senate does not lag behind the House in air-mindedness. Only last week it passed a similar authorisation. But by refusing to commit additional funds now, it has classed the 70-group Air Force as a luxury beyond the means even of the United States in a year when the budget gap is widening. The total approved by the Senate is \$14.8 billion.

★

This includes a cut of approximately \$500 million in the cash requested by the President. By a coincidence this is almost exactly the size of the saving which Mr Johnson, the Secretary of Defence, announced last week will result, eventually, from his order dismissing 135,000 civilian workers with the military, releasing 12,073 reserve officers from duty, and shutting down 51 installations at home and abroad. The saving this year would amount to \$200 million. Consequently a sharp debate is going on as to whether the credit for retrenchment should go to Mr Johnson and the President, or to the strong hint given by the Senate Appropriations Committee. The Senate may be counting chickens before they are hatched; the House has yet to consent to the appropriation cuts.

The Hoover report on the Services insisted that about \$1 billion of waste could be squeezed out of the defence establishment without impairing, indeed while increasing, its efficiency. But even Mr Johnson's modest beginning has shaken the theoretical attachment of many Congressmen to government economy. It will throw nearly 150,000 men on a labour market already burdened with 4,000,000 unemployed, and narrow the patronage enjoyed by Congressmen. The over-enthusiastic friends of the Navy, who suffered such a humiliating collapse during the investigation of the contracts for the B-36, are hinting that the cuts carry one stage further. Mr Johnson's cold war against the Navy. But if the Secretary is to achieve his aim of cutting the defence budget next year to just over \$13 billion, he cannot afford to be put off either by Service hotheads or Congressional cold feet.

★ ★ ★

Eating the White Paper?

If the State Department hoped its White Paper on China would stun the Congressional friends of the Nationalist Government, it under-estimated the obstinate faith of Mr Judd, Senator Knowland, and their circle of "Sinecogues." They are still determined to secure at least a token gesture of aid and support for China. Because their votes may vitally affect the sum the Senate approves for military aid for Europe, the State Department may be forced into an appearance of eating its own White Paper almost before the ink is dry on it.

The conclusion of the White Paper was that further aid to the Generalissimo would be utterly indefensible. Mr Acheson has rather sharply refused to admit the justice of any of the charges of distortion, omission, and glossing over levelled at the White Paper by Mr Judd and his friends. But Administration supporters in the Senate have been forced to give ground before Senator Knowland's insistence that the military aid programme should allocate \$175 million to China. Mr Dulles

is among the Republican leaders who believe that some concessions should be given on China to ensure that only a small cut is made in the Administration's requests for arms for Europe. This would give the Senate conferees an important bargaining point when they meet with representatives of the House, who voted to cut in half the programme for the Atlantic Pact signatories, and, incidentally, turned down a \$75 million grant to China.

What the State Department is believed willing, if not precisely enthusiastic, to accept is a provision of \$100 million for economic and military aid to China, provided that it be added to, rather than subtracted from, aid to Europe, and that its spending be left entirely at the President's discretion. Thus it might never be spent at all, and at least would await the report on Far Eastern policy now being drawn up by three experts who have no former connection with official policy.

★

The final vote of the two Senate committees considering military assistance has been held up, not only by considerations of the Far East, and will not be taken until next week. One of the stumbling-blocks has been the amount of arms surplus to the American mobilisation reserve which could be sent abroad—primarily to France. This \$450 million of arms will be charged to the programme only at rehabilitation cost, \$77 million, and some Senators were anxious to ensure that book-keeping juggling did not deprive Korea, the Philippines, and perhaps China of their fair shares. It has also been decided that weapons taken from the reserve to start the programme off will be charged at replacement or original cost. One Administration victory has been the committee's decision, after it had heard General Bradley's testimony, to approve \$155 million to encourage arms production, though not the building of new arms plants, in Europe. Senators Vandenberg and Dulles had hoped to save \$161 million, reducing the total to a nice round billion, by eliminating this encouragement to self-help, which they argued should await the formation of an Atlantic Defence Council, and might antagonise the Germans.

Stockpiling Problems

One possible plank in an emergency bridge across Britain's dollar gap has just lost some of its solidity. The Senate has cut by more than half, to \$245 million, the Munitions Board's authority to make advance contracts for future purchases of strategic materials for the US stockpile. Furthermore, the Senate Appropriations Committee has directed the Board to exhaust every possibility of obtaining minerals and materials in the United States before making foreign purchases, and to enter into only short-term contracts abroad. Such a directive does not have the force of law, but it is advisable to treat it with respect, even though it seems completely at variance with the purpose of a stockpile programme, designed to build up reserves of vital materials which would be unobtainable if overseas communications were interrupted in time of war. In the last fiscal year only 20 per cent of stockpile purchases came from domestic sources.

The reduction in contract authority is in effect a reduction in next year's appropriation for stockpiling. The Federal Bureau of Supply has already for some time been busily spending the \$525 million which has been appropriated for the current fiscal year. During the first two years of the stockpiling programme contracts amounted to only about \$275 million, but since last summer the monthly rate of expenditure has been running at \$65 million, and by the end of this year only about one-third of the total stockpile will remain to be bought.

This acceleration is explained partly by the international situation, but chiefly by the falling demand for metals. They can now be bought for stockpiling without interfering with

normal civilian consumption and at reasonable prices. The drop in prices has reduced the estimated cost of the five years' programme from \$3.7 billion to \$3.2 billion. But the decline in demand for metals has also forced many marginal mines to close down, and this accounts for the pressure that is now being put on the Munitions Board to make its purchases in America and on Congress to take special steps to assist the small mining companies. If Congress is not strong enough to resist the demand for direct subsidies, the President has let it be known that he will be, but the prospects are good for a substitute Bill, acceptable to the Administration, which would provide government incentives for increased exploration and conservation of America's mineral resources.

If, as one Congressional witness said, the backbone of the American economy is metal, the sinews are rubber. The Rubber Act of 1948, intended to ensure that America should never again be sinewless, expires next year, and already its replacement is being discussed. The present Act provides that at least one-third of American synthetic capacity—665,000 tons a year—must be kept in operation. There is talk of allowing consumption of synthetic rubber to find its own level. But, if the new "cold" synthetic lives up to its promise of wearing better than natural rubber in tyres, that level will probably be high, even though natural rubber is now selling at a lower price than synthetic.

★ ★ ★

Restitution for the Nisei

Three American-born Japanese women who renounced their American citizenship during the war have had its restoration sustained on the ground that the renunciations were made under duress. This will be welcome news for 4,000 others who similarly regret having sold their birthright, either under threats from other Japanese in the relocation centres into which they were herded in 1942, or from a fear that, as citizens, they might be deprived of the protection of internment and sent back into communities obsessed by the "yellow peril." Judge Denman, in upholding a lower court, wrote a withering decision directed at the racial hatred shown by the officer in charge of removing Japanese from the West Coast and denounced the whole shameful record of relocation—the five days given innocent families to leave their homes and the prison atmosphere of Tule Lake and other centres to which they were taken.

About two-thirds of the 127,000 Japanese in the United States are Americans by birth and known as Nisei. But whether they were aliens or citizens, all were sent inland *en masse* out of a fear, after Pearl Harbour, that none could be trusted. These suspicions die hard, even though no Japanese living in the United States or Hawaii was convicted of spying or espionage during the war, and many Japanese distinguished themselves for bravery in the Army. It is this record, in the main, which persuaded the House last June to pass a Bill which would make foreign-born Japanese and certain other Asiatics eligible for citizenship, and admit Japanese immigrants (185 a year) for the first time since the Exclusion Act of 1924. The exclusion of the Chinese was abandoned in 1943. The most immediate effect of the Bill, however, would be on the 45,000 Japanese residents who today may not become citizens although they may have lived in the United States for thirty or forty years and their children are Americans by birth.

If it can slip through the eye of Senator McCarran's needle, the Bill may also affect the laws which in eleven states forbid aliens "ineligible to citizenship" to hold land and elsewhere to engage in certain professions and trades. About 60,000 of the 112,000 Japanese forcibly removed from the Pacific coast have now returned, but many have been unable to regain their leased lands and have had to abandon the fruit and vegetable businesses in which many whites considered them to have

enjoyed an unfair monopoly before the war. Most observers agree, however, that despite certain sporadic outbursts of prejudice, their reception has been friendly.

Shorter Notes

Colonel McCormick, of the *Chicago Tribune*, has ventured into what, to him, is a foreign country, inhabited by "pantie-waists" and "cookie-pushers." He has bought the *Washington Times-Herald* and has established "an outpost of American principles" in the nation's capital. Until her death a year ago, the *Times-Herald* was owned by Colonel McCormick's cousin and it has always followed the *Tribune's* isolationist line, as does the *New York Daily News*, once owned by another cousin, but now also controlled by the Colonel. He thus becomes responsible for a leading newspaper in each of America's three most influential cities. He has handed over to his niece the duty of presenting "the American point of view" to the "parasite community" of Washington.

★

New York and the East of the United States have for over three months been suffering from the worst heat-wave since 1871—and in New York 80 degrees is a comfortable temperature—which even a hurricane does not seem to have broken. The high temperature of the ocean and the presence of tropical fish has given rise to rumours that the Gulf Stream has moved closer to the New Jersey coast, but this explanation of the summer's inferno is officially labelled "highly improbable."

★

The average individual in 1948 received an income from all sources of \$1,410, nearly 7 per cent more than in 1947. The total of individual incomes for the year was \$206 billion, an all-time record.

THE WORLD OVERSEAS

Politics in the Soviet Zone

MOSCOW chastens its followers for failure, but never admits defeat. The elections in west Germany, which should never have taken place if Russian efforts had succeeded, have been followed by an intensified campaign to form a "National Front" which will undermine the new Federal Government at Bonn. Two events reveal the way in which the campaign will develop. In Berlin, the so-called "democratic bloc," consisting of the dominant Socialist Unity Party (SED) and the rump bourgeois parties of the Soviet zone has been ordered to tighten up its organisation. Hitherto, the *bloc*—formed in 1945—has existed in name only; now it is to groom itself for presentation to the west German people as a genuine coalition. The purpose of this move is clearly to prepare for the formation of a "Government" which will claim to be more representative of the whole German nation than the Bonn "gathering of Quislings." In particular, the Soviet zone section of the Christian Democratic Party (CDU)—despite the fact that its real leader, Jakob Kaiser, is to join the Bonn Government—will be induced to take up links with its sister party, the victor of the elections in the west.

The second pointer to the renewed Soviet zone campaign for "unity, a just peace and the withdrawal of troops" is the meeting held last Sunday at Bad Godesberg by the aged ex-ambassador to Moscow, Rudolf Nadolny. Herr Nadolny is used, wittingly or unwittingly, as propagandist for Moscow policy, and has already held a similar gathering of Christian Democrats at the home of Andreas Hermes, another veteran of Weimar. Hermes was turned out of his party office in Berlin by the Russians, and should be aware of the use to which Nadolny's work is put. After a public warning from Dr Adenauer, most of Nadolny's invitations to Bad Godesberg were refused on this occasion. The most important figure present was another aged Christian Democrat colleague from the Wilhelmstrasse—Freiherr von Prittwitz, a former envoy in Washington, and one of the aspirants to the post of Federal Germany's first Foreign Minister. The chief result of the meeting was Nadolny's announcement that he intended to form a standing Committee of National Unity to rally supporters for the cause.

Change of Tactics

The National Front is an example of the way in which the Moscow Central Committee of the Communist Party, which rules eastern Germany, can adapt its tactics to meet failure. In 1945, and the following year, Moscow's prospects of capturing all Germany by means of the German Communist Party seemed bright. The Potsdam agreement had opened the way; the Social-Democrat party in the eastern zone had been swallowed by a tricked fusion carried out under the noses of the western political representatives; economic conditions, despite dismantlement carried to crazy limits, were temporarily better than in the west; "Anti-Fascism" was the slogan of the day; and the Socialist Unity Party proclaimed its intention to establish the dictatorship of the proletariat.

After June, 1948, however, the Soviet zone's advantage over the east vanished. With currency reform and the flow of American relief imports into the west, the contrast between the eastern and western zones made it still harder to win the Germans for Communism. Moscow thereupon changed its tactics. It had recourse to the nationalist appeal. An organised effort was begun to win the ex-Nazis and the peasants. The National Democratic Party and the Democratic Peasants Party were formed to rope in the small Nazis and the land-

workers, under Communist guidance. Lieutenant-General Vinzenz Mueller, a member of the "Union of German Officers" that was formed in Moscow during the war, is head of the National Democratic Party (NDP). Special favours were introduced for technicians and intellectual workers. An ex-Luftwaffe officer was found to conduct propaganda to former officers on behalf of the NDP. Rudolf Nadolny held his first talks with west German politicians. Professor Hans Meyer of Leipzig University, has been appealing to the intelligentsia in the west to support the idea of a "neutral" Germany, united and "freed" from western defence (and, of course, from Marshall aid). Professor Noack, leader of the Nauheim Circle, propagates the same idea from the western side of the green frontier. Communist agents work among the thousands of refugees who still live in squalid camps in the west. Gerhart Eisler, escaped from the United States, is actively lending his experience to the work of winning all classes in the west.

A parent body to act as a central point for this propaganda, the People's Congress, and its executive "Cabinet," the People's Council—ostensibly all-party organisations—were formed in December, 1947. These were established when it became clear that the British and Americans intended to go ahead with a western German Government, in face of Soviet demands for a centralised, Communist-dominated united Germany.

Pressure on the West

Last May, the People's Council was given a special task within the framework of the "peace" campaign which Moscow organised through all the Communist Parties of western Europe. The Council was to organise a pressure group to influence the Foreign Ministers in Paris. At a meeting of the *præsidium* of the Council on May 9th, Grotewohl announced that an all-German National Front must be formed; it would have the immediate, imperative object of securing an all-German conference which would send a joint memorandum to the forthcoming meeting of Foreign Ministers in Paris. An invitation was sent to the western German parties, the trade unions and youth associations, the Peace Society, the Nauheim Circle, and all the Bonn delegates who had voted against the west German constitution.

This effort was a fiasco. The invitation was refused by all the responsible leaders in the west, who spied the Russian cloven hoof. British Military Government prevented a fake meeting from being held in Hanover, and, in the end, no joint memorandum could be sent to Paris.

In the meantime, the People's Congress also suffered a blow in its home territory. "Elections" of delegates in the Soviet zone in May ended in a big adverse vote, although they were framed as a plebiscite for or against "unity and a just peace." How many Germans actually voted "No" is uncertain, but one-third of the total was admitted by the People's Council. Consternation was evident, although Ulbricht brazenly declared that "the People's Congress has emerged from the elections as the only representative body of the German people. The Council to be elected by the Congress will thus be authorised to speak for the German people at the Foreign Ministers' Conference." The western Foreign Ministers, naturally, refused to recognise this claim.

Something of the true situation was admitted by the Berlin executive of the SED in a resolution published by the party organ *Vorwaerts* after the elections. "We have not yet succeeded in creating even the beginnings of a National Front in

western Berlin," it stated. The reasons were revealing—Communist inability to work with the *bourgeoisie* and anti-Soviet feeling. The SED was told: "To pay lip-service to the role of the USSR is not enough; every reservation and every form of national arrogance is in reality a disavowal of the Soviet Union's position." Insistence on open declaration of friendship for Russia and enmity towards America runs through the slogans issued for peace demonstrations on September 1st. These include: "National Front against the US warmongers, the principal enemies of German independence." "Let us live in peace—not die in the interests of the dollar." "Friendship and peace with the peoples of the USSR." "Friendship with the New Poland." "No Occupation Statute, but withdrawal of occupation troops." "The Ruhr must be the backbone of the German peace industry and not an American arsenal."

New hope for the Front appeared when large-scale unemployment developed in western Germany, and manufacturers became nervous about a possible slump in America. Ulbricht laid down the lines for exploiting this new position in May:

The democratic front must be broadened into a National Front which would include the most diverse social classes. The conditions for such a development are favourable. For the workers, German unity is a natural political aim. But the *entrepreneurs* in western Germany, too, have come to realise that a unified Germany which would conclude trade agreements especially with eastern Europe is in their own immediate interests. It would be quite wrong to ask every German primarily whether he is a convinced democrat or whether he ever held a membership card of the Nazi Party. All that matters today is his attitude to the question of unity, a just peace and the withdrawal of occupation forces.

At the moment, however, the Oder-Neisse frontier stands as a barrier to the success of the National Front. The German Communists have been accepted as probationary members into the Cominform fold, but the price they have to pay is open support for the hated frontier. It is a price that leaves them almost bankrupt.

The Mood of Europe

[FROM OUR CORRESPONDENT AT STRASBOURG]

AFTER three weeks of debate, it is presumed by almost all the members of the Council of Europe that at long last Europe is, in some manner, really going to live in fellowship. This sense of expectancy distinguishes the meeting at Strasbourg from every other international gathering since the war.

There nevertheless seems to be an unconscious antagonism between the "continental" (or French) habit of thought, which states exuberant principles before getting down to brass tacks, and the Anglo-Saxon (plus Scandinavian) method which is prosaically to examine the implementation of principles without first giving a classic exposition of them. As Mr Aidan Crawley remarked:

I think perhaps that there is a difference of technique. In England, when we want to get something done, we begin trying to understand the difficulties, and we are rather too apt to take for granted the goal and the ideal if we know that we are agreed upon them.

This is certainly true of Mr Morrison and Dr Dalton whose temperatures have remained steady at 98.4 and 97.6 respectively. On the other hand, Mr Churchill, Mr Macmillan and Mr Eccles, without abandoning the firm earth, seem rather more to enjoy life upon it and are, as a result, livelier companions in a creative enterprise. (Inter-party baiting among the British, which at first mystified even M. Spaak, is now accepted as an animating feature of the Assembly.)

The debate on "the role of the Council of Europe in the economic field, taking account of existing international organisations" has proved the focal point of this year's Assembly. Mr Mackay, who opened the debate, recommended that the Council of Europe should take over the Organisation for European Economic Co-operation and should be given limited powers so that it could put into effect those economic measures which the experts of OEEC had long known to be necessary

...the Barclays Group can help

IN THE UNITED STATES
With a coast to coast network of correspondent banks, a New York office of Barclays Bank (Dominion, Colonial and Overseas), and a representative in San Francisco covering the West Coast, we can:

- Get information for you on United States markets;
- Introduce you to agents who can handle your goods;
- Provide all the necessary banking services.

IN CANADA
Barclays Bank (Canada), a Canadian Chartered Bank, with branches in Montreal, Toronto and Vancouver offers the same services in Canada.

IN THE UNITED KINGDOM
Ask any Branch Manager of Barclays Bank Limited to explain to you how easily exporters can make use of these facilities, or write direct to 54 Lombard Street, London, E.C.3.

THE BARCLAYS GROUP OF BANKS

but which, as servants of individual governments, they had been powerless to execute. This was a flying start. Subsequent speakers did not echo the need for immediate executive authority, but most agreed that the OEEC was a body of excellent officials which could be used more creatively under the aegis of the Council of Europe. M. Gaillard and M. Buron of France as well as Mr Eccles all proposed that OEEC officials should be given the opportunity of talking as Europeans in front of a permanent committee of the Council, which should not, however, have executive powers.

Need for Popular Support

M. Reynaud rebutted any form of constitutional approach to the problem of European unity. "We cannot build a Europe *a priori*," he said, "we must give to Europe, on the political plane, the means of facing its economic needs." His main emphasis was on the necessity for a redistribution of work among European countries in order to bring about greater efficiency and a single European market. Such a transition, which was essential to the survival of Europe as an economic competitor in the world, would cause suffering. The problem was how to persuade the European masses that suffering was necessary. "The only issue before us is to go to the people and speak to the people. Nothing can replace discussion between the representatives here in this Assembly and the electors in Europe." (An interesting statement in view of the current rumour that the French are planning to elect their European representatives by universal suffrage next year.) M. Reynaud referred to the understandable dislike of those nations, such as Britain and Sweden, which had already achieved a high standard of living for their working people, of relinquishing this boon in the interests of European prosperity as a whole. The choice, however, was not between the *status quo* and the painful renewal of Europe, for the *status quo* was going to end in any event in 1952. Mr Eccles agreed, and pointed out that economic difficulties work not for but against closer union between countries: "The more a man is frightened of being hungry and unemployed, the less willing is he to share with others what he can still call his own."

M. Longchambon, in a more technical speech on the complexities of economic organisation, said that there was no question of a sudden unification of the European market—if Europe wished to remain Europe. For many years to come, statesmen would have somehow to maintain full employment and constant technical progress, and to this end they would always have to work according to local conditions. He envisaged, therefore, not so much an international solution as a co-ordination of the activities of responsible individuals and groups.

Alternatives to a Super-State

This anti-central note, which discorded so strikingly with M. André Philip's plea for publicly owned European key industries, was taken up in another context by Professor Ohlin of Sweden. "I hope that I shall not be misunderstood," he said, "if I suggest that the idea that only the formation of a large European state can solve our problems has, to my mind, a tinge of 19th century thinking." The future might produce other forms of international organisations than the creation of a super-state. There were, indeed, already in existence, several unions which were for different purposes, which were not co-extensive and some of which included countries across the ocean.

The conception of the development of international authorities by treaty and with different purposes and different memberships is perhaps the most likely outcome of Strasbourg. For whatever the formal aspect of a federal election, there is little reason to suppose that individual European communities would accept hardships from a Federal Government which they would not accept from their local, national governments. A state of general famine or other emergency might gain effective support for such a government, but in the present state of affairs, in which disaster is only impending, it seems prob-

able that a federal authority would have less—or at least no more—authority than national governments.

Europe's problem is not the problem of winning consent from a majority of Europeans for a specific, contentious programme which, theoretically, might be against the wishes of a substantial minority. The practical issue would rather seem to be: can a group of statesmen, each, in a general manner at least, representing one nation, meet together and agree on the right questions in the right order? If they can agree, their lack of collective mandate will not cause people to lose much sleep. If they cannot agree as intelligent individuals, no amount of federal elections and parochial tickets will find other representatives better able to do so.

The success of this year's Assembly depends on the extent to which delegates themselves reach agreement on European priorities. Such agreement and the illustrations and arguments that accompany it will serve to stiffen the European purpose and to illumine the understanding of the co-operating ministers. The prospects of common action seem remarkably good, and the record to date of the Council of Europe has been a reproach to those disbelievers who considered that power, not thought, was what was needed.

Uno's Staff Troubles

[FROM OUR SPECIAL CORRESPONDENT AT LAKE SUCCESS]

THE problems which surrounded the creation of an international staff equipped to handle international affairs ably, efficiently and loyally have by no means been solved in the three years that Uno has been functioning. How contented is the personnel? How far does the international stalemate of today cause it merely to go through the motions of doing hard work? How is it weathering the climate, physical and mental, of New York?

A key point in its make-up was lately outlined in a PEP study of international staffing problems:—

An International Secretariat . . . is bound to deal with recommendations rather than legally binding decisions. These recommendations . . . are addressed to sovereign States, who reserve to themselves the decision whether to implement them or not. An International Secretariat consequently has little executive authority, and such executive powers as it does possess will extend to a small area only of its field of action.

Graduates of the League of Nations Secretariat insist that these things were much better in the old days in Geneva, and apart from the factor of nostalgia there are reasons for believing that this is true. Certainly that staff was small, compact, experienced, and extremely busy. Not until after the rise of Hitler did frustration begin to quell their enthusiasm, and even then the momentum of the past held their morale steady. More than one expert has noted that while the League failed politically, its technical committees laid the foundation for work which still continues. But it is not Uno which is empowered to carry on this side of the League's work. The technical jobs have been parcelled out among specialised agencies situated not at Lake Success but in faraway Copenhagen, or Geneva or Paris. This division of labour accounts in no small part for the complaints of frustration, idle hands, and consequent mischief.

Inside its building at Geneva members of the League's staff handled vaccines, refugees and things that could be touched and seen. The work done at Uno—the end-product of the factory at Lake Success—is to a great extent intangible and hard to evaluate. The staff is made up of clerical workers who pound typewriters and run mimeograph machines, of translators who hear one set of words and speak another which means the same thing, of junior and senior officers whose time is spent in talking, studying, persuading or being persuaded, making decisions and writing reports. Their labours have little visible result aside from piles of printed paper, a large portion of which is devoted to recommendations that may never be carried out. Were these people actively governing the world, or even policing it, the coefficient of individual frustra-

tion which obtains, and which in turn affects the quality of work done, would be far less than it is.

There is little that could be done by the staff managers, as opposed to the states members, to avoid this state of affairs. A second important criticism is one that could be met by better organisation. It is that of "empire building" within the organisation itself—a charge which was made last year and which is repeated in the 1949 report of the Advisory Committee on Administrative and Budgetary Questions which has just been issued. The Committee feared in 1948 that "a system of self-contained Departments had developed, contrary to the spirit of the Preparatory Commission's recommendations on the organisation of the Secretariat as a single entity"; this year it finds that despite some mitigation, "expansionist tendencies still persist". Large private offices have developed "around several of the Assistant Secretaries and in many cases even around the Directors," and the situation is so serious that the Committee recommends that the Secretary-General undertakes to review it in the hope of cutting staff, improving the quality of work done, and setting up a better structure within the Secretariat. All this should, in the opinion of the Committee, be done before moving to the new (and as yet unfinished) headquarters in Manhattan, which means before 1950.

This new review by Secretary Lie will by no means be the first he has made of the problem. The existence of the Advisory Committee is in itself an attempt to answer criticism which has been repeated since 1946 when the Uno staff first mushroomed into being. A Committee of Experts on Salary Allowances and Leave Systems is now at work on the financial end. Studies have been made by Mr. Lie's office, by specially appointed committees and outside experts, until officers complain openly that if less time were spent in filling questionnaires the actual work of the organisation itself would proceed more speedily and more smoothly.

To a certain extent similar criticisms may be made of any civil service—state, national, or local—but Uno has charac-

teristics which render it peculiarly subject to charges of administrative malingering. In the first place its staff was built from nothing to about three thousand between May and September, 1946 (it is now nearing four thousand) and the greatest expansion occurred in a period when experienced persons were hard to come by in any country. The Preparatory Commission asked that officers and staff members should be selected on a basis of the highest competence, integrity and efficiency, and with due regard for geographical distribution. Each of those requirements set up its own difficulties. Because the favoured administrative techniques were those practised in Britain, Western Europe and the United States it was natural that a larger proportion of the nationals in those areas should be trained and ready, but it was also true that the best of their people were already occupied. While other regions complained (and still complain) that the Secretariat was too heavily staffed with English, Canadians, and Americans (the criticism now extends to French, Poles and Chinese) it was noted in those countries that the most frequent applicants for Uno jobs were the newly graduated young, furnished better with dreams than with experience. All this has made for a high rate of turnover among those who found that the job did not measure up to their illusions, and a bout of empire-building among those who stayed.

These difficulties have been increased by the contract system, the New York climate, the housing problem, and the difficulty of adjusting national habits to the conditions prevailing in the United States. The contract offered Uno employees is for five years at the longest, and then renewal may be discussed. (The League's "permanent" contracts turned its employees into international civil servants for life.) To the young the UN offer may look ample, but older men with families regard it as something less than the security they need. If they take their families to a foreign land for five years, what will happen at the end of that time? The uncertainty about renewal makes it difficult to hold to the ideal of international service

"Glad you like this sherry —it's South African"

It's extremely good. I got some South African wine the other day . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too.

NICKEL AND OUR COAL

Do you know that nickel plays a vital part not only in the production of coal but also in its conversion to light, heat and power? The cutters, conveyors and miners' lamps that are used in the mining of coal, the railway engines and the road vehicles concerned in its distribution, the plants converting it to steam power and electric current—in all these, nickel is present, toughening and strengthening the metals used in their construction, making them staunch against the attacks of wear, corrosion and heat.

Thus nickel is contributing to the efficiency of the tools and equipment with which Britain is achieving her recovery.

THE MOND NICKEL COMPANY, LTD

Sunderland House, Curzon Street, London, W.1.

25/U.12

for life, and so one keeps the way open to a job back home. Insecurity of tenure means that the best men may not apply for Uno posts. Nor is this factor offset by the large salaries offered, with the tax-free provisions and the additional allowances, for those salaries which look so large in Ruritania or even in London have a way of shrinking in the New York shops.

The business of living in and around New York City continues to be for most non-American staff members an upsetting experience which takes its toll of staff morale. Costs of living are high, quarters crowded, the pace much faster and the leisure less satisfying than men remember back home. On the other hand, it is only fair to say that the fact of residence in or near a great city has its compensations. Not only is there theatre, music and art of high quality available for those who want it, but the city absorbs the Secretariat into its own life and forestalls much of the hot-house atmosphere which arises in smaller places. Even those who loved Geneva best will admit that the Swiss city had a certain parochial quality which did not help League work.

Uno is not the first government organism to discover that the less there is to do, the more people are needed to do it, but at least it has the distinction of trying to stop this trend. The extra two hundred staff members requested for 1950 (which, if allowed, will bring the total to 3,912) will do work that the General Assembly authorised, but there seems little doubt in the minds of the Advisory Committee that given proper organisation the work could be done by people already employed. The gross cost of staff salaries is now estimated at \$23 million a year, with an additional \$4,796,000 for "common staff costs." Sixty-three per cent of Uno's budget goes for labour. Cuts are recommended by the Advisory Committee for several divisions, notably the Department of Economic Affairs, the Department of Social Affairs (both of which are reprehended for the pattern of large private offices for the respective Assistant Secretary-General and many of the Directors) and the section which has charge of Conferences and General Services.

But there is little hope that cuts will do all that is needed. The ailments from which the Uno staff still suffers are many. The PEP recommendations, made after careful study, include a clearer definition of qualifications for employment, a co-ordinated plan for recruitment to be used jointly by several international agencies and which is now being studied, a decision on length of tenure for all jobs so that the staff member may have a sense of greater security, and a certain interchangeability between agencies of personnel on upper levels as a way of satisfying good men who have reached the possible top but who do not wish to stagnate there.

These are technical suggestions. They will help to smooth present rubs, but they will not create the competent and forceful international officer who is to guide world affairs in the ways of peace. As in 1930, when Sir Arthur Salter first wrote of him, he is "something new in the world's history," and the best of his kind can only flourish when he knows that his work may bear fruit.

Prospects in China

[FROM OUR SPECIAL CORRESPONDENT]

Hongkong, August 20th

THE operations by Communist armies which were resumed in the middle of June were not preceded by the usual exhortatory orders of the day issued by Mao Tze-tung and Chu Teh such as preceded other major Communist drives, but they have resulted in the occupation of enormous tracts of territory both south of the Yangtse and in north-west China. At the moment of writing Communist armies are closing in on Lanchow, the main trading and administrative centre of north-west China, and nobody expects Canton to last much more than a month. The tempo of these operations

has been slower than in some of the previous Communist offensives. This has been due primarily, not to any opposition put up by the Nationalist forces, but to administrative difficulties on the Communist side and to natural obstacles like the extensive floods in central China.

There has in fact been no major clash of arms. General Pai Chung-hsi, who commands most of the Nationalist forces in south China, is generally believed to be more interested in falling back on, and trying to hold, his native province of Kwangsi rather than in putting up any determined resistance for Canton. Even much of Kwangsi province is out of the control of the provincial government and in the hands of pro-Communist guerillas. Equally disappointing has been the performance of General Ma Pu-fang's forces in the north-west which included several divisions of much-vaunted Mohammedan cavalry. There has been some hard fighting in the north-west, in which the Nationalists have been worsted, but it looks as if the two Mohammedan warlords, Generals Ma Pu-fang and Ma Hung-wei, are preserving the bulk of their forces with a view to falling back into their native provinces of Chinghai and Ninghsia. The Chinese Mohammedans are brave fighters but they are seriously short of arms and ammunition and lack any armament industry, even of a rudimentary kind, to enable them to keep up a prolonged resistance. Nowhere else on the mainland is there any prospect of successful or even resolute opposition to the Communists. At least half of Yunnan, like Kwangsi, is out of the hands of the provincial government. And Szechwan, where agrarian abuses are probably worse than in any other province in China, is a ripe plum waiting to be picked.

Formosan Dislike of Chinese

The only base which the nationalists can count on with any degree of assurance is the island of Formosa. Not that it can be considered a firm base; the Formosans have come to hate what they regard as rule by Mainlanders and their economic position has declined steadily since the efficient if ruthless Japanese were succeeded by an inefficient and hopelessly corrupt Chinese administration. Nevertheless it is difficult to foresee any spontaneous popular rising or any successful infiltration by Communists from the mainland as long as the Nationalists retain the loyalty of the 400,000 troops on the island. These troops are being well looked after and are much smarter in appearance than the usual run of Nationalist troops. But few expect even Formosa to last very long.

In the meantime, however, Formosa enables the Nationalists to blockade the coast, less with their navy than with their air force and less with aircraft than with the threat of them. The blockade is becoming steadily less effective in the north and it will be practically impossible to enforce it in south China, long famous for its smugglers. But it is almost completely effective as far as Shanghai and central China is concerned. It is undoubtedly hurting the Communists at Shanghai, although less perhaps than was expected by some foreign observers when it was first imposed two months ago. The Shanghai Power Company seems to have switched from oil to coal quite successfully and few factories have closed down, although all are running at greatly reduced output. The blockade, or rather its effects, is one of the factors behind the decision of the Military Control Commission to move two million people out of Shanghai before next spring. The chief sufferers are probably the Chinese and foreign merchants who are being squeezed out of business. The British merchant community, whose interests in China are greater than those of any other foreign country, is having a most difficult time as a result of the blockade, and there are many merchants who would like to see the British government intervene actively to enable British ships to break the blockade. British firms are currently having to remit nearly £500,000 monthly to their branches in Communist China to enable them to keep going. They cannot do this for very much longer, and some of the smaller firms are already at the end of their reserves.

Most foreign observers out here believe that the Nationalists are finished once and for all, and that their fortunate possession of Formosa is merely prolonging the agony. They have failed to produce any new ideas, any fresh appeal, or to attract any of the youthful and dynamic elements in the country to their side. The regime is still led by the same men who have been in power for twenty years. The fall of Canton seems to be only a question of time, and morale is again as low among the politicians as it is among the troops opposed to the Communists.

The Communists have made several references recently to peasant uprisings in various provinces of central China and have put the blame for them on "feudal elements" and "Kuomintang remnants," the latter inevitably receiving moral and material help from "American imperialists." It is difficult to gauge the exact extent and seriousness of these uprisings as information from independent sources is difficult to obtain. It is probable that if they were really serious the Communists would suppress all mention of them. They confirm what is known from many other sources, namely, that

the Communists are running into many difficulties, in the countryside and, even more, in the big cities. However, it would be unfortunate if these references to peasant unrest produced the impression in the west that a widespread popular opposition to the Communists is building up in China. Such would not appear to be the case at present. There is dislike, anxiety and fear among some of the classes who are losing their privileges, and disappointment and disillusion among many people, even among peasants and workers, who hoped for more from the change in regime than it has brought them so far. But the regime seems to be establishing itself firmly, and the opposition it is meeting is coming less from any spontaneous resistance than from the nature and scale of the task it is attempting.

It is generally expected that a central government for the whole of Communist China will be proclaimed on October 10th, the festival of the "Double-Tenth," which commemorates the outbreak of the revolution against the Manchus. The question of international recognition will then become a practical issue, and the Communists will undoubtedly insist that, before they exchange diplomatic missions with any foreign power, that power must withdraw recognition from the Nationalists. Once the Nationalists become a sort of government-in-exile in Formosa, as they themselves well realise, their claim to a retention of foreign recognition will become weaker and most British residents in China feel that, in view of the complete bankruptcy of the Nationalists, the sooner formal relations are established with the Communists the better for everyone concerned.

That's my holiday—that was!

Lucky the motorist who can forecast his holiday weather—and luckier still if he comes back to an empty In-tray. Britain's need to save dollars makes it necessary to market petrol of "pool" quality. But it is our aim, when Shell returns, again to give motorists both the quality and quantity of petrol they deserve.

you can be sure of

Your Safeguard

We of "the trade" have a special duty to the public. We have to ensure that what we sell shall be absolutely pure and of the highest possible quality.

The brewer-owner no less than the tenant has this duty since licensing justices, the police and large sections of the community have come to regard him as being ultimately responsible for the service given on licensed premises.

It follows that the quality of beers, wines and spirits must be a matter of fairly strict agreement between owner and tenant. Such agreements in fact are common in "the trade": they are freely

entered into by both parties and are open to inspection by the licensing justices.

Failing any arrangement of this kind, the owner would be defaulting on his share of responsibility. But an agreement in precise terms between tenant and owner is your safeguard against being served with inferior liquor.

Issued by the Brewers' Society

THE BUSINESS WORLD

The Sterling Balances

ONE subject which may take a high place in the Washington negotiations—or certainly ought to do so—is the vexed question of the large accumulation of sterling owned by countries overseas, and especially by members of the sterling area. In Britain the whole problem of unrequited exports, with which the existence of these balances is so closely linked, has long been a matter of controversy. But it has lately assumed a new importance as people have come to recognise the extent of the strain imposed upon Britain's economy, both directly and indirectly, by the mechanism of the sterling area. Only recently has it been perceived that "easy" exports to the sterling area—easy because the buying countries, instead of providing an equivalent return flow of goods to Britain, pay for them merely by surrendering a paper claim against London—are becoming a critical impediment to the drive for dollar equilibrium. This system does more than pre-empt goods and productive resources which might have been directed towards dollar markets; it also sets up a cumulative tendency which increases the range of pre-emption and actually attracts additional resources away from the dollar drive. The greater the scarcity of dollar purchasing power abroad, the greater becomes the pressure for unrequited sterling goods and the higher the premium, in terms of sterling prices, they will command.

For this reason, the continuing ability of the sterling area countries to command a surplus of sterling available for current expenditure in Britain has become not only one of the main props of the excessive level of British prices and costs, but also a lever which is constantly widening the gap between that level and the level of dollar prices. More disquieting still is the evidence, which plainly emerged from the recent agreement on releases of sterling balances for expenditure by India, that the British Government is actually anxious to sustain this dangerously swollen flow of spending power. It can hardly be doubted that this anxiety to bolster up the existing disequilibrium springs principally from a fear that a diminution of easy exporting would cause unemployment in the supplying industries, would unmask the pretence that the balance of payments is virtually in "overall" equilibrium, and would bring the Government face to face with the necessity for taking strong and unpalatable measures to strip British costs to the point at which British exporters can gain ground in dollar markets.

If these suspicions about government policy are well-founded, one may further presume that Britain's negotiators in Washington may not be anxious to see this problem fully ventilated there—not, at least, in such terms as these. The Americans, however, not only evidently harbour these same suspicions, but also acquired an abhorrence for the sterling balances, and the system they were believed to represent, even before any of these undesirable consequences began to show themselves. To understand the background against which the coming talks will take place in such matters as this, it is necessary to recall the evolution of this American attitude. To the Americans, the existence of the accumulated sterling balances, and Britain's policy in relation to

them, explain a large part of the peculiar difficulties from which Britain is suffering and is repeatedly being rescued by dollar assistance. United States opinion views the greater part of these sterling liabilities as being in the same category of credits as the \$30 billion which the United States Government cancelled when it wiped the Lend-Lease slate clean. It has never fully understood why Britain's sterling creditors could not clean their slates similarly. The existence of these abnormal liabilities is seen in many American eyes as the main reason why sterling cannot now be a convertible currency. In American post-mortems of the short-lived 1947 convertibility of sterling, the failure to immobilise the bulk of these balances still tends to be advanced as the main reason for that fiasco. These liabilities are therefore regarded as an integral part of a sterling area mechanism which is discriminatory in its effects and within which trade will for ever be conducted with a bias against the dollar world. The sterling balances, in short, are anathema to the Americans, and the more friendly and sympathetic they are to Britain, the more inclined are they to "see red" on this subject.

This attitude was very much in evidence during the Anglo-American loan negotiations in 1945. To the British participants in those discussions, it may have appeared somewhat irrelevant and even interfering. But in retrospect the American insistence upon enlightenment about the probable future of these balances acquires some logical justification. The world of convertibility and non-discriminatory trade towards which the United States was seeking to guide Britain through the loan agreement may not have been attainable in any conceivable circumstances, at least within the time-limits set in the agreement; but any lingering doubts or hopes were removed as soon as it became evident that the sterling balances were not to receive the treatment that had been envisaged for them in another clause of the agreement. It will be recalled that the balances—amounting in mid-1945 to £3,052 million—were to be divided into three parts in the contemplated negotiations between Britain and its creditors. The first part, it was hoped, would be cancelled as a contribution by the creditors to a redistribution of the wartime financial sacrifices largely shouldered by Britain; the second part (the intention was that it should be small) was to be immediately made available for expenditure in any part of the world; and the third part was to be funded on a long-term basis and gradually liberated, the sums so freed being made available for expenditure anywhere in the world. The intended scale of releases was embodied by implication in the clause of the agreement which provided that in calculating the UK balance of payments for the purpose of invoking the "waiver" of interest on the loan, a sum of £43½ million per annum in repayment of these balances might be regarded as a "current" item; any excess over that figure was to be deemed a capital transaction.

Only to a very slight extent have these intentions been translated into practice. There has been no cancellation, save that effected by the Australian and New Zealand gifts totalling £38 million. The releases, except in

the brief convertibility interlude of 1947, have not been freely expendable anywhere; but this particular deviation from the intentions of the agreement is part of the wider problem of the return to and subsequent retreat from convertibility. The repayment of the balances has, moreover, considerably outstripped the rate anticipated in 1945. In the immediate postwar period of reconversion and demobilisation the factors primarily responsible for the growth of these balances—overseas government expenditure and the virtual extinction of normal British exports—continued to operate, though with diminishing force. Thus the sterling balances held on overseas account continued to grow. From the figure of £3,052 million on June 30, 1945, they rose to £3,715 million at the end of 1946. But from that point, which must have been near the peak, the sparse officially published figures, reproduced in Table I, show a large decline.

The reduction in the total of these balances in each of the last two years is many times the amount contemplated at the time of the 1945 loan negotiations. The totals, which are the only figures the Government has been prepared to divulge, are not a trustworthy guide to the decisions of the Government in allowing releases; for some overseas holders of sterling have continued to increase their balances during this period—Australia's London funds, for example, have risen from £120 million in mid-1945 to £310 million in May of this year—while for other countries, notably India, the releases have far exceeded the average.

The reluctance of the Government to give more detailed information on the changes in these British liabilities is usually justified on the ground that the relation between a banker and his customer is a matter in which the strictest secrecy is enjoined, at least on the former. This explanation does not carry much conviction. In almost every case the "national" total, which is the relevant figure, is itself the product of many individual holdings to which the vows of secrecy would justifiably apply but which, when merged with others in their national group, could be made public without arousing any serious objections. These arguments of secrecy will not avail the British negotiators in Washington. It may be assumed that the information is being provided in all its details to the Americans. And it is to be hoped that thereafter it will be officially released—otherwise it is sure to leak out somehow or other, just as it did through a Congressional committee in 1946.

The figures which appeared then, relating to mid-1945, have provided the starting point for many of the attempts subsequently made to estimate the distribution of these sterling balances. With the help of such details of releases and use of sterling balances as has been published in connection with the agreements negotiated with these countries, and using as crosschecks the figures of sterling assets regularly published—though sometimes with much delay—by the several central banks and monetary authorities, it is possible to hazard fairly accurate guesses about their distribution. The accompanying Table II, reproduced from a recent report of the National Foreign Trade Council of the United States, and presumably compiled in this fashion, shows the distribution at mid-1948. Table III sets out the releases agreed subsequently, so far as they are known.

One glance at these tables will reveal a few outstanding examples of extravagance in British releases—and still greater extravagance in the creditor's actual expenditure. India is the most striking case. Over the year to July 30, 1949, the sterling assets of the Reserve Bank of India—the largest item in the total of Indian balances—have fallen from Rs. 13,907 million to Rs. 8,046 million, i.e., from £1,050 million to £600 million. Part of this fall arises from

special capital transactions, notably the amount paid under the Pension Annuities Scheme of July, 1948. But even allowing for the £220 million thus involved in the arrangements made with India and Pakistan, the extent and rate of decline plainly lend substance to the fears which the Americans have always harboured about the British treat-

* More detailed figures after the division of Pakistan and India put the joint balances at £925 million, of which £780 million is attributed to India and £165 million to Pakistan, after some £220 million had been deducted for various pensions payments, stores, etc.

TABLE III.—RELEASES FROM BLOCKED STERLING BALANCES
(£ Million)

	1948-49				1949-50	
	Hard Currencies		Sterling		Hard Currencies	Sterling
	Agreed	Actual	Agreed	Actual (b)		
Ceylon	Nil	Nil	3.5	7.5(e)	(f)	7.0(g)
Egypt	6.3	32.0	32.0	30.0(f)	5.0	30.0(f)
India	15.0	36.0	(a)	130.0	35.0(c)	100.0
Pakistan	5.0	6.0	12.0	27.0	...	17.0(d)
Taipei	5.75	...	14.0(h)	...	5.5(i)	3.0
Israel	Nil	Nil	...	...	...	7.0(h)

(a) The 1948 agreement did not provide for any specific release from India's blocked balance in 1948-49 since it was considered that the Indian working balances, 12 months ago over £60 million, should be run down by some £50 million to meet the Indian deficit in the period. (b) Actual drawings include estimated decreases in working balances. (c) According to forecast made by Indian Finance Minister. (d) Provision made for additional releases if needed. (e) Including £4 million released specifically to raise working balances. (f) Ceylon—a net dollar earner—will be retaining \$1 million to start a hard currency reserve for its new central bank. (g) An additional £1 million may be released to cover cost of food imports. (h) Including releases to raise working balances. (i) First 6 months of 1949. (j) £12 million of firm releases and up to a further £18 million to maintain level of working balances. (k) May 1 to Oct. 31, 1949.

ment of these balances. India, it is contended in defence of the British Government's leniency, is a "special case"—but virtually every applicant for release can advance "special" claims. After the end of the war India was put in that section of sterling area members whose recourse both to accumulated sterling balances and to the sterling area dollar pool was defined by specific agreement with Britain. The successive agreements, however, have been broken—no doubt for seemingly convincing reasons—and the breach has subsequently been condoned by new agreements accepting the *fait accompli* of excessive drafts on the balances and providing for yet larger releases in the future. Under the latest financial agreement, moreover, India has prevailed upon the British Government to include it among

those countries whose access to the gold and dollar reserve of the sterling area is left to their own discretion. Had a firm limit been put upon the sterling releases to India, that would have acted also as a brake upon the direct demands for dollars. As it is, the releases of sterling are to some extent a licence for future demands for gold and dollars—quite apart from the strain upon the dollar account which comes indirectly from the flow of unrequired exports paid for by drafts on the balances.

It is important to recognise, too, that the rate at which these liabilities to other members of the sterling group are being repaid—repaid by the sweat of British labour and by the sacrifices of British consumers—measures only a part of the burden which Britain is shouldering for the rest of the sterling area. No official estimate of the size of the whole burden has ever been published—though this, again, is a subject on which the Americans are likely to show a lively curiosity. On this wider aspect of the problem, some unofficial estimates, made by Dr E. H. Stern in a timely article in the current issue of *The Banker*, merit attention. Some of these figures are presumably no more than intelligent guesses, but they suffice to show the broad magnitude of the problem. Dr Stern calculates that the balance of payments deficit of the overseas sterling area, i.e., the sterling area exclusive of the United Kingdom, amounted to £510 million in 1948 and about £300 million in the first half of 1949; he roughly confirms these estimates to some extent by cross-checks through official figures taken from a large variety of official publications. It can be presumed, and indeed the form of the estimates shows, that the main burden of financing these deficits fell upon the United Kingdom.

Television in a World Market

TELEVISION equipment will play a larger part in the radio exhibition at Olympia at the end of this month than in any previous British show. But not one of the 30 manufacturers who will, between them, show more than 50 different television receivers is satisfied with the progress made in television transmission since the end of the war. The BBC started the first regular television service in the world as long ago as 1936. Transmission in the United States did not begin until ten years later. Since then some 66 stations of varying performance have been opened in America, and there may be 100 by the end of the year. Progress in the world outside the United States has been extremely slow, though Britain has completed at Birmingham the most powerful transmitter yet built, which has a range, officially, of 50 miles and, unofficially, of 100. France has had some rather sporadic transmissions. Authorities in many countries have watched transmission demonstrations, congratulated the demonstrators and sent them home.

For two years or more it has seemed that television must be on the brink of great expansion. Manufacturers are convinced a large audience is waiting if only the broadcasting authorities could decide what service to give. But television is almost exclusively a form of entertainment. Industrial applications, except for certain demonstrations and the monitoring of some dangerous processes such as nuclear reactions, are few; and the times have not encouraged the public sponsoring of "luxury" investments.

Confusion about the different technical methods of transmission is still acute. Of several methods of picture transmission, the Marconi system has replaced the Baird system for regular services. Within the Marconi system there are

Britain's share has been reflected partly in the release of sterling balances for expenditure in Britain, partly in new investment in the territories concerned, and partly in demands upon the dollar pool.

The old banker of the sterling area is certainly playing his traditional role; but today he is playing it on a scale beyond all prewar precedent and doing so without the substance which in the past enabled him both to play the part and thrive on it. This whole problem, as has been shown, far transcends the question—difficult and pressing though it is—of the inadequacy of the financial reserves, which are puny beside such demands. The intolerable strain has to be measured by its impact upon the production and real resources of Britain's whole economy and upon its standard of living. The policy which permits it to continue is rash and doomed to failure.

It is equally foolish when judged in terms of the banking analogy by which its advocates so often try to defend it. Britain is portrayed as the courageous and wise banker who pays out freely in a crisis to allay panic among his depositors. But such a course depends for its validity upon the assumption that the customers, perceiving that they can after all get their money, quickly decide that they do not need it. Britain's experience has been the very reverse of this. Its most importunate customers demand an ell as soon as they are offered an inch, and thus secure for themselves a disproportionate share of the exiguous reserve which has to serve for all. If the whole clientele does not soon get together to work out a voluntary and equitable restraint involving a partial standstill, the banker will surely have to impose a moratorium to avoid closing his doors altogether.

variations of detail; the most notable of these is between the "positive modulation" adopted in Britain and the "negative modulation" used in the United States. Opposition between the sponsors of positive and negative modulation is the keener because sets to receive differently modulated signals cannot be made on the same assembly line; economies in production depend largely on the volume of uninterrupted output, and firms tend to specialise on one type.

Another important technical variation is in the number of lines which compose the transmitted picture. Britain started transmission with a 405-line system and has adhered to it. The Americans use 525 lines. France, which for a time used 445 lines, now appears to have settled on 405, but is still interested in the possibility of 819 lines. The manufacturer himself is less concerned by the number of lines (which requires relatively minor adjustments in the construction of the sets) than by the differences in modulation. But the cost of the receiver increases with the number of lines.

British and American television firms are competing in European and South American countries for contracts to erect transmitting stations, and are aware that the country which gets these contracts can expect the lion's share of the receiver market on which the profits are made. Indeed, the Americans have shown some disposition to offer transmitters as gifts, or at least at less than their cost, in order to secure the receiver market for their system; but British makers cannot afford to cast bread upon the waters on such a scale as this. Eighteen months ago, the Radio Industry Council, which represents the British manufacturers, demonstrated the 405-line positive modulation system of Alexandra Palace in Copenhagen. An American party travelled through Europe

about the same time (but beginning in Spain, and arriving in Scandinavia some months later) demonstrating the 525-line negative modulation. The view of British makers—that their improved transmission equipment gives them a better 405-line picture than the Americans can at present get with their greater number of lines—may well be correct. But it is hard to explain to viewers unless they can see the two systems demonstrated side by side. What is unfortunate, in the view of some firms at least, is that the different line systems have tended to acquire national labels. There are psychological drawbacks to a strict association of the British industry with the older system and the smaller number of lines. The association is, in any case, likely to last only until the change-over to colour television becomes possible. British firms which make it clear that they are able and willing to build transmitters for any type of service are, therefore, well advised.

To say this is not to question the considerable merits of the 405-line system in the form which it has attained. Improvements in transmission techniques and equipment have invalidated many of the criticisms which were current and have almost silenced the advocacy of 1,000-line systems heard only a few years ago. It is also becoming clear that the high price of receivers for a television service with a high number of lines must limit the potential audience. Unless it provides mass entertainment, television misses its purpose.

Technical problems are also involved in the wider wave-band which is needed for the transmission of a greater number of lines. International recognition of a right to so large a share of the already overcrowded ether might be hard to obtain. Some manufacturers and technicians have tacitly agreed to promote a 625-line picture as a compromise between the present British and American systems and a technical ideal of 800 or 1,000 lines. The Australian Government has invited tenders for transmitters in each of the six capital cities and has stated that they are to be for 625-line transmission. The modulation required has not been

officially announced, but seems likely to be negative. The contract for some of these will be announced this month; an impression is current in London that it will be given to Britain. A share in developing Australian television would mean a good deal to the British television industry.

No one knows on what type of transmission the European countries will decide. Hopes that there would at least be the single system of positive modulation in Europe were killed when the Radio Corporation of America began to build a transmitter at Turin. This transmitter cannot be intended to serve Italy alone, or it would have been sited in Milan or Rome. Programmes from Turin will be received in some districts of France and Switzerland. The Radio Corporation

of America has said that it is prepared to lend transmitters for a trial period, and the Turin transmitter was believed to be supplied under an arrangement of this kind. But recent press reports have suggested that the transmitter may now be paid for by ECA funds. Dollars have been allocated for the purchase of electrical equipment by Italy, and the transmitter might conceivably be included under this heading. The British television industry, and indeed the British Government, would not welcome such an unexpected application of Marshall Aid.

Elsewhere in Europe, Luxemburg, Holland and Denmark are likely to start a television service fairly soon. Experimental transmitters have been tested, but have not proved satisfactory. Norway, Sweden and Denmark may enter the field as a unit. These countries have shown interest in the 625-line positive modulation system, but are in no hurry to commit themselves, having recently become aware of the annual cost (which might be £3,000,000) of a programme service. These expenses can be reduced by using films or by sharing programmes with other countries. Such programme-sharing is technically simple, provided that both countries use the same modulations and the same line system. Radio relay links can take the form of either a tower sited on high ground, or an aeroplane carrying the neces-

Figures of prices and sales are prepared by the Radio and Television Retailers' Association. Production figures: Board of Trade.

sary equipment. These devices, and coaxial cables, will carry sound and vision signals to areas beyond their normal range. Pictures up to 405 lines can be transmitted on the type of coaxial telephone cable now being laid on British and European trunk lines. Differences of language impose some limit on the programmes suitable for interchange, and the costs of interchange are substantial. Radio relay link towers (to take one example) are not very large or complicated, but they must be built at intervals of 20 to 50 miles according to the contours of the ground. Airborne relay, though made difficult by the need to keep an aeroplane circling in a small and sharply defined orbit, should not be prohibitive in cost. The coaxial cable costs £1,000 a mile to lay; once laid, it can carry 400 telephone calls every three minutes, and postal authorities are not easily persuaded to surrender so useful an asset. One such cable was laid between London and Manchester before the war expressly for the purpose of relaying television programmes. It now appears that the Post Office is prepared to deny the existence of this cable rather than lose the use of it. In spite of the difficulties in the way, the European countries have given a good deal of thought to programme-sharing, and this has done much to incline them towards a standardised method of transmission.

The dollar shortage may work in the British favour, but its effects can be overrated. It is true that South American countries which showed leanings towards the United States system have become more receptive to British manufacturers now that dollars are scarce. But the news from Italy has shaken faith in the argument that television is too much of a luxury to deserve dollar expenditure on transmitters and receivers.

Postal authorities can rarely be induced to authorise television transmission until they are persuaded that there is a large audience; but until a programme service has been started, the existence of an audience is impossible to demonstrate. Experience in the three countries which have had a television service shows how difficult it is to predict the market for receivers. The American market receives novelties readily; sales expand at the outset, and the market is quickly saturated unless prices are reduced. The British market, more cautious, tends to postpone purchases until the new service appears to have settled down. Sales are spread more evenly over the years, and the market, though steady, may seem to some manufacturers unattractively small.

In Britain more than 155,000 sets have been sold. This figure represents 5 per cent or less of the families living within receiving range of Alexandra Palace. But in certain ways that district is not representative of the country; Londoners tend to stay at home less than families in the North and Midlands. When the Birmingham transmitter starts this winter, sales of receivers are expected to increase rapidly. By the winter it may also have been possible to overcome the fear of potential buyers that developments in transmission will soon render out-of-date a set which is bought today. Both the manufacturers and the BBC have given an assurance that any changes made within the next decade will be of a kind to which existing sets can be adapted.

Receiver sales in the United States have exceeded two million; this is said to represent about 12 per cent of the families within range of television stations. The American sales figures are the more impressive because until recently, receiver prices were higher than in Britain. American viewers expect to be able to tune in to programmes from different stations, and this adds considerably to the cost of production. There have been signs of a temporary satura-

tion of the American market. A sudden drop in sales in the spring, after two years of unbroken rise, led American manufacturers to reduce production from 182,361 sets in March to 160,736 in June, and even fewer were produced in July. Dealers, in accordance with American custom, have cut their prices severely in order to get rid of stocks, and American sales are now beginning to recover; the recession may still prove to have been mainly seasonal.

The fall in American prices has been sharp; to take one example, sets with a ten-inch tube have come down from \$375 to \$199.50. British prices for television sets have fallen by about 13 per cent in the past year. The cheapest British receiver (also with a ten-inch tube) now sells at a retail price of 36 guineas, though purchase tax brings the price to the home consumer to more than £46. In any comparison of British and American prices it needs to be remembered that the American set is tuneable and takes a 525-line picture. But one British firm about to make 525-line negative modulation receivers for the Canadian market finds that it can do so at a competitive price. Demand for a larger screen, a greater number of lines, or refinements such as colour, is reflected in higher manufacturing costs. Production of the most expensive component, the cathode ray tube, is particularly subject to economies of scale. A market for 250,000 cathode ray tubes a year would make possible a fully automatic production line. In the United States the price of a 12-inch tube has fallen for this reason from \$38 to \$25. The British market has not yet seemed large enough to justify fully automatic production; the tube bulbs are still blown by hand, but the remainder of the operation is automatic.

Manufacturers in both countries are seeking a mass market. Sales have so far been made not to what are generally classed as the "upper income groups," but to buyers with incomes between £700 and £1,000 a year, together with some of the better-paid industrial craftsmen. Some people in the trade hold that if the cost of the receiver and its installation is £50, a family needs a minimum combined income of £500 to be able to afford one. What the term "afford" means in this connection is not very clear, but the calculation may be valid from the salesman's point of view. If it is, there are, perhaps, 561,000 families in the London area, and 296,000 within the official range of the Birmingham transmitter, which can "afford" a television set. This would give the industry an immediate potential market of about 700,000.

By the same calculation, if the BBC were to extend transmission to Huddersfield, Glasgow, Bristol and North Wales as it has planned to do, and if British prices (including tax and including installation) were to come down to £35 (thus increasing the number of families within the income range) the British industry could expect a potential home market of 4.7 million families, rising to 5.9 millions if services are relayed to other areas. Yet real expansion in the British television industry turns on the size of the export market. Few firms now make television receivers continuously; a batch is made, and production is then turned to other equipment. The opening of overseas markets may make possible more regular and, therefore, cheaper production, a larger home market, and eventually, if all goes well, the full economies of large-scale manufacture. But this programme will depend on the acceptance over a sufficient area of the world of the British system or something close enough to it to be served by the same manufacturing plant. This may still happen; if it does not, the British industry will be faced with fresh exercises in adaptability before the promise of its early start can be realised.

Markets and the Talks

Sir Stafford Cripps and Mr Bevin left for Washington on Wednesday armed with the comprehensive brief duly approved at Monday's Cabinet meeting—but without giving any worthwhile hint of the contents of that document. Nor has there been any official disclosure, by either British or American sources, of the agenda which will confront the assembled Ministers next Wednesday. Meanwhile, the daily press on both sides of the Atlantic has devoted a formidable acreage of newsprint to industrious, but exasperatingly repetitive, speculations. At the end of it all, no more is precisely known about the intended course of the talks than was understood ten days ago. Since the reliable information is so vague, the probable outcome of the discussions remains even more unpredictable. In the City, the inevitability of continuing uncertainty has reduced still further the turnover in stock markets. It has not, however, involved any return to the hypersensitive condition of a few weeks ago, when people were talking wildly but vaguely about the possibility that the coming talks would have rapid and dramatic repercussions. Now it is more generally recognised that the only quick and spectacular consequence which is even conceivable would be an early devaluation of sterling—but the most responsible City opinion now regards any such speedy decision as improbable. In the majority view, the most likely result is that any projects or plans which may be set in motion in Washington will require many weeks of close study and behind-the-scenes negotiation before reaching the point at which they could exert any important tangible effects.

Against this background, high-grade industrials have remained firm, with a slightly rising tendency—the industrial ordinary share index of the *Financial Times* gained a full point between Thursday of last week and the early days of this week. Despite the more recent doubts among those who had been confidently predicting an early devaluation, there has been no perceptible setback in the prices of those securities—chiefly gold shares and commodity shares, especially rubbers—which have been bought as devaluation hedges. The mood of depression in the gilt-edged market, however, still continues. On Thursday of last week it had made its second major attempt to shake itself free from this despondency—on that day prices showed gains of up to a full point, carrying Old Consols to 74, or virtually the level at which they stood before the slump of end-July. Once again, the recovery proved short-lived. Despite a further minor advance on Friday, the whole gain—as measured by the movement of Consols—has since been lost. This weakness perhaps owes something to the competitive attractions of the £6,500,000 offer-for-sale on behalf of W. H. Smith and Son, and especially to the feeling that, if this issue could survive the chilly waters of present markets, others might be encouraged to take the plunge. To the extent that this argument has validity, the short-run prospect for gilt-edged has not been improved by this week's experience: the lists for the Smith offer were closed within a few minutes on Thursday morning.

* * *

Fall in Bank Deposits

Bank deposits last month showed a welcome, and quite abrupt, reversal of the rising trend of the previous few months. "Net" deposits of the clearing banks dropped during the four weeks to August 17th by £54 million, a movement which contrasts with a fractional increase in the corresponding period last year, and reduces the growth of bank credit, on an annual comparison, to less than £7,000,000. This is a somewhat unexpected movement, first because it had been thought that the difficulties of the new issue market might be throwing additional demands on to the banks and, secondly, because the

Treasury's borrowings from the money market and the banks, considered as a whole, seemed to have been rising. In fact, bank advances have risen, but only by £3,600,000, while the banks' investment portfolio was fractionally reduced. The whole of the counterpart of the fall in deposits is therefore to be found in the banks' money market assets and their holdings of Treasury deposit receipts. The latter have fallen by £72 million, reflecting the latest phase of the Treasury's policy of switching its floating debt borrowings from TDRs to tender Treasury bills. As, however, the total repayments of TDRs have fallen short of the expansion in the total supply of tender bills, it might have been expected that the direct repayments to the banks would have been mainly, if not wholly, offset by an expansion in their bill portfolios and in loans at call in the money market. Actually, these two items have risen by only £15 million so that the Treasury's effective demands for bank credit have been reduced during the month by some £57 million.

It seems evident, therefore, that a substantial proportion of the increase in the supply of tender Treasury bills must have been in effect financed by quarters outside the money market—including official quarters. An examination of the actual Treasury bill tenders suggests, in fact, that during the four weeks most nearly approximating to the period covered by the bank figures, the discount market's take-up of bills was about £44 million bigger than in the previous four weeks, whereas the total supply of bills was increased during this period by £90 million. It should be noted that, owing to the frequent interventions of the authorities in the market—both as buyers and sellers of bills—the results of the bill tenders are a poor guide to the different sources of finance and, in this instance, it seems likely that the official share in the financing was even larger than the above figures suggest.

At all events, it is evident that the Treasury during this period must have been benefiting from a significant flow of funds in addition to that provided by its disclosed surplus. The revenue returns for the four weeks showed an "overall" surplus of only about £20 million, after crediting net receipts from tax reserve certificates and providing for net encashments and withdrawals of small savings. Allowing for the effects of a net decline in the active note circulation during the period, the funds ostensibly available for repayment of indebtedness to the banks were almost £40 million short of the repayments actually made in the nearest comparable period. A fair proportion of this difference is probably fortuitous, and may be presumed to have arisen from the fact that important mid-monthly disbursements by the Exchequer, though charged in the Exchequer returns for the period, did not exert their full effect on the banks' figures at the moment of the make-up. For the rest, it seems evident that the Treasury's receipts from sales of gold and dollars must in this period have substantially exceeded the amounts it had to provide to permit overseas holders of sterling to run down their sterling balances. If this is so—and it is the only explanation which seems to fit the banking figures—it also implies that the short position in sterling, so far from being further extended, must have begun to contract during this period.

* * *

Ending the Wool Control

The Board of Trade, after discussions with the wool textile industry which have lasted for two years, has announced that it is "satisfied that the remaining controls on the wool textile industry can safely be lifted at the end of the current rationing period"—that is, on October 31st. Statutory instruments giving effect to the decision will be published shortly; these will permit manufacturers to apply the utility mark to their cloth without specific authority from the Board of Trade, and

September

September is the month when schools reopen. Entering a new school, moving into a fresh form, embarking upon a different course of studies—these are important occasions in the lives of young people. For all parents and guardians, provision for the future is an ever-present obligation, and it is good sense to ensure that plans for the coming generation will be faithfully observed. The Manager of any branch of the Midland Bank will readily explain the services of the Bank's Executor and Trustee Company, where friendly personal assistance, based on wide experience, is always at your disposal in matters concerned with wills, trusts (educational or other) and settlements.

**MIDLAND BANK
EXECUTOR AND TRUSTEE COMPANY LIMITED**

BARCELONA TRACTION, LIGHT & POWER COMPANY, LIMITED

STATEMENT BY THE PRIOR LIEN BONDHOLDERS' COMMITTEE.

Prior Lien Bondholders will have seen the notice in the Press convening a General Meeting of creditors of Barcelona Traction for 19th September, 1949, in Spain to appoint Sindicos and a Press statement published by the Receiver and Manager appointed by the Canadian Court expressing his view of the consequences of the appointment of Sindicos. The Prior Lien Bondholders' Committee has the following comments to make.

1. The Committee has been advised by its Spanish lawyer that, because Spanish law requires the presence of creditors in person or by their specially authorised proxies and the strict proof of debt by means of documents, neither the Committee nor the Trustee (the National Trust Company Limited) can vote as representing the Bondholders at the meeting convened for the appointment of Sindicos. The Committee accordingly will not do so. Individual Bondholders are therefore free to vote as creditors in accordance with Spanish law. In the opinion of the Committee they should in their own interests do so and for such purpose should consult their bankers.

2. The Committee has further been advised by its Spanish lawyer (a) that there is no objection in Spanish law to the appointment of Sindicos at this stage; (b) that the Prior Lien Bondholders cannot be forced to accept payment otherwise than in sterling in accordance with their rights under the Trust Deed, and (c) that it will be the duty of the Sindicos to sell the assets only in such a way as will ensure the payment of sterling to such Bondholders.

3. The Committee does not therefore agree with the view expressed by the Canadian Receiver that "the ultimate danger of the bankruptcy proceedings in Spain continue is that the point will be reached where the assets of the subsidiary companies will be sold for non-convertible pesetas," nor with his statement that the appointment of Sindicos may have serious consequences for the Prior Lien Bondholders.

4. The Canadian Receiver refers to the Company's repeated contention that the failure to service the Prior Lien Bonds has been due to exchange restrictions imposed by the Spanish Government. So far as the Committee is aware the case of Barcelona Traction is the only one in which a major foreign creditor has not been able to reach agreement with the Spanish Government. For the reasons explained in its Third Report published on 19th February, 1949, the Committee does not agree that the Spanish exchange restrictions are the full explanation of the Company's failure to service the Prior Lien Bonds; in particular it would appear that the Company or its Spanish subsidiaries have failed as yet to provide explanations which were required in connection with their applications for foreign exchange.

Byzantium

The trade routes of Europe, Asia and Africa from ancient days passed through the Golden Horn. From Persia, India, China, Abyssinia, from the Adriatic, the Danube and the Caspian came the caravans and fleets to deliver their goods into the clearing house of Constantinople.

The development of the Americas, Africa and Australia in the past hundred years altered the trade channels of the world, and Britain became the clearing house through her great ports built by her merchants, and through the banks they founded.

will thus formally endorse what is substantially the existing practice. The Wool Control, which under Sir Harry Shackleton has maintained a successful co-operation with the wool textile industry on a more flexible basis than the system of control in the textile industries at large, will be wound up, though for the time being it will continue to collect statistics of wool textile production and allied matters. The industry has given assurances that exports, "particularly to North America," will continue to be pressed and that output of utility cloth will be maintained.

The terms of the Board of Trade announcement leave the industry in some uncertainty as to the degree of official supervision to which it will, in fact, be exposed; and this is unlikely to be fully cleared up until the precise status and mode of operation of the proposed Development Council for the industry are known.

Industry

Wages Structure in Coal Mining

Both the Coal Board and the National Union of Mine-workers are agreed that an overhaul of the existing wages structure of the mining industry is overdue. But the issues which will arise when the overhaul comes to be made are difficult and controversial; and they arise not only between the union and the board, but also between the constituent parts of the NUM itself. The decision, which the executive of the NUM has now made, to open negotiations within a few weeks for a new wages structure, was preceded by many months of internal discussion, and the negotiations which are to follow will be prolonged.

The Porter Tribunal, when it awarded national minimum rates of pay for the mining industry in 1944, emphasised the need for a general and radical revision. The National Coal Board discussed the subject in its annual report for 1948, pointing out that the existing wages structure "is not conducive to economy and efficiency," and particularly that it "does not provide the fullest incentive for men to go and work in those places where their effort would be most productive." The Board, though it has accepted the equalisation of minimum wages, is not anxious to see standard national wages established; these would oblige the profitable coalfields permanently to carry the labour costs of the unprofitable coalfields (as they do to a certain extent already), and would be "a strange way of encouraging the workers" to make themselves more efficient. Clearly, therefore, the Board is thinking of a system of differential wages between districts which would express not only the miner's effort but the economic return which his effort yielded. Only by such a method could it hope to get the redistribution of mining manpower which its development plan for the coalfields will require. It will also seek a formula which will enable the results gained through more efficient mining—through reorganised and better-equipped pits—to be reflected not only in higher earnings or easier conditions of work, but in lower costs as well.

The Mineworkers' Proposals

It is clear that the questions of principle which will arise in negotiating a new wages structure for the coalfields will themselves be enough to preclude any swift settlement, and both sides appear to recognise this. But difficult practical questions will also have to be resolved. These will include the cost-of-living allowances, the free or concessionary coal, and other allowances which the National Coal Board inherited from the private owners. They will also include the wage relationships between the various grades. The union, in its initial proposals, has suggested six main categories of mine-workers—three grades underground and three for surface workers. It is worth noting that the winding enginemen have

been placed in the highest category, and would therefore recover their losses in status over the past ten years; the NUM, it appears, is aware of the need to conciliate the winders—though its reported preparations for the training of alternative winders in the collieries can hardly be regarded as a friendly act. The union's proposals would aim at reducing and gradually eliminating the existing differentials between the various grades of craftsmen; in this they run counter to the tendency in (among others) the engineering unions, which have lately shown some anxiety that the differentials should be maintained or even increased.

Any new system will have to replace a confusion of local rates and practices, made workable in the districts by a system of conciliation for which, as the National Coal Board has complained, no guiding principles exist. The negotiations will offer to the NUM a new opportunity to show that it can think in national terms, can overcome the entrenched strength of district arrangements, and can take into account the economic needs of the industry as a whole.

* * *

Story of the Utility Cuts

New that the utility price cuts have been translated into Orders, the Retail Apparel Margins Joint Committee (which represents the retail traders' organisations concerned) has published its record of the history of the price cuts. This is in some ways illuminating. It explains more clearly than has previously been done the period of hesitation in which the proposed cuts were known to be under review, but the nature of the review was obscure. The programme at first contemplated by the President of the Board of Trade was to comprise (the committee states) the present cuts in retail margins together with a cut of 2½ per cent in the clothing manufacturers' ceiling prices, and cuts of one "conventional step" (e.g., from 17½ to 16½ or from 15 to 12½) in the wholesalers' margins. The basic assumption was, apparently, that a reduction of 2½ per cent in retail margins together with a cut of 2½ per cent in the manufacturers' price would produce a total cut of 5 per cent in the retail price. At some stage it was pointed out that these two cuts together, ignoring the wholesalers' part, would have reduced retail prices not by 1s. but by 1s. 8d. in the pound, and the proposals were revised in order to avoid a larger cut than had been intended. The impression current at the time—that Mr Wilson was engaged in transferring some of the retailers' cut to the clothing manufacturers and the wholesalers—was proved wrong in the event; as the committee points out, the only changes which Mr Wilson made were to halve the wholesalers' and manufacturers' cuts.

The point of arithmetic which arises is made in a letter on page 498, correcting the Note which appeared in these columns last week. It is that a reduction of the retailer's margin from (say) 27½ to 25 per cent of the selling price produces a cut of not 2½ per cent but 3½ per cent of the retail price (since the margin after the cut is a reduced percentage of a smaller total). In view of the confusion that has occurred, the retailers' contention that the proper way of cutting prices is to start at the manufacturing end may be difficult to rebut.

The committee states (and the statement, if accurate, is astonishing) that the President of the Board of Trade told the retailers that his scheme was "a dramatic move to help bridge the dollar gap," and was intended to meet a situation in which "a psychological hunch must take precedence over scientific data." He did not, apparently, press in the discussions the point which he had made in Parliament—that retailers could offset their losses by reducing their staffs. The retailers pointed out that, while the number of their employees had risen by only 10½ per cent since 1946, the quantity of clothing and textiles which they handled had risen by 30 per cent. They also pointed out that a cut of a quarter of their entire wages costs would be needed to offset the full amount of the price reductions.

How far economies in labour costs really are from the Government's thoughts is underlined by the news this week that the Cabinet—yielding to open pressure from the TUC—has decided in favour of three of the new wages awards for shop assistants, which the Minister of Labour had been reluctant to approve.

* * *

Labour Dispute in the Tobacco Industry

Fears of unemployment in the tobacco industry because of the restriction of tobacco consumption have rarely proved to have any substance, but they recur persistently; and a dispute which has now arisen appears to reflect these fears. The Imperial Tobacco Company has lately been engaged on a scheme of rationalisation of production which, by its own statement, is merely "part of the normal process of making ourselves more efficient." The scheme requires negotiation with a number of unions, and one of these, the Tobacco Workers' Union, has replied with a request for a forty-hour week, which it appears to intend as a device to avoid redundancy in the factories.

The company refused this request, and the union has notified the Minister of Labour of the existence of a dispute. The union does not seem to have sought or obtained any support from the other unions (some of them, such as the Transport and General Workers' and the Municipal and General Workers' Union, far more powerful bodies than itself) for its proposal. Indeed, these unions have accepted in principle the scheme of reorganisation of work, and are at present engaged in the detailed negotiations of new rates through the National Joint Council for the industry. If the request for a forty-hour week is designed to keep a constant labour force employed in the industry whatever the consumption of tobacco and whatever the improvement in productive efficiency, it deserves no sympathy.

British Shipping Earnings in 1947

The fact that the net foreign exchange earnings of the British shipping industry in 1947 amounted to some £60 million deserves wider currency and fuller explanation than it has received. This figure is reached by the General Council of British Shipping after an investigation conducted at the request of the Minister of Transport. The General Council was not obliged to publish its findings and has not published them in detail; but it might have taken the opportunity of producing fuller evidence of the value of the shipping industry than is furnished by the bare statement which has appeared. It may have feared misinterpretation; some people might jump to the conclusion that the total of £60 million bore some relation to shipowners' profits. But this idea would not bear a moment's scrutiny. It is more necessary, perhaps, to make clear that the shipowners' figure is not comparable with that given in the White Paper on the United Kingdom Balance of Payments.

The White Paper showed that payments on account of shipping in 1947 amounted to £181 million, whereas receipts of foreign exchange totalled £205 million; this gave a credit balance of only £24 million. This sum excludes payments and receipts in respect of the tanker section of the industry, which were embodied in the oil account; the General Council's figure covers tankers as well as dry-cargo and passenger vessels. But this alone does not account for the difference of £36 million. The General Council is concerned merely with comparing the receipts of foreign exchange in payment for services rendered by British ships in foreign trades with the disbursements made by those ships in foreign ports. The Government's figures, on the other hand, take into the debit side of the balance freight charges paid to foreign ships by British importers or exporters and fares paid by British nationals travelling in foreign vessels. On the credit side the disbursements of foreign ships in United Kingdom ports are taken into account, and by these means a net figure of £24 million on the credit side of the balance of payments account is reached in respect of dry-cargo shipping only. The provisional calculation for 1948 gives a figure of £60 million. The improvement from £17 million in 1946 to £60 million in 1948 is due to the progressive return of British ships into commercial service after reconversion from wartime rig (a long and expensive process which is at last nearing completion) and to the entry of new ships into commission. The calculation made by the General Council of Shipping has a different purpose and follows a different method; when it is repeated for 1948 it will probably produce a figure on the credit side exceeding £100 million, and this would be something like the average of 1937 and 1938.

* * *

American Film Agreement at Work

The film industry, conscious of its position as one of the most controversial sectors of sterling-dollar trade, will observe the Washington talks with some attention. The industry is in certain ways insulated by the Anglo-American film agreement from the impact of the dollar deficiency. Remittances in dollars from the earnings of American films in this country are restricted, in the first place, to \$17 million a year; and even the devaluation of sterling would not change this arrangement. As a source of dollar earnings for Britain, the film trade can be disregarded completely, since the permitted level of dollar remittances from London is augmented by the amount of British film earnings in the United States.

Yet the first review of the working of the agreement will begin towards the end of this year, and the conditions in which the review will take place may be determined by the Washington talks. Neither side is satisfied with the way the film agreement is working. From the British point of view, its effectiveness as a stimulant to the circulation of British films in the United States has been (to put the matter mildly) disappointing. *Kinematograph Weekly*, in a review this week of the current state of Anglo-American film relations, reported that the British Government had recently authorised the remittance of an extra

A contradiction in terms? Certainly not. Any woman, admiring the gleaming surfaces of a range which cooks for twenty guests, is likely to call it opulent, and realising how little fuel it uses, will certainly call it economical.

The Advance Cooker No. 1 provides sufficient hotplate and oven space to cater for twenty people—or even thirty with an auxiliary oven. It will burn night and day with the minimum of solid fuel, replenished only once in twenty-four hours—or twice when using coke. Here is a cooker to save time, work, health and temper—the Advance Cooker No. 1. Write for folder number 34 which tells you all about it.

\$500,000 as a first counterpart for the earnings of British films in the United States in the second half of 1948. This sum does not represent the total British earnings for the six months, which may possibly approach £1,000,000; but earnings in the first half of 1949 are known to have been very much less, and the same source estimates that they may fall to nothing in the second half of this year. Its suggestion that the Board of Trade will want a more specific agreement, with some guarantee of a wider showing for British films and the investment of more "frozen" sterling in British film production, is entirely credible.

The agreement has not tended to encourage British film earnings in the United States, though it might have worked differently if the atmosphere had not been poisoned by bitterness over the high British quota. As things are, the American companies are tending towards joint production arrangements (though these are not on a large scale) and towards the use of their sterling for the outright purchase of the dollar rights in British negatives. Apart from such arrangements, the incentive to American companies to encourage the showing of British films in the United States is strong only on paper. In practice, the extra remittances which are allowed in respect of the dollar earnings of British films are paid into a pool, which is then divided among the American companies in proportion to their earnings in Britain. One company (Universal) which has been more active than the majority in distributing British films in the United States, has expressed discontent with this arrangement, which deprives it of any proportionate return for its efforts.

Finance and Investment

Battle of Barcelona

Events are moving to a new climax in the protracted Barcelona Traction bankruptcy proceedings. The company, which is registered in Canada, was declared bankrupt and the seizure of its assets was ordered by a judge in the Spanish provincial town of Reus in February, 1948, on the ground that it could not meet the service and arrears on its sterling debt. This debt consists of prior lien bonds and first mortgage bonds mainly held, it is understood, by nominees of Señor Juan March. Subsequent representations by the Belgian Government—which is interested in view of the important interest of Sofina in the Barcelona Traction Group—and the Canadian Government succeeded in securing the transfer of the case to the jurisdiction of a special judge appointed by the Spanish Government. Before this move, certain small holders of the first mortgage bonds of the company obtained a stay of proceedings for eight months while the competence of the Spanish Courts to deal with the case was investigated. This period has now elapsed; during it a receiver acting for the trustees of the prior lien and first mortgage bondholders was appointed in Canada as a result of an enforcement action brought by the trustees, though his right to appear at the bankruptcy proceedings in Spain has not been recognised by the Spanish courts.

The Spanish courts have now ordered a creditors' meeting to be called. This will take place on September 19th, and apparently it is the intention then to proceed one stage farther in sequestrating the assets of the company by appointing "sindicors," who under Spanish law have wide powers of disposal of assets. As might be expected, the legality of the appointment of sindicors is being hotly disputed by the company, especially as the bankruptcy proceedings have not yet been completed. But counsel for the prior lien bondholders' committee, according to a statement elsewhere in this issue, has advised that their appointment is legal and that in any case under Spanish law neither the trustee for the prior lien bonds nor the representatives of the committee are legally entitled to vote at the creditors' meeting. There is no fear on their part that the sale of assets by sindicors will result in an accumulation of non-convertible pesetas. Moreover, from the outset the Committee has maintained, and now

repeats, that the service on the sterling bonds has not been altogether precluded by Spanish exchange restrictions.

It is a tangled story in which only the main issue seems clear—that is, the desire of Spanish interests to assume control of the assets of the company. The tactics employed would not be out of company among the roughest struggles for control in the United States at the beginning of the century. So far, the British Government has not associated itself with representations to the Spanish Government on the subject, though the United States Government, which is not directly involved, appears to have done so. It is possible that a firm approach from the British side would have some influence on the outcome of the present tussle.

Delays over Potash Loan

After three years of negotiations to obtain some partial release of funds, German Potash bondholders had expected that the trustees would be able to obtain early court sanction to pay out dollar and guilder funds freed before the Courts rose in July. In a cautious statement issued this week, the trustees now "hope" to make the necessary application to the Court during the next legal term. Bondholders should not be too impatient. Their interests may be best served by careful preparatory work, even though it may seem protracted. It should be possible to obtain Court sanction for the release agreement concluded with the Dutch bankers. But the Court will also have to decide whether these funds are to be paid out as accumulated arrears, and therefore subject to tax, or can be disbursed as a tax-free repayment of capital. The trust deed, which gives capital redemption priority over repayment of interest arrears, suggests the possibility of obtaining sanction for the second course.

So far the trustees have obtained the release in Holland of some £2,280,000 in Dutch guilders and £275,000 in US dollars. These are the funds on which Court ruling is to be obtained. There remain to be recovered for bondholders \$5,700,000 held in the United States and Sw. Fr. 5,500,000 held in Switzerland. Negotiations for the release of these further sums are proceeding, but legal title, in particular to the American funds, may not prove easy to establish.

As a German loan in default, the two issues of the Potash Syndicate would scarcely be valued at their present level—59 for the 7½ per cent issue and 56 for the 6½ per cent issue—but for the various wartime accumulations of foreign exchange assets. Yet even when these assets have been recovered and distributed, the Potash loans may still be a more interesting proposition than any other German loan, since both capital and interest are formally secured on something tangible—the proceeds of potash exports. But their eventual status, and their ranking compared with other German loans, will have to await the settlement of the entire question of the prewar German debt.

World Bank Loans for the Colonies?

Mr Eugene Black, the President of the World Bank, took advantage of his recent visit to London to meet the chairman of the Colonial Development Corporation to discuss the Corporation's application for a \$10 million loan. Mr Black said afterwards that he saw no reason why a loan for the purchase of machinery and equipment from the dollar area should not be granted—provided that certain technical points could be worked out. Although the projected loan is a small one, it is apparently regarded as the first of a possible series to be made by the Bank to the Corporation over a period of years. Some of the broad issues involved in borrowing of this sort therefore deserve examination at this stage. In the first place, it would be interesting to know how much of the loan is earmarked for the purchase of expensive agricultural machinery—heavy caterpillar tractors, disc harrows and rice combines have been

among the items mentioned. The wisdom of the present British policy of relying on heavily capitalised plantation agriculture in the Colonies, at a time when the utilisation of the old system of indentured plantation labour is becoming increasingly difficult, has been seriously questioned of late—most recently by Professor W. A. Lewis in a thought-provoking article in the second issue of the *Three Banks' Review*.

Secondly, the interest charge (including the special commission charge) on current World Bank loans amounts to 4 per cent per annum—payable in dollars. The failure of any project with hard currency overheads of this magnitude would be a much more serious burden for the sterling area to bear than an equivalent failure in, say, the sterling-financed groundnuts scheme. Finally, as far as can be seen, the loan would be made for various projects in the widely separated areas covered by the Colonial Development Corporation. There is apparently no question of interesting the Bank in the development plan of any one Colonial territory taken as a whole. Great care will have to be exercised if the planning mechanism whereby a Colony puts up a development proposal to the Corporation, and the Corporation borrows for it from the World Bank, is not to lose some of the advantages which might be gained by a more integrated approach. These reservations do not mean that a loan of this sort should not be welcomed; but any project which involves a dollar commitment at the present time must obviously be dragged through a critical tooth comb.

Fisons' New Issue Plans

One big new issue does not make a new issue revival. But close on last week's announcement of the W. H. Smith offer for sale (which was oversubscribed on Thursday) Fisons have given details of a plan to raise new capital which may mark a new phase in the capital market, after the recent lean period and the hard experience of underwriters of the Babcock and Wilcox and Guest Keen Nettlefolds issues. Fisons intend to raise £6,000,000 of new money in two operations. First, shareholders are shortly to be asked to sanction an increase in the share capital to £8,500,000 by the creation of 1,500,000 new £1 ordinary shares. Subject to the consent of the Treasury an issue would then be made of 2,219,278 £1 ordinary shares (out of a total of 2,780,722 unissued) in the first instance to ordinary shareholders at par or at a small premium by way of renounceable rights on a one for one basis. Since the present price of the ordinary shares is around 39s. a substantial rights element will be involved, and this alone should be a strong factor making up success.

The second stage of the plan envisages an issue of £3,000,000 unsecured loan stock, a method of approaching the market increasingly adopted if not yet popular. This issue will be delayed until the winter months, when the precise terms and method of issue will be framed according to market conditions at the time. The plan of the company to spend £5,500,000 on increasing production of phosphatic fertilisers to meet the needs

of the agricultural drive was conceived in 1944 in the first instance at the request of the Coalition Government. A further £500,000 was then needed to develop Fisons' interests in North Africa and Rhodesia. In 1947 some £1,750,000 of new money was raised by preference and ordinary capital issues, but the growing requirements of working capital place the group in need of an additional £1,750,000. Big strides have already been made in implementing the expansion of productive capacity since output further increased by 100,000 tons in the year to June 30, 1949. The board state that profit for the past year will not be less than in 1947-48, while the results of the groups principal subsidiary, British Chemicals and Biologicals—which had a poor trading experience last year—have shown some improvement in the current period. It is intended to recommend a final dividend of 9½ per cent, making a total of 12 per cent for the past year on the old shares and a 2½ per cent final dividend on the new shares. It is expected that a dividend of no more than 9 per cent will be warranted on the capital as increased for the full year to June 30, 1950.

Scottish Motor Traction Reorganisation Scheme

The capital reorganisation scheme of Scottish Motor Traction to be submitted for approval of ordinary shareholders on September 16th has not had a good reception. The scheme follows the agreement reached on January 25th between the company and the British Transport Commission for the payment of £20,498,000, plus adjustments for the assets of the company vested in the Commission and of approximately £3,000,000 for the minority interests in its subsidiaries. The holders of the £1,000,000 6½ per cent cumulative preference stock are not unnaturally disgruntled that under the scheme they are to receive only par (20s.) as a capital repayment, together with dividends accrued to the date of repayment.

Their hopes had been supported by the hint given by the chairman last January that they might do better than that. The expectation had been generally pitched at 22s. 6d. as a minimum. But since that time the decision in two colliery preference shareholders' appeals—Wilsons Clyde Coal and Chatterley Whitfield—in the House of Lords have had a withering effect on such optimism. These judgments left no doubt that in law preference shareholders are entitled to no more than is provided for in the Memorandum and Articles of Association either in the case of liquidation or in a repayment of capital. Where no special provision is made there for repayment above par, then the legal entitlement is par. That much is clear. But in the case of Scottish Motor Traction preference stockholders may well point to the generous treatment afforded by the Transport Commission to the minority preference shareholders of the Thomas Tilling group when those interests were taken over in some cases at substantial premiums. It will therefore be surprising if the SMT scheme goes through without strong representations being made for a higher payment. As much as 32s. 6d. was paid by buyers of

NATIONAL PROVIDENT INSTITUTION

FOR MUTUAL LIFE ASSURANCE

— ESTABLISHED 1835 —

48 Gracechurch Street, London, E.C.3

the preference shares in 1945. The implications of the scheme for preference shareholders as a class are most unpalatable.

The scheme also provides for the cancellation and extinction of £502,989 ordinary stock held by the British Transport Commission. This, together with the repayment of the preference stock, would entail a reduction of the capital of the company to £1,247,011 divided into £502,939 ordinary stock and 2,976,085 in unissued 5s. shares with no defined rights. The present capital is £2,750,000 and it is intended, after making this reduction, to restore the capital to this figure by the creation of 6,011,956 5s. shares with no defined rights. It is further proposed to alter the Articles of Association to provide for the distribution of £8,047,836 of 3 per cent British Transport Wagon Stock 1968-73 among the remaining holders of the £502,989 ordinary stock in proportion to the amounts held. The absence of any indication of the value of residual assets after the distribution of Transport Stock has given the market little to work on in arriving at a revised valuation of SMT ordinary. The latest quotation is 86s. 3d. which, ex the current value of the portion of Transport Stock calculated at 75s., leaves 11s. 3d. as the present market valuation placed on the residual assets.

Northern Area Road Passenger Scheme

The scheme which the Transport Commission has proposed for road transport in the northern area must be regarded, at this stage, as provisional. It affects six local authorities, one joint board and one hundred and thirty other undertakings providing road transport in Northumberland, Durham, and the greater part of the North Riding of Yorkshire. Each of these operators has received a précis of the scheme, and they have a clear two months in which to make representations about it to the Road Passenger Executive. These are necessary preliminary steps, for the Commission is under the obligation to consult all interested parties who may be affected by an area road passenger transport scheme before it submits any draft proposals to the Minister. Then a further chain of processes is involved. First, the Minister if satisfied with the proposed scheme (if he is not satisfied, he may return it to the Commission for reconsideration), may prepare a draft order to implement it; the draft must then be open to inspection for at least forty days; and if objections are made to it he must order a public enquiry.

Since this is the first area passenger scheme to be proposed, and will presumably set the pattern for later schemes, these procedural points are important. Co-ordination of local passenger transport is going to be a protracted job. It will not, indeed, be completed until the Commission has made real progress with road and rail charges schemes, in the preparation of which the Commission has lately been granted two further years' grace by the Minister. Meanwhile, the constitution, powers and duties of the Area Board will be examined with care. The précis lays stress on the intention of the Commission to leave the Area Board as free as possible to discharge its functions and to decentralise as much authority as the Transport Act allows. That itself is a welcome assurance. The Area Board will consist of a full time chairman, with not less than seven or more than eleven part time members. The aim here is to evolve an administrative unit working effectively as agent of the Commission, and leaving responsibility for day to day transport operations in the three separate districts proposed under the scheme in the care of area and district managers.

The scheme allows for the continued operation, on certain conditions, of road services which are within or partly within the area, and of services which traverse the area. The main controversy is still likely to arise from the taking over of municipal transport undertakings on the basis of their net debt—a procedure which works particularly harshly in the case of Newcastle. No amount of consultative machinery to enable local opinion to find expression will redeem this initial injustice. And that is what the Act requires, and it will affect other cities

as well as Newcastle. There will be consultation between the Area Board and the Railway Executive to co-ordinate services, to provide through booking, inter-available tickets and connecting services. These are useful steps, and given common ownership, there would be no excuse for failing to provide them; but indeed they touch only the fringe of real transport co-ordination. That is a question rather of costs and charges. Until a charges scheme is introduced, the Commission will not be able to increase road fare without the Minister's approval.

Trade and Commodities Stockpiling through Barter?

Britain's hopes of increasing its dollar earnings through larger American purchases of strategic materials are rapidly diminishing. The British delegation will no doubt raise this matter again in Washington despite the fact that an official British request in favour of such purchases received no response when it was made early in July. Judging from recent events in the United States, the amount of help Britain is likely to get from stockpile purchases will be small. In the first place, Congress has reduced quite drastically this year's authority to make advance contracts—this topic is discussed at greater length on page 506. Secondly, the Munitions Board is still concerned with a "balanced acquisition," and it has again stressed this point in its latest six-monthly Report. Although all materials being accumulated are essential, a plentiful supply of one may be rendered useless by the lack of another. The stockpile already holds sizeable quantities of rubber, jute, and industrial diamonds—the main strategic materials available in the sterling area—so that this year's appropriations are more likely to be spent in acquiring those goods which until recently were in short supply.

The use of the sterling counterpart fund to purchase critical materials may give support to the individual commodity markets, but it does not increase the sterling area's dollar earnings. The Economic Co-operation Administration has recently been empowered to act as agent for the Bureau of Federal Supply in acquiring goods for the stockpile, and such purchases would be paid in dollars from the Bureau's annual appropriation. This, however, is only an administrative change; it will not increase the total amount of dollars available for stockpiling.

Perhaps the greatest blow to Britain's hopes is the Congress authorisation to the Commodity Credit Corporation empowering it to exchange agricultural products in its possession against strategic materials produced abroad. In 1939, America concluded a similar barter transaction with Britain when it exchanged 600,000 bales of cotton against 80,000 tons of rubber. This method certainly has possibilities, but its value for the sterling area, at any rate, is limited. The Commodity Credit Corporation holds large quantities of cotton, tobacco, cereals and other farm products. With the exception of cotton, Britain can either do without these goods or purchase them from other sources without incurring a dollar expenditure.

Cocoa Problems and Prices

The trend in cocoa prices in the New York market over the past nine months has probably created more anxiety for the Treasury than for cocoa producers. The production of cocoa beans cannot be expanded or reduced very rapidly, but demand is almost a direct function of the level of national incomes—and particularly of the level of national income in the United States. When prosperity prevails, demand is high and so, too, is the price of cocoa. Last year, exports of cocoa beans from the Gold Coast and Nigeria together earned nearly \$110 million, but during the present year dollar earnings have fallen to less than half this sum. Cocoa reached its peak price in New York of 51 cents a lb. (monthly average) in November, 1947. After an initial decline it recovered to 44½ cents in July, 1948, but thereafter prices fell steadily to 18½ cents last March. Since then there has been a slight recovery to 24 cents in August but the present price stands at 20½ cents a lb. The

Planting grass... to harvest steel!

These Welsh sandhills were a desolation... until the man came along with marram grass to start the scheme of raising the foreshore level by twenty-six feet. For a place had to be made for steel—the Abbey Works, to cover three times the area of Hyde Park.

This is one of the boldest of our post-war industrial developments, a new steel works now building at an estimated cost of £60 million to take its place among the largest and most up-to-date plants in the world.

3/4-MILE OF ROLLERS. The pride of the men at the Abbey Works will be the immense 'continuous hot-strip mill', running through high sheds like Zeppelin hangars for three-quarters of a mile. A slab of white-hot steel, 8 in. thick, will enter the rolling mills at 200 ft. a minute and race out at 2,000 ft. a minute one-tenth of an inch thick!

1,000,000 TONS A YEAR. Output at the Abbey will be a million tons a year of this hot strip, much of which another great works now rising at Trostre, 25 miles to the west, will turn into tin-plate.

There you have a glimpse of one part of the steel industry's own 5-year development plan, already well advanced, and estimated to cost £240 million.

'I have seen sites of this character developed in various parts of the world, but I have never seen anything developed better and more speedily'—
MR. ARTHUR DEAKIN,
general secretary of
the Transport and
General Workers
Union.

producers' price is fixed by the Gold Coast and Nigerian Cocoa Boards. As these Boards are believed to possess ample funds, the price paid to producers may not fall so sharply as the market price in New York. Some reduction on last season's price, however, will probably have to be made, especially if cocoa in New York falls still farther.

Swollen shoot remains the serious menace to West African cocoa producers, though the excellent growing conditions of the recent season did much to mitigate its effect on output. Lord Rennell in his address this week to the Cocoa, Chocolate and Confectionery Alliance, advocated urgent action in combating this disease and added that the only known remedy was cutting out the affected trees. Since 1939 the number of trees on the Gold Coast infected with swollen shoot is estimated to have risen from 1,000,000 to 50 million—a colossal figure

which represents one-eighth of the total number of trees. At this rate of infection Lord Rennell estimated that the cocoa industry in the Gold Coast would be extinguished within five to seven years. Yet during the riots in Accra at the end of 1947, the Gold Coast Government surrendered to "political agitation" and suspended its cutting-out policy, thus virtually allowing the disease to spread unchecked.

When prices received by producers are high, any policy which involves cutting-out of infected stock (which can still bear sound fruit) is bound to be unpopular, unless the rate of compensation is sufficiently attractive. As the price paid to producers is likely to be lowered, it may be possible to repair some of the damage done in the past year and a-half. A new and much more vigorous cutting-out scheme seems the only remedy. Unless that is done, the prosperity of the Gold Coast will be at stake and the sterling area would also lose a valuable source of dollars.

What Price Tin?

The future of tin marketing must remain in abeyance until the end of the month, when the working party set up by the Tin Study Group submits its report on the prospects of an international agreement. At the meeting of the Study Group last June, British representatives were anxious to secure a marketing scheme for tin, and subsequently Sir Stafford Cripps suggested that this could be explored at the forthcoming Washington talks. The United States delegates were opposed to an international agreement unless it allowed for an expanding world production. At that time the United States was also opposed to a free world market; it wanted to maintain the international allocation scheme. Since then, however, the American Government has decided to lift immediately the ban on the domestic use of tin for such items as jewellery, novelties and ornaments, and to abolish by December 1st the restrictions on tin used in tin cans and closures for food containers. Private import of tin metal is also to be permitted, though import licences will still be required.

The effect of these relaxations on the tin market is uncertain. The maintenance of import licences is only necessary so long

as tin is allocated to the various consuming countries by the Combined Tin Committee. In the past twelve months, however, it has been price rather than international allocation which has restricted consumption in most countries. In the United States it is generally believed that the price of tin will fall; if so, the profits of Malayan producers and the dollar earnings of the sterling area will fall. The Ministry of Supply has temporarily suspended the sale of Straits tin through London to American dealers—presumably to see what will happen in New York.

American commercial consumption of tin is still not back to its prewar level, and in the first six months of 1949 it has been estimated at 27,000 tons against 32,000 tons in the first half of 1948. If, through the lifting of restrictions on the use of tin, American consumption increases by 10,000 tons, world production will still be well in excess of consumption. World output of tin in June reached a postwar peak of 15,000 tons owing to larger production in Malaya, Bolivia and the Belgian Congo. Tin metal production, however, declined by 700 tons to 14,000 tons. In the first half of this year, tin production totalled 77,900 tons, tin metal production 83,800 tons, whereas apparent tin consumption amounted to only 62,000 tons, a decline of over 10,000 tons on the first half of 1948. If American stockpile purchases are not increased, it seems evident that the price of tin will tend to fall.

New Trade Pact with Germany

In the new trade agreement between western Germany and the sterling area, which is to run for twelve months as from July 1, 1949, a substantial trading surplus is foreseen for the sterling countries. In the agreement British and sterling area exports are put at \$278 million plus \$12.9 million for non-essentials, while imports from Germany are put at \$205 million and \$12.9 million for non-essentials. Of the \$205 million, \$40 million is to go to the Dominions and a similar amount to the colonies. Germany will be exporting fewer raw materials and more manufactured goods. Ever since the war the Germans had been complaining—with some justification—that they were being pressed into the unnatural position of exporter of raw materials and importer of manufactures. The new schedule of German exports has a decidedly new look. True, steel scrap at \$43 million is still the largest item. But timber exports—which have always been a sore point with the Germans—have been entirely dropped, and textiles worth \$30 million are to be exported to Britain alone. Potash exports, which have a special interest in view of British and Continental interest in the German Potash Loan (a topic discussed in more detail in a note on page 526) will amount to \$2,300,000. The working-up of foreign-owned raw materials into finished products is to earn \$6,000,000 in commissions, and machinery exports to the Colonies alone are put at \$15 million. The German import list is dominated by three items: food products worth \$44 million, wool, jute, cotton and similar materials worth \$93 million, and rubber imports of \$36 million.

In all, the agreement represents a step in the right direction notwithstanding a good deal of impatience displayed by some exporters on either side who claim potential markets are still being needlessly obstructed. The sterling area's trading surplus does not, however, hold out hopes of substantial dollar settlements by Germany. At the moment Germany is still receiving assistance in kind under the bizonal fusion agreement at the rate of £17.5 million a year. These gift goods are included in the \$278 million, and when \$70 million, the dollar equivalent of the £17.5 million subsidy, is subtracted, the payments balance all too neatly. It is, in fact, unlikely that the subsidy will continue much longer in its present form. Negotiations are proceeding to substitute drawing rights of a similar amount for the existing arrangements. Such a change would suit both sides well. The Germans, instead of being presented with a rigid list of predetermined free imports, would be able to choose freely, and this country would receive dollars for the drawing rights granted. But such a change will require American approval.

COMPANY MEETING

TELEPHONE RENTALS, LIMITED

ANOTHER SUCCESSFUL YEAR

LONG-TERM DEVELOPMENTS

MR FRED T. JACKSON'S SURVEY OF ACTIVITIES

The twentieth annual general meeting of Telephone Rentals, Limited, was held on August 29th at the Central Hall, Westminster, S.W., Mr. Fred T. Jackson, O.B.E., Comp.I.E.E., chairman and joint managing director, presiding.

The Secretary, Mr. G. H. Field, read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to December 31, 1948:

It is with pleasure that I am able once again to review another successful year of your company. The accounts are the first submitted since the Companies Act of 1948 came into force. This has necessitated very few changes in the form of accounts submitted previously. I should, however, like to make a few observations with regard to certain of the items in the accounts.

PROFIT AND LOSS ACCOUNT

The profit of Telephone Rentals, Limited, for the year, before providing for taxation, is £322,034, as compared with £264,381 for the year 1947. The various appropriations made from this profit are shown in the profit and loss account.

With regard to income tax, you will remember that last year a higher charge fell to be made by reason of the fact that we were able to set aside for the first time the sum necessary to cover the estimated liability based on the profits for that year. The income tax charged for this year, £91,418, includes a reserve based on the profits for the year now under review.

CONTINGENCIES RESERVE

You will observe that we have made an appropriation of £50,000, being a transfer to a contingencies reserve. This is a large sum, therefore it requires some explanation. Although we cannot foresee what the future holds, your directors feel there is no doubt that there are difficult times ahead for industry. A very large number of industrial companies came into being during the war and made great progress, but, owing to the extremely high taxation it has not been possible for them to put on one side and build up substantial reserves from profits earned. These remarks also apply to private incomes. In these circumstances we feel that a large number of concerns will have difficulty in surmounting an economic crisis through lack of reserves. This state of affairs is bound to have its repercussions on companies which have been established many years, such as your company, and which have been able to build up a sound financial structure during the years prior to this excessive national taxation. It is felt, therefore, that while not prophesying a large number of bankruptcies, it is only wise for us to make a substantial appropriation for possible losses from individual contracts in the next two or three years, thereby leaving our profit-earning capacity and our rate of dividend unimpaired.

It would seem appropriate to state here that it is your directors' opinion that industry in this country cannot forge ahead when the

Government takes more than half of the profits earned to finance Socialistic schemes which the country cannot afford, however desirable these schemes may be.

PENSIONS

You will also note we have transferred £10,000 to a reserve for supplemental pensions to our staff, which also requires some explanation. You are aware of the fact that we have a contributory pension scheme, which has been in existence since 1928. The purchasing power of the £ forces on your directors the fact that they have a moral responsibility to older employees to establish a fund which will enable them to supplement existing pensions in cases of hardship. We have also to recognise that we have a certain number of older employees who have spent the best part of their lives in working for your company but who were too old at the inauguration of the pension scheme to join it. In these cases, too, we feel again we have a moral obligation to come to their assistance when they retire.

We have transferred a further £20,000 to the general reserve, bringing this up to a total of £300,000. After making these appropriations, providing for the dividend in respect of the year, and setting aside £32,927 for distribution to employees under the company's participating scheme, there is left the substantial balance of £73,649 unappropriated and carried forward to the current year.

BALANCE SHEET

Will you now please turn to the company's balance sheet. Our revenue-producing installations have been increased throughout the year and the value at which these installations now stand in our books is £1,573,494, as compared with £1,218,672 last year. This value is a very conservative figure and represents a sum of approximately one and a half times our annual revenue.

During this year we have added to our freehold and leasehold properties, the main acquisition being a central stores in which our equipments and accessories are stored and distributed to all our branches throughout the country.

Under the heading of subsidiary companies the increase in our investments of £1,000 over last year represents our holding in our South African subsidiary formed during the year. This South African company has two subsidiary undertakings, one of which operates on similar lines to your company, and I am glad to be able to report that the business obtained has been quite phenomenal and it should, in due course, contribute substantially to the profits of the group.

There is an item under this heading appearing for the first time—namely, "Loan to subsidiary company (S. Africa)," amounting to £73,343. This sum represents the balance (after deducting the above-mentioned investment and the preliminary expenses of formation) of the £75,000 which appeared in last year's balance sheet under the heading of "Cash at bank in South Africa."

Referring now to the other side of the balance sheet, our issued capital and capital

reserves remain at substantially the same figure as last year. Under our revenue reserves, the general reserve increases by the appropriation to which I have already referred. Your interest in the company's capital, reserves and surplus is £1,906,484 as against £1,816,012 at the corresponding date last year.

CONSOLIDATED BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The consolidated balance sheet and consolidated profit and loss account follow a similar form to the accounts of the holding company, but certain changes have been made by reason of the acquisition of the South African businesses. In view of the changes made this year and owing to the fact that the accounts of the South African subsidiaries, although made up to December 31, 1948, do not cover a full year, the 1947 figures have not been printed, but comparative figures will, of course, appear in future years.

It is not necessary for me to comment in detail on the consolidated accounts as the items are quite straightforward and can be followed quite readily.

Finally the profit of the group before taxation is £333,269 and, after making the various appropriations of the group, the balance of unappropriated profits carried forward applicable to the holding company's shareholders amounts to £81,953.

CAPITAL

You will remember that at our last annual general meeting I mentioned the necessity for further capital; during the current year we issued 400,000 4s. per cent. Cumulative Preference shares at 21s. 6d. per share. This issue was over-subscribed and the total amount applied for was £1,419,348.

A considerable proportion of the amount accrued from this issue was absorbed in clearing the current liabilities which appear in the balance sheet now under review.

During the year we have added a further item of equipment to our industrial services known as "Centralograph." This we believe has a very great future in textile industries and will in due course make a very valuable contribution to our revenue.

THE YEAR IN REVIEW

Last year I gave you a description of our organisation and I think it would be of interest if I now amplified this with a description of what we have been doing during the last twelve months.

We firmly adhere to our policy of allocating priority in manpower and materials to our existing subscribers, for once we add a new subscriber to our ever-growing list we expect that he will be a permanent subscriber as long as we do all in our power to give satisfaction and service.

During the past year we have reorganised our experienced commercial staff and the whole of the British Isles has been divided into districts, each with an experienced representative responsible directly to his own branch manager. The representative's job is to keep in touch with all subscribers in his district and to assist and advise them on the application of all sections of T.R. Service adapted to their particular requirements.

As an organisation we are being called upon more and more to act as consultants to industrial concerns in all trades with particular reference to preventing loss of time and helping in costing.

THE OUTLOOK

In connection with plans for the expansion of our business we have commenced a long-

term plan for development by the recruitment and special training of new representatives. Most of these representatives we take on are young and very keen to become fully qualified T.R. Service representatives; to enable them to achieve this they are trained under experienced salesmen for a period of two to three years, provided they obtain the necessary standards at each stage of their training. This training consists of a graduated series of sales schools, held at intervals over a period, with special assistance from experienced T.R. representatives.

We firmly believe that by the methods now in operation, in spite of the fact that we are face to face with a buyers' market, we shall more than hold our own in the difficult months that undoubtedly lie ahead.

I feel that a special word of thanks should be extended to the high level officials of the Board of Trade and the Ministry of Supply, both of whom have been so helpful to us. It has to be borne in mind that the civil servants are those who have to carry out the instructions of the Government of the day and, however much industrialists may disagree with the instructions given the high level civil servants cannot be blamed for them.

In conclusion, on behalf of the management, I should like to express our thanks to all our employees throughout the whole organisation for their loyalty and keenness. I can assure you that the spirit of comradeship and goodwill between our employees at all levels, is something which has to be experienced to be appreciated.

The report and accounts were unanimously adopted, the proposed dividends were approved, the retiring director, Mr Charles H. Jackson, A.C.A., was re-elected; the remuneration of the auditors, Messrs. Chris. W. Rooke Lane and Company, was fixed and a resolution was passed adopting new articles of association.

T. R. ROBERTS, LIMITED

DIVIDEND OF 15 PER CENT.

The fifty-fourth annual general meeting of T. R. Roberts, Limited, was held on August 31st in London, Mr L. P. Jackson, chairman of the company, presiding.

The following is an extract from his circulated statement:

The accounts now presented may be viewed as relating to the first normal year since the reconstruction of your company. This year we have the benefit of a full year's profits from all but the subsidiary which was acquired in September last, and your directors have accordingly recommended an ordinary dividend of 15 per cent. in the confident anticipation that, subject to normal trading conditions, they can look forward to a period of consolidation and stabilisation.

In this regard it will be noted that the unappropriated profit carried forward has increased by £6,474 to a sum of £14,090, which amount is equivalent to a dividend of approximately 30 per cent. on the ordinary stock.

In the report accompanying last year's accounts, your directors stated that the current excess value of the subsidiary companies' assets over the book values as shown in the accounts would more than cover the figure shown in the balance-sheet as excess cost of shares. Ample justification of this is provided in the case of the sale of a freehold at approximately three and a-half times its book value.

In spite of difficult trading conditions and the obscure economic future, I am pleased to report that current group trading to date compares favourably with last year's equivalent figures, and feel that we can anticipate another successful and profitable year's trading.

The report and accounts were unanimously adopted.

CROPPER AND COMPANY, LIMITED

SATISFACTORY RESULTS

The fifty-second annual general meeting of Cropper and Company, Limited, was held on August 30th, at the registered office, Thitcham, Berkshire, Mr Frank W. J. Smith (chairman and managing director) presiding.

The following is the chairman's speech, which was circulated with the report and accounts: Gentlemen, in spite of the more competitive conditions that have prevailed during the greater part of the past year, I am pleased to be able again to submit very satisfactory accounts. In fact the results are better than for any other year in the long history of the company, with the solitary exception of last year, which in many respects was abnormal.

The profit for the year, £162,231, is subject to a provision of £87,891 for taxation, which includes adjustments for previous years. The total provision for taxation at the date of the balance-sheet is no less than £215,000. Against this we have tax reserve certificates amounting to £200,000, and in addition there is about £300,000 either in cash or in investments that can readily be turned into cash, so the company has ample liquid resources.

DISTRIBUTION MAINTAINED

The directors recommend the payment of a dividend upon the ordinary shares of 10 per cent. and a bonus of 10 per cent., which is the same distribution as last year. The directors do not think it advisable to increase this in view of the undertaking given to the Chancellor of the Exchequer at the request of the Federation of British Industries, notwithstanding that the earnings are more than four times the amount of the distribution. It is also proposed to transfer £25,000 to general reserve, £25,000 to reserve for replacements, and to carry forward the balance of £39,630. The general reserve will then stand at £150,000 and the reserve for replacements at £52,052. You will notice that the fixed assets, land, buildings and plant have been written down over a period to the low figure of £83,706. Their real value is considerably in excess of this amount.

Our associate company, Colthrop Board and Paper Mills, Limited, has not had a good year, for reasons fully set out in my speech to the shareholders of that company. Briefly the reason is that the purchase price of its raw materials and the selling prices of the finished product, both of which are strictly controlled, afford insufficient margin for a reasonable profit, notwithstanding the fact that production was higher than for any previous year. Our fully owned subsidiary company, Containers, Limited, has had a satisfactory year and is paying the same dividend and bonus as for the previous period.

It is difficult to forecast the future of our company in these unstable times, but new machinery has been installed during the year, more machinery is on order, the organisation works well, the order book is full and we can look forward with confidence in the knowledge that we are well equipped to face the future whatever it may bring. My thanks are due to my colleagues on the board and to the staff and employees, without whose loyal co-operation and energy these results would not have been possible.

The chairman, addressing the meeting, said: In my speech which was circulated with the report I fully explained the position and I do not think there is anything that I could usefully add. I might perhaps have emphasised the strength of the balance-sheet by pointing out that the current assets are nearly three times as much as the current liabilities, and that the general reserve, together with the balance carried forward in the profit and loss account, are more than

half the amount of the issued share capital, but after all the figures speak for themselves. The report and accounts were unanimously adopted.

COZENS AND SUTCLIFFE (HOLDINGS)

The eighth annual general meeting of Cozens and Sutcliffe (Holdings), Limited, was held on August 26th at Grosvenor House, London, W.1, Mr H. V. Cozens (chairman) presiding.

The following is his circulated statement: As in previous years, we are publishing the balance-sheet and accounts of Cozens and Sutcliffe (Holdings), Limited, together with the consolidated balance-sheet and profit and loss account of the company and its subsidiaries.

The accounts for the year under review disclose a net trading profit of £40,397 3s. 2d., which must be very satisfactory to shareholders when it is considered that the company is subject to the same difficulties which have beset industry as a whole during the past 12 months.

Your company's freehold site at Enfield continues to justify its existence, and in my opinion has to-day a value at least seven times as great as its cost. The plant and machinery of the company also continues to be maintained in a high state of efficiency, and here again I can assure shareholders that the market value of this asset is 10 times greater than the figure shown on our balance-sheet. The directors consider that the financial position of the company is very good.

As to the future, the order book is full and the export position is excellent. The directors have, despite these very stringent times, every reason to believe that profits are likely to be maintained during the current year. The report and accounts were adopted.

TEETGEN AND COMPANY, LIMITED

RECORD SALES

The fifty-fourth ordinary general meeting of Teetgen and Company, Limited, was held on August 25th in London.

Mr John Passmore, chairman and managing director, who presided, said: Ladies and gentlemen, from the report sent to you over three weeks ago you have probably discovered that the net profit for the year is less than in the previous year. The reason for this is the lower margins of profit allowed on controlled goods, smaller rations, increased expenses and also partly due to the year's trading account being only for 52 weeks as against 53 weeks in the previous accounting period.

The sales were the highest for any year since the formation of the company. In 1934 we had 14 branches; to-day we have 23. The larger bacon ration will materially help to increase turnover. The new branch at Croydon is proving satisfactory, and we have purchased another business at Cowfold, Sussex, which we take over on September 6th.

In the balance sheet of Teetgen and Company you have no doubt noticed the very considerable reserves and also that we have plenty of cash in the bank, while liabilities are less than at the close of the year before. Fixtures, plant, property and investments are worth more than the book values. All stocks have been valued and certified by Messrs. W. H. Cork and Company as usual. Although repairs are nearly up to date we have provided another £4,000 for this year. The carry-forward is up by £2,000.

I now propose that the accounts be adopted and that a dividend of 10 per cent. be paid on the ordinary shares and I will ask Mr Derry to second the resolution.

Mr E. W. Derry seconded the resolution and it was carried unanimously.

Company Notes

Watney Combe Reid.—Consolidated trading profit declined from £1,798,481 to £1,373,793 in the year to June 30, 1949. Transfers from provision for repairs and renewals in relief of deferred repairs charged against current profits amounted to £396,505 (£180,555) and other income to £662,432 (£631,712).

Wellman Smith Owen Engineering.—Group trading profit increased from £226,213 to £381,386 in the year ended March 31, 1949. Net profit amounted to £164,224 (£93,684). The dividend of 12½ per cent. for the year is repeated, plus a special tax free cash bonus of 5 per cent. (nil).

Richardsons, Westgarth.—Consolidated trading profit increased from £484,330 to £526,290 in the year ended March 31, 1949. Net profit amounted to £169,303 (£161,981). Net current assets at March 31, 1949, were £1,064,296 (£974,742).

Distillers.—The dividend of Distillers for the year to March 31, 1949, is 27½ per cent. (same) and not as incorrectly stated in last week's issue. A capital bonus of 50 per cent. in ordinary stock was announced in July.

Dufay-Chromex.—After writing back £3,321 from provisions, charging £15,000 for possible losses on realisation of some slow moving stocks and £5,000 for additional taxation. A loss of £101,223 was incurred in the year to September 30, 1948. The loss for the previous year was £14,222. This adverse result is attributed to loss of export markets. A reorganisation is in progress.

Scribbans-Kemp.—Profit, after taxation, for the 11 months to March 31, 1949, amounted to £298,642. Dividends on the ordinary and deferred shares of 7 per cent. and 19 5/6 per cent. respectively are recommended.

A. G. Cossor.—A net loss on group trading of £78,615 occurred in the year to March 31, 1949, compared with a profit of £59,405 in 1947-48. The net loss was £269,465 (loss £110,153).

Investment Statistics

Austin Crompton Parkinson Electric Vehicles.—Control has been acquired of LTD, Ltd., sole world distributors of "Stacatru" and "Aerolift"—a petrol-driven range of British industrial work lift trucks and ancillary materials.

British Clues and Chemicals.—Consolidated profit increased from £398,467 to £411,374 in the year to April 30, 1949. The dividend of 25 per cent. is unchanged.

Steel and Co.—Consolidated profit before taxation increased from £232,871 to £259,754 in the year ended March 31, 1949. A final dividend of 10 per cent. is recommended, making 17½ per cent. (same) for the year.

Furness Withy.—After providing for taxation, depreciation and deferred repairs, profit for year ended April 30, 1949, amounted to £506,726 compared with £497,054 in 1947-48. A first and final dividend of 8 per cent. is recommended (same).

Fisons.—Ordinary shareholders are to be offered 2,219,278 £1 ordinary shares in the proportion of one new share for each share held. The price remains to be announced but it will be at or just over par. At a later date it is proposed to issue £3,000,000 unsecured loan stock.

Murphy Radio.—£300,000 5 per cent. cumulative £1 preference shares have been placed privately at par.

Millets Stores (1928).—Preference shareholders are to receive one new preference share for each six per cent. 10s. cumulative participating 10s. share. Ordinary shareholders will have the value of each share written up from 5d. to 1s. The issue will capitalise £104,166 from general reserve.

Thomas Preston.—Subject to Treasury consent, ordinary shareholders are to receive a bonus of three new ordinary shares for each ordinary share held. Shareholders are also offered 220,000 1s. ordinary shares at 10s. 6d. per share in the proportion of two new shares for each five shares held on August 22nd. The company is raising £250,000 by the private placing of 4½ per cent. first mortgage debenture stock.

Capital Issues

W. H. Smith and Son (Holdings).—Lists opened and closed on September 1st for the sale of 2,500,000 4½ per cent. cumulative redeemable £1 preference shares at par, 1,650,000 "A" £1 ordinary shares at 40s. per share and 1,650,000 4s. "B" ordinary shares at 8s. per share. Group profit subject to taxation but after charging directors' emoluments, depreciation, etc., for years ended March 31st: 1940, £330,962; 1948, £1,561,418; 1949, £1,366,911. Assets as at April 2nd, 1949: Fixed assets, £3,412,682; trade investments, £63,171; Total current assets, £6,606,600; net current assets, £2,819,586; debentures outstanding of subsidiaries, £1,801,354.

Fairbairn Lawson Combe Barbour.—As soon as market conditions permit it is proposed to issue at par 1,997,132 1s. ordinary shares in the proportion of one new share for each share held, £400,000 cumulative £1 preference shares and in due course £500,000 first mortgage debenture stock.
