castes and scheduled tribes. The Madras High Court issued the writ on the ground that the circulars in question were invalid and unconstitutional, presumably because they militated against the provision for maintaining the administrative efficiency unimpaired. The Supreme Court's judgment is divided, but the majority of the bench, consisting of Justices Ganjendragadkar, Sarkar and Das Gupta, ruled that there was no warrant for the assumption that reservation cannot be extended to all grades and higher or selection posts and the constitutionality of the circulars cannot be challenged on this score. The minority judges — Justices Wanchoo and Raja Gopala Iyengar — gave judgments rejecting the appeal and they upheld the contention that the ends of adequate representation of backward classes are satisfied if reservation is made at the initial stage of entry. To extend the rule of reservation to each grade or category of posts is to introduce a new doctrine threatening to undermine the quality of the administration. It could lead to exclusive reservation of top posts in some categories where the number of posts is so small that the posts or a majority of the posts must be reserved exclusively for the backward class candidates or they must go without adequate representation. The force and logic of the minority judgments are of little avail in the context of the majority decision.

The quality of the administration is an important resource which is progressively declining. This adverse process ought not to be hastened by technical resort to the latest judicial interpretation. The spirit in which reservation is granted should be observed by upholding the superior claims of maintaining efficiency intact.

Angola

THE REIGN OF TERROR

THE REIGN of terror that has been let loose on Angola by Dr. Salazar's regime has shocked the conscience of the world. Far from recognizing the wind of change which is now blowing fast over the entire African continent, Dr. Salazar has given proof of his vindictiveness. North Angola, more than any other part of this Portuguese colony, is in the grip of rebellion which is being crushed with ruthlessness. The number of persons massacred has been put at above 20,000, while military terror is taking its toll in other ways. When the UN Committee on Information from Non-self-governing Territories gave Portugal gentle advice to follow liberal policies in Angola and the United States backed this plea, Portugal gave expression to her anger by bringing the Methodist Mission under special attention. Curious as it may look, the civilian population in Portugal hugs to its bosom the dream of the permanence of the empire and supports Dr. Salazar's policies. But the army knows the nature of the job it is called upon to perform in Angola and some of its officers have made no secret of their lack of faith in fighting an entire population for an indefinite time. This seems to have hardened the attitude of Dr. Salazar who has assumed the Defence portfolio.

"The New York Times" in a bluntly worded editorial on May 4 has urged Dr. Salazar to recognize the force of the liberation movement in the African continent and to reconcile himself with the inevitability of decolonization. The editorial says: "Despite Portuguese resentment of any 'foreign interference,' it is essential for Portugal's allies to urge it to make the inevitable changes through reform and evolution rather than court a runaway revolution." The reference to Portugal's allies on the eve of the meeting of the NATO Council of Foreign Ministers cannot be missed. In Oslo itself on May 9. Mr. Halvard Lange, the Foreign Minister of the host country, warned his fellow delegates against doing anything which might be interpreted as tacit approval of Portugal's policy in Angola. It will, however, be a surprise if these pressures succeed in converting Dr. Salazar in the near future. Nevertheless, the pressures cannot be relaxed for this reason.

The World Abroad

WHY FRENCH PLANNERS SUCCEED

By

ODYSSEUS

MY DARK DISTRUST of hard-faced central planners and of state interference with the mechanisms of the market is notorious.

But I now have frankly to report that the British National Institute of Economic and Social Research and the French Institute of Applied Economics have, in the course of a conference in London attended by leading business men, civil servants, and economists, scored a major triumph: their exposition of the work of the French National Planning Commission convinced me (and some other sceptics) that planning may under certain circumstances, be a good thing!

But before Indian planners reach for their hats to go out and have a drink (a stiff double Mysore coffee and soda?) to celebrate my conversion, they should take note of some fundamental differences between the objects and machinery of the Indian and French National Plans. The object of New Delhi's planners is a Socialist pattern state, in which state enterprise is the big brother with all the levers of command in its hands, while (at any rate up to the present) the private sector has been tolerated as a necessary nuisance that impedes the achievement of perfection. But, at the outset, M. Pierre Masse, France's Planner in Chief, made it clear that French planning is based on no political doctrine, but on simple, unideological economic expediency and empiricism.

THE GOODWILL OF PRIVATE ENTERPRISE

Its aim is not to create a Socialist state but to enlist the goodwill of private enterprise to promote economic growth with least waste of resources.

What was so persuasive about M. Pierre Masse was that when I asked him: "To what extent would you claim that France's excellent average annual growth rate of 7 per cent is due to planning?", he replied with disarming candour: "I don't know! It is difficult to determine what part the plan plays in actual development. Nevertheless, the general results have been so good that it seems reasonable to suppose that the plan had something to do with it!"

The father of the French plan, that great economist and patriot, Jean Monnet, realised that if the plan was to work it must evoke the enthusiasm of all concerned — the government, the civil servants, leaders of industry and the workers. His aim was economic advance by agreement.

The machinery of the French plan is in three tiers. Over all is the Planning Commission. Reporting to it is the Modernisation Commission which, in turn, collates the reports of (a) 20 subcommittees, each concerned with a major industry or sector of the economy, and (b) 5 subcommittees concerned with broad questions of policy which affect the economy as a whole — finance, labour, research, productivity, and regional planning.

The Planning Commission has successfully disproved Parkinson's law by never having had more than 30 members (drawn from a wide range of administrative and technical bodies). Its job is, on the basis of the reports received from the Modernisation Commission, to reconcile planned hopes with the facts of life, and to stimulate and co-ordinate, without encroaching on the

responsibilities of any ministry, and nationalised body, or private enterprise. It disposes of no funds but provides a forum to ensure co-operation between the representatives of the government, the public services, nationalised industries, industrial and professional associations, private enterprises, and trade unions.

The Modernisation Commission is made up of 40 to 80 members nominated by the government (on the Planning Commission's recommendation) from among civil servants, heads of private firms, trade unionists and experts. Its subcommittees, or working groups, which co-opt experts, do the detailed planning. Total membership of commissions and groups is three to four thousand people — all unpaid.

A key Working Group is that on steel. This is divided into sub-groups concerned with outlets, iron ore mines, scrap, investment, technology and research equipment and finance. The group on outlets prepares a market survey, based on the provisional level of national output suggested by the Planning Commission.

There is naturally a close inter-relation between the proposed national growth rate and the productive capacity and prospects for steel. The estimate of total steel production is reached by relating the proposed industrial growth rate to domestic consumption of steel, adjusted for exports and imports. This is checked by enquiries into end-uses and into the pattern of foreign trade in steel and steel products. This provides a break-down of production into different steel products. These two methods of estimating lead to slightly differing results, on which Modernisation Commission must find a compromise.

The iron ore mine group starts with a questionnaire to all mining companies to arrive at estimates of (a) the growth capacity projected during the plan and (b) the volume of investment required by the projected increase in capacity.

Vitality important is the investment group. All plants are asked to submit expansion programmes, outlining what is to be launched, what completed, during the planned period, and the output capacity thereby attained. From this, the intended total output capacity for the French steel industry and its distribution by products is estimated. These capacity estimates are adjusted with the estimates of demand (prepared by the outlets group). The capacity and demand estimates do not differ greatly from the target set by the plan, but the product pattern sometimes needs varying up or down. In cases where an excess or deficiency of production is foreseen for a particular product, all companies concerned are informed and asked to re-examine their projects. More often than not, M. Masse told us, this mere exchange of information on company's projects is enough to reach an agreement on adjustment.

NO COMPULSION

But there is no compulsion.

If a company decides to go ahead with a project, which will give it capacity in excess of its proportion of the plan as a whole, it must take the risk either of inability to sell all that it produces, or to incur heavier overheads by not working to full capacity. If, on the other hand, it decides not to raise its capacity propor-

tionately to the over-all planned level, it risks being left behind in the race for orders and markets. Of course, the government has various incentives and disincentives at its disposal. It can encourage investment by its general economic policies, by accelerated depreciation allowances, by its control of capital issues in the money market, and so on. Up to 1958, the government fixed a time-table for new issues. This still applies to bonds, and there is also some control on medium and long-term loans. Dividends not exceeding 5 per cent of paid-up capital are exempt from company taxes if the companies increase their investments in accordance with the Plan's aims. And so on.

But M. Masse emphasised that this Commission was chary of imposing sanctions, first, because their indiscriminate use would stir up resentments and spoil the atmosphere of harmony for which he strives; secondly, because, as he added with his winning smile, "After all, in the ultimate analysis there is an element of guesswork in all this forecasting. We think we're right, but we don't know that we are. So if someone won't play, we say 'Go ahead on your own hunch, at your own risks and perils, without state aid.'"

If M. Masse's captivating exposition is to be trusted — and he largely convinced my sceptical mind — then the real secret of the success of French planning is that it relies essentially on the team spirit aroused in the joint consultations of the working groups. Most participants originally approached these groups with suspicion; ready to defend to the death their individual rights as Frenchmen; aware only of their individual

problems of finance and production; conscious only in general terms of those of their industry; and generally hazy about the economic factors at work in the economy as a whole. The first impact of these working groups was informative and educational; the second to awaken the spirit of co-operation and emulation, and, above all, to make French industrialists "growth-minded."

"Would you agree," I asked M. Masse, "that the trend in Europe, as a whole, and in France, in particular, is towards excess capacity in motor car production? If so, how do you reconcile that with planning?"

Again, M. Masse's candour left me defenceless. "We do not pretend that planning solves all problems. We hope that by making all industrialists conscious of what they are doing, better informed about the situation in their own industry, and alive to the broad factors at work in the economy as a whole, the mechanism of the market will work more smoothly. But you can't ensure a placid surface any more than you can eliminate the waves from the sea. Personally, I think that the trend is towards overproduction in cars throughout Europe. But motor car manufacturers are notoriously sanguine people. Few inherited their wealth. They are mostly aggressive, adventurous, self-made men. It's difficult to hold them back. I believe that the creation of the European Economic Community opens the door to international co-operation in planning, and I think that ultimately we'll get it. For the present, we must try to persuade motor manufacturers to rationalise, to amalgamate."

OPTIMISTS CONFIRMED IN W. EUROPE

From Our Special West European Correspondent

PARIS, May 7.

SINCE the last review of Common Market business conditions on this page (February 10), three new developments have occurred: the American recession is admitted to have "bottomed out" in February-March, there has been an improvement in British economic activity, and two Common Market currencies, the mark and the florin, have been revalued. Actually, none of these has as yet had any noticeable influence on business in this region and their effects will be felt only in the months ahead. If the outlook is today viewed with more optimism than at the beginning of the year, that is for reasons that have to do with the internal dynamics of the Common Market economy. Not that the prospects were poor in January-February. It was agreed that expansion would continue, carrying activity to higher levels than were touched in the 1960 boom. But the emphasis was on the slowing down of the rate of expansion, described as a deceleration or flattening out. This process was referred to in unnecessarily mournful language; an economy whose expansion has slowed down from 6 per cent to 4 per cent has not itself slowed down but is still growing appreciably. However, the shape of growth-rate curves (although imperfectly understood) has passed into the field of political controversy where there are Cassandra who, failing an imminent depression, will seek to present as a disaster the slowing down of a speed-up.

The latest figures leave even less room for this artificial pessimism. No one is ready to say that 1961's results will surpass 1960's, but it is already evident that the deceleration will be less marked than was feared, and there will be no cause to speak of a flattening out. The main change is perhaps psychological: a firm that was saying in February, "We are doing well but not quite as well as we were doing lately" is saying in May, "We are doing well and in fact rather better than we expected". The change in terminology is not without importance, especially because of its effect on investment outlays which are currently among the main stimulants to expansion in this region. Nor is it arbitrary; producers began to change their tune when the results of the first quarter revealed that the performance of the six economies had exceeded expectations.

The reasons for over-conservative forecasts of West European business activity lie, I should guess, in an inadequate appreciation of the volume of investment that has been taking place for several years past. Outlays on new capital assets have been an important element in the high level of activity for many months, even when overshadowed by such factors as the keen export demand for European products. Unlike export demand, which can decline sharply without leaving any permanent benefit (as has happened with motor cars recently), capital investments continue to mature fairly slowly and then produce a volume of goods and of demand to buy them (wages and rewards to investors) greater than was foreseen. This is especially important in all the Common Market countries, save Italy, because the labour force is fully employed, and it is only the coming into production of new and highly productive machinery that enables an extra quantity of goods to be offered at constant prices. For a good two years past, many observers (including myself on this page) have been prophesying that the manpower shortage would set limits to the increase of West Euro-

pean production and/or touch off a rise in prices that would have a depressing effect. In reality, this has not happened, even in West Germany and Holland where labour is least plentiful, because an immense quantity of investment has been going on with the objective of saving labour, and it is now bearing fruit.

Another reason is that long-term structural changes are going forward in Common Market industries, changes which tend toward steadily increased production regardless of temporary variations in the business climate. Almost all industries in this region have their minds set on the day when there will be one market of 170 million consumers, for whose custom firms in every country will have to compete equally. To get ready for that situation they are expanding, modernising and amalgamating according to long-range plans which cannot be altered to match the mood of the moment. In many cases this is a healthy process; by simply ignoring the American slowdown and disregarding forecasts of short-term setbacks, producers ensure that these are indeed of brief duration. In other cases, however, they are postponing the day of reckoning: in their competitive anxiety to make sure that they retain their share of the market, they are undertaking investments which, when added up, must mean eventual overproduction. In these cases, temporary fluctuations in present demand are not negligible, but are warnings of long-term dangers.

Two examples will illustrate. The Italian economy is the best case of profound structural change leading to certain expansion, regardless of ups and downs in business confidence about the short term. Italy's integration into the Common Market, the rapid growth of northern industry and the industrialisation of the south are all virtually irreversible processes that have a long way to go before they are completed. An Italian industrialist (or the American and other foreign investors now placing funds in Italy) would have to have very poor nerves to be impressed by the solemn forecasts made at the beginning of the year about a slowdown in the economy. Even if it occurred it could have very little importance in the long run. In the event, it has not happened. Results in the first quarter have belied the cautious provisions of mid-winter. The slowdown has been limited to textiles and food, while the capital goods industries have continued their vigorous expansion regardless. Something similar is happening throughout the Common Market wherever producers have their attention fixed on the remoter prospect. The extraordinary indifference of French industry (and its many foreign supporters) to the recent political crisis had similar origins. West Europe seems to have entered a phase where short-term predictions are of minor concern alongside long-term certitudes (or what are taken for such).

The other case is the automobile industry. If investment were sensitive to short-term provisions, or even to actual current fluctuations, outlays in this industry should have slumped considerably in the past year. Exports, which had been absorbing about half European output, fell very sharply, with no immediate prospect of recovery, and the short-term forecasters agreed in predicting only moderate rises in domestic demand and, therefore, considerable declines in output. Some fall in output did indeed occur, notably at Renault, one of the biggest Continental producers and

the one that relied most heavily on export sales. Yet the Common Market automobile industry in general ignored these warnings of a crisis; some increased their production, others raised their prices despite weaker demand, and all boosted their investment targets. Firms that should have gone to the wall, like Borg Ward in West Germany, were kept alive by an ill-advised municipal socialism. The upshot is that West Europe today has in hand expansion programmes in the automobile industry which, far from taking account of the short-term setback, seem to over-estimate the long-term possibilities. Any one producer would probably agree that the total investments of the industry are excessive but he still clings to his own target as the only way to ensure he holds his own in an increasingly competitive business. According to present plans, West Germany in 1965 will produce 3 million cars (against 2 million today), France 1.8 million (against 1.3 million) and Italy 1.5 million (against 700,000 last year). Since Britain, who may or may not be inside the Common Market by 1965, will be producing 3 million vehicles (against 1.8 million), West Europe will altogether turn out 9.5 million cars, whereas forecasts of demand at that date mention only 8 million buyers. If American competition becomes keener meantime, the situation could be dangerous.

However, even for the automobile industry which is exceptional, that danger is still remote, and the interim prospect is clear: production will rise this year more quickly than was expected in January, when the flattening out theory was generally accepted. Though consumer goods sales might not much exceed 1960's, the brilliant progress of the steel, machinery and heavy electrical equipment industries in the first four months of the year shows that private investment will be

vigorous. Meanwhile, the export prospect has brightened, more particularly for the late summer and winter, by which time the USA should be well out of the slough of despond. Official forecasts made several months ago of a 4.5 per cent rise in the Common Market's gross national products this year had now better be taken as absolute minima, and the figure of 6 per cent can no longer be regarded as optimistic.

What most concerns India in this is that earlier forecasts of bigger imports into this region in 1961 are now fully confirmed. It was first thought that 1961 imports would show a smaller increase over 1960's than that year's did over 1959. This might still be true, for the type of investment now going on does not have a high import-content, and moreover there is no inclination to stock raw materials as long as prices remain weak and shipping surplus. On the other hand, the revaluation of the mark and florin should lead to a greater volume of imports, and the more optimistic view now taken of the level of future demand must provoke (has already done so, as one sees in the French and Italian trade figures) larger imports of raw materials. To the extent that Common Market demand determines prices of raw materials, one would predict a modest rise in these for the rest of the year, which will be accentuated if the American recovery hastens and if British imports rise further. On the other side of the account, the export prices of Common Market manufactures will probably fall under the influence of keener competition between members. West Germany appears to have been losing trade to Britain in the Free Trade Area, and will seek to recoup these losses by competing more strongly in overseas markets. In sum, a deterioration of the region's trade balance is more certain than ever.

Basic Research in the Chemical Industry: A major contribution to India's scientific development has been made by CIBA India Ltd., in constructing a centre for basic research in the chemical industry. Addressing a Press Conference in Bombay, last week, Dr. Albert Wettstein, Director of Research, CIBA Ltd., Basle (Switzerland), claimed that the Basic Research Institute is the first of its kind to be established by private enterprise in the chemical industry. The Institute is to be devoted to genuine basic research, while not ignoring development work.

Initially, basic research would be conducted on dye-stuffs and pharmaceuticals, including chemical and biological investigations of Indian medicinal plants and the elaboration of new synthetic medicines. The Basic Research Institute to be set up at Goregaon in Greater Bombay is to work in close collaboration with other CIBA Research Institutes, particularly those in Switzerland and the USA, which is as it should be. In this way, the Institute would be able to draw on their experience and tradition of research organisation and thereby make a significant contribution to our country's scientific development. Of particular interest to India is the proposal to recruit outstanding Indian scientists, both in India and abroad, to form a well-knit team. The various research departments, such as organic chemistry, biochemistry, pharmacology, are expected to commence working early in 1963.

*

Power Generation: The installed capacity for power generation in the country at the end of the Second Five-Year Plan rose to 4,681,700 kw. from 1,362,839 kw. on December 31, 1947. The installed capacity at the beginning of the First Five-Year Plan was 1,712,647 kw. rising to 2,689,800 kw. at the end of the Plan. This was stated at an Informal Consultative Committee Meeting of the Ministry of Irrigation and Power. It was also stated that for purposes of flood control in Orissa 240 flood control schemes, estimated to cost Rs. 213.47 lakhs, had been approved for Central loan assistance.

*

Order For Lighthouse Tender: The Government of India have placed an order for the construction of a lighthouse tender with Tito Shipyard in Yugoslavia. The lighthouse tender of 2,500 G.R.T. will be 331 feet long with a speed of 20 knots. It will be powered by two diesel engines with two more as stand-by. The vessel, which will cost Rs. 150 lakhs, is expected to be delivered early in 1963.

*

Improving the Handicrafts: For improving the various aspects of handicrafts, assistance of many experts has been sought from abroad. Four experts have now arrived and they have started work as under:

S. N.	Name of the experts	Name of the country
1.	Miss A. S. Hansen	Denmark
2.	Mrs. Ruth Reeves	U.S.A.
3.	Mr. Wilhelm Moesch	Germany
4.	Mrs. Lisbet Holmes	U.K.

United Kingdom

New De-Humidifier to Raise Industrial Efficiency: A British firm (O.N. Beck & Co.) has developed a compact de-humidifier for use in industry generally which it believes will be of tremendous value in tropical countries. The Dryzair—as the unit is known—is designed around a $\frac{1}{2}$ h.p. refrigeration unit and uses a chemical known as Refrigerant 12. In shipbuilding, the makers claim, the unit keeps the air dry and prevents corrosion. Perishable goods whether stored in warehouses or in ships' holds, are kept fresh. In oil tankers the correct temperature can be maintained. There are many more uses: the makers suggest the rapid drying of cement, paint, concrete and plaster, the seasoning of timber, photographic processing, and so on. Its uses in the humid climates will be endless. Very little attention is needed for the Dryzair, which although, robustly constructed, is light enough to be carried by two men.

France

French Firm to Construct a Dam in Indonesia: A group of French business undertakings led by the Compagnie Francaise d'Entreprises, is at present constructing a dam at Djatiluhur, in Java, on the river Tjitarum, near the town of Purwakarta, 74 miles from Djakarta. It will have a yearly production of 700 millions of Kwh., which is equal to the annual production in Indonesia at the present time. This structure, of the type made up of built-in rocks, will be 329 ft. high and an artificial lake having a capacity of 4 billion cubic yards will be created which will permit, in addition to the production of electric current, the irrigation of 600,000 acres of land. The conception of this dam is unique; in the central part, there will be a tower 329 ft. high and 296 ft. in diameter. The upper part will be used as a top weir and the hydroelectric power station will be in the base. The first stage of the work is practically completed. It comprised the construction of the foundations for the tower and the excavation of its central part. The first stage of the purely constructional work on the dam, should be completed by June 1962.

Yugoslavia

2 HP Citroen Car: The 2 HP Citroen Car will be built in future in Yugoslavia by the firm Tomos who are important manufacturers of motorcycles and motorised bicycles, the factory being situated at Koper, on the Adriatic coast, 6 miles from the Italian border. The agreement concluded between Citroen and Tomos is within the framework of industrial and technical co-operation planned for both countries. The manufacture of the 2 HP limousine and light vans will be actively promoted. The 2 HP being well adapted to traffic conditions in the country, will contribute in a large measure to the motorisation in Yugoslavia.

Place(s) and institution worked with

- i) All-India Handicrafts Board, New Delhi.
- ii) Regional Design Centre, Bangalore.
- iii) Pilot Dolls & Toys Centre, Bombay.
- i) All-India Handicrafts Board, New Delhi.
- i) Regional Design Centre, Okhla, Delhi.
- i) All-India Handicrafts Board, New Delhi.

Denmark

Food Fair: Five recipe bars will be a special feature of this year's Danish food fair. At each of these bars qualified home economists will demonstrate new recipes based on the raw material at hand. The active interest of today's consumers in new recipes has prompted this novel idea. Danish food producers believe that it is important to be able to demonstrate the versatility of their product to the buyer. For some weeks past home economists have been experimenting with new recipes and a special prize will be awarded to the most interesting recipe. The judges will be a panel of house-wives taken at random at the fair. Buyers visiting the Danish Food Fair in Aalborg between June 2 and 11 will be given special sales promotion material to support the products.

Japan

Personal Consumption Expands: According to the Bank of Japan, increase in the Bank notes issued for fiscal 1960-61 registered Y 200,300 million (Y 80,000 million more than in the previous fiscal year), the peak so far. Treasury accounts with the public revealed a net withdrawal amount of Y 4,600 million. Consequently, the increase in the Bank's loans totalled Y220,500 million (Y 13,400 million increase for the previous fiscal year).

Features on fund demand-supply conditions in fiscal 1960-61 are as follows:

(1) Increased cash drains for feeding economic growth met by central bank loans in the main.

(2) Increase in Bank notes issued was mainly due to expansion in personal consumption expenditure, and Japan's growing economy was propped by demand consumption for the most part.

Kenya

Plans for New Plastic Industry: A new industry, utilizing the by-product of petroleum—expanded polystyrene—is now being planned in Kenya by a Nairobi businessman, Mr. Graham Boswell. Following discussions with the Shell Company of East Africa, Mr. Boswell plans to produce quantities of polystyrene which is one of the most recent plastic discoveries and can be converted into a cheap form of building material. A new company has been formed to initiate production in Nairobi's industrial area. Power plant is already in existence and the necessary expansion machinery is expected to enable production to commence in July.

Austria

Pure Water and Waste Water Pumps for Pits: An Austrian firm specialising in the construction of modern pumping plants turns out a vertical pure water and waste water pump which may be used for conveying pure water, industrial water or waste water from pits, collecting tanks, sewage treatment plants etc. The pump which is being installed vertically below the original water level, is driven by a driving engine above the ground. The pump itself hangs on hollow rods that serve at the same time as support for the shaft bearings. In order to achieve a smooth operation of the pump, the entire unit must be assembled tension-free within the pit. The discharge of the liquid is made through a separate pressure pipe. According to the type of the pump mounting, wet or dry installation is possible. The entire unit consists of the bearing block, the rods and the pump. Such plants are being delivered for capacities between 8 and 1800 cub. m/h and lifts upto 55m. The production programme of the firm

moreover includes sewage pumps, water circulation pumps for heating systems, pumps for liquid manure, different automatic horizontal or dip pump plants etc. The enterprise has had a long experience in the manufacture of pumps for industry, crafts, agriculture, and housing. Particularly interesting items are pumps for gardening and for car washing in modern garages. Different types of pumps are intended for drinking water supply in dwelling house.

F.A.O

Pharmaceuticals Company Joins in F.A.O. Campaign: Participation by a worldwide pharmaceuticals company in a Freedom-From-Hunger Campaign project was announced by the Director-General, Mr. B. R. Sen recently. The company is CIBA Ltd., of Basle, Switzerland, and Mr. Sen said it has agreed to take part on a "most generous and welcome" scale in a project to control or eradicate animal diseases which cause substantial losses of food and other animal products. Ciba's participation in the project will be fourfold. It will contribute the full costs of an expert's field survey in Latin America, it will supply free of charge all amounts of any CIBA products needed by FAO experts in their field work against animal diseases, it will also donate these products to governments for field trials when recommended by FAO experts, and, finally, the company has offered to finance the preparation by FAO of a much-needed technical publication on animal diseases. Final details of CIBA's agreement with FAO were worked out recently during the visit to the Organisation by Dr. Hubert Meyer, a director of CIBA, and Dr. W. Merk, of the research division of CIBA.

World Bank

Loans for Railways in Thailand: The World Bank has made a loan equivalent to dollars 22 million to the State Railways of Thailand to assist in the execution of a six year programme of modernization. The programme will increase the capacity of the Railways, improve operating efficiency and reduce operating costs, mainly through the addition of more diesel locomotives. Thirteen commercial banks are participating in the loan, without the World Bank's guarantee for a total amount of dollar 1,955,000 representing the first four maturities and part of the fifth maturity which fall due between December 1, 1964 and December 1, 1966. The Bank has participated in two earlier programmes to improve the railways. A loan of \$3 million made in 1950 was used mainly to re-equip the Makasan Workshops near Bangkok, and a loan of \$12 million in 1955 was used for the procurement of 170 passenger cars, 850 freight cars, 5,745 sets of automatic couplers, and modern telephone and teleprinter equipment. The rolling stock is in operation; the installation of automatic couplers was completed last year; and the efficiency of train dispatching and car distribution has been greatly improved by the modern telecommunications system.

T.W.A.

Boeing Jets with Fan Engines: Charles C. Tillinghast Jr., President of Trans World Airlines has announced that TWA is acquiring 30 of the newest and most advanced jetliners through a 187,000,000 dollar lease-purchase order placed with the Boeing Airplane Company. Four of these planes leased by TWA will be delivered to the Airline by September this year, while the remaining 26 bought outright by TWA will be with the Airline by late fall of 1962. All the planes will be powered by the most modern turbofan engines. These 30 aircraft combined with the 47 TWA already has or is in the process of receiving will give the airline more four-engine jets than any other U.S. carrier.

DAGGER BRAND CUTTERS FOR LASTING PRECISION PERFORMANCE

BACKED BY YEARS OF TRADITION and rigid control at every stage of production DAGGER BRAND CUTTERS (available in inch and metric sizes) assure precision performance.

They are made of superior quality steel, specially heat-treated to ensure long life, and manufactured in India's biggest and most modern factory for small tools.

THE INDIAN TOOL Mfrs. Ltd.
101 Sion Road, Bombay 22.

THEIR PERFORMANCE

NEWS IN BRIEF

INDIAN

A sum of about Rs. 21 crores has been provided in the Third Plan for directly helping landless labour to settle on the land.

*

It is reported out of 88 jute mills, which had to implement the Jute Wage Boards recommendations for cash interim relief for workmen, 82 had already implemented the recommendations. With regard to the remaining 6 mills, the State Governments were pressing the matter.

*

UNESCO has approved assistance to the extent of \$1,587,800 for the period of 1961-62 for technical education and scientific research programmes in India.

*

The Central Advisory Committee on Agricultural Labour of the Planning Commission recently recommended a programme for the provision of house sites to 50 lakh families, free of cost out of available Government lands on sites specially acquired for this purpose at a cost of Rs. 10 crores.

*

The Community Development Programme which was launched on October 2, 1952, now extends to over 3,100 blocks comprising some 4 lakh villages and benefits nearly 20 crores of people. Nearly 3,200 agricultural extension officers work in these blocks.

*

The Government of India has set up a Committee to consider various problems connected with the iron and steel scrap in the country.

*

The organizational setup of National Coal Development Corporation is being revised so that frequent supervision from technical personnel is available at the site of production.

*

The co-operative societies in Punjab cover 20,164 villages or 96 per cent of the rural population. In March, 698 co-operative societies were registered, bringing the total number in the State to 31,962.

*

The Rajasthan State Government has allotted Rs. 19 lakhs for distribution as loans to small-scale industries in Rajasthan during the current financial year.

*

The Tariff Commission has agreed that the Metal Corporation of India Limited, Calcutta, should be exempted retrospectively from the obligation to reduce the zinc prices for every increase in the lead price by about Rs. 1,123 per ton.

FOREIGN

Sony Corporation, a Japanese manufacturer of transistorised radios, magnetic tape recorders and other electronic products, has filed a registration statement with the S.E.C. relating to a proposed public offering of 2 million shares of the Company's common stock in the U.S. through underwriters headed by Smith Barney & Co. and the Namura Securities Company.

*

According to a report from Washington published in the American Metal Market, some 4,000 tons of tin owned by the U.S. Government may be released in the near future.

*

A number of firms in Johannesburg have told the Bantu Wage and Productivity Association that they intend immediately to increase the wages of Africans.

*

The Companies Amendment Bill in the South African House of Assembly, contains provisions which would make it easier for foreign companies doing business in the Union to transfer their property and licences etc. to companies which they register in the Union.

*

The U.K.-Brazil and U.K.-River Plate Conference Lines have decided "in the light of the current conditions" to increase a number of outward freight rates, coming into operation with shipments located on or after July 1.

*

The 14th International Banking Summer School, which will be attended by 210 bankers from 50 countries, will be held for the first time in the City of London from July 16 to 18, when it will move to Christ Church, Oxford, until July 29.

*

The deepest oil well yet drilled in the East — 15,000 feet, or nearly three miles — has been drilled in the Sylhet district of East Pakistan by the Shell Oil Company.

*

It is reported a long-term agreement for the sale of Canadian wheat, barley and flour, has been signed with Communist China.

*

A major contract for the British Petroleum lubricating oil refinery being built at Kwinana, Western Australia, has been placed with two U.K. organisations.

*

An interesting study of fertility trends in Ceylonese women has been made by Dr. Siva Chinnatamby, a member of the IPPF Governing Body.

*

An important French Group, led by the Societe de Construction des Batignolles, has been given the Contract for construction of an aerodrome at Waru, near Surabaya (Java) by the Indonesian Government (Navy Department). The contract covers both the civil engineering work and the supply of equipment for the aerodrome.

*

It is reported Convair Division of the General Dynamics Corporation will deliver two Convair 880-M jet aircraft to Swissair late this summer.

It's Always Possible to MAKE YOUR TRUCK TYRES LAST LONGER!

All Users of truck and bus tyres are now aware that the Tyre Industry in India does not yet have sufficient manufacturing capacity to meet the demands of all parties. It is not a matter of distribution. More than 100 Tyre Dealer Associations and Syndicates covering a network of approximately 5000 Tyre Dealers have set up controls so that such supplies as become available are allotted at the recognized retail price to those Tyre Users whose need is both imperative and proven. It will be some time before the new Tyre factories, now in the course of construction, commence to produce tyres. The expansion programmes of the present manufacturers cannot be implemented overnight.

In the meantime, what—?

WE BELIEVE that this prolonged tyre scarcity condition can be attacked if everyone who has anything to do with trucks and buses does his utmost to see that the USEFUL LIFE of each and every tyre is extended as far as possible by CAREFUL REGULAR INSPECTION AND MAINTENANCE. Here is one way to achieve long life and maximum service.

MINOR CUTS MUST BE REPAIRED—OTHERWISE THIS MAY HAPPEN

This tyre is now a complete loss. Water has entered through cuts in the tread which were neglected and allowed to develop as the tyre continued in service. Had this tyre been removed and repaired it would not have "died young" like this.

THE EFFECT OF CHANGES IN MONEY SUPPLY ON NET OUTPUT AND PRICES: 1955-56 TO 1965-66

MONEY supply with the public at the end of the Second Five-Year Plan was about Rs. 591 crores more than at the beginning of the Plan—an increase of over 28 per cent as compared to the estimated increase of 23.5 per cent in the national output. The country's net output in the Third Plan, with the financial targets of total outlay limited to Rs. 7,500 crores in the public sector, is expected to grow at 5 per cent per year. Behind these changes in national income and investment there are likely to be marked movements in the pattern of economic activity. Developments envisaged in the various sectors will alter the level as well as the structure of money supply. Therefore, great interest at present attaches to the manner in which changes in money supply in the Third Plan will affect the total volume of production, the general price level, and in consequence the raising of total outlay of Rs. 7,500 crores (at constant prices). Some preliminary, even if hazardous, calculations need to be attempted.

In a study made by the Indian Institute of Public Opinion in its latest "Quarterly Economic Report", it has been indicated that money supply—estimates of which have been worked out on the basis of the secular trends obtained separately for 'notes in circulation' and 'demand deposits' over the period of 1952-53 to 1960-61 (Table I)—will go up by Rs. 730 crores during the Third Plan. Table II on page 1176 sets out the estimates of 'currency' and 'demand deposits' over the period 1961-62 to 1965-66. It will be observed that the share of currency in total money supply is expected to increase from 71 per cent in 1960-61 to 77 per cent in 1965-66; in absolute terms, notes in circulation will have increased by Rs. 498 crores to Rs. 2,447 crores in 1965-66. In the Draft Outline of the Third Plan, on the other hand, the additional money supply in the hands of the public at the close of the Third Plan is estimated at Rs. 950 crores. In working out this estimate, it has been assumed that "aggregate output and money supply would be approximately at balance at the end of the Second Plan."

The estimates presented above in regard to money supply clearly demonstrate the inflationary tendencies possible in a situation where money supply in the hands of the public is outstripping net output. For the past decade, it has been investigated that no possible correlation of the total volume of production which acts as a cushion against prices exists with the volume of money because a great deal of production is absorbed in the rural sector without the direct play of money. But the relationship between money supply and prices, which the Institute has obtained in its study, accounts for all the factors operating in the Indian economy.

In exploring the genesis of inflation which the Indian economy has seen over the Second Five-Year Plan, the Institute suggests that food articles and industrial raw materials together have accounted for three-fourths of the total rise that occurred in general prices at 34.5 per cent between 1955-56 and 1960-61 (Table III). Industrial raw materials prices have, however, grown much faster than the food articles prices, indicating a cost-push inflation that is now built into the Indian economy. It is also estimated that food articles and industrial raw materials will continue to produce pressures on the general prices in the Third Plan.

What will be the magnitude of rise in the general price level during the Third Five-Year Plan? Concrete price rises that will be witnessed in the general price level in the Third Plan are unlikely to be precisely known but some broad estimates can be made in the light of the inflationary tendencies that the Indian economy developed over the Second Plan period. It has been estimated that, over the five-year period from 1955-56 to 1960-61, an increase of ten per cent in money supply tended to produce a rise of 9.9 per cent in the general price level. This provides, in the first approximation, a fair guide to the course which the general prices will take in the Third Plan. On this basis, it is predicted that the additional dosage of Rs. 730 crores in money supply will result in

TABLE I.

NOTES IN CIRCULATION AND DEMAND DEPOSITS: 1952-53 TO 1960-61

(Rs. Crores)

Years	Notes in Circulation		Percentage Deviation from Actual	Demand Deposits		Percentage Deviation from Actual
	Actual	Estimated*		Actual	Estimated*	
1952-53	1133.12	1105.58	-2.43	532.82	528.80	-0.76
1953-54	1185.92	1208.71	+1.92	528.76	563.30	+6.53
1954-55	1277.09	1311.84	+2.72	574.26	597.80	+4.10
1955-56	1466.64	1414.97	-3.52	635.67	632.30	-0.53
1956-57	1526.09	1518.10	-0.52	711.88	666.80	-6.33
1957-58	1579.13	1621.23	+2.67	745.94	701.30	-5.99
1958-59	1701.53	1724.36	+1.34	733.62	735.80	+0.30
1959-60	1844.90	1827.49	-0.94	793.95	770.30	-2.98
1960-61	1948.48	1930.62	-0.92	744.22	804.80	+8.14

an increase of 26 per cent in the general price level over the entire period of the Third Plan. The year-to-year changes in the General Index of Wholesale Prices are best described by the figures given in Table IV. It will be seen from Column 4 of the table that the rate of increase in the general price level will show a steady decline, from 5.5 per cent in 1961-62 to 4.2 per cent in 1965-66. Broadly, it has also been shown by the computations made by the Institute that the annual lower limit for price rise might be 4 per cent covering unavoidable rises due to indirect taxation (2 per cent), one per cent

increase in labour cost and one per cent from miscellaneous.

Another estimate of the price rise which the Institute has computed with additional money supply of Rs. 950 crores (presented in the Draft Outline of the Third Five-Year Plan) places the increase at 32 per cent; it is assumed here that the stable aggregate output envisaged in working out the money supply may not materialise, but it is very likely that the level of money supply anticipated will be reached by 1965-66.

TABLE II.
AN ESTIMATE OF MONEY SUPPLY: 1961-62 TO 1965-66

(Rs. Crores)

(1)	Currency*		Demand Deposits**		Money Supply	
	Total	Additional	Total	Additional	Total (2) + (4) = (6)	Additional (7)
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1961-62	2033.75	85.27	839.30	95.08	2873.05	180.35
1962-63	2136.88	103.13	873.80	34.50	3010.68	137.63
1963-64	2240.01	103.13	908.30	34.50	3148.31	137.63
1964-65	2343.14	103.13	942.80	34.50	3285.94	137.63
1965-66	2446.27	103.13	977.30	34.50	3423.57	137.63
Total increase (1960-61 to 1965-66)	—	497.79	—	233.08	—	730.87

* Estimated from the equation $Y = 103.13X + 1105.58$, where X denotes number of years after 1952-53, Y denotes notes in circulation and the constant term in the equation is termed 'catch-all' variable.

** Estimated from the equation $Y = 34.50X + 528.80$ where X denotes number of years after 1952-53, Y denotes demand deposits and the constant term accounts for all other factors operating in the economy.

TABLE III.
WHOLESALE PRICES DURING THE SECOND PLAN

(Groupwise)

(Base: 1952-53=100)

Group	1955-56	1960-61	Percentage increase between 1955-56 & 1960-61	Contribution of each Group to General Price Rise
1. Food Articles	86.6	120.2	38.7	19.50
2. Liquor & Tobacco	81.0	109.6	37.0	0.78
3. Fuel, Power, Light and Lubricants	95.2	119.5	25.5	0.77
4. Industrial Raw Materials	99.0	144.1	45.5	7.05
5. Intermediate Products	100.1	123.8	23.7	0.97
6. Finished Products	99.6	122.3	22.7	5.45
7. General Index	92.5	124.5	34.5	34.5

TABLE IV.
PRICES AND MONEY SUPPLY: 1955-56—1965-66

Year	Money Supply (Rs. Crores) Xi	Wholesale Price Index (Base: 1952-53=100) Computed Values for Xo**	Percentage deviation of computed values from observed values
1955-56	2102.31	99.2 (96.2)	+4.0
1956-57	2237.97	105.3 (102.4)	-2.8
1957-58	2325.07	108.4 (106.4)	-1.8
1958-59	2435.15	112.9 (111.4)	-1.3
1959-60	2638.85	117.1 (120.7)	+3.1
1960-61	2692.70	124.5 (123.2)	-1.0
1961-62	2873.05	131.4	+5.5
1962-63	3010.68	137.8	+4.9
1963-64	3148.31	144.0	+4.5
1964-65	3285.94	150.2	+4.2
1965-66	3423.57	156.5	+4.2

* $\log_e X_o = 0.99696 \log_e X_i - 3.06064$.

Where X_o denotes Wholesale Prices and X_i indicates money supply and the constant '3.06064' (catch-all variable) in the above equation takes into consideration the effects of all other variables (such as supply of consumer goods) which come to play a significant role in establishing the relation between money supply and prices.

Note: Figures in brackets indicate the computed values for the period 1955-56 — 1960-61; for the period 1961-62 to 1965-66, column 4 indicates the percentage increase over the preceding year.

THE BUSINESS WORLD

Decentralisation, but not Democratisation!

By

CROESUS

IN no other field has there been such a wild welter of ideas and so frequent changes in policies in the recent years as in the co-operative field. The result naturally has been a good deal of confusion, leading to an avoidable slowing down of consolidation and improvement. The latest essay in this competition of naive, if not novel, ideas has been in regard to Co-operative Education and Training.

It may be recalled that the Union Ministry of Community Development and Co-operation appointed a Study Team in November 1960. Now, this Committee has come to certain conclusions after a supposed study of the existing arrangements in the field of Co-operative Education and Training with a view to suggesting measures necessary for making them commensurate with the requirements of co-operative development during the Third Plan period. One wonders whether this study preceded the conclusion or followed it; the particular course of action recommended and many of the recommendations made by the Study Team were being freely talked about even before the Team began its work. Apparently, the study was only designed to discover reasons for a pre-conceived course of action.

The present organisation of Co-operative Education and Training consists of a Central Committee for Co-operative Training which is composed of prominent non-officials connected with the Co-operative Movement, Registrars of a few important States, representatives of the Ministry of Community Development and Co-operation, of the Planning Commission and of the Reserve Bank of India, and the President of the All-India Co-operative Union. This is a fairly representative body in all conscience, and one may say also possible, inasmuch as both the Government of India and the Reserve Bank are supposed to have jointly nominated the members. At the regional level, there are Local Committees consisting of representatives of State Co-operative Unions, the Registrar of Co-operative Societies and a prominent educationist of the region, besides the Member-Secretary of the Central Committee. Lower down still, at the State level, training institutions are managed either by the State Co-operative Unions where the Unions are strong and efficient, or by the Co-operative Department, with the clear understanding that they are to be taken over by the Unions when they acquire the required capacity, as the underlying idea being to leave the movement as non-official as possible at all levels. This explains why the training of members and office-bearers of co-operative societies has remained the responsibility primarily of the State Co-operative Unions and the All-India Co-operative Union, aided and assisted, though it is by the Government of India.

It may be of interest to mention at this stage that the whole organisation as detailed above had been initiated even prior to the Report of the All-India

Rural Credit Survey Committee. That was the joint effort of the Government of India, the Reserve Bank, the State Governments, the All-India Co-operative Union and State Co-operative Unions. In so far as one has been able to follow, this programme of training of co-operative personnel has worked with commendable success. This is not to say that the administrative arrangements and the content and course of studies cannot be improved upon. As a matter of fact, one has reasons to believe that they have been and are constantly being, improved upon, in the light of experience and changes in co-operative policy and practice, which is as it should be.

In these circumstances, the proposal of the Study Team to replace the Central Committee by a Board nominated solely by the Government of India is not understandable. One would have appreciated the proposal had the Study Team backed it up with a list of duties required of the new government body which cannot be done by the present Central Committee for Co-operative Training. In the absence thereof, the proposal is liable to be interpreted as an affront to the veteran non-official co-operator who presently heads the Central Committee. Furthermore, it would almost amount to the end of all professions in the past that the movement should and would remain predominantly non-official. Also it is likely to be construed as a calculated move on the part of the Government (or is it the party in power?) to appropriate to itself some more avenues of patronage.

Possibly, the Study Team might have been prompted by considerations of administrative decentralisation, but, if this were all that was intended, surely it could have been done by giving additional powers to Local Committees. It is significant that the Study Team has not recommended any Local Committee for the State-level institutions. According to its Report, where the State Co-operative Unions are not in a position to manage the institutions, the running of institutions will be blatantly a departmental affair. This may be "decentralisation", but certainly not democratisation, and it would unquestionably be a retrograde step.

Among others, the Study Team's recommendations include: (1) replacing the Central Committee by a Board nominated by the Ministry; (2) organisation of training institutions for each State separately; (3) replacing the All-India Co-operative Training College at Poona with a Central Research and Training Centre, and (4) minor changes in the content and duration of each course. It may not be out of place here to state that, according to available information, the Central Committee itself was contemplating the distribution of the location of training institutions in such a manner as to ensure one institution for the training of intermediate personnel for each State. Proposals are also believed to be under consideration for developing the All-India Co-operative Training College at Poona into a

full-fledged Training and Research Centre. What the Study Team has suggested, therefore, merely amounts to this, namely, that all these duties should now be taken over by the Government of India. One thought that those who conceived these proposals even before the Study Team reported would normally have been called upon to implement them, if only out of a sense of recognition of the good work done and the imagination displayed. But that seems too much to expect of the Government in its present frame of mind.

In saying all this I do not mean to say that there are no areas at all in the co-operative structure that

do not need development. That would be shutting one's eyes to reality. Everyone knows that not all is well with the working of our marketing co-operatives. Then there are industrial co-operatives which are still in their experimental stage. And we are soon to have a crop of co-operative farms. The Government of India would do well, therefore, more to bestow its effort and attention on these fields, where a lot needs to be done, than to try and take over a sphere of work that is already being looked after in a reasonably good manner by organisations which are fairly representative and, what is more, have acquired experience in this particular field of work.

Middle Class Cost of Living in Dhanbad Area

By A. B. CHAKRAVARTY

TWO independent surveys on the cost of living of middle class families in Dhanbad and its suburbs show that cost of living in this region is considerably higher than that in Calcutta. About a year back, between December 1959 and January 1960, a survey on the cost of living in Dhanbad and its suburbs was conducted by the Association of Scientific Workers of India (Central Fuel Research Institute), which revealed that the cost of living index for Dhanbad was 134 when the cost of living in Calcutta was taken as 100. In February 1961 another independent survey, more comprehensive than the previous one, was conducted in respect of cost of living in these coalfields. By applying proper weightage, the recent cost of living index comes out to be 135 in the coalfields, taking Calcutta as 100. It is rather fortuitous that two independent surveys, carried out at an interval of one year, have led precisely to the same conclusion that every Rs. 100 in Calcutta buys at the same time the same quantity of goods and services as obtained at about one-third extra money spent in the coalfields.

The items considered under cost of living were: food, clothing, house rent, fuels, light, transport, education, medical facility, entertainment and services etc. The Table below gives the indices for cost of living under various items and presents a comparison with the indices estimated by the A.S.W.I. a year before. The index for each item was based on a number of components not indicated in this Table. For instance, the index for food was based on a number of components like rice, wheat, vegetables, fish, meat, milk etc., and the prices of all such components were obtained from a market study done at Calcutta and Dhanbad

simultaneously. The indices for all other items shown in the Table were derived similarly.

The cost of living indices prepared by different organizations in India give a measure of comparison between the relative costs of living at the same place for different points of time. The present study does not calculate such a conventional index. On the other hand it attempts to evolve an index for comparing relative costs of living at two different places at the same point of time. The study is confined to the calculation of a suitable index for middle class families in Dhanbad and suburbs, the coalfields of Bihar and its surrounding regions as compared with that of middle class families with similar level of living in Calcutta. Such studies can be undertaken to compare the cost of living at different towns and cities in India at the same point of time.

During the recent months prices in Dhanbad and suburbs have shown a marked upward trend. Prices of many consumer goods of everyday use have suddenly increased; and such a rise in prices is more marked in coalfields than in Calcutta. Dhanbad region itself does not have much of supply potential as regards consumable articles and it would be seen in near future that cost of living in Dhanbad would go up, for with industrial development, rising money income would absorb the available goods and services at higher prices. In view of this phenomenon and the great industrial and employment potential of this region, it is imperative that such studies on the cost of living of middle class families in such regions are undertaken at regular intervals of time.

INTERIM MIDDLE CLASS COST OF LIVING INDEX IN DHANBAD AND ITS SUBURBS AND CALCUTTA

	A.S.W.I. estimate			Present estimate		
	December 1959 — January 1960			February, 1961.		
	Weights	Calcutta	Dhanbad	Weights	Calcutta	Dhanbad
	(1)	(2)	(3)	(1)	(2)	(3)
1. Food	45	100	105	43	100	111
2. House Rent	15	100	129	13	100	115
3. Clothing	10	100	110	10	100	112
4. Transport	10	100	280	9	100	280
5. Education	7	100	200	7	100	200
6. Medical Facility	5	100	120	5	100	128
7. Entertainment	3	100	140	3	100	135
8. Fuels Lights etc.	5	100	85	5	100	85
9. Services	—	—	—	5	100	153
Overall:	100	100	134	100	100	135

Note: In this survey a middle class family has been defined as one, which has an income between Rs. 250 to Rs. 1,000.

world-wide organization

Sven Wingquist,
founder of SKF and
his epoch-making
design...the self-
aligning ball bearing
—Sweden 1907

The place was Sweden—the year 1907, when Sven Wingquist invented the first self-aligning ball bearing, which revolutionized the bearing industry.

Manufacturers liked the new type of bearing and demand for it became world-wide.

With the passing of time SKF has grown with the industry it serves. Today you will find SKF at work on all types of machinery in every industry, filling the intricate precision requirements of the jet aircraft, to the tough needs of huge construction units. Wherever a bearing is required, SKF will meet the requirement—with the finest bearing in the world.

Business Notes

Manganese

NEED TO MAXIMISE EXPORTS

HOW OFFICIAL policy and imposition of various restrictions and burdens on the export of manganese ore by mine-owners and exporters has resulted in a fall in India's exports of this valuable foreign exchange earner was graphically narrated by Mr. Natwarlal S. Worah, Chairman of the Western India Minerals' Association, at a Press Conference held in Bombay last week. Since the advent of the State Trading Corporation in this field in 1956, he disclosed, there had occurred a sharp fall in our manganese ore exports—from 16.5 lakh tons in 1955 to 9 lakh tons in 1960—when, over the same period, world exports of this commodity had gone up by 20 per cent! This sharp fall in India's exports, Mr. Worah asserted, was, by and large, due to the policy of intervention by the Government to protect the interests of the State Trading Corporation. No less responsible were the various restrictions and burdens imposed by the Government on the industry and trade, such as increase in royalties and railway freight, application of the Minimum Wages Act, etc., all of which went to enhance the cost of ore to price out Indian manganese from the world markets.

The Chairman of the WIMA also offered a few valuable suggestions to remedy the situation and restore manganese exports to the pre-STC era level. The most notable of his suggestions was that traders should be allowed to participate in barter deals directly in their own name without having to go through the STC, as at present. The foreign buyer was only interested in getting his supplies at the cheapest possible price, said Mr. Worah. He explained how it would be uneconomic for the Indian exporter to go through the STC. This, he said, would mean avoidable inflation of the price as a result of the addition of servicing cost by the STC. In order to regain our traditional export markets, Mr. Worah suggested taking a number of measures, immediately, such as (1) reduction in railway freight to the levels that prevailed in 1958, (2) waiving of the dead rent entirely till the market improves and stabilises, (3) bringing down of the royalty to a uniform rate of Rs. 5 per dry long ton, with no royalty on manganese ore below 38 per cent Mn. content, (4) lowering of port charges to the pre-1956 level, (5) provision of cash incentives to mine-owners who produce ore containing 30 to 42 per cent Mn. content, and (6) giving of export incentives to exporters by way of a cash subsidy or import licences for certain listed commodities in short supply or imports of machinery for government projects.

While on the question of exports, Mr. Worah referred to the fact that, against a target of two million tons set for manganese ore exports during the Second Plan, the country had hardly achieved six lakh tons! Accordingly, he urged the need for a realistic approach to the problem so that the country could derive the maximum benefit from a commodity which has an assured market abroad.

Mr. Worah also stressed the need for immediate appointment of a commission, composed of geologists, mining engineers, mine-owners and exporters, to assess the cost structure of mining lease up to shipping filing of an application for mining lease up to shipping of the ore. He further wanted setting up of a permanent committee, comprising the same members, to devise suitable measures to reduce the cost of production at different stages. Not until these practicable steps are taken, can we expect our manganese exports to look up, he pointed out. There seems to be a tendency in certain quarters to minimise the gravity of the fall

in this country's manganese exports in view of the increase in our iron ore exports, but those who know the economics of both these are extremely critical of this complacent attitude. Surely the authorities ought to know that, ton per ton, exports of manganese yield more foreign exchange than those of iron ore.

Export Risks

EXPANDING E.R.I.C.

NO COUNTRY which desires to push its export trade can afford to minimise the important role of institutions that provide cover against risks to which exports are exposed. As early as in the year 1957 itself, India did well, therefore, in starting her Export Risks Insurance Corporation. The ERIC has been making steady progress since then, as is evident from the gradual improvement in the number of policies issued by it from year to year.

For purposes of record, it may be stated here that apart from providing facilities and encouragement for developing trade between India and other countries in the form of insurance against certain commercial and political risks resulting in non-payment by foreign buyers, the Corporation also protects insured exporters against losses arising from circumstances outside their control, as also of the buyers. To suit the varying needs of exporters and to provide for the widely differing patterns of trade, the Corporation has to, and, in fact, has been devising new forms of protection. Thus, last week, Mr. T. C. Kapur, Managing Director of the Corporation, outlined the latest of these intended to afford facilities to cover risks of manufacturers in India supplying goods to shippers on credit terms for purposes of export. This scheme, it is noteworthy, has been designed in response to requests made by numerous manufacturers, who have, in their turn, to give credit facilities to exporters. In this connection, Mr. Kapur referred to the fact that not all manufacturers export their goods themselves, but sell them to shippers who export them, although many manufacturers would fain export their goods themselves because of the attraction of export incentives in the form of import licences. Be that as it may, the buyers in foreign countries also seek goods on credit terms, and so shippers often ask for credit from manufacturers. The new scheme should, therefore, be particularly welcome to all these interests.

It may be recalled that, towards the end of 1960, the Corporation extended the field of its activities by issuing Packing Credit Insurance policies to cover risks involved in credits given by scheduled banks and Government organisations to exporters to enable them either to manufacture or purchase goods for the purpose of exports. In order further to facilitate pre-shipment finance, the Corporation has decided to cover risks where pre-shipment advances are given by institutions other than banks and Government organisations.

Thanks to all these efforts, the ERIC's activities are on the increase every year. During the first four months of the current year, shipments and contracts insured amounted to Rs. 2.66 crores with a premium income of Rs. 84,183, as against Rs. 2.55 crores with a premium income of Rs. 78,500 for the corresponding period last year. The Corporation also registered, during the same period, 581 assignments in favour of banks of the value of Rs. 72.37 lakhs for negotiation of documents for the policies issued by the Corporation as additional security. Incidentally, it may be noted that during its nearly four years' working, the Corporation has paid 33 claims aggregating Rs. 4,51,697.82 nP.

Central Bank of India

RECORD PROFIT AND HIGHER DIVIDEND

AT THE 50th Annual General Meeting of the Central Bank of India, Sir Homi Mody, the Chairman of the bank, had a happy news to convey to the shareholders. It was that the bank had made a net profit of Rs. 133 lakhs in 1960 — the highest in the bank's long history. In view of the record profit made, Sir Homi Mody said, "the Directors have proposed an increase over the dividend paid to shareholders last year. The interim dividend of Rs. 2.10 per share, subject to tax, already paid for the half-year ended June 30, together with the final dividend of Rs. 2.50 per share, subject to tax, now recommended for the second half of the year would make a total dividend of Rs. 4.60 per share, subject to tax, equivalent to Rs. 3.22 net per share. This works out to 12.88 per cent net for the whole year." It is also proposed to give the shareholders a Jubilee Bonus of 50 nP. per share, subject to tax.

Dealing with the country's economic conditions as such, Sir Homi Mody made some pertinent remarks on the Third Plan and vehemently criticised the rising level of prices. The extent and seriousness of the damage caused by rising prices, he said, can be gauged from the fact that between March 1956, and November 1960, there had been an increase of nearly 28 per cent in the general price index. To counteract the effect of rising prices, Sir Homi Mody pleaded that a more realistic fiscal and economic policy be evolved. He asked that with our limited resources and materials and technical personnel, whether it was wise to accord topmost priority to heavy industry in our development plans. In his opinion, the products of heavy industries were by their very nature incapable of absorbing all the additional purchasing power pumped into the economy. Hence, the fear that such a lopsided pattern of outlay might tend to aggravate the general inflationary pressure. To provide some relief to the industry he pleaded that the Reserve Bank should provide more liberal rediscount facilities. But, how this is going to be reconciled with his plea for stricter monetary restraints to produce a wholesome effect on the economy, it is difficult to understand.

B.I.C.

NEED FOR REHABILITATION

MR. H. S. CHATURVEDI, Chairman of the British India Corporation Ltd., at the annual general meeting of the company, held at Kanpur recently stressed the need for rehabilitation and renovation of the company's plant and machinery. With special reference to woollen branches of the company, he pointed out that most of the machinery in these factories was about fifty years old and some of it dated back to 1880. A stage had reached, he said, when productivity was bound to suffer if steps were not taken to rehabilitate the present plant, much of which was now obsolete and uneconomic. The chairman indicated that the technicians of the Company had prepared a blue-print of rehabilitation programmes with the aid of foreign experts and would be approaching the Government for import licences to implement the first part of the scheme.

Mr. Chaturvedi observed that the textile industry was performing an important role of earning valuable foreign exchange for the country in the present difficult phase of India's economic development. It was quite ironic, therefore, that this very industry could not per-

form efficiently to improve its competitive power in the production of high quality cloth at reasonable prices. There was an apparent case where special attention ought to be paid so that the textile mills, both woollen, and cotton did not find it impossible to procure machinery and spare parts for renovation and rehabilitation.

B. & C.

NEED FOR RATIONALISATION

MR. E. F. G. HUNTER, Chairman of the Buckingham & Carnatic Company Ltd., at the annual general meeting of the Company's shareholders, held recently at Madras, pointed out that the company was preparing to meet a substantially higher wage bill as a result of implementation of the recommendations of the Central Wage Board for Cotton Textile Industry. The Company had negotiated with the labour union for the implementation of these recommendations, but at the same time it was discussing the basis for an agreement in respect of rationalisation and the procedure to be followed to give it a practical shape. It was true that the textile industry could pay higher wages only out of increased returns to the industry. It had been argued that higher demand, which did exist at the moment, alone was not sufficient for the industry to enable it to pay higher wages. Along with higher production, an efficient performance had to be achieved which partly was possible only through a degree of rationalisation. The Chairman pointed out that the Central Wage Board also stressed the need for "rationalisation as soon as possible".

The Chairman was critical of the new excise duty which was levied on textiles produced on automatic looms. He pointed out that any form of penalty which did not apply equally to all mills, could only be considered discriminatory. This levy, he opined, was certainly not conducive to progress or to modernisation. In fact, the cost of modernisation was so high that the government ought to assist the industry in this crucial field.

Textiles

A NEW UNIT FOR RAJASTHAN

THE GOVERNMENT OF INDIA has granted a licence to Aditya Mills Ltd., to set up at Kishengarh, in Rajasthan, a textile factory having 25,000 spindles and 500 looms. The construction of the factory is now being taken in hand as the necessary electric supply has been assured. The company has acquired 56 acres of land for the aforesaid purpose and intends to acquire 44 acres more.

The initial cost of this factory will be Rs. 1.10 crores. Of this, Rs. 50 lakhs will be provided as loan to the Company by the Industrial Finance Corporation of India and the balance will be subscribed by the promoters, their friends and associates and by the public; approximately Rs. 20/25 lakhs worth of shares will be offered for public subscription. The Government of Rajasthan has agreed to take shares worth Rs. 15 lakhs. As the plant gets going, it is likely that staple fibre, rayon and boards may also be manufactured. On completion, the total cost of this unit is expected to be Rs. 2 crores. When fully in operation, this textile factory will go a long way in fostering the economic development of a hitherto backward and depressed area. About 700 persons are likely to be provided employment at the factory straightaway.

FROM THE CAPITAL'S CORRIDORS

CO-ORDINATING COLLABORATION SCHEMES

In order to avoid delay resulting from separate and successive consideration by different authorities of the various aspects of the major Third Plan private sector projects, such as industries Act licensing, capital issues, terms of collaboration, import licensing for capital goods, etc., the Government of India has decided to place on special duty, in the Ministry of Commerce and Industry, a senior officer who would be in a position to undertake co-ordinated consideration of all aspects of these projects at the same time, in consultation with the authorities concerned. The officer appointed, it is learnt, is Mr. R. V. Subramaniam.

The Government has also drawn up a list of industries in which foreign capital would ordinarily be welcome to participate. The list takes into account the gaps in capacity which exist at present in relation to planned targets. The industries included in the list are: iron and steel structural; iron and steel castings and forgings; iron and steel pipes; special steels; non-ferrous metals and alloys; boilers and steam generating plants; equipment for transmission and distribution of electricity; furnaces; marine diesel engines; industrial machinery, including major items of specialised equipment used in specific industries and general items of machinery used in several industries such as equipment required for various unit processes; ball, roller and taper bearings; speed reduction units; machine tools; tractors, earth-moving and construction machinery; plastics; industrial and scientific instruments; fertilizers; organic chemicals, fine chemicals and intermediates; industrial explosives; industrial gases; agricultural chemicals such as insecticides; dyestuffs and drugs, including the production of basic intermediates; newsprint and pulp.

The list is only illustrative; collaboration schemes falling outside this list will also be considered on merit. The list is as well subject to revision from time to time.

The fields in which foreign capital is ordinarily not needed have also been listed. They cover banking, insurance, trading and commerce activities and plantations, apart from the industries included in schedule "A" of the Industrial Policy Resolution of 1956. In special circumstances, exceptions may be made in these fields after full consideration if this is found to be in the public interest.

Basically, the policy regarding foreign investments is to attract private foreign capital in the fields in which the country needs to develop in pursuance of planned targets. While Government has been generally encouraging the investment of private foreign capital in the country, it is to be recognised that this has necessarily to be on a selective basis. If any project is approved for development in the private sector and if imported plant and machinery are required, foreign capital investment would ordinarily be welcome as a form of financing the project.

Ordinarily, Indian majority holding in a project would be required. But the ratio of foreign capital to Indian capital in a joint venture will have necessarily to be judged on merit. The various considerations that will be taken into account in this respect are the foreign exchange requirements of the project, amount of technical skill that will be needed, etc. Importance will also be attached to the arrangements proposed for

training of Indian technicians and executives in all aspects of production and management. Long-term assembling and formulations and productions based on imported intermediate products will be avoided. Special encouragement will be given to schemes which would involve expansion of exports on an economic basis with or without the assistance of foreign collaborators' overseas marketing organisations.

PROF. GALBRAITH'S "POSITIVE APPROACH TO ECONOMIC AID"

In a signed article in the April issue of "Foreign Affairs", Prof. John Kenneth Galbraith, the American Ambassador to India, suggests a normal liberal formula of 25 per cent more foreign aid for making it effective together with a positive approach to economic aid for the underdeveloped countries. This approach includes a new system of organising foreign assistance under the name of The Positive Development Plan, whose important features are two: (a) it sets achievable but firm goals for the country seeking development, with provision for measuring progress towards their attainment, and (b) it seeks the removal of all the barriers to advance in the particular country. The Plan envisages a small but a talented group of men assembled in Washington under the aegis of a new agency which may be termed The National Development Institute. The proposed purpose of this Institute is first to help countries seeking development under this Plan to set the targets or goals which they can reasonably hope to attain over, say, a 7-year period, and to devise steps for achieving these goals; and second, to help the Government, not only to execute the programme, but also to develop the permanent administration required to achieve these goals and to continue on the path of permanent and independent development. Prof. Galbraith, of course, makes it clear that the assistance provided by the Institute would be voluntary and failure to do so would not prejudice access to other forms of aid. He has also mentioned India, Pakistan and Mexico as exceptions to which the Plan is not applicable; because these countries have a positive approach to the problem of development, or (as in the case of Mexico) they have broken through the main barriers to advance.

Prof. Galbraith is critical of the view that the 'only' missing element in the development of under-developed countries is the external resources—above all, capital. He is of the opinion that four other things are crucial for bringing about development of an under-developed country: (1) a substantial degree of literacy and a sizeable number of people with higher educational skills necessary to man a Government and undertake the managerial and technical tasks, associated directly or indirectly with economic advance; (2) a substantial measure of social justice, reflected in more even distribution of wealth and income; (3) a reliable apparatus of government and public administration; and (4) a clear and purposeful view of what development implies—a strong sense of purpose coupled with the technical skill and a clear view of their destiny. Prof. Galbraith is very emphatic and ably demonstrates how, in practice, one or more of these four factors are missing in most of the poor countries, and each is as critical as capital. The only successful development, according to him, will be that which supplies the missing elements, depending on a particular case in point and not according to a common prescription for development.

To Prof. Galbraith's mind, education and literacy are the pivot of all progress. He substantiates his argu-

ment very ably by advancing India's example of substantial measure of industrial progress, but very little agricultural progress. He argues: in the agricultural villages, literacy is low; the social inequalities are high and many know that, come what may, they will live on the bare margin of subsistence; village government is decayed and ineffective and only recently have efforts at rejuvenation been made; and the Indian village is hardly inclined to address itself purposely to economic advance. So, Prof. Galbraith concludes, even though India of all the economically distressed countries, makes the best use of its aid, it too fails in the part of its economy where other requirements of advance, notably education, are lacking.

Prof. Galbraith is equally emphatic on applying tests for judging the efficacy of aid advanced to underdeveloped countries. He pleads for an enquiry into whether the recipient countries are on the way to self-sustaining growth. Has national income been increased? Has poverty been mitigated? Has the likelihood of disorder been lessened?—These are the questions to be answered for judging the efficiency of aid advances.

The pitfall of prescribing medicines by American experts to underdeveloped countries on the basis of their own experience in the United States in recent times has come in for a very critical attack by Prof. Galbraith. It is very often forgotten that the United States has a great variety of developmental services appropriate for high stage of development and for things of secondary importance. The tendency to develop these in underdeveloped countries leads to heavy burdens and a radical dispersion of energies. The particular dispersion will depend on the extent of personalities. The arrival of a specialist in plant-breeding will lead to a new enthusiasm for hybrid corn; someone with a background in adult education will revitalise leadership to a movement for adult education until he departs for the next country. Officials of a number of countries have said quite frankly that they do not hesitate to adjust their requests to the preference or whims of current personnel in the American mission. Money talks. Nor are the insights and preferences of the recipients more acute. The result is a measure of incoherence, discontinuity, dispersal of scarce energies and, inevitably, of waste.

ASSISTANCE FROM AID-INDIA CLUB

Reports from Washington suggest that at the recent meeting of the Aid-India Club, the United States offered to provide assistance to India, subject to the approval by the U.S. Congress, to the tune of one billion dollars (approximately Rs. 480 crores) for the first two years of the Third Plan, provided it was matched by a similar contribution by the other members of the Club, namely, the United Kingdom, West Germany, Canada and Japan. As the other members of the Club were hesitant to commit themselves to provision of aid on this scale and wanted some time to consider the proposition, the meeting was postponed to May 30.

How far the Aid-India Club will come to the rescue of India in her fight against poverty is anybody's guess. India today wants loans mainly in an untied form, repayable over a period extending upto 50 years, with no obligations to repay during the first 10 years. India's difficulties obviously are being appreciated abroad as is evidenced by the two loans granted by the United Kingdom Government a fortnight ago. These loans have to be repaid in easy instalments extending over 25 years.

Assistance to the tune of one billion dollars may not be forthcoming from the U.S.A. during the first two

years of the Plan if for no other reason than for the fact that a matching contribution may not be made available by the other members of the Club. Expectations here are that substantial assistance will be made available by the Aid-India Club for the first two years of the Plan and this will go a long way in helping us to tide over our balance of payments difficulties. Our balance of payments deficit during the current financial year is estimated to be around Rs. 304 crores. In 1962-63, it is expected to increase to Rs. 425 crores.

U.S. ASSISTANCE TO PRIVATE INDIAN FIRMS

Loans totalling Rs. 24.69 crores were made available to private Indian firms by the U.S. Government agencies during the Second Plan period. The following are the details:

Indian firm receiving Loan	U.S. Government agency giving loan	Amount of loan
Dollar Loans:		
1. National Rayon Corporation Ltd.	Export-Import Bank	\$ 1.8 million (Rs. 86 lakhs approx.)
2. Sundatta Food & Fibre Ltd.	-do-	\$60,000 (Rs. 3 lakhs approximately)
3. Hindustan Aluminium Corporation Ltd.	-do-	\$13.65 million (Rs. 650 lakhs)
4. Ahmedabad Electricity Co. Ltd.	Development Loan Fund	\$ 3.90 million (Rs. 186 lakhs)
5. Premier Automobiles Ltd. (Formal Loan Agreement not yet signed).	-do-	\$ 7.2 million (Rs. 343 lakhs)
Rupee Loans		
1. Otis Elevator Co.	Export-Import Bank (Cooley, Loan)	Rs. 10 lakhs
2. Goodyear Tyre and Rubber Co.	-do-	Rs. 225 lakhs
3. Mysore Cements Ltd.	-do-	Rs. 55 lakhs
4. Synthetics & Chemicals Ltd.	-do-	Rs. 392 lakhs
5. Hindustan Aluminium Corporation Ltd.	-do-	Rs. 100 lakhs
6. Merk Sharp & Dhome of India (P) Ltd.,	-do-	Rs. 50 lakhs
7. Ex. Cell-O Corporation	-do-	Rs. 20 lakhs
8. Seshasayee Bros.	-do-	Rs. 200 lakhs
9. Premier Tyres Ltd.	-do-	Rs. 30 lakhs
10. Lederle Laboratories India (P) Ltd.	-do-	Rs. 25 lakhs
11. Gabriel India (P) Ltd.	-do-	Rs. 5 lakhs
12. Limac Ltd.	-do-	Rs. 52 lakhs
13. Carrier India (P) Ltd.	-do-	Rs. 37.5 lakhs

SHARAVATHY HYDRO-ELECTRIC PROJECT

Meanwhile, the U.S. Ambassador here has announced the approval by the U.S. Government of two loans, totalling \$57,775,000, for Mysore's Sharavathy hydro-electric project. One loan (for \$21.5 million) will be in foreign exchange from the U.S. Development Loan Fund and the other (for \$36,225,000) in rupees from the PL. 480 counterpart funds.

The two loans together will finance the entire cost of the second stage of the Sharavathy project, which involves installation of 445,000 kilowatts additional generating capacity at the project. Earlier, the U.S. Government had provided from the D.L.F. a loan of \$8.4 million in foreign exchange and another one of \$14.6 million from PL. 480 counterpart funds for the construction of the first stage of this project, which included construction of the dam and reservoir, a power plant with two 89,100 kilowatt generators and 238 miles of transmission lines. The work on the first stage is said to be progressing satisfactorily.

TECHNOLOGICAL CONSULTANTS BUREAU TO BE SET UP

It is proposed to set up, under the aegis of the National Industries Development Corporation, a Bureau of Technological Consultants which would undertake industrial surveys on behalf of Government, Government undertakings or private sector. It will have a number of sections such as (i) process and production designs section, (ii) project engineering section, (iii) engineering designs section, (iv) inspection section, and (v) erection supervision section, and would be headed by a Chief Director who would be assisted by Section Chiefs, one for each section. The recurring expenditure on the Bureau is estimated around Rs. 70,000 per month.

The Process and Production Designs Section will be entrusted with the task of selection or designing of the process to be followed in a given plant or designing of new processes for an industry. It will also be the function of this section to give consideration to alternative processes which could do the job. The section would collaborate with the various National Laboratories to test and analyse raw materials and end-products, to test out new processes and to find alternatives to known processes, where necessary to suit local requirements.

After a particular process has been accepted, the preliminary studies for a project will be undertaken by the Project Engineering Group which will examine its both technical and economic aspects and prepare preliminary reports.

The Engineering Designs Section will do the actual plant layout and detailed designing and prepare working drawings for a project.

The Inspection Section will be charged with the duty of rendering assistance to both the public and private sector industries in matters of testing equipment.

The Erection Supervision Section, which will be manned by persons with sufficient experience in the field of construction and erection of equipment in industry, will be providing assistance in respect of supervision of erection and initial operation of a plant. The task of training staff to carry on with the normal operations in a factory will also be undertaken by this section.

The Bureau would be able to turn out each year preliminary reports on four projects as well as detailed project reports for at least two medium-sized projects (costing about Rs. 5 crores).

MADRAS ALUMINIUM-MONTECATINIS COLLABORATION ARRANGEMENTS

The Government of India, it is learnt, has approved the technical and financial collaboration arrangements proposed to be entered into by the Madras Aluminium Company with M/s. Montecatini, of Italy, for setting

up an aluminium smelter at Mettur, on the following basis:

- (i) Allotment of free equity shares of the Indian Company to the Italian firm in consideration of technical know-how — Rs. 45 lakhs.
- (ii) Payment in Italian liras to the foreign firm:
 - (a) towards engineering fees, drawings, assistance in purchase of plant and other allied services — not exceeding Rs. 40 lakhs;
 - (b) cost of foreign experts, contractors and agencies for the construction, supervision and other services charges, etc. — not exceeding Rs. 35 lakhs;
 - (c) the rupee out-of-pocket expenditure on Montecatini's personnel in India — Rs. 15 lakhs.

The total sum under head (ii) is permitted to be accounted against share certificates of the Indian company in favour of the Italian company as and when bills are presented to the Indian company for supply of designs, for engineering fees and reimbursement of out-of-pocket expenses, etc.

MANUFACTURE OF FERTILIZERS

A U.S. firm has offered to set up in India fertilizer plants based on utilization of liquid ammonia to be produced in the Persian Gulf area from natural and refinery gases available there. The matter is said to be under consideration of the Union Government.

Highest priority has been accorded in the Third Plan to schemes for setting up fertilizer factories. The following units have so far been approved for being set up under the Plan:

Location	Capacity (In tons of Nitrogen)	Sector
1. Trombay	90,000	Public
2. Nahorkatiya	32,500	Public
3. Gorakhpur	80,000	Public
4. Vishakhapatnam	80,000	Private
5. Madhya Pradesh (exact location is yet to be decided)	50,000	Private
6. Hanumangarh	80,000	Private
7. Kothagudam	80,000	Private
8. Ennore — Madras	8,250	Private

PURCHASE OF TANKERS

The Government of India has allowed the private sector as well to acquire tankers; originally it had been decided that the acquisition of tankers would be only in the public sector. The number of tankers that would be acquired by both the public and the private sectors during the Third Plan period would, in addition to the availability of resources, depend on the availability of immediate employment for them.

The National Shipping Board, it may be recalled, had recommended a target of 14.22 lakhs G.R.T. for shipping in the Third Plan to be achieved with an outlay of Rs. 118 crores, which included the acquisition of one coastal tanker of 7,500 G.R.T. at a cost of Rs. 1.15 crores and four overseas tankers of 66,000 G.R.T. at a cost of Rs. 8.60 crores. The final allocation for shipping in the Third Plan has now been fixed at Rs. 55 crores. Correspondingly, the tonnage target has also been pruned down to 11 lakhs G.R.T.

So far as tankers are concerned, it was estimated that within this reduced allotment, it would be possible to add only one coastal tanker of 7,500 G.R.T. at a cost of Rs. 1.15 crores and three overseas tankers of 53,000 G.R.T. at a total cost of Rs. 6.80 crores. This position is, however, now likely to change in view of the proposed acquisition of some second-hand overseas tankers by Jayanti Shipping Company from its own resources.

Mazagon Dock Limited, Bombay, has placed an order for marine gears with McKie and Baxter, a Scottish engineering firm, to be installed in the two tugs which are at present being built for the Vizagapatam Port.

N.C.D.C.'S PROGRESS

The National Coal Development Corporation, it is learnt, is taking steps to improve its working in the light of the suggestions made by an expert from the National Coal Board of the United Kingdom, who visited this country last year to make an assessment of the progress made by the N.C.D.C. and to review the different aspects of its coal raising operation. This expert had observed that production from the N.C.D.C.'s new mines, both deep and open-cast, was small in relation to the capacity of equipment installed. He had also suggested setting up of first class maintenance service in order that the installed machines could be kept running for the maximum time. The N.C.D.C., it is learnt, is setting up a central workshop to look after important repairs and maintenance jobs. The maintenance men attending the machines are also being provided intensive in-job training. The organisational set up of the Corporation is also being revised so that frequent supervision from top technical personnel may be available at the site of production. The facilities for transport of coal are also being increased during the Third Plan period. It is hoped that with all these measures, the costly equipment will be utilised to its maximum capacity in due course and production stepped up to the optimum level.

AFRO-ASIAN ECONOMIC CO-OPERATION

The Afro-Asian Organisation for Economic Co-operation is scheduled to meet here from December 11 for a week. About 38 central chambers of commerce of various countries, who are members of this organisation, are expected to participate in the meeting. Sixteen other countries eligible for full membership and 25 territories and dependencies eligible for associate membership have also been invited to send their represent-

atives to the conference. Besides deliberating on the general problems of fostering trade between Asia and Africa, the participating countries will be given an opportunity to discuss specific trade matters of particular interest to them. An international industrial exhibition is being held to co-incide with this meeting. This will provide an opportunity to the representatives of Asian and African countries to study the latest techniques of production. Some European countries, the United States and the Soviet Union are expected to participate in this exhibition.

"CHAIN" LETTERS

The Department of Company Law Administration in the Union Ministry of Commerce and Industry has decided not to register in future companies formed with the avowed object of promoting what are called "chain letters" schemes. While such schemes are sought to be promoted ostensibly on the plea of providing mutual aid and incentives to save, the Department considers that by according recognition to these schemes, there is likelihood of undesirable persons exploiting the gullible public and defrauding a large number of individuals of relatively small sums of money.

"Chain letters" schemes envisage despatching of letters to a number of addressees, each one of whom is called upon, in turn, to send out similar letters to other persons along with a nominal sum of one or two rupees. The sponsors of these schemes generally collect small sums of money at every stage of the chain transaction.

BRIEFS

With the production of bitumen by both the Burmah-Shell and the Stanvac refineries, India has become more or less self-sufficient in its requirements of bitumen road binder. The present production of bitumen from the Stanvac refinery alone is about 1,20,000 metric tons per annum. This is expected to go up to 1,25,000 metric tons per annum by the end of the current year.

The total net collections in small saving securities during the five years of the Second Plan amounted to Rs. 406 crores. For the first time, collections in a year exceeded Rs. 100 crores in 1960-61; the total collections during this year were of the order of Rs. 106 crores.

There is a proposal to extend the Indo-Norwegian Fisheries Project of Kerala to some of the other maritime States. The matter is understood to be under discussion here between a five-member Norwegian delegation, led by Mr. Krogh Hansen, and the Government of India.

BOOK REVIEW

AN INDIAN MARSHALL PLAN?

INDIA AND THE WEST: By Barbara Ward. Publishers: Hamish Hamilton, London: Price 18s.

ANY book by Barbara Ward is an event. "Sane", "judicious" and "reasonable" are adjectives that come to mind in describing her writing and, unlike other authors who combine these virtues, she is able to do so without exacting a price in boredom. She is liberal without being pallid and her belief in the middle way is ardent enough to persuade one to offer two cheers for democracy. The third cheer, perhaps, belongs to Communism even on the strength of Miss Ward's analysis.

The first part of the book seeks to place in perspective the solutions offered to the problem of breaking through from poverty into self-sustaining economic growth. They are 'Western' solutions, because, until recently, the problem itself has been exclusively Western. But Miss Ward sees them as Western in a deeper sense. Both the liberal and the apocalyptic Marxian answers are, according to her, rooted in Christian society and philosophy. "Indeed neither can be found anywhere else. . . . To think that human society might be perfectable and humanity redeemable belongs to the Jewish and Christian tradition alone. One can surely dispute the view that only one religion is compatible with progress. One can also argue that the Hindu ethics, as much as the Protestant ethics, are rich in those entrepreneurial virtues most conducive to rapid capital formation. Finally, one has to object that religion no longer shapes economics, whatever its influence in pre-industrial England. But this is to dispute the philosophical penumbra. The actual alternatives can be agreed upon more easily. Miss Ward delineates with skill the evolution of the mixed economy and of governmental action, both national and international, as a corrective to the recurrent failures of laissez-faire systems to be fully self-regulating. She proclaims with conviction "the paradox that judicious government action does not repress, but, on the contrary, produces a pre-condition of vigorous private enterprise." The Marshall plan is the vigorous example of international action applied to stimulate the free and integrated growth of open societies; mutilate the free and integrated growth of the future. "If its success draws clearly a pattern for the future. "If a crisis on the scale of Europe's collapse in 1947 could be overcome by vigorous, purposive inter-governmental action, a precedent had been set, a tool invented for working on other possibly more intractable problems in other areas of the world economy."

The second, and the apocalyptic Western answer, is not put before us quite so ably. The labour theory of value is quickly dismissed—it has, after all, ethical overtones which matter more in history than its factual correctness. Both Marx and Lenin are criticized for reasons of generalising from transient phases of capitalism, as if these phases were immutable archetypes. The idea that colonies are needed as an outlet for surplus capital is refuted by pointing out that the flow of international capital has been overwhelmingly to countries that are industrially advanced. "The total British investment in 1914 (in India) after a hundred years of empire was not much more than a tenth of British investment overseas." This may dispose of one plank in the platform; but the stubborn suspicions of the man in the Asian Street that colonies have been needed for raw materials and markets, and, in short, for exploitation in whatever manner possible, and that if colonialism is dying, it is doing so wisely rather than willingly, are not wholly

dealt with by Miss Ward's persuasiveness. Her own version of colonialism—that the flag follows trade and acts in order to secure it—is too benevolent for those to whom foreign occupation is an all too recent memory.

These, however, are sources of analysis. When it comes to the solution that is being analysed—the Communist answer to the problem of breaking through into industrial growth—no attempt is made to minimize its effectiveness. Stalin, Miss Ward acknowledges, "carried his country from the wooden plough to the atomic pile in forty years. Thus he not only gave Russian Society the sheer brute strength to survive in an angry world. He provided an alternative blueprint for economic growth in any society too caught in its own contradictions or divisions or poverty to achieve development by more spontaneous methods."

India, therefore, has the choice of two paths. She comes to this choice in unique circumstances because she is the only nation in history that has sought to achieve industrialisation within the framework of parliamentary democracy and a universal franchise. In other countries the industrial revolution has either preceded the growth of political rights or has suppressed it in the name of total mobilisation. In India alone the process of industrialisation must rest on those rights and remain responsible to them. We cannot, therefore, choose the solution of laissez-faire capitalism; forced saving through gross income inequalities; or the solution evolved by communism: forced saving by systematically mopping up all excesses above the margin of subsistence. We have to choose a middle way, and even our rate of progress is determined precisely by conflicting pressures. If we proceed too slowly, we will breed disappointment; if we proceed too rapidly, the social cost is likely to break open into political discontent.

It is against this background and within these dilemmas that our economic progress must be judged. Miss Ward considers it "an entirely rational decision on the part of the Indian authorities to put food and heavy industry at the core of their plans." Indeed, she thinks that "Steel plants—the core of heavy industry—could, with advantage, have been initiated earlier in the planning process." Railway development has been adequate, but "road-building still does not receive the priority it deserves." The bulk of our power output will have to continue to come from thermal stations, but the coal industry is "one of the few really clear instances of direct damage caused by the government's preference for public enterprise." Nevertheless "in India, as elsewhere in the non-Communist world, a vigorous government stimulus to investment is proving the most effective spur to private development as well. India is repeating the experience of France under the Marret Plan." The growth of the private sector demonstrates that "Indians, given the opportunity, have the entrepreneurial gift." As against this, Miss Ward has to conclude that "an entrepreneurial revolution is what the public sector chiefly needs." The breaking of bottlenecks does not come easily to the civil servant trained in the British tradition. He prefers to defer action while all alternatives are weighed — or simply to pass the file upwards."

On the whole the growth and diversifications of Indian industry "compare favourably with the most

(Contd. on page 1189)

THE GANESH FLOUR MILLS COMPANY LTD., DELHI

REGISTERED OFFICE, SUBZIMANDI, DELHI.

NOTICE

NOTICE is hereby given that the 69th Annual General Meeting of the Shareholders of The Ganesh Flour Mills Co., Ltd., Subzimandi, Delhi will be held at the Registered Office of the Company at Subzimandi, Delhi on Friday the 9th day of June, 1961 at 10 A.M. to transact the following business:-

- To receive, consider and adopt the Directors report and the Audited Balance Sheet and Profit and Loss Account of the Company for the year ending 30th September, 1960;
- To declare Dividends;
- (a) To appoint a Director in place of Shri Satya Narain Gupta who retires by rotation under the Articles of Association of the Company and being eligible for re-appointment, offers himself for re-appointment as a Director of the Company;
- (b) To appoint a Director in place of Shri Om Prakash who retires by rotation under the Articles of Association of the Company and being eligible for re-appointment, offers himself for re-appointment as a Director of the Company;
- To appoint Auditors for the Financial year 1960-61 and fix their remuneration. Messrs. A. F. Ferguson & Co., Chartered Accountants, the retiring Auditors being eligible for re-appointment offer themselves for re-appointment as Auditors of the Company for the year 1960-61.

SPECIAL BUSINESS

- To consider and if thought fit to pass with or without modification the following as an ordinary resolution:- "Resolved that in respect of 4 per cent 2nd, 3rd, 4th. and 5th., Cumulative Preference Shares (Tax free) of the Company, an additional dividend at 1.71 per cent (Gross) subject to deduction of appropriate tax be paid for the year ended 30-9-1959 out of the profits of the Company for the year ended 30-9-1959, payable to those 2nd, 3rd, 4th. and 5th., 4 per cent Preference Shareholders whose names appear as such holder of shares in the Register of Members of the Company as on 19-5-1960";
- To consider and if thought fit to pass with or without modification the following as an ordinary resolution:- "Resolved that this General Meeting of the Shareholders of the Company hereby gives its consent to the Board of Directors of the Company for borrowing moneys for the purposes of the Company even though the moneys to be borrowed together with the moneys already borrowed by the Company (apart from the temporary loans obtained from the Company's Bankers in the ordinary course of business) may exceed the aggregate of the paid up capital of the Company and its free Reserves, that is to say, Reserves not set apart for any specific purpose upto a maximum limit of Rupees two crores (Rs. 2,00,00,000) at any time".
- To consider and if thought fit to pass with or without modification the following as a Special Resolution:- (a) That in Article 10 page 7 lines 9 and 10, the words, "is confirmed holders of the shares", be substituted by the words, "with the sanction of a Special Resolution passed at a separate meeting of the holders of the issued shares".
- In the same Article and on the same page lines 10 to 15 beginning with the words, "and supported issued shares of the class", be deleted.
- That in Article 13 at page 8 for the word, "new" wherever it occurs the word, "further" be substituted and in the same Article in line 4 after the word, "meeting" the words, "by a Special Resolution or with the sanction of the Central Government as provided for in Section 81 of the Act", be added.
- That on page 10 in Article 20 line 4 after the words, "shall be made", add the words, "subject to the rules as may be framed under the Act."
- That on page 15 in Article 50 last but one line, after the words, "sent to the Transferee", add the words, "Transferor or to the person giving intimation of such transfer or transmission as the case may be." And in the same Article and in the same line after the word, "Transfer," add the words, "or transmission." And in the same Article in line 5, after the word, "Transfer", add the words, "or transmission".
- That on page 16 in Article 55 line 3, substitute the figure, "18" by figure, "84". That in the same Article on page 17 in line 8 the words, "one month," be substituted by the words, "three months".
- That on page 19 in Article 67 as amended by a Special Resolution, the words, "eight months" be substituted by the words, "six months."
- That on page 21 in Article 72, line 21, the words, "nature and extent of the interest", be substituted by the words, "the nature of the concern or interest."
- That on page 29 in Article 112 line 7, 8 and 9 the words, "by himself as such Director," be substituted by the words, "and no such Director shall act as a Director of the Company unless he has within 30 days of his appointment signed and filed with the Registrar his consent in writing to act as such Director".
- That on page 30 in Article 116 at the end of the Article substitute, "comma" for "full-stop", and add the words, "provided that not more than two months shall intervene between the last day of the calendar month in which such meeting is held and the date of the next meeting."
- To consider and if thought fit to pass the following with or without modification as an ordinary resolution:- "Resolved that the Company hereby approves of the appointments and consents to the continuance as the case may be of the following as Dealers of the Company for a period not exceeding five years commencing from the dates of such appointments and for the products and the area respectively set out against each subject to any variation that may be made in terms of their appointments

including changes in Areas and Products and subject also to the conditions that the arrangements may be terminated earlier by one month's notice on either side:-

Name of the Agent. Area. Product.

Note:

(The list of all such dealers is being sent to the Shareholders alongwith the Balance Sheet).

By Order of the Board of Directors,
for THE GANESH FLOUR MILLS CO. LTD.,
Sd.- KIRPA NARAIN
Secretary & General Manager.

DELHI,
Dated, 5th May, 1961.

N.B.:-

- The Share transfer books of the Company will remain closed from 27th May, 1961 to 9th June, 1961 both days inclusive;
- Members unable to attend are requested to send their Proxy forms, sent alongwith the notice, duly stamped, signed and completed in favour of a person attending the meeting. Forms not properly signed and/or completed or received less than forty-eight hours before the meeting will be treated as invalid;
- A member entitled to vote is entitled to appoint a proxy to attend and vote instead of himself and that a proxy need not be a member of the Company.

AN INDIAN MARSHALL PLAN?

(Contd from page 1187)

rapid expansion achieved anywhere else in the free world," and amounts to "something very like the 'big push' needed to achieve sustained growth." In agriculture the story has been different. There are no clear and dominant reasons for this failure. Fusion of individual holdings is part of the answer, "but reform has to proceed cautiously, not outstripping the readiness of the majority of the rural voters to follow behind." For the rest, Miss Ward suggests better farming methods combined with irrigation, more intensive agriculture and the development of rural industries.

At the nadir of the foreign exchange crisis many experts considered our plans too ambitious. Those who still think so should also think of China where in 1959 steel output stood at 13 million tons, coal at 365 million tons and electricity at 41 million kilowatt hours. China's national income has doubled in six years; ours has risen 42% in ten. The proportion of our national income devoted to investment has risen from 5 to 11 per cent through two plans and is expected to reach 14% by 1966. China's proportion has already been driven to 20%. Fortunately the peasant does not spend his evenings calculating growth rates with the aid of the slide rule he cannot afford to buy. If progress is tangible and consistent, he is likely to consider it adequate. On this basis, Miss Ward is certainly right in maintaining that "the Indian economy is dynamic—but only just—can afford no slowing down or interruption. Its pace is almost certainly the slowest that still allows for momentum. But it may also be the fastest popular opinion will accept."

To maintain this precarious and minimal momentum £400 million is needed annually in foreign aid. Miss Ward suggests a doubling of this amount within the frame-

(d) A copy of the existing Memorandum and Articles of Association of the Company as well as a copy of the proposed amendments to the Articles of Association of the Company, duly signed by the Chairman for purposes of identification, shall also be available for inspection of members during business hours at the registered office of the Company on all working days from 27-5-1961 to 9-6-1961.

(e) The terms of appointments of dealers as mentioned in item No. 8 above will be open for inspection of the members at the Registered Office of the Company on any working day between 27-5-1961 to 9-6-1961 during office hours.

(f) Explanatory statements as required under Section 173 of the Companies Act is being sent to the Shareholders of the Company alongwith the Balance Sheet by post.

(g) As the dividend warrants for the additional dividend for the year ending 30-9-1959, if approved by the General Meeting, will be issued to members holding 2nd, 3rd, 4th, and 5th. C. P. Shares on 19-5-1960, such holders are requested to send their present address so that the dividend warrants may reach them.

(h) All Share holders of the Company are also requested to send their present address to the Company before the date of the meeting so that dividend warrants for the year ending 30-9-1960 may also reach them at their address.

work of a Marshall Plan for the less developed countries, financed by a one per cent levy on the national incomes of the industrialised nations. The one per cent idea goes back to the financing of UNRRA; it is also reflected in a resolution which India piloted through the last session of the U.N. General Assembly. It would result in contributions of over £2000 million annually of which India's share would be approximately two-fifths. Here, a caution needs to be entered. Even if this total were to be realised we would have to improve greatly our present performance to secure an equitable proportion of the total. We receive less aid per capita than almost any other country; and, even in United Nations programmes, our share is much closer to 15 than 40 per cent.

The assistance, Miss Ward rightly insists, should be organised and purposive. It should be long-term, instead of hand to mouth and in the form of loans at rates as low as 2% repayable over as much as 40 years, so that the spirit of gifts can be preserved within the letter of borrowing. India should be the centre of this effort because "India has the plans, the administrators, the lively entrepreneurs, the general will to develop which ensure that capital assistance will make the maximum impact." An effort on this scale pressed with the determination to render it successful, is the necessity that now confronts the West in moral terms as well as the terms of self-interest. "They have on their hands a far more forceful decision than whether or not to help India. They are, in fact, deciding whether the open society has any future in Asia at all."

This is a provocative book and a wise one. If it is not always reassuring, that is in the nature of its subject. The truth is not meant to comfort man but to arm him.

B. RAJAN.

COMPANY AFFAIRS

HUKAMCHAND MILLS

In spite of several difficulties which the textile industry had to face, particularly in obtaining cotton as also abnormal rise in the price of fuel, mill stores and wages, the Hukamchand Mills Ltd., Indore during the year to December 31, 1960 recorded satisfactory progress. The sales of cloth, yarn and waste increased to Rs. 3.23 crores as against Rs. 2.87 crores during the previous year. In line with the sales the net profit of the Company, after providing Rs. 6.65 lakhs as depreciation, was Rs. 27.71 lakhs. Adjustment was made in respect of the loss carried forward from the previous year to the extent of Rs. 2.14 lakhs. The provision for development reserve was Rs. 1.72 lakhs. A sum of Rs. 20 lakhs has been appropriated to general reserves. The dividend has been recommended to be paid at the rate of Rs. 7.50 per equity share of Rs. 100, subject to deduction of tax which will absorb Rs. 4.53 lakhs.

During the year under review the Company received Rs. 4.95 lakhs as loan from the N.I.D.C. Ltd. out of the sanctioned loan of Rs. 30 lakhs. The Company repaid an amount of Rs. 2 lakhs as first instalment. The second application to the N.I.D.C. Ltd. for another loan of Rs. 40 lakhs has not yet been finalised and the Company has revised its demand and now has reduced it to Rs. 25 lakhs.

The Wage Board Award was given effect from January 1, 1960 and it is estimated that it accounted for a rise of nearly 5 lakhs in the salaries and wage bill of the Company. The trend of cloth prices was, however, rising and the Government of India felt concerned at the same and urged on the Industry to take steps to arrest and reduce the prices in the interest of the consumers. In pursuance thereof the Indian Cotton Mills Federation had advised all the cotton mills in the country to adopt the price stamping during the year on the level of a formula based on the prevailing prices in August 1959. At the close of the year there has been another cut in the said stamped prices imposed by the Federation under advice from the Central Government. The Directors have pointed out that all these restrictions have considerably handicapped the progress of the Company. Representations have been made that the mofussil mills which are not equipped with modern machinery and which have been mainly employed in coarse and lower medium counts had to suffer a great deal in the past few years and therefore, special consideration should have been made for them in obligatory price stamping so as to partially mitigate their hardships. This appears to be a justifiable

demand and the Government should pay attention to it.

DALMIA IRON AND STEEL

During the year to September 30, 1960, Dalmia Iron & Steel Limited increased its capital. Four lakh equity shares of Rs. 10 each of the value of Rs. 40 lakhs were offered at par to the existing holders of Equity Shares in the ratio of 1:1. This fresh issue of Rs. 40 lakhs was fully subscribed, and the subscribed and paid up capital of the Company is Rs. 80 lakhs.

Production operations improved during the year as is evident from this following figures:

	1959 (in tons)	1960 (in tons)
1. Spun Iron Pipes	5,030	13,755
(9 months' production)		
2. Grinding Media	2,319	3,642
3. Alloy Steel Castings	538	815

There has been a marked improvement in the working of spun iron pipe plant. But recently due to the shortage of raw materials and power supply, its production had to be suspended which the directors expect will be resumed shortly. The production in the grinding media plant exceeded the installed capacity during the period under review. The steel casting plant could not achieve the installed capacity of 125 tons due to delay in receiving the Import Licence for two automatic moulding machines which are expected to be installed very shortly.

The Company has been granted an industry licence to expand the present capacity of cast steel grinding media from 3,000 to 6,000 tons per annum. The Company has also applied for an industry licence to increase the present installed capacity for the manufacture of special alloy and heat resisting steel castings from 1,500 to 3,500 tons per annum. The Company is negotiating for technical collaboration and financial participation with the leading spun iron pipe manufacturers in the world in order to achieve the newly licenced capacity of 75,600 tons of spun iron per annum.

The sale proceeds of the Company during the year under review were Rs. 1.30 crores as compared with Rs. 66.14 lakhs for the previous year. Net profit, after providing for depreciation and development rebate reserve, was Rs. 7.52 lakhs. The previous year's loss of Rs. 3.48 lakhs was set off. The Directors had declared an interim dividend of Rs. 1 per share which absorbed Rs. 4 lakhs.

Company Meeting

THE CENTRAL BANK OF INDIA LIMITED

Summary of the Speech delivered by the Chairman, Sir Homi Mody, at the 50th Annual General Meeting of the Shareholders of the Central Bank of India, Ltd., on Friday, the 5th May, 1961.

Sir Homi Mody, Chairman of the Central Bank of India, Ltd., speaking at the Fiftieth Annual General Meeting of the Bank struck a cheerful note when he informed the Shareholders that the net profit of the Bank amounted to Rs. 133 lakhs, the highest in the Bank's history.

At the beginning of his speech, Sir Homi commented briefly on some of the notable events of the year under review.

He said that there was a general upward trend in trade and industry and notable advances were made in West Germany and Japan where production, employment and exports continued to rise resulting in substantial increases in the gold and foreign currency resources of these countries. "In Britain," continued Sir Homi, "there was an abnormal expansion of Bank credit and special measures had to be taken to deal with it, and for the first time Banks were called upon to make special deposits." "In the United States, a recession set in, the extent and duration of which are difficult to estimate. Considerable loss of gold and dollar resources took place and the balance of payments position deteriorated. The situation has since improved and the drain on the reserves has been arrested."

INDUSTRIAL PRODUCTION: SIGNIFICANT INCREASE

Sir Homi said that in India during the first eleven months of the year, industrial production showed a significant increase, and despite shortage of coal, iron and steel production was up, though not to the extent of the target set. The textile industry passed through a difficult phase, owing mainly to a poor cotton crop, non-availability of raw materials at reasonable prices and a heavier wage bill. Sugar production reached a peak level of 2.42 million tons, as a result of the establishment of new factories and the expansion of the crushing capacity of existing units. Sir Homi emphasised that the most encouraging feature of recent economic growth had been the emergence of a more broad-based industrial structure and a steady diversification of the general pattern of development.

The general price level, which Sir Homi considers of vital importance, continued to soar. A relieving feature, however, was the fact that the price level of food articles had not gone out of hand and the upward trend had been arrested temporarily. "In respect of industrial raw materials," Sir Homi Mody stated, "there had been a big jump in prices and consequently the price level of manufactured articles had also moved up substantially." "The extent and seriousness of the damage," Sir Homi said, "may be gauged from the fact that between March 1956 and November 1960 there had been an increase of nearly 28 per cent in the general price index."

THE THIRD PLAN

Touching upon the Third Five-Year Plan, Sir Homi Mody expressed that in spite of all the assurances that public opinion would be fully consulted and given due weight the Plan had finally emerged as it was originally conceived. The total outlay on the Plan was estimated to be of the order of Rs. 11,250 crores. He, however, observed that while the size of the Plan was

equal to that of the first two Plans together, its physical proportions were likely to be smaller because of the inflated prices prevailing and further pressures on the price-level which might be expected.

Discussing the emphasis on rapid industrialisation indicated in the Third Plan, Sir Homi Mody stated that it was certainly open to question whether with our limited resources in materials and technical personnel, it was wise to accord such preponderance to heavy industry in our development plans. "The products of heavy capital industries," he observed "were by their very nature, incapable of absorbing all the additional purchasing power pumped into the economy, and it might legitimately be feared that such a lopsided pattern of outlay might tend to aggravate the general inflationary pressure."

"Amongst the resources for Third Plan," Sir Homi Mody stated, "additional taxation had been given an important place and was expected to provide as much as Rs. 1,650 crores during the five-year period and it would be obvious to all but the Planners that the country was not in a position to bear such a crushing burden and deficit financing to an extent higher than what had been estimated might have to be resorted to." Sir Homi went on to say that by far the most important and crucial source of finance for the Third Plan was foreign aid and the Plan must depend vitally on the availability of a far larger volume of foreign assistance. He was, however, doubtful whether with all the goodwill in the world under the present world conditions, foreign resources of the magnitude required would be made available to us. He felt that even at the best we were mortgaging the future a little too recklessly, and it was possible that the Third Plan might have to be recast drastically.

MONETARY TRENDS

Dealing briefly with the main trends noticed in the monetary and banking fields, Sir Homi Mody said that the money supply with the public had increased during the year by Rs. 217 crores. The Scheduled Banks' advances had shown a steep rise of Rs. 216 crores to reach a record figure of Rs. 1,180 crores, reflecting the unmistakable impact of the growing tempo of economic activity on the banking system.

Sir Homi at this stage pointed out the difficulties that the Bank had to face whilst meeting the heavy demand for finances. While the Bank tried to do all it could to accommodate its old customers, it had to a certain extent also to cater for its new constituents. The Sugar Industry was a case in point which was meeting with considerable difficulty in securing adequate finance to take care of its substantial increase in production. Sir Homi was of the opinion that this problem could be dealt with only by a suitable revision of the policy of the Government. In the meanwhile, he suggested more liberal rediscount facilities on the part of the Reserve Bank of India to provide some relief to the Industry.

With a view to curbing undue expansion of Bank credit, Sir Homi said that the Reserve Bank in addition to the Selective Credit Control measures, had resorted, for the first time, to the more direct device of variable reserve ratios, whereby they impounded and

WANTED

A large Indian public company intends to appoint an assistant to the Managing Director. The appointment carries prospects of eventual promotion to the Board in an executive capacity for a man possessing the requisite qualifications, which include preferably membership of one of the Institutes of Chartered Accountants, experience in modern methods of financial control and management accounting, knowledge of industrial legislation and ability to deal with personnel problems at different levels. There is no fixed scale of remuneration for this appointment but a good salary with commensurate allowances, depending on age and experience, will be paid to the successful applicant.

Reply, stating age and giving full particulars of experience, along with the names of two Referees, to the Advertiser, C/o. Post Box No. 34, New Delhi-1.

immobilised, in two stages, 50 per cent of all additional deposits secured by Scheduled Banks. In addition, ceilings were fixed on the limits upto which individual Banks could borrow from the Reserve Bank, any excess over the ceilings being subjected to penal rates of interest. Banks were also directed not only to enforce a minimum interest rate of 5 per cent on all their advances, but also to step up their average lending rate by $\frac{1}{2}$ per cent. Sir Homi Mody warned that the fact that the general price level continued to rise in spite of these measures adopted by the Central Banking Authority should serve as a timely reminder to the Government that if they wished to maintain price stability, which was an essential pre-requisite for the success of any Plan, they should not fight shy of shedding their doctrinaire attitudes and of adopting a more realistic fiscal and economic policy.

PROFITS: HIGHEST EVER

Dealing with the Balance Sheet and Statement of Accounts, Sir Homi Mody informed the Shareholders that the Bank's working fund at Rs. 225 crores represented a substantial increase of Rs. 32 crores, or 17 per cent, over the 1959 figures. The gross earnings and net income amounted respectively to Rs. 10.78 crores and Rs. 6.44 crores, as compared to Rs. 9 crores and Rs. 5.14 crores in the previous year. The net profit amounted to Rs. 133 lakhs, which is the highest in the Bank's history.

Advances, too, had reached a high level and recorded a jump of Rs. 32.92 crores over the previous year.

The Establishment Charges continued to move up disconcertingly year after year and over the period 1956-60 the increase has been of the order of Rs. 107 lakhs, equivalent to over 41 per cent. He said that during the year under review alone, Establishment Charges went up by Rs. 32 lakhs and that in relation to the gross earnings and net income, they absorbed as high a proportion as 34 per cent and 56.8 per cent respectively. What was particularly a matter of con-

cern was the fact that despite the increase in the strength of the Bank's staff, overtime allowance should have amounted to as much as Rs. 13 lakhs during the year.

"In view of the higher profits that had been made," Sir Homi Mody said, "the Directors have proposed an increase over the dividend paid to Shareholders last year. The interim dividend of Rs. 2.10 per share, subject to tax, already paid for the half-year ended 30th June, together with the final dividend of Rs. 2.50 per share, subject to tax, now recommended for the second half of the year, would make a total dividend of Rs. 4.60 per share, subject to tax, equivalent to Rs. 3.22 net per share. This works out to 12.88 per cent net for the whole year. In addition, it was proposed to give the Shareholders a Jubilee Bonus of 50 nP. per share, subject to tax."

Before concluding his speech, Sir Homi Mody thanked the Vice-Chairman, Mr. C. H. Bhabha, the General Manager, Mr. N. K. Karanjia, and the Deputy Managers, Mr. F. C. Cooper and Mr. V. C. Patel, and the other Officers at the Head Office and Branches and the members of the clerical and subordinate staff throughout the country. He also thanked the Local Advisory Committees at the various centres for the co-operation and guidance they had always extended to the Bank.

Finally, Sir Homi Mody expressed the hope that as the years rolled by, it would be the good fortune of the Bank to serve the interests of the industrial and business community even more efficiently than in the past. He looked forward with confidence to greater and greater efforts on the part of one and all connected with the Bank to enhance the prestige, position and prosperity of the great Institution with which all had the privilege to be associated.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

COMMODITY NEWS AND NOTES

ALL-INDIA FINAL ESTIMATE OF MESTA, 1960-61

The All-India Final Estimate of Mesta, 1960-61 puts the current year's area and production at 694,000 acres and 1,147,000 bales respectively, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. As compared with the partially revised estimates of 704,000 acres and 1,118,000 bales for 1959-60, the estimates for 1960-61 show a decrease of 10,000 acres or 1.4 per cent in area and an increase of 29,000 bales or 2.6 per cent in production.

The decrease in area during the current year has occurred mainly in West Bengal, the most important Mesta growing State. This is attributed generally to unfavourable weather conditions at the time of sowing. This decrease in area has, however, been offset, to some extent, by the increase registered in Andhra Pradesh, Tripura and Bihar. Despite the overall decrease in area, the current year's production of the crop has recorded an increase as compared to last year. The increase in production is accounted for mainly by Bihar and Tripura, and is attributed generally to favourable climatic conditions during the growing period of the crop. Andhra Pradesh, West Bengal and Mysore have, however, reported a decrease in production.

TWO LAKH TONS OF SUGAR RELEASED

The Government of India has decided to release two lakh tons of sugar for the month of May. There will be no release for free sale from the factories in Uttar Pradesh, Bihar and Punjab, except a small quantity which will be released to each factory for sale at the factory gate. Allotments of sugar to Madhya Pradesh, Rajasthan, Uttar Pradesh, Bihar, West Bengal, Orissa, Madras, Kerala, Maharashtra, Gujarat, Himachal Pradesh, Assam, Manipur and Tripura from factories in the controlled region will be made only to the nominees of the State Governments. In the case of Punjab and Jammu and Kashmir, allotments will be made direct to the State Governments or to their nominees. Allotments to Delhi will continue to be made on the existing basis. Allotments will be made at prices fixed under Notification No. GSR 1112/Ess. Com/Sugar dated September 15, 1960 and GSR 1/Ess. Com/Sugar dated January 2, 1961. The controlled ex-factory price for U.P. and North Bihar factories is Rs. 37.85 per maund and for factories in Punjab and South Bihar Rs. 38.35 per maund for ISS D-29 grade with the prescribed price differentials for other grades. The fixed f.o.r., destination prices in respect of allotments made to Kanpur and Calcutta will be Rs. 38.60 and Rs. 39.85 per maund respectively for sugar of ISS D-29 grade.

PRODUCTION OF CRUDE FROM ANKLESHWAR OILFIELD

The Oil and Natural Gas Commission proposed to start trial production of crude oil at the rate of approximately 1500 tons per day from Ankleshwar oilfields only towards the end of 1961, stated Mr K. D. Malaviya, Union Minister for Mines & Oil, in a written reply to a question by Mr T. B. Vittal Rao, in the Lok Sabha. Pending the establishment of a refinery in Gujarat, added the Minister, it was proposed to transport this crude to the Bombay refineries. The negotiations between the Oil & Natural Gas Commission and the private sector refineries in this connection were in progress. The possibility of utilising Cambay crude by the industries in Ahmedabad and Baroda as fuel was also being considered.

PRODUCTION OF SPECIAL ALLOY STEEL

A number of applications, including those from major producers, for setting up units for the manufacture of special alloy steels, were under consideration and a decision in the matter was likely to be taken shortly. Capacity already existing or licensed in the country for steels with a minimum of chromium, nickel, molybdenum and other alloying elements which required specialist plant, was about 10,000 tons. It was estimated that the requirements would be about 200,000 tons per year by the end of the Third Plan. As it took some time for production to come up to capacity, it was proposed to license capacity necessary to produce initially 200,000 tons a year. The central alloy steels plant will contribute about 50,000 tons and the ordnance factories would make available another about 35,000 tons.

PRICES OF ETHYL ALCOHOL FIXED

The Government of India have issued an order fixing the maximum ex-distillery prices of Ethyl Alcohol (Industrial Alcohol). Under the Ethyl Alcohol (Price Control) Order which takes effect immediately, for absolute alcohol conforming to the ISI specification, naked and of 100 per cent V/V strength, the ex-distillery price will be 20 nP. per litre. For rectified spirit conforming to ISI specification, naked and at 100 per cent V/V strength, the ex-distillery price will be 19 nP. per litre. The order also provides that additionally a maximum of 8 nP. per litre may be charged based on the actual average costs of transport of molasses to the distillery during the previous year. Where the alcohol is supplied after denaturation, the cost in this respect may also be added.

Personalised

SERVICE

With specialised knowledge acquired through long experience, the Punjab National Bank is in a unique position to-day to be of positive help in providing PERSONALISED SERVICE.

EVERY DESCRIPTION OF BANKING BUSINESS IS UNDERTAKEN.

THE PUNJAB NATIONAL BANK LTD.

New power in industry

On a 600-acre site at Durgapur, amidst intense activity, the scene is being set for yet another vitally important contribution to India's industrial growth—a contribution made possible through the vast technical knowledge of ACC-VICKERS-BABCOCK LTD. (A.V.B.), a new and powerful industrial group formed by The Associated Cement Companies Limited, Vickers Limited and Babcock & Wilcox Limited.

Already, considerable progress has been made in erecting this new Industrial Plant. Workshops are rapidly taking shape and foundations are being prepared for some of the most up-to-date machinery in the world. Very soon now the A.V.B. Plant will be ready to make its contribution to Indian industry, and to help Indian engineers overcome some of the difficulties which have faced them for so long.

MODERN EQUIPMENT

Some of the most up-to-date industrial equipment of its kind in the world is being installed in the new A.V.B. Plant, from the radio-active cobalt X-ray equipment capable of X-raying steel plates up to a thickness of 6" to the vast 3,000-ton hydraulic press, the largest in Asia, designed to bend steel plates of up to 5" thickness. The workshops of A.V.B. are thus fully equipped to manufacture machinery for the cement-making and mining industries, thermal power plant and industrial steam-raising equipment equal to the best in the world.

VITAL ROLES

THERMAL POWER: A.V.B. have the technical knowledge, the men and the machinery to participate in the supply of vital plant to be installed in Thermal Power Stations throughout India. They will make a notable contribution towards the target set by the Government for erecting boiler plant and thermal power plant

to the value of Rs 34 crores per year by the end of the Third Five Year Plan.

CEMENT-MAKING MACHINERY: A.V.B. are already discussing projects which will enable them to supply machinery to help increase the output of cement for which the Government's target is 13 million tons per year at the end of the Third Five Year Plan. Not only will A.V.B. help to meet the exigencies of industrial expansion but they will ultimately contribute towards the earning of valuable foreign exchange through export.

SITE STRATEGICALLY LOCATED

A.V.B. have shown considerable foresight in the location of Durgapur as their base for operation. Close to the now well-known Durgapur Steel Project, they are within what is fast developing into the industrial heart of India. They are within easy reach of India's coal and general mining centres. The Port of Calcutta is only a hundred miles away, a factor which is of tremendous advantage for the import of special raw materials.

EFFICIENT STAFF

The new company has adopted a far-sighted policy regarding the housing of the staff at Durgapur. Resulting from this the AVB housing colony which is situated but a short distance from the factory site is one of the finest in India. The houses are modern and the colony itself will be completely self-contained with its own dispensary and its own shops, parks and playgrounds. Here will live the workers of the A.V.B. group from the man of the shop floor to the skilled engineers and advanced technicians, a team that will keep a close watch on this modern plant which will harness such a vital and powerful new force to Indian industry.

...a Powerful Partnership for Progress

ACC-VICKERS-BABCOCK LTD. 16, Queen's Road Estate, Bombay 1

CALCUTTA OFFICE: Ilaco House, 1 & 3 Brabourne Road, CALCUTTA 1 • WORKS: Durgapur, West BENGAL

27 factories

Twentyseven Factories in twentyseven Countries. Twentyseven Productive enterprises in which experience is gained. Twentyseven observation posts that watch each technical advance, investigate, develop and apply the same.

The fruit of all this immense amount of knowledge and experience is contained in just a small piece of carbon paper, in just one inked ribbon, and in that sheet of Stencil Paper, all products of the House of Kores.

If you buy equipment that is going to cost you a great deal of money, then the knowledge that you are buying from a firm with a world-wide reputation gives you that very comfortable feeling of safety. For just the same reason, it is preferable to choose "KORES" when you need Carbon Paper, Ribbons and Stencils.

In this way, you will preserve and add to the distinction of your organization by sending out letters that are clear and legible and which leave behind them as a fitting memorial copies which are clean and clear.

On behalf of twentysix Kores Companies.

KORES (INDIA) PRIVATE LTD.

For your Kores-pondence

Women's Education: Plus and Minus

MRS. Durgabai Deshmukh, delivering her presidential address at the recent session of the National Council for Women's Education, raised at the outset the grievance that a ruthless cut was being made in the allocation of outlay in the Third Plan on special schemes for the expansion of girls' education and training of women teachers. An attempt to do this in itself amounts to an unkind cut at the Government and the Planning Commission, which are doing their very best to remove the backlog in women's education as fast as the available resources, particularly in terms of finances and teachers, can allow.

A leap forward is being taken in the matter of women's education, if due allowance is made for the fact that paucity of resources in men and money has made it imperative on the Government and the Planning Commission to apply the axe, however reluctantly, to certain schemes of social welfare which have been admittedly slowed down in the first two plans. In the Second Plan, the original allocation for expenditure on the special schemes for girls' education and provision of an expanding base of women teachers was Rs. 7 crores, including allocations from the Centre and the States. For reasons which it is not necessary here to analyse, there was a serious failure on the part of the State Governments to perform their part in the matter of provision of funds. But totally disregarding the vital principle of extending assistance to the States on condition of matching resources of a modest size being raised by the States themselves, the Centre made liberal grants for these special schemes, so that a substantial part of the target was realized in fact. The attitude of the States deserves some attention, when the Centre and the Planning Commission are being made the targets of criticism for lack of full interest and sympathy for the cause of giving a pronounced acceleration to the spread of women's education. Relying on the experience of the Second Plan, the State Governments did not show any enthusiasm in making any contribution to the outlay on the special schemes for women's education. But at a later stage when they received a firm indication from the Centre that it was not going to bear the entire brunt in this matter, the States awoke to the necessity of their responsibility and showed

their readiness to provide finances for this programme.

The cause of women's education has continued to receive special attention since planning was undertaken. The extraordinary difficulties created by a legacy of social prejudices against women's education has made the magnitude of this task in physical terms very high. It is particularly in the rural areas that girls' education presents a tremendous problem. To get a sufficient number of girls to attend schools even up to the age of 11 years, which is the limit for the primary stage, is in itself a tough problem. To spread secondary education in the countryside in the case of girls is a matter as much of resources as of fighting social prejudices. Even so, finances are being provided with tangible results. In the Third Plan the percentage of boys in the age group 6-11 attending primary schools will be raised by 21 per cent to 100 per cent. In the case of girls it will be raised from 60 per cent to 80 per cent or an increase of 20 per cent. It is thus clear that allocation of funds for expansion of primary education scrupulously aims at maintaining parity in the rate of growth in the case of boys' education as well as girls' education. Who can say that a fair deal is not being meted out to the fair sex?

The point raised by Mrs. Durgabai Deshmukh would appear to be trivial. Originally when the outlay for education was estimated at Rs. 980 crores in the Third Plan, the special programmes for expansion of girls' education and training of women teachers were allotted Rs. 95 crores. This was only an estimate of the requirements of education conceived in isolation, which few believed to be feasible, when an integrated picture of the entire Plan would come to be drawn up. Actually, things happened this way. The outlay for education as a whole was brought down to Rs. 370 crores in which Rs. 17 crores were made available to programmes for special schemes in the case of girls' education. This allocation had to be revised and readjusted in the light of the priority and urgent demands for specified types of education. It is crystal clear that the exigencies created by limited resources and urgent preference for laying a sound base for industrial expansion dictate a deliberate preference to technical education. It was because of this

urgency that the overall provision for outlay on education was raised to Rs. 400 crores and in the process of making adequate allocations to priority programmes, the funds earmarked for expenditure on special programmes for girls' education were fixed at Rs. 11 crores in place of the earlier tentative estimate of Rs. 17 crores.

It is about this pruning of Rs. 6 crores that the President of the National Council for Women's Education has made so much ado. Her argument that at this rate it may take a full century for establishing parity between boys and girls in the matter of education at all stages may at best be taken as an outburst of sentimental resentment. Once a solid base of a satisfactory rate of growth in national income is created by expanding agriculture and industry, all the segments of the economy will expand on the principle of accelerated growth. Even those who are putting women's education above everything else need not despair of this country having to wait for a century for parity between males and females in education.

Mrs. Durgabai Deshmukh has raised the contention that the principle of proportionate reduction ought to have been accepted in revising downwards the allocations to different programmes of expenditure. She overlooks the fact that even as between the programmes of high priority there are wide disparities of importance and the principle of proportionate retrenchment is inapplicable. The fact that higher overall allocation for education was made on revised considerations is indicative of the compulsion of rectifying the mistakes in the earlier estimates of the requirements of priority programmes like technical education. It does not mean that more funds

can be made available for proportionate extra distribution to different programmes.

Dr. Shrimali made a very balanced assessment of the criteria which impelled the Government and the Planning Commission to make the allocations in the manner in which they have been made. He stressed the urgency of expansion of education not merely for social development but also for economic advance—a dictum which applied as much to women's education as to men's education. There has been no lapse on the part of the Government to render the maximum possible assistance within its resources to women's education; but, in the final analysis, it is difficult to escape the harsh limitations imposed by basic financial resources. In the case of women's education he appropriately laid stress on launching a determined campaign to remove deep-seated social prejudices to create a climate in which funds can be put to effective use in educating larger numbers of women. In the special programme for women's education top priority must be assigned to building up expanding cadres of trained women teachers because there is at present an acute shortage in this category.

Mere comparisons between percentages of boys and girls receiving education and an obsession with establishing parity between the two indicates a distorted view of this problem. In any event, the quality of education cannot be sacrificed in the pursuit of quantitative expansion. The National Council for Women's Education would be well advised to address itself to the task of preparing the necessary social background at a time when funds for opening more schools are insufficient instead of raising petty controversies over allotments in the Third Plan.

A Fair Deal for Shipping

MR. MORARJI DESAI'S dialogue with the Indian shipowners has revealed that the position has not improved in any mentionable degree since the Draft of the Third Five-Year Plan was released and that the major pressing requirements of the shipping industry remain unsatisfied. There is no room for pessimism at the present moment that the industry's demands will be cold shouldered, but some redress may be expected as the position is still indeterminate. The time has not yet arrived to take firm and positive decisions on outstanding issues, such as allocation of additional foreign exchange and grant of relief in income-tax.

The expansion of Indian shipping has been proceeding at a tardy pace chiefly because of the shortage of financial resources, which, in this context, mean foreign exchange resources. Fourteen years after the Shipping Policy Sub-Committee made out a very reasonably argued case for developing Indian shipping so as to enable it to capture at least 50 per cent of the overseas trades in less than a decade, the share of Indian shipping in these trades has not exceeded 9 per cent. Of course, percentage comparisons, particularly in this case, are not altogether appropriate inasmuch as the volume of sea-borne trade which has now grown so enormously could not be envisaged in 1947. Nevertheless, it is an indisputable fact that the gap between the target and its achievement is very big. The Plan conceived by the National Shipping Board, whose authoritative assessment ought to be accepted by the Government, con-

templates the allocation of the Indian tonnage at the end of the Third Plan roughly in the ratios of 2:1 for the overseas trades and the coastal trades on the assumption that the total tonnage will be 14.2 lakh tons.

But the target is pitched much lower in the Draft Third Plan at 11 lakh tons, of course, tentatively. This is because of the limitations of foreign exchange resources in respect of which the position continues to be fluid. The Draft has provided only Rs. 55 crores plus Rs. 4 crores from the Shipping Development Fund as against Rs. 118 crores from the Exchequer and the shipping companies as suggested by the National Shipping Board. There is a frank official admission of the gross inadequacy of allocation for shipping, but along with it there is the commitment that it will be revised. The overall outlay on transport has been stepped up marginally by Rs. 25 crores. These are rupee funds which are of little help to shipping and precisely for this reason the allocation for shipping remains what it was in the Draft. At last week's annual session of the Indian Steamship Owners' Association, Mr. Morarji Desai could do no more than to say that this issue would be borne in mind. At the present time India is spending as large a sum as Rs. 130 crores per annum by way of foreign exchange expenditure on shipping freight and the smaller the programme for the expansion of shipping the more onerous will be this liability because of the rapidly increasing volume of external trade which is implicit in the Plan. It would be a deplorable

policy to grudge foreign exchange for the acquisition of additional tonnage, while foreign exchange continues to be spent increasingly on foreign shipping freight.

The shipping industry has been caught in a very tight corner because of the prolonged depression in the freight market and all Indian companies, including the premier ones, have to eke out their existence with great hardship. Against this background, the demand of the shipping industry for economic freight rates to be paid by the Government for transporting food from America in Indian bottoms is quite reasonable. But surprisingly enough, Mr. Morarji Desai turned it down on the plea that India pays American shipping only at the prevailing global freight rates and the excess is paid by America. Here is a clear instance of how an advanced maritime country gives an operating subsidy to its national shipping. There is every reason why this imaginative policy should be followed by the Government of India. In no country has shipping grown and flourished by its internal competitive strength. This strength has

Guest Editorial

Another Year of Crises

By WILLIAM REES-MOGG

THIS year has started badly with two crises—Cuba and Algeria—which might reasonably have been avoided and with a third crisis, Laos, which is proving very intractable. Already one can see that two more international crises are being brewed, one in Iran and the other, the recurrent crisis of Berlin. Both are potentially very serious, and either could have been a cause of war in the pre-nuclear era.

The situation in Iran is that the existing Government broke down and has had to be replaced by the Shah. The story is one familiar in relatively backward and feudal countries. The feudal lords have failed to adapt their system to the pressures of the twentieth century. Great wealth is wasted; in the case of Persia, enormous oil resources have failed to provide economic stability. There is growing unrest in the towns. The Shah himself has the intention of reforming these abuses, but reforms are very difficult to carry through. The result is an extremely unstable political situation which, like that of Czarist Russia, sometimes looks less critical but never really hopeful. Not surprisingly, in his interview with Walter Lippmann, Mr. Khrushchev referred to Iran as a country in which a revolution might be imminent. His information services are no doubt thorough.

Obviously, it is impossible to predict for certain whether there is going, in fact, to be a revolution, and if so, what course it will follow. Potentially it must, however, be a threat to the international oil interests in Persia, of which Britain has the largest share. Even if Persian oil was cut off, there would be no world shortage (there would merely be a reduction in the world surplus). As in 1951, however, the Persian situation must be looked upon with doubts.

There is also a strong probability that the Berlin crisis will again reach an acute stage sometime in the course of this year. Russian diplomats make out that Berlin is the real problem that has to be solved and there is again talk of a separate Russian peace treaty with East Germany. There is no doubt that the Berlin situation has become an acute embarrassment to the

to be created by external assistance from the State. Considering the small share of Indian shipping in the transport of foodgrains from America, the burden of paying economic freight rates would be modest.

The shipping industry has certain grievances relating to taxation, particularly those relating to the development rebate reserve, whose compulsory earmarking from the very start detracts substantially from the relief provided by the rebate at the liberal rate of 40 per cent. There is also another reasonable plea that the sale-proceeds of ships and insurance amounts realised by the shipping companies should be exempt from income-tax wherever these funds are used specifically for reinvestment in the expansion of tonnage. The Finance Minister has referred the industry to the Select Committee on the Income-tax Bill and constitutionally he is right in not forestalling its recommendations. It is to be trusted that the Select Committee will consider these straightforward demands with a liberal attitude they merit.

Russians. East and West Germany provide the one direct comparison between Communism and the West in Europe. The steady flow of refugees from East Germany has denuded the country of skilled labour and of young people, and has been the clearest possible evidence that given a choice people choose not to live under Communism. This steady drain of prestige is probably the main reason for the concern that is felt over Berlin, for so long as Berlin is open there is no way of closing off East Germany. In any case, the German contrast must in itself be intolerable to the Russians. West Germany's spectacularly successful economy certainly disgraces East Germany's poor performance.

It also supports the theory that freedom of choice is a much larger economic advantage than appears on the paper. What matters is not the level of total production, but that production should correspond to what people want. In providing basic needs of food and shelter, what people want can be predicted simply enough—they want to be fed. Once that stage has been passed the problem of consumer choice becomes vital, for if an economy fails to satisfy people's wants, it fails to do everything.

The extraordinary thing is, however, that the world can be faced with the possibility or probability of two major international crises without anyone being really alarmed. The truth is that we all accept nowadays the immense strength of what might be termed the nuclear assumption, that is, the assumption that no country with nuclear weapons can afford to start a major war. This is enforced peacefully, even if it is not peaceful co-existence.

One cannot be equally sure that the economy of the world will not be affected. Each crisis does have some further inflationary impact. It makes real disarmament less likely and makes people more inclined to hold stocks. On the other hand, the jerking of confidence can do no good to investment. Another year of crises will be psychologically unpleasant and economically disadvantageous as well.

THE WEEK'S NOTES

Laos

GETTING OFF TO A START

THE INITIAL hurdles, which were by no means easy, have been crossed and the 14-nation International Conference on Laos got off to a start at Geneva on May 16. The main impediment to the start of the conference was the representation for Laos. In view of the firm positions taken up by America and Russia on the lawful Government of Laos, the problem presented real and serious difficulties. Nevertheless, a compromise has been found by inviting "the representatives of Laos", meaning thereby Prince Boun Oum's Government, Prince Souvanna Phouma's Party and the Pathet Lao. As an integral part of this arrangement the agenda at Geneva is to be strictly confined to the international aspects of the Laos problem, keeping the settlement of internal issues studiously out of the discussions at Geneva. These two points resolved the difficulty arising out of the recognition of the Government in Laos.

At last Tuesday's opening session, Lord Home presented a four-point plan, the essence of which is to establish neutrality in Laos and to give a reality to it by setting up an international machinery for control of delivery of arms into Laos and for channelling economic aid to that country. The conference was boycotted by Prince Boun Oum, but America attended it obviously to test Mr. Khrushchev's statement that he believed in the Austrian type of neutrality for Laos. Meantime, at Ban Na Mon the delegates of the three groups in Laos announced the agreement on the internal problem. But the nature of this agreement is significant. The first problem to be discussed, as agreed, is that of forming a coalition government and next would follow the issue of cessation of hostilities and, finally, defining the duties of the International Supervisory and Control Commission and cognate problems. The seeds of trouble in the immediate future are to be found in this order of priorities because any coalition would mean the inclusion of the Pathet Lao. International diplomacy will have a still tougher test here.

The Akali Dal

AFTER THE BREAKDOWN OF THE TALKS

THE TALKS between the Prime Minister and Sant Fateh Singh held on May 12 broke down in a matter of a few hours. Little information is available about the reasons which led to the precipitate breakdown. What exactly the Akali Dal expected the Prime Minister to concede, is difficult to comprehend. Early in January this year the prolonged talks which Master Tara Singh had with the Prime Minister made one thing clear beyond doubt. It is that the Prime Minister regards the Punjab as actually a unilingual State in existence and he is prepared to give full support to elevating the status of the Punjabi language in this problem State. But he has no illusions whatsoever that the demand for the Punjabi Suba is, in essence, not a demand for a unilingual State, but a demand for a Sikh State. As such, he is not prepared to countenance it. This attitude does not indicate any rigidity on the part of the Prime Minister, for he has made consistent appeals not to mix up the communal issue with the problem of the Punjabi language. In view of this clear and rational position

taken up by the Prime Minister, it was hardly to be expected that the Punjabi Suba of the type conceived by the Akali Dal would be acceptable to the Government. On the other hand, Master Tara Singh is not prepared to compromise on the question of a separate Punjabi Suba. To outward appearances, therefore, there is not much room for conciliation. The situation has been complicated by the avowed support which the Praja Socialist Party and the Communist Party have given to the demand for the creation of the Punjabi Suba.

The failure of last Friday's talks has relegated Sant Fateh Singh from the foremost position of a negotiator on behalf of the Akali Dal and Master Tara Singh emerges as the leader in the vanguard which he normally has been. He has consolidated his position and reasserted his personal influence on the Dal after it had received a temporary setback owing to the demoralization and frustration caused in the Akali ranks as a result of the Akali Morcha and Sant Fateh Singh's fast having led them nowhere. Now after the failure of the talks Master Tara Singh has reiterated his determination to continue the agitation for the Punjabi Suba and he has explained that he is going to make it an issue at the forthcoming general elections. As we go to Press, the Working Committee of the Shiromani Akali Dal has not met, but it may be that not much will be disclosed about the next positive move which the Working Committee decides to take. Two alternatives which seem to threaten the Punjab are a fast by Sant Fateh Singh, and also probably by Master Tara Singh, and revival of the Akali agitation.

This is a prospect by which neither party stands to gain and all that will happen is to embitter the feelings between the two communities in the Punjab. The movements of the Akali Dal disclose that it apprehends a sudden and swift anticipatory action by the Punjab Government to deal with the agitation. But neither precautionary measures to forestall the agitation nor the fast are going to solve the problem. It is vitally necessary that the good offices of influential mediators should be obtained for rapprochement.

Trade Unionism

REPORT TO THE ILO

THE REPORT prepared by Mr David Morse, Director-General of the International Labour Organisation, for submission at its forthcoming annual conference, makes a comprehensive survey of recent trends in the development of trade unionism separately in the industrialised and underdeveloped countries. Many of Mr Morse's findings in respect of the spread of trade unionism in the underdeveloped countries are highly instructive, although it may appear that some of them have a familiar ring. The Director-General has emphasised the vital part played by "outsiders" in the organisation and growth of trade unionism in economically backward countries. These outsiders, as is the common experience in Asia, are drawn from intellectuals, politicians, lawyers, etc. In this list, rather curiously, inclusion can be claimed in India by medical practitioners, too. These outsiders have become indispensable and this is also the consensus of opinion in this country. All the three parties, the government, employers and employees, agree that to exclude them in impatient haste would be to place the movement in the hands of irresponsible persons (controlling it from

outside), who cannot be brought within the discipline of the bipartite or tripartite machinery. Until the training of workers in sound trade unionism reaches a high level, the elimination of outsiders will be premature and a loss to good labour relations. While this is true, Mr. Morse is equally emphatic in stressing some pernicious influence exercised by the dominance of outsiders. Many of them are motivated by political ambitions or ideologies and it is an undoubted fact that inter-union rivalry from the base to the apex, which has become so rampant in underdeveloped countries, is directly attributable to the personal or political ambitions of this element. These observations will come home to many of the Asian countries, India not excluded.

Trade unionism has so far covered a small area of the industrial sector of the economically backward countries and the size of the unions, their limited membership and finances make them weak organisations for labour. If this finding is taken into account with the weight it deserves, it is difficult to reconcile with it the Director General's strongly argued plea that the process of collective bargaining which, in the ordinary course, will take a long time in the underdeveloped countries, should be hastened by all possible means. There is a limit to the speed with which programmes of education and training of workers can be pushed. Nevertheless, two observations made by the Director-General are very important: He has pointed out that a proper understanding of the human and social problems of work would be conducive to an enlightened appreciation of the role of trade unionism on the part of employers and, in so far as its organisers are concerned, the fundamental fact which need to be imbibed is that trade unionism cannot be divorced from the social and economic traits of the community as also from its past traditions.

Assam

THE DARKENING SHADOW

REPORTS EMANATING from the Cachar district and other hill districts of Assam hardly leave any doubt that the language issue with which peace and stability are interwoven in this frontier State, cannot be taken as settled after the exacting efforts at bringing about a compromise last year. General Srinagesh, the Governor of Assam, was here last weekend for discussions with the Prime Minister and the Home Minister on the likely resurgence of the threat to law and order particularly in the Cachar and hill districts. Independently of this official assessment, the Prime Minister has been apprised of the situation by Congress leaders. The memories of the ghastly language riots have not yet faded out and particularly in the areas, where Assamese is not the language of the majority, the fear that agitation may be rekindled is reasonable.

The Official Language Act was made acceptable to be linguistic minorities on the basis of a compromise to which they did not subscribe without reservations. The late Pandit Govind Ballabh Pant's strenuous personal mediation had succeeded in winning consent to the compromise whereby Bengali was conferred the status of the official language at the district level in Cachar, but not higher. There are now signs that dissatisfaction with this formula will make itself manifest in the demand by the Bengali speaking majority population of Cachar and the tribals in the hill districts and pressure will be exerted to concede to Bengali a higher status than that of the official language in the Cachar district—the status of the second recognised language in the State. If statesmanship and tolerance fail to exhibit themselves before it is too late, it is anybody's guess when disturbances involving a challenge to law

and order may rear their head. The status of Assamese will in no way suffer if the substantial linguistic minority demand to give higher recognition to Bengali is conceded. There is an earnest feeling that now is the time to make the necessary change, because the apprehensions are that, if it is postponed until after the general elections, the return of the rigid element in the linguistic majority, showing an illiberal attitude, may make the passage of the reform difficult.

Indian Muslims

THE PROPOSED CONVENTION

IN THE light of the unfortunate and tragic occurrences at Jabalpur and other cities in Madhya Pradesh, to question the propriety of the calling of the Muslim Convention would be to create apprehensions in the minds of the minorities that attempts are made to keep them inarticulate. The members of the minority communities have the freedom of association and expression like any other citizens and it is proper that they should take counsel together. The events leading up to the sending of the invitations to attend the Convention already show a happy change in the attitude of the sponsors. The move seems to have emanated from three organisations, namely, the Jamiat Ul Ulema-e-Hind, Jamiat Islami and the Kerala Muslim League. The Jamiat Islami's proposal of confining the invitations to real Muslims who believe in the true spirit of Islam was scotched at the very start by the Jamiat Ul Ulema-e-Hind. It is a happy augury that finally no such complexion was given to the Convention and the invitations were sent by the sponsors in their individual capacities. Among the 260 or so delegates who are being invited to the Convention, scheduled to start in New Delhi on June 11 next, are members belonging to other minority communities. This composition of the invitations would give the Convention a broader base than originally contemplated.

India is straining every nerve to establish a fully secular State and the Government can point to its credit that members of the minority communities, in particular those of the Muslim community, have been appointed to responsible positions, like those of Ministers in the various Cabinets, Governors, Judges of the High Courts and the Supreme Court, Ambassadors and so on. They also find an honoured place in other spheres of the nation's life. But the resurgence of communalism, as exemplified in Madhya Pradesh, may raise apprehensions about the security of life and property of the minority communities. This is one issue which will be taken up for consideration at the Convention. The National Integration Committee of the A.I.C.C., presided over by Mrs. Indira Gandhi, has reportedly come to the conclusion that full confidence about the security of life and property is the first condition of the integration of the minorities in national life. The Committee might very well benefit from the deliberations and recommendations of the Convention.

Nevertheless, it goes without saying that the minority communities of whatever description will be causing a serious harm to their natural and healthy growth if they rely upon the crutches of concessions. The Convention, it is said, is going to discuss the scope of employment and other economic opportunities that are actually available to them. Here it ought to be stressed that there is equality of opportunity for all citizens and the minority communities would be promoting the cause of their members if they align themselves with secular political parties which eschew communalism and base their programmes on economic creeds. It is primarily in this way that they will find integration without mental reservations easy of achievement.

The World Abroad

THE BRITISH LION TWISTS ITS OWN TAIL

By

ODYSSEUS

LOOKING BACK at this column over the years, I suppose that, with my periodical strictures of the nonsenses of the welfare state and nationalisation, I must have contributed something to strengthen the widely held view of the post-war UK as economically a decadent state. The truth — as always — is not so simple a black and white as that. I take the occasion of the appearance of a useful little book, "British Industry: Change and Development in the 20th Century" (Hutchinson. London. 1961. 232 pp, 30sh.) by J. H. Dunning and C. J. Thomas, of the University of Southampton, to try to sketch in some of the qualifications. I do not take back the criticisms that I have previously made of the tremendous burden that Welfarism and Nationalisation, with the killing taxation that they necessitate, have imposed on the UK's economy. But Dunning and Thomas's book does bring out how truly remarkable has been the UK's post-war effort and, indeed, industrial renaissance. One cannot help surmising that without this burden, she would have had export surpluses on the German scale, and with the City of London's natural bent towards overseas investment, some of the developing countries would be substantially further along their road. There is, however, new hope in the evolution of UK public opinion on policy towards lower tariffs and revision of the tax system that has been gathering impetus since Peter Thorneycroft's Chancellorship in 1957.

It is indisputable that in the inter-war years, the UK economy was languishing. Why was this? It was largely, I think, due to the inheritance of her own economic history. The UK pioneered the industrial revolution. When we think of industry, we are apt to conjure up pictures of vast enterprises like General Motors, Imperial Chemicals, or Tatas. But remember that the revolution in the UK was the cumulative work of innumerable small men, starting small, new, local enterprises. In the UK, it came first in the woollen, cotton, and silk textile industries, iron and steel, and shipbuilding, based on coal power. These industries were among the first to be exported and established in many overseas centres. In 1907, 88.9 per cent of the UK cotton industry's total output was exported, and over half of this went to Far Eastern markets. However, with growing competition from India and Japan, the UK's Far Eastern exports fell by 38 per cent between 1913-1925. India slashed her imports from the UK by 57 per cent.

The same story is roughly true of wool in these and other markets. The growth of iron and steel industries in Europe and the USA, and elsewhere, took heavy toll of the UK's export markets. The slump in the UK's coal exports from 87 million in 1913 to 48 million tons in 1929 was caused by the opening of mines in foreign countries, by greater efficiency in utilisation, by the appearance of oil as a substitute, and by the virtual disappearance of the coal-fired ship from the seas.

INTER-WAR DEVELOPMENTS

Inter-war Britain was slow to react to these challenges. Small enterprises, so many of them proud

family firms with long traditions of individual enterprise behind them, were loath to sink their identities in amalgamations. Just as striking was the UK's failure to grasp the opportunities offered by the growing world trade in newer industrial commodities. In 1929, of the total manufactured exports of the UK, the USA, and Germany, those in which world trade had expanded by more than 150 per cent since 1913 accounted for 28.6 per cent of U.S. exports, but only 4.5 per cent of German exports and 4.3 per cent of UK exports. On the other hand, those manufactures which had expanded by less than 75 per cent in world trade accounted for 17.1 per cent of US exports, but for no less than 42.1 per cent of UK exports. These figures show clearly the UK's declining role as a leading exporter of manufactures, her failure to forsake her old established lines, and to launch out on new ventures.

Part of the UK's difficulties was due to the belief that the depression was a passing phenomenon and to the failure to realise that the decrease in exports also reflected a long term shift in tastes.

On the other hand, it would be wrong to imply that there were no important technological advances in the UK in the inter-war period. The war and its aftermath gave impetus to many new developments, in wireless and telecommunications, ship propulsion, automatic welding and hull design, new stainless steel, and chemicals, and the expansion of the motor industry (although, in the last, the reluctance to limit the range of models and to amalgamate were handicaps). Notable increases in the production of electrical equipment were also recorded, although less than in the USA and Germany. The UK was slow to adopt electrical power because of the relative cheapness of coal power, the reluctance of staple trades to switch, and the multiplicity of small generating plants, each with their own frequencies and voltages.

The UK recovered slowly following the devaluation of sterling, the lowering of the rate of interest, and growing recourse to rationalisation. Although Dunning and Thomas do insert some qualifications, they also give credit to the UK's abandonment of free trade and adoption of protection, and to the Ottawa Agreements and Imperial Preference. I find this hard to accept. If the UK has staged a sizeable come-back after World War II, its magnitude has been limited by her relatively high tariffs and by keeping so much of her trade canalised towards old established, and mostly English-speaking, markets. This has undermined the competitive spirit, made it more difficult to quit established grooves and set ways, and helped to keep alive the comfortable belief that everyone the world over can read an English catalogue and is ready to write letters in English. Fortunately, the erosion of Imperial Preference by inflation is steadily correcting this.

THE SPIRIT OF THE NATION

World War II proved a blessing in disguise for UK industry. In the first place, the challenge to sur-

vival aroused the spirit of the nation as nothing else could have. Secondly, it dispelled the comfortable habit of thinking that the UK led the world industrially and foreigners would always prefer British "quality". As the war drew to its close, the whole nation realised that the UK's industrial future was uncertain, and that a real effort would be needed. War had shocked the nation out of its complacency, but had not undermined the Englishman's determination to continue to play a major role in world affairs. The national effort in the war itself, and in the post-war defence programme, gave tremendous impetus to readiness to launch out in new techniques.

In no period have circumstances been so conducive to change and technological progress as during 1939-59. The whole balance of industrial power has been shifted within the UK and the relations between individual trades revolutionised. The war accustomed companies to work together and made amalgamations easier. Of the developments, none has been more far-reaching than the emergence of the oil-refining and nuclear power industries, in which over £1,000 million were invested between 1945-59. Only second in importance have been the changes wrought by the discovery of many new industrial raw materials, the rapid innovations of the aircraft, electronics, and chemical industries, and the amalgamations and tremendous expansion of the motor car industry. Steel output has risen by 55 per cent since 1938. Shipbuilding has been modernised and has enjoyed prosperity for most of the post-war period, largely because of the expansion of the oil-refining industry. Only textiles have declined continuously, and rightly. Overall, the volume of industrial production has risen by 76 per cent since 1938. In contrast to the inter-war years, the rate of increase in exports has been even better, attaining 105 per cent

over 1938. Although the UK's share of world trade in manufactured exports has declined from 23.8 per cent in 1948 to 17.3 per cent in 1959, it remains true that the place of the newer industrial exports is much better than pre-war. In 1959, the UK's exports of, e.g., aircraft, refined petroleum, synthetic fibres etc., accounted for nearly three-fifths of all her exports.

Another evil of the inter-war years was that an ever-widening circle of industrialists met the challenge of depression and changing markets not by aggressive reorientation but by defensive agreements to regulate output and prices, and by other restrictive practices, which not only made for rigidities in production and distribution, but eroded the competitive spirit and principle. Rationalisation was identified more with defence than with development. In the expansive economic climate of the post-war world, the idea of competition has been born anew in the UK. Although I recently criticised the U.K. Restrictive Practices Act here, its weaknesses are in its methods, not in its aims, and there is no doubt that, as worked at present, it is giving a big boost to competition, and is serving the valuable purpose of making trade restrictions socially unrespectable.

On the other hand, the post-war trend has seen amalgamations and take-over bids snowballing along, so that the milky way of small companies of the inter-war years has yielded to more and more oligopoly, which is not in itself an evil, and any of whose harmful possibilities, it is to be hoped, will be curbed by the Restrictive Practices Act.

Altogether, the old lion has sprung into active new life by vigorously twisting its own tail.

COPIES—

with

Kodak
DOCUMENT-COPYING EQUIPMENT

Whatever your copying problems, solve them the modern way—with 'Kodak' document-copying equipment. For instance, the 'Kodak' Document Copying Printer gives clear copies, which need no checking—in less than two minutes. So easy to operate, this new copying aid—now made in India—is considered the greatest invention since the typewriter!

Other 'Kodak' document-copying equipment include Verifax, Duostat, Recordak (Microfilming), Photostat and Statfile. We will be glad to help you choose the right equipment for your special needs.

The European Scene

WHEN COLONISTS COME HOME

From Our Special West European Correspondent

PARIS, May 11.

WHAT happens, it was asked recently on this page, when colonial capital comes home; and it was shown that, far from being "integrated" into the anonymous pool of domestic capital, it tended to follow characteristic occupations. Now, what happens when the colonists themselves come home to a Europe without colonies? The two questions are not by any means the same, since most of Europe's colonists were not capitalists or even well to do. The rich Rhodesian farmer, the wealthy landlords of Algeria, the well-paid servants of the Societe Generale in the Congo, and the Clive Street 'burra sahib' are, no doubt, typical products of European imperialism but, numerically, they are a small minority among an emigration that lasted several centuries and drew on every class. The reflux of these people to a truncated Europe creates many and various problems, both political and economic.

Compared with the 12 million refugees that West Germany has absorbed from the east, their numbers are moderate; about one million in the last decade, though this number could be doubled in the near future if the independence of Algeria leads to a wholesale exodus. To date 350,000 Frenchmen have returned from North Africa, 300,000 Dutch citizens from Indonesia, 250,000 Italians from Libya and East Africa and 60,000 Belgians from the Congo. This last figure, though the smallest, represented the most dramatic movement of refugees, for it was concentrated into a few days when the Congo collapsed into anarchy. The West German precedent shows that a refugee influx of these proportions can be digested without too much trouble by a vigorously expanding economy, but the present influence of the refugee parties in West German politics also shows that the political integration of the mass of newcomers is harder to arrange. Yet most of the German refugees, save those expelled from Czech Sudetenland and Polish East Prussia, came to West Germany on their own decision, or at least for reasons that were not the fault of the Government in Bonn.

The refugees of colonialism, on the other hand, return with a complex: the mother country is held responsible for their uprooting, since the political liberation of the colony was decided at home, so they feel that the nation is heavily in their debt. Whereas the East German often crossed the border because he knew that West Germany was booming, and then sought to earn his share of that prosperity, the colonials come home in a very different mood. They usually walk off the ship with a demand for a total indemnity for all their losses—a demand that no West European Government has agreed to meet. Even the Italians, whose expulsion from Africa was part of the collapse of Fascism, tend to contrast the hopes they knew in Mussolini's reign with the disappointments of the camps where they are sent by the successor democratic regime.

Although no Government has consented to pay decolonisation reparations, all have offered some special assistance to home-coming colonials. Only in Holland have these been adequate, in the sense of organising the reintegration of large numbers into the domestic economy. Holland has enjoyed a long boom that made work for everybody, so that today the country even has a manpower shortage after making room for 300,000 peo-

ple from Indonesia. (These people, incidentally, were Dutch only in that they carried Dutch passports; the majority were Eurasians.) Moreover the exodus began so early (Indonesia was freed in 1949 and all Dutch property in the islands was expropriated in 1953) that the effort required to receive them was grafted on the post-war reconstruction programme. Since Holland had lost 28 per cent of its housing in the war, the extra building needed to accommodate the newcomers was a simple extension of work in hand. This in no way detracts from the Dutch achievement, which remains a model for other European countries facing the problems of decolonisation. Holland lost 30 per cent of her revenues when Indonesia cut adrift, yet her economy is today one of Europe's soundest and her currency has just been up-valued.

The other former imperial powers on the Continent have managed less well. The Italians returned to a country where unemployment is still endemic and most of them went back to the poorest regions of the South where living standards have never been notably above those of Africa. The Belgians came back to a nation that was immediately plunged into a disastrous general strike, from which it has not yet recovered; it has now to organise a complete modernisation of its economy on an austerity basis. The returning French colons' had the good fortune to come back to a country where land is plentiful and work freely available, but which, on the other hand, is burdened with a chronic housing shortage. With about four million people at home yet to be rehoused in decent conditions, the Government has refused to give the colonials the preferential treatment in housing that they received in Holland and Italy. Discontent among the repatriated colonials is often acute and they constitute a pressure group whose influence over French policy in North Africa has been reactionary.

The purely economic difficulties of absorbing these people are not insuperable, but they make it an urgent duty for European Governments to maintain and if possible stimulate the expansion of their economies. President de Gaulle has understood this in posing the question of faster planned development in this country before the Algerian question is settled. Expansion at home is not intended to attract the many Europeans who remain in North Africa, and whose continued presence there, on different terms perhaps, will be useful to the young states. There are still several hundred thousand white settlers working in Morocco and Tunisia, and it is hoped on both sides that a similar number will stay on in Algeria. However, the possibility of speedy reintegration into the mother country's life must be open to settlers who want to stay without feeling that they are prisoners or hostages, and that possibility must be visible right now if they are to accept the necessary political transformation in Algeria otherwise than as a personal disaster.

For those who have returned and will do so in the future, moreover, their smooth absorption into the national economy is an urgent political necessity, since West Europe will not outgrow the imperial age painlessly if it leaves festering centres of discontent among the repatriated victims of decolonisation. Enough Italian colonials have joined the neo-Fascist movement, enough Belgians noisy and reactionary pressure groups, and enough Frenchmen sinister conspiracies and anti-demo-

cratic movements to make this point plain. It is not just a question of providing them with work and housing (which, I repeat, has not even been achieved in those three countries yet), but of drowning their rancours in a veritable surge of expansion that will make nostalgia for imperialism seem absurd. Most imperialist nations have pet theories about their national "dynamism," which is held to have revealed itself in their colonial exploits, and the fate they all fear is that of Spain: relapsing into a timeless torpor once the field of imperial enterprise is closed for ever. This torpor, furthermore, is the breeding ground of anti-democratic movements which will have less opportunity only if new and more timely national vocations succeed the myths and glories of imperial rule. The most effective vocation available today is that of national development and economic progress, and thus the expansion of the home economy is psychologically important beyond the matter of providing accommodation for the colonials.

The immense explosion of European imperialism in the last few centuries was an extraordinary display of national energies. Today it ends in the homecoming of hundreds of thousands of miserable, resentful and dispossessed colonists, looking for work and shelter in a homeland that tends to regard them as disgraceful reminders of a past that Europe wants to forget in a hurry. They are perhaps entitled to little pity, for what

most of them resent above all (even the "poor whites" from North Africa and Indonesia) is the loss of colonial privileges and the necessity to merge into a social landscape where they have no claims to special treatment. Yet their condition is a symbol and a challenge to the European economies, which have a political duty to engage them in a task bigger and better than imperialism. The alternative political danger is clearest in France, where the numbers of homecoming colonists is already greatest and could become embarrassing if events turn for the worse in Algeria. Most people here believe, correctly, that the recurrent threats to French democracy have come from the Algerian war, but they jump too hastily to the conclusion that once that war is ended, the threats will disappear. On the contrary, a settlement in Algeria that left a million or more people bitter and resentful (not to mention the ambitions of the soldiers who, during a long colonial war, have embraced the cause of the settlers), would just be the beginning of a period of political insecurity. The energies of homecoming colonists will have to be harnessed to other work, for reasons that are political and psychological as well as economic. The realisation of this fact, which is nowhere clearer than in the recent pronouncements of President de Gaulle, is a guarantee—one among others—of sustained effort in West Europe to maintain the pace of economic growth and the speed of economic integration in this region.

Economic Report from the U.S.**CORPORATE TAXATION**

By GUY SIMS FITCH

WASHINGTON, May 11.

THE Kennedy Administration has followed the example of the Eisenhower Administration in urging Congress to retain the present high rate of corporate taxation to help meet the President's budget objectives. This point figured prominently in testimony given this week before the Ways and Means Committee of the House of Representatives by U.S. Budget Director David E. Bell. The Corporate Tax Act, which is calculated at a basic 52 per cent of earnings, has been scheduled to drop automatically for the past eight years, but each time has been continued by special congressional action. Chances now are that it will be continued again this year, even though the corporate profits picture has been anything but bright.

According to a recent survey by a leading bank in New York city, net income of nearly 700 companies during the first quarter of this year dropped 15 per cent below the fourth quarter of last year, and 19 per cent below the level of a year ago. It appears, however, that the worst may be over now, and this past quarter may well turn out to be the low mark for the year. Already, a number of companies have reported improvement in their earnings in the past two months. It seems likely that with new orders increasing and the economy in a definite upturn, corporate income also will be on the upgrade as the year goes on.

Of course, chances of accomplishing this would be enhanced if profit margins were larger. But profit margins have been historically low in the United States, running no better in most cases than five or six per cent of sales. And margins, if anything, have showed a tendency to grow smaller rather than larger in the past year, as competitive pressures and comfortable capacity positions have induced companies generally to hold their price lines. Even more revealing are the data showing after-tax corporate income. In 1959, this came to a total of \$23,800 million, of which \$13,400 million was paid out in dividends, leaving undistributed profits of only \$10,500 million. Yet way back in 1950, despite the notable gains in the U.S. economy since then, after-tax earnings of corporations came to \$22,800 million — nearly as much as in 1959 — and undistributed profits to \$13,600 million, even more than in 1959. This recital only serves to point up a fact that sometimes seems too little understood. It is that when all is said and done, the largest gains by far from the working of the U.S. economy have been won by the public at large, who are at one and the same time the nation's workers and consumers. For example, the personal income of all Americans — the wherewithal to turn the wheels of American industry — has been rising steadily throughout the post-war period. It is now at an annual rate of about \$410,000 million, compared with some \$230,000 million back in 1950 — a gain of fully \$180,000 million, or about 80 per cent. Even during 1960, a year of recession, personal income rose to record highs in every section of the country. For the nation as a whole, personal income last year totalled \$402,000 million, about \$21,000 million or five per cent higher than in 1959. What is more, income rose at a much faster rate than did prices. This means, in effect, that real purchasing power rose in every part of the country.

In a democratic society, of course, where the individual is essentially free to make his own choices as to how he earns and uses his income, there really is no such being as an "average" or "common" man. Yet for statistical purposes, it is interesting to note that average income per person rose four per cent last year to \$2,242. Even after taxes, per capita income

came to \$1,969, as against \$1,905 in 1959 and \$1,369 back in 1950. It is well to remember in assessing the role of the individual in the U.S. system that labour income, which means to all intents and purposes the total of wage and salary disbursements, accounts for more than two-thirds of all the personal income earned in the United States. As an example, in 1960 labour income accounted for some \$285,000 million of the personal income total. On the other hand, business and professional income came to about \$36,000 million.

Another recent survey — this concerned with personal rather than corporate income — throws considerable light on this situation, and offers a significant contrast with the corporate trends. Conducted by a New York purchasing company, and using the year 1951 as a base, it offers irrefutable testimony to the gains registered by the average or common man — for want of a better term — in the United States. For example, since 1951 the income of proprietors, meaning those who own their own business, farms or professions, has risen 14.8 per cent, while wages and salaries have gone up nearly 60 per cent, about parallel with the rise in all personal income since that year. In 1951, moreover, more than 16 per cent of all personal income came from professional, business and farm owners, as compared with less than 12 per cent today. The two most spectacular areas of increase since 1951 also reflect advantages accruing to the average citizen. For one, a 127 per cent rise is noted in "fringe" benefits for company employees — including such items as pension and retirement rights, medical insurance and other benefits which are not directly represented in the cost of wages and salaries. For another, Government transfer payments have gone up 150 per cent. At a current total of \$31,500 million, they now account for nearly eight per cent of all personal income, as against five per cent in 1951. The marked increases in these social insurance benefits, both public and private, provide statistical evidence of the growing security and sense of well-being the American is finding in his socio-economic system.

WORLDGRAM**India**

Mor: Relief for Handloom Industry: It will be recalled that to help the handloom industry and to maintain the existing price level of the ordinary varieties of the handloom fabrics used by common people, the Government of India exempted mill-made cotton yarn of count not exceeding 40 if issued in hanks, from the whole of the excise duty leviable thereon. As a measure of further relief to the handloom industry, the Government have now decided to give an exemption of 10nP. per kg. to yarn of count above 40s if issued in hanks. Consequently the yarn of this description will now pay duty of five naye paise per kg. only. The reduced rate takes effect from May 12, 1961.

Prevention of Occupational Risks: India will participate in the Third World Congress on the Prevention of Occupational Risks to be held in Paris towards the end of this month. Mr V. N. Rajan, Director General, Employees State Insurance Corporation, has been elected Vice-Chairman of the Congress and in that capacity will also attend the meetings of the Committee on the Prevention of Occupational Risks of the International Social Security Association. He will be the Chairman of one of the three committees which will examine present-day trends in research work, progress in technical discipline and progress in medical and psychological disciplines. Mr N. S. Mankiker, Chief Adviser Factories, will represent the country on the Congress which will be attended by about 800 delegates from nearly 50 countries. The Congress has been organised by the French National Safety Institute in collaboration with the Committee on Prevention of Occupational Risks of the International Social Security Association and in co-operation with the International Labour Office. The object of the Congress is to enable specialists to examine various aspects of the prevention of occupational risks to enhance their knowledge of research and progress in the service of prevention.

Consumption of Petroleum Products in India: The trend in consumption of petroleum products in India was discussed at the third session of the Oil Advisory Committee which met recently. During the general review of the category-wise estimates prepared by the Steering Committee, the Chairman, Mr. K. D. Malaviya, advised the members to take into account the rising trend in consumption in the wake of speedy industrialisation of the country before arriving at any final conclusions. The Committee, therefore, decided to review the forward estimates. Reference was also made at the meeting to the price structure of petroleum products with special reference to the needs of the North-East region. It was agreed that the oil companies including the Government-owned Indian Oil Company should consider the question. The Committee was set up early in 1960 to advise on problems of common interest concerning petroleum products and in particular, problems pertaining to pattern of demand, supply, distribution and consumption of these products. The Committee includes representatives of oil companies and the concerned Ministries of the Government of India besides the Planning Commission.

United Kingdom

Employment in Britain: The number of people in employment in Britain increased in February by 13,000 to a total of 23,695,000, according to estimates issued

by Ministry of Labour in London. There were 3,35,000 more at work in February than a year earlier. The increase in employment figures, which has been steady in recent months, shows that industry as a whole is gearing itself for expansion of output this year, bearing out the forecast in the economic survey for 1961.

Aircraft Industry: India was the third largest buyer of the British aircraft and parts during February and the fourth largest buyer for the first two months of this year. For February, India's purchases were worth £421,000 and for the two months her purchases amounted to £911,000. The largest buyers during February were Canada and the United States. The British Aircraft Industry's export sales in January and February totalled £253,000,000—nearly £2 million more than the corresponding figure last year and only £280,000 less than the 1959 record for January and February.

U.S.S.R.

Overseas Aid: The Russians and their friends contribute in investment and aid to countries overseas a total of £100,000,000 in a year. The West's contribution to investment in aid is £2,100,000,000

Pakistan

Fish Production: The Government of East Pakistan proposes to reclaim 22,000 acres of derelict water areas for fish production in the province at a cost of Rs. 48.28 lakhs. These derelict areas will be improved and stored with important species of fish for a period of three years and then made over to the Board of Revenue for management and exploitation. The Board will grant leases to private parties for the purpose. And the entire project is likely to take five years to complete. The East Pakistan Government will also examine the possibility of leasing out larger areas to private parties on a long-term basis for 20 years or more. Private enterprise could thus be attracted to develop these derelict water areas.

Netherlands

KLM Airlines: KLM Airlines have announced that they will include Toronto on their services in the near future. There is already a service to Montreal. One of the most important features of KLM's summer schedules, introduced from 1st April, is the increase of capacity and frequencies of many services. The 12 DC-8 aircraft and 12 Lockheed Electras jointly account for nearly 65 per cent of the total capacity of 850 million ton kilometers in 1961. The fleet now comprises 105 aircraft; this summer it will be enlarged by the addition of 5 more DC-8 jetliners (equipped with Turgofan engines). The total distance flown will increase by 12 per cent and is estimated at about 55 million miles (last year about 50 million miles). The KLM network covers 114 cities; it is the second largest airlines company in the world.

Norway

Seamen's Education: In a report submitted to the Parliament recently, the Norwegian Ministry of Commerce has drafted a ten-year programme proposing that 125 million kroner be spent on improving seamen's education. This comes in addition to the ordinary grants

for the running of seamen's schools. The 10-year programme also makes provision when essential for a further 7.5 million kroner to be granted to purchase equipment for courses for engineering candidates. Provided the present ordinary grants remain unchanged, they will total approximately 70 million kroner during the ten-year period.

Increased Activities for Norwegian America Line:

The Norwegian America Line had a balance of 35 million kroner from its operations in 1960 before depreciation, interest and administration had been accounted for. The whole of the balance was then disposed of for these purposes. A dividend of 20 kroner per share was paid out from a special reserve fund. The company's three liners carried 22,529 passengers across the Atlantic roughly 1000 more than the previous year. Cruise activities also increased. Sixteen cruises based on New York took 5,621 passengers on round trips. The company's report says that there is growing competition in the trans-Atlantic traffic as well as in cruises. The company receives no government subsidies.

Brazil

Cocoa Beans Exports Rise: In spite of the fact that world cocoa markets had been unsteady in recent months, Brazil reports a 37 per cent rise in 1960 cocoa bean tonnage exports and a cruzeiro value increase of 61 per cent. According to the Rural Economic Services, the country exported 1,23,360 tons of cocoa beans valued at Cr\$6,235,000.

Automobile Industry: In the four years in which Brazil has had an automobile manufacturing industry, the country has produced 3,21,150 vehicles. According to the executive group of the automobile industry, which has released the data, the growth rate of the industry has been 20 per cent annually. This is approximately the same rate of increase as that of the demand for new vehicles. It is expected that the demand will grow and keep pace with the rising output.

Nigeria

£10m. Domestic Loan Floated: The Government has decided to allow the Central Bank of Nigeria to launch a £10m loan under domestic market. This is believed to demonstrate its determination to build up a domestic capital market. The loan is four times as large as the total volume of funds previously raised by the Government locally.

U.A.R.

"Arabization" of Syrian Banks: Early last month, President Nasser issued a decree calling for the 'Arabization' of all foreign banks in the Syrian province within a year. As a result of the new law, 19 foreign banking establishments in Syria will become limited joint stock companies, each with a minimum capital of about £300,000 and must be controlled substantially by U.A.R. subjects. This step, bringing the Syrian situation into line with that which has obtained in the Egyptian province for some years, has been officially explained as protecting the people's interests and assets against any foreign threat to the national economy. Foreign banks affected include the British Bank of Middle East with branches in Aleppo and Damascus. But it has been stated that the new law need not affect the relations of the Syrian branches of foreign banks with banks abroad.

Tanganyika

World Bank Survey: The report of an economic survey mission organised by the World Bank laid before the legislative council in February, expresses the view that agricultural, mining and industrial production have all been increasing at a reasonably rapid rate. It points out that the territory could benefit greatly from increased grants and low interest loans with long repayment periods.

Italy

Trade with U.S.S.R.: Under an agreement concluded in Moscow at the end of February, Italy will take 4m. tons of Russian oil in 1961, while the total trade between the countries should be of the order of £250m.

Japan

Reserves Up: The country's gold and foreign reserves rose by another \$52 millions in February to reach \$1,987 millions, but the Ministry of Finance Officials have pointed out that American measures to reduce procurement spending in Japan may cause the payment surplus to contract, slowing down the rate of growth of reserves.

Steel Expansion: Six leading steel producing companies have announced plans for expansion that will entail outlays of about £1,400m. between now and 1965. The aim of their programmes, in every case, is to double existing output.

Iceland

\$1.6m. Stand-by Arrangement: The Iceland Government has entered into a stand-by arrangement with the International Monetary Fund making \$1.6m. available in support of the economic stabilisation programme. When this plan was undertaken a year ago, \$2.8 millions were drawn from the fund and subsequently \$4m. were drawn under a standby arrangement. The credit of \$12 million was negotiated with the European Fund, of which \$5m. remains unused.

Fishing Agreement: Agreement has been reached with Britain on proposals for ending the fishery dispute. The main point of the new agreement is that the British objection to the establishment of a 12 mile fishing limit around Iceland will be withdrawn on the understanding that for a three year transitional period British vessels will be permitted to fish in the greater part of the zone between six and 12 miles of Iceland at certain seasons.

World Bank

Loan for Japanese Railways: The World Bank has made a loan equivalent to \$80 million to the Japanese National Railways for the new Tokaido line to link Tokyo with Osaka, via Yokohama, Nagoya and Kyoto. The railway will provide the fastest train service in the world; it will run 311 miles to the industrial heart of Japan, and will relieve the present heavily over-loaded rail and road transport facilities. The loan is for a term of 20 years and bears interest at the rate of 5-3/4 per cent annually including the one per cent commission which is allocated to the Bank's Special Reserve. Amortization will begin in November 1964. The loan is guaranteed by the Japanese Government. The cash requirement for the entire programme will amount to the equivalent of 3.8 million.

NEWS IN BRIEF

INDIAN

Statistics now available place the number of tourist arrivals into India (barring Pakistan nationals) during the year 1960 at 123,095 which is an all-time record. As compared with arrivals in 1959 (1,09,464) this registered an increase of 12.5 per cent.

The Railway Board has sanctioned the construction of the Diva-Panvel urban broad-gauge railway line on the Central Railway, covering a distance of 33.69 miles. The construction work will be carried out by the Central Railway administration.

The Union Government has reconstituted the National Shipping Board for two years from May 1, with Mr. G. L. Mehta, continuing as Chairman.

The Central Government has permitted the Gujarat Cotton Growers' Association to export 50,000 bales of cotton. According to the Association, more than two lakh bales of cotton are lying idle in Gujarat due to lack of demand.

The World Bank will give a loan of \$20 million for the development of Calcutta port and navigation on the river Hoogly. The Chairman of the Calcutta Port Commissioners, Mr. K. K. Mitter, and the Secretary of the Union Transport Ministry are likely to leave for Washington next month to sign an agreement for the loan.

The overall approximate production of iron and steel by the Tata Iron and Steel Company at their Jamshedpur works during April is lower compared with the previous month.

Tea exports from Cochin during March, 1961, were slightly higher at 6.53 million lb. compared to 6.24 million lb. in the corresponding month of last year.

It is reported, the Government of India has decided to extend the Intensive Agricultural District Programme (Package Programme) to all the States. Previously it was restricted to 7 States and was being implemented in co-operation with the Ford Foundation of America.

The Government of India have constituted a Committee to assess the working of the Contributory Health Service Scheme for Central Government employees in Delhi and New Delhi.

FOREIGN

Brazil and the U.S. have signed a third wheat agreement under U.S. Public Law 480, forming part of President Kennedy's "Alliance for Progress" programme for Latin America. The new agreement provides for the supply of 1 million tons of U.S. wheat during the current year valued at \$70 million.

U.K. consumption of lead in all forms rose to 32,601 tons in March from 30,430 tons in February, according to the British Bureau of Non-Ferrous Metals statistics. Total consumption for the first quarter of 1961, at 94,176 tons, was 2,876 tons lower than for the corresponding period of 1960.

President Kennedy has signed into law, a Bill passed by Congress authorising the U.S. to sell abroad an additional \$2,000 million worth of U.S. surplus farm products.

A widespread turnover to American management method is to be expected in the European steel industry, according to a report now circulated by the High Authority to steel companies in the six E.C.S.C. countries.

The French index of industrial production for March was 182, only 1 point above the figure around which it has stood for the previous four months.

A contract will be signed shortly between the Pan American International Oil Company and the U.A.R. State Petroleum Authority, covering oil prospecting in Egypt's Western Desert.

The International Bank for Reconstruction and Development reports that its reserves rose by \$72.8 million in the first nine months of the current fiscal year to a total of \$579.3 million.

Australia's trade gap of only £A5 million in April has reinforced earlier indications that a turning point has been reached. The Government's deflationary measures, although slow in operation, have at last succeeded in bring the imports bill for April down to the lowest level for years.

It is reported, Italians are offering to build a refinery, if the Ceylon Government sets up a joint corporation with the E.N.I. on a fifty-fifty basis.

Israel's exports of fresh citrus fruit — the country's largest single export item — declined by 20 per cent during the season owing to adverse weather conditions and pest infestation.

*Special Article***INVOLVEMENT IN AFRICA**

THIRTEEN months have passed between Mr. Macmillan's "Winds of Change" speech and the exit of South Africa from the Commonwealth. These months (if one may arrange the calendar a little) can justly be called the year of Africa. Sixteen African States have emerged into independence. Long term programmes for African development are being discussed. Technical assistance is being given an African slant. The explosion of freedom has more than doubled the United Nations budget and shaken the office of the Secretary-General. In the heart of the continent, a territory three quarters the size of India is advancing steadily from chaos into anarchy.

In all these happenings we have an unusual stake. There are close on half a million people of Indian origin in South Africa, over two hundred thousand in East Africa, perhaps twenty thousand in Zanzibar and fifty thousand in Mozambique. In Nyasaland the number is at least three thousand. Indian labour built the African railway system. Sikh soldiers liberated Nyasaland from the slave trade. Yet, in South Africa, the Indian community has celebrated its centenary, forced out from the prosperity it has helped to create. The country in which non-violence was born may yet have to face its most exacting applications. Elsewhere, the colons no longer rule, but the Indian community, even when it has not sided with the past, has failed to make its alliances with the future. It has lived in the economic middle and sat on the political fence. It now must look forward to majority rule, not with enthusiasm but with the uneasiness bred of its equivocations.

If Indians in Africa have sometimes been too restrained in their commitment to African nationalism, the same can hardly be said of our country's policy. We have pressed for African independence in the Trusteeship Council and in the committee on non-self-governing territories, which is itself partially an Indian creation. Indeed, our anxiety to secure the earliest possible independence for the French Cameroons brought us into conflict with Ghana and helped in the installation of a Government whose representatives are ironically, among India's most vocal critics. As for the item on race conflict in South Africa, it is worth remembering that we brought it before the General Assembly and that we spearheaded the attack on discrimination for five years at a time when no African government south of the Sahara was represented in the United Nations. We have reminded the Indian communities in Africa repeatedly and with clarity of the direction in which the destinies lay. We have set up University chairs in African studies and provided scholarships to African students, who criticise their host country with the same refreshing independence that Indian scholars show when returning from America.

It is in the Congo, however, that our policy towards Africa has been most vigorously formulated. We were quick to provide it with assistance, first with wheat flour, then with a hospital unit, and finally, with Mr. Rajeshwar Dayal. The worsening of the situation provoked no second thoughts. We made no attempt to assert our non-involvement by relieving Mr. Dayal of a task that was inherently all but impossible and which he had been obliged to perform under unprecedented handicaps. Instead, in an unprecedented act of commitment, we plunged the Indian army into the imbroglio after him. It must be presumed that we did so intelligently, which means that though the proximate reason for our action may have been our desire to arm Mr. Dayal with more than resolutions, or to save the

U.N. from impotence, or the Congo from itself, the real reasons must have arisen from the recognition that enlightened self-interest required us to take sides in Africa and so to commit ourselves decisively to the right side. Can we say with confidence that the decision was well-judged? Is our popularity in Ghana and Guinea at its zenith? Are the voices of criticism silenced in Nigeria? Is an Indian community anywhere in Africa more secure because of our African policy?

Perhaps we should take a second look, and ask ourselves if involvement is really necessary. Perhaps one should return to the everyday prudence of diplomacy which is to take a position only when one must and then only to the extent that one is obliged to do so. Behind the slogans of Pan-Africanism, of Africa for the Africans, behind the fervent talk of an African personality, there is the deep-seated desire of all Africans to find and form themselves on their own responsibility, free from external pressures. Perhaps, we should be circumspect in assisting this process while making it clear always that we stand ready to assist it. An approach to Africa that is more pragmatic and less evangelical will not be spectacular in terms of the world's headlines, but it may be at least as effective as our present policy which has neither won friends, nor commanded reluctant respect, nor increased the area or the degree of our influence.

Most of all we need to take a long hard look at the realities of our trade with Africa. In 1957, our balance of trade with the Continent was a favourable one of Rs. 419.7 lakhs. In 1959, it was unfavourable to the extent of Rs. 1065 lakhs. In 1960, this deficit rose to Rs. 2802.7 lakhs. These achievements took place at a time when African States were moving towards independence, when African incomes were rising steadily and when our policy towards Africa should have resulted in a better climate for commerce. Nor is this the entire story. On the eastern seaboard to which we have easy access and where large Indian communities with historic mercantile interests are placed to function as our commercial spearheads, the adverse trends have been particularly marked. Our exports to Africa as a whole fell by 17.7% from 1957 to 1960. In Kenya, Uganda and Tanganyika, they fell from Rs. 1219.0 to 760.3 lakhs, a decline of 37.6%. In Central Africa, the figures verge on the fantastic. We exported to Southern Rhodesia in 1957 slightly over two-thirds of what we imported from her. In 1960, this ratio fell less than two-sevenths. Our exports to Nyasaland in 1957 were over ten times our imports; today these exports are only two-thirds of our imports. Our export-import ratio for Northern Rhodesia was about one to ten in 1957 which is a sufficiently disconcerting figure; today it is of the order of one to sixty. The Central African tariff structure operates to our disadvantage and we have apparently been unable to use our position as one of the chief buyers of Northern Rhodesia's copper to have this structure altered in our favour. All over Africa the bicycle and the sewing machine are becoming status symbols; they are not which carry Indian trademarks. In the hard world of competition we are losing ground steadily to Japan whose African policy is unprogressive and whose attitude to racial discrimination is so equivocal that Japanese nationals are soon to be declared "whites" in terms of South African laws. It is, of course, naive to expect noble words and right action to succeed in selling textiles; but can it be said that our position would not be better if we were to bring to the unspectacular but vital world of commerce some of the energy, dedication, and passion we devote to the more diplomatic aspects of our African policy?

THE BUSINESS WORLD**Textile Wage Board Legislation**

By
CROESUS

THE appointment of a wage board for every industry has become the avowed and accepted policy of the Union Government. The acceptance of these Wage Boards, as also the implementation of their recommendations, by a majority of the units of the concerned industries is a tribute to all the interests concerned. But this is not to say that none of the industries concerned, or the interests involved, has had any protest to make against, or any mental reservation about, the awards of the Wage Boards. Yet, if implementation has generally been accepted by the employers, it is predominantly due to the intense desire on their part for industrial peace. For, as every one knows, without assured industrial peace for a reasonably long period, the tempo of industrial production can hardly be maintained, let alone augmented, as the planners envisage.

So far, however, the implementation of the Wage Boards' awards has been voluntary, which is as it should be. When a Wage Board is representative of both the employers and the employees, as well as the State, as it is, and when its recommendations are unanimous, few, if any, would refuse to implement them. Some units of an industry here or there might not implement these recommendations, but every care and effort must be employed to seek and find out the reasons for that. The need for this is obvious; whilst enforcing implementation, the authorities themselves try and exempt certain units for special and, no doubt, justifiable reasons. In view of this, it is really difficult to appreciate the logic behind the Cotton Textile Workers (Central Wage Board Recommendations) Bill, 1961, which was recently introduced in the Rajya Sabha by the Union Deputy Minister for Labour.

On the face of it, the proposed Bill is aimed at compelling those establishments which have not implemented the award of the Textile Wage Board to do so. Inasmuch as the Government can force the recalcitrant elements to toe the line under the existing machinery of Tribunals itself, the move only betrays the increasing mania of our Government these days to enact a law

for almost everything. This apart, it strikes at the very root of the principle of collective bargaining. It also calls in question the sanctity of agreements freely entered into by parties regarding the implementation of the Wage Board's recommendations; in fairness, at least such agreements should have been kept outside the pale of the Bill in question.

It is worth recalling here that, when the employers and the employees agreed to the appointment of the Central Wage Board for Textile Industry, the underlying idea was that the recommendations would not be left for legal enforcement but to the good sense of the parties concerned. Presumably because of this, one notes that the representatives of both employers and employees have been adopting a refreshingly reasonable and realistic attitude, but this is bound to be the first casualty if the proposed Bill to enforce the recommendations by law is enacted.

There is one other aspect that the sponsors of the Bill in question would have to bear in mind. It is the complications that are sure to set in, when, as seems to be the case presently, the authorities want to enforce only some of the recommendations and not all. If legal enforcement is thought to be necessary, it should not be restricted to the remuneration of workers alone, but should extend to the rationalisation of the industry as well. Again, although clause 6 of the Bill seeks to put restrictions on claims for further revision of basic wages (incidentally the loose use of the terms "basic wages" and "minimum wages" might raise a controversy) for a period of five years from 1-1-1960 and prohibits strikes and lock-outs on the plea of demands for higher wages, there is no knowing, judging from the interpretations which some labour leaders seem to be skilfully straining to put on certain terms and definitions, whether the much-desired industrial peace, the 'raison-de etre' for all this, will at all be secured. In short, the move to enforce implementation of recommendations of a Wage Board by law may create more complications than it is hoped to solve.

Business Notes**Coal Crisis****FICCI'S SOLUTION**

IN A COMMUNICATION addressed to the Coal Controller, the Federation of Indian Chambers of Commerce and Industry has offered a few suggestions to solve the current coal crisis in the country. Coming as they do from the premier body of Indian industrialists, these suggestions deserve particular notice. The Federation has pointed out—and rightly—that

creation of coal dumps, from where industries could draw their requirements, is not an economic proposition; instead of solving the problem, it might create many others as the price of coal is bound to go up if this method of solving the problem is resorted to for any long period. Building of coal dumps at transshipment points of metre-gauge and narrow-gauge railway systems can, however, serve some useful purpose, as also creation of dumps for catering to the demands of low priority users under classes DRK, Z and SSI.

The Federation is also critical of resorting to movement of coal by sea on a permanent basis. This, it says, will also raise the cost of coal which will ultimately lead to increased cost of production. As ex-factory prices of a number of commodities are determined by the Government on the recommendations of the Tariff Commission, the Federation quite legitimately feels that it is imperative to ascertain how increased cost of coal, consequent upon creation of coal dumps, movement of coal by sea or increase in excise duty under Coal Mines (Conservation and Safety) Amendment Bill, 1961, should be shared by the industry and the consumer.

The Federation's suggestion that the requirements of industries situated at places over 500 miles from collieries should be met by supplies of selected grades coal, so that their consumption is less and the transport capacity thus relieved can be used to meet the requirements of other consumers, is, however, incomprehensible. Output of selected grades coal in the country today is hardly sufficient to meet the requirements of top priority users such as steel plants, railways, etc. From where is the superior grades coal to come to feed the industries situated at long distances from the coal mines?

The ultimate solution of the present-day coal crisis obviously lies in augmenting the capacity of railways to move this vital energy producing material and switching over to other sources of energy such as furnace oil. Arranging of movement of coal in block rakes can go some way in resolving the crisis; turn-round of wagons can be improved considerably through this measure. There is also need to expedite the commissioning of 8-wheeler wagons by the railways. These wagons carry freight approximately double than what is carried by the conventional 4-wheeler wagons.

Foreign Aid

I.D.A.'S LOAN TO HONDURAS

IDEAS ABOUT provision of economic aid to under-developed countries apparently seem to be changing. An eloquent testimony of this fact is provided by the latest loan granted by the International Development Association for a programme of highway development and maintenance in Honduras. The Loan is for \$9 million, to be utilised for extension of the western highway of Honduras, construction of feeder roads, continuance of the maintenance programme of this highway and for undertaking further planning of the transport system in the region. No interest is to be paid on the loan as is the case with all the credits granted by the Association; only a small sum — 0.75 per cent of the amount withdrawn and outstanding at the end of a particular year — will be charged annually to meet the IDA administrative costs. The loan is repayable in dollars over a period of 50 years, with another 10 years of grace in case of default. The first instalment of repayment falls due not earlier than September, 1971. For the next 10 years, annual repayment obligation is confined to one per cent of the principal. The rest of the 90 per cent principal is to be repaid over a period of 30 years at the rate of 3 per cent per annum.

The terms of the credit are in line with those advocated in the recent past by India and as suggested by President Kennedy in his inaugural message to the U.S. Congress, for grant of loans by world lending institutions for economic development of backward countries. Confining of loan repayment liability to a short span invariably puts a great strain on the balance of payments of an economically weak nation. It is all to the good that this fact is increasingly being appreciated by the international lending institutions and the

more prosperous countries who provide aid to developing countries. Will this encouraging trend gather momentum?

Gujarat

SALES TAX ON STEAM

TO THE already existing taxes in the State, the Government of Gujarat has sought to add yet another in the form of sales tax on steam supplied to factories at Porbander. Whatever theoretical justification the tax authorities may find in support of this new impost, it seems hardly fair or equitable to the unit or units of the industry that would be affected by it. The Indian Merchants' Chamber, Bombay, has lost no time, therefore, in representing to the Secretary, Finance Department, the Government of Gujarat, that the decision to subject steam to sales tax is wrong in principle generally and, in the case in point, also inequitable.

Adducing arguments to prove this, the IMC has pointed out how one of the factories affected by the decision wanted to set up its own power plant for the supply of steam and electricity required by it and how the then Saurashtra Government actually dissuaded it from doing so in order that it should draw its supplies power, as well as of steam and sea water under an agreement, from the State's central thermal plant. If the Government of Gujarat has since decided, as reported, to levy sales tax on supplies of steam to factories, those factories that have to draw their daily supplies of steam from outside sources (for example, Saurashtra Chemicals) would be placed at a disadvantageous position vis-a-vis those—and there are at least two units—which produce their own power and get their own supplies of steam for producing energy, as the latter can do so without having to pay sales tax thereon. In the case of industries such as those affected which have to sell their products at prices fixed by the Government, the adversely affected one will suffer for no fault of its own, or rather, it seems, for the fault of having heeded to the suggestion of a predecessor Government to the present Gujarat Government. That surely is an unmerited reward.

It needs hardly to be mentioned that at a time when the intensive industrialisation of Gujarat is the avowed objective of the State, the levy of a novel tax, such as a sales tax on steam supplied to factories (at the rate of 3 nP in a rupee plus a general sales tax at the rate of 2 nP in a rupee) would only hinder and not help the achievement of the goal. On second thoughts, at least, it is to be hoped, therefore, that Gujarat Government would withdraw this new levy.

Engineering Industry

SHEET ROLLERS' SUFFERINGS

THERE IS no gainsaying the fact that the engineering industry plays an important role in the industrialisation of any country, even as it has been doing in our country. But it could play a more important role still if various other allied industries, such as the sheet-rolling industry, catered more fully to its requirements. If the latter is not able to do so, it seems, it is not due to any unwillingness on its part, but to reasons beyond its control, as Mr. S. P. Khaitan indicated in the course of his presidential address at the twelfth annual general meeting of the Western Indian Sheet Rollers' Association, in Bombay, last week.

The most important problem that the non-ferrous sheet rolling industry faces today is that of non-availability of raw materials, such as copper and zinc, in

required quantities. With the foreign exchange position worsening every year, one realises troubles are bound to arise in securing larger imports of these basic raw materials. But what passes one's understanding is that, even when larger imports are effected, the organised sector of the industry should be starved of its legitimate share. Thus, the statistics for 1960 show that imports in that year were higher than in 1959. Despite these larger imports and the doubling of production of sheets and circles within the country, according to Mr. Khaitan, the allocation of the raw materials to the scheduled sheet rolling industry was further pruned during the last import period. If the explanation for this is that the larger imports were partly on account of Government, semi-Government and new industrial undertakings, still the question which the President of WISRA posed remains to be answered, namely: "How could the total production in the country have gone up?" Now the monthly average of production of copper and brass sheets and circles, expressed in tons, was 263 and 1,700 in 1958, 223 and 1,747 in 1959, and 413 and 3,633 during January-September, 1960. Needless to say, and as Mr. Khaitan also rightly inferred, while the production of the scheduled units was restricted, that of the small-scale sector was allowed to be increased sharply.

There can be no prejudice in any quarter against the development of the small industries as such, but the authorities should take care to see that this does not happen at the expense of the organised sector. It should be borne in mind that it is far more difficult and complicated to allow any unit of the organised sector to retrench its staff or close down. In the interests of industrial peace at least, the authorities concerned should ensure a judicious and equitable distribution of the available raw materials among all so as to enable the scheduled units also to contribute their share to the general increase in production.

Forging Shops

A NEW VENTURE

THERE IS a rapidly expanding market for forging components and the automobile industry is perhaps the most important consumer. Other important consuming industries are internal combustion engines, motor cycles, railways, tractors, heavy earth-moving equipment, aircraft and agricultural machinery. They all need the services of forge shops. A new venture, Forgings and Drop Stamping Ltd., is, therefore, likely to have considerable scope for successful functioning. The principle promoter of this company, Mr. K. C. Sud, already has a concern in Calcutta, Sudsons (Manufacturing) Private Limited, which is catering to similar needs of several manufacturers of automobiles, like Ashoka Leyland Limited, Enfield India Limited, and Hindustan Aircraft Limited. His experience in forge shop techniques will be of considerable initial advantage to the new company. Further, the new company will have technical collaboration of Messrs. B. & S. Massey Limited, one of the important manufacturers of forge shops equipment in the United Kingdom.

The Industrial Credit and Investment Corporation of India has granted to the company a foreign exchange loan of Rs. 27 lakhs, which will be sufficient to meet the cost of capital equipment to be imported from the United States, the United Kingdom and other European countries. Rupee capital to the extent of Rs. 50 lakhs—Rs. 40 lakhs in equities and Rs. 10 lakhs in preference shares—is now being raised. In view of the experience of the promoter in this field, the company will hardly have any problem of marketing its products. The Government, it is gathered, has already asked the automobile and other manufacturers to reduce their imports and forgings. The new venture will thus have an assured market for its products.

Cotton Textiles

THE PROBLEM OF COSTS

MR. A. H. HAKSAR, Chairman of the Kohinoor Mills Company Ltd., at the Annual General Meeting of the Company, held in Bombay recently, highlighted the problem of costs of the cotton textile industry. There are two major elements which have complicated the situation, he said. Those are: the rise in the prices of raw cotton and the non-availability of foreign exchange for the import of new machinery necessary to increase efficiency of the industry. Mr. Haksar pointed out that earlier estimate of 48 lakh bales cotton crop during 1960 was revised to 38 lakh bales, a quantity far short of the demand. This resulted in an acute scarcity of the desirable quality of raw cotton despite liberal imports. Restrictive measures had to be taken by the Textile Commissioner in the form of quality controls. By the end of January, the Chairman pointed out, the situation was alarming and raw cotton imports had to be stepped up.

The Kohinoor Mills Company has tried to carry out a programme of renovation of its machinery. It has installed latest types of machinery which have modernized a part of the factory. The Chairman added that the 48 automatic looms which were allotted to the company had been ordered to be set up, but unfortunately no further allotments had been made. He was hopeful that further licences to enable the company to fulfil its programme of renovation and modernization would be forthcoming. The cotton textile industry, which through the Indian Cotton Mills' Federation is trying to reduce the sale price of cloth, obviously deserves a more sympathetic attitude because this price reduction has ultimately to come from an improved working of the mills. This has become even more important in view of the problem faced by the industry on account of raw cotton prices, which are not always stable.

U.N. FERTILIZER MISSION'S REPORT

DETAILS are now available of the report submitted by the United Nations Fertilizer Mission to the Government of India on setting up of fertilizer manufacturing units under the Third Plan. The Mission visited this country early last year.

The Mission, in its report, recalls that during the Third Plan period, output of nitrogenous fertilisers in India is envisaged to be increased from 150,000 tons nitrogen in 1961 to one million tons nitrogen in 1965-66. To achieve this target, the Mission opines, India will have to set up thirteen factories which should go into production in the four years from 1962 to 1966. Besides, expansion of the existing factories will also have to be undertaken.

There are five fertilizer factories in operation, either fully or partially, at present in this country; they are, Sindri fertilizer factory, Alwaye fertilizer plant, Nangal fertilizer manufacturing unit and two by-product ammonia plants. The total installed capacity of these five units, in terms of nitrogen, is 243,000 tons per annum. Two fertilizer factories, one at Rourkela and the other at Neyveli, with a total capacity of 155,000 tons nitrogen per annum, are envisaged to be commissioned in 1962. Another three plants—at Trombay, Ennore and Vishakhapatnam—with a total capacity of 168,000 tons nitrogen per annum, are suggested by the Mission for completion in 1963. Five more plants, with a total capacity of 310,000 tons nitrogen per annum, are recommended for completion in 1964; they are to be located at Alwaye, Kothagudam, Nahorkatiya, Tuticorin and Durgapur. Another three plants, the Mission suggests, should be set up in 1965. They should have an installed capacity of 250,000 tons nitrogen per year and should be located at Gorakhpur, Ankleshwar and Mangalore.

The following are the observations made by the Mission on some of the proposed fertiliser manufacturing units:

Nangal Plant: With the heavy water production somewhat of a question mark at the present time, it appears that this plant will be a high cost ammonia production unit. The plant is now being brought "on stream." A long-term project should be drawn up to plan a gradual change over to a cheaper raw material when the electric power now used is required for other industries. The calcium ammonium nitrate production (nitrochalk) should be held at 30 per cent nitrogen content, instead of being diluted to 20.5 per cent as planned.

Rourkela Plant: Whatever help is needed to complete and start up the Rourkela fertilizer plant should be given immediately. This plant is designed for 120,000 tons of nitrogen production per year as ammonia, but some estimates indicate that a shortage of coke-oven gas will reduce the output to about 80,000 tons. If this is the case, some other raw material should be considered now and provided for in order to utilise the full capacity of this plant. The final product is to be calcium ammonium nitrate (nitrochalk) and, as for Nangal, a 30 per cent nitrogen content product, instead of 20.5 per cent, should be seriously considered.

Neyveli Project: Completion of Neyveli fertilizer plant should be speeded up by any means available. Long-term planning should include evaluations for phosphatic (complex) fertilizers to supplement the single plant product, urea. This plant has a capacity for 75,000 tons of nitrogen per year as ammonia at the reasonable operating factor of 90 per cent.

Trombay Plant: The Trombay fertilizer factory is being built for 350 tons ammonia per "stream" day, which is equivalent to 95,000 tons of nitrogen per year. The installed spare compressors at this factory will allow future incremental expansion at minimum cost and this course should be planned now because of

Trombay's excellent location as regards raw material availability and marketing.

Visakhapatnam and Kothagudam Projects: The pending decision on the grant of licence for setting up of the Visakhapatnam fertilizer plant should be made immediately since continued delay could seriously hamper the Third Plan schedule. (The licence has since been granted to Messrs Parry and Company). Visakhapatnam is an excellent site for setting up of a fertilizer plant in spite of the over-loaded rail system in this area. This situation must be recognised however and plans to avoid serious transportation bottlenecks should be made now. Low-cost naphtha raw material is available from the Caltex refinery and importation of both sulphur and phosphate rock is facilitated by the site being on the sea coast. Kothagudam, however, will definitely be a higher cost operation, both capital-wise and production cost-wise. It is favourably located from a marketing and transportation viewpoint, but this will not altogether counterbalance the effect of the use of a poor quality and expensive raw material such as slack coal. It is suggested that these two plants be considered together and be operated jointly, preferably by the same company. This would afford the most economic operation possible for Kothagudam and should not penalise Visakhapatnam too severely. They could complement each other in that phosphatic complex fertilizers could be produced at Visakhapatnam and high nitrogen content urea at Kothagudam, thereby affording the proper and required N-P or N-P-K ratio to be maintained throughout the combined marketing area.

Durgapur Plant: The availability of adequate coke oven gas to support an ammonia plant of economic size, i.e. 80,000 tons of nitrogen per year, in a potentially high fertiliser acceptance and consumption area, makes the Durgapur fertilizer plant a sound and financially attractive project. It is proposed to make here both urea and nitro-phosphate fertilizers; this should, therefore, be a relatively low cost operation.

Gorakhpur Project: There will be sufficient surplus naphtha available from the Barauni refinery (scheduled to be commissioned into production by 1963) to supply food to more than one ammonia plant in East U.P. and Bihar. The market potential for fertilizers is so large on the Gangetic Plain that Gorakhpur should be built initially for 85,000 tons of nitrogen per annum as ammonia, and arranged so as to be easily expandable. Urea is planned initially as the high nitrogen content solid fertilizer. For the longer term, it will be necessary to plan for complex fertilizers containing N-P-K. This plant should be planned to produce in the Third Plan. Additional site study is recommended to make sure that proper location is established from both the short-term and long-term viewpoints.

Ankleshwar Plant: The Ankleshwar fertilizer factory, in Gujarat, should be planned along with the Gujarat Refinery development. Naphtha supplied from Trombay could be considered initially as a raw material for this factory. Site studies should be conducted jointly with the refinery investigations, adequate port facilities being one of the principal factors to be taken into consideration in arriving at a decision about location. This plant should be planned on similar lines to Gorakhpur, on a large size expandable basis because of its economically favourable location.

Ennore Project: The Ennore fertilizer project is planned for ammonia production equivalent to 8,000 tons of nitrogen per year. This is a favourable plant location from a raw material, product marketing and transportation point of view. A site at or near Ennore should be studied with a view to erecting a plant to manufacture fertilizers containing 85,000 tons of nitrogen per annum. This could be done either by expanding the present small factory there, or by putting up a factory at a fresh site. The situation seems good from

both the transport and the market points of view. Either this factory or the one at Tuticorin should fit well into the Third Plan.

Tuticorin Plant: There are plans for further development of port facilities at Tuticorin. This is a logical and an economic location for a future fertilizer plant, particularly in view of the fertilizer acceptance and demand in the southern part of India. A plant, based on naphtha as raw material, making 85,000 tons of nitrogen annually is justified in this area. The market should require such a plant in the Third Plan. The market for ammonium chloride as a fertilizer for paddy and coconut in the Tuticorin area should be evaluated, and consideration should be given to the manufacture of ammonium chloride as one of the solid fertilizers to be made there. The complex phosphatic fertilizers and urea could also be produced at this factory to obtain the proper N-P-K balance.

Hanumangarh Project: The long-term development of extensive irrigation of large acreages as large co-operative farms in Rajasthan makes Hanumangarh a potentially attractive location for setting up a fertilizer plant. It will, however, take considerable time to put this land into extensive production and to develop the large fertilizer consumption required to justify the planned 80,000 tons per annum nitrogen output at this plant. The production of the fertilizer based on coal will be high cost. It is possible to utilize naphtha by transporting north from Gujarat, but this entails considerable freight and additional load on the rail-road. It is possible that gas will become available in Rajasthan either by agreement with Pakistan or by actual discovery of gas fields nearby. Since there is no urgency to build a plant immediately in this area, it is suggested that construction be postponed until the irrigation system is nearer operation and much more fertilizer market development work is done. During this period, if natural gas becomes available, plans should be made to build quickly a low capital cost and a low operating cost plant similar to the one in Assam, but larger and economically expandable to take advantage of the large potential future fertilizer market in Rajasthan.

Itarsi Plant: The initial studies for the fertilizer plant to be located at Itarsi were based on the development and use of good grade coal deposits in this area. Ammonia manufactured from coal is relatively high cost and much more capital is required for a plant to be based on it than for one based on naphtha. If a large fertilizer consuming area is nearby, freight, handling and distribution cost savings tend to counterbalance the higher basic fertilizer cost. This is not the case with Itarsi since the fertilizer market in Madhya Pradesh is small as yet, and demand is largely concentrated in the eastern parts, towards the Orissa border. Thus, not only will this be high cost fertilizer, but it will also be at a disadvantage freight-wise. The small size of the projected plant—50,000 tons of nitrogen annual capacity—is also a disadvantage. It is recommended that this plant be postponed until the Fourth Plan and re-examined at that time with the latest market demand and trend data. This will allow a more accurate economic evaluation of the project and facilitate a firm decision on its location, size, products to be manufactured by it and on raw materials to be used (Naphtha may be available as an alternative raw material).

Another Fertilizer Unit for Koyna Area: Growing fertilizer requirements will favour setting up of another fertilizer plant in the Koyna area. Site studies should be initiated now to determine the most favourable location for it. This plant should be scheduled for commissioning during the Fourth Plan period.

SHORTAGE OF TECHNICAL PERSONNEL

The Mission notes that India today faces a critical shortage of trained and experienced technical personnel

needed to meet the requirements of industrial expansion under the Third Plan. This shortage, it says, will be very keenly felt in the fertilizer manufacturing plants because the number of such units proposed to be set up is large. This Mission, therefore, suggests that the available talent should be made use of fully and some top technical help may even be solicited from foreign countries.

The Mission makes a pertinent observation about the wastage of technical skill in India; the number of engineers and chemists normally used in the Indian fertilizer plants, it says, is excessive. This fact, it observes, is recognised by some managements as well. Staffing of new plants, the Mission suggests, must be done on a planned and time-schedule basis so as to ensure adequate training of all personnel, whether supervisors, operators or craftsmen.

To make efficient use of the limited capital and production equipment available to this country, the Mission suggests that efforts should be made towards increasing productivity per man-hour.

THE TIME FACTOR

The following data has been adduced by the Mission to illustrate that the time taken in India to plan and erect fertilizer factories is much longer than warranted. The Mission, for the purposes of comparison, has worked out a normal time-schedule on the basis of the experience of some of the Western countries and has adjusted it to suit Indian conditions.

TIME TAKEN TO SET UP FERTILIZER FACTORIES IN INDIA COMPARED TO NORMAL TIME TAKEN ABROAD

Phasing of the Project	Approx. time taken by Government of India (months)	Normal time period (months)
1. Preliminary analysis, project report and initial decision to proceed with the project.	5—7	4—5
2. Preparations of tenders, preliminary process and specification, etc.	3—4	3—4
3. Contractor's project bid, review of bids and final decision to construct the factory.	12—20	4—8
4. Ordering, construction and Start-up	32—40	24—30
TOTAL	52—71	35—47

The Mission draws two conclusions from this data. Firstly, the time taken in India to plan, erect and commission a fertilizer factory into production is about 17 to 24 months longer than is warranted. Secondly, valuable time is lost in the process of arriving at a final decision and also in the actual erection and starting of the factory. The extra time taken in the latter part, in India's present state of development, the Mission thinks, is inexcusable. With a large development programme in progress, the deliveries of construction materials, locally made machinery etc. present problems of co-ordination and administration which effect the time-schedule of erection of a factory. But the extra time taken in arriving at a decision once the contractors' bids are submitted is serious. This, the Mission opines, is a part of the decision-making process which should be speeded up considerably.

In the case of private sector projects too, the Mission states, a similar situation exists. Decision-making, in this case again, has become the bottleneck. The time taken to start construction of the factory from the completion of preliminary studies is about 24 months, which is much the same as is taken in the public sector.

At its present stage of development, the Mission observes, India cannot afford to lose time. If two years are lost in commissioning a factory into production,

it makes a great deal of difference in the implementation programme of the Third Plan, which is only a five-year plan. It also means loss of valuable foreign exchange, which in the case of one factory alone would be about Rs. 8 crores—not to mention the exchange needed for the import of food. The Mission recommends that a time limit should be set for arriving at a decision. Once the bids are received, the total time to evaluate these and arrive at a decision should be under four months.

STANDARDISATION OF PLANTS

The Mission advocates setting up of standardised plants in India. This, it says, will result in accruing of the following advantages:

- (1) The capital cost of plants will be reduced and so will the cost of spare parts, of which fewer will be required.
- (2) The plants and spare parts will be more easily made, and hence will be made in India at an earlier date.
- (3) The time required to build plants, train personnel, and start up plants will be reduced.
- (4) Standard plants will facilitate good operation, good maintenance and inter-change of personnel with the minimum of training.
- (5) They will also facilitate and make more valuable the inter-change of design, production, maintenance and other technical data.

It is obviously too late, the Mission says, to attempt standardisation of the heterogeneous fertilizer plants already operating in India or those which are at the final stage of planning or construction. It is, however, definitely not too late, it opines, to consider standardisation of design and equipment for the new fertilizer plants now in the early planning stages and the succeeding plants.

A great capital advantage, the Mission thinks, can be obtained by standardisation of the plants requiring large capital investment. It, however, adds that this cannot be the sole criterion since some equipment and some processes are better adapted to standardisation than others.

For the future, setting up standardised single string ammonia plants of 300-350 tons per day capacity is recommended by the Mission. There should, thus, exist in India two standard sizes of fertilizer plants: (1) the 175 tons per day capacity plants now being built (as at Trombay), and (2) the larger ammonia units recommended by the Mission for future planning. The following plants recommended by the Mission for completion between 1964 and 1965 offer an excellent opportunity for standardisation:

- (1) Gorakhpur,
- (2) Ankleswar,
- (3) Tuticorin or Ennore,
- (4) Mangalore.

The Mission has recommended that these plants should be of the same design and use similar raw material (petroleum naphtha). Another plant in the Koyna area or South Maharashtra could be added to this list for completion in the Fourth Plan.

MINERAL CONCESSION RULES

The Government of India has invited the attention of applicants for grant of prospecting licences, mining leases or their renewal to provisions number 11 and 24 of the Mineral Concession Rules, 1960, which prescribe the time limit within which such applications are to be disposed of. These rules prescribe that in case the State Government does not dispose of the applications within the prescribed time limit, such applications shall be deemed to have been refused after the expiry of the prescribed time limit. Once an application has been refused or it is deemed to have been refused due to its not being disposed of by the State

Government within the prescribed time limit, it will not be permissible for the State Government in accordance with the rules to grant fresh concession or renewal against it.

In all such cases it is necessary for the applicant, in order to safeguard his interest, to come in review to the Central Government in accordance with rule 54 of the Mineral Concession Rules. If an applicant, in the circumstances, does not file a review application, he has no further remedies in respect of his application. It will be open to another person to apply for concessions over the same area and the applicant who has not filed a review application will not be entitled to consideration.

These provisions of the Mineral Concession Rules, 1960, are being specifically brought to the notice of persons interested in mining, as review applications can be filed only within a period of two months from the date an application is deemed to have been rejected.

DISTRIBUTION OF OIL PRODUCTS

The Indian Oil Company Limited, it is understood, is going ahead in right earnest with completing of its arrangements for distribution of oil products. The Company has already taken over from Burmah-Shell its naval tankage installations at Vishakapatnam. One storage tank has also been completed at Cochin and construction of a second tank and a broad-gauge railway siding there is on hand. Storage installations at Wadala, near Bombay, are expected to be ready by July next. Construction work on storage tanks at Kandla is said to be progressing well. The installations at Calcutta are also at an advanced stage of erection; they are expected to be commissioned by October. Construction of depots at Kotah, Nagpur, Bhopal, Amraoti and Sholapur has also been taken up.

The Company had imported 66,000 tons of kerosene and high-speed diesel oil from Russia against rupee payment. Nearly 37,175 tons out of these had been sold by then. A new licence has been issued to the Company to import one lakh tons of kerosene and HSD during the current licensing period. Besides, it has been permitted to import the balance of nearly 50,000 tons of these oil products against the unutilised portion of the previous licence. The Company is also negotiating with the Soviet Union for the import of furnace oil for meeting the growing demand for this fuel in Kandla and Cochin port areas.

To solve the current coal crisis in western and southern India, the Government, it is understood, has decided to encourage switching over from coal to furnace oil in some selected industries. It is estimated that by the end of the Third Plan period, furnace oil will replace coal as energy producing material to an appreciable extent; the demand for furnace oil may increase to about 5 to 6 million tons in 1965-66, as against 2.2 million tons envisaged in the Draft Outline. Most of this furnace oil, however, will have to be imported as the production plans of both the private and the public sector refineries provide for an output of only 1.7 million tons.

ROPEWAYS IN JHARIA, RANIGUNJE COALFIELDS

It is proposed to install seven ropeways in the Ranigunje and Jharia coalfields—one in the Ranigunje area and six in Jharia region. The capital cost of these ropeways, approximately Rs. 10 crores, is envisaged to be advanced by the Government of India as a loan. The foreign exchange cost of the first of these ropeways is likely to be met from the credit made available for the Third Plan by the British Government. Sources for meeting the foreign exchange cost of the other ropeways are being explored at present.

Project reports of six ropeways have already been approved by the Union Government. The project for the seventh one is expected to be finalised in the near future.

COAL REQUIREMENTS OF STEEL PLANTS

According to the latest estimates prepared by the Union Ministry of Steel, Mines and Fuel, coal requirements of steel plants during the Third Plan period are expected to be of the order of 25 million tons per annum.

The Polish Team, which had submitted a preliminary report, towards the end of March last, to the National Coal Development Corporation for operating a deep mine in Sudamdih area, is understood to have submitted draft agreements for preparing a regular project report and for shaft sinking in the mine. They are said to be under examination of the Government.

Import of machinery and technical know-how to work this mine will be financed through the aid provided for the Third Plan by the Polish Government.

INDIAN DELEGATION TO I.L.O. CONFERENCE

The Indian delegation to the 45th Session of the International Labour Conference, scheduled to be held at Geneva from 7th to 29th June, will be led by the Union Deputy Minister for Labour, Mr. Abid Ali. Other members of the delegation are: (1) Mr. R. L. Mehta, Joint Secretary, Union Ministry of Labour and Employment; (2) Mr. A. S. Mehta, Consul-General of India in Geneva; (3) Dr. S. T. Merani, International Labour Adviser, Consulate-General of India, Geneva; (4) Mr. N. S. Mankiker, Chief Adviser, Factories, Union Ministry of Labour and Employment; (5) Mr. Babubhai M. Chinai, M.P.; (6) Mr. P. Chentsal Rao, Secretary, All-India Organisation of Industrial Employers; (7) Mr. K. J. Khambatta, of the Bombay Dyeing and Manufacturing Company; (8) Mr. G. D. Ambekar, General Secretary, Rashtriya Mill Mazdoor Sangh; (9) Mr. Gulab Singh, M.L.C., Financial Secretary, INTUC-Punjab Branch; and (10) Mr. Heera Lal Sharma, General Secretary, Ujjain Mill Mazdoor Sangh. The first four are the Government representatives on the delegation. Mr. Chinai, Mr. Chentsal Rao and Mr. Khambatta will represent the management and Mr. Ambekar, Mr. Gulab Singh and Mr. Sharma will be the representatives of labour.

The 10-point agenda of the Conference includes discussion on reduction of hours of work, workers' housing, employment problems and policies, vocational training, need for equality of treatment of nationals and non-nationals in social security, the proposed convention for partial revision of the convention adopted by the International Labour Organisation at its first 32 sessions for the purpose of standardising the provisions regarding the preparation of reports by the Governing Body of the I.L.O. on the working of conventions, and the role of the I.L.O. in the promotion of economic expansion and social progress in developing countries.

CALCUTTA-ASSAM FREIGHT RATES

The Government of India has appointed a Committee to enquire into the reasonableness or otherwise of the freight rates charged by the Joint Steamer Companies for the transport of goods from Calcutta to Assam and vice versa.

The Indian General Navigation and Railway Company Limited and the Rivers Steam Navigation Company Limited (commonly known as the Joint Steamer Companies) who maintain services as common carriers on the inland waterways of North-East India increased the freight rates for the transport of all commodities, other than foodgrains, by the river route from Calcutta to Assam by 10 per cent with effect from March 15, 1961. Following discussions with the representatives of the Joint Steamer Companies for getting their freight rates reduced, it had been agreed that they would, with immediate effect, limit the enhancement of the rates to 6 per cent till June 30, 1961, and that

in the meantime, the Government of India will hold an enquiry into the economic working conditions and the rate structure of the steamer companies.

The Government, therefore, has set up a Committee to be known as the Inland Water Transport Freight Rates Enquiry Committee, with Mr. S. R. Kalyanaraman, Member, Railway Rates Tribunal, Madras, as Chairman. The other members of the Committee are: Mr. K. Nagaswami, Senior Cost Accounts Officer, Ministry of Finance, Mr. Surendra Nath Barua, Officer on Special Duty, Department of Transport, Government of Assam, and Mr. D. A. Rama Warriar, Under Secretary, Union Department of Transport (member-secretary).

The Committee will examine the traffic handled by the Joint Steamer Companies during the last three years on the river route from Calcutta to Assam, the freight rates prevailing in 1960 and the anticipated traffic and operational results in the immediate future on the basis of the freight rates in force prior to revision in March, 1961, and recommend whether any increase in freight rates is justified and, if so, to what extent. It will also recommend how the increase in freight rates should be distributed among the various commodities other than foodgrains.

The Committee has been asked to submit its report before June 15, 1961.

CENTRAL SEEDS CORPORATION

The Government of India has decided to set up a Central Seeds Corporation as a company registered under the Indian Companies Act, 1956. The Corporation, with a share capital of Rs. 5 crores, divided into 500,000 equity shares of Rs. 100 each, will promote the production of improved seeds in the country by giving financial aid, technical guidance, establishing suitable production and marketing organisations and sponsoring training programmes in collaboration with the Central and State Governments and other interests.

The Corporation will be an autonomous body. Its Board of Directors will include representatives of the Government of India, the seed industry and other interests. It will also have executive and financial committees.

The Foundation Seed Organisation, to be set up under the control of the Central Seeds Corporation, will have control over the production, movement and supply of seeds to units or agencies engaged in the production of certified seeds. Four such units, each of 500 acres, are proposed to be set up during the Third Plan period, for hybrid maize seeds, and one or two units for hybrid jowar seeds. They will also produce seeds of rotation crops such as wheat, groundnut and cotton as also seeds of green manure crops.

The scheme also provides for setting up of certified seed agencies which, as far as possible, will be co-operatives. These will in effect be seed-growing villages with all the villagers in contiguous areas growing the same hybrid or other improved seeds and organised on a co-operative basis.

BRIEFS

In view of the specific recommendations made by the Sachdev Committee on Utilisation of Middlings, the setting up of two coal washeries at Karanpura and Anuppur/Kurasia has assumed considerable importance. It is proposed to include the Anuppur/Kurasia washery in the Third Plan.

During the first quarter of the current year, India exported only 29,079 metric tons of motor spirit, as against 54,141 metric tons exported during the corresponding period last year. Exports of paraffin also declined to 4,518 metric tons in the first three months of 1961, from 5,587 metric tons during the corresponding months of 1960.

BOOK REVIEW

LIBYA'S ECONOMY

THE ECONOMIC DEVELOPMENT OF LIBYA:
Report of a Mission organized by the I.B.R.D. (John Hopkins Press: Price \$7.50).

The Economic Development of Libya is a good well thought out book, written by the Economic Survey Mission to Libya which was sponsored, in late 1958, by the International Bank for Reconstruction and Development at the behest of the Libyan Government. The Mission comprised 13 experts from 9 different nationalities. Their report outlines the problems of the Libyan economy, discusses the long-term possibilities opened up by the discovery of oil there and makes specific recommendations for a five-year development programme for the country.

Some of the basic facts of the Libyan economy are: a population of approximately 1.2 million, 90 per cent of which is illiterate with only a handful of the remaining 10 per cent at a University or higher skilled level; 75 per cent of the population is spread over an area of 1,760,000 square kilometers of "neglected" land and the remaining 25 per cent is concentrated in towns; of the 75 per cent rural population, two-thirds exists on an out-dated agricultural system while the remaining one-third is nomad, living on livestock and shifting cultivation.

Thus, there exists in Libya today a dual economy. On the one hand, there are agriculturists and nomads who till land and graze livestock on the fringes of the desert, largely consuming what they produce, living in one or two-roomed houses, tents, tin shacks or caves and using for transport a camel, horse or donkey; such amenities as electricity and running water are practically unknown to them. On the other hand, there are the rich urban dwellers owning modern villas in towns or cities having brightly lit streets, shops, cinemas, restaurants and gas stations.

The modern sector of the Libyan economy consists of some 40,000 permanently resident Italians, other foreigners who live on a more temporary basis—foreign troops, technical U.N. and U.S. aid programme personnel and oil company employees—and a few thousand Libyans employed in industries and service trades which depend largely on foreign demand or on demand financed by foreign aid.

The urban 25 per cent absorb the influence of foreign aid (military and otherwise) which comprises one-third of the national product; there will, of course, be many more in the near future who will benefit from the direct and indirect multiplier effects of the revenues arising from the discovery of oil, although the actual business of producing and transporting oil is never likely to be a major source of income to them since oil operations are highly capital intensive. The rest of the people receive only one-fourth of the national income. It was estimated that £L 65,000,000 (£L=£s) were there for Libya's domestic use in 1958. On rough calculation, 55-60 per cent of this sum was absorbed by private consumption, 20-25 per cent by current expenditures of the Federal and Provincial Governments, municipalities and foreign aid agencies and 15-20 per cent by gross capital formation, both public and private.

Heavy current expenditure by the Government or by its agencies and gross capital formation of 15-20 per

cent of the national output have not meant increased income for the bulk of the Libyan people and neither will they increase their revenue in the near future if the national output continues to be spent in the same way as hitherto. The reasons for this are not far to seek; they are: shortage of skills; heavy concentration on social investments which take a long time to yield fruit; the need in agriculture to make good heavy arrears of investment in measures of soil and water conservation; the high cost of Government and investment in Government buildings; the dispersal of a small population over a huge area necessitating abnormal investment in transport and communications. All these factors, particularly the first one, help to explain why economic development programmes have so far yielded only limited dividends in terms of increased output.

The Mission thinks that at present agriculture and processing of agricultural products are the best activities that can be pursued in Libya. Fishing and tourism have great potential for development in the near future. In the long run, development of petro-chemical industries can add considerably to economic wealth. It is, however, necessary to build up the abilities and skills of the people, to give agriculturists individual rights on land, to provide improved Government services to the peasantry, to extend water and soil conservation work and to create better facilities for credit, marketing, cold storage and transport. To achieve all this, the Government has to be better organized, education and technical training must get high priority, the Federal Government must get more authority and there must be better co-ordination between the Federal Government and the provinces in the planning and execution of development programmes. The size of the public development programme should be increased gradually. The agriculturist must get an individual right to the land.

The latter recommendations are all to the good; otherwise there is no possibility of real economic progress reaching the mass of the people, i.e., the ones who are tied to the land. The imperative need seems to be a reform of the land laws. The Mission could perhaps put more stress on this.

The Mission is to be congratulated for its careful compilation of statistics. Further, it deserves congratulations for its very reasonable judgment of the capacity of the Libyan social system to absorb a development programme. Its recommendation for public capital expenditure of the order of £L 25 million for the five years, April 1960-65, appears to be very sound. The assumption is that total public expenditure, recurrent and capital, will rise from an estimated £L 20-21 million in 1959-60 to £L 24-25 million in 1964-65. Such a high level of public expenditure (50 per cent of the estimated gross product for 1958) is justified on the assumption that large oil revenues will eventually be forthcoming to sustain it.

Libya has a wonderful chance—a high revenue with a small population and a good authoritative report outlining its economic road. It must now get down to tackling its politico-economic problems of strengthening the Federal Government and of reform of its land laws, as also the educational problem of raising the level of skills of its nationals.

—V. A. KIRPALANI.

COMMODITY NEWS AND NOTES

ALL-INDIA FINAL ESTIMATE OF DRY GINGER, 1960-61

The All-India Final Estimate of Dry Ginger, 1960-61 puts the current year's area and production at 43,600 acres and 16,400 tons respectively, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. As compared with the Partially Revised Estimates of 41,000 acres and 15,200 tons for 1959-60, the estimates for 1960-61 show an increase of 2,600 acres or 6.3 per cent in area and 1,200 tons or 7.9 per cent in production. The increase in area under ginger during the current year as compared to the previous year is accounted for mainly by Kerala, the main ginger producing State, and West Bengal and is attributed to favourable weather conditions at the sowing time. The increase in production is also shared mainly by these States and is attributable partly to the increase in acreage and partly to favourable weather conditions during the growing period.

MINERAL CONCESSION RULES, 1960

The Government of India have invited the attention of applicants for grant of prospecting licence, mining lease or their renewal to rule 11 and 24 of Mineral Concession Rules, 1960, which prescribe the time limit within which such applications are to be disposed of. These rules also prescribe that in case the State Government does not dispose of the applications within the prescribed time limit, such applications shall be deemed to have been refused after the expiry of the prescribed time limit. Once an application has been refused or it is deemed to have been refused due to its not being disposed of by the State Government within the prescribed time limit, it will not be permissible for the State Government in accordance with the rules to grant fresh concession or renewal against it.

In all such cases it is necessary for the applicant, in order to safeguard his interest, to come in review to the Central Government, in accordance with rule 54 of Mineral Concession Rules, 1960. If an applicant, in the circumstances, does not file a review application, he has no further remedies in respect of his application. It will be open to another person to apply for concessions over the same area and the applicant who has not filed a review application will not be entitled

to consideration. These provisions of the Mineral Concession Rules, 1960, are being specifically brought to the notice of persons interested in mining, as review applications can be filed only within a period of two months from the date an application is deemed to have been rejected.

U.S. COTTON OUTLOOK

The 1960 cotton crop of 14.3 million running bales was about 2 lakh bales lower than that of 1959. Harvested acreage increased but yield per acre was down. With the starting carry-over also down from 1959, total cotton supplies of about 22.1 million bales for 1960-61 are 1.5 million bales below 1959-60. And with disappearance probably at about 15 million, carry-over next August should be around 7 million—about 1/2 million bales below 1960 and the smallest since 1953. Cotton exports for the entire season probably will be about 3/4 of a million bales lower than that of a year earlier.

PROBE INTO DECLINING EXPORTS OF INDIAN TEA

The Indian Tea Association and the United Planters' Association of Southern India have jointly made a representation to the Government of India to find out the causes of declining tea exports to the U.K., U.S.A., and to some extent to Canada. In an interview in New Delhi, Mr. D. C. Kothari, former president of the UPASI revealed that apart from strong overseas propaganda of Ceylon, African teas are coming into market in a big way and there is increasing competition from Brazil as well. Mr. Kothari who represents tea, coffee and rubber interests in the country on the Executive Committee of the Federation of Indian Chambers of Commerce and Industry, said the cost of Indian tea production was growing and, that the heavy taxation left nothing to plough back for further investment. During the last budget presented to the Indian Parliament on February 28, Mr. Kothari said, the Government had shown some awareness to making Indian tea very competitive abroad with the lower export duties. But in the opinion of the industry, the relief given was insufficient. Fertilizers were in short supply in the UPASI area. Tea propaganda within the country, Mr. Kothari emphasized, should be intensified. The number of tea promotion officers now being posted abroad, should also be increased.

COMPANY AFFAIRS

BELSUND SUGAR

During the year to September 30, 1960, the Belsund Sugar Company Limited crushed 35.08 lakh maunds of sugarcane as compared to 31.12 lakh maunds in the previous year. In fact the quality of cane during the year under review was inferior in quality due to draught conditions and naturally the recovery was at 9.47 per cent as compared to 10.15 per cent in the previous year. The sale proceeds of the Company during the year under review were slightly lower at Rs. 1.11 crores against Rs. 1.26 crores during the previous year. Naturally, therefore the profit was slightly lower at Rs. 6.59 lakhs against Rs. 6.63 lakhs last year. After making the adjustments for taxation and development rebate reserve, the Directors proposed the payment of dividend at the rate of Rs. 1.40 per share subject to reduction of tax, absorbing Rs. 3.64 lakhs.

The Directors report that the crushing during the season 1960-61 is expected to be more than 48 lakh maunds and it is estimated that the industry will produce about 27 lakh tons of sugar.

DEORIA SUGAR

The season 1959-60 for Deoria Sugar Mills Ltd. was not very favourable because the Company crushed 31.70 lakh maunds of cane, with a recovery of 9.48 per cent which was considerably lower when compared to last year's cane crush of 32.63 lakh maunds with an average recovery of 9.72 per cent. The higher crush and recovery that was achieved during the previous season fell short of the year under review mainly due to series of unprecedented machinery troubles, which led to a loss in recovery too. The Directors have reported that necessary steps have been taken both from administration as well as mechanical side to set the matters right and the working of the factory in current season 1960-61 has been considered much better. The mills are reported to have crushed 36.33 lakh maunds of cane with a recovery of 9.3 per cent. The total estimated crush for the current season may be in the neighbourhood of 40 lakh maunds of cane. The reports from the factory reveal that the plantation of cane is progressing satisfactorily and the Directors expect to have still better crush and net gain than the last year. During the year to August 31, 1960 the Company made a gross profit of Rs. 3.75 lakhs as against Rs. 8.72 lakhs in the previous year. After making usual provisions for depreciations and taxation the Directors proposed the payment of a dividend of 35 nP. per share of Rs. 10 each subject to deduction of tax.

SITARAM SUGAR

Shri Sitaram Sugar Company during the year to August 31, 1960, crushed the total quantity of 34.42 lakh

maunds of cane with a recovery of 9.46 per cent. Last year 31.40 maunds of cane was crushed with a recovery of 9.60 per cent. The increase in total quantity of cane available for the crush this season was mainly due to large area and higher yields, as a result of cane development efforts on the part of the Company. The Directors have reported that the recovery percentage was slightly lower than the previous season mainly for two reasons: in the first instance, excessive rains in the earlier part of the season delayed maturity of cane and secondly due to higher crush the duration of the season had to be extended further during the low recovery periods. The Directors added that during the current season 1960-61 total cane crushed may be around 40 lakh maunds and the recovery too may be higher.

During the year under review the Company recorded a gross profit of Rs. 7.48 lakhs. After making usual appropriations towards depreciation and taxation, the Directors have proposed the payment of dividend on ordinary shares at the rate of Re. 1 per share of Rs. 10 each.

COMPANIES REGISTRATIONS IN THE EASTERN REGION

Two hundred and thirty-eight new companies with a total authorised capital of over Rs. 36 crores were registered under the Companies Act, 1956 in the Eastern Region, comprising West Bengal, Bihar, Assam and Orissa during the half-year ended March 31, 1961. Of these 26 were public limited companies with an authorised capital of Rs. 26.78 crores, 210 private companies having an authorised capital of Rs. 9.72 crores and the remaining two were companies limited by guarantee.

Forty-five public and private companies with a total paid-up capital of Rs. 88.82 lakhs went into liquidation while 51 companies with a total paid-up capital of Rs. 1.47 lakhs were finally dissolved.

In West Bengal 215 companies with a total authorised capital of Rs. 33.42 crores were registered during the period under review. Of these 24 were public companies with an authorised capital of Rs. 24.53 crores, 189 private companies having an authorised capital of Rs. 8.87 crores and two companies limited by guarantee. In Bihar two public companies and nine private companies were incorporated having authorised capital of Rs. 2.25 crores and Rs. 52.00 lakhs respectively. Six companies with total paid up capital of Rs. 4,39,000 (approximately) went into liquidation during the period. Only two companies having an authorised capital of Rs. 10 lakhs were registered in Assam. In Orissa, ten private companies having authorised capital of Rs. 23.20 lakhs were incorporated.

Company Meeting

THE KOHINOOR MILLS COMPANY LTD.

CHAIRMAN'S SPEECH

By

MR. A. N. HAKSAR

Gentlemen,

I am glad to report that the year under review has definitely been an improved one for your Company. The working in all sectors of the Mill was better than last year and higher efficiency and production were achieved. Your Company increased the production of fine and super-fine fabrics to suit consumer demand. New bleached and dyed sorts in both men and women's wear were introduced and some of these have been popularised in the market. The Company progressively started 45,500 spindles by introducing a third shift in the spinning section of No. 2 Mill. This was done without additions to preparatory machinery. In your No. 3 Mill, screen printing was introduced and is running satisfactorily now.

COTTON:

The Cotton Year 1960 was a most difficult one. Untimely rains in most cotton producing districts adversely affected the crop quality and quantity. Early estimates of a 48 lakh bales crop had to be revised to 38 lakhs resulting in an acute scarcity of desirable qualities and a sharp advance in prices. Despite liberal imports and restrictive measures taken by the Textile Commissioner in the form of quality controls and Mill Quotas, cotton prices continued to advance. By the end of December, an extremely tight supply position was evident and at January end the situation was alarming. To overcome this shortage and enable Mills to maintain their production, Government was forced to step up imports of foreign cotton, especially of short staples from America. Even so, stocks in mills were reduced to a minimum at the commencement of the new crop. Fortunately, the quality of the new crop was good and first estimates forecast 50 lakh bales. To stabilise the market, however, the Textile Commissioner continued the system of Mill Quotas and Quality Control. These measures assisted by a larger crop, had the desired effect of bringing down prices and the position was much improved by the new cotton year. Your Company, like other textile units, suffered from higher prices both for Indian and imported cotton for the year under review.

CLOTH:

During the first half of the year, cloth movement was good and the stocks carried by the Company were reasonably low. In the second half, however, Government made it known that a reduction in cloth prices was desired. This caused uncertainty in the market and the movement of cloth became extremely sluggish. Negotiations took place between Government and the Indian Cotton Mills Federation and it was agreed to start stamping prices on cloth from 10th September, 1960, on a formula based on August 1959 cloth prices. Even after the agreement was reached, Government required still further reduction in cloth prices and, therefore, uncertainty in the market continued. The final formula applicable from 1st January, 1961, resulted in a still further reduction. This price reduction will obviously bring down the profit margin of all mills. It will be the endeavour of your management to make up

this shortfall in profit by improving working efficiency. Until the formula was agreed, movement of cloth was nominal and, therefore, stocks at the end of the year were higher than had been expected.

In our endeavour to earn foreign exchange both for the country's and your Company's benefit, we stepped up our exports from Rs. 22.37 lakhs last year to Rs. 34.97 lakhs. Even though we sell in the export markets at marginal profit levels, your management considers it beneficial to export with a view to earning machinery licences to modernise your Mills and to obtain licences for the import of extra quantities of cotton. In the coming year we hope to maintain and, if possible, to step up our export programme. This would, of course, depend upon market tendencies.

YARN:

We had no problems in the marketing of sewing thread and its movement was well maintained through the year. We ventured into certain new and more paying counts of yarn, and a part of this benefit was felt during 1960. Our yarn exports for 1960 were Rs. 15.51 lakhs against Rs. 7.44 lakhs last year.

SALES AND STOCKS:

Our sales for both cloth and yarn continued smoothly. I have explained above the reason for an increase in stocks in December, but as the trade finally settled down in January 1961, stocks moved extremely well. I am glad to report that today our total stocks of finished products constitute only about three weeks production. This is a very satisfactory position. It will be our endeavour to maintain low stocks and reduce them further if possible. Our thanks are due to your Selling Agents who have done very well throughout this period.

LABOUR:

By the Central Wage Board Award 1959, the basic wages of textile workers were enhanced by an average of Rs. 8 per worker. This was the first step in a two-phased programme which was intended to give a total benefit of Rs. 10 per worker. The additional Rs. 2 will be levied in 1962. Whereas this was a benefit to the labour force in the textile industry, it was a tremendous drain on the profitability of Mill units. This Award, however, recognised rationalisation as a part of the total scheme. This, I feel, is a step in the right direction as the Indian textile industry can only become competitive in world markets by linking up the utilisation of rationalised labour with high production machines.

Our relations with the Rashtriya Mill Mazdoor Sangh, which is the recognised Labour Union for our Mill, were most cordial, and with their help rationalisation and standardisation measures were introduced in various sectors. In all 785 posts were reduced and this without any deterioration in our labour relations. Out of this, retrenchment compensation and gratuity was paid to 547 persons and we took advantage of

natural wastage to abolish the balance 238 posts. The R.M.M.S. gave us their full co-operation during this period and assured us of their complete assistance in future. In our No. 3 Mill, the four-loom-to-a-weaver system was introduced in half the Weaving Shed and to avoid unemployment and the payment of retrenchment compensation and gratuity, a second shift was started in the whole Weaving Shed in the middle of the year.

MACHINERY:

A comprehensive programme of maintenance and rehabilitation was carried out throughout the year. New machinery of the value of Rs. 37.68 lakhs was installed in your Mill and we have further orders on hand for machinery worth Rs. 46 lakhs. New N.M.M. Ring Frames were received from the month of March onwards and these are being progressively erected to replace old ones. A new set of Whitin Combers was erected and are in production. The Company also installed the latest type of hot air stenter from Germany and automatic pirn winders from Holland. Most humidification systems were renovated and these have greatly improved working conditions. We have still to receive a number of modern machines which will improve the quality of your mill production. The 48 automatic looms which we had been allotted some while ago are now on order, but unfortunately no further allotments have been made. I trust, however, that in due course we will receive further licences to enable us to have a full shed of this machine. Your Management is seeking all avenues to modernise in the best and quickest manner possible.

NO. 3 MILL:

For your No. 3 Mills, which is a Silk and Art Silk Unit, we have been facing the problem of non-availability of raw material. There is a great shortage of synthetic

yarn in the country and sometimes very high premiums have to be paid for yarn vitally needed to keep the Unit working. To solve this problem, your Management has decided on a policy of export for earning licences for the direct import of the required yarn. This policy will certainly bear fruit and we hope the account of No. 3 Mill will show a marked improvement in 1961.

PROFIT AND LOSS ACCOUNT:

From this you will notice that we have shown a gross profit of Rs. 32.18 lakhs after adding back to the net profit Depreciation, Taxation, Managing Agents' Remuneration and Development Rebate totalling Rs. 24,41,572. This profit has been arrived at after payment of certain non-recurring charges which absorbed Rs. 15.91 lakhs. These constituted mainly of retrenchment compensation and gratuity paid (Rs. 6.49 lakhs and Rs. 4.50 lakhs respectively), and the payment of staggering compensation for the year 1952 amounting to Rs. 4.92 lakhs. Although these measures have reduced the profits in the year under review, there is no doubt that in the years to come these losses will be more than recouped and the Company will stand to benefit. You will appreciate that the actual working profit for this year was more than double that of the preceding one. This, I submit, is a reasonable achievement. I can only hope that this improvement will be maintained.

There were a few other additional burdens the Company had to bear over and above last year. Like all other Mills, we paid an additional average of Rs. 8 per worker which totalled Rs. 7 lakhs for the year. Dearness allowance was higher by Rs. 11.75 lakhs. The bonus for 1958 was also paid which amounted to Rs. 2.96 lakhs.

Note: This does not purport to be the proceedings of the Annual General Meeting which can be seen by any shareholder on request.

GOVERNMENT OF INDIA

Further Issue of $3\frac{1}{2}$ per cent. National Plan Bonds — Third Series ($3\frac{1}{2}$ per cent. 1967) — Issue Price
Rs. 98.90 per Rs. 100 (Nominal) — Repayable at par on 16th July, 1967.

The holders of $3\frac{1}{2}$ per cent. National Plan Bonds (First Issue) 1961, $2\frac{1}{2}$ per cent. Loan 1961 and 3 per cent. Hyderabad Loan 1951-61 (H.E.H. the Nizam's Government 3 per cent. O.S. Rupee Loan 1360-70F) have been given the facility of converting their holdings into $3\frac{1}{2}$ per cent. National Plan Bonds — Third Series ($3\frac{1}{2}$ per cent. 1967) to be issued at Rs. 98.90 per Rs. 100 (Nominal) and repayable at par on 16th July, 1967.

2. Securities tendered for conversion will be accepted at the following rates:-

$3\frac{1}{2}$ per cent. National Plan Bonds (First Issue) 1961: Rs. 100 per Rs. 100 (Nominal).

$2\frac{1}{2}$ per cent. Loan 1961: Rs. 99.75 per Rs. 100 (Nominal).

3 per cent. Hyderabad Loan 1951-61: Rs. 85.00 per Rs. 85.71 or O.S. Rs. 100 (Nominal).

3. Interest on the securities tendered for conversion will be paid at the respective rates upto 31st May, 1961 inclusive. Interest on the $3\frac{1}{2}$ per cent. National Plan Bonds — Third Series ($3\frac{1}{2}$ per cent. 1967) to be issued by way of conversion will be paid from 29th May, 1961; interest warrants for the period 29th May to 15th July, 1961 inclusive will be delivered along with the new securities and thereafter interest will be paid half-

yearly on 16th January and 16th July, commencing from 16th January, 1962.

4. Applications for conversion will be received during the period 29th May, 1961 to 3rd June, 1961 (both days inclusive) at the following places:

- Offices of the Reserve Bank of India at Bangalore, Bombay, Calcutta, Madras, Nagpur and New Delhi;
- Branches of the State Bank of Hyderabad conducting Government work and those at Jagga-yapet, Mancherla, Nagarjunasagar and Sirpur Kagaznagar in Andhra Pradesh, Manwath, Purli-Vaijnath and Sailu in Maharashtra State and Shahabad in Mysore State.
- Branches of the State Bank of Mysore in the State of Mysore except those at Bangalore, Mangalore and Gulbarga; and
- Branches of the State Bank of India at Mangalore and at other places in India except at the places specified in (a), (b) and (c) above.

For full particulars, a reference may be made to any of these offices/branches, or Government Treasuries.

**TWO of India's leading Banks* choose
WORTHINGTON air conditioning**

...for year-round 'engineered climate'

The imposing new buildings of the United Commercial Bank and the Punjab National Bank
at New Delhi are completely air conditioned (for summer cooling and winter heating)
with WORTHINGTON Centrifugal Systems — 230-tons and 300-tons respectively.

These Banks offer not only excellent banking facilities but the right atmosphere
for their patrons and ideal working conditions for their employees.

These are yet other instances where high performance and economy
in operation led logically to BLUE STAR engineered
WORTHINGTON installations. Whether your requirements
are large or small — you will find that BLUE STAR
can serve you best in 'climate control.'

Why do I prefer it?

It has a greater cooling capacity.

Protrudes only 2½" into my room.

It lasts many years.

And Service is superb,

prompt, efficient and

in fact, the best in India.

Naturally—I prefer a Crystal.

A Voltas Crystal air conditioner cools a room, cuts down outside noise and allows you to work, relax, or sleep undisturbed. It creates a cool climate healthfully free of dust, damp and insects. This hardy machine, specially designed for India's difficult climatic conditions, is built to last you many years.

With a Voltas Crystal you get famous Voltas Service—the best in India.

More people buy a Crystal than any other air conditioner.

Crystal

Exploration at Vienna

TO describe the meeting between President Kennedy and Mr Khrushchev at Vienna on June 3 and 4 as another summit conference is a misnomer. It is also to miscalculate its purpose and to set, by implication, exaggerated standards to assess its outcome. The Washington communique on the agreement to hold the meeting anticipated speculation of this variety and it took the precaution to explain that the object in holding the talks was not to negotiate and conclude any settlement on the international issues crying for solutions at the present time. If a summit conference is to be held on a compact basis, by limiting it to the Big Two in place of the Big Four, the least that Western unity and identity would require is prior consultation between the allies. No such consultation has been arranged and it is by a chance coincidence, resulting from a programme fixed earlier, that President Kennedy is scheduled to have talks with President de Gaulle on the eve of the Vienna meeting. The Moscow radio has broadcast that the object of the two leaders in getting together is to open up a new prospect of improved relations between the Soviet Union and America which may produce a salutary effect on lessening existing tensions. The object of the Vienna talks will be exploratory—to hold a dialogue to try to understand each other, to explain respective viewpoints in an effort to narrow down the area of tension and to discover the possibility of reaching a common ground.

Any attempt to recall for comparison the Geneva Conference of 1955, the profuse display of a new spirit at Camp David in 1959 or the debacle at Paris in May 1960 would be out of place. It would also be hardly relevant to question whether President Kennedy has agreed to a timing that could be considered appropriate. The swift developments in Laos and Cuba have produced adverse repercussions on American influence in the context of international affairs, Russia's space performance, though offset partially by America's success, has nonetheless shown the present time-gap and on the Continent itself President de Gaulle's regime has still to recover fully from the aftermath of the Algerian shake-up. It is persistently asked whether this atmosphere is propitious for talks to produce substantial results.

The White House communique explains that discussion was started as early as the beginning of March through diplomatic channels to arrive at an arrangement on holding the talks and that these preliminary approaches were followed by a regular exchange of communications between President Kennedy and Mr. Khrushchev. The period of these diplomatic and direct communications was coincident—particularly its latter half—with

the developments which are being mentioned. If in spite of them, President Kennedy has deemed it essential to meet Mr Khrushchev and the latter finds no bar in them to hold useful talks, it underscores the object of the meeting which is exploratory. And there can be no exploration worth the name without a personal contact and a personal exchange of views.

The question of negotiating from positions of strength hardly arises at all. In the first place, there is no agenda that should contain issues on which negotiation is sought for a settlement. In the second place, a build-up of strength by the two leading countries is part of the objective philosophy of each as a defensive preparation. President Kennedy's message to Congress on May 25 to launch a great positive adventure, to which a solid content is to be given by a defensive build-up, including a 9-billion dollar five-year programme for the space conquest, was delivered at this time as part of the American process of Congressional appropriations for the ensuing fiscal year. Neither Russia nor America has indulged in the incredible professions of unilateral nuclear disarmament or at least freezing of such armament. The fact that the American programme is publicly announced, while the Russian programme which is under way is not, explains the difference between the democratic and totalitarian processes of budgetary expenditure. It would be an error to read anything purposeful in yesterday's presidential message to Congress.

An exchange of views necessarily implies a brief discussion on each important outstanding problem. President Kennedy and Mr. Khrushchev, as leaders of the two premier nations leading the two world blocs, have it in their power to influence, within the limits of their political systems, the defence and international policies which their governments have to carry out. It is from this angle that personal contacts between them and a meeting of minds are vitally necessary to explore fresh ground to reduce existing tensions. The greatest single obstacle to their reduction and eventual elimination is armament, which, in the existing context, means nuclear armament. Coexistence is no longer a question for debate. It is accepted by both the sides. In the growing state of nuclear armament, no alternative to peaceful coexistence is possible except that of co-destruction. An explosive nuclear build-up holds a perpetual terror and a dangerous potentiality of being let loose in a moment of desperate decision. The Geneva deadlock notwithstanding, it is nuclear control to which the exploratory dialogue will be principally directed.

The Accord on Oil

NEGOTIATIONS between the Burmah Oil Company and the Union Ministry of Fuel on oil exploration in Assam, over an area of 1,800 sq. miles in the neighbourhood of Nahorkatiya and Digboi oilfields, have come to a fruitful end. Understanding has been reached at the "official" level on the terms and conditions for the issue of a prospecting licence to Oil India Limited, a partnership firm of the Government of India and the BOC; a formal agreement is expected to be signed early next week. In the absence of precise details of the pact, it is difficult to say which party has got the better of the bargain. On the Government side, much of the grace in coming to a fair settlement has been lost in view of the failure of talks with the Esso Standard Oil Company and the stalemate in the negotiations with Ente Nazionale Idrocarburi of Italy.

From the precious little that has been permitted by the Fuel Ministry to percolate through selective channels, it appears the Burmah Oil Company would give to the Government 50:50 partnership in Oil India Limited, which will enable the latter to have equal representation on Oil India's Board of Directors. The Chairman of the Board and the Financial Director of the reconstituted Oil India would be alternated between the two partners by annual rotation. The BOC has been assured of an average return of about 10 per cent on its capital employed in Oil India; for this a formula has been evolved which would govern the price of Nahorkatiya crude and of the oil that may be struck in the area for which a new prospecting licence is to be granted. The Burmah Oil Company will meet all the foreign exchange cost of the project, but Oil India will have no share in the refining and marketing of the oil. It will also pay all the taxes which aggregate 63 per cent of the profits. An assurance has been given to the BOC that the existing share of its subsidiary, the Assam Oil Company, in the petroleum products market of Assam will be safeguarded; it may even be given some concession on exchange of products with the Nummati Refinery. The pre-production expenditure which Oil India may have incurred, or will incur, on exploring the area, including that on infructuous wells, will be treated as expenditure for the purposes of income-tax. Since the effective control of administration of the reconstituted Oil India has been left to the technical skill perfected by the BOC, undue interference in the day-to-day matters, it is hoped, would be avoided. The agreement needs to be implemented in the spirit it has been entered into.

The accord obviously has been reached after considerable accommodation from each side. The Burmah Oil Company has made a major concession in stepping up the Government share in Oil India from one-third to parity. Mr. K. D. Malaviya, the Minister for Fuel, has apparently climbed down from the high pedestal of ideology — may be, by the hard logic of reality. The agreement, it is fair to presume, sets the pattern for future collaboration in oil exploration with foreign private investors. Incidentally, it removes one superfluous hurdle in the flow of foreign private investment into India. By the consensus of authoritative business opinion abroad, the obduracy shown so far in Government's oil policy had a deterrent effect on the inflow of foreign private capital. The modification now introduced should help fostering an attractive climate.

In view of the rapidly expanding industrial base of the Indian economy, our oil requirements

are bound to grow at a strident pace. Conservative estimates, based on the current pattern of energy consumption, made by an expert, put India's minimum requirements of petroleum products at about 12 million metric tons by 1966, 16.4 million tons by 1970, 24.1 million tons by 1975 and 35.9 million tons by 1980. These may go up substantially—anywhere up to 23 million tons by 1970, 39 million tons by 1975 and 72 million tons by 1980—if the pattern of energy consumption changes as envisaged in official assessments. To provide for the minimum needs alone, the crude oil requirements will be of the order of 13.2 million metric tons in 1966, 18 million tons in 1970, 26.5 million tons in 1975 and 39.5 million tons in 1980. Of this, India today produces only a fraction. The indigenous output even after exploitation of the Nahorkatiya-Moran and the Cambay-Ankleshwar oilfields will be about 4 million metric tons per annum. To meet the oil requirements of the Third Plan alone, it is estimated we will have to incur an expenditure in foreign exchange to the tune of Rs. 520 crores.

There is, thus, a need to redouble our efforts to tap indigenous sources of crude oil. This is a function primarily of expeditious exploration of the country's potential oil-bearing belts and this type of exploration involves the risk of a gamble. The experience of the public sector in oil exploration—though the Oil and Natural Gas Commission has been singularly lucky in finding oil in Cambay, Ankleshwar and Sibsagar areas without heavy investment—is not adequate to the task by global standards. The time taken by the ONGC in drilling a well is much too long and unless greater efficiency is injected into its operations, the ONGC, despite all the luck it has, cannot be expected to deliver the goods in an optimum period. Large areas which may be having black gold in their bowels have been reserved by the Government for exploration by the public sector. This is, perhaps, a folly. The interests of the nation brook no delays in the exploration of these areas as the huge outlay of foreign exchange on imports must be eliminated as expeditiously as possible. Oil imports otherwise will be a criminal drain on the country's limited foreign exchange resources, thwarting the development of the economy in other sectors. It is to be trusted that the new chapter which has now been opened will be carried to its logical conclusion. In this alone the interests of the nation really lie.

Some foreign oil companies may like to come to terms with the Government of India on slight variations from the agreement with the BOC; instead of offering 50 per cent partnership to the Government, they may offer 25 per cent to it and another 25 per cent to the private Indian investor, which, in effect, safeguards the principle of parity for India. This should be tried. Again, the Burmah Oil Company may also be interested in areas like the Indo-Gangetic Plain or the Himalayan southern foothills. The capital which this company is understood to be diverting to South America and elsewhere can profitably be induced to stay in India. Since refining of crude has been specifically earmarked for the public sector—which is of key significance—there is little to lose by interesting foreign companies in oil exploration here. Inducement to foreign capital to remain or flow into India can be offered effectively only if the pragmatic, flexible approach now accepted by the Government is faithfully adhered to. Let us hope that there is an end to ideological brinkmanship.

Project Planning for Fertilizers

MORE than usual interest attaches to the report of the United Nations Fertilizer Mission, a brief summary of which was published in the last week's issue of *The Eastern Economist*. Food self-sufficiency by the end of the Third Plan has become not only an acid test of the success of planning but a pre-condition of the accelerated development of the economy in every other sector. Even industry cannot be expanded at the rate necessary to redress the imbalance in the economy, unless expenditure of foreign exchange on food imports is first eliminated.

A new urgency has now been imparted to the achievement of self-sufficiency in food and in real terms it demands a higher target of food production. The preliminary estimates of the 1961 census results have brought the agonising reappraisal that the first sector of the economy in which the targets in the Third Plan must be revised upwards is food. It is the estimate of *The Eastern Economist* that the target of output of foodgrains will now have to be stepped up by not less than 3 million tons. Any future increases in the production of food can be brought about principally and substantially by intensive methods of cultivation alone. There is no conceivable alternative.

Among the intensive methods of cultivation, first reliance must, perforce, be placed on extensive application of chemical fertilizers. In fact, the contribution of chemical fertilizers to the additional output of foodgrains in the Third Plan cannot be less than two-fifths of the total. If a slogan were to be coined for food self-sufficiency, it would hardly be possible to find any more meaningful than "fertilize or perish". This vulnerable dependence on fertilizers as the mainstay of additional food production imparts special significance to the planning for fertilizer projects. It is the realisation of this urgency and the technical complexities involved in the decisions on setting up fertilizer projects that impelled the Government to obtain the good offices of the United Nations Fertilizer Mission to enable it to reach correct decisions on the projects after the spade work was completed by the Kane Committee. The Mission's report is in the hands of the Government now for nine months and it is only to be presumed that full consideration has been given to its views on the merits or otherwise of the individual projects.

There appear to be grounds for misgivings that the Mission's expert advice is receiving less than the weight that is undoubtedly due to it. Some representative illustrations may be cited. The Hanumangarh project in Rajasthan has a potential market in the State itself and on this ground the location of the project is fully justified. But in the context of the Third Plan it is hardly entitled to priority as the demand will materialise only after more experience is gained to stabilise large-scale farming and irrigation facilities bring large areas under cultivation. But the licence for setting up of this plant has already been granted and, in the result, the output will have to be marketed at a high transport cost. The plant at Itarsi is out and out a low priority project and it could certainly have been relegated to

the Fourth Plan, but in this case, too, the licence for the plant has been issued and an erroneous priority is being allowed to divert foreign exchange from other programmes of higher urgency. Similarly, the Mission had strongly urged that the two projects in Andhra Pradesh at Visakhapatnam and Kothagudam should be operated as a joint enterprise for a variety of technical reasons. But the grant of the licence for the Visakhapatnam project to a private party and the reservation of the Kothagudam project for the State Government obviously defeat the Mission's recommendation. It must be questioned whether the State Government would have made any surrender of genuine gain to the State, if it had abandoned its pet scheme of operating this plant under its own auspices.

The end of the Third Plan will find a string of thirteen fertilizer plants fully or partially erected in this country. This is obviously a period of concentrated development of fertilizer projects and it offers quite a fruitful opportunity to plan the projects on an integrated basis of proved principles and techniques. The Mission has argued a very strong case for the standardisation of groups of plants on the ground of reduction in capital costs, expediting indigenous manufacture of whole equipment as well as spares, saving in construction time, uniformity in the training of technical personnel and facility in maintenance techniques among other benefits. It has suggested two standards for fertilizer plants in this country and has stressed the point that a good start can be made in standardisation at least with the five plants at Gorakhpur, Ankleshwar, Tuticorin, Ennore and Mangalore. Since all these projects are still being processed, standardisation can be laid down as one of the imperative conditions in the issue of licences.

This concentrated programme of expansion of fertilizer projects necessarily raises the basic question of procuring the technical knowhow. Frankly, the Mission has made the forthright suggestion that in many of these plants the services of foreign technicians will need to be obtained at the top level. Standardisation will surely facilitate the schemes of technical training at all levels, including engineers, supervisors, operators and craftsmen. But a broad-based plan of building up indigenous cadres will have to be drawn up in advance. The Mission has uttered a timely warning against the paradox of waste of technical skills in the midst of their scarcity. The number of engineers and chemists normally employed in India's fertilizer plants is excessive by any test. Productivity per man-hour, too, leaves considerable room for improvement. Here is one direction in which the resources can be conserved, while there is a pressing need to acquire more.

It is one of the fortuitous circumstances attending the priorities in the setting up of the plants that they will necessarily be spread over the entire period of the Third Plan. This opportunity can certainly be put to good use by refraining from making any further departures from the advice of the experts. There is still ample area available to proceed in the right direction.

THE WEEK'S NOTES

Iran

ANOTHER BID FOR REFORM

THE CUP of corruption and maladministration was full to over-flowing when the Shah of Iran made a supreme decision to dismiss his Cabinet of Ministers and appoint Dr. Alimi as the new Prime Minister. Four generals and several civilian officials holding high ranks have been put under arrest. The immediate cause which resulted in the previous Ministry toppling down was the general strike of teachers (forced to go without pay) in which one was shot dead in the capital city. This was a signal for a likely conflagration to be kindled. But the dismissal of the Ministry put a stop to further precipitate developments.

It is an empty treasury which Dr. Alimi has taken over. It has been emptied by reckless expenditure undertaken by a corrupt administration. Popular discontent was rising high, but there was no genuine forum from which to ventilate it. The Majlis was elected under laws which were anything but just and fair. The Majlis and the Senate have now been dissolved and it is Dr. Alimi's important charge to evolve fair laws to ensure free elections. The first nationwide reform which is indispensable for progress in any direction is the breaking up of the huge-sized agricultural estates and redistribution of land. Dr. Alimi himself belongs to the landed aristocracy, but he holds progressive views and believes conscientiously in reform through redistribution of land as the primary necessity of the economy. There are other reforms too, but more urgent than any of these is the stamping out of corruption and establishing a clean administration which will inspire the confidence of the people. This is a herculean task. The entire administration needs to be toned up and overhauled to the extent practicable before programmes of economic development can be executed faithfully.

No time schedule has been fixed for the holding of the general elections to the Majlis and restoration of parliamentary rule. This gives Dr. Alimi good starting opportunity to put through expeditiously the urgent, preliminary administrative measures without the handicap of the dilatory process which was proverbially involved in the leisurely working of the Majlis. Dr. Alimi was Ambassador of Iran in Washington as recently as 1957 and it may be that now as Prime Minister his task may be facilitated, if an approach is to be made for economic aid from abroad which the near-bankrupt state of the treasury may make indispensable. It is likely that in the general elections the National Front—a common platform for different political creeds with a preponderance of leftists—will emerge victorious. But the Tudeh Party—the Communist Party of Iran—has been studiously excluded from this platform. The Tudeh Party is torn by internal dissensions and even otherwise its influence is restricted within severe limits. That is a saving grace in a situation which is otherwise explosive.

Communalism

CURBING THE MENACE

THE COMMITTEE on National Integration has submitted its report to the Congress President for consideration at the forthcoming session of the AICC scheduled to commence at Durgapur on May 28. If the diverse recommendations of the Committee for fighting the canker of communalism and promoting harmony sound somewhat platitudinous, the Committee is hardly to be

blamed for it. The problem of integration is essentially a problem of emotional integration and no remedies can be prescribed at the legal, governmental or political level to ensure its accomplishment. This is largely a function in the sphere of economic and social intercourse. A sense of homogeneity and identity can be created only by strenuous effort over a period of time.

Nevertheless, in recent times, the monster of communalism has threatened to rear its ugly head to such an extent that it would be a grave dereliction of duty on the part of the Government not to take stern legal measures for its prevention or for exemplary punishment where it takes a violent form causing loss of life and property. To this end, the Committee has very rightly urged that the Preventive Detention Act should be used strictly and even ruthlessly, where a breach of peace by communal disorder is apprehended. It has suggested that where a particular community is proved to be the aggressor in an area troubled by riots, collective fine on the members of the aggressor community should be imposed. It has pointed out, without naming any particular State for obvious reasons, that to foster a sense of security of life and property in the minds of the members of the minority community the State Government must display alertness and effectiveness in maintaining law and order. By implication, in some parts of the country at least, performance has not been up to the standard desired. In matters of appointments to the services under the State auspices, the Committee has ruled out the policy of adhering to prescribed proportions for minority communities as any reservations of this type tend to perpetuate themselves and also perpetuate a sense of separateness. Fair representation is left to the sense of justice on the part of the various Governments.

There is one significant suggestion for maintenance of law and order which cannot escape notice. The Committee commends for consideration the proposition of setting up a Federal Police Force. This recommendation is not so simple as it appears on the face of it. Law and order is a State subject and to set up a Federal Police Force for its emergency maintenance, presumably for use in areas of any State, is to infringe upon the State's jurisdiction. The constitutional implications of this suggestion are very complex.

South Korea

THE MILITARY COUP

THE FULL implications of the coup d'etat staged by the military junta in South Korea will be unfolded only in course of time. But one thing is certain and it is that the coup came as a surprise. Lieutenant-General Do Yung Chang, the Army Chief of Staff, who led the coup, was determined in ousting the Ministry of Dr. John Myon Chang and he lost no time in putting a majority of the members of Dr. Chang's Cabinet under arrest. Apparently, President Po Sun Yen, who disapproved the coup and in any event did not want to associate himself with it, immediately tendered resignation of his high office. This was an embarrassment to General Chang, who prevailed upon the President to withdraw his resignation in a matter of twenty-four hours. The ostensible reason given for this course was to save foreign governments from the trouble of recognising the new regime, but in reality General Chang was in doubt whether recognition could be taken for granted at least from some foreign governments which he cannot ignore. However, matters were complicated by General Magruder, the American Commander of the

UN forces stationed in South Korea, who called upon General Chang to withdraw with his units to the 38th Parallel and put Dr. Chang's Cabinet back into power. But he had no intention to be obliging enough.

General Chang has left no doubt that he would take a firm stand against any communist activities, overt or subversive, and to that end he has issued an omnibus decree, which passes under the name of a decree against anti-State organisations. The downfall of Dr. Syngman Rhee thirteen months ago brought about only one significant change and that was the holding of really free elections throughout the country. Dr. Chang's government which was put into power had hardly sufficient time to grapple with the multifarious problems left unsolved by Dr. Rhee. His government's energies were pre-occupied with new problems created by serious crop failures, inflation and growing unemployment. But the younger generation which had extended full support to the overthrow of Dr. Rhee had no patience and it demanded quick removal of corruption and administrative incompetence. Meantime, new trends emerged. In Seoul itself there was a good deal of talk seriously questioning the economic viability of South Korea and pressure began to be exerted on Dr. Chang for contacts with North Korea. It was probably to forestall this new trouble that General Chang staged the coup. But he has to demonstrate that his regime will safeguard political stability in his country. Already the junior army officers are getting restive. How far he has the intention and capacity to introduce economic reforms thereafter, it is difficult to surmise.

By-election

A MAJOR CONGRESS REVERSE

THE DEFEAT of the Congress Party candidate at the by-election to the Lok Sabha from the Sultanpur constituency in Uttar Pradesh cannot but be ranked as a major reverse for the party. The vacancy was caused by the death of Mr. Govind Malaviya, who, in the last general elections of 1957, won a splendid victory over his rivals. The Sultanpur constituency has always been a stronghold of the Congress Party. In selecting Mr. K. C. Pant as its candidate the party counted on an apparent advantage. Sultanpur is a "convenient" constituency where the political consciousness of the electorate cannot be rated high. The combination of all these factors should have made it possible for the Congress to retain the seat. But Mr. Pant was defeated by an independent candidate, Mr. Ganpat Sahai, who polled 37,785 votes as against Mr. Pant's 36,656. The remaining candidate in this triangular fight was Mr. Jitendra Kumar, a nominee of the Jan Sangh, who captured a good 28,577 votes. The margin by which the Independent candidate won cannot be considered as slender. He owed his victory to the support of the Communist Party. The votes secured by the Jan Sangh, although the lowest at the poll, are substantially large. The growing influence of the Communist Party and the Jan Sangh in this virtually harmless constituency speaks for the breach which has been made in the prestige and influence of the Congress Party.

The implications of the verdict at Sultanpur are much deeper than what ordinarily may be attributed to the results of by-elections. They indicate the ebb in the influence of the Congress Party in Uttar Pradesh and this is a matter for serious introspection. The morale of the leadership and organisers of the Congress Party in Uttar Pradesh has shown evident signs of a sharp decline. In Uttar Pradesh, May 20 was fixed as the final date for tendering of applications for candidature at the next general elections in respect of the constituencies which were lost to the Congress Party in the general elections of 1957. The response is de-

pressing. If a significant pointer to the general morale and self-confidence of the members of the Congress Party was required, it is provided by the refusal of the Chief Minister, Mr. C. B. Gupta, to bow before the earnest appeal of the Party to contest the forthcoming election from his traditional constituency of Lucknow East, where he was defeated in 1957.

A party which has remained long in office anywhere is generally tested by the gap between its election promises and performance while in office. The Congress Party labours under this handicap. But the decline in its influence goes far beyond this explanation. The causes of disillusionment and dissatisfaction with the Congress Party on the part of the electorate in all parts of the country need to be probed into to rectify its shortcomings to the extent now possible in the short period available.

The Congo

MR. DAYAL'S RESIGNATION

MR. RAJESHWAR DAYAL'S resignation of his office as Mr. Hammerskjöld's special representative in the Congo to supervise the United Nations complicated operations may possibly bring some relief, at least for the reason that it puts an end to a long suspense whether or not he would return to his post at Leopoldville. Mr. Dayal's services were spared by the Government of India at the request of Mr. Hammerskjöld in September last and it was then presumed that his good offices may not be required longer than six months until February. The Government of India, in the meantime, kept his post as High Commissioner for India in Pakistan vacant and it remains so up to this day. Mr. Dayal certainly did well in declining to accept the UN Secretary General's offer of another post at New York as an adviser on the Congo.

It was in February that Mr. Dayal went to New York for consultations with Mr. Hammerskjöld. His presence was of value during this period for the debates on the Congo in the Security Council and the General Assembly as well as for the deliberations of the Secretary General's 18-nation Advisory Committee on the Congo. But ten weeks was a long period for the usual diplomatic consultations and it was no secret that Mr. Dayal's stay was prolonged at New York owing to the resistance put up by Mr. Kasavubu to his return. By its very nature Mr. Dayal's assignment was delicate, embarrassing and likely to create frequent misunderstandings. To negotiate with such diverse and opposite personalities as Mr. Kasavubu, the late Mr. Lumumba, Mr. Tshombe, General Mobutu, Mr. Bomboko and still others required the high skill of a diplomat of calibre and Mr. Dayal showed it in a good measure. His task also involved unravelling the tangle created in Katanga by the presence and the activities of the Belgians. The pressure for the demand for his recall by the leaders of the Congo was somewhat strengthened by the tacit attitudes, actual or supposed, of some of the embassies stationed in that country.

But independent elements in this country have rightly questioned the wisdom of the original decision to spare him for deputation to function in such an awkward situation in Africa. Mr. Dayal often found his patience strained in his negotiations with the Congolese leaders and on not a few occasions he made no attempt to conceal his feelings about their immaturity, lack of experience and extremism resulting from, what he considered, misguided views. This personal equation stiffened the attitude of Mr. Kasavubu and others. For whatever reasons the Congolese might choose to regard as correct, they seem to have formed their own judgment on India's neutrality and probably its repercussions have spread to other countries in Africa.

*The World Abroad***STATE ENTERPRISE**

By
ODYSSEUS

THE case for state enterprise has never been better put than in Professor William A. Robson's new book, "Nationalised Industry and Public Ownership" (Allen & Unwin, London, 1960. Price 50s.), which gives a detailed account of the motives, parliamentary control, organisation and management, consumers' and consultative councils, public accountability, labour relations, finance, and an objective analysis of the actual performances, of all the UK's nationalised industries.

Professor Robson shows that a great deal of the criticism directed against the UK's nationalised industries is ill-informed and factually untenable. The Professor firmly believes in nationalisation, but he is as fair as it is humanly possible to be, and while exploding ill-informed criticism, he makes many constructive criticisms, which every convinced upholder of state enterprise should ponder. His object is to try to make state enterprise work as efficiently as possible.

The morale of the management and the workers of many of the UK's state enterprises, particularly the coal mines and railways, is low. This is because a substantial part of public opinion—more than half, judging by the General Elections covering the last ten years—does not accept the principle of nationalisation. It follows that the managements have had to work under a continuous fire of nagging public criticism, grumbling and disgruntlement. In such circumstances, the best men shrink from undertaking the thankless job of entering the public service; those in office are disheartened; and the mass of the workers feel that they belong to enterprises which are despised.

If the state ownership of the UK's existing nationalised industries be accepted for what it is—an unalterable fact—one can have nothing but praise for Professor Robson's defence and his sound suggestions for improving efficiency and morale. Unfortunately, Professor Robson does his own cause serious disservice, by feeling it necessary to carry the war into the enemy's camp and to denigrate private enterprise by criticisms just as untenable as those which he is rebutting. It is one thing to say "We are faced with the accomplished fact of nationalisation. What can we do to get the best results of it?" It is altogether another to say that the principle of nationalisation is sound, that private enterprise is incapable of handling such industries as have been nationalised, and that nationalisation should be extended because private enterprise is itself full of demonstrable human weaknesses.

THIS IMPERFECT WORLD

Professor Robson's well-informed criticisms of industrial leadership in both private and state enterprises shows that neither system is perfect and prompt the question: Which, public and private ownership, is conducive to fewer mistakes and carries in it more or less built-in correctives? All the evidence suggests that the verdict is on the side of private enterprise.

Professor Robson complains, for example, that where as any mistake of policy or other committed by public management is jumped upon in press and parliament, private enterprise can commit the same errors twice over without denunciation. But the answer is that once an enterprise is nationalised, it becomes nobody's business, and what is nobody's is everybody's business. Everybody criticises because in a state enterprise it is generally impossible to pinpoint responsibilities which lurk in the interplay of personalities in a parliament (inundated

with legislation), in the Nationalised Boards of Control, and in departmental committees in the Ministries concerned. In such circumstances, wrong policies can go uncorrected for years, partly because it is usually in the interests of the Nationalised Board and/or the Ministry, and/or one of the political parties, to conceal it, or play it down, partly because it takes a large-scale drive to get anything done. The result is exasperation on the part either of disinterested people who want to improve matters, or of individuals or groups which suffer from the error.

Much of the difficulty arises because once an industry is nationalised it becomes a vested interest, which can, by and large, be protected for decades on end from the cold North wind of change, the biting East wind of diversification, and the stormy West wind of growth, that blow on private enterprise.

Private enterprise, all the way from giant units like General Motors or Imperial Chemicals down to the grocer on my street corner, is subject to competition. General Motors in recent years has had to meet a head-on challenge from small European cars in its vast, apparently safe, home market. I.C.I. has been forced to decide that it must set up factories inside the European Economic Community, if it is not to lose its markets there. Professor Robson objects that it is unrealistic to assert that the distinction between public and private enterprise is the difference between monopoly and competition. In most of the important branches of UK trade and industry, he says, belief in competition is no longer found, either among managers or trade unions. A vast network of restrictive practices, designed to eliminate many important aspects of competition permeates industry, big and small. The steel industry was probably the most heavily cartelised of any UK industry before it was nationalised. Neither nationalisation nor denationalisation, he asserts, has had any serious effect on competition in steel production. Many UK industries are riddled with restrictive practices imposed by trade associations in order to reduce competition. Although the experience of the Restrictive Practices Act of 1956, he says (writing presumably in 1959), is that the number of restrictive agreements is likely to diminish rapidly, it remains to be seen how far amalgamations will take their place.

THE RENAISSANCE OF COMPETITION

All this may be true, but it is an argument for the promotion of competitive conditions, not for the expansion of nationalisation. It is true that the unions do not believe in competition, but it is not true that industry and trade no longer believe in it. It was the depression of the inter-war years, which undermined free trade and competition, and promoted protectionism. But now that we understand better how to deal with unemployment, the logic of free trade and competition has reasserted itself to an extent so remarkable, that the minority of us who believed in competition during the depression, and who foretold that protectionism would merely make matters worse, would never have dared to hope would be possible. The anti-trust laws in the USA have never been so actively enforced as today. The passing of the Restrictive Practices Act in 1956 by a Conservative government itself shows the strength of the reversion against protectionism. That the Conservative government was able to put forward its scheme for a European Free Trade Area, which would have meant opening the UK's industrial markets to free imports from the whole of Europe, was not only received without any significant hostility but was acclaimed by the majority of industry, from the

Federation of British Industries and the Association of British Chambers of Commerce downwards, disproves Professor Robson's contention that belief in competition no longer exists. Since the inception of the 1956 Act, some 600 agreements have been abandoned, and an unknown but substantial number have been dissolved rather than face publicity. Whether many amalgamations are to follow remains, as Professor Robson says, to be seen. But they will have to pass the tests laid down by the Act, recently outlined in this column. What is more, mere amalgamation, or mere size, does not necessarily mean monopoly. In the USA, the courts found that although du Ponts' supply 75 per cent of cellophane output, the market is sensitive to price changes and that du Ponts in fact have no significant power in the packaging market as a whole.

I suggest that Professor Robson's argument constitutes an indictment of state, rather than of private enterprise, because although admittedly private enterprise often seeks to create monopolies or to restrict markets, the ever increasing diversification of products makes effective restrictions more and more difficult. Plastics, for example, are in many uses a substitute for steel and other metals, and no amount of restrictive agreements has altered the fact that the UK motor car

industry remains, despite amalgamations, one of the most fiercely competitive. On the other hand, a nationalised industry like coal or electricity, backed by the full support of the state, the Exchequer, and the voice of organised labour, has many means of resisting competition and change, for example, by maintaining such low prices as artificially to swell demand for its products at the expense of potential competitors.

The doubts at first expressed about the efficacy of the Restrictive Practices Act have dwindled. The pressure of informed opinion, led by such organs as "The Economist" of London, is to extend its powers. People may criticise the means adopted by the Act: nobody criticises its objectives.

Finally, the searching of heart provoked by the UK's halting rate of economic growth have produced widespread agreement that among the UK's greatest sources of weakness are her high tariffs and inadequate domestic competition. This is, in effect, another argument in favour of flexible private enterprise and against the extension of ponderously moving, defensively minded, nationalised industries.

(This is the first of three articles discussing the problems and lessons of nationalisation in the U.K.—ED.)

For top grade Industrial Chemicals

'SEE
MONSANTO'
FIRST...

Monsanto works constantly to develop new, better chemicals—and to improve those chemicals you already use. In every industry, whether it be agriculture—automotive—aviation—ceramics—chemical processing—cosmetics—electrical—foods—insecticides—mining—oil—paint—paper—rubber—soaps and detergents, there is a Monsanto chemical that will help to improve production and quality.

Monsanto Chemicals Limited, London • Monsanto Chemical Company, St. Louis, U.S.A. Dependable service from Monsanto companies in London, Melbourne, Montreal, Paris, Bombay, Tokyo, Mexico, D.F., Buenos Aires and from sales representatives in all principal cities of the world.

The European Scene

THE ENGINEERS' EUROPE

From Our Special West European Correspondent

PARIS, May 21.

A ship suitably named Ampere is this week loading on board in the port of Calais a cable 35 miles long, which it will proceed to lay on the floor of the English Channel to connect together the French and British electricity grids. This will be the first time anywhere in the world that high-tension electric current has been transported by submarine cable. Its economic justification is evident; given the difference in time between the Continent and the British Isles, peak periods of demand for current do not coincide and so it is possible to share the burden first in one direction then in the other. In the same week but at the other end of the country, Italian and French engineers announced that, burrowing under Mont Blanc (Europe's highest peak) from opposite sides, they had completed over half of the road tunnel that has been a dreamed of project since the 18th century. The Italians have dug 3,130 yards and the French 3,390 yards, making a total of 6,520 yards out of the 11,600 yards that will be the length of the completed tunnel. The French team is already directly under the South Needle of the peak, at which point their tunnel is 2,440 yards below the surface. This latter distance, known to engineers as the "cover", is the deepest the tunnel will require and it is also the greatest cover under which such as tunnel has ever been constructed anywhere.

Turning to Europe's southern shores, the South European Pipeline Company (which groups 16 American, British, French, German, Dutch and Belgian oil companies) last month floated a loan to complete the capital necessary for its 470-mile crude oil pipeline from near Marseilles to Strasbourg and the German Ruhr. The piercing of the few tunnels that will be needed to get the pipe up the Durance valley has already begun. Outdistanced by pipelines in the USA, Canada and Russia, this will nevertheless be the first comparable European achievement and, with its ultra-modern electronic equipment for remote control, it will be technically their equal. Moreover, it may soon have equals elsewhere in West Europe: a pipeline from Rotterdam to Strasbourg, and an Italian-Swiss-Austrian line from Genoa to the heart of the Continent. Meantime, the oceanographers continue the work of plotting the course of a pipeline for oil and/or natural gas that will go under the Mediterranean from North Africa to Cartagena in Spain, follow the Mediterranean littoral around via Barcelona till it meets the South European line. Completion of that project would require the South European line to be extended westwards across France, sending out a shoot to the Parisian region, so far as Dunkirk, so as to carry the Saharan fuel to the English Channel. The British gas corporation last month signed the contract for purchase of the fuel over a long period.

We are now back on the shores of the Channel where we began, once again looking across the strait of Dover from a power-surplus Europe to an England whose energy needs will increase as her economy develops, while her native resources of high-grade coal dwindle. At this point we come upon the most ambitious of the projects so far mentioned, one that is connected with the transport of fuel but which would serve many other needs besides — and which was in fact dreamed of before modern fuels were known. This is the plan for a permanent structure spanning the 20-mile Channel, that "scar on the face of Europe" that

Charles James Fox and Bonaparte first aimed to mend. Best known to the public in the shape of a design for a rail tunnel, this project has by no means run into trouble, as the lack of news since the Suez Company formed the new Tunnel Company might suggest. Technical preparations continue, only under the shadow of a new and even more ambitious rival scheme: the construction of a road plus rail bridge across the Channel. The Suez Company, rejuvenator of the tunnel scheme, thinks this rival serious enough to have brought up a tenth of the capital of its author, the Compagnie Francaise des Entreprises, whose designs have been underwritten by the biggest British and U.S. engineering firms. The tunnel plans are already before the two governments concerned and the bridge plans will be so next month; one or other of them is bound to mature, it is believed here, within a year or so.

This glance around at some of the biggest projects that West European now has in course of execution or on Ministers' desks reveals the shape of the engineers' Europe. It is composed of works in no way unworthy of the age of space travel, whose interest and utility they considerably exceed. With work of this size in hand it is no wonder that the six-nation coal and steel pool was once again, in the first quarter of this year, the world's biggest steel producer, surpassing the output of Russia and the U.S.A. The South European pipeline alone will require 138,000 tons of steel tubes, while the Channel bridge would need 800,000 tons. (Europe's biggest metal beam plant, which could make the sections of the bridge, was opened in Alsace this month by the company that designed the bridge). European engineers and the financiers who are backing them are in an ambitious mood, and the sort of united Europe they have in mind would be easily the equal of the Russian and American economies. All the projects mentioned are multi-national and represent a pooling of European abilities such as has never occurred before. They give point to M. Antoine Pinay's claim last week in Buenos Aires, "In the next few years we shall witness the formation (in Europe) of an immense market whose size and capacity will be able to rival those of the American and Soviet markets. Thus the union of our efforts and our means will enable us to reply to the challenge thrown by the Communist world to the free world, to reply effectively and victoriously". There is no braggadocio in this, at a time when the region is turning out more steel than its compeers and has in hand the most considerable engineering projects.

It will already have struck readers that the engineers' Europe does not coincide with the Europe of the trading blocs, the Six and the Seven. The world's first submarine high-tension cable and the projected bridge/tunnel across the Channel concern the originator the Common Market, France, and the instigator of EFTA, Britain. The network of oil and gas tubes involves members of both blocs, as well as Spain, while even the Mont Blanc tunnel concerns Switzerland as much as the two builders, France and Italy. In other words, the imagination of the engineers who are seeking to convert Europe's chequered geography into a 20th-century-size space cannot be limited by the divisions imposed by tariff preferences. That does not entitle us to conclude that there is something unnatural or uneconomic about the formation of limited trading

zones such as the Common Market, any more than U.S.-Canadian collaboration on the St. Lawrence seaway proves anything about the insufficiency of the U.S. economy.

It should be noticed, rather, that the engineers' plans are being realised despite the division into trading blocs, which, we were assured till lately, would disrupt and cripple Europe. Far from the commercial division being inconsistent with great works of physical unification, it has made them possible, for the node of concentrated energy formed by the Common Market has everywhere been the rallying point for external collaboration. Constructions such as the Mont Blanc tunnel and the fuel networks are economic only in view of the expansion and intensification of trade stimulated by the Common Market. The scope of the engineers' designs only shows that, far from being dismantled, the Common Market should perhaps be extended, as far as is consistent with its unificatory aims. This is especially pertinent in regard to the Channel bridge or tunnel: its completion will no doubt coincide with Britain's entry into the Common Market, which — while still for the middle future — becomes rather more likely every month. The Channel link, that is, will not connect France with Britain but will connect Britain to the Common Market.

However, though the engineers' Europe is outward-looking in the sense that it bursts the six-nation framework of the present Common Market, it is inward-looking in another sense. It represents a determined concentration of West European efforts on the affairs of West Europe itself. The men behind it, both engineers and financiers, are, after all, the same as built the Suez Canal, constructed giant barrages everywhere from Java to Bolivia, developed the oil resources of countries from Iran to Venezuela, and put up the material monuments that European imperialism has left in colonies scattered about the earth, as well as in the countries now behind the Iron Curtain. Their capital

and their capacities are today, for the first time strange as it may seem, being concentrated within West Europe, whereupon they immediately open up the prospect of achievement as notable as American or Russian. So far, their work is hidden from a distracted public attention by the more spectacular events attending the winding up of colonialism; the Congolese and Algerian affairs, for example, claim more space in the European Press today than do the tasks to which West European capital and technique have already turned from the blind alley of imperialism.

Perhaps a better symbol of the transfer of interest that is taking place is the announcement that at the end of this month the Orient Express will cease to run, after 78 years' service between Paris and Constantinople. It is difficult to see this today, but the departure in 1883 of the first Orient Express was hailed as one of the great international achievements of the 19th century. The first land link, and the fastest, between Europe and Asia, it rapidly acquired a symbolic fame, which was no stranger to its appearance in the adventure fiction of the past two generations down to Graham Greene and Agatha Christie. It was, indeed, a typical achievement of 19th century enterprise. Invented by a Belgian called Nagelmackers, who founded the Wagons Lits Company, and backed by King Leopold II, the "owner" of the Congo, it required the co-operation of the private, imperial or royal railroad companies of East France, of Alsace-Lorraine, of the Grand Duchy of Baden, of the Kingdom of Wurtemberg, of the Kingdom of Bavaria, of the Austro-Hungarian Empire, of the Kingdom of Rumania, and so on. In short, a considerable and complex enterprise. Today, the Iron Curtain and the aeroplane have killed it, and the most romantic of trains will be stopped. The engineers and financiers who ventured as far as Constantinople and Suez two generations ago have been much further since — as far indeed as they could go — but now they are back to where they began and are looking for greater works to accomplish between the Alps and the English Channel.

Bank vaults are always made of steel...
because steel is so dependable!

symbol of security!

Through the years Steel has come to be considered the symbol of security... not merely physical security, but economic security as well! The larger the amount of steel a country produces, the higher the rung she occupies on the ladder of economically stable countries... the greater her credit in the international market. And that is why India today is striving so hard to raise her output of steel — Steel that will endorse her claim to economic stability... Steel that she can hold up to the world as a symbol of her security.

Economic Report from the U.S.**INTERNATIONAL COMMODITY AGREEMENTS**

By GUY SIMS FITCH

WASHINGTON, May 17.

RECENT weeks have seen increasing evidence that the United States is prepared to take a serious and sympathetic look at reasonable proposals for international commodity agreements. This does not mean that the United States has adopted a doctrinaire approach in favour of these stabilizing agreements, any more than it had a doctrinaire opposition to them in the past. But it does indicate that the administration of President John F. Kennedy is moving beyond what was once described as a U.S. attitude of "benevolent neutrality" to a more positive and receptive position on this difficult subject.

Perhaps the most explicit elaboration of the developing U.S. position, which was first indicated by President Kennedy some months ago, was that offered by Deputy Assistant Secretary of State Werner Blumenthal at the meeting in New York two weeks ago of the United Nations Commission on International Commodity Trade. At that time, he offered the following significant comments: "Though we do not as yet have any firm conclusions, there are at least two basic assumptions under which our work in this field is progressing: 'First, we have no doctrinaire or 'a priori' opposition to any particular method of attacking the malaise of a commodity market. My government is willing to examine any reasonable proposal ranging from informal consultation to more formal multilateral types of agreements. 'Second, we believe strongly that commodity problems must be studied . . . on a case-by-case basis since each commodity has its own special characteristics and presents particular and unique problems.' In this connection, it is generally agreed that such products as coffee, cocoa, lead and zinc are among those which tend to fall in the problem area where current supply price situation could endanger the economies of exporting countries. As a practical matter, and as far as Latin America in particular is concerned, the United States thus will be going to the Inter-American Economic Conference in mid-July with an open mind on the question of establishing price-stabilizing international commodity agreements. By the same token, one cannot say whether or to what extent the United States will be prepared to commit itself to any particular form of stabilizing agreement. The interest of the United States in this entire subject springs naturally from its international economic position and from its long-standing policies in pursuit of economic development around the world. The United States, after all, is both a major consumer and importer, and a major producer and exporter of commodities. As an example, it is the world's leading exporter of such products as wheat and cotton, and the largest single buyer of such products as rubber, coffee and cocoa. In addition, the United States has been expending in the neighbourhood of \$4,000 million a year on economic assistance to other countries.

About 40 of the developing nations today depend on the export of one or two basic commodities for the bulk of their foreign exchange earnings. For many of them, there is an obvious connection between their export income and their development programmes. These programmes are dependent not only on outside aid, such as that offered by the United States, but also on the ability of the developing nations to finance them to a significant degree from internal resources. It follows, then, that the United States has a vital interest in seeking constructive ways of helping developing lands expand their markets and eliminate extreme fluctuations in their export earnings from primary commodities. What is more, the U.S.

Government believes that all industrialized countries have a responsibility to help in these related fields of aid and trade. But an open mind on this subject does not necessarily signify that any one solution is applicable to all international commodity problems. Nor does it necessarily follow that an international commodity agreement would be the best, or even a desirable, step in every case. Economists point out that over the long run there may be many fruitful approaches to commodities problems. To name a few: there is the accelerated development of the economies of exporting nations—an important element in President Kennedy's foreign aid programme; the diversification of these economies once they have developed sufficiently; the reduction in the marketing costs of primary commodities through improved research; the continuing search for new markets and new uses for commodities. There also is the international study group approach, which has been found effective, apparently, in the case of rubber, under which interested nations sponsor the exchange of economic data and perfect advanced techniques of production and of market research and forecasting. From this, it appears that international commodity agreements, while they may prove after consideration to be worthwhile remedies in some cases, should not be accepted merely as substitutes for other types of constructive action. Other forms of national endeavour and international co-operation also should be explored and utilized where feasible in meeting the challenge. That challenge, as Mr Blumenthal pointed out to the U.N. Commission lies over the long run "in developing the economies of all countries throughout the world so that all people can enjoy an adequate standard of living."

Chanda Committee's Questionnaire: The Central Excise Reorganisation Committee has extended the time limit for submission of replies to its questionnaire upto July 31, 1961. This decision has been taken in response to several representations both from the public and the trade. The Committee while issuing the questionnaire, had fixed the dead-line for replies by the end of this month.

*

General Insurance Business in 1959: The net premium income in India in all classes of general insurance business of Indian insurers increased to Rs. 15.02 crores in 1959 from Rs. 12.98 crores in 1958. In 1959, Rs. 5.14 crores were earned from fire insurance, Rs. 2.6 crores from marine insurance and Rs. 7.26 crores from miscellaneous insurance business. In the case of non-Indian insurers, the net premium income in India was also higher in 1959 than in 1958 in marine and miscellaneous insurance business, but it was slightly lower in fire insurance business. The corresponding figures in their case in 1959 were a total of Rs. 7.45 crores, of which Rs. 3.19 crores related to fire, Rs. 1.81 crores to marine and Rs. 2.45 crores to miscellaneous insurance business. The net premium income outside India of Indian insurers which was also higher in 1959 than in 1958, amounted to Rs. 13.32 crores in 1959, of which Rs. 7.28 crores were earned from fire insurance, Rs. 2.39 crores from marine insurance and Rs. 3.55 crores from miscellaneous business. The index number of general insurance business in India recorded a rise of 10.5 points for 1959 as against a rise of 6.4 points in 1958. These figures are given in the Indian Insurance Year Book 1960 recently published by the Controller of Insurance, Government of India.

*

Gandakh Irrigation and Power Project: In pursuance of the agreement between the Government of India and the Government of Nepal on the Gandak Irrigation and Power Project, the Government of India with the consent of the Government of Nepal has set up a Co-ordination Committee to establish a forum for discussion of problems of common interest and in order to expedite decisions for the early completion of the project. The Committee will consist of three representatives from each country to be nominated by their respective Governments. The Chairman of the Committee will be a Minister of the Government of Nepal or an officer deputed by the Government of Nepal and the Secretary of the Committee will be the Chief Administrator of the Gandak Project. The Committee would meet from time to time to consider certain matters of common interest concerning the project including land acquisition, rehabilitation of displaced population, maintenance of law and order, soil conservation measures and such other items as may be referred to the Committee for consideration by the Nepalese Government or the Government of India from time to time. The Committee will meet as and when necessary at Khatmandu or at the project or such other place as may be necessary at the direction of the Committee.

*

Bhal Reclamation Scheme. A Memorandum was signed the other day between representatives of the

Government of India and the Royal Netherlands Government to effect the transfer of the Pilot Polder (Reclamation of low-lying land) of the Bhal Reclamation Project to the Government of Gujarat. The transfer will come into effect on June 1, 1961. Technical and financial assistance to accelerate the desalinization of saline soils along the Saurashtra coast of Gujarat State was provided by the Netherlands Government under an agreement concluded in 1959. In addition the Netherlands undertook construction of the pilot Polder at a cost of little over Rs. 19 lakhs. The total project, which aims at raising the standards of living of the population by increasing the productivity of the local soils, is expected to benefit ultimately a net area of 55,800 acres and yield produce worth about Rs. 75 lakhs a year. Netherlands assistance will be continued till 1963, by which time the Pilot Polder is expected to be brought progressively under cultivation. The Government of Gujarat will provide funds and the staff for the execution of the scheme.

*

Technical Properties of Foundry Moulding Sands:

Technical data on the properties of moulding sands, bonding clays and other bonding materials have been made available to the foundry industry in India for the first time as a result of an extensive survey carried by the National Metallurgical Laboratory of India. The preliminary results of the survey are embodied in a 180-page monograph published recently by the Council of Scientific and Industrial Research. The monograph gives the chemical, physical and moulding characteristics of more than 40 samples of foundry sands taken from all over the country. Recommendations for the utilisation of these sands in moulding for different metals and alloys have also been made. The survey fills an important lacuna in the development of the foundry industry, which did not have adequate technical data available till now. With the growing demand by the engineering and basic industries for castings of exact specifications, quality control has become essential. At present about 80,000 tons of steel castings are made in approximately 1,500 established foundries. More and more heavy quality casting of 100 tons and above are being moulded in the country. A significant contemporary development in foundry technology is the realisation of the importance of proper selection and use of foundry sands and moulding materials.

United States

Bank of America: It is reported, a new overseas branch of Bank of America NT & SA will soon be opened in Karachi, West Pakistan. Bank of America NT & SA and its wholly owned subsidiary Bank of America (International) have officers and representatives in 20 countries of the world. The last overseas branch was opened in Buenos Aires, Argentina, in October 1960. The Karachi branch is expected to be operational soon. Quarters for the new office have been leased in the New Jubilee Insurance Building on McLeod Road, in the financial centre of Karachi.

U.S.S.R.

World's Largest Steel Smelting Shop Designed: The world's largest steel smelting shop has been designed at the Ukrainian State Institute for designing metallurgical works. The gigantic shop which will

occupy an area of 40,000 sq. metres will have super-powerful arch furnaces whose volume will be 150 per cent larger than that of the furnaces now in operation in Soviet Union. All latest achievements of Soviet metallurgical engineering have been taken into account in the design of these powerful steel smelting units. The furnaces will be equipped with original mechanisms which will make it possible to quickly lift and turn the bell of the furnace, to incline and rotate its hearth. These improvements will help to cut considerably the duration of smelting. Special induction devices will be used for stirring liquid metal and pumping off the slag. A cybernetic installation will calculate with absolute accuracy the composition of the charge and also determine the most rational thermal regimen of steel making. A 165 cubic meter bucket has been designed for carrying the ore to the furnaces. It is transported to the furnaces by the overhead crane of 300 tons capacity. Such mechanisms are being created for the first time in world practice.

*

Biggest Sheep Breeding Museum: The world's biggest museum of Karakul sheep breeding has been established in the Uzbek city of Samarkand. The collections of the museum include about 500 Karakul sheep skins of rare colouration including such as "Shamchirak-Guli" which means the colour of a candle flame and "Malya-Sur".

*

Automatic Magnetic Station: Soviet polar explorers are preparing to install an automatic magnetic station 800 km. east of the Mirny South Polar observatory in Antarctica. Geophysicists believe that a second zone of polar light and magnetic activity is located in this area.

Japan

Technical Assistance Agreement with Ceylon: For the economic development of Ceylon, Japan has agreed to set up a fishery technical training centre in Negombo, near Colombo as a joint project of the two nations. An announcement made by the Ministry of Foreign Affairs states that the agreement was signed in March in Colombo by the Ceylonese Minister of Agriculture, Land Irrigation and Power and the Japanese Ambassador to Ceylon. Under the agreement, Japan will send to Ceylon technicians to train Ceylonese fishermen and the fishing boat engine repairmen and engage them in improving fishery techniques at the projected training centre, and will provide training materials including boats, fishing tackle, engines, machines, educational materials, tools, machine parts, and the like. On the other hand, Ceylon will offer a site for the centre, buildings, port facilities, operating funds and indigenous personnel.

Yugoslavia

Improvement of Health Services: Some 96 billion dinars will be invested in health service promotion in Yugoslavia during 1961-65. These funds will be used primarily to expand the capacity of hospitals, which now have 90,000 beds as well for medical staff training, preventive protection, etc. There are some 14,000 physicians in Yugoslavia today or one per 1,320 people which is above the world average. Over 6,500 physicians graduated during the last seven years. Two more medical faculties were opened last year, in Nis and Novi Sad, which brings their number to 8. There are over 5,000 clinics for out-patients, carrying out some 85 million examinations a year.

United Kingdom

Big Overseas Attendance Expected at Interplas: Organized parties of businessmen, technicians and students, from 26 countries are already being arranged to visit Interplas one of the world's largest international displays of plastics materials machinery and products—which opens at Olympia, London on June 21. Countries represented by these parties include Australia, Brazil, Canada, Ceylon, Denmark, Egypt, Eire, France, Germany, Holland, Hungary, Iraq, Israel, Italy, Japan, New Zealand, Norway, Portugal, Pakistan, South Africa, Spain, Sweden, Switzerland, U.S.A. and Yugoslavia. Prominently featured at Interplas will be the international design display in which the world's foremost industrial designers will show their application of plastics to over 200 products for the home, ranging from dinnerware and dining chairs to dish drainers, dustbins and electric drills. Items in the U.K. section will be selected from the Design Index of the Council of Industrial Designs and overseas products will be chosen by each country's appropriate design institute. The products in the display, in which 11 countries will participate, will be judged at the exhibition by a panel of international design authorities and the award will be presented to the designer of the product considered to be the best.

France

Organisation of a Rural Training Programme: To meet the increasing needs of newly independent states for rural teaching personnel, the office for the Development of Agricultural Production has opened, the third session of a programme which will train personnel in educational methods used in the training of future rural workers. 16 Africans, 2 Madagascans, and one Comorian will attend this training programme which will last up to November 1961. Those attending the programme will be initiated in Paris to active educational methods by instructors from the High Commissariat of Sports and Youth. Between 1st June and 30th September, they will participate in sessions of training programmes organised in the French provinces in co-operation with different organisations specialised in the problems of rural youth.

Honduras

Dairy Plant: The first dairy plant producing dry milk in Honduras was officially inaugurated in the city of San Pedro Sula at the end of April. The plant went in actual production in last November and has already reached 25 per cent of its production capacity. The Honduran Government has invested the equivalent of more than \$3 lakh on the project, and the UN Children's Fund has provided some \$2,20,000 worth of imported equipment for processing, refrigeration, laboratory work etc. In addition to providing powdered milk, the plant will produce pasteurized milk, butter, cheese and other dairy products, thus opening a permanent market for Honduran farmers. The plant is the fourth dairy plant to come in operation in Central America with the aid of the UNICEF.

Holland

Record Exports of Cotton Rayon and Linen Fabrics: Activities in 1960 in the Dutch cotton, rayon and linen industry reached an unprecedented level, as did exports of cotton, rayon and linen fabrics. Improvement in qualities and utilisation properties, designing and finish of the fabrics produced resulted in substantial progress in the sales of fabrics in the western countries, the setback in Asian markets thus being amply cancelled out.

NEHRU BRIDGE AT AHMEDABAD

LIGHTING BY PHILIPS

For India's latest and widest road bridge over the Sabarmati river at Ahmedabad, the authorities would accept nothing but the best... and, therefore, they specified lighting by Philips.

Philips exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy through maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience, research and development to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible *plus* of Philips' international experience and know-how.

PHILIPS

quality lighting
for ultimate economy

FREE: For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.

NEWS IN BRIEF

INDIAN

The Employees Provident Funds Act, 1952, initially applied to six industries, has gradually been extended to 47 industries. With effect from the 31st May, 1961, it is being further extended to starch industry.

Apart from increase in employment and higher output, protection has helped in laying sound foundations of important industries like bicycles, various types of machinery, aluminium and other metals, chemicals, automobiles and electrical goods.

For the first time in India Cathodic protection against corrosion in the new water main under installation for Calcutta has been adopted. When completed, this cathodically protected Calcutta's pipeline will be the first of its kind in the world.

At the Central Fuel Research Institute near Dhanbad in Bihar, a new proto-type low temperature carbonization plant for the production of smokeless domestic fuel from coal was inaugurated by the Chief Minister of Bihar recently.

The Controller of Capital Issues has granted consent to six companies for issue of capital of various categories.

The Council of Scientific and Industrial Research has drawn up a programme to ensure that new processes and inventions developed by national laboratories are more effectively used for industrial advancement.

Oil has been struck in a well in a village about six miles from Surat. The oil, which is stated to be greenish in colour was struck at a depth of 1,224 metres.

It is reported, negotiations are in progress with Soviet Union on a contract to supply equipment and material for an oil refinery at Barauni in Bihar. Soviet experts have completed plans of the refinery, which will have an annual capacity of two million tons and be built with Soviet technical assistance.

The outstanding balance of the 3½ per cent National Plan Bonds (first issue) 1961 is repayable on 1st June 1961 and no interest will accrue thereon, says a Government press note issued recently.

It is reported, work on irrigation-cum-power project of Naigarh (Kashmir) costing Rs. 1 crore would soon be taken in hand.

The Government of India have removed all restrictions on inter-State movement of Khandsari, sugar candy and bura sugar. An order has been issued amending the Sugar (Movement Control) Order 1959, to this effect. At present, there is no restriction on inter-State movement of confectionery.

FOREIGN

A £16m. contract for building the first stage of the Volta River Dam Project has been awarded to the Italian group, Impresit, which was responsible for the Kariba Dam in Central Africa.

The Canadian Government has announced that it is granting subsidies to shipbuilders, and also seeking to reserve domestic Canadian trade in the Great Lakes area for Canadian ships. A subsidy of 40 per cent of construction costs is to be paid on inland, coastal and deep sea shipping until March 31, 1963, after which it will be 35 per cent.

The U.S. Federal Reserve Board's seasonally adjusted index of industrial production rose in April to 105 per cent of the 1957 average. This was three percentage points higher than the March figure.

Australia has sold 750,000 tons of wheat to the China Resources Company, Hong Kong, which acts on behalf of the Peking Government, the Chairman of the Australian Wheat Board announced recently.

Australian insurance companies during 1960 increased their assets by £A82m. to £A1,009m. and invested £A31m. in company shares, the Commonwealth Insurance Commissioner disclosed recently. Investment in public securities, however, declined by £A7m.

All the major economic problems of concern to the Commonwealth will be reviewed by Senior Commonwealth officials when they met in London from May 24 to 26.

The New Zealand Government recently took further drastic action to curb the rate of private importing by announcing that 1961 import licenses valid until December 31, 1961, may have to last until March 31, 1962, or even longer.

The Government intends to take over shortly the Tanganyika Agricultural Corporation—a Joint Tanganyika and British Government enterprise which runs cattle ranching, tenant farming and irrigation schemes over some 250,000 acres.

After five years search, Gulf Oil has made a discovery in Bolivia which appears to be a major oilfield. In the Caranda area, some 30 miles north-west of Santa Cruz, it has tested a well at a rate of 1,570 barrels a day of 51 degree gravity crude.

GATT, the General Agreement on Tariff and Trade, has decided to advise and aid new independent States on their trade policies upon request. The decision was taken by GATT's Executive Council at its eighth session.

Special Article

REFURBISHING THE I.M.F.

By PAUL BAREAU

A great deal of thought is being given at the highest official levels in central banks and ministries of finance to the problem of strengthening the International Monetary Fund and making it even more flexible than it has recently become. It is probable that a scheme designed to achieve these objectives will be ready for submission to member countries in time for discussion at the next Annual Meeting of the Fund which, with that of the World Bank, is due to be held next September in Vienna.

The need for some refurbishing of the International Monetary Fund has been underlined by the recent experience of the two great reserve currencies of the world, the dollar and the pound sterling. The dollar had to withstand considerable pressure last year. This year sterling came under heavy strain as a result of withdrawals of hot money and of speculative attacks which followed the revaluation of the German mark. In each case the pressure on the two currencies was due to capital rather than current transactions. In each case that pressure derived from the fact that dollars and sterling, because they act as reserve currencies, are particularly vulnerable to movements of short-term capital due either to divergencies in interest rates or to more brazenly speculative operations.

Of all the plans which are now being considered, one which has been elaborated and propounded by Mr. Edward M. Bernstein holds the centre of the stage. Mr. Bernstein was for a long time a high official at the U.S. Treasury and was one of the American experts who, at Bretton Woods, helped to evolve the Articles of Agreement of the International Monetary Fund. He then joined the Fund and served it as a high official for many years and has since become an economic consultant of high repute. His proposals are designed to meet the situation caused by the vulnerability of sterling and the dollar by reason of their functioning as reserve currencies. The extent to which they are so used may be gathered from the statistics for the end of 1960 which showed that governments and central banks outside the United States and Britain held about \$11 billion in dollar assets and over £2,550 million in sterling assets as part of their official reserve.

The consequent vulnerability of these two currencies, and of the dollar in particular, has been enhanced by the fact that the International Monetary Fund in its transactions has, in the main, dealt in dollars. Countries in balance of payments difficulties have tended until now to take dollars from the Fund and exchange those dollars for the currencies of which they happened to be in short supply. Thus from 1958 to 1960 the International Monetary Fund sold over \$500 million in dollars, though during that period the United States suffered a net gold outflow of \$5 billion. Thus the International Monetary Fund was by its operations accentuating the weakness of the world's principal reserve currency.

The Bernstein plan falls into two parts. The first is essentially psychological: it is an invocation to all members of the International Monetary Fund to regard their quotas with the Fund as an integral and published part of their reserves. This invocation is addressed principally to the United States. Mr. Bernstein argues that the United States should abandon their somewhat

haughty attitude towards taking assistance from international institutions. He suggests that all members of the Fund should use their access to its resources as a matter of normal and very familiar practice and that the leadership in establishing this practice should be taken by the reserve centres of the United States and the United Kingdom. Mr. Bernstein points out that if the quotas are to be regarded as part of the reserves of members, they must draw on these quotas in modest amounts whenever they are using their own reserves.

If, however, the United States and Britain are to use the Fund more regularly, they may find that the currencies they need are not available in the required quantities. The Fund quotas have been so calculated as to provide the Fund with relatively small amounts of such currencies as German marks, Italian lire and French francs, which have recently been in particularly scarce supply and keen demand.

It is, therefore, proposed that all the great trading nations of the world should be prepared to lend money to the Fund, either by buying the Fund's debentures or by giving the Fund drawing rights up to specified amounts. The Fund, or as Mr. Bernstein suggests a subsidiary institution to be named the Reserve Settlement Account, should make the currencies which it borrows, available to the rest of the world on specially favourable terms.

Suppose, for example, there were a sudden outflow of \$3 billion from the United States to the United Kingdom, Germany and the Netherlands, drawn there by relatively high interest rates, the Fund or its Reserve Settlement Account, would borrow the appropriate amount in sterling, marks and guilders from these three countries. These currencies would then be lent to the United States which would either sell them in the exchange market and thus offset the movement of hot money, or use them for converting and repaying dollar balances. These operations would be subject to a gold guarantee. They would have the effect of satisfying the demand for scarce currencies, supplementing the resources of the Fund and taking some of the load which on occasion piles up on sterling and dollars, by reason of the good and valuable work they do as world reserve currencies. Some such scheme will unquestionably be presented to member countries in the near future.

A warning note should, however, be sounded. This scheme for reinforcing the I.M.F. would supplement informal inter-central banking arrangements which have already been completed by which the major central banks of the world have undertaken to hold one another's currencies up to unspecified amounts without exercising their rights to convert these balances into gold. These arrangements are working satisfactorily. If they are supplemented by more flexible I.M.F. provisions a position may easily be created in which the chronic debtor will find it all too easy to "raise the wind" in financing his deficits. The new arrangements should be specifically focussed on the problem of meeting short term capital movements and offsetting speculative operations. They should not be abused to finance balance of payments deficits. They should not blunt the urgency with which all countries should endeavour by their own efforts to correct disequilibria in their balances of payments.

THE BUSINESS WORLD

Whither Industrial Bombay?

By CROESUS

THE recent propaganda of the Maharashtra Government that the Third Five-Year Plan of the State "will be oriented to create a base for industrialisation in rural areas" has naturally aroused some anxiety among business circles about the industrial future of Bombay City. A frank expression to this anxiety was given by Mr. Pratapsinh Mathuradas, President, Maharashtra Economic Development Council, at a meeting, last week, of the Council, which was attended by Mr. Y. B. Chavan, Chief Minister of Maharashtra, who also gave certain welcome assurances on the occasion. It is necessary to record here the viewpoints of both to be able to appreciate them, if only because what happens to Bombay at this stage is sure to happen to other cities which are bidding fair to compete for a place with Bombay on the industrial map of India.

Public opinion on this subject is generally influenced more by subjective considerations of the individuals concerned than by an objective appraisal of the position from the point of view of the State as a whole, let alone the entire country. That is why one often hears the cry that Bombay has already overgrown and that all attempts at further expansion of the City must be ruthlessly resisted in order that the citizens might not be subjected to the concomitant hardships of shortages of accommodation, transport, water supply, medical aid, sanitation, etc. There is some force no doubt in this line of reasoning, but the question also requires to be looked at from another angle or other angles, as Mr. Mathuradas observed. There is perhaps one consideration, more than any other, that ought to weigh with those who rule over the destinies of Bombay City from an industrial point of view, namely that every care should be taken to see that the policy of a balanced regional development does not itself defeat the objective of the development of the Maharashtra State.

As the M.E.D.C. President said, "the concept of regional balance and the dispersal of industries does not (and ought not to) imply an approach of antipathy towards, or neglect of the developed areas of the State." It should not be forgotten that industrial development in Bombay and in its close proximity has resulted in certain advantages in respect of location and provision of overheads which add to the potential available for further development. Nor should it be assumed that those industries which are sought to be developed in or near Bombay would go contrary to the goal of regional balance and prevent the spread of industries to the under-developed regions of the State, for Bombay City should be viewed as "the spearhead of the industrial advance in Maharashtra". If certain industries tend to get established in Bombay and its neighbourhood, it is for certain special advantages that only this area can offer. For instance, there is no great repair of even the most complicated part of a machine that cannot be undertaken in Bombay. Even long-established industrial concerns outside the State are known to rush to Bombay in the event of a major breakdown in their plant. Presumably, this is the reason why the Maharashtra Government also has chosen to map industrial areas around the Island of Bombay. Whatever the reason for it, the State authorities should make it a point not to impose any restrictions on the location

of industries in this area (except perhaps those necessitated by the absence of adequate supply of power, water, etc.) In other words, to quote Mr. Mathuradas, "the object of effecting an industrial spread in the State of Maharashtra should be achieved not by a negative approach of preventing a further spread of industrialisation in the developed areas, but by a definite and positive approach of locating areas and building over-heads (or, what is more fashionably termed these days as "infra-structure") in the new regions which require to be developed under the Plan."

Had Mr. Mathuradas said only this much and left it at that, he would undoubtedly have invited some cynical comments from Maharashtra's Chief Minister, but he took care to assure the Maharashtra Government, on behalf of his Council, that "we would continuously apply ourselves to the work of industrial promotion in the various regions on the basis of respective economic needs of the regions and the availability of facilities and services like adequate power supply, communication, transport, local 'entrepreneurial' talent, etc." This may not quite meet the needs of an all-out regional balance, at any rate of the sort that is being aimed at by the powers-that-be. But it is unquestionably a sound, practicable and helpful policy. After all, the shrewd businessman that Mr. Mathuradas is, he knows only too well that it is not possible to locate an industry where some politicians, inspired may be by the best of motives, may desire it to be located in the absence of certain services and facilities, unless at an enormous or uneconomic cost. That may satisfy the whims, for the time being, of the politicians, but will never be a successful business proposition. No one can prevent us from producing sugar in a region where the sugarcane crop cannot but be poor both in quality and quantity, but, then, we must be prepared to pay for and eat the sugar manufactured from that cane ourselves. Even under relatively the most ideal conditions of sugarcane cultivation as we have in the Deccan, we are today finding that the cost of sugar manufactured by us is so much higher than in some foreign countries that we are unable to export our sugar, notwithstanding all the tax concessions offered. In other words, in the final analysis, it is primarily the economic factors that decide the location of a given industry in a given region.

But this is not to say that no attempt should be made to take industries to regions where there have been no industries so far, despite the availability of a number of natural facilities, mainly because of want of funds. As a matter of fact, it is such regions that ought to receive the first and foremost attention, especially of Government swearing by slogans, such as "planned economy", "Welfare State", and so on, although, unfortunately, this does not always happen. The M.E.D. Council has done well, therefore, in offering to carry out economic surveys of selected districts to bring to the notice of the Government the potentialities of promising areas.

Being an essentially practical administrator, Mr. Chavan was not slow either to appreciate the anxieties of the entrepreneurs or to recognise the limitations that inhibit the economic growth of certain regions. "I

quite understand your anxiety about the industrial future of Bombay City", he said in his address to the M.E.D. Council and further reassured those present by adding: "You need have no fears that the declared policy of the State Government of ensuring a balanced development of the State as a whole means the neglect of the Bombay City." He even went on record as saying that, "while drafting the Third Five-Year Plan, care has been taken to make adequate provision for the expansion of industries in Greater Bombay to the extent possible. In fact, our objective is to expand the City itself beyond its limits (and he significantly added 'not the jurisdiction of the Bombay Municipality!') by constructing a bridge over the Thana Creek and turning marshy lands into industrial areas". And, yet, he cited two considerations why his Government felt it should enlarge the field of industrialisation locating industries other than in Bombay, namely, (i) barring Greater Bombay, the Maharashtra State cannot be said to be industrially advanced, and (ii) Maharashtra's progress industrially during the last ten years does not compare favourably with that made by other States in the country. Hence the reorientation in the Third Plan of the State, we are told, "to create a base for industrialisation in rural areas". In keeping with this objective, it must be conceded, the State has been according the utmost importance to the establishment of more and more industrial estates and to the creation of more and more "agro-industries."

Whilst dealing with agro-industries, Mr. Chavan made a particular reference to the co-operative sugar

factories and said the success in this sphere ought to encourage other agricultural processing industries based on rural resources, both in the primary and the secondary processing sectors. This statement, it would appear, is open to correction, for the sugar co-operatives are not based merely, or even mainly, on rural resources. As everyone knows, the Union Government has provided abundant credit facilities to sugar co-operatives through the Reserve Bank indirectly and the State Co-operative Banks directly. Furthermore, it is not every agricultural crop that lends itself so admirably as sugarcane to processing, let alone co-operative processing. Fortunately, the Chief Minister of Maharashtra has not yet chosen to reserve all agricultural processing industries for the co-operative sector only. "Where co-operatives of rural raw materials producers are not likely to be in a position to set up the industries, owing to complex technology or excessive capital cost involved", he has said, he is willing to invite the collaboration of the private entrepreneur. To quote him, "we are thinking now in terms of a 'joint sector' where the State and the private sectors collaborate and establish large industrial enterprises in rural areas. Besides providing for public sector enterprises, the State's Plan will make adequate provision for participation in joint sector enterprises." This is good in so far as it goes, and there is sure to be some response to his appeal to private enterprise to come forth in ample measure to take advantage of this. But one cannot help asking: how much more this response might have been, had the Maharashtra Government not precipitated its land ceiling policy 'vis-a-vis' the sugar factory farms?

Business Notes

Trade

CONSOLIDATING POSITION IN AFRICA

WITH THE gap in our foreign trade tending to widen more and more, it becomes imperative to explore every conceivable avenue to boost exports. In addition to many of our traditional markets in Africa, a number of new States, such as Senegal, Morocco, Ghana and Nigeria, have become independent in the so-called Dark Continent. Like India, these too are, by and large, agricultural countries, having a keen desire to industrialise themselves in order to meet the growing needs of their developing economies. It, therefore, behoves us to study this changing pattern and adapt our export drive to these changes. For instance, presently, although some of these countries may manufacture greys, they are in need of processed cloth, and it is in such spheres that Indian manufacturers can do something to increase cotton textile exports to the African countries.

Recently an Indian Cotton Textile Delegation, sponsored by the Cotton Textile Export Promotion Council, was in West Africa. On the return of the Delegation, the leader, Mr. Chinoobhai C. Javeri, has issued a statement in which he has made some interesting remarks in this connection. As a result of most of the African countries setting up their own textile mills for the manufacture of greys, which they were hitherto importing from India, he observes, our exports of cloth, which comprised greys mainly, have shown a marked decline during the past few years. Even so, he thinks, there still remained a good market for greys—in spite of our comparatively higher prices—in these territories, due to the local production being inadequate to meet the total requirements. As he has suggested, a prompt and proper diversification of our exports at this stage to include, say, wax-prints, fancy varieties and quality cloth, for which there would appear to be a large market, should arrest the deteriorating situation in our cotton textile exports.

Dealing with trade agreements, the leader of the Delegation said that, having become independent, the new African States naturally wanted to pursue a policy of diverting their future requirements to those countries

which bought their products in turn. As India has today a more or less one-way traffic in its trade with these countries,—i.e. buying little or next to nothing from these countries—the Government of India should seriously examine the position and endeavour to find out a suitable basis for concluding trade agreements with them, and appointing well-equipped Trade Commissioners wherever necessary. Mr. Chinoobhai has also suggested that India should undertake to collaborate, even in a small way, in industrial projects in these countries. According to him, starting new industries in collaboration would not only foster good relations for promoting trade in the future, but also provide markets for Indian machinery and equipment and earn precious foreign exchange for the country when the profits of these industries are remitted to India. This is perfectly right. In the good old days, it used to be said: "Trade follows the flag." The slogan today is: "Trade follows industrial collaboration." In this connection, the Delegation has made a commendable twin proposal, one, that a team of leading industrialists from India should visit these countries and explore the field—a beginning has, in fact, been made by the Birlas who have set up a joint industrial venture in Ethiopia—and, two, that a Government-cum-trade team from these countries should visit India at the time of the Indian Industries Fair, to be held in New Delhi towards the end of this year, to get a first-hand knowledge of the trade opportunities in our country.

Gujarat

POWER SHORTAGE AND FUTURE PROSPECTS

LAST WEEK'S informal discussions between Mr. H. M. Patel, Chairman of the Gujarat Electricity Board, and the committee members of the Indian Merchants' Chamber in Bombay provided a much-needed opportunity for the business community to get detailed information not only on the various measures announced recently by the authorities in Gujarat for economising the consumption of power but, more particularly, on the steps which are being contemplated by that State to overcome the shortage during the Third Plan period. Mr. Patel made no bones about admitting that Gujarat was short of power.

He pointed out how, although all the projects contemplated under the Second Plan for the regions now comprising the Gujarat State had been completed, at the end of the Plan, there was no surplus left to be carried over to the Third Plan.

It is debatable as to who is responsible for this state of affairs and one need not bother about going into this rather unedifying chapter. What is relevant to the present context is the assurance of Mr. Patel that, although the supply position in the State is at present a little difficult, the series of measures contemplated under the Third Five-Year Plan for augmenting the power supply should create adequate additional capacities to meet all the needs of the industries. In any case, he thought, there would necessarily be a lag of 3 to 4 years between the time a decision was taken to start a new industry and the time when it could actually go into production. By and large, it was comforting to be reassured by the GEB Chairman that no industry need be deterred by the fear that adequate power would not be made available. Not equally comforting, however, were his references to the diversity of the rates charged to consumers in the different regions of the State itself or the generally high level of power rates in Gujarat.

Referring to the various restrictions which have been recently imposed to economise the consumption of power in the State, Mr. Patel explained that consumption of power had been increasing at a rapid pace both for industrial and domestic purposes in the Ahmedabad region. The existing restrictions on the use of power by industries, he said, were only motivated by the desire to ensure that power so saved could be made available to new industries which had already been set up, so that considerable investment that had gone into the setting up of such industries would not be obliged to remain idle and unproductive for a considerable length of time. The GEB Chairman further disclosed that the scheme for the expansion of the Ahmedabad Electric Supply Company's power house had been approved and that the situation in and around Ahmedabad region would improve by March, 1962. The supply from the Dhuvaran Power Station with a capacity of 200/250 M.W. was expected to be available after the completion of the project by the end of 1962 or early 1963.

Knitting Wool

NEED TO FIX QUOTA FOR SMALL PROCESSORS

AT A Press Conference here last week, Mr. Tula Ram Mittal, President, Delhi Hand-Knitting Wool Processors Union, narrated the tale of woe of some 5,000 families in the country—3,000 in Delhi alone—who for their livelihood are dependent upon the business of processing grey wool on cottage industry basis. The lot of these families, mostly displaced persons and widows, he said, had been growing from bad to worse because of the crisis that had overtaken this industry during the past four or five years because of shortage of raw material and setting up of dyeing and processing plants by the spinners themselves. The position this year had become very acute and not a little alarming, he added. Though the season is fast approaching, the spinners have not cared to finalise with the processors contracts for the supply of grey wool, which normally should have been negotiated in December last. To cap this, they are demanding unreasonably high prices—in some cases as high a price as Rs. 14 per lb., as against a normal price of Rs. 10 per lb. The result has been that many processors who over a number of years have built up this important cottage industry, are faced with the predicament of either abandoning this business or undergoing serious privations.

One fails to understand how, contrary to its protestations, the Government has allowed this situation to arise. The matter, according to Mr. Tula Ram, was brought to the notice of the Textile Commissioner near-

ly five months ago, requesting him to make suitable arrangements for ensuring essential supplies of raw material to the hand-processing industry. In a memorandum to him, the Delhi Hand-Knitting Processors Union had protested against the setting up of new units by the spinners. In view of the expanding consumption of knitting wool in the country, it may not be advisable to put a blanket ban on spinners setting up their own dyeing and processing units. But care has obviously to be taken to avoid extinction of this already established cottage industry which has made its mark by producing satisfactory quality knitting wool. This will not only save harassment to the poor people employed in this industry, but will also save unnecessary spending of foreign exchange on import of dyeing and processing machinery.

To alleviate the immediate distress of knitting wool processors, it is imperative that raw material should be made available to them expeditiously, at reasonable prices and in adequate quantities. The question of fixation of prices of grey wool, it is understood, has already been entrusted to the Tariff Commission, but, meanwhile, the Textile Commissioner will do well to fix a quota for hand-knitting wool processors unions which are working satisfactorily at the four main centres—Delhi, Ludhiana, Amritsar and Calcutta—where this cottage industry is mostly concentrated. Supplies can be made available to these unions at a provisionally fixed price, for distribution among their members. The difference between the provisional price and the price to be fixed by the Tariff Commission can be recovered from them later. An early decision is called for in this matter.

Aid-India Club

GOOD AUGURY FOR THE NEXT MEETING!

COMING CLOSE on the heels of the indications that the United Kingdom is favourably inclined to step up its assistance for the first two years of India's Third Five-Year Plan, the disclosure by Sardar Swaran Singh,

Personalised

SERVICE

With specialised knowledge acquired through long experience, the Punjab National Bank is in a unique position to-day to be of positive help in providing PERSONALISED SERVICE.

EVERY DESCRIPTION OF BANKING BUSINESS IS UNDERTAKEN.

THE PUNJAB NATIONAL BANK LTD.

Established 1895
Head Office: New Delhi.

the Union Minister for Steel, Mines and Fuel, at a Press Conference here on Wednesday, that Japan was keen to increase its credit programme for industrial ventures, both in the private and the public sectors, in this country augurs well for the Aid-India Club meeting scheduled to be held in Washington next week. It is not known how far West Germany has revised its stand of contributing only about \$331 million, including \$131 million to finance repayment of loans contracted under the first two Plans, but it can reasonably be expected that it will follow suit. The next week's meeting of the Aid-India Club, thus, will probably be starting in more fortunate and congenial circumstances than those in which the last April one was held.

No final decision about the aid that may be made available by the Club for India's economic development in 1961-62 and 1962-63, however, can be expected to be reached at this meeting, if for no other reason than for the fact that the U.S. contribution will have to await authorisation by the Congress, which will be forthcoming sometime in July; what can be expected is only an indication of the approximate amount of assistance that might be available from this source. That, of course, should be of great help in planning execution of the Plan during the first two years of its operation.

Another heartening statement that Sardar Swaran Singh made at the Press Conference was that Japan was willing to enter into collaboration arrangements with Indian interests for providing technical know-how and equipment for development of machine-making, special steel and mining industries. This should be an indication of the broadening of interest in the developed countries in the development of under-developed economies. How far India can avail of the Japanese help in its industrialisation, however, will depend to what extent the Japanese Government is prepared to simplify its aid authorisation procedure which stood in the way of expeditious utilisation of the two loans made available by it during the Second Plan period.

Instruments Industry

MANUFACTURE OF PRECISION INSTRUMENTS

AMERICAN HELP, which has been forthcoming quite liberally for this country's various developmental pro-

jects, would now also be available for the manufacture of precision instruments. The General Industrial Society Limited, Calcutta, has entered into collaboration arrangements with Messrs. American Gage and Machine Company Inc., U.S.A., for the manufacture of various instruments in India. A new company is being floated for this purpose. The forms of collaboration by the American concern partake the nature of supplying the technical know-how, the capital equipment and participation in the equity capital of the Indian company. The development is heartening in the sense that many such types of precision instruments which had been imported so far would now be produced within the country when the plant goes into full production in 1963.

Messrs. Size Control Co., Inc., Messrs. Walsh Press and Die Co., Inc., and Messrs. Simpson Electric Co., Inc., affiliates and subsidiary companies of Messrs. American Gage and Machine Company, would be working quite actively in this collaboration scheme. These companies have varied experience of many years and are well established in the field. While the Size Control Company would assist the Indian company in the manufacture of various types of precision equipment for use in missiles, aircrafts, ordnance and other like fields, the Walsh Press and Die Company would lend hand in the manufacture of complete line of power presses. Simpson Electric Company would help in the manufacture of various types of electric and electronic testing equipments to meet the demand of the electrical, radio, refrigeration, aircraft and air-conditioning industry. Under their automotive division would be manufactured various types of testing equipment, such as ignition carburetter, engine starters, magnetic and general tune-ups, for automobiles.

The new company will have a capital of approximately Rs. one crore. During the period the instruments are not manufactured here, it would try to make available for the use of the country all these equipments against import licences. The main advantage that will accrue on the completion of the project would be that foreign exchange that is now being spent on the import of these instruments would be saved to some extent.

A Letter to the Editor

INVOLVEMENT IN AFRICA

The Editor,
The Eastern Economist,
New Delhi.

Dear Sir,

May I express my deep appreciation of your article, "Involvement in Africa", in "The Eastern Economist", dated May 19, 1961?

You have raised the crucial question: "Is the Indian community anywhere in Africa more secure because of our African policy?" Let me venture to give a reply and suggest ways and means by which the Indian community in Africa could be enabled to acquire a fair sense of security.

There is a very vital point in connection with the development of intimate relations between India and Africa. The Indian community abroad can act as the ambassadors of India for promoting mutually beneficial trade ties between this country and Africa and in this process help expand India's exports which could serve the African market. Today the tendency is to look upon Indians abroad with a good deal of suspicion, as if they belong to a different category and

are of a different complexion from Indians in India. There is unhappily a misinformed attitude which tends to consider them as mere parasites in Africa. It is not appreciated that most of them have made Africa their home, that they have helped in building up the country of their adoption and all this without any political power or influence over several decades past.

You stress that "an approach to Africa should be more pragmatic and less evangelical". Indians in Africa do not want any political privilege or power, but they want to be assured of the normal human rights. They legitimately expect the enjoyment of the universally recognized right to property and the right to conduct their business or avocation, subject, of course, to the laws of the land they have adopted, without any discrimination in favour or against them. In talking about building up the "African Personality", let us not forget the people of Indian origin in Africa who have faithfully contributed their mite to this noble endeavour.

Yours faithfully,
FAIR PLAY.

FROM THE CAPITAL'S CORRIDORS

CHANGE OF LOCATION OF INDUSTRIAL UNITS ALREADY LICENSED

THE Committee set up by the Union Ministry of Commerce "to consider and make recommendations whether the location of an undertaking in respect of which licence had been granted should be allowed to be changed", it is understood, has suggested that normally requests for such change of location should be discouraged, and attempt should be made to persuade the licensee to adhere to his original plans of location of the undertaking. The Committee, however, thinks that there might be some genuine cases where change of location would be desirable. Such cases, the Committee recommends, should be considered carefully and change of location should be permitted only if the following two conditions are fulfilled:

(1) That the change is desired on account of important economic considerations which were overlooked at the time of applying or have arisen after the licence was issued, either due to reasons beyond the control of the applicant or due to an error of judgment on his part initially. A few examples of such consideration would be non-availability of power supply or basic facilities at the original location, higher cost of production at the original location, greater advantage to consumers, preference by the foreign collaborator for the new site on cogent grounds, etc. In each such case, the applicant should justify in detail with facts and figures the desirability of a change of location.

(2) That the original licence was granted not mainly with the object of correcting any regional disparities or that the proposed transfer helps to industrialise a backward region.

Before deciding as to whether a request for change of location should be acceded to, the Committee recommends, the point of view of the State Government should be duly considered by the authorities concerned — by the Licensing Committee where a case is referred to it before being decided or by the Ministry where a case is to be settled by it without reference to the Licensing Committee.

On the point whether the Union Ministry of Commerce or the Licensing Committee should be the ultimate deciding authority about applications of change of location after a licence to set up an undertaking has been granted, the Committee says: "In view of the opinion of the Ministry of Law that except in cases in which the Licensing Committee had agreed to the issue of a licence on the distinct understanding and necessary condition that the factory should be located at a particular place, it is not obligatory on the part of the Ministry to refer such cases of change of location to the Licensing Committee. Where this is so, it will be left to the Ministry to decide whether a case of transfer of location should be put up to the Licensing Committee or cleared in the Ministry without reference to the Licensing Committee."

If as a result of change of location being agreed to, a State Government or any other party concerned whose application had been rejected on account of grant of licence originally, wishes to revive its application, the cases of such parties should be sympathetically considered, recommends the Committee. In cases where, in the opinion of the Ministry, a request for change of location should not be accepted and still the licensee insists on change of location being agreed to, the Committee thinks the licensee should be advised to surrender his licence and apply for a fresh one for setting up his undertaking at the new location. Such cases then should be submitted to the Licensing Committee for consideration on merits. The Committee thinks Chair-

man of the Licensing Committee may be authorised to decide the requests for change of location after, if need be, giving an opportunity to the party and the representative of the State Government to represent their viewpoints.

There is minute of dissent attached to the report of the Committee. It says that the request for change of location from a licensee of an industrial undertaking should ordinarily be agreed to unless in approving the original application special account had been taken of the location or there were other valid objections to the change. The test should be: Had the party applied in the first instance for locating its undertaking at a particular place, would its application have been rejected?

EMPLOYEES' STATE INSURANCE

A scathing criticism of the Employees' State Insurance Scheme is contained in the report of the one-man committee — consisting of Sir Lakhshman-swami Mudaliar — which was appointed by the Union Government in October, 1959, to enquire into the working of the State Insurance Corporation, with particular reference to the delay in extension of the Scheme to new areas, extension of medical care to families of the workers and the delay in the construction of hospitals. The Committee says, "the visits paid (by it) in Bombay and Calcutta to the various consulting rooms of the panel doctors have indeed been a most disappointing experience."

"In Bombay," the Committee observes, "the panel practitioners have so-called consulting rooms which are in small places in the main thoroughfares and are not dissimilar to the cubicles where small shops might have been located it cannot be said that there are facilities such as would be expected for proper consultation and examination of the employees." The position in Calcutta and Howrah is said to be no better. In some respects, the premises where the panel practitioners are supposed to practise, are even more disquieting to view. Some of these places are not merely in slum areas, but are actually slums themselves.

The Committee goes on to say: "While realising that the availability of space in Bombay and Calcutta is a problem, it cannot be said that many of these places where panel practitioners are supposed to look after the interests of the employees can be said even remotely to approximate to what a consulting room ought to be." The Allocation Committee, the Committee, opines, has failed to recognise its responsibility both in Bombay and in Calcutta in regard to dispensaries as well as to some of the hospitals that have been recognised. The case of a hospital in Bombay is cited where there were previously over a hundred insured persons, which strength was reduced later on to 40 which the hospital could manage. The amount of over-crowding, insanitation and mixing up of tuberculosis patients with others at this hospital gave to the Committee a dismal picture of the facilities for hospitalisation. There were no X-ray facilities available at that institution. It would have been unnecessary, the Committee thinks, to have utilised such places as hospitals if the Corporation had launched on the scheme of building hospitals at a much earlier stage. The Committee recommends that building of hospitals should be one of the highest priorities in the implementation of the Scheme.

The Committee has found similar faults with the working of the Scheme in Delhi. In one of the most crowded localities of Delhi, it says, the ground floor of a particular building, which was dark and dingy, was

All Iron and Steel making facilities have now been installed at Durgapur Steelworks. Rated at a daily output of 1250 tons of iron each, Nos. 1 & 2 Blast Furnaces have frequently exceeded this figure. No. 3 Blast Furnace, now ready for operation, completes the Iron making Plant. Up to date nearly 2 lakh tons of steel have been produced from the Open Hearth Furnaces which have been put into operation in the Steel Melting Shop. All the Open Hearth furnaces are now ready for operation.

AUSTRALIA, the land of kangaroos and cricketers, is one of the 50 countries importing BINNY'S textiles.

BINNY'S fabrics are made from yarns spun only from cotton of the best quality and are dyed with the fastest colours or so carefully bleached that the full strength of the cloth is preserved. Rigid Quality Control* ensures maximum durability and perfect finish.

*Quality Control:

Modern machines process yarn and cloth so fast that often defects, invisible to the naked eye, creep into the cloth. Quality Control is

laboratory testing to eliminate defects at every stage of production. That's why BINNY'S fabrics stay smart so long.

Testing size mix to ensure strengthening of yarn

Viscosity and temperature of the size mix are tested to ensure uniform penetration, dressing and strengthening of yarn.

BINNY - a great name in textiles

BINNY'S manufacture nearly 90 million yards of cloth every year. Here are some of the varieties they make:

Shirtings • Khaki Drills • Bleached & Dyed Drills • Towels
Anticrease Suitings • Tussore • Union Fabrics • Silk Sarees
etc. etc.

being utilized as a dispensary two large rooms thereof being considered for housing in-patients. The whole set-up of the dispensary gave a rather dismal picture of what the employees had to go through. When one knows that this small part of a storied building was rented for Rs. 2,000 per mensem, one cannot help feeling that with the amount expended during the last three or four years, it would not have been difficult to have built an insurance hospital or more than one polyclinic for the permanent use of the Corporation.

The irregular attendance by panel doctors at their dispensaries has also come in for criticism by the Committee. The Committee cites various instances where the panel doctors were not found at the places of their duty during the stipulated hours of work.

The Committee regrets to note that at places where treatment to workers is provided under a system of reserved beds in certain State hospitals, the treatment meted out to the employees leaves very unwholesome memories with them; at several places, they are not treated very differently from those who get hospitalisation without contributing anything towards such facilities. Even in cases where it has been suggested that the treatment is different, the psychological factor which an employee has got that he and his employer have paid for what he is entitled to is hard to be satisfied.

In the circumstances, the Committee feels that if the Scheme is extended to include the families of the workers, the hospital facilities provided at present by the Corporation will prove to be deplorably inadequate. At present, the hospital facilities that are available are hardly sufficient to meet even the needs of the insured people.

U.S. VICE - PRESIDENT'S VISIT

The U.S. Vice-President, Mr. Lyndon Johnson, paid a short two-day visit to New Delhi last week. During his stay here, he had discussions with the Prime Minister, the Finance Minister and some members of the Planning Commission, on the Third Five-Year Plan. In a joint communique issued at the end of his talks with the Prime Minister, Mr. Johnson stated, "While American aid is dependent on the decisions of the Congress and also on parallel efforts by the other developed countries, it is the President's hope that the American aid to the new Plan will both be substantial in amount and effective in form."

This in a way confirms the reports from Washington that, subject to two over-riding stipulations, the U.S. Government had offered at the last meeting of the Aid-India Club one billion dollars for financing the Third Plan during the first two years of its operation. The two conditions stipulated were: (1) that the other members of the Aid-India Club will make available a matching contribution for economic development of India in 1961-62 and 1962-63 and (2) that the aid offered by the United States would be subject to approval by the U.S. Congress. The United Kingdom, it is learnt, had offered at the last meeting of the Aid-India Club to make available to India assistance to the tune of \$200 million and West Germany had proposed to contribute \$331 million, including \$131 million for repayment of loans entered into between India and West Germany during the first two Plan periods. The U.K. Government, it is understood, is favourably inclined to step up its contribution. Whether West Germany will follow suit it is difficult to say.

Meanwhile, a regular pressure campaign has been started by India with a view that maximum amount of foreign aid is made available by the members of the Aid-India Club, other than the United States, to match the latter's contribution. The Foreign Office took an unprecedented step last week when it sounded the envoys of the countries which are members of the

Aid-India Club or which have been sending their observers to the consortium meetings, urging them to request their Governments to make the maximum contribution to reach a target of \$1,100 million, which, along with the expected contribution of \$400 million by the World Bank, would enable the United States to make available aid to the tune of one billion dollars.

The Secretary for Economic Affairs, Mr. L. K. Jha, who is at present in Europe to attend some routine meetings on financial matters, has been directed to pay visits to some of the uncommitted nations—France, Italy, Netherlands, Norway, Sweden and Denmark—to persuade them to join the Aid-India Club.

TRADE WITH EAST EUROPE

With a view to step up trade with the Soviet Union, negotiations, it is understood, have been started to include cotton textiles, jute manufactures and steel black pipes in the list of commodities to be exported from India during the current year. It is proposed to import from the U.S.S.R. calcined petroleum coke worth Rs. 20 lakhs, furnace oil worth Rs. 65 lakhs, tractors and other agricultural machinery worth about Rs. 31 lakhs and synthetic fishing twine worth Rs. 31 lakhs.

Negotiations are also understood to be in progress for import of Rs. 42 lakhs worth textile machinery and typewriters from East Germany against exports of rolled steel from here. It is also proposed to import 30,000 tons of special and alloy steel and 33,000 tons of steel rods, sheets and wires against exports of manganese and chrome ore, bauxite, heavy woollen textiles, sugar, etc.

Hungary proposes to supply to this country newsprint in exchange for such goods as jute manufactures, raw and tanned hides and skins, groundnuts and tapioca. Newsprint which Hungary will be exporting to this country will probably be imported by her from Finland. This raises an important issue. India exports her goods under barter deals to Communist countries on the understanding that these goods will not be exported by them to other countries. Whether Hungary will be able to respect this understanding it is difficult to say, since she will be supplying newsprint imported by her from another country.

INDO-NEPAL TRADE TREATY

Meetings between the Indian and Nepalese Trade Delegates in terms of the Treaty of Trade and Transit between the two countries were held in New Delhi during the week. The Treaty, which came into force on November 1, 1960, provided for periodic consultations between the two Governments in order to resolve the difficulties which might arise in its implementation. It was fully appreciated on both sides that it was in the common interest of Nepal and India that the procedure for transit of goods through Indian territory should be such as to prevent, to the largest extent possible, any diversion of goods 'en route' and that all means should be tried to simplify and speed up the procedure for transit traffic, subject to reasonable safeguards. The talks were held in order to remove some of the procedural difficulties which had come to light in the working of the arrangements for the transit of goods to Nepal through the Indian territory.

One of the difficulties of the Nepalese importers was in regard to the bonds which had to be executed under the Rules for the goods in transit to Nepal. As it was represented that this led to the locking up of the capital of the Nepalese importers for a considerable time, it was agreed after discussion that the amount of the bond would be drastically scaled down. Further, as the Government of Nepal had appointed an Agent for clearing the bulk of the goods, the Indian Delegation agreed that a general bond with the smallest pos-

sible amount of surety may be executed by this Agent for this purpose. To facilitate the free movement of passengers and their baggage, the Indian Delegation further agreed to a considerable relaxation in the procedure at present being followed, and to permit 'bona fide' baggage to pass in transit without special formalities, even if such baggage did not strictly conform to the Indian Baggage Rules. The Indian Delegation also agreed to allow transit of goods to Nepal by road in special circumstances.

IMPORTS FROM WEST GERMANY AND THE NETHERLANDS

The Government has decided to grant certain special facilities to importers for clearing shipments from West Germany and the Netherlands and make remittances for the goods concerned. This has been done to avoid inconvenience to importers following the recent revaluation of West German and Dutch currencies as a result of which the c.i.f. value of shipments to India will be in excess of the c.i.f. value available under the relevant import licences. The facilities have been announced in an Import Trade Control Notice. Generally, the c.i.f. value specified in the licences will be deemed to have been increased to the extent necessary to accommodate the altered rupee equivalent.

DUTY DRAWBACK ON EXPORT GOODS

As a measure of export promotion, the Government of India has decided to allow drawback of customs and Central excise duty on jute goods manufactured out of raw jute imported from countries other than Pakistan, paper products (napkins, toilet paper and drinking straw), shrimp cartons for packing sea food, low-tension electrical switchgears, motor starters, cosmetic preparations, perfumery compound and perfumery and safety razor blades. Some changes have also been made in the items relating to umbrellas and umbrella ribs, hydraulic brake fluid, diamonds, mild steel, paper pins and clips and paper products (playing cards, carbon paper etc.) Items relating to hessian and sacking have been deleted from the Customs and Central Excise Duties Export Drawback (General) Rules, 1960.

DEVELOPMENT OF ROADS AND PORTS

Mr. Venkateswara Ayyar, Secretary to the Union Ministry of Transport, is shortly visiting Washington to negotiate two loans, one with the International Development Association for development of roads and the other with the World Bank for development of the Calcutta port. It is proposed to acquire with the loan being sought from the World Bank, crafts, dredgers, tugs, barges and other equipment for undertaking expansion of the Calcutta port during the Third Plan period. The World Bank, it may be recalled, gave a loan of \$20 million in 1958 for similar purposes.

On his way back from Washington, Mr. Ayyar will be visiting Britain, Norway and West Germany to explore the possibilities of securing technical collaboration for the second shipyard proposed to be built during the Third Plan period at Cochin. The British Government, it is learnt, may not be able to make available a separate loan for this shipyard, but in case the negotiations are successful, it may permit the use of part of the credit it has offered for the Third Plan.

THE VIZAG SHIPYARD

The Union Government has decided to fully nationalise the Vizagapatnam Shipyard by acquiring the stock-holdings of Scindias. It is believed that Scindias will be paid Rs. 80.4 lakhs for their share in the shipyard; the payment is proposed to be adjusted against the loans advanced by the Government to this company for purchase of ships from abroad.

The Government, it is understood, is not prepared to further reduce the price of ships built at this shipyard as these are already being sold at a subsidized price, based on the prices obtaining in Britain.

THE ROURKELA STEEL PLANT

The project report for the expansion of the Rourkela Steel Plant has been received. For expansion by 0.8 million tons, this plant will require one more blast furnace, two coke-oven batteries, two L.D. converters and one generator in addition to some expansion of the existing capacity of the blast furnaces. The total cost of this expansion programme is placed at Rs. 90 crores, half of which will be in foreign exchange. The West German Government has already promised to meet this foreign exchange component of the expansion programme.

RE-ROLLING INDUSTRY

In planning the development of the steel industry in the Third Five-Year Plan, the place of the re-rolling industry has been reviewed taking into account the demand for sections which can be rolled in re-rolling mills, the possibilities of producing additional billets and the need for regional development. In doing so it has been the desire of the Government that: (i) the re-rollers should be encouraged and pressed to use the major part of their capacity to roll special sections which integrated steel works cannot produce easily—the demand for this is estimated at about a million tons (including wire rods); and (ii) the re-rolling industry should as far as possible be enabled to work two shifts.

Inconvenient as it is for integrated steelworks to produce billets, it has been planned that a million tons of billets will be supplied from the integrated steelworks. Another about 200,000 tons are expected to be available from electric furnaces. Although the existing capacity of the re-rolling industry is claimed to be about 1.3 million tons on two-shift basis, actual consumption of billets in the year 1960-61, when supplies were easy, has shown that it should be possible to license between 100,000 to 150,000 tons of further capacity. In selecting new units for licensing, it is the desire of the Government that they should be located in hitherto unserved areas. Judging from the availability, in different areas, of products which can be produced by the re-rolling industry and bearing in mind the need to eliminate movement, as far as possible, of products of re-rolling mills over a distance of about 100 miles, new units can be licensed in the following States—

State	No. of Units that can be set up
1. Andhra (Telengana area)	One
2. Assam	One
3. Bihar (north of the Ganga)	One
4. Bombay (Vidharba area)	One
5. Gujarat	One
6. Kerala	One
7. Madras	One
8. Mysore (Karnataka region)	One
9. Orissa	One

In view of the limited availability of billets and the need to spread the industry on a regional basis, it is the desire of the Government that the capacity of a new re-rolling mill should not be more than 15,000 tons on two-shift basis.

NEW CAPITAL ISSUES

The Controller of Capital Issues has granted consent for issue of capital of various categories by six companies: the Arvind Mills Limited, Ahmedabad; the Raipur Manufacturing Company, Ahmedabad; the Birla Jute Manufacturing Company, Calcutta; the Standard Mills Company, Bombay; the Delta Jute Mills Company, Calcutta, and the Electroflo, a new company floated in West Bengal.

ENGLISH ELECTRIC

HIGH RUPTURING CAPACITY HEAVY DUTY FUSEGEAR

H. R. C. CARTRIDGE FUSE-LINKS

Hermetically sealed construction—Non-deteriorating—ASTA certified for 35 MVA rupturing capacity—Visible indication of operation—Ratings up to 300 amps.

COMBINATION FUSE-SWITCHES

Ratings from 30 to 750 amps—Rugged construction, fully shrouded and interlocked—Type tested for 35 MVA rupturing capacity.

COMBINATION FUSE-SWITCHBOARDS

Incorporating Combination Fuse-Switches upto 750 amps—Robust and compact construction—Readily modified and extended—Type tested for 35 MVA rupturing capacity.

DISTRIBUTION FUSE-BOARDS

Robust, dust and moisture proof construction—Type tested for 35 MVA rupturing capacity—Ratings from 15 to 100 amps.

Flexibility of power distribution—Can be installed without disturbing existing layout or production—Avoids chasing of floors for ducting—Approved by Fire Insurance Authorities

OVERHEAD BUSBAR EQUIPMENT

A complete range of distribution equipment manufactured at the Madras Works of The English Electric Company of India (Private) Ltd.

STATE BANK OF INDIA'S

RUPEE TRAVELLERS

CHEQUES FOR

CARE-FREE TRAVEL

You can travel anywhere in India and outside without having to carry a large amount of cash, without being in fear of theft or of running short of money.

The State Bank's travellers cheques, issued in denominations of Rs. 100/- and Rs. 50/-, represent the ideal travel funds. They are as safe as a bank draft and are encashable anywhere, anytime.

This is one of the many services the Bank provides to its clients and the general public. For complete information, please ask for a copy of our illustrated booklet from the branch nearest to you, or consult your travel agent.

SISTA-1-55-13

Messrs. Arvind Mills have been allowed to capitalise their reserves to issue 40,000 ordinary shares of Rs. 100 each as bonus shares in the proportion of two for every three shares held. The present paid-up capital of this company is Rs. 86,25,000, consisting of Rs. 60 lakhs in equity shares and Rs. 26.25 lakhs in preference shares.

The Raipur Manufacturing Company has been granted permission to issue 20,000 ordinary shares of Rs. 100 each as bonus shares in the ratio of two for every three held. This company has at present a paid-up capital of Rs. 40 lakhs—Rs. 30 lakhs in equity shares and Rs. 10 lakhs in preference shares.

The Standard Mills Company has been given consent to issue 43,900 equity shares of Rs. 100 each as bonus shares in the proportion of two for every five shares held. This company at present has a capital of Rs. 121.75 lakhs.

The Birla Jute Manufacturing Company has been granted permission to capitalise its reserves to issue bonus shares worth Rs. 22,81,500 in the form of 2,28,150 shares of Rs. 10 each, fully paid. The bonus shares can be issued only after the company has completed the issue of 4,56,300 new equity shares of Rs. 10 each at a premium of Rs. 6 per share for which consent of the C.C.I. was obtained by the company early in February last. The paid-up capital of the Birla Jute Mills Company on the date of the bonus issue application was Rs. 215.90 lakhs, comprising equity shares of the value of Rs. 91.26 lakhs and preference shares of the value of Rs. 123.64 lakhs.

The Delta Jute Mills Company has been granted consent to the issue of capital of Rs. 37.10 lakhs in (i) 28,000 equity shares of Rs. 100 each at par to be issued to the holders of 28,000 equity shares in Belvedere Jute Mills Company Limited, and (ii) 9,100 preference shares of Rs. 100 each at par as fully-paid to the holders of 7,000 preference shares in the Belvedere Jute Mills Company, in exchange of the assets and liabilities of the latter. The consent is subject to the orders of the Court approving the amalgamation of the Belvedere Jute Mills Company with the Delta Jute Mills Company.

Messrs. Electroflo Limited, a new company floated in West Bengal, has been given consent to the issue of capital of Rs. 50 lakhs in:

- (i) 4,00,000 equity shares of Rs. 10 each; and
- (ii) 10,000 cumulative non-redeemable preference shares of Rs. 100 carrying dividend at 9.2 per cent.

The capital is required for the company's scheme for the manufacture of Watthour Meters, in collaboration with a Japanese firm which will also invest in preference capital to the extent of Rs. 8.17 lakhs.

The consent in all these six cases is valid for a period of 12 months.

RAYON TYRE CORD MANUFACTURE

Raising of output of tyres from 1.5 million numbers to about 4.5 million numbers by the end of the Third Five-Year Plan, it is learnt, will require 70 million lbs. of tyre cord — 33 million lbs. of cotton cord, 30 million lbs. of rayon cord and 7 million lbs. of nylon cord. The Planning Commission has tentatively proposed a target of 20 million lbs. output of rayon tyre cord yarn for the Third Plan period. This will fall short of the actual requirements of this type of yarn by about 10 million lbs. There are in the country today three units which are (or will start shortly) manufacturing high tenacity rayon yarn for conversion into tyre cord; they are, Century Rayons, Bombay (5 million lbs. capacity), National Rayons, Bombay (4 million lbs. capacity) and Delhi Cloth and General Mills, Delhi (8 million lbs. capacity). Attempts are to be made to fill the gap between the present installed capacity and the ex-

pected requirements of rayon tyre cord yarn by the end of the current Plan period.

N.C.A.E.R.'S STUDY ON SAVINGS

The National Council of Applied Economics Research in a study on savings has estimated that savings in all sectors of the Indian economy between 1949-50 and 1957-58 increased from about Rs. 600 crores to Rs. 1,200 crores. The study shows that the share of Corporations, Government and individuals in national savings is of the order of 5 per cent, 15 per cent and 80 per cent respectively. By far the most important in the national economy for saving is the Individuals' sector, which represents non-corporate business enterprises and all other households, including individuals. This sector has in it at least two major sub-sectors, namely, entrepreneurial or business sector and non-entrepreneurial or personal sector. The Council has, however, not shown separate estimates of savings by these two sub-sectors.

The total domestic investment, which was about Rs. 600 crores in 1948-49, registered an all-time record of Rs. 1,600 crores in 1957-58. Government appears to be mostly responsible for this increased investment and accounts for about half of the total investment in the economy during 1957-58, as against its investment of only Rs. 160 crores in the year 1948-49. Corporate investment increased from Rs. 150 crores to Rs. 250 crores during the same period. Individuals' investment, which stood at Rs. 300 crores in 1948-49, rose to Rs. 600 crores by 1957-58.

Except for three years, 1951-52, 1952-53 and 1953-54, all other years during this ten-year period witnessed positive net foreign investment in India, both on Government and private account. The percentage of the net foreign investment to the domestic investment during this period works out to about twelve. During 1957-58, however, it was about one-fourth of the total domestic investment. This provides a significant insight into the role of foreign investment in India's economic development.

The Government investment, on the other hand, recorded a constant rise from Rs. 160 crores in 1948-49 to nearly Rs. 800 crores in 1957-58, the tempo of investment being more prominent in the last four years of the series. A greater portion of total Government saving and investment is contributed by the public authorities, viz. Central and State Governments and the Local Authorities, and the rest by the Government Statutory Corporations and Government registered companies. Of the public authorities again, it is departmental enterprises that contributed a major share of the total investment.

The National Council's estimates of marginal and average saving-income ratios for the nation — 0.20 and 0.10 respectively — point to an income elasticity to save of two. This finding suggests that national saving would be of the order required to place the Indian economy well on the path of "self-sustained" growth from 1975-76 onwards.

BRIEFS

Talks are expected to start in the near future for entering into a fresh trade agreement with Indonesia. The last India-Indonesia trade pact expired on March 31. Negotiations are also due for the renewal of trade agreements with Italy and Spain.

Free Africa, it is understood, is thinking in terms of increasing its trade with India. An Economic Delegation from Nigeria is expected here towards the end of June to discuss problems of stepping up trade between Nigeria and this country.

Negotiations are understood to be in progress between the State Trading Corporation and the Hindustan Steel Limited for a 20-year agreement for supply of iron ore by the latter to the former.

COMMODITY NEWS AND NOTES

U.S.A.'s TEA IMPORTS

Tea imports into the United States in 1960 reached a record of 116,077,418 lbs. a seven per cent increase over the 108,408,836 lbs. imported the previous year, the Tea Council of the U.S.A. Inc. reveals in its annual report released recently. The report notes a trend in tea sales away from loose tea in favour of instant tea which rose to 4,300,000 lbs. in 1960 compared with 2,900,000 lbs. in 1959. At the same time, sales of loose tea fell 1,900,000 lbs. from 33,200,000 in 1959 to 30,000,000 in 1960. An international partnership composed of the Governments of India, Ceylon, Indonesia and the U.S. tea trade, the Tea Council's mission is to promote the sale and consumption of tea in the United States.

COFFEE GROWING IN THAILAND

Thailand is experimenting in coffee growing to meet its own requirements. Coffee cultivation has been encouraged since 1954 and acreage is steadily expanding as can be seen from the figures given below:

1954	1,144 acres
1957	4,482 "
1958	5,230 "
1959	5,980 "
1960	8,200 "

Thailand's Department of Agriculture has a 1961-63 programme aimed at increasing coffee plantings to 21,800 acres.

TEA PROCESSING PLANT IN PAKISTAN

The Pakistan Government is planning to set up a 500 acre tea plantation in Manshera Tehsil of Hazara Distt., if current experiments of tea cultivation in the area prove successful. The Pakistan Tea Board has been entrusted with the responsibility of making arrangements for the plantation of tea in a 500 acre site near village Buffa. According to preliminary estimates, the tea plantation would produce 5 lakh lbs. of tea annually after five years. The site would be planted with three tons of tea seed obtained from Japan, China and Ceylon. The experimental plantation of tea in this area was carried out with seed imported from East Pakistan and Japan. The Japanese variety of seed was found to be most suitable to the local soil and climate. Meanwhile, a proposal to set up a tea processing and blending plant near the plantation area is being considered.

IMPORT OF DRY FRUITS FROM IRAN

The Government of India have decided to grant ad-hoc licences for import of dry fruits, Asafoetida and red oxide from Iran during April-September 1961. Licences will be granted to established importers, who have imported these items from Iran during any finan-

cial year from 1951-52 to 1960-61. The imports will be allowed within a prescribed ceiling. The licensing authority will be the Chief Controller of Imports, New Delhi and the validity period of the licences will be six months. Established importers may submit separate applications in respect of each item, along with documentary evidence of past imports. All applications should reach the Chief Controller of Imports and Exports, New Delhi before June 30, 1961. The import licences will be granted subject to the condition that the goods will be imported either by sailing vessels or through the land route.

ALLOTMENT OF STEEL ANNOUNCED

The Iron and Steel Controller has announced the allotment of steel for the first half year of 1961-62 (April-September 1961). Excepting for sheets (thicker than 14G), wire and baling hoops, all the remaining categories have been relaxed. In regard to the relaxed categories the main feature of the procedure to be followed for this period is that there is no time limit for the indents which may be submitted. This will help the consumers to place their indents for relaxed categories throughout the currency of the period.

NEW MINERAL DEPOSITS

The Government of India have decided to reward persons who supply information leading to the discovery of new mineral deposits of economic importance. A reward of Rs. 500 will be given to persons giving information regarding tin, copper, lead, zinc, bismuth, nickel, mercury, antimony, cobalt, arsenic and elemental sulphur, asbestos (chrysotile variety), borax and coking coal. Persons supplying information about precious metals and precious and semi-precious stones, such as gold, silver, platinum, diamond, ruby, sapphire, emerald, etc. will get a reward of Rs. 100. A reward of Rs. 200 will be given to persons supplying information about other minerals not included in the above groups.

If the deposits need detailed exploration, an additional sum twice the amount of reward will be paid and if the exploration proves that the deposits is economically workable, another reward up to Rs. 10,000, depending upon the reserves and quality, might be paid. No reward will be given for any deposit which does not hold promise of commercial value. The grant of a reward is entirely voluntary on the part of the Government and does not involve any legal commitment. The discoverer, who claims a reward for a new mineral deposits, shall have no special or preferential claim for the mineral concession over the area for the discovered mineral deposit. Samples of new discovery and other information may be sent to the Director, Geological Survey of India, Calcutta or Director, Indian Bureau of Mines, Nagpur.

COMPANY AFFAIRS

THE AHMEDABAD ADVANCE MILLS

Mr Naval H. Tata has departed from the traditional practice of reserving a speech for the annual general meeting and has instead issued a statement to the shareholders along with the annual report. While commenting on the working of the Ahmedabad Advance Mills Ltd. during the year to June 30, 1960, when the company made a gross profit of 29.36 crores against Rs. 11.00 lakhs during the previous year, he pointed out that the cotton textile industry is often faced with a clamour against soaring prices of cloth. Each time, he said, this matter was discussed in public, there was a good deal of irresponsible and loose talk on the subject. In view of the persistent attacks against the industry, he has attempted in objective study of cost in an endeavour to assess the extent to which the textile industry had been guilty of profiteering charges. Taking the figures of Ahmedabad Advance Mills for the year 1959-60 as the basis of this study, he has tried to analyse the cost to the consumer per yard of cloth produced by the company. By that method the following interesting analysis was drawn:

	(average) Per yard nP.
Cost of cotton	31.00
Manufacturing costs	53.00
Total cost of cloth	84.00
Provision for gratuity, bonus, depreciation, development reserve and managing agency commission	7.75
Dividends	1.50
Net surplus carried to General Reserve	2.25
Realization (ex-mill rate)	95.50
Excise Duty	17.75
Distributing charges	17.25
Approximate cost to the consumer	130.50

It appears the consumer paid 37 per cent more than the ex-mill rate; out of this half was paid to Government as excise duty and other half was paid out as distribution cost. Further, of the ex-mill price, at least 88 per cent was composed of items of cost beyond the control of industry, such as raw cotton, salaries and wages, bonus, stores, etc. From the remaining 12 per cent, the industry had to provide for tax, dividend, depreciation and reserves and rehabilitation. It may be worthwhile if similar figures for other textile mills and industries were collected to determine and compare the profitability of cotton textile industry with industries manufacturing other consumer goods.

NATIONAL RAYON CORPORATION

The working of the National Rayon Corporation Ltd. for the year to December 31, 1960 shows a profit of Rs. 78.97 lakhs after allowing for depreciation, taxation and development rebate reserve. This net profit was higher than the previous year's Rs. 74.86 lakhs, although the sales during the year were slightly lower due to the fact that the opening balance of stocks at the beginning of the year 1959 was higher than the opening balance of the year under review. A sum of Rs. 10 lakhs was separated towards debenture and redemption reserve and Rs. 3.50 lakhs towards gratuity reserve. The net dividend to be paid on preference shares of the company has been adversely affected by the Preference Shares (Regulation of Dividends) Act 1960 but the Directors have proposed the payment of Rs. 5.55 per preference share of Rs. 100 each. A dividend at the rate of Rs. 22 per share has been proposed to be distributed on ordinary shares of Rs. 100 each.

The Directors have reported that the import licences for wood pulp for the second half of 1960-61 was cut by 10 per cent of the normal requirements, but the cut was restored by the Government on the basis of making available rayon yarn to the weaving mills at concessional rates for export promotion. This seems to be a

sound policy. The company is going through a programme of expansion and has installed additional spinning frames. The Directors report that there has been a slight delay in pressing tyre cord plant into commission due to shortage of cement. The plant is expected to go into production towards the end of this year. Machinery is also being installed to set up 100 ton sulphuric acid plant. The company also received industrial licences for putting up a cellophane paper plant and for the expansion of caustic soda plant. With this expansion the company is likely to function on a fairly sound basis.

CENTRAL INDIA

The Central India Spinning, Weaving and Manufacturing Company Ltd. registered a loss of Rs. 8.93 lakhs for the year to June 30, 1960. The loss was mainly due to unsatisfactory trading conditions for a substantial part of the year under review and due to further increase in the cost of production and heavy interest charges during the period of reorganization. In fact the need for modernization of the equipment in the textile industry was so great that it had become quite impossible for a large number of units to register favourable results without a large-scale modernization. It is estimated that several hundred crores of rupees will be required for renovation and modernization for which the industry's resources are grossly inadequate.

MR. AL FOIL WRAPS CONFECTIONS TO PERFECTION

"Why not say it 'sweetly' Sir," said Mr. Foil helping out the worried gentleman. "Delicious chocolates and toffees to tempt sweet sixteen, soft candies to please Grand-Ma and ice-cream or biscuits to delight the kids at home... your choice in sweet presents is wide. Only be sure that they are all foil wrapped. Confectionery protected by aluminium foil looks attractive and tastes wonderful as only fresh sweetmeats do... because foil packing keeps in the tasty goodness while keeping out dirt, damp and dangerous contamination.

Long and extensive experience as Manufacturers of Aluminium Foils for packing goods in Cigarette, Pharmaceutical, Confectionery, Tea and many other industries.

Tormented Assam

THE language controversy in Assam eclipsed all other issues at the A-ICC's recent session at Durgapur. Violent agitation, spectacular demonstrations, attack on a junior minister and, to cap them all, the reprehensible attempt on the life of the Congress President cannot, by any stretch of reasoning, be treated as momentary outbursts of anger and resentment on the part of the local population. Many have questioned the wisdom of convening the A-ICC's meeting at Durgapur in the close vicinity of Calcutta at a time, when feelings, once exacerbated over the language issue, still continue to agitate the minds of the people deeply. Whether or not Durgapur had been chosen as the venue of the session, the fact that the explosion would have taken place on some other occasion — not remote — can hardly be disputed.

Mr. Nehru has pleaded for the maintenance of the *status quo* in Assam for one year with the specific object of enabling the parties to consider the issue in a calm atmosphere and with the fullest appreciation of its long-term repercussions. The *status quo* would positively imply that the Assam Official Language Act should not be enforced. Its application can be given a delayed start, made piecemeal and spread over a maximum period of five years. But this appeal has come too late in the day. Passions have been inflamed by the passage of the Bill and one year will be regarded as too long a period to amend it.

The proper time for maintaining the *status quo* was in October last year, when the Bill was on the legislative anvil. At that time the necessary psychology of confidence could have been created and reconciliation could have been brought about before the linguistic majority and minority drifted woefully apart. It is wishful to hope that the majority, having scored the triumph on which it had set its heart, will be in a mood to show patience and the minority, under the shadow of a psychology of fear, will hardly be disposed to act otherwise.

The Pant formula of conferring on Bengali the status of the official language at the district level in Cachar was never accepted wholeheartedly by the State Government. It is pointed out that under the provisions of the Assam Official Language Act, it is open to the local boards and the mahakuma parishads to declare Bengali as the

official language in Cachar District. But strong doubts can be raised about the legality of this provision and it could be argued that under Article 347 of the Constitution it is not competent for any authority except the President to declare any additional language as the official language in a State or a part of a State. The wording of Article 347, however, would lend itself to an ambiguity in its application to the situation in Assam. That Article stipulates that, if the President is satisfied that a substantial proportion of the population of a State desires any language spoken by it to be declared as the official language in the State or a part of the State, he may make a declaration to that effect. Legal quibbling may centre round the phrase "a substantial proportion of the population of a State" and it may conceivably be contended that the demand may not be entertained unless it emanates from a majority of the people in the State. It would be unwise to treat this issue at a technical level. A forthright amendment of the Assam Official Language Act is the real course open.

The Assamese speaking population of the State accounts for 55 per cent of the total and its majority status offers a safeguard for its linguistic interests. Furthermore, the two languages are so akin to each other. The Assamese stand to lose nothing whatsoever by showing generosity and a genuine national spirit by accommodating the demand of the Bengali speaking population to treat Bengali as the official language in Cachar District. On the other hand, they stand to gain everything by reintegration with their Bengali speaking brethren.

Mr. Nehru has dilated so much upon the Centre's sincere desire to respect the autonomy of the State. Its bona fides were not held in doubt; but they are hardly relevant to the issue. In a question of fundamental significance it would be short-sightedness to make a fetish of autonomy where its exercise does not square with the larger national interest. The Home Minister is proceeding on a mission of reconciliation by personal contacts and persuasion. If he succeeds in it, it will be a great achievement; but on this score there is not much ground for reasonable optimism. The Centre has to make up its mind to shake off its attitude of indecision and vacillation. Firm and timely action is the least that the explosive situation in Assam requires.

A Re-estimate of Savings

THE finding of the National Council of Applied Economic Research that the Planning Commission has been rather too conservative in the estimation of India's rate of savings in recent years is contentious and difficult to be accepted at face value. It bears further scrutiny and more ample corroboration. Nevertheless, it has raised a point of great and immediate practical signifi-

cance. If it turns to be correct, it will step up the estimate of the domestic resources and may shorten the gap between these resources and the investment target of the Third Plan. The main conclusion of the Council in its survey puts the figure for the current rate of savings at 10 per cent of the national income as compared with the Planning Commission's estimate of over 8

INDUSTRIAL IBCON CONSULTANTS

per cent. Though the Council does not expressly state so in the study, the inference may be drawn that a bigger Third Plan with a higher investment target could be sustained. Whether such an inference can be drawn without the risk of repudiation, one cannot be confident. But the Council makes a suggestion to this effect by implication. It has been careful to explain that its finding is tentative and open to correction on the basis of later surveys. The National Savings Committee has already raised the savings target — on what basis remains unexplained, but certainly not on the strength of the Council's finding.

The Council's next major conclusion is that the marginal rate of savings is as high as 20 per cent, or within about 5 per cent of the rate existing in some of the world's most advanced economies. In the absence of a high degree of the habit of institutional savings, which has grown so impressively in the advanced countries, it is wrong to presume that the higher savings in India can be related to the outlay on the Plan. Still another conclusion of the Council is that savings have almost doubled between 1950 and 1957. This is harder to accept in view of the fact that the growth of savings of this order, unaccompanied by a comparable rise in national income during the same period, would be possible only on the hypothesis of a complete revolution in the savings habit of the people. The Council's finding that 80 per cent of the total of all savings are effected by individuals and the fact that a major portion of the rise in national income during the first two plan periods went to people whose propensity to consume was very high detract from the force of its finding and make it sound over-optimistic.

It is highly improbable that a majority of the people in this country would accomplish the feat of doubling their savings, while at the same time they consumed more of their current earnings for bettering their standards of living and also bore a higher burden of taxation. This theory is to be tested with reference to the fact that real incomes rose no more than 10 per cent during this period.

The S.T.C. X-Rayed

THE findings on the export performance of the State Trading Corporation, recorded by The Economist Intelligence Unit, London, in an investigation referred to it by the Council of Economic Education, Bombay, have rightly received the publicity they merit. The share of the STC in the export trade of this country is about 5 per cent, which cannot be considered as negligible for an individual enterprise. In view of the urgency which export promotion has acquired, the findings of the Intelligence Unit should be taken for what they are really worth. Easily, the outstanding achievement of the STC is that it has given a reassuring character of regularity to the export trade in iron ore with Japan and it is problematic whether private exporters would have been able to show a like performance given a similar opportunity. It is the view of the Intelligence Unit that they would not have been. This difference explains the secret of the negotiating strength provided by the power vested in the STC for bulk trade and the resources placed at its disposal.

The Intelligence Unit has come to the conclusion that no blame could be attached to the STC for the decline in India's share in the world manganese ore exports since it was the outcome of a situation beyond its control. Coming to a longer-term assessment of the declining trend, it has argued that competition of Brazilian ore as a source

The Council's statistical findings run counter to common experience and are not sustained by sound reasoning. Here is an obvious case of statistical data derived indirectly from various sources which demand cautious interpretation in the light of the conditions prevailing in this country.

Consistent with the over-optimistic note which runs throughout the study, the Council concludes that the rate of savings in India "augurs well for the future growth and health of the Indian economy". Even if the rate arrived at by the Council were correct, it is necessary to bear in mind that it is only one principal factor in development. Of no less importance are the processes of development including literacy, education, a reliable apparatus of government and the level of the efficiency of public administration. An integrated view of the future growth and health of the economy ought to be based on a balanced consideration of both.

The findings of the Council's study are probably confined to academic interests at the present stage and they need to be verified by checks based on factual rural and urban surveys. The principal statistical limitations consist in the tentative nature and the large margin of error in the estimates, firstly, of gross investment in capital goods by the 'individual sector' (representing the farm and non-farm unorganised sector) and next, in the inadequate allowance for depreciation on such assets. Apart from data deficiencies, the major limitations arise from the short time-span in respect of which data are available, so that the estimates of the marginal propensities to save are subject to a substantial margin of uncertainty. Depreciation allowances could not be estimated in all the cases due to the non-availability of data and, wherever attempted, they could hardly be estimated on a satisfactory basis.

The findings of the Council's study, which are admittedly too tentative in character, do not warrant that degree of cogency which is essential to treat them as effective aids in formulating objective plans.

of supply to the United States, of Indonesian and Australian ore supplies to Japan and of Russian and African ore supplies to Western Europe has thrown up a real challenge to India's semi-monopoly in this trade. But in regard to the increase in the exports of iron ore, it has been equally frank in highlighting the fact that the sustained spurt in the demand from Japan was the basic cause of the expansion of the STC's exports.

Thus it is that wherever increases have occurred or setbacks have been received in the important items of export, it is the profound trends of change in the direction of the world export trade which have benefited or damaged the country's interests entrusted to the STC. Credit or blame is to be attributed largely to adventitious circumstances. There are certain small segments in which the STC has broken new ground. Exports of textiles and tobacco to the Communist countries illustrate this point. It is, however, pertinent to stress the fact that the export trade in footwear was the result of diversion from the established channels and not the STC's independent contribution. But if the STC's trade with the Communist countries has now expanded to 20 per cent of the total, it is because the volume of that trade has recorded an impressive and speedy increase.

The barter deals which the STC has concluded with private firms in Western Europe enter the debit side of the balance sheet. They have adversely affected the terms of trade of this country since the prices of our exports had to be reduced or alternatively the prices of imports from these countries had to be raised. To this finding may be added an analogous liability. There is reason to believe that the need to strike bilateral balance in the trade with the Communist countries has probably brought a relative loss to this country, in terms of quality or prices.

An important term of reference prescribed for the Intelligence Unit was the reaction of foreign business communities to the methods of operation of the STC. The verdict on this very crucial question is anything but flattering to it. It is significant that Japan, with whom such an impressive trade in iron ores has been built, has an unpleasant experience of the STC's techniques of business. Dilatoriness in pursuing negotiations or making deliveries of shipments is the cardinal

flaw in the STC's business deals and this is largely explained by the bureaucratic procedures which have been transplanted in the sphere of trade. This is an inevitable outcome of making a heavy draft on the civil administrative personnel to man the posts in the STC.

The special position which it enjoys in negotiating deals abroad has obviously removed any incentive for taking initiative and in fact lack of initiative is characterised as an important failure of the organisation. Ignorance, inexperience and a noteworthy absence of technical expertise have hampered the progress and execution of its business transactions as a matter of normal course. To this may be added the want of responsiveness to the changing market demands and consumer preferences. It should be plain that at the root of all these handicaps lies a dearth of business acumen. No bias can be attributed to this appraisal and it should be valued particularly for indicating the directions in which rationalisation of the STC's operating techniques would make it a more effective export agency.

Co-operative Training

WITH co-operation in its various facets having been assigned a place of crucial importance in the development of agriculture and an impressive programme laid down for its future expansion, it was quite natural that thought should have been bestowed on the problem of imparting adequate training to those who are to guide and make a success of this movement. The appointment of the Study Team on Co-operative Training in November last, therefore, came at an appropriate time. The Study Team in its report has expounded a detailed programme for co-operative training during the Third Plan. Coming as they do from persons who have been associated with the movement actively for a fairly long time and who understand its needs in the changing circumstances, one can find little fault with most of the recommendations of the Team.

The Study Team's recommendation that co-operative education and training should be completely decentralised and entrusted to State Governments within the next five years and that the Reserve Bank should totally withdraw from the field during this period is, however, not comprehensible. The Team has suggested reconstitution of the Central Committee for Co-operative Training into a National Board, having a broad-based membership and a non-official as Chairman. This Board is envisaged to be essentially a policy-making body, which should not be saddled with any administrative or executive functions. The benefits purporting to accrue from this change are that co-operative training would become more efficient and flexible, that it would be imparted in regional environments of the particular States and, finally, that it would create adequate enthusiasm amongst the State Governments about the movement. It is difficult to subscribe to the view that the benefits will really accrue.

In a cogently argued minute of dissent attached to the report, the Reserve Bank's representative on the Study Team, Mr. J. C. Ryan, has expressed scepticism about the presumptions made in putting forth this suggestion. The reconstitution of the Central Training Committee and complete withdrawal of the Reserve Bank from this field within the next five years is apparently not a feasible proposition. The time obviously is not ripe for the State Co-operative Unions to undertake this mighty task. They have already

a wide field open to them for imparting training to the junior staff and they will do well to devote their energies to this work. The proposed change, apart from resulting in deterioration in the standards of training, will put a great financial burden on the State Governments or the State Co-operative Unions which they are not in a position to meet at the moment without Central Government's assistance. The Reserve Bank obviously under its present statute cannot allow its funds to be administered by an outside agency and abdicate its responsibility for their efficient use. Even if the Act is amended to provide for this, it is highly questionable if the Reserve Bank can completely withdraw from the co-operative movement while it is made to retain a great financial stake in it in the form of its heavy investments in loans to the State Governments and co-operative societies.

Apart from this, there are certain inherent difficulties which probably have not been fully appreciated by the Study Team. To attract top-class persons to the co-operative training institutions, the emoluments of the training staff may have to be fixed at a level which may cause a chain reaction on the other educational institutions under the charge of the State Governments. Again, there will be the problem of making available adequate numbers of instructors for these centres. Further, there are certain advantages in having some Central institutes for co-operative training. These advantages will have to be foregone if complete decentralisation of co-operative education is effected. Decentralisation will also lead to unnecessary multiplication of co-operative training institutions, which obviously is a step in the wrong direction in view of the fact that even the present colleges run by the Central Committee do not have on their rolls the optimum number of trainees.

In the circumstances, it is appropriate that decentralisation of co-operative education should be proceeded with only gradually. Senior and intermediate staff colleges should be handed over to State Co-operative Unions only when they are in a position to undertake this task, both in respect of financial resources and in matters of teaching personnel. A change with indecent haste will only lead to deterioration and considerable setback to the co-operative movement.

THE WEEK'S NOTES

Backward Classes

A RETROGRADE REPORT

THE REPORT submitted by the Mysore Backward Classes Committee under the Chairmanship of Dr. Nagan Gowda is a glaring instance of a retrograde document, which seeks to enunciate a new principle that may result in prolonging, instead of shortening, the period of special treatment to the backward classes. It will be recalled that the Constitution confers the discretion on the State Governments to extend special treatment in the matter of educational facilities and employment under their auspices to socially and educationally backward classes. These backward classes are quite distinct from the Scheduled Castes and the Scheduled Tribes for whom safeguards for special treatment have been specifically made. In the case of the Scheduled Castes and Scheduled Tribes there is full historical justification for special reservations in the matter of access to education and employment under the State. The case of the backward classes rests on a less secure ground.

The Committee has made a frank confession that it could not obtain community-wise data on population and literary percentages, presumably because of the territorial changes involved in the re-organisation of the State. In the result, it has relied, curiously enough, on the census figures of 1941 (and not 1951). It has made certain assumptions in adjusting them for what it considers to be the probable present condition. The most retrograde principle it has enunciated in the matter of reservations for backward classes is to carve out a new category within the larger category of backward classes. This new category is defined as one whose standard of education is 50 per cent of the average standard prevailing for the State as a whole. The new category will have a guarantee of a minimum reservation of seats out of the total reserved for these classes in technical institutions and government posts. This reservation within reservation is sought to be based on the plea that the less backward classes (or the relatively more advanced among the backward classes) would capture the reserved seats and posts to the detriment of the new category. Where does this principle lead to? How about those who are 49 per cent, 40 per cent or even 30 per cent below the State's average in respect of educational standards? Will they not be deprived of their due share by the less backward classes? Fifty per cent of the available seats in technical institutions and 45 per cent of State Government jobs are to be reserved for the backward classes. In addition to this, there is, of course, the reservation for scheduled castes and scheduled tribes. By the process of elimination, the area that will be left for admission to educational institutions and recruitment to government services on merit will be reduced to pitifully small dimensions with obvious consequences on qualitative standards. It would be desirable if nationwide norms were fixed on the basis of economic status to define the backward classes. In their absence, reservation for the backward classes will lead to further compartmentalisation and hamper the process of integration.

Algerian Settlement

CONFERENCE AT EVIAN

ON MAY 24, the French Government and the spokesmen of the FLN reached an agreement to hold sessions

on alternate days at the current conference at Evian. The utmost secrecy is being maintained about the progress of the negotiations. This is not the only special feature of this conference. Security measures have been taken on an unusual scale and armoured vehicles as well as anti-aircraft guns have been kept in readiness. After the revolt of the colons in Algeria, this was inevitable. The FLN has not found it possible to agree to a cease-fire for a month as proposed by President de Gaulle presumably during the pendency of these talks. It suspects propaganda in it. It has insisted that there can be no cease-fire unless a settlement is reached first. But the FLN has no intention of continuing the fight during the period of the conference at Evian. This attitude relegates the question of cease-fire to an altogether unimportant place. Mr. Krim is evidently under continuous high pressure from the extreme elements amongst the nationalists. At this stage anything that would smack of a compromise may be interpreted as a surrender and the leaders of the revolution cannot take risks on this count.

The French authorities take it for granted that a referendum in Algeria would result in an overwhelming vote for independence. What France is really concerned with is not independence for which Algeria would opt, but whether she would consent to keep constitutional association with France. The associated status is what France would desire to be agreed upon and it would appear that it is also in the interest of Algeria. Once Algeria becomes sovereign, she does not lose by agreeing to the associated status. But this status raises important issues which will take still more hard bargaining. The gain to Algeria would be that she would receive economic and technical assistance for development from France in terms of the Constantine Plan. It presumes a customs union between the two countries. Such a union will confer upon Algeria the full benefits accruing from the Common Market which she enjoys at present. But from the French side the further implication of the associated status is that France would desire agreement with Algeria on the lease of the naval base at Mer-el Kabir and the air base at Maison Blanche. Furthermore, a clear definition of the type of citizenship status for Europeans and safeguards for that status in the constitution would be pressed by France to make the minority population accept the change with a sense of security. The FLN has raised the issue of Algeria's rights in Sahara which cannot be territorially dissociated from her. But the French view is that any talks on Sahara to be taken up afterwards must include the participation of Tunisia and Morocco. For the present the hurdle over Sahara does not appear to be in the forefront.

Orissa

MISLEADING ELECTION CAMPAIGN

ORISSA, LIKE Kerala, threatens to be a problem State in the Indian Union in the sense that the balance between the different political parties may prevent the formation of a stable secure government, deriving a really solid mandate from the electorate. The pre-poll forecasts are practically unanimous that no party will gain a decisive victory in the mid-term election. In the result, the stability of the government may fluctuate with fluctuations in the alignments which would go to make up the coalition. The electorate not only seems to lack enthusiasm but it appears to be apathetic. In the light of the

recent political history of the State, this is hardly surprising.

It is most unfortunate that at least the Congress Party is not setting the example it should in conducting the election campaign on the issues involved and confining the attacks on the other parties within the bounds of propriety. The fact is that real issues as such are difficult to find in this election. Mr. Nehru could have avoided succumbing to the temptation of indulging in vehement outbursts. His condemnation of the disgruntled Congressmen standing as independent candidates—and there are as many as 47 of them—as traitors is certainly strange. Instead of branding them with this epithet, the Congress leadership needs to make deep heart-searching why such a large number of dissidents has sprung up in its ranks and furthermore, why it is driven to the course of contesting the elections as independents. Something is radically wrong with the allocation of party tickets at the elections. Mr. Nehru's denunciation of the Ganatantra Parishad as a feudal party of reactionary princes will fall on deaf ears for two reasons. The Congress was a partner in the coalition with the Ganatantra Parishad and it has set up princes as its own candidates. Mr. Morarji Desai tried to appeal to the voters with a curious logic. His first thesis was that neither the Praja Socialist Party nor the Communist Party has set up a sufficient number of candidates to form the government and hence votes would be wasted on them. He has also impressed upon the electorate the error in voting into office a party different from the party in office at the Centre. This is to put a novel interpretation on the need for opposition parties or groups in a parliamentary democracy and on the nature of our federal constitution envisaging the possibility of different party affiliations of the governments at the Centre and in the units.

Aid Consortium

BETWEEN THE TWO MEETINGS

THE SCANTY report of the proceedings at the last meeting of the consortium of the creditor nations on assistance to India for her Third Five-Year Plan created an atmosphere of suspense. But on the eve of this week's meeting convened again at Washington, much of this suspense is being removed. It now transpires that, between the two meetings, a new policy of economic aid to developing countries is gaining support. India will be treated as a typical case of the application of this policy. All this change is being brought about by President Kennedy's steadfast adherence to his declared objective of putting aid for development of backward economies on a long-term basis.

At the last meeting of the consortium, America offered to provide aid of the order of \$1.1 billion for the Third Plan for the first two years. But a reasonable condition was tagged to this offer that aid of this size should be matched by equal aid from all the other members of the consortium put together. The American viewpoint was as logical as it was objective. If she in the midst of the continuing strain on her balance of payments was prepared to stand by her moral obligation, a like display of faith was expected at least from West Germany which had a comfortable payments surplus. But at \$331 million, the German offer did not come up to the expectation and, besides, part of this amount represented an element analogous to conversion, since it took the form of renewal of outstanding credits over an additional term of a short duration. Britain offered \$204 million. The total offers of the consortium members excluding America added up to \$350 million below the

target of \$1.1 billion proposed for them. The time gained between the two meetings was utilised for consultations. Whether the shortfall of \$350 million will be made good it is dogmatic to be confident; but much of it will be wiped out. At \$2.2 billion in two years, India will have obtained nearly 40 per cent of the external assistance envisaged in the Draft Third Plan. That is a good augury. But actual outlay of foreign exchange of this order will materialise only if India raises internally the matching rupee component. On this count, continuous vigilance is the only safeguard against underfulfilment.

Pakistan

TENSION WITH AFGHANISTAN

ONCE AGAIN relations between Pakistan and Afghanistan have been strained—this time owing to a tension that has been created over some stirrings in the Bajaur Hills lying to the north of the Khyber Pass. Information about the actual developments that took place there is obscure, but it would appear that the tribesmen inhabiting the Bajaur Hills are fomenting trouble, possibly with the inspiration from the other side of the border. The dissident tribesmen in the hills are being organized and led by one Badshah Gul. In March this year a village in Bajaur was strafed by the Pakistan Air Force and this evidently gave an opportunity to Badshah Gul to foment more trouble. President Ayub Khan has recently made positive charges of supply of Russian arms to the dissidents as well as the arrival of Afghan personnel to help the tribesmen. The Pakistan Air Force has been used to put down trouble in this frontier area, as apparently that seems the only effective way by which Pakistan considers herself able to take military action.

But there is something more in it. A suggestion has been thrown out that Afghanistan's internal troubles over food in particular have made the Government of that country use the opportunity of stirring trouble among the Pathans on the Pakistan side as a device to divert attention. This is a stock and far-fetched theory, looking at the very restricted scale of the actual trouble. It may be recalled that in August last two Pakistan Air Force planes violated the Afghan air space for which they were made to forceland at Kandahar. The pilots who were taken prisoner were released only the next month. This incident has only served to sow bitterness and heighten the tension. Pakistan is technically justified in contending that as a successor government to the former British Government, she is entitled to claim the Durand Line as the agreed frontier between Pakistan and Afghanistan. But in any hilly borders inhabited by tribesmen, who live their free way of life, peaceful settlement is usually difficult. Mr. Khrushchev has thrown his weight on the side of Afghanistan and openly maintained that a border dispute between Pakistan and Afghanistan does exist. This is only a part of the cold war projection in this part of the globe and it is a counterpart to Pakistan's participation in SEATO and CENTO. There is no evidence at all that Afghanistan wants the Pathan inhabited areas on the Pakistan side of the Durand Line to be merged with her, but she has lent her support to the demand for Pakhtoonistan as a buffer. Pakhtoonistan is hardly a live issue and if attempts are made to revive it, it only implies lack of goodwill between the two neighbouring Muslim countries. Mutual interest requires that the two Governments should try to come to a direct agreement for friendly relations.

STANDARD MOTORS rely on CARBORUNDUM UNIVERSAL ABRASIVES for all grinding operations

"The moving parts in a motor car must be ground to very close limits of accuracy and with good finishes, so as to prevent friction and so prolong the life of the parts. Carborundum Universal grinding wheels enable us to obtain the perfect accuracy and fine surface finishes so essential for the production of these moving parts. Also, the consistent good quality of Carborundum Universal abrasives, assures us of the high standard of every grinding operation."

The World Abroad

WHICH IS THE LESSER EVIL?

By
ODYSSEUS

AS I WAS SAYING here last week when I was interrupted, Professor William A. Robson has in "Nationalised Industry and Public Ownership" (Allen & Unwin. London. 1960. 50sh.) published the ablest, and best informed, factual defence of public ownership in industry that I have come across. It should, I suggest, be read by everyone concerned with state enterprise, whether as politician, government servant, manager, or worker, and should give a tremendous lift to their morale.

Why then, you may ask, do I take up space to criticise Professor Robson? Because as long as he is expounding how best to make a state enterprise work, which is a politically accomplished fact, I have no quarrel with him. But when he criticises private enterprise and shows up its demonstrable weaknesses, he forces us to ask the question: Which system is the lesser evil, which conducive to easier economic growth? I submit that his attack on private enterprise recoils on his own head and provides, from an unexpected source, convincing arguments against the further extension of public ownership where it already exists.

What you need for economic advance is dynamic industrial leadership, responsive to new ideas, change, and growth. Which is more responsive? The huge monolithic state enterprise, backed by politicians, governments, ministries, civil servants, and the thousands of workers engaged in it, all of whom have no interest in seeing a state enterprise disappear when threatened by new techniques, new raw materials, or new products, but, on the contrary, have a vested interest in avoiding trouble and maintaining the status quo? Or the directors of a private enterprise responsible to their shareholders for profits? Directors can be changed, if shareholders are persistently dissatisfied. Political parties, parliament, departmental committees, workers, and other vested interests are not involved.

Mention of shareholders exasperates Socialists. Professor Robson is no exception. "Shareholders' meetings," he says "are notoriously impotent; and the larger and more complex the company, the more futile the tiny gatherings of shareholders who make it their business to attend the annual meeting..." However, the Professor continues: "The accountability of the directors—so far as it goes—is nonetheless of fundamental importance. It is imposed by law and safeguarded by the practices and traditions of business executives, professional accountants and solicitors. It is essentially the means by which the directors seek to gain and hold the confidence not only of the shareholders but also of stockbrokers, bankers, issuing houses, and the large institutional investors who can give expert scrutiny to the reports and accounts of companies."

On the Professor's own showing, therefore, directors are subject to strong influences which pinpoint their responsibility. Moreover, as one who, in his time, has been a director of companies, I can testify that even if directors are confident that they could steam roller some measure through, they are extremely sensitive to the possibility of—even minority—shareholder criticism, with all the embarrassing press publicity that it may involve. If minority shareholders rarely, in fact, cause much trouble, in nine cases out of ten it is because directors have taken steps to avoid it. Moreover, that the confidence of the accountants, solicitors, stock-

brokers, bankers, issuing houses, and large institutional investors listed by Professor Robson, is necessary to directors shows that shareholders are not such defenceless sheep as Socialists would have us believe.

WHO PAYS FOR THE FAILURES?

What is more (as I said here on February 24), under any ownership, state or private, someone must pay for the enterprises that fail. The difference between failure in state and private enterprise is that the latter faces disaster quickly, urgently, realistically. It is not supported by a Ministry which, anxious to avoid a parliamentary uproar, finds ways and means to ward off the evil hour for years, or decades, by subsidies from the pockets of the taxpayers. State enterprise procrastinates, piling up bigger and bigger losses. Private enterprise minimises losses, and salvages as much as possible, either by timely liquidation or by selling out to a more efficient management.

Professor Robson says that public ownership eliminates the shareholder whose interests are inimical to the consumer. To which I reply that the shareholder wants as big dividends as possible and that, in competitive conditions (and, as I mentioned last week, the star of competition, under a cloud in the inter-war years, is, driven by the example of the success of the German "miracle", in the ascendant throughout the free West) the bigger his dividends, the clearer the indication that his company has been satisfactorily meeting the consumer's choice. It is true that in the UK most nationalised industries have hitherto by ministerial order been forced to sell their products more cheaply than economic practice would warrant. But such help as this has given the consumer has been illusory. It has led to inflationary financing and to distortion of the economy by stimulating demand for under priced products.

While I readily concede that it is impractical to denationalise the UK's state enterprises, that they should be criticised constructively, and helped to develop better morale, the more that I reflect over Professor Robson's able defence, the more do I feel that his own evidence leads ineluctably to the conclusion that if the UK wishes its economy to be flexible and capable of rapid growth, no more industries should be nationalised.

As we do not know what the future holds in store, the point may be seized by reflecting upon the past. In the UK in 1820, the stage coach reigned supreme in passenger transport, and the provincial inns, which provided relays of horses and refreshment for traveller, were flourishing. But for the next twenty-four years the stage coaches were under ever increasing competition from the newly spreading railways. Thousands of stage coach employers, booking clerks, drivers, stablemen, ostlers, farriers, horse breeders, inn-keepers, and their staffs, lost their jobs. If there had been Socialists to insist that the stage coach and inn-keeping industries should be nationalised because they were incompetently managed, and could not survive unless they put up their prices, and that the public interest demanded cheap travel, the UK would have been saddled for decades with the burdens of taxation necessary to keep a complex group of vested interests in being. To be realistic one must imagine the nationalisation of several other leading industries as today, all competing for subsidies and development grants from the Exche-

quer, so that the UK's 19th century economy would have inched its way along by an annual increment of 2.7 per cent as today, instead of bounding ahead as it did, and capital would have been in short supply. In such a statically inclined, consumption-orientated economy, the railways would have had difficulty in developing. We should probably still be travelling from London to Edinburgh at 8 miles an hour in coaches at a cost of the equivalent in today's prices of about 4/- a mile. The transport of heavy goods would still be limited to horse-pulled canal barges.

THE MISTS OF THE FUTURE

Looking back, we see how the face of the UK was transformed by coal, iron, and steel in the 19th century, and by other materials in this century. Without them, a business letter to India would want a year for reply. Homes, lit by oil lamps, would be without running water. Towns, without drainage systems, would be wasted by cholera. We do not know what inventions lie concealed behind the mists of the future. But it is certain that if any of them seriously threatens to displace the UK's nationalised railways, coal, gas, electricity, aeroplanes, etc., these vested interests, with their 2,250,000 employees and huge capital investment (between 1948-58, the nationalised industries absorbed no less than £6,827 million, i.e., Rs. 89 crores, or 26 per cent of total UK capital invested) will stage tremendous delaying campaigns.

If it be argued that nationalisation has not impeded the development of air travel and atomic energy,

one can only recall that the development of both has been authoritatively criticised. We are, for example, only today beginning to experiment with aircraft that rise vertically. Professor John Jewkes of Oxford has pointed out that one reason for this was because the huge sums invested by governments in vast air fields gave no incentive to economise space, whereas faced with the need to satisfy shareholders, stock brokers, issuing houses, and institutional investors, the air industry would have been compelled to search for ways to use space and capital more economically. As to atomic power, by pushing ahead under government pressure and financed, willy-nilly, by sheep-like taxpayers notoriously impotent to control the use of their money, it looks as though the UK may have saddled itself with an expensive and already obsolete form of generating it. But, of course, as a famous UK Court of Enquiry into the plight of the railways said in 1955: "The Nation has provided by statute that there shall be a nationalised system of railway transport, which must therefore be regarded as a public utility of the first importance. Having willed the end, the Nation must will the means." In other words "fiat justitia, ruat coelum", which may be roughly translated "Come what may, a nationalised industry must stay."

(In a final article next week, we will examine (a) Professor Robson's analysis of the state of opinion on nationalisation in the British Labour Party, and (b) his six criteria whereby to decide whether an industry should or should not be nationalised).

The European Scene

BRITAIN AND THE COMMON MARKET

From Our Special West European Correspondent

PARIS, May 28.

IT is expected in some quarters (to judge from what has been said lately in British newspapers) that the talks between Presidents Kennedy and de Gaulle this coming week will have a decisive influence over Britain's future relations with the Common Market. It is thought, that is, that there is something President Kennedy might say to his host in Paris that could facilitate Britain's entry into the six-nation enterprise. It is hard to imagine what it could be. In the matter of defence strategy, it is possible (though not probable) that the U.S. President could make certain concessions to the General's ideas which, in turn, would incline France to closer co-operation with Britain, instead of seeking to build up the Common Market bloc into an independent defence unit. But that would have nothing to do with the problems of Britain's economic connection with the six-nation unit. In reality, the notion that Britain's entry into, or association with, the Common Market can be secured by suitable political intervention or by a change of heart among national leaders, shows considerable misunderstanding of the economic questions involved.

At the risk of seeming prosaic, we shall leave the great ones of the earth to exchange generalities, and come down to the bare economic facts. To some of them, rather: a glance at the agricultural problems alone will suffice to show how intricate the question is. A cornerstone of the Common Market treaty is the joint agricultural policy. The reasons are evident. The region has a chance of forming a unit just because there is complementarity between its industrial areas (largely in the north) and its agricultural areas (largely in the south). Just as important as the unified market for manufactures is the marriage between industry and agriculture. It is not strictly true that Germany exports manufactures and France exports food, and that is why they can be members of a larger unit; but this exaggeration recalls that agriculture is not just a difficulty, or poor cousin, in the Common Market, but one of its reasons for existing. So agricultural commerce cannot be set aside as a "special case" (as London suggested in the days when it proposed a common market limited to manufactures) without removing one of the principal motives for creating the Common Market. Countries like Britain and West Germany may regard their subsidised farms as luxurious little sidelines that must be kept out of the serious business of international trade, but a moment's thought shows that substantially peasant societies like Italy and much of France could not envisage economic unification without a common agricultural policy for the integrated region.

The Six are still struggling with this problem, and indeed it is the hardest they have set themselves. It has been relatively easy to cut tariffs on manufactures (they will probably be just half what they were in 1957 by the end of this year), but it is considerably more complex to free trade in primary produce. It was socially impossible to treat farm produce like manufactures and simply lower tariffs, abolish quotas, with-

draw price controls and subsidies, and let producers fight it out in a free market of West European dimensions. The only method was to substitute for the present national farm policies joint, supra-national agricultural policy, which would fix prices for the whole region. That policy is still being sought. For a time it seemed that the West Germans (just because their agriculture is socially marginal, like Britain's) were not eager to press on with it, being more interested in free trade in manufactures. But Messrs. de Gaulle and Adenauer are understood to have agreed last week in Bonn that the Rome Treaty on this point would be applied fully, in letter and spirit. However intricate, the problem is at least soluble because all the Continental countries have followed roughly the same sort of policy for the support of their agriculture: they have made their own consumers foot the bill, by keeping out competitive farm produce and making consumers pay the fixed prices required to keep their farms going.

Britain, whose entry to the Common Market is being contemplated today, has followed a totally different policy—neither more nor less rational, economically, and more in keeping with her social traditions. British consumers have not been required to pay for the support of British farms. On the contrary, they have been able to buy food imported from some of the world's cheapest producers, New Zealand, Australia, etc. The output of British farms has been sold on the same market, at the same prices. Since those prices were grossly inadequate to support British farmers, the Government has made up their revenues to a fixed "fair" level by paying them subsidies. In the current year, the British Government will pay out £266 million in farm subsidies—a sum which, it has been reckoned, is equal to the net revenue of British farming. It may seem at first sight that this just means that British farms are financed by the taxpayers whereas West German and French farms are financed by consumers; since taxpayers and consumers largely coincide, the difference is one of technique, surely. Not at all, because it also means that British food prices are extremely low whereas Continental food prices are quite high—a circumstance that is at once reflected in the cost of living and thus in the prices of manufactures.

To see how different the two systems are, imagine first what happens if the Continent admits Commonwealth foodstuffs duty-free; Continental farms would be gravely jeopardised for they cannot match Australian and New Zealand agricultural prices. On the other hand, what happens if British consumers had to pay the prices required to keep British farms going: the farmers would be as well off as ever for they would receive the same income, but British manufacturing industry would see its labour costs and raw material prices soar to heights where its competitiveness in foreign markets would be seriously impaired. I have seen mentioned the case of a British biscuits maker who today buys his flour at world prices (the British farmers who supply him with any part of it are paid the difference by the Government); if he had to buy his flour in France he would pay 30 to 40 per cent more for it. This is not because the French wheat

GR-124

farmers are any less efficient or more prosperous; the prices actually received by British and French farmers are in fact equal.

Obviously, British agriculture cannot trade its products freely with Continental agriculture in a common market, and the quest for a joint agricultural policy would mean nothing short of a revolution because the approach has been diametrically apposite on either side of the Channel. In view of difficulties like this, just what is President Kennedy supposed to say in Paris next week that will suddenly facilitate Britain's entry into the Common Market? It should be clear that the questions involved are rather more complicated than seems to be thought by people who envisage Britain's entry into the Continental system being decided suddenly at a weekend meeting of statesmen. Nor is there the least possibility of Continental industries agreeing to British membership before the agricultural question is settled: one cannot have a common market for manufactures where some firms are paying much less for their raw materials and their workers' food than the rest. Or, supposing that Continental manufacturers received some suitable indemnity for this, there is no chance of Italian and French farmers agreeing to have Britain in without getting access to British food markets. In other words, the agricultural question is not an incidental complication that can be ironed out with a dose of goodwill; it is basic.

What would be the consequences if Britain abandoned her present system of food subsidies and adopted a policy that could be harmonised with Continental

practice? The first result, if the matter were bungled, would no doubt be the defeat of the Conservative Party, but we shall stick to economic consequences. It has been calculated that by coming on to the Continental system Britain would see her food prices rise at least 8 or 9 per cent. Food being half the workers' budget, the official cost of living index would rise by 4 per cent, and wages by as much. These calculations seem very conservative to anyone who has done the household shopping in both Britain and France lately; much sharper rises seem likely. However, even a 4 per cent jump in British labour costs would be sufficient to threaten British exports and shake the pound sterling. Moreover, Britain's full membership of the Common Market would also entail applying the common external tariff on Commonwealth food exports, with resultant loss of preferential access for British manufactures to Commonwealth markets; once again, a fall in British exports.

This prospect is so uninviting that London has several times stated that she hopes to join the Common Market without going to such lengths. Yet if the Common Market's agricultural policy is amended so as to make Britain's entry painless, it will not be the Common Market she is joining but some variety of customs union for manufactures—and there is no desire on the Continent to enter that path. Politicians on both sides of the Channel have lately made enthusiastic references to Britain's coming entry into the Common Market, but until some real progress is made on the apparently insuperable agricultural problem it would be safer to assume that the negotiations are deadlocked.

Portugal

BRITAIN'S PORTUGUESE CONNECTION

By WILLIAM REES-MOGG

SPAIN and Portugal were until recently the forgotten countries of Europe. Their regimes are both pre-war dictatorship; Dr. Salazar, the senior of the two dictators has seemed the more tolerable because even before the war he avoided entanglement with the Fascist and Nazi regimes of Italy and Germany. General Franco has acquired a certain international acquiescence in his regime merely by surviving and by the post-war fear of Communism. He was certainly one of the founder members of the anti-communist club. Relatively few statesmen feel that it would have been better if the Communists had won in Spain, and even a Castro-type revolution would not be at all welcome.

This acquiescence was, however, based on Spain and Portugal keeping very much in the background of international affairs. This they were quite content to do. The regimes of Salazar and Franco have been by no means adventurous; they want to preserve the ancient social structure of their countries; they want to continue the sleep which descended on the Iberian peninsula in the seventeenth century. Far from wishing to enter the twentieth century they do not even wish to enter the nineteenth, and they regarded the eighteenth with considerable suspicion.

Two developments have now focussed attention on these stage-shy dictators. One is the development of Europe; the other and much the more important is the movement to expel from Africa and Asia those colonial powers which will not grant independence. The Spanish colonial possessions have so far been out of the limelight; the colonial possessions of Portugal have very much been brought into it. The continuing issue of Goa, over which Portugal has been unwisely obstinate, has now been surpassed in importance by Angola, where terrible massacres of Africans and Europeans are taking place.

The European question is, however, also very important. Spain and Portugal have so far been left out of the post-war European revival, though Italy, with which they have traditional connections, has been one of the pioneers of its development. At some point it seems likely that this long separation will have to come to an end.

The question on which people are divided is whether this re-association can take place before the end

of the present regimes. Both Franco and Salazar are old men; in the course of nature they are unlikely to be able to continue their autocratic power indefinitely. There are those who would like to wait and welcome the successor regimes rather than try to associate the present ones.

It is to be hoped that this view will prevail—the next regimes whatever their political character are unlikely to be sympathetic to the present dictatorships and it would be a pity to tie European policy to such obsolete governments. In any case Portuguese colonial policy is so intolerable and obscurantist that it must be wrong to express sympathy for it.

Unfortunately the British Government has allowed itself to be drawn into an equivocal position. Mr. Butler embarrassed himself by making some lunch-time civilities to his Spanish hosts—"Spain's traditional contribution to European civilization" and that sort of thing, and allowing, to be quoted in a rather exuberant Spanish translation.

This is probably of no great importance. More significant is the visit to Spain and Portugal of Lord Home—Mr. Macmillan's surprise choice as Foreign Secretary. Lord Home seems to have a greater sympathy for the Portuguese entente than other members of the British Government. The decision to send a frigate on a good-will mission to Angola has emphasised the doubts that are felt about the value of the present visit.

More sensible people in Britain feel that the contrary policy is needed. Colonialism is so unpopular in the present stage of history that even successful colonial administration, aimed at early independence, is bound to be suspect. Any gesture which appears to identify British colonial policy with that of Portugal tends to discredit Britain and makes the task of preparing for independence, particularly in East Africa, more difficult.

The odd thing is that Lord Home stands for very little except himself. His policy is doubted by some of his colleagues in the Cabinet. The Prime Minister had to use his full prestige in order to obtain his appointment, and it is probable that he now regrets his decision. This is a melancholy, but fortunately a minor episode in British diplomatic history.

Economic Report from the U.S.**BALANCE OF PAYMENTS PICTURE**

By GUY SIMS FITCH

WASHINGTON, May 25.

GROWING international confidence in the U.S. dollar and in the U.S. economy seems to be the order of the day. This confidence is reflected to a large degree in the recent report that the U.S. international balance of payments now is in the best shape since 1957. U.S. Commerce Department preliminary estimates of the balance of payments for the first quarter of this year show that the deficit dropped sharply during this period to an annual rate of about \$1,000 million. This is only about one-fourth the rate in the last quarter of 1960, and the best quarterly showing in four years. Included in the first-quarter deficit, moreover, was an outflow of only \$370 million in gold purchased by foreigners. By way of comparison, last year's deficit totalled \$3,800 million, of which \$1,700 million was taken in gold.

What is particularly significant is that most of the first-quarter 1961 foreign gold purchases came in January. Since mid-February, the U.S. gold supply has held steady at about \$17,400 million. In fact, there has been a tendency in the past few weeks for the U.S. gold supply to rise slightly. This would seem to indicate, as the Commerce Department observes, that foreigners are using extra dollars not to buy U.S. gold but to invest in the United States—a development considered a significant expression of confidence in the U.S. position. Coupled with a decline in the outflow of short-term U.S. capital, this trend is credited for most of the improvement in the U.S. balance of payments picture. This does not mean, however, that merchandise trade trends are to be overlooked. Exports of goods and services, which are a major plus factor in the payment balance, continued to rise during the first quarter, while imports, a minus factor, declined slightly. The net result was a trade surplus that reached an annual rate of better than \$6,000 million. This surplus was offset, as usual, by the continued heavy outflow of U.S. Government grants and loans, private investment capital and other remittances—hence the deficit in the balance of payments despite the huge trade surplus. While the balance of payments situation has improved to the point of instilling renewed confidence in the U.S. position and of reinforcing the Kennedy Administration's faith in the U.S. ability to meet this problem, government officials still are reluctant to take a continuing improvement for granted. They point out that the balance of payments remains vulnerable, even though there is a good possibility that the U.S. accounts actually could show a slight surplus during the second quarter of this year. The most important factor in this lack of official complacency at the moment is the realization that as the U.S. economic upturn quickens, imports can be expected to expand. Thus, even assuming a continued high level of U.S. exports in response to the generally high level of economic activity in Europe and other parts of the world, it is entirely possible that the U.S. trade surplus could shrink later in the year.

Moreover, officials here point out that while short-term capital outflows have declined, they still are large (relatively large) by some earlier standards. This helps explain the emphasis that the U.S. Government continues to place on several basic programmes—pro-

grammes that would relieve some of the pressures of the balance of payments while encouraging a general widening of opportunities for trade and economic growth around the world. Among them are programmes to stimulate U.S. exports, to encourage other countries to continue reducing their barriers against U.S. goods and dollars, and to encourage other industrial nations to assume a large share of the aid total for developing lands. U.S. exporters themselves are very much aware of the challenges they face, and have shown a heartening progress in adjusting to the growing competition in world markets. They are cutting costs, studying foreign requirements, providing prompt deliveries and stepping up their sales and servicing activities. Under the combined influence of these government and private activities, there is reason to believe that the balance of payments problem can be solved. As the recent results show, much progress in that direction is being made. U.S. Treasury Secretary C. Douglas Dillon has indicated that it is the Kennedy Administration's goal not merely to keep the balance of payments deficit within manageable proportions, but eventually to erase it entirely—perhaps by 1963.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Re. 50/-.

India

Kothari Cables and Electricals Ltd.: M/s. Kothari & Sons have been granted a licence for the manufacture of 3,000 tons of ACSR and 18 million core yards of PVC and other wires. The Company will be called 'Kothari Cables and Electricals Ltd.' and will be situated near Madras. The total share capital of the Company will be Rs. 65 lakhs as proposed now, out of which Rs. 40 lakhs will be fixed capital and Rs. 25 lakhs will be working capital. Kothari's have been negotiating with foreign firms for technical and financial participation in this project. It is learnt that a reputed foreign company has entered into an agreement to supply know-how and plant and equipment. They will also be investing substantial part of the foreign exchange required for this project. In the proposed capital of Rs. 55 lakhs, Rs. 40 lakhs will be available in the form of equity capital, and Rs. 25 lakhs in the form of loans. The foreign collaborators will provide Rs. 12 lakhs and 28 lakhs will be raised by M/s. Kothari & Sons. In the Rs. 25 lakh loan, Rs. 8 lakhs will be in the shape of sterling loan and Rs. 17 lakhs in the shape of rupee loan. The company will have a Board of Directors consisting of eminent public men and experienced industrialists.

Deposit Insurance Legislation: The Government of India have after careful consideration decided to take action for the implementation of deposit insurance scheme. It is proposed that for this purpose, a separate autonomous corporation should be set up with the Governor of the Reserve Bank as its chairman, who will be assisted by a small board consisting of one of the Deputy Governors of the Reserve Bank of India, a representative of the Central Government and at least one non-official. The Corporation will have an authorised capital of Rs. 5 crores which will be allotted to the Reserve Bank entirely. The deposits in all the commercial banks functioning on the dates of introduction of the scheme other than the State Bank of India and its subsidiaries, will be insured under the scheme. The State associated banks will, nevertheless, be required to contribute to the funds of the Corporation. The limit of amount of individual deposits insured and the rate of premium will be fixed by the Corporation with the approval of the Central Government and may be varied from time to time in the light of the experience gained. It is expected that, to begin with, individual deposits to the extent of not less than Rs. 1,000 will be guaranteed under the scheme. The actual figure will be determined by the Corporation after it has been formed.

Khetri Copper Project: An agreement for consultancy services for Khetri Copper Project was recently signed between the National Mineral Development Corporation Ltd. and M/s. Western Knapp Engineering Company. Under the agreement, the project report is to be submitted by the consultants not later than the end of this year. M/s. Western Knapp Engineering Company is a division of the Western Machinery Company San Francisco, California, U.S.A. Khetri copper project is included in the Third Five-Year Plan and envisages the production of 10,000 tons of electrolytic copper annually.

Coal Mines Provident Fund: The Government of India have decided to grant to the subscribers of the Coal Mines Provident Fund on their accumulations interest at the rate of 4 per cent during the year 1961-62. This has been done in consultation with the Board of Trus-

tees. The same rate of interest was fixed for the previous year. Over 4 lakh colliery workers subscribed to the Fund during 1960-61 in Assam, West Bengal, Bihar, Madhya Pradesh, Orissa, Maharashtra, Andhra Pradesh and Rajasthan.

United Kingdom

Selective Breeding of Trees: As a first step to selective breeding in timber cultivation, specimens of wood taken from trees grown in various parts of Britain are being examined by radio isotopes methods at the Forest Products Research Laboratory of the U.K.'s Department of Scientific and Industrial Research. The Laboratory, a few miles west of London, has an apparatus which has been developed for this purpose. It is completely automatic and micro-scale measurements of density which would formerly have been very laborious process can easily be made without human intervention, by measuring the transmission of beta particles (electrons) through a thin specimen of wood.

Terms of Trade: The United Kingdom's terms of trade (import prices as a ratio of export prices) moved up by one point in April, according to statistics issued by the Board of Trade in London on May 26. The export price index was again unchanged in April at 112, while the index of import prices moved up one point to 98, so that the terms of trade also rose by one point to 88 (1954 taken as 100). An upward movement in the terms of trade means that import prices are increasing in relation to export prices. The United Kingdom's terms of trade, however, still remain distinctly favourable.

U.K. Firm Sells £4,000,000 Nylon Plant to Russia: The British firm Vickers Ltd. announced in Moscow that it had sold to the Soviet Union a £4,000,000 plant to produce nylon. The plant, which will turn out industrial yarn and tyre cord, will have a capacity of more than 6,000 tons a year. It is the first large contract to be announced at the British Trade Fair in Moscow which opened on May 19, but negotiations for it have been under way for more than five months.

Deliveries to the Soviet Union will begin in more than a year's time, and the plant will be completed early in 1964. Announcing the contract, Lord Knollys, the Vickers chairman, said in Moscow that the Russians were paying cash in sterling in London and had not asked for credit. Most of the machinery would be produced at Barrow and Newcastle. The nylon plant will be assembled by the Russians, but Britain will send out technicians to supervise the work.

Food Preservation Without Refrigeration: Housewives will be able to buy a week's supply of food and keep it fresh without the aid of a refrigerator as a result of a new freeze-drying technique known as "sublimation" developed in Britain. The new preservation technique is based on research conducted by British Ministry of Agriculture scientists at Aberdeen, Scotland, and is now being applied for the first time as a commercial process in a factory equipped by the British firm of Vickers-Armstrongs Ltd. The factory, built for an Irish sugar company, was recently opened at Mallow, Eire. It cost £250,000.

Experiments in accelerated freeze-drying of food—which supersedes accepted methods of dehydration by drying food in high vacuum—were first carried out in

70,00,000 FIRESTONE TYRES!

The Firestone factory in Bombay has now passed another landmark in its 21-year existence. The production of Firestone tyres in India has topped the figure of 70 lakhs. From a small beginning, through successive expansions, production has now reached around 2,000 tyres daily, covering a vast array of different sizes, ranging from 3.50-10 for Motor Scooters to 21.00-25 28 Ply Rating for Heavy Earthmoving Vehicles.

But the overall demand for tyres of all types is still so far in excess of output in India that, in spite of equitable distribution arrangements, there is a severe shortage which is felt throughout the country. Expansion schemes are afoot, but it will be some time before supply catches up with demand.

WE BELIEVE that the ill-effects of this prolonged scarcity can be kept within limits if every truck tyre user does what he can to extend the life of his tyres. Follow the 3-Point Programme —

Fabrications to specifications

Under licences from Messrs Fives-Lille-Cail, France, who built the largest sugar and cement plants in the world and have supplied Soviet Russia in 1959 a five thousand ton daily capacity cement plant, we manufacture machinery and equip complete sugar and cement plants.

We also manufacture and supply complete sulphuric acid and super phosphate plants. We have secured orders for five complete sugar plants, of one thousand tons daily sugar cane crushing capacity.

the laboratories of the British Ministry of Agriculture at Aberdeen. Vickers-Armstrongs engineers have designed and produced the freeze-drying machinery which makes it possible to market economically food preserved by this method.

U.S.S.R.

Spring Crops: 104 Million hectares of spring crops had been sown in the U.S.S.R. by May 20. This is 80 per cent of the total spring crops in the country. The sun flower sowing programme has been over fulfilled. Over 400 million hectares have been planted under this crop or 250,000 more than last year. The sowing of grain maize is drawing to a close. Fourteen million hectares have already been planted. Favourable conditions for the sprouting and growing of all farm crops exist in most areas of the country.

Yugoslavia

Imports - Volume and Structure: Various kinds of commodities valued at 59.2 billion dinars were imported during the first three months of this year. The total sum realized was 6 billion dinars, that is 9 per cent below that in the corresponding last year. This trend in imports and the simultaneous increase in exports were reflected in the decline of the passive trade balance by almost 9 billion dinars. The reduction in imports of industrial goods and particularly of materials for reproduction (raw materials and finished goods) was the main trend in imports. Imports of agricultural produce was somewhat above those last year, mainly due to an increase in imports of fruit, coffee, cocoa, spices and milk products.

Australia

New Plant at Newcastle Steel Works: The Broken Hill Proprietary Co. Ltd., recently brought into operation the sinter-producing section of its new £10,000,000 sinter and ore-handling plant at its steel-works at Newcastle, New South Wales. The new machine is one of the largest in the world, with a grate area of 2236 square feet. Sintering is the process in which the fine iron ore is mixed with coke and ignited to produce semi-fused lumps of ore. This ore can be more effectively smelted in the blast furnaces than the fine ores which would cause operational difficulties. The new plant at Newcastle comprises ship unloading facilities, an ore-screening plant, and a coke and limestone crushing section.

U.S. Petroleum Group Extends to Australian Marketing: The big American petroleum group, Phillips Petroleum Co. is planning to form a marketing organisation in Australia, and to offer a 50 per cent share interest in its venture to the Australian public. Marketing will be confined to Queensland and to northern New South Wales. The U.S. parent will subscribe 1,790,000 5/- shares at par in a new company, Phillips Oil Products, Ltd., and the public will be offered 1,790,000 5/- shares at par and £400,000 in 9 per cent registered first mortgage debentures. Phillips Petroleum is stated to be the 16th largest industrial concern in the United States. In Australia it has been active in the search for oil in Queensland.

France

Bertin Silencer: An interesting contribution to the campaign against noise and its disturbing effects has been made by Air-France with the installation of two silencers for the ground testing "Caravelle" engines. The silencers, manufactured by Bertin & Co., under M.

Duthion's supervision, are giving remarkable results. The sound reduction achieved close to 30 db (leaving only 1/1,000th part of the initial noise-power) makes it possible to perform all engine control operations without disturbing the neighbouring population, and at the same time gives efficient protection to the personnel carrying out the tests. All engine inspection and timing are now taking place on a special area, located 325 meters south of the maintenance and overhauling shop, and exclusively reserved for jet planes. Measurements made by the technicians of the "Aéroport de Paris" showed that "Caravelle" engines at full power, equipped with a Bertin silencer and 300 metres away, give only 85 db which corresponds to the noise recorded in a Paris street during average traffic.

Italy

ENI Associate to Build Refinery in Tunisia: The refinery with SAIPEM, an associate of ENI group is going to build in Tunisia will have a capacity of 1 million tons of crude oil per year, with possible further increase to one and a half million tons. The construction of the refinery is part of an agreement signed on June 10, 1960 by the Government of Tunisia and ENI, concerning the formation of the joint Italian and Tunisian Company.

Total Vehicle Output: The Italian motor vehicle industry manufactured 6,44,617 motor vehicles in 1960, of which 5,95,907 were motor cars with an increase of 28.73 per cent over 1959. Exports totalled 203,935 motor vehicles, a 7.80 per cent decrease over 1959. The percentage of exports over total production is approximately 32 per cent. The slight decrease recorded in exports last year was mainly due to certain difficulties which made themselves felt particularly in the U.S. market, motor car industry sources have revealed.

Export of Italian Typewriters: The Italian typewriter industry has enjoyed a continued boom during the past few years. The results achieved in 1960 are expected to be even more spectacular than those recorded in 1959. Even though it is too early at this time to make a final estimate, the data now available for the first ten months of 1960, show that the efforts made by the Italian business machine industry as a whole—one of the most dynamic factors of the Italian industrial work—were very successful last year. A marked increase was observed not only in production but also in sales abroad. 8,019 metric tons of typewriters and calculating machines were manufactured during the period January to October 1960 with a 36.1 per cent increase over the period in 1959. Even greater was the increase in export during the aforementioned period (73.5 per cent). This figure was slightly above the percentage increase in the total value of export (68.9 per cent) due to a slight drop in average prices (2.7 per cent).

Germany

Technical Advice for Indian Company: The Vereinigte Ultramarin Fabriken AG (Ultra-marine Works) in Cologne Bensheim, recently concluded a consultation contract with the newly founded Ultramarine and Pigment Ltd. in India. The Indian plant is to be erected near Madras and to produce 1,200 tons of ultramarine blue annually. The German partner will confine himself to furnishing technical know-how and will not enter into a financial participation in this project. The technical personnel will be trained in Germany. The new plant will be able to start its production in some two years.

NEWS IN BRIEF

INDIAN

Soil surveys of over 24 million acres in various States had so far been carried out by the Central Water and Power Commission, Ministry of Irrigation and Power. The surveys were conducted by them directly or by the States with technical guidance from CPWC.

India will participate in the 7th Plenary Session of the International Commission on large dams to be held at Rome and the 5th Conference of the International Society on Soil Mechanics and Foundation Engineering to be held at Paris. The Rome Session will be held from June 26 to July 1, 1961 and the Paris meeting from July 17 to July 22, 1961.

India is likely to export in the immediate future 75,000 tons of sugar, two-thirds of the quantity going to Iran and the rest to Pakistan.

The Government of India has decided that the export of raw equamarine stones and emeralds cut will be allowed, without an export permit in post parcels of 100 tolas. The concession, says a Press note issued by the Ministry of Commerce and Industry, has been allowed as exports of raw equamarine stones and emeralds earn valuable foreign exchange.

The Government of India has decided to continue free licensing of mustard rapeseed oil by all shippers, on shipping bills supported by evidence of firm sale contract upto the end of September, 1961, the Joint Chief Controller of Exports announced recently.

The Iron and Steel Controller, Calcutta, has announced in a public notice that permission for import of finished steel against export of permissible varieties of ferrous scrap during the year 1961-62 will be given by his office.

The Governing Council of the United Nations Special Fund meeting in New York has announced financial assistance of about \$1.4 million to India for the establishment of the Central Instructor Training Institute at Madras and for the Petroleum Exploration Institute at Dehra Dun.

It is reported that 12,500 service co-operatives would be set up during the Third Plan in Madhya Pradesh. For this purpose, Rs. 7 crores have been earmarked. The co-operatives would seek to raise food output by supplying seeds, fertilizers and manures to cultivators.

Latest official estimates place the current season's coffee crop at a record figure of 63,300 tons comprising 29,500 tons of top grade plantation, 9,500 tons Arabica cherry and 24,300 tons Robusta.

A provision of Rs. 45,00,000 has been made by the Punjab Government for the execution of soil conservation schemes in the State under the Third Five-Year Plan.

It is reported an Indo-Japanese agreement may be signed next month for export of 2.25 million tons of iron ore a year to Japan, for five years. The export which will be made by the State Trading Corporation, will commence from 1963.

FOREIGN

Syria is to have an irrigation dam comparable in scale to the Aswan High Dam in Egypt and it will be built with West German assistance. This is the Euphrates Dam for which Soviet experts completed a technical and economic study last year.

It is reported emergency duties for two major sections of the Australian textile industry are being considered by the Tariff Board following references by Mr. John McEwen, Trade Minister.

The Soviet Union may soon have a bigger and better merchant marine than the U.S. Russia now operates 800 merchant ships compared with 990 by the U.S. By 1965 the Soviet Union plans to double that figure.

Switzerland is to grant Yugoslavia a 22 million Swiss francs 5½ per cent loan redeemable in 10 years, subject to ratification by the Swiss Parliament. Loans to assist Yugoslavia in her economic reform have already come from the International Monetary Fund, the U.S. and European countries.

The Ministry of Industry of the U.A.R. is giving renewed consideration to an offer by Shell concerning oil prospecting in Egypt's Western desert.

An assembly plant for Chrysler cars will be established in Syria under an agreement between Chrysler and the Arab Products Distributing Company, a State-owned concern. The plant will cost £500,000 and will have a capacity of 300,000 vehicles a year.

German industrial production in April came close to equalling the record output of November, 1960. The index (1950=100) for April came to 266. This has been exceeded only once, by the index figure of 281 recorded last November.

It is reported that the U.S. Government plans to extend for five years legislation under which agricultural surpluses are sold or given to countries unable to pay for them in hard currency.

French imports of foreign cars were nearly quadrupled in the first three months of 1961 by comparison with the same period in 1960. Imports of British cars, however, went up by only just over 60 per cent.

The Pakistan Government has acquired all mineral rights within the country, through an order issued by President Ayub Khan, without disturbing existing leases for mineral exploration.

Antara News Agency has reported that Indonesia will give no new concessions to foreign oil companies nor extend old ones, the Minister of Development revealed recently during an inspection tour of local oil industries.

Special Article

FOREIGN INVESTMENTS IN INDIA AND MODIFIED TAXATION

CONTRIBUTED

THE burden of taxation which actually falls on the capital invested in the corporate sector of the capital-importing countries is an important criterion which is applied when a foreign investor makes his choice where to export his capital. In the post-war era, the achievement of sovereign independent status by country after country has made it obligatory upon them to launch programmes of rapid expansion. But the rate of national savings being too inadequate for this purpose, there is the indispensable need of importing capital from foreign countries. There is the additional advantage that technical skills accompany foreign capital. The system of taxation which India has chosen to develop has, therefore, a direct bearing on the decision which the foreign investor makes in exporting capital to this country.

One fact that needs to be underlined in relation to foreign capital in India is that the fullest equality of treatment and non-discrimination are the very guiding principles of the Government's policy in relation to foreign capital vis-a-vis Indian capital. Recently, positive new trends have emerged in the policy of the Government of India towards foreign capital to offer it attraction to flow into this country and this change has earned appreciation abroad. But it had only a limited bearing on taxation. The Finance Act, 1961, however, marks an important step forward in the modification of corporate taxation in India which is bound to have a salutary effect on the climate for the import of capital from abroad. The broad implications of the changes in taxation introduced in this year's budget are discussed in this article in relation to their application to foreign corporate investments.

The Finance Act, 1961, has made certain alterations in the structure of Indian corporate taxation. Firstly, the development rebate which was hitherto available at 25 per cent of the value of the new plant and machinery, is proposed to be reduced to 20 per cent. But this new rate would apply to only those investments which take place after 31st March, 1961. Secondly, the levy of a 20 per cent uniform super-tax rate on dividend income of all companies removed, in the first instance, the differentiation that existed between dividends derived from a subsidiary and a non-subsidiary company. And, in the second instance, the new uniformity in super-tax rates will remove the anomalous discrimination existing against a foreign company holding non-subsidiary interests in an Indian company. Under the new provisions, a foreign company, which holds a non-subsidiary interest in an Indian company incorporated after 31st March, 1961, will bear a total tax of 40 per cent (20 per cent Income-tax and 20 per cent super-tax) on its dividend income from the Indian company.

Since 1959, the Government of India has been endeavouring to reduce the incidence of corporate taxation on foreign companies which hold only non-subsidiary interest in an Indian company. For instance, dividends received from an Indian company, not being a subsidiary and which was formed and registered prior

to 1st April, 1959, are taxable at 63 per cent. This was brought down in 1959-60 to 53 per cent, but the new rate was applicable to only those Indian companies which were incorporated after 31st March, 1959. Now it has been steeply reduced to 40 per cent. This substantial reduction in tax incidence on foreign companies holding majority interest in an Indian undertaking has also achieved "parity", so far as the tax burden is concerned, between subsidiary and non-subsidiary investments. Since this parity has been achieved, partly by raising the tax rate on subsidiary investment, the foreign investor may be induced to hold a minority share in an undertaking which he intends to promote in India; indeed, Indian policy, except on taxation, has been in favour of minority participation.

A striking change has been introduced in the corporate tax structure in respect of income-tax and super-tax payable on royalties. It will be recalled here that the aggregate tax on royalties is a matter of great importance to the foreign collaborator as well as the Indian investor using the patent etc. Up to the last financial year the income-tax and super-tax together worked at the rate of 63 per cent on the royalties received by foreign enterprises from the Indian companies. At 63 per cent the tax was the highest for royalties in any country in the world. This was not a happy state of affairs and at any rate it was obvious that the incidence of the tax on royalties was borne in the last analysis by the Indian enterprises entering into the agreement. This was for the reason that the foreign concern naturally pitched the rate of royalty at a point which would give it a return net of taxation comparable to what it would obtain elsewhere. This perfectly legitimate technique involved fixing of royalty on the patent, etc., at a very high level and made negotiations needlessly complicated. Now the aggregate tax on royalty has been reduced by 13 per cent to 50 per cent, so that it would be possible to import technical skills on a larger scale and the lower taxation would facilitate negotiations between the foreign and Indian parties. To illustrate, if a foreign enterprise aimed at obtaining a net return of 50 rupees out of the royalty, under the old dispensation of the total tax of 63 per cent, the amount of royalty would be fixed at Rs. 135 whereas now with taxation brought down to 50 per cent, the amount of royalty would be fixed at Rs. 100. This illustration graphically brings out the significant change made by the modified taxation.

The objectives of the present study are to focus attention on the full implications of the operation of the modified Indian tax rates on all forms of foreign capital, such as portfolio investment (non-subsidiary interest), direct investment (subsidiary interest in an Indian company, or branch office of the foreign parent) and loan capital. Apart from taking into consideration the tax relief available in the form of the development rebate and tax holiday, it is important to bear in mind the nature of the activity in which the foreign capital is engaged. For example, if foreign capital is employed in basic industries* such as cement, steel, chemicals,

* Those industries which have been specified in Section 56A of the Indian Income-tax Act, which reads as follows:-

No super-tax will be payable by a company on such part of its income as consists of dividends received from an Indian company, where the Central Government is satisfied that the company is wholly or mainly engaged in an industry as specified in the First Schedule to the Industries (Development and Regulation) Act, 1951.

mineral oils and industrial machinery manufacture, dividends received are exempt from super-tax levy, i.e., dividends will bear a tax incidence of 20 per cent only compared to the standard rate of 40 per cent.

The impact of taxation is worked out for the first fifteen years of operation for a new undertaking in the Indian Union. The results are set out for three cases in the table below:

INCIDENCE OF TAXATION AND RETURN ON FOREIGN CAPITAL INVESTMENTS IN INDIA

(In percentages)

Nature of Foreign Investment in India	Incidence of Taxation			Return on Investment		
	Case I	Case II	Case III	Case I	Case II	Case III
1. A foreign company operating in India through its branch office	51.5	47.5	45.7	12.5	8.5	5.7
2. A foreign company holding shares in an Indian company covered by Section 56A	45.7	42.0	40.9	14.0	9.4	6.2
3. A foreign company holding shares in an Indian company not covered by Section 56A	54.6	50.6	49.5	11.7	8.0	5.3

† Proportion of "profits after total tax liability" to equity capital.

Note: Gross Profits as a proportion of capital employed are assumed to be 20, 15 and 12 per cent for the three cases I, II and III respectively.

The study clearly brings out that for a given level of gross profits, the incidence of Indian taxation on

foreign capital that flows into India on or after 1st April, 1961, would be the least when it is covered by Section 56A of the Indian Income-tax Act. Consequently, the best return on capital after providing for all taxation would be obtained from investment in such an undertaking. Thus in case II, in which the gross profits are assumed to be 15 per cent of the capital employed for a company under section 56A, investment would bring an average return of 9.4 per cent in 15 years of operation to the foreign company, compared to 8.5 per cent and 8.0 per cent for a branch of a foreign parent and a foreign company which holds subsidiary or non-subsidiary interest in an Indian company respectively, that does not enjoy the benefits of super-tax exemption on dividends as provided in Section 56A.

It undoubtedly goes without saying that the exporter of capital will necessarily expect a higher return than is available to him at home for, the simple reason that he would like to be adequately rewarded for the risks which he undertakes in exporting capital to a foreign country. The fact that foreign capital chooses to flow to India indicates that this fundamental test is satisfied by the Indian system of taxation. (Another consideration that would weigh with the exporter of capital is the relative burden of taxation in different countries which are desirous of importing it). The burden of taxation in two countries cannot bear precise comparison because there are factors other than the rate of return which influence the flow of international capital. For instance, political stability, the policy of the Government on remittance of dividend or repatriation of capital, nationalisation, and so on. Hence a bare comparison between the burden of taxation in one capital-importing country with the burden in another is of little purpose because the tax burden is only one factor which is taken into consideration in making a decision on exporting capital. Nevertheless, the point ought to be stressed that the modification which has now been brought about in this country argues for a greater flow of capital from abroad.

THE BUSINESS WORLD

Plea for Product-intensive Ventures

By CROESUS

FOREIGN collaboration with Indian industries need not necessarily be spectacular to be useful, although, from an ideological or propaganda point of view, the more spectacular an industrial project, the greater the popular appeal of the venture and, therefore, of the collaborating country concerned. But, in the prevailing circumstances, it is joint ventures in the medium-sized category that will prove beneficial to the Indian consumer in terms of greater productivity and be also of real value to the collaborators. From this point of view, the talk that Mr. Frank S. Wilson, Chairman, Gabriel India Ltd., gave to the Press Guild of India, last Monday, on "The Challenge of Smaller Industry in India" deserves wider notice. Of course, when he said "smaller industry", he did not mean industries smaller than our small-scale industries, but only those smaller than our major or large-scale industries. Accordingly, he did not minimise the importance of the village or cottage or small-scale industries, but only sought to direct public attention to the problems of what he termed the "smaller industry", which is known to the people of our country as industries falling under the medium-scale sector. This "smaller industry" would require an investment of, say, some Rs. 10-15 lakhs covering an employment ranging from 50 or less to 500 or more, depending upon the peculiar circumstances of the industry concerned.

Three very interesting reasons were given by Mr. Wilson for considering his "smaller industry" scheme as very important. First, such "smaller industries" offer in many lines of endeavour an opportunity to organise a type of enterprise of the minimum size necessary to take full advantage of modern high production technology. Secondly, they afford scope for the exercise of the managerial talents of a new and rising generation of Indian industrialists — not only does this process vastly broaden the scope of industrial opportunity for young managers, staff and workers, but it offers a major channel, financially sound, for releasing the energies of the people and improving the standard of living of all. Thirdly, with the best of modern technology usually concentrated in the know-how of individual manufacturers around the world, it is the joint venture of Indian and foreign groups which can most rapidly establish modern technology in all its diversity. Elaborating this point, Mr. Wilson observed: It is the medium-sized industry that is the smallest to which successful foreign collaboration can be brought, a limitation which is due both to the fact that foreign collaboration with a smaller scale enterprise requires just as much executive time for working it out as in the case of medium-scale enterprise and to certain complexities of the approval process in India. As per his calculations, in terms of travel, maintenance and similar out-of-pocket expenses, some Rs. 30,000 to 75,000 or more would be needed before a new enterprise is ready for launching. This amount is in addition to what the Indian collaborators would have to expend on their own. It is needless to point out that, while a big industry could take this much of expenditure in its stride, it would be a burden for the medium-scale enterprise. This is perhaps why no joint Indian and foreign collaboration seems to be possible with an outlay of less than, say Rs. 10 lakhs.

Incidentally, it is only upto this limit that the Government of India also regards an industry as a small-scale industry.

In answering a question whether his "smaller industry" would be capital-intensive or labour-intensive, Mr. Wilson provided a new and interesting concept. "Concerning the problems and opportunities of medium-scale industry", he said. "I should like to suggest a new measure of the contribution which such industry can make to India. Must we need to choose between these two limiting alternatives?" he asked and proceeded to suggest, instead, an altogether new measure of industry value: "is it product-intensive?" Given the tremendous speed with which the organisation of new industries must proceed under the Third Five-Year Plan, together with the limitations of resources which beset us, as Mr. Wilson opined, "it would be prudent to seek out deliberately industries fitting the needs of the country, which promise maximum product yield for minimum capital investment — industries, in a word, which are product-intensive. Elaborating this point, he went on to say that "such industries are, 'per se' neither necessarily labour-intensive, nor prodigal of labour. They employ workers in numbers appropriate to the operation. In the aggregate, they can vastly increase employment. But, above all, they conserve and use capital resources 'frugally' in the national interest."

These are, indeed, constructive points, which, of course, one would expect from a person of the equipment and experience of Mr. Wilson, who, by the way, is no stranger to this country. As a matter of fact, India may well claim him to be an Indian; he was born at Kodaikanal. But it was not until 1953, when he arrived here from America as the Principal Adviser to the Government of India on Industry, Transportation and Private Investment, attached to the U.S. Technical Co-operation Mission, that one began to discern and take note of his genuine interest in India, the interest of a son of the soil, as it were. Among others, he has contributed, in large measure, to the establishment of the Industrial Credit and Investment Corporation of India, the U.S. in-Plant Industrial Consultation Service and the Management Association Movement in India. He was also Chief Adviser to the Indian Railways and, in that capacity, was responsible for organising the work of the U.S. Railway Advisory Team and in administering the U.S. assistance of over \$80 million to the Indian Railways. He was, again, Principal Adviser, Machine Tool Industry Advisory Group, which surveyed the Indian machine tool industry in the fifties. Thereafter, he went to Jordan on a more or less similar mission to return to the States in 1959. He is back again in India in 1961 as the Head of Messrs. Gabriel India Ltd., which, in collaboration with Messrs. Anand Automobiles of Bombay, will shortly be manufacturing shock absorbers. The only independent manufacturers of telescopic shock absorbers in India, Gabriel India expect to supply over 75 per cent of the shock absorber requirements of the automobile industry in the country. The automotive parts industry, of which the manufacture of shock absorbers is one of the many lines, is a product-intensive industry with considerable potentialities. Mr. Wilson

described India vividly as an "Awakening Giant," and he said he looked at India as a market of 40 million relatively prosperous citizens with more becoming prosperous each year. To quote his own words, "to view it as a market of some 40 million consumers able to buy the kind of products which an automotive industry exemplifies but with only a limited number of cars and (other durable goods) yet being made on which to spend their earnings, is to see India as one of the largest unsaturated markets on earth. A market long static with an annual production of less than 30 thousand cars, trucks and buses for over 20 years has now more than doubled its output and should produce over 100,000 units annually before 1966."

A champion of Indo-American collaboration in the

Business Notes

Rural Credit

CO-OPERATIVES AND RURAL PROSPERITY

SOME IDEA of the extent of progress (or, is it failure?) made by the co-operative movement in our country was provided by the Governor of the Reserve Bank, Mr. H. V. R. Iengar, the other day, when he addressed the 16th session of the Tamilnad Co-operative Conference in Kumbakonam. If one does not want to say the movement has failed, and wants to be a little more charitable, one could say it has not made as much progress as was expected. But to quote Mr. Iengar's own words, "the main causes of the relative failure of co-operatives in India are largely socio-economic in character and are relatable to certain fundamental weaknesses which have developed in the rural structure. Some of the factors making for these weaknesses, such as caste, have always been there; some of the weaknesses are inherent in most agricultural economies, especially those which consist of small units of operation together covering a vast area; but the features most significant in this context are those which have emerged from the combined impact of commercial colonialism, industrialisation and urbanisation on these pre-existing conditions."

Mr. Iengar went on to remark: "It is manifest that the progress of co-operatives is mutually interdependent on agricultural prosperity" and that "if the agrarian economy is a subsistence economy and if savings are impracticable, co-operative effort cannot succeed". Now, although savings may not be impracticable, it cannot be gainsaid that our agricultural economy is, by and large, still a subsistence economy. Therein perhaps lies a part of the explanation for the tardy progress that the co-operative movement has made in India.

That the progress of co-operatives is interdependent on agricultural prosperity as stated by Mr. Iengar is clearly borne out by the example of Japan which the Governor outlined with facts and figures. In this context the position of agriculture in India makes a striking contrast. Judging dispassionately, the average yield per acre in India since 1931 appears actually to have declined over a greater part of the period! True, the yield per acre has increased in the last few years, but, even so, it is today very little more than what it was in 1931-32. Thus, as Mr. Iengar observed, the average yield of rice per acre in our country is only 906 pounds, as compared to 4,243 pounds in Japan.

Proceeding, Mr. Iyengar pointed out that although the rate of interest charged by the co-operatives in Japan is very much higher than in India, unlike here, the higher rates are not regarded as being inhibitory to progress in that country. While recent developments in the commercial banking field in India had led to some increase in interest rates on advances, the advance rates of co-operative institutions had been kept steady. In the present circumstances, Mr. Iengar said,

industrial field, Mr. Wilson has not only an abiding interest in the industrial development of India, but is evidently determined to bring more of such joint ventures in the smaller and medium-sized sector which, he believes, should prove beneficial to the Indian consumer in terms of greater product value, be of mutual value to the collaborators, and make a contribution to the sound economic development of this country. It is fortunate that while our planners also have realised that small industrial undertakings are vital to India's expanding economy, the investment climate for foreign investment too should be as propitious as it has turned out to be now. In fact, it is more favourable than at any time before which is a good omen for the success of such joint ventures as those sponsored by Mr. Wilson.

the anomaly in the advance rates between co-operative institutions and commercial banks would naturally make it necessary for the former to consider the question of raising their rates too. As a corollary to the increasing interest on deposits, the question of increasing the rate of interest on advances would necessarily arise. After having conceded this, however, Mr. Iengar went on to say: "It is important to see that the farmer gets 'at reasonable rates' all the credit that he needs from the co-operative and that he gets it at the correct time and in the correct form." Does this mean that there should be two sets of advance rates in the co-operative sector, one a "reasonable rate" for the farmer, and another an "economic rate" for the non-agricultural borrower from co-operatives?

Paper

RIISING COST OF PRODUCTION

THE COST of production in the paper industry has been increasing during the last few years. The manufacturers have been finding it more and more difficult to sell their products at the prices stipulated by the Tariff Commission. These prices are based on the Tariff Commission's enquiry into the cost structure of the industry in 1958. Because the costs have tended to increase, the paper mills approached the Government for revision of prices. To substantiate their case, the two associations of paper manufacturers — the Indian Paper Makers' Association and the Indian Paper Mills Association — have jointly conducted an enquiry into the production costs of their mills. They have based their findings on the costs of seven selected mills out of the eight which were selected by the Tariff Commission in 1958. The cost structure of the eighth unit is unfortunately not available.

The results of this investigation reveal that cost of production per metric ton of paper has gone up by Rs. 137.37 since 1958. The most important factor contributing to increased costs is said to be the cost of raw materials which accounts for nearly Rs. 47 per ly to the fact that some mills have to pay higher royalties for their bamboos and partly to increased freight charges consequent upon raising of the surcharge on railway freight by 5 per cent. The price of waste paper, too, is said to have gone up. The second important factor leading to increase in production costs has been nearly Rs. 46 per metric ton increase in cost of chemicals due mainly to stepping up of excise duty on certain chemicals like caustic soda. Power and fuel charges have also gone up substantially owing to increase in pithead prices of coal and 5 per cent surcharge on railway freight. The industry is said to have suffered also because many of its units were obliged to accept coal by road since the railways could not spare sufficient wagons for it. The industry also points out that its coal supply is often downgraded by the Fuel Efficiency Committee. The

results naturally are lower efficiency and higher costs. Costlier power and fuel is said to have increased the industry's production costs by about Rs. 19 per metric ton. Other factors which have led to higher costs are labour and depreciation which have sent up the expense bill by nearly Rs. 11 per ton. Other overheads are said to be cashing about Rs. 7 per metric ton more.

This rising cost structure, therefore, presents a strong case for an increase in paper prices. It may also be added that the steady rise in costs which has already occurred is by no means at an end and further increases can be expected in the near future. It is, therefore, necessary that paper industry's prices are increased to include increases in costs. A fresh enquiry by the Tariff Commission, is, perhaps, due so that justice may be done to this important industry.

Chemicals

EXPORT PROMOTION COUNCIL'S DELEGATION

A COMPOSITE study-cum-scale delegation of the Chemical and Allied Products Export Promotion Council visited recently West Pakistan, Iran, Iraq, Kuwait, Lebanon, British East Africa, Eden, Egypt and the Sudan in line with the policy of the Government of India to stimulate active investigation of foreign markets. During its stay abroad, the delegation made a study of these markets in respect of off-take of particular chemical products and also tried to understand the problems faced by the Indian exporters of these products. In the report now made available, it is pointed out that the delegation was received with considerable amount of enthusiasm in most of the countries.

The report indicates that insecticides, ammonium chloride, fertilizers, paints, sanitary ware, oils, toilet goods, perfumes and dye-stuffs are the items which can be exported to these countries profitably; there is in these markets considerable scope for selling these products. The report also contains a detailed list of various chemicals which can find favourable market in all these countries. The Indian producers of chemicals can take hints from the report to increase their exports to these markets.

The report contains various other suggestions and recommendations which if implemented can go a long way in fostering exports in general. It is believed that the delegations which visit foreign countries must be better equipped with the background material so that they can prove more useful to the prospective purchasers. The report also suggests holding of seminars on export promotion techniques in which various executives and officers concerned with the production and trade of chemicals and the Government departments concerned with their export should participate. The report points out that staff position in various Indian embassies and consulates should be reviewed and strengthened so that greater assistance can be received by businessmen who visit the foreign markets in search of export possibilities.

One very important suggestion in the report is the setting up of the trade centres abroad. Japan, the United States and various other countries found these centres of valuable assistance in export promotion. In these centres, located in important cities of the world, a series of exhibits can be displayed periodically. The arrangement can be in the hands of experts who can determine the selection of products in consultation with Trade Commissioners and other such organisations. In some countries, Indian trade centres are already doing useful work, but such centres should be opened in other important cities of the world too.

Among the major hinderances in the export of chemicals is the payment problem faced in Pakistan, Egypt and Sudan. The Government of India can look into this issue at the time when trade agreements are signed with these countries. Another important factor

that goes against the Indian products is that their prices are in many case out of parity with the prices obtaining for similar products in these countries. There are some other complaints too. The important among these are that Indian products have poor packing, are sometimes short in weight, that the supply is not strictly in conformity with the approved samples, and that there are delays in shipment. These complaints have obviously to be squarely met if a stable market for Indian products has to be established in these countries.

Plantations

LEVIES BY PANCHAYATS

WHILE, ON the one hand, the claim is being made that the country is fast moving towards the so-called "take-off" stage, there are also complaints, on the other, that higher productivity is only rewarded with uneconomic returns. Evidently, it is not the sugar industry alone that is suffering from a "surplus crisis"; coffee also seems to rank as a close runner-up to sugar in this race. As in the case of sugar, the increase in coffee production has been due to the enormous efforts put in, and the heavy amounts expended by, the plantation interests on improved methods of cultivation. Instead of being rewarded for this, the coffee industry is being plagued not only by enhanced excise duties (in the last Central Budget, the excise duty on coffee was raised by 33-1/3 per cent) — and this at a time when there is a world slump in coffee prices — but also by the Coffee Board's unimaginative marketing policies and the Panchayats' excessive exactions. As Mr. R. W. Thorpe, Chairman, Nilgiri-Wynad Planters' Association, told the members at their annual meeting last week, the Coffee Board's present marketing policies are now found "to be woefully inadequate to cope with increased production and violent fluctuations in the world market." In this connection, he fully endorsed the suggestions of the UPASI to the Coffee Board for solving the problems which include, among others, earmarking a minimum export quota; radical changes in the coffee export procedures, including open auctions; auctioning of small lots of individual coffee under their estate names; introduction of cup testing; abolition of the multi-channel system in the internal market, and replacement of Sales Tax by the Central Excise Duty, etc.

Industries these days, it seems, have to reckon not only with Union Government taxes and State Government levies, but also levies of local bodies, including the latest entrant into the field, namely, the panchayats. While one may not question the role assigned to panchayats and the importance attached to it by the authorities, one cannot help cautioning these panchayats to go slow, especially as regards the plantations which have their special problems that admittedly mark them out for a different treatment altogether. It is unthinkable that plantations should be assessed by the panchayats in so arbitrary a fashion, as has been alleged. In the Nilgiri-Wynad area, for example, it is stated that 57 per cent of the revenue of the five important panchayats is contributed by plantations. In the case of three groups of estates, their contributions are estimated to constitute as much as 79 per cent of the revenue of the Panchayat Boards concerned. And, notwithstanding the heavy penalty imposed on them, thus, we are told, the plantations do not have any representation or say in either the determination of the rates or the disposal of the revenue. At the same time, it is not the panchayats but the plantations themselves that continue to provide all the facilities and amenities to the resident workers. Unless the State Governments look into this anomalous state of affairs in good time, it is just possible that panchayats may go too far and endanger the future of the plantation industry irretrievably. It is to be hoped that this will not be allowed to pass.

FROM THE CAPITAL'S CORRIDORS

THE THIRD PLAN

THE National Development Council is meeting here this week. It will consider the final draft of the Third Five-Year Plan. The draft has already been approved at the Cabinet level.

Latest indications reveal that though the physical target for public sector outlay under the Third Plan is being retained at Rs. 8,000 crores, the financial target for the present is being kept at Rs. 7,500 crores. Within this target, some adjustments, however, have been made for various developmental activities. Railways, for instance, have been sanctioned another Rs. 70 crores for their developmental programme under the Plan. A minor cut is said to have been effected in the allocation for major irrigation works.

The outlay on the development of the minerals industry is expected to be of the order of Rs. 498 crores. Of this, Rs. 438 crores will be the outlay in the public sector and Rs. 60 crores in the private sector. The foreign exchange component of this developmental programme in the two sectors is put at Rs. 200 crores and Rs. 28 crores respectively.

The target for coal output is being retained at 97 million tons. Compared to the Second Plan target of 60 million tons, this means that 37 million tons more coal will have to be raised per annum from the year 1965-66. Nearly 20.13 million tons of this have been earmarked for production in the public sector. The private sector is being asked to raise its output by 16.83 million tons. Of the public sector target of additional coal raisings, 17.13 million tons have been allocated to the National Coal Development Corporation. The remaining 3 million tons are envisaged to be had from the Singareni coalfields. The National Coal Development Corporation will be required to step up its production of non-coking coal by 10.83 million tons, of coking coal by 4.82 million tons and of blended coal by 1.48 million tons.

A sum of Rs. 115 crores is being earmarked for oil exploration during the Third Five-Year Plan period. Additional allocations will be made under this head from time to time as production stage is reached and oil is ready for transportation. The final draft of the Third Plan, it is understood, contains a specific reference that in the field of oil exploration, the Government will seek foreign collaboration on mutually acceptable terms.

A DECADE OF PLANNING

A full chapter has been devoted in the Third Plan's final draft for an assessment of the progress made by India under the first two Plans. The following extracts from this chapter would be read with considerable interest:

"The First Five-Year Plan took over several projects which had been worked out earlier and integrated them into a well-knit scheme of economic and social development embracing every part of the country. Through its emphasis on agriculture, irrigation, power and transport, the Plan succeeded in creating the base for more rapid economic and industrial advance in the future. In stressing the place of social change and institutional reforms in the economic development of the country, the Plan initiated some of the basic policies which were further developed during the Second Plan.

"While the First Plan placed great emphasis on the stepping up of agricultural production, rehabilitation of transport and communications and a fuller utilisation of the existing capacity in industry, one of its main aims was to establish the basic social and

economic policies for economic development in accordance with the Directive Principles of State Policy laid down in the Constitution. The reform of an antiquated land system which was inhibiting agricultural production, setting up a nation-wide agricultural extension service as part of a comprehensive Community Development Programme, revitalisation of the co-operative movement, expansion of irrigation and power facilities on a large scale, strengthening and improving the administrative structure of the country, and establishing a number of specialised institutions for providing credit to agriculture and industry, for developing small-scale industries and for giving special assistance to backward sections of the population were some of the notable features of the First Plan. The Plan focussed the nation's attention on the vital need for planned effort for achieving rapid economic growth as well as social justice. It offered to the people not only the objectives for which to work, but also the means with which to realise them through mutual self-help and co-operation and the mobilisation of local resources.

SECOND PLAN EMPHASIS

"While the Second Plan carried the basic policies initiated under the First Plan a step further and aimed at a larger increase in investment, production and employment, its main contribution was to direct the economy towards the next important stage which followed logically from the policy of planned development which the country had already accepted. It placed special emphasis on the development of basic and heavy industries for, with the advantages in natural resources which India already possessed, this was an essential element in the strategy for speeding up the development of the national economy over the next 15 or 20 years. The Plan also defined more clearly the key role that the public sector was to play in the economic development of the country. Along with the emphasis that it put on accelerating the rate of growth of the national economy and creating conditions for more rapid development in future, the Second Plan placed before the nation the goal of the socialist pattern of society. It also set the objectives of increasing employment opportunities and reducing disparities in income and wealth and bringing about the more even distribution of economic power.

"As a result of economic planning, there was a substantial increase in the rate of investment, especially in directions calculated to accelerate the economic development of the country. The total investment, public and private, in the economy increased from over Rs. 500 crores per annum at the beginning of the First Plan to Rs. 850 crores at its end and reached an annual level of about Rs. 1,600 crores at the end of the Second Plan. Corresponding figures for investment by public authorities are Rs. 200 crores, Rs. 450 crores and over Rs. 800 crores. The total investment during the two Plans was Rs. 10,100 crores; about Rs. 5,210 crores in the public sector and Rs. 4,900 crores in the private sector. The following are the details:

TABLE I
I & II PLANS: OUTLAY AND INVESTMENT
(Rs. crores)

	First Plan 1951-56	Second Plan 1956-61	Total 1951-61
Public sector outlay	1,960	4,600	6,560
Public sector investment	1,560	3,650	5,210
Private sector investment	1,800	3,100	4,900
Total investment	3,360	6,750	10,110

Save with the simplicity of HONEYWELL TEL-O-SET* Miniature Instruments

- Tel-O-Set Features**
- Quick-connect mounting
 - Unit construction
 - Versatile operation
 - Wide range of reset rates
 - Low air consumption
 - High precision
 - Exceptional compactness
 - Chart re-roll

NEW and improved *Tel-O-Set* miniature pneumatic instruments are low in cost, easily installed, compact and require minimum maintenance. They can handle a broad range of temperature, pressure, flow and liquid level applications...

With all their simplicity, these instruments are highly sensitive and respond instantly to change. They operate on a pneumatic-balance principle which eliminates lost motion and friction.

Honeywell *Tel-O-Set* indicators, recorders and controllers are today's most advanced miniature instruments.

MA. SAN. 277

The distribution of outlay in the public sector as between different heads of development is shown in table II.

TABLE II
DISTRIBUTION OF OUTLAY (PUBLIC SECTOR)

(Rs. crores)

Heads	First Plan				Second Plan			
	Provision	Percent- age	Expenditure	Percent- age	Provision	Percent- age	Expendi- ture	Percentage
Agriculture and community development	346	17	291	15	568	12	529	11
Irrigation	434	21	310	16	498	10	450	10
Power	127	6	260	13	415	9	416	9
Village and small industries	50	2	43	2	200	4	176	4
Industries and minerals	146	7	74	4	690	14	900	20
Transport and communications	498	24	523	27	1385	29	1367	28
Social services and miscellaneous	468	23	459	23	1044	22	829	18
Total	2069	100	1960	100	4800	100	4600	100

"This distribution reflected the changes in emphasis in the two Plans. In the First Plan, relatively greater stress was placed on programmes designed to build up the agricultural potential of the country. Consequently, programmes for agriculture and irrigation comprised 38 per cent of the Plan provision. In the Second Plan, greater emphasis had necessarily to be given to industrial development and the relative share of industries and mining increased from 7 per cent to 14 per cent. Transport and communications were given high priority in both the Plans. Social Services comprised 23 per cent of the First Plan and 22 per cent of the Second Plan provision. The variations between provisions and expenditures during the two Plan periods reflected partly lags in implementation and partly adjustments in the light of actual requirements. The reappraisal of the Second Plan in 1958 was due to the sharp decline in foreign exchange reserves during the first two years of the Plan, the fact that external assistance was not yet available on the scale needed, the unfavourable agricultural seasons during 1957-58, and the fall in the prices of primary products abroad.

RESOURCES

"The financing of the public sector outlay in the two Plans originally proposed and as it actually emerged was as follows:

TABLE III.
FINANCIAL RESOURCES (PUBLIC SECTOR)

(Rs. crores)

	Originally Proposed	Actual
First Plan		
Outlay on the Plan	2,069	1,960
Budgetary Resources	1,258	1,352
External Assistance	521	188
Deficit Financing	290	420
Second Plan		
Outlay on the Plan	4,800	4,600
Budgetary Resources	2,800	2,562
External Assistance	800	1,090
Deficit Financing	1,200	948

"During the Second Plan in particular, there was a substantial set-up in the tax effort. A number of new direct and indirect taxes were introduced. The gap in resources was made up partly through deficit financing and partly through external assistance. During the earlier years of the Second Plan, budgetary deficits were rather high. An attempt was, however, made in the later years to reduce them. Actual deficit financing during the Second Plan was roughly of the

order of Rs. 950 crores, as against the original provision of Rs. 1200 crores.

"The balance of payments did not present a problem during the First Plan period. The actual deficit amounted to Rs. 318 crores over the Plan period. It was met to the extent of Rs. 196 crores by external assistance and Rs. 122 crores by withdrawal from the country's foreign exchange reserves. The Second Plan which put greater stress on industrialisation naturally required heavier expenditure of foreign exchange. The Second Plan Report estimated the aggregate deficit in the balance of payments over the five-year period at about Rs. 1100 crores and assumed that about Rs. 800 crores out of this would be met by external assistance. It ran, however, into unexpected balance of payments difficulties from the very second year. Foreign exchange reserve had to be drawn down by Rs. 610 crores in the Second Plan period. In addition, external assistance of the order of Rs. 872 crores was utilised in the public as well as private sectors, besides commodity imports of Rs. 540 crores under the P.L. 480 assistance. Stringent restrictions were imposed on less essential imports. Efforts were made to increase exports, but the total export earnings for the five-year period turned out to be somewhat lower than the Plan anticipations.

RECORD OF GROWTH

"The record of growth over the last ten years has not been uniform. There have been significant ups and downs—occasionally due to natural causes or international developments and sometimes due to deficiencies in implementation. During the First Plan, owing largely to the progress recorded by agricultural production, the national income increased by 18 per cent as against a target of 12 per cent. During the Second Plan, on the other hand, the increase in national income was 20 per cent as against a target of 25 per cent, partly due to foreign exchange difficulties experienced in the earlier years of the Plan and partly to adverse weather conditions.

"The past decade has witnessed striking developments in industry—in terms of the rate as well as the pattern. Some idea of the trend may be obtained from the following indices of industrial production:

TABLE IV.
INDEX OF INDUSTRIAL PRODUCTION

	1950-51	1955-56	1960-61
General index	100	139	194
Cotton textiles	100	128	133
Iron and steel	100	122	238
Machinery	100	192	503
Chemicals	100	179	288

"The index of industrial production thus recorded a cumulative rate of expansion of about 7 per cent per annum. The actual increase was, in fact, more pronounced than indicated by the above figures because a number of new industries which have generally shown more marked progress, are at present not included in the index.

"Even more significant than the quantum of industrial development has been the direction in which the expansion has taken place, especially under the Second Plan. During the First Plan what has been proposed initially for large industry was chiefly to encourage the already existing factories to use their capacity to the full. Industrial production, even with this mild stimulation, rose by 39 per cent during the quinquennium.

"With the successful completion of the First Plan, it was possible to take up in a large way the development of new industries, especially the capital and producer goods industries, which constitute the very basis for any programme for accelerated industrial growth. Judging by the progress so far achieved by the metallurgical, mechanical and electrical engineering and chemical industries in augmenting industrial potential and taking cognizance of the heavy machine building projects recently initiated, it can be now stated that some of the basic conditions required for an accelerated growth towards the goal of a self-reliant economy were successfully established during the last decade.

"A key role was assigned to the public sector in the development of basic industries in particular. Total public sector outlay on industries and minerals amounted to Rs. 974 crores over the decade, out of which investment in Second Plan period alone amounted to as much as Rs. 900 crores or 60 per cent of the total investment in organised industry, public and private, during the quinquennium. But even more important was the nature of the public sector industries most of which were of a heavy type. This development has not only helped to strengthen the public sector, so essential from the standpoint of a basic objectives discussed earlier, but also helped to create conditions conducive for a rapid growth of medium and light industries in the private sector.

"A major step forward was taken with the establishment of three new steel plants in the public sector and the expansion of the two units in the private sector. The production stage of the new projects has now been reached and the capacity for finished steel has increased from 1 million tons in 1950-51 to 4.5 million tons in 1960-61 and of pig iron from 350,000 tons to 900,000 tons. The availability of other essential industrial materials like aluminium, cement, heavy chemicals, such as sulphuric acid, soda ash and caustic soda and dyestuffs, of fuels, such as coal and petroleum and of power has also increased substantially since 1950-51. New skills and experience have been acquired by a rapidly increasing number at all levels from industrial manager right down to the factory worker.

MACHINE-BUILDING INDUSTRIES

"Another significant development has been the rapid growth of machine building industries. India is now producing progressively increasing quantities of machine tools and machinery for use in agriculture, for needs of the transport industry and for such industries as chemical and pharmaceutical, textiles, jute, cement, tea, sugar, flour and oil mills, paper, mining, etc. Most of the machinery and equipment needed by the railways, except diesel and electric locomotives, are now available from indigenous sources. A large

variety of electrical equipment and scientific instruments are also now being produced in the country. The production of graded machine tools has increased from Rs. 34 lakhs in 1950-51 to Rs. 550 lakhs in 1960-61. Steps have been recently taken for the establishment of a heavy machine building plant and the foundry-forge plant at Ranchi and the coal mining machinery plant at Durgapur. The aggregate value of all kinds of industrial machinery and capital goods increased by about eleven-fold during the last decade. A beginning has also been made with the production of heavy electrical equipment. The Heavy Electrical Project at Bhopal has entered the stage of initial production. When all stages are completed, Rs. 25 crores worth of equipment will be produced.

"The progress made by chemical industries, particularly pharmaceuticals, heavy chemicals and fertilisers, has also been significant and capacity for a wide range of primary organic chemicals has been stepped up.

"The programme for the modernisation and re-equipment of important national industries, such as jute, cotton textiles and sugar has been progressing. In the case of the jute industry, it is at an advanced stage on the spinning side. The bulk of the machinery required for the modernisation of the jute industry in the preparatory and spinning departments has been manufactured within the country.

"Another achievement during the period under review was the progress made in increasing the indigenous content of industrial products manufactured in the country. Yet another indicator of the country's industrial development is the production of a growing number of new industrial items, e.g., industrial boilers, milling machines and other types of machine tools, tractors, industrial explosives, sulphur and anti-biotic drugs, D.D.T., newsprint, motor cycles and scooters, calcium carbide, dyestuffs, staple fibres, etc.

OIL AND POWER

"While the output of mineral oil within the country is as yet small, valuable oil resources have been found in Nahorkatiya area in Assam and indicators obtained of a sizeable oilfield in Cambay-Ankleshwar areas in Gujarat. Prospecting operations are in progress in other areas as well. In view of the importance of establishing indigenous sources of oil, and Oil and Natural Gas Commission was set up for undertaking on an intensified scale, geological surveys, geophysical investigations and exploratory drilling for oil. Government have also decided to invite foreign oil explorers to join the quest for oil subject to mutually acceptable terms. Construction of two refineries at Nunmati and Barauni was taken up in the public sector and the Indian Oil Company, a Government agency for the distribution of oil products, was formed in 1959.

"Provision of adequate power is one of the basic requirements for the development of both large and small-scale industries. A number of hydro-electric and thermal power projects were put up during this period and the total public sector investment in power amounted to Rs. 647 crores. The four multi-purpose projects, Damodar Valley, Bhakra-Nangal, Tungabhadra and Hirakud, which were begun before the First Plan, were incorporated into the integrated programme of river development. Among the hydro-electric projects started during the last decade, mention may be made of Chambal, Rihand, Koyna and Nagarjunasagar. A large programme for thermal power generation was also undertaken. The installed capacity for hydro-electric power increased from 0.56 million KW to 1.93 million KW and of thermal from 1.74 million KW to

The State Bank of India, through its many branches, is ready to offer help and advice to small industrialists in need of a loan. Please call on the Agent of the branch in your town for full particulars.

3.77 million KW during the last decade. The total installed capacity thus went up from 2.3 million KW in 1950-51 to 5.7 million KW in 1960-61. The generation increased from 6,575 million KW hrs. to 19,850 million KW hrs. out of which as much as 62 per cent was required for industrial purposes. Impressive as this increase was, it represented nevertheless a substantial shortfall from the target of 6.9 million KW mainly due to foreign exchange difficulties that arose during the early years of the Second Plan and also delays in the execution of some of the major projects. Special attention was paid to extend electricity to rural areas as this was considered to be an important measure for developing and modernising the rural economy. The total number of small towns and villages electrified went up from 3,687 in 1950-51 to 23,000 in 1960-61."

**HEAVY ELECTRICALS AND PUMPS &
COMPRESSORS PROJECTS**

The Russian Government in two of the project reports submitted by it recently to the Government of India is understood to have advised against setting up of a third heavy electricals plant and a shop for the manufacture of heavy pumps and compressors. The latter project, it says, would be an uneconomic one. About the former the view expressed in the report

is said to be that India's Third Plan requirement for heavy electricals would be adequately met by the expansion of the Bhopal Electrical Plant and another unit proposed to be set up.

This should, however, not be taken to mean that the Soviet Union is contemplating reducing its offer of credit for the Third Plan. Any amount that will be found surplus by non-inclusion of these two projects in the Third Plan will, it is learnt, be available for utilisation on some more important projects.

CEMENT MANUFACTURE

A proposal to step up the Third Plan target of installed capacity for the cement industry from 15.238 million metric tons per annum to 16.762 million metric tons is understood to be under consideration of the Government of India. The installed capacity of the industry at the end of the Second Plan was 9.134 million metric tons. An additional capacity to the tune of 6.781 million metric tons has already been licensed or approved for grant of licences. Included in this additional capacity are 28 expansion programmes and 15 schemes for setting up new units. The following are the details of some of the new units that are proposed to be set up and the expansion programmes of the existing units for which either licences have been issued or approval has been granted provisionally for the grant of a licence.

ADDITIONAL CAPACITY COVERED BY IMPORT LICENCES

No.	State/Name of firm	Location (New/Expansion)	Annual capacity to be installed (in metric tons)
1.	Gujarat: Chorwad Cement Factory, Veraval	Veraval (New)	50,290
2.	Andhra Pradesh: K.C.P. Ltd., Madras	Mancherla (Exp.)	152,380
3.	Andhra Pradesh: Associated Cement Companies Ltd., Bombay	Mancherla (Exp.)	167,620
4.	Bihar: Associated Cement Companies Ltd., Bombay	Chaibasa (Exp. Slag)	172,700
5.	Mysore: Mysore Cements Ltd., Bangalore	Ammasandra (New)	101,590

TOTAL:					2,273,570

FOREIGN AID

An important development has taken place in the recent past on availability of economic assistance from the United States. The U.S. Export-Import Bank is reported to have decided to grant credits for exploration, refining and marketing of oil by a Government agency in an under-developed country. India is likely to take advantage of this and the Oil and Natural Gas Commission is expected to make a request for a \$2 million loan from this agency.

A change in the pattern of economic assistance provided by the Soviet Union is also said to be in the offing. A proposal is understood to be under discussion here under which the Russian Government may enter into collaboration with a private sector firm for the manufacture of trucks at a plant to be located in Andhra Pradesh.

THE SMALL CAR

The Pande Committee on Low-Cost Car has submitted its Report to the Union Government. The Committee, it is learnt, has observed that "on the basis of the present level of material costs, labour rates and taxes", a small car can be produced in this country at an ex-factory price of Rs. 5,100 (excluding excise duty), provided the annual production rate is 50,000 units. If the turnover is to be 20,000 units, the cost would be Rs. 6,150 (excluding excise duty).

The model favoured by the Committee for manufacture is understood to be "Renault Dauphine".

NEW ISSUES

Ten more companies have been granted consent by the Controller of Capital Issues for the issue of capital of various categories. The following are the details:

1. **The Britannia Engineering Company, Calcutta**, has been granted permission to issue capital worth Rs. 50 lakhs in 5 lakh equity shares of Rs. 10 each, for cash at par. This capital is required for the manufacture of wagons, road-rollers and printing machinery. The share money shall be collected in one call.

2. **Messrs. Kothari Sugars and Chemicals Limited**, have been granted permission to issue debentures worth Rs. 35 lakhs to the Bank of India, Bombay. The debentures will carry a rate of interest not exceeding 6½ per cent. The proceeds of the issue together with the equity capital of Rs. 80 lakhs raised under the authority of the consent order dated October 22, 1960, would be utilized by the company for setting up a sugar factory of 1,250 tons cane-crushing capacity per day.

3. **T.I. Miller Private Limited, Madras**, a company under formation, has been granted consent for the issue of capital worth Rs. 25 lakhs. Of this, Rs. 22.50 lakhs will be subscribed for cash by Messrs. Tube Investments of India Ltd., Madras. The rest of the capital will be offered to H. Miller & Company Ltd., Birmingham, in lieu of the technical know-how which it will make available to the Indian company. The proceeds of the issue are to be utilized for the manufacture of automobile lamps and dynamo lamps.

4. **The Century Spinning and Manufacturing Company Ltd., Bombay**, has been granted permission for the issue of bonus shares of the value of Rs. 50.98 lakhs in the ratio of one bonus share for every four shares held. The company at present has a paid-up capital of Rs. 203.91 lakhs in equity shares and Rs. 125 lakhs in preference shares.

5. **Messrs. Prabhat Limited**, have been granted consent to issue capital worth Rs. 70 lakhs in equity shares of Rs. 100 each. The issue will be at par. Shares of a value not exceeding Rs. 30 lakhs will be issued by this company for consideration other than cash against assets to be taken over and against loans from directors, relatives and friends, dealers and agents as on March 31, 1961, and the balance for cash. The object

of the issue is to take over the Prabhat (Stove & Lamp) Products Company (Private) Ltd. and to run the same.

6. **The Asian Cables Corporation Limited**, has been permitted to issue further capital worth Rs. 155 lakhs in equity shares of Rs. 100 each, for cash at par. Shares of the value of Rs. 55 lakhs would be offered to Phelps Dodge Copper Products International Corporation of U.S.A. and Enfield Cables of U.K. who are the foreign collaborators of this firm for the manufacture of cables in India, against supply of capital equipment. The balance of Rs. 100 lakhs will be issued to the existing shareholders of the company on the basis of two new shares for each share held.

7. **The Mysore Paper Mills Ltd., Bhadravati** has been granted consent to issue further capital worth Rs. 100 lakhs in equity shares of Rs. 100 each to be offered to the existing shareholders of the company at a premium of Rs. 2 per share in the ratio of four new shares for every one share held. This issue will meet part of the expenditure on the expansion scheme of the company which is estimated to cost Rs. 330 lakhs. The remaining requirements of the expansion scheme will be raised by the company as loans from financial agencies. The company is engaged in the manufacture of printing and writing paper.

8. **The Indian Drugs and Pharmaceuticals Limited**, a private company formed by the Government of India to look after the four drugs, pharmaceuticals and surgical instruments manufacturing units to be set up under the Third Plan in collaboration with the Soviet Union, has been granted consent to issue equity capital worth Rs. 60 lakhs.

9. **The Tennure Bank Limited, Tiruchirapalli** has been given permission to issue 400 ordinary shares of Rs. 50 each, for cash at par, to the existing shareholders in the ratio of one new share for every five held. The new issue is envisaged to improve the liquidity of the bank. The present paid-up capital of the bank is Rs. 50 lakhs, all in equity shares of Rs. 50 each.

10. **The Rayon Pulp Manufacturing Company, Bombay**, has been granted consent to issue capital worth Rs. 50 lakhs, for cash at par, in the form of 4 lakh equity shares of Rs. 10 each and one lakh redeemable cumulative preference shares of Rs. 10 each. Shares of the value of Rs. 15 lakhs would be subscribed privately and the balance by the general public. The proceeds of the issue are to be utilized for the manufacture of bleached rayon grade pulp.

The consent orders in all these cases are valid for twelve months from the date of issue.

FRENCH QUOTAS FOR INDIAN HANDICRAFTS

As a result of the visit of Mr. K. B. Lal, Additional Secretary, Union Ministry of Commerce and Industry, to the Common Market countries last year and the negotiations held recently with the Indo-French Economic Mission, the French Government has sanctioned the following quotas for the import of handicrafts from India.

1. Hand-made woollen carpets, knitted, with less than 450 rows to a meter, worth 600,000 new francs.
2. Woollen carpets, knitted, with 450 rows to a meter and more, worth 400,000 new francs.
3. Chain-stitched Kashmir rugs worth 200,000 new francs.
4. Handicrafts such as ivory goods, earthen-ware, brass-ware, copper-ware, filigranoworks, fancy jewellery, basket-ware, etc., worth 700,000 new francs.
5. Miscellaneous textile articles, shawls, scarves, embroidered shoes, etc., worth 200,000 new francs.

The quotas are to be utilised by December 31, 1961.

COMPANY AFFAIRS

JUGGILAL KAMLAPAT COTTON

The Directors of Juggilal Kamlapat Cotton Spg. & Wvg. Mills Co., Ltd., have pointed out in the annual report that the cost of production in their cotton textile unit increased during 1960 due to rise in the prices of cotton and other consumable stores and higher wage bill. Due to failure of cotton crop in 1959-60 season on account of adverse climatic conditions, there was scarcity in the supply of Indian cotton. Consequently the prices soared high and pierced the ceilings. The Government had to reintroduce the quota-system for Indian cotton with a view to ensure equitable distribution. Foreign cotton was also imported to fill the gap in the supply of indigenous cotton. The implementation of the Wage Board's recommendations from January 1, 1960 imposed an additional burden on the Company. With a view to hold the price line the Cotton Textile Industry agreed, at the request of the Government, to reduce the prices of cloth and yarn from 1st August, 1960 by making only such additions to the prices prevailing in August, 1959 as were commensurate with the increase in the cost of production.

The Rayon Plant and other auxiliary units like the Sulphuric Acid and Carbon-bi-Sulphide Plants which started operations in August, 1959 worked satisfactorily during the year. The rayon filament yarn produced by the plant has been well received in the market. The Company is going to put up a plant for the manufacture of Sodium Sulphate to be recovered as by-product from the Rayon Plant. Orders have been already placed for the import of the requisite plant and machinery from West Germany and the same are expected to be shipped shortly.

During the year to December 31, 1960, the Company made a profit of Rs. 91.91 lakhs. A sum of Rs. 72.62 lakhs was provided for Depreciation and Rs. 10 lakhs for Development Rebate Reserve. The Directors have proposed the payment of a dividend at the rate of 12½ per cent or Rs. 1.25 nP. per equity share of Rs. 10 each which will absorb Rs. 15.63 lakhs. The Directors are pleased to report that they have been able to recommend payment of Dividend on the increased capital within a short period after the issue of new shares which were allotted on 3rd June, 1960.

INDO-BURMA PETROLEUM

The sales of the Indo-Burma Petroleum Company Limited during 1960 were maintained in India and Burma, while in East Pakistan there was a small increase over the previous year. During 1960 the Government of the Union of Burma completed purchase of control (51 per cent) in the Burma Oil Company (1954) Limited by paying the amounts till then due against their original 33-1/3 shareholding and thereafter purchasing the additional 17-2/3 per cent shareholding necessary to give them the 51 per cent control holding in that Company. These developments resulted in the disposal of part of I.B.P.'s shareholding in the B.O.C. (1954) Ltd., which yielded a surplus over the written down book value of Rs. 34.42 lakhs.

The profit for the year from the Company's normal operations (i.e. excluding the surplus proceeds over

book value of Investments sold), after providing for depreciation, amounted to Rs. 66.30 lakhs. An interim dividend of Rs. 1 per share was paid on ordinary shares and the Directors have now recommended the payment of Rs. 1.50 per share subject to tax, on ordinary share capital which will absorb Rs. 15 lakhs.

TRIVENI ENGINEERING WORKS

Four sugar companies have announced the incorporation of a company to be called the Triveni Engineering Works Ltd. These four companies are: The Ganga Sugar Corporation Ltd., The Mahalakshmi Sugar Mills Co. Ltd., The Upper India Sugar Mills Ltd., and The Ramkola Sugar Mills Co., Ltd. With an initial capital of Rs. 60 lakhs the company will be in partnership with Messrs. Booker Brothers, McConnell & Co., Ltd., of London, well-known internationally as the Booker Group. A heavy engineering works will be set up by this company to manufacture sugar machinery under licence from Messrs. George Fletcher & Co., Ltd., and Duncan Stewart & Co., Ltd., both subsidiaries of the Bookers Group. Arrangements have also been made to manufacture industrial process turbines under licence from Messrs. Peter Brotherhood Ltd. In addition plans are being finalised for the manufacture of other engineering products. The company hopes to be the first in the country in the field of steam turbine manufacture. The works are to be situated at Naini, near Allahabad, in the Triveni District of Uttar Pradesh.

GOOD YEAR ALLOTMENT OF SHARES

The preliminaries in connection with the Company's new share issue were completed within a month of the closing of subscriptions. A total number of 4 lakh shares (at Rs. 17 each including premium) was offered to the public, and at the close of the list on April 27th a total of 88,778 applications were received for 1,01,84,501 shares representing a sum of Rs. 17.3 crores--the shares being oversubscribed 25 times. Of this 84.57 per cent applicants were in 50 and 100 share group, representing 43.24 per cent of the total number of shares applied for. The Directors have decided to allot 44.41 per cent of the total to the group of applicants for 50 and 100 shares, and allotment in the group will, if necessary be, by ballot, each successful allottee receiving 5 shares. Other applicants will receive 10 shares for each applicant of the 150-400 group, 40 shares to each applicant of 1,000 shares, 55 shares to each applicant of 1,500 shares and so on.

KILLCOTT TEA

During 1960 the crop of Killcote Tea Co. Ltd. was estimated at 5.39 lakh kilogrammes as compared with 5.19 kgms. in 1959. The average selling price recovered was also higher at Rs. 5.09 per kgm. as against 4.74 per kgm. in the previous year. Naturally, therefore, the profit of the company was higher at 6.39 lakhs as compared to the previous year's figure of 5.12 lakhs. A sum of Rs. 10,000 was transferred to development rebate reserve, Rs. 1.25 lakhs to revenue reserve and Rs. 20,000 to investment reserve. The Directors have recommended the payment of a dividend at the rate of 25 per cent.

COMMODITY NEWS AND NOTES

STEADY RISE IN COMMODITY PRICES

During the Second Five-Year Plan period commodity prices rose uninterruptedly and the general index, with 1952-53 as 100, recorded an increase of 30.7 per cent—from 92.5 in 1955-56 to 124.8 in 1960-61, according to the Tata Quarterly.

The first sharp spurt came in 1958-59 due mainly to food prices, but thereafter industrial raw materials and manufactured articles took over the lead.

The index for industrial raw materials, which was hovering around 116.0 in the first three years of the first three years of the Second Plan, rose to 123.7 in 1959-60 and 145.4 in 1960-61. Similarly, the index for manufactured goods, which was around 108 in 1958-59, increased to 123.8 in the last year of the Second Plan.

IRON ORE PRODUCTION IN INDIA

The production of iron ore during March, 1961 was 961,000 metric tons, according to the Indian Bureau of Mines. This brings the total output during January-March 1961 to 2,815,000 metric tons which was higher by about 6 per cent compared to the output during the corresponding period of the preceding year. Orissa was the leading producing State with an output of 335,000 metric tons, followed by Bihar, with an output of 230,000 metric tons. Production in Madhya Pradesh, Mysore and Maharashtra was 217,000, 120,000 and 40,000 metric tons respectively. During March, 1961 despatches for consumption in the iron and steel plants totalled 654,000 metric tons while despatches for export totalled 195,000 metric tons.

FACTS ABOUT TOBACCO

Tobacco is an important commercial crop in India. It is the mainsay of agriculturists in areas where its production is concentrated. It brings to the growers an annual income of Rs. 50 crores and fetches about Rs. 15 crores foreign exchange to the country. The Government earns Rs. 50 crores every year in the form of excise duty, agricultural cess and customs revenue.

India is the third largest producer of tobacco in the world with an annual production of over 700 million lbs. from an average planted area of 900,000 acres. Andhra Pradesh and Bombay occupy dominant position in tobacco production, Andhra's share being about 35 per cent and that of Bombay about 25 per cent. It is used in the country for the manufacture of cigarettes, bidis, snuff, cigar, 'hookah' and chewing tobacco. The total quantity utilised, within the country, for all these amounted to 485 million lbs, according to a recent estimate. Of this, the cigarette manufacturers used about 14 per cent while 50 per cent was utilised for 'bidis' and chewing, another 24 per cent was consumed in 'hookah' and 'chillum'. Increasing quantities of tobacco are being used for the manufacture of cigarettes, 'bidis' and snuff in India. In 1959-60, 32,000 million cigarettes were produced as compared to 18,000 million in 1952-53. About 88 million lbs. of unmanufactured tobacco valued at Rs. 14 crores was exported during 1959-60. The United Kingdom is an important importer of tobacco from India. About 90 per cent of the exports are made up of cigarette tobacco. India ranks fifth among the suppliers of unmanufactured tobacco to the world market. Indian tobacco is exported to nearly 50 countries.

IMPORT POLICY FOR CARDAMOMS, CLOVES, NUTMEGS, ETC.

The import policy for the pending items (1) cardamoms, cassia, cinnamon, (2) cloves all sorts, whether ground or unground, (3) nutmegs, (4) mace and (5) betelnuts for the licensing period April-September, 1961 has now been announced. The Government of India have decided that established importers of each of these items will be granted 'ad hoc' licences for a value of Rs. 500 for the import of the item concerned during the licensing period. The 'ad hoc' licence will be granted to each established importer irrespective of the quantum of his past imports of the item concerned. Established importers may submit applications for 'ad hoc' licences to the port licensing authorities by July 31, 1961. Applications should be sent separately for each of the items in question in the usual form and manner duly accompanied with quota certificates.

BUYING OF WHEAT IN THE OPEN MARKET

Roller flour mills in India now have the option of buying indigenous wheat in the open market or acquiring imported wheat from Central stocks, the latter at the issue price of Rs. 14 per maund inclusive of gunny costs f.o.r. destination. The Government of India's decision to permit roller flour mills to buy in the open market — previously they were fed from Government stocks only — is because of the general decline in prices, a trend that might be accentuated when the full impact of the arrivals of new crop wheat is felt in the market. It is, therefore, a step to prevent losses to cultivators. The major decision follows the removal of restrictions on the movement of wheat throughout the country, announced early last month, and the more recent decision to lift curbs on bank advances against stocks of wheat. Although the mills may now purchase indigenous wheat, the prices of wheat products from these mills will continue to be subject to the ceiling prices fixed irrespective of whether indigenous or imported wheat has been used in their manufacture.

CANADIAN OIL EXPORTS

The Inter-provincial Pipeline Company, which is now carrying to the U.S. about 76,000 barrels daily of Canadian crude, chiefly to the Mid-West, is asking for permission to export into the Buffalo area of New York. The Company has submitted an application to Canada's National Energy Board. Export at that point would require the construction of a 20-mile spurline from the company's trunk line around Hamilton, Ontario. Two refineries in the Buffalo area have a crude oil capacity of 57,000 barrels daily.

KENYA SISAL PRODUCTION

In four years, sisal production in Kenya has gone up from 39,636 tons to 62,620 tons, an increase of 58 per cent. These figures were given by Mr. R. J. M. Swynnerton, Permanent Secretary to the Ministry of Agriculture, Kenya, in an address to the Sisal Growers Association in Nairobi. In one year alone, the f.o.b. export value of sisal went up by £1m. to £4m. This production record is remarkable achievement and could not have taken place at a more opportune time in Kenya's history. It could only have resulted from the fact that better production methods had been applied in a wide scale.

KALINGA TUBES

*Announce the
opening of their*

NEW TUBE MILL

Our new mill goes into immediate production of 4", 5" and 6" nominal bore tubes to Indian Standard specifications. With the commissioning of this new mill the production target of one hundred thousand tons of tubes per annum is now attainable.

First to manufacture steel tubes and pipes in India, we were also the first to export, earning valuable foreign exchange.

Escape from Objectivity

THE National Development Council's last session was of crucial importance inasmuch as its principal object was to approve the final version of the Third Five-Year Plan. Welcome reports continued to pour at the nick of time creating a climate of confidence that the problem of foreign assistance would not pose any difficulties whatsoever. In view of this agreeable change in the outlook, it was expected of the NDC to take up the corresponding challenge and prepare the scheme for internal resources as well as the objectives of the Third Plan in a spirit of plain realism. But, instead of conducting a businesslike session, the NDC frittered away a good deal of its energy in vague thinking and tiresome platitudes on the objectives of the Plan. When it came to grips with the question of rupee resources, it was amazing that it made a display of much wishful thinking.

During the first day of the debate, concentration of economic power and the remedies to break it occupied much of the energy of the NDC. It was simply presumed that concentration had developed to an extent at which it had become a menace to the free growth of the economy and posed a problem of urgency to fight it, when the reality of the situation is that economic regulations under the various enactments impose curbs on private enterprise at every stage, particularly, in the industrial sector, which have proved quite adequate for preventing the hypothetical emergence of any such menace. Nevertheless, proceeding on the hypothesis of the existence of concentration of power, the NDC endorsed the view that the one effective remedy in the short run was for the public sector to enter the field of large-scale and heavy industries more vigorously than it was doing. In the sphere of heavy industry, the pride of place in new expansion goes to the public sector. But if the State is to enter the field of other large-scale industries, the implications which it raises ought to be fully examined. The demands they make on the State in terms of finance, technical and managerial personnel, among others, ought to have received priority consideration in this discussion. But they were conspicuous by their total exclusion.

Further it was argued that there should be a wide diffusion of industrial licensing with a deliberate bias for issue of licences to new entrepreneurs. This question has been discussed thread-bare by the Estimate Committee in its report on the Development Wing of the Commerce and Industry Ministry. But the final conclusion to which it was driven on this question of diffusion was that, in the event of sufficient new entrepreneurs failing to come forward, new entrepreneurs should be granted to the existing entrepreneurs. This is a clear admission that there exist serious doubts in the minds of

those who are making much ado about the concentration of economic power about the feasibility of the proposed diffusion. Encouragement to the co-operative sector and to medium and small-scale industries, as well as a conscious regulatory direction of fiscal policy were other remedies suggested to break the concentration of ownership in industry. These are no novel proposals, but the depressing aspect of this discussion was that not a moment's thought was given to making a general appraisal of the progress of the co-operative, medium and small sectors and their potential capacity to substitute the large-scale sector during the period of the Third Plan without prejudice to the fulfilment of the industrial targets.

Finally came the question of a machinery for vigilance. It is here that the NDC showed itself patently hazy in its reasoning. A special organisation to keep a watch on the trends in the distribution of incomes was recommended, when, in fact, even the Mahalanobis Committee has not yet finished its assignment of an investigation into the recent pattern of income distribution and recorded its findings on it. Mr. Nanda ventilated his grievance that the redistributive function of taxation was proceeding very tardily in spite of the radical changes in the Budget proposals of May 1956. His solution as a corrective remedy was the appointment of yet another taxation enquiry commission. This abiding faith in a succession of commissions of enquiry cannot fail to convey the unmistakable inference of a search for escapism.

The faith of the NDC in setting up a special machinery of vigilance was exhibited again during the course of the discussion on the efficient and expeditious execution of the schemes in the Plan according to schedule. Special functions were proposed to be assigned to the Planning Commission to keep a continuous watch on the proper execution of the programmes in the Plan. The NDC proceeded a step ahead and recorded its decision that Mr. Nanda, as Minister for Planning, should undertake quarterly rounds of visits to the State capitals for discussions with the Cabinets on the execution of the State programmes. All the previous elaborate schemes of drawing up annual plans for the States and scrutinizing their implementation according to schedule were conveniently forgotten. No one paused to ask why it was that the progress reports on the Plan, at least from year to year, could not be prepared according to the earlier firm decisions.

A substantial amount of Rs. 4,100 crores worth of investment in the private sector of the economy has been envisaged in the Third Plan period. The least that was expected in the final discussion on the Draft Plan was that a definite scheme should be approved to assist the private sector in obtaining the necessary aids to raise

these resources, since its own efforts must perforce be supplemented by co-operation from the State. But, this strategic aspect of development was totally ignored. On the contrary, in the course of the discussion on raising resources for the public sector outlay, a novel suggestion was made which ran directly counter to the legitimate interests of the private sector. The proposal emanated from the Finance Minister of Madras that deposits of commercial banks should be diverted in a significant measure to financing industries in the public sector.

The direct consequences of such a policy of damaging diversion were not analysed even superficially. The fact has obviously escaped the notice of the NDC that the contraction of bank credit available to private parties, which would inevitably result from the diversion of bank deposits to the State sector, would react sharply on bank deposits. If entrepreneurs in the private sector could not hope to get adequate accommodation from the banks, what inducement would there be for them to deposit their funds with the banks, unless it be that they would be motivated by a new philosophy of obliging the State sector? The one most injurious result of such diversion would

The Consortium's Courageous Lead

THE consortium of the six creditor nations has given a courageous lead to this country in launching the Third Five-Year Plan with a full faith in its destiny. External assistance constitutes a strategic part of the scheme of resources for the Plan and until recently there existed considerable uncertainty about it. The Draft Third Plan gives ample evidence of the halting attitude of the Planning Commission in prescribing a firm order of priorities in the programmes primarily on account of this uncertainty. It is now being removed and there is the assurance that India can look forward to obtaining the external aid she requires in a full measure. This undoubtedly is a happy augury for launching the Plan.

The consortium's decision to provide liberal assistance constitutes a vote of confidence in India's rational approach to planning and her capacity to execute the planned programmes with speed and efficiency. Planning has caught the imagination of the people in this country and there is distinct evidence that they have become intensely plan-conscious. This is one of the main motive forces behind the marked momentum which economic development has gained in this country. The members of the consortium made the preliminary decision that it was of the utmost importance not only to sustain this momentum but to carry it to a higher pitch in consonance with the demand for a high rate of economic growth. This view has been strengthened by its conclusion that the Third Plan programmes have been drawn up with care and the size of the Plan is in no sense ambitious. But in any developing country there can be no escape from supplementing the internal resources by external aid. The precondition of supply of external assistance is the capacity and readiness of the country to raise its own resources. The consortium is convinced that India will satisfy this test.

The impressive change in the attitude of the consortium has been brought about primarily by President Kennedy and Mr. Eugene Black. The President of the World Bank has always played a vigorous role in urging the members of the Aid India Club to step forward with timely and ade-

quate offers of assistance. But aid on the scale which is now promised was possible mainly because of the liberal philosophy of foreign assistance which the Kennedy administration has declared as an article of faith with it. It was the initiative taken by President Kennedy that was responsible for persuading the other members of the consortium to take a liberal view of India's requirements and to provide for them.

Although the outlay on the public sector has been held at Rs. 7,500 crores, the same figure as was approved by the NDC at its meeting in January last, the untenable anomaly of maintaining a dual target for the Plan—the financial and the physical—was not eliminated. A Micawberish faith was displayed and expression was given to the optimism that resources could be raised to the full extent of Rs. 8,000 crores to fulfil the physical target and even more—to the tune of Rs. 8,300 crores. The only fitting reply to this school of advocacy of higher resources, led by the Chief Ministers, was the one given by Mr. Morarji Desai, who posed a simple question to them why they did not seize the opportunity of the first budget in the Third Five-Year Plan to levy additional taxation. In fact, the major redeeming feature of the session of the NDC was the dogged determination of Mr. Desai to stand up against any indulgence in wishful thinking passing under the convenient concept of optimism.

quate offers of assistance. But aid on the scale which is now promised was possible mainly because of the liberal philosophy of foreign assistance which the Kennedy administration has declared as an article of faith with it. It was the initiative taken by President Kennedy that was responsible for persuading the other members of the consortium to take a liberal view of India's requirements and to provide for them.

Total aid of the order of \$2,225 million has been announced for the first two years of the Third Plan. But simultaneously with it, West Germany has announced her decision to defer the Rourkela credit of \$61 million whose payment falls due in the third year of the Plan. If this amount is also included in the aid that is announced, the aggregate quantum comes to \$2,286 million. The biggest contribution, of course, is being offered by the USA to the tune of \$1,045 million. Next in order are West Germany—\$364 million, the United Kingdom—\$250 million, Japan—\$80 million, Canada—\$56 million and France, the latest entrant in the consortium—\$30 million. It is a noteworthy feature of this credit that the IBRD and IDA are participating in the joint venture and, between them, they would contribute \$400 million.

The combined contribution of the members of the consortium other than America falls short of parity with America's contribution by \$265 million or nearly 25 per cent. But there could be no rigidity about parity. It is well to remember the factors responsible for the size of the contributions of individual countries now announced—Germany's pre-occupation with the general elections and the UK's obligation to provide assistance to the new emerging sovereign States which were formerly her colonies. The amount of aid has been divided in the proportions of \$1,295 million for 1961-62 and \$930 million for 1962-63. This allocation fits broadly with our programme of outlay. It is well to remember that the problem of our overall payments in the second year may prove more apparent than real, if factors like aid from other countries, notably Russia, are taken into account. But this is not enough. To reduce the possible strains on our balance of payments,

it is only legitimate to expect that the friendly creditor countries should reinforce their policy of aid by aid along with trade, implying a substantial step-up in the offtake of India's exports.

The offer of aid on a liberal scale puts us on our mettle. It now remains for us to justify the confidence reposed in us. And to justify it, we need to approach the task of raising the internal

Labour Policy for the Third Plan

THE predicament that Mr. G. L. Nanda faces in his dual capacity as the Deputy Chairman of the Planning Commission and Minister for Labour and Employment, is to a great extent reflected in the labour policy proposed to be followed during the Third Plan period. In the chapter devoted to an explanation of this policy in the final version of the Plan, an attempt has been made to reconcile the conflicting claims of the country's present-day economic situation and the Directive Principles on promotion of labour welfare laid down in the Constitution.

Which considerations have weighed more heavily with the Planning Commission in enunciating this policy, it is not difficult to say. The policy has apparently been guided more by the Directive Principles of the Constitution. A concerted attempt is to be made to provide greater social security to industrial workers. It is proposed to integrate the various provident fund schemes and convert them, as early as possible, into statutory old age, invalidity and survivorship pension-cum-gratuity schemes. The provident fund rate in some industries may be raised to 8-1/3 per cent of the wages. There are also plans to provide assistance to helpless individuals—the physically handicapped, the aged ones, women and children to begin with. Gradually this aid will be extended to other needy workers.

Wage boards are envisaged for the major well-organised industries in which the emoluments of workers have not so far been codified by an expert body. Greater attention is proposed to be paid to such labour welfare activities as provision of houses, prevention of occupational diseases etc. The lot of agricultural labour and of workers employed in the unorganised sector of industry, who have not benefited much from the labour welfare schemes so far, is sought to be improved through various measures. A Bonus Commission has been set up to lay down the principles which should govern the payment of bonus in the major industries. One can find little fault with all this programme theoretically. But how far can the Government go in its implementation in the context of the present-day economic situation is a debatable point.

The labour policy to be realistic for the Third Plan period has obviously to take note of two crucial problems—maintenance of industrial peace and reduction of production costs. It is, indeed, gratifying that these two imperatives have not been wholly overlooked by the Planning Commission in enunciating the policy for the Third Plan. The Planning Commission has appropriately laid great stress on increasing productivity in industry; "the vicious circle of poverty and unemployment and low productivity," it says, "can be broken only by a tremendous stress on the maximum possible contribution being made by all the participants in the processes of production." It has been rightly pointed out to workers that no real advance in their standard of living can be had without a steady increase in

resources and executing the programmes in the Plan with an unswerving attitude of objectivity. If in the preceding article a candid exposure had to be made of the wishful attitudes displayed by some of the participants in the National Development Council's deliberations, it was not in a spirit of carping criticism, but with a view to bringing home the urgency of imbibing this spirit of a realistic approach to the task.

their productivity. The management too has been advised to bring about maximum rationalisation in its own sphere by eliminating unjustifiable practices, which at present act as disincentives in drawing the best out of the workers. The pride of place accorded to rationalisation is a welcome development.

Appreciable improvement in productivity of industrial workers can be effected by imparting to them intensive occupational training. The training programme that has been chalked out for the Third Plan period, despite plans to place the Apprenticeship Training Scheme on compulsory footing, however, does not seem to be commensurate with the growing requirements of trained workers. Training facilities, therefore, have to be made broad-based if any real advance is to be made towards raising of productivity of workers.

To maintain industrial peace during the Third Plan period, it is proposed to make the implementation of the Code of Discipline, which has been in operation in this country since 1958, more effective. The Code has been instrumental in reducing appreciably the time-loss on account of stoppage of work owing to strikes, lockouts and go-slow tactics. Strengthening of the various sanctions for breach of this Code is apparently called for. Side by side with this, there is need to remove apprehensions amongst workers who feel that the Code is weighted against them. A far more important factor that can contribute to fostering of peace in industry, however, is educating of labour to enable it to form an intelligent view of its real stake in a trade dispute. The notice of strike from June 15 issued by the dock workers of Bombay is a case in point. Hardly any one among the rank and file has a real appreciation of which of the different scales of pay and allowances suggested by different committees in the recent past are in labour's interest. Proper education will enable labour to exercise correct judgment when ballots are taken on launching of strikes.

The impressive programme drawn up by the Government for workers' education can also be quite helpful in eliminating in progressive stages the outside leadership. Greater emphasis, of course, needs to be placed in this programme on making workers understand their responsibilities along with their privileges. The scheme of workers' participation in management has to be implemented at a slow pace to be dictated by the progress that is achieved in the sphere of workers' education and in fostering mutual trust between the management and labour.

The success of the labour policy proposed to be followed during the Third Plan period, in the ultimate analysis, depends largely on how far the Government is successful in containing the expanding price spiral. Any undue rise in prices will lead to claims for upward revision of wages which cannot be resisted when the value of the pay-package is being undermined.

THE WEEK'S NOTES

Assam

THE LANGUAGE COMPROMISE FORMULA

THE LANGUAGE compromise formula, which has been announced formally by Assam's Chief Minister, Mr. Chaliha, should put an end to a painful and unhappy episode. This formula is as much a triumph for the spirit of accommodation shown by the Government of Assam and the Assam P.C.C. as it undoubtedly is for Mr. Lal Bahadur Shastri's qualities of sweet reasonableness and persuasiveness. Having carried the dispute to an extreme pitch, it was very difficult—and politically embarrassing—for the Assam Cabinet and the State Congress Party to modify their position. But they have taken courage in both hands and shown the readiness to incur popular displeasure in the Brahmaputra valley in the immediate run.

The greatest stumbling block was the conversion of the advocates of Assamese as the sole official language throughout Assam to agree to the amendment of the Assam Official Language Act. Nothing short of the amendment to the section in the Act, conferring on the Mahakuma Parishad in Cachar the right to opt for Assamese as the language of the Cachar District, could have paved the way for the settlement. In terms of the Shastri formula this provision will be deleted and Bengali will receive secure recognition as the official language of the Cachar District. It is also agreed that in so far as the communications between the Cachar and the hill districts, on the one hand, and the State headquarters, on the other, are concerned, they will be conducted in English until it is replaced by Hindi. At the apex, English would be used exclusively, but subsequently it would continue along with Assamese. This is a great improvement on the original position taken by the Assam Government.

Two representatives of the Bengali speaking population, Mr. Baidyanath Mukherjee, a former Minister, and Mr. Moinul Huq Choudhury, Minister for Agriculture, were present at the meeting of the Cabinet convened to take a decision on the Shastri formula and they have signified their assent to it. The Sangram Parishad would now do well to accept the reasoning put forward by Dr. B. C. Roy in favour of giving unreserved support for working out the formula. The Parishad's demand for making Bengali an official language throughout the State, including the Brahmaputra valley, where it lacks popular support, now loses force and ought to be given up. The Chief Minister of Bengal has given the right counsel in stating that in matters such as this a compromise ought to be struck in the interest of maximum agreement. It remains for the Sangram Parishad to withdraw its agitation and now is the time to act with grace. But the greatest responsibility rests on the State Government to keep unremitting vigilance to ensure that its officials at the lower level carry out its directives about the language policy and safeguards for linguistic minorities in the spirit of reconciliation which inspires the Government's changed attitude.

The Press

THE ISSUE OF FREEDOM

AT THE 10th General Assembly of the International Press Institute held at Tel-Aviv, between May 30 and June 1, one of the basic questions which was debated at length was whether the Press in the developing countries should surrender its right to freedom, if

political conditions were not conducive to its independent growth. Discussion on this problem assumed a pointed edge because of the sharp cleavage among the editors of the Indonesian newspapers which was caused primarily by the 19-point undertaking demanded by the Government of Indonesia from all its editors as a condition for permission to continue publication. The Editor of "Pedoman", Mr. Rosihan Anwar, signed the declaration in the hope that he could, by this technique, keep "the flickering flame of democratic aspirations alive in the face of governmental pressure". Another courageous journalist, Mr. Muchtan Lubis, a former editor of "Indonesia Raya" and a former Chairman of the National Committee of the IPI, had refused to compromise on this issue of principle and had been constrained not only to suspend the publication of his paper but to remain under house arrest for more than four years. It may be stated that the IPI decided to suspend Mr. Rosihan Anwar as a member; but before this decision reached Mr. Anwar, the Government of Indonesia had banned the publication of his paper "Pedoman".

The concensus of opinion at the Conference was that, while all efforts should be made to uphold the principle of free journalism—in terms of the freedom of the Press, "understanding amongst journalists, free exchange and flow of news etc."—under certain circumstances the battle of the freedom of the Press could be fought better by yielding on certain points on a limited scale as a matter of expediency. The doctrine, "give me my liberty, or give me death", is too abstract for practice for nurturing the growth of a free Press in countries where the full conditions of democratic freedom are not present. Another pertinent observation was made by one of the delegates that the IPI had failed to take any action in cases where all the papers in a country partly signed off the liberty of the Press. This fact alone had given the impression that in countries where the principle of a free Press did not find acceptance with their Governments, accommodation was a preferable alternative to effacement in the hope of reviving the struggle for freedom at an appropriate time.

Port Labour

THE THREAT OF STRIKE

THE BOMBAY TRANSPORT and Dock Workers' Union has issued a notice of strike from June 15. The Union is totally in the wrong in jumping to the remedy of last resort without even taking a strike ballot, not to speak of exhausting every other remedy to settle the dispute. It cannot be permitted to take action in such a light-hearted manner—action which will result in paralysing traffic in this major port. The Union's attitude is a reflection on its leadership's sense of responsibility and also on its maturity of understanding. If a show-down is forced, the Government has indicated its determination to meet the challenge. The Union would make a serious miscalculation if it would count on public support or sympathy in this situation.

This is not to say that it has no grievances or that its grievances are trifling. They do exist. In fact the whole issue of the pay scales and allowances of dock and port labour at the three major ports of Calcutta, Bombay and Madras has been handled clumsily. Responsibility for this attitude rests squarely on the Government which has chosen to tackle the question piecemeal and to adopt ad hoc decisions. The Chaudhuri Committee, appointed at the close of 1956, was

restricted in its assignment to selected posts and categories of labour. Then arose the serious crisis of a general strike at the major ports which was averted by the intervention of the Prime Minister. As part of the understanding reached with him, the Jeejeebhoy Committee was appointed late in 1958 to go into the entire complex and diversified classification of port labour and to rationalise the pay-scales and other emoluments with reference to the categories. A year after this Committee's appointment, in December 1959, was published the report of the Second Pay Commission, some of whose recommendations had application only to a few posts comparable with posts under the Central Government. Evidently, it was necessary to await the publication of the Jeejeebhoy Committee's report for a comprehensive settlement.

The Government, however, cannot escape the charge that it does not act with a sense of urgency in its dealings with this class of labour unless prodded to do so. The Jeejeebhoy Committee's report which was likely to be published next month is being released in haste now. Two merits of this report are that it is unanimous and its recommendations are applied retrospectively from October 1, 1957. Labour must now give up its war-like posture and hold its soul in patience during the inevitable time-lag.

Uttar Pradesh

EXPANSION OF THE CABINET

AFTER THE inordinate and inexplicable delay over the reconstitution of the PCC in Uttar Pradesh, it was expected that whatever differences had been responsible for the delay had been ironed out and the ground was cleared for establishing smooth relations between the organisational wing and the ministerial wing of the State Congress Party. Mr. A. P. Jain, the new President of the UPPCC, issued sanguinary statements and even took the Press into confidence by disclosing that Mr. Nehru intended to take greater interest in the affairs of the UPPCC. This was welcome news as the State Congress, torn by internal dissensions, required a healing touch and a supreme effort on the part of the state leadership to subordinate sectional interests to the larger interests of the party.

But it would appear that the accord which has been brought about is not without mental reservations. There has been an unhappy display of divergence between the Congress Chief and the Chief Minister on the expansion of the UP Cabinet. Mr. A. P. Jain told the Press on June 4 at Kanpur that six cabinet ministers were too few to cope with the administrative problems of such a big and thickly populated State as Uttar Pradesh and he undoubtedly favoured an expansion of the Cabinet. What he stated was an obvious fact. But this statement evidently provoked Mr. C. B. Gupta, the Chief Minister, who, immediately the next day, contradicted Mr. Jain. Technically Mr. Gupta is justified in maintaining that under the circumstances he, as the Chief Minister, is the right person who would take a decision on the expansion of the Cabinet. But it is no secret that a convention has been set up in the Congress Party to abide, in the matter of formation of Cabinets, by the directives of the High Command, which is scrupulous in ensuring that harmony is maintained between the two wings of the Party. It is idle to pretend that the Chief Minister exercises his abstract right to the exclusion of the views of the PCC Chief. It is apparent that Mr. Jain had in mind effective ministerial control of the administration and there was nothing exceptionable in what he pressed for. But Mr. Gupta's tone in his retort leaves no doubt that he resented Mr. Jain's statement,—“after all the question

is to be decided by me alone.” It is significant that on the previous day Mr. Jain declined to disclose whether he was consulted on this question by the Chief Minister. His reluctance to clarify this point indicates that differences have emerged between the two so soon after Mr. Jain's assumption of office. It is an unhappy development. The differences ought to be composed and the Cabinet expanded without avoidable delay.

National Integration

CHIEF MINISTERS' CONFERENCE

THE OFFICIAL communique issued after the Conference of the Chief Ministers, held on May 31 and June 1, makes a forthright admission that the question of tackling the problem of communal harmony was engaging the attention of the Government since independence; but although it was taken up in 1948 and again in 1955, it was not pursued at the official level with the zeal that it called for. It would appear that a false sense of complacency was responsible for this lack of sustained interest. Little purpose can be served by crying over the spilt milk. But there can be no doubt that as a result of the recent rude shocks which this complacency has received, the authorities are seized of this problem with a full sense of its gravity. The Chief Ministers' Conference, convened by the Prime Minister, was a belated measure because the A-ICC had already taken its decisions on the recommendations contained in the report of the Committee on National Integration.

Nevertheless, this conference was useful for thrashing out measures which need to be taken at the administrative level. Appropriate amendments to the Penal Code, the Criminal Procedure Code and the Representation of the People Act are to be made as they will operate as essential deterrents. The problem of creating communal harmony for national integration is essentially a psychological problem of a change in outlook. From this view-point, much depends upon the attitudes which are inculcated by the officers, particularly at the higher level in the districts, who have to tackle on the spot problems involving communal grievances, differences of disturbances. The Committee on National Integration has urged that the right type of personnel should be recruited and care should be taken to ascertain that they bring a national outlook to bear upon the handling of communal issues. It is certainly difficult to assess intangibles such as this. The best course is to incorporate, as part of the training of probationers, necessary courses of instruction to inculcate the true national spirit. This has been agreed upon. The Prime Minister has pointed out in a subsequent communication, addressed to the Chief Ministers, that the National Academy at Mussoorie for the training of probationers for the Central Services, has prescribed the “foundational course” for the trainees to inculcate the national spirit and outlook. A similar course of training is urged by him in the case of the administrative personnel recruited by the State Governments. Another important point which has emerged from the deliberations at the Chief Ministers' Conference was the criterion to be applied in determining the backwardness of any sections of the community. It was heartening that the approach is to be radically changed. Economic backwardness is recommended as the main criterion for giving special facilities for uplift whether for entrance to educational and technical training institutions or government jobs. Reservation of government posts for backward communities or classes is to be confined preferably to the medium and lower cadres of service as a transitional safeguard.

*The World Abroad***BRITISH SOCIALISTS ON NATIONALISATION**

By

ODYSSEUS

WHAT DO BRITISH SOCIALISTS think about nationalisation today? Not least of the services rendered by Professor W. A. Robson's authoritative defence in "Nationalisation and Public Ownership" (Allen & Unwin) is to provide an up to date symposium of Socialist views.

Professor Robson quotes Mr. Gaitskell as stating that "the most vital question is how far greater social and economic equality can be achieved without more nationalisation and public ownership." He notes that Mr. C.A.R. Crosland says that, except for water, there are no more public utilities worth nationalising and, except for steel, no more which are basic, like coal. If size is the criterion, Mr. Crosland says that shipbuilding, motors, chemicals, aircraft, radio and electrical equipment would be indicated, but adds that these industries are neither monopolies nor inefficient. Nationalisation may improve the structure of such industries as electricity distribution and coal mining, but the weaknesses of the motor industry are in such spheres as design and marketing which are unlikely to be cured by nationalisation. Nor does Mr. Crosland believe that industries working for highly competitive markets at home and abroad will prosper under a centralised corporation. He asserts that Socialism's aim, to substitute common interests for those of class, will not be advanced by setting up more public corporations. Professor Robson records that there has been widespread Labour rejection of further nationalisation of whole industries on the 1945-51 model, with the exception of steel and road haulage, "for these are existing commitments which it is difficult for the Labour party to disavow without making a confession of past error."

In 1957, the Labour party's pamphlet "Industry and Society" drew attention to some 500 large firms, responsible for about half total private investment. They recommended that the path to equality lies in acquisition by the state of shares in these large companies which would enable the community to share in the capital gains which accrue "almost automatically" to shareholders, while leaving the companies under their present managements.

Professor Robson himself advances cogent arguments against this recommendation. There are, for example, possible conflicts of interest. Did the government do all that it could to make the activities of the former Anglo-Iranian Petroleum Co. acceptable to Iranian nationalism, or were they inhibited by a wish to obtain maximum profit from their shareholding? Then, since an equity shareholder does not realise a capital gain unless he sells, the state will have to buy and sell shares on the Stock Exchange if it is to make capital gains. This would lay the state open to constant suspicion that its share operations had been influenced by foreknowledge of cabinet decisions. If the government had, for example, a plan for road construction, its mere announcement might increase the prices of shares of companies supplying roadmaking materials. What would be easier than for the government to buy before, and sell after, the announcement? Again, the main attraction of equities is often capital appreciation. If this were substantially reduced by the capital gains tax, as recommended by "Industry and Society", the government might find few buyers. Professor Robson shrewdly says that the Labour party's proposal to obtain revenue from shares instead of by taxation is the method of the USSR where most revenue is obtained by trading

and manufacturing trusts owned by the state. Prices are fixed so as to yield whatever sums the state decides that it needs to spend. The result is concealed indirect taxation. What would happen in the UK if the state owned large blocks of equities? The government would influence companies to fix prices to maximise profits and, in time, would give them a privileged position to prevent them from being undersold by competitors. There would be far less parliamentary control, and public understanding, of concealed indirect taxation than exists now with the present recognisable taxes.

But there are still many Socialists who believe that the Labour party's ultimate aim should be to eliminate private enterprise. Mr. J. Dugdale M.P. wrote in 1957 that even at the then level of taxation some large firms were already transferring their headquarters abroad. If taxation, and its avoidance, were tightened, the move to quit England might become a stampede. Many people reckon that, with an expense account and capital gains, hard work is worth while. What if both were taken from them? Mr. Dugdale doubts that entrepreneurs will develop production without the expected rewards. To combine a high degree of public control and of taxation would end in disaster. Private enterprise cannot be "milked" indefinitely to pay for Welfare. He concludes that nationalisation is the only way in which industry can be run for the community.

Professor Robson criticises Mr. Dugdale's view that nationalisation will avoid difficulties in the private sector under a Labour government, and asks if they are not likely to occur also in the public sector. Are the directors, managers, and high level technicians, needed in public corporations no less than in private, indifferent to financial incentives and oppressive taxation? The 1957 Labour party pamphlet "Public Enterprise" asserted that the salaries paid to the executives of public corporations should not be less than those paid by private enterprise. It would, says Professor Robson, be rash to assume that men with administrative abilities and technical knowledge, in worldwide demand today, will be ready to work nationalised industries if taxes are driving business men abroad. "In its policy statement on Equality, the Labour party has already expressed concern at the emigration of scientific and technical personnel. The Labour party will have to face up to these disagreeable questions sooner or later; and the sooner the better," he adds.

Professor Robson offers six points by which to decide whether to nationalise or not:

1. Where an industry or a firm is working successfully, there is no point in nationalising merely because of its size. Only if an official enquiry shows that it is abusing a monopolistic position should it be nationalised. To which I reply that there are many ways of dealing with a monopoly other than to throw it to the electoral wolves in the public arena.

2. Industries or firms operating abroad, or exporting, might meet sales resistance on political grounds in several countries if nationalised.

3. If the state takes over an industry suffering from bad management, or technological backwardness, or inadequate investment, the state will find it difficult to halt the momentum of decline.

4. The best results have been in industries which have come under public control early in their existence like the airlines and atomic power. Public enterprise

does better in new and expanding than in old and contracting industries. (So does private enterprise!).

5. It is a mistake to identify nationalisation with giant, monopolistic industries. The optimum size for the unit in each industry should be ascertained and competition encouraged between separate undertakings within nationalised industries, or between public and private enterprise in the same industry. Professor Robson seems unaware that where, as in India, public and private enterprise is in competition, the state is suspected of stacking the cards in favour of its own.

6. Although it was right to nationalise coal, gas, electricity, railways, road haulage and the air lines, in future it would be better to take over individual firms or set up a new undertaking rather than a whole industry.

Professor Robson criticises the Labour party's commitment to nationalise any firm which is "failing the nation", because this will saddle the state with inefficient, contracting, or stagnant industries. How right he is! Why interfere with the natural economic process of liquidation that paves the way to change and growth?

Professor Robson castigates the private management of the U.K. coal mines, which, he says, left the National Coal Board with a heritage of bad management and under investment. He does not mention that a "momentum of decline" had spread over most of UK industry in the depression, that the coal industry's fortunes depend on the general level of prosperity; that coal, in particular, was hit by three other world developments beyond the control of the ablest management: (1) the opening of many new mines in Europe and Asia, (2) growing economy in fuel utilisation, (3) the substitution of competitive fuels for coal, as in the oil-fired ship: in 1914 96.6 per cent of the world's mercantile

marine was coal-fired; by 1932 it had fallen to 60 per cent and by 1939 to 54 per cent. This "badly managed" industry produced in those years an average of 236 million tons a year, yielding an average surplus for export of 60 million tons. The nationalised industry has averaged 215 million tons, and despite the investment of £1,276 million between 1947-65 is expected to attain only 233 million tons in 1965, i.e., 3 millions less than the pre-war average. What is more, until the recession of 1957, the UK had to import coal to meet her needs. That pre-war investment was inadequate is true, but it is difficult to raise money in a long depression, and investment lagged in most industries. It is also likely that management was poor in many firms after the UK introduced protection to cushion them from competition.

The UK's postwar recovery has been partly due to the avoidance of depression by adopting Keynes's theories and partly to world expansion. That her growth has been slower than elsewhere may be blamed, inter alia, on the inept policies of the nationalised industries (especially the distortions of consumer demand, and of investment, by under pricing), on inequitably allotted taxation, and on lack of enterprise caused by persistence in high protection. If private enterprise had continued in coal, bankruptcy would have closed uneconomic pits and forced amalgamations on others, and the industry would have made the enormous profits which Professor Robson says that the National Coal Board could have made if it had pursued a purely commercial policy. Such profits would have attracted the investment needed. Anyone who has read PEP's Report, "Growth in the UK Economy", must conclude that a substantial part of the £6,827 million invested in all the nationalised industries between 1948-58 was allocated uneconomically and used wastefully.

ECONOMIC PLANNING IN WEST EUROPE

From Our Special West European Correspondent

PARIS, June 2.

THE scope for economic planning in an industrialised democracy has lately become a subject of discussion in West Europe to a degree unknown since the end of the war. The fact is notable because all the countries of this region are under liberal governments—liberal in the narrower economic sense, most of them being Catholic-conservative regimes whose orthodox neo-capitalist policies have served them well in recent years and whose natural instincts are opposed to the dragooning, State initiative and technocracy that planning suggests. Obviously, it is not Leninist planning that interests them, nor even the sort of five-year planning to which most developing countries believe they are obliged by the immensity of their task and the absence of adequate private enterprise. Rather, what they mean by planning is the "concerted economy", which, in a fashionable pun, is compared with a concert given by unconstrained instrumentalists who have agreed beforehand on the tempo at which the piece will be played and have their eyes on a conductor—it being understood that the conductor can only use his baton to invite sections of the orchestra to perform, and never a long whip.

This harmonisation of efforts may appear absurdly inadequate to the doctrinaires of development by dictatorship, but it is quite properly called planning because the fundamental operation is the same: the preparation of a national input-output table for the medium-term future, along the lines of the 'tableau economique' invented by Louis XV's personal physician, Quesnay. (An achievement that Marx noted, incidentally, as one of the great events in the history of economics.) Although the question was long obscured by ideological dispute between liberals and socialists, there is nothing in the bare notion of such a forward-looking table to say who shall decide what production figures for a future date will be written into it (whether a dictator, a college of planners or a parliament of free men), not to say what means shall be used to see that actual practice conforms roughly to its forecasts (whether brute force, monetary incentive or enlightened self-interest plus a measure of induced enthusiasm). So there is room for all sorts of planning that still deserve the name, from the most rigid to the most democratic. And we must add, remembering some of the Himalayan blunders committed by Communist planners, that the loosest and most liberal is not necessarily the least efficacious in the long run—it can hit more of its own targets. A digression that would take too long to develop but which should be noted in passing is that modern electronic computers have changed the face of the problem since the classic debate half a century ago about Pareto's "ministry of production".

Renewed interest in these issues is natural in France because the Fourth Four-Year Plan is currently being written and will be presented in October. "Odysseus" reported here on May 12 the discussions in London about French planning methods, which have inspired a "model of the British economy in 10 years' time" (what I have called an economic table for the future) prepared by the Cambridge Institute of Applied Economics. If this latter were adopted it would constitute Britain's 10-year plan, and articles in 'The Guardian' (May 4) and 'The Observer' (April 30) show that a section of opinion is in favour of such a plan as a

means of quickening the UK's relatively slow expansion. The need for an "indicative programme" (in contrast to an imperative programme) has also been agitated in recent months in Italy, while there is a movement in support of a Common Market Plan for the whole six-nation region.

While this discussion was going on, a speech by President de Gaulle seemed to foreshadow an important change in planning methods in the very country where "forward programming" is practised (on the admission of the Russians) most scientifically. As compensation for the loss of her last colonial distraction in Algeria, and as reward for the support the working class gave the regime when threatened by rebellious generals, the President offered France a more ambitious and more "popular" plan. The targets would be set higher; there would be more of them, the plan taking cognisance of social needs like housing as well as industrial objectives; the setting of targets would entail more consultation with trade unions and other popular movements; and the fulfilment of targets would become a matter of "ardent obligation for all". None of the first three points involves a revolution, but the last appeared to.

The fulfilment of targets is now not a matter of obligation. It relies on four factors, all of them perfectly liberal. Firstly, the people asked to reach certain targets are just the people who set them, since the plan is drawn up by a sort of parliament of officials, employers and workers. Secondly, the plan is coherent which means that it prefigures an economy where supply and demand for each factor and commodity are in equilibrium, so that it is in each producer's interest to turn out the goods expected of him because he knows he will be able to sell them. Thirdly, the State, thanks to its normal administrative work, to its nationalised industries and to its role in financing housing, controls about 50 per cent of national investments and thus has the key to stimulating or slowing down the economy so that targets are met. Finally, the government has a whole arsenal of incentives—credits, tax exemptions, depreciation facilities, etc.—to encourage just the industries whose target-hitting is most important.

If President de Gaulle were projecting to introduce into this liberal framework the notion of obligation, French national planning would take a turn toward a form so far unknown in Western Europe. Of course, one must beware of the superficial reactions ("epidermic" reactions, the French say) of the classic liberals, who rebel at the very mention of "obligation" in economic life. Our democracies are riddled with obligations, there are numerous things people and firms are forced by law to do; there is an infinite number of stages between free programming and dictatorial planning; so to introduce a few compulsory targets into a plan that has been democratically and rationally written would not be the end of the world, nor the end of democracy.

The President himself has not explained what he meant, but official exegetes have explained it all away. The apposition of "ardent" and "obligation" shows, they say, that he meant an interior psychological force rather than an external constraint. That is, every means would be used to bring people to want to fulfil plan targets. To the extent that this was not sufficient,

the government would use more freely its battery of incentives and disincentives; the only compulsion would be aimed at the government's own departments, whose remissness in fulfilling plan targets has caused some disappointment in the recent past. Lastly, it was hinted that in a few industries, of no great size but of crucial strategic importance for the operation of the plan, some measure of compulsion (starting out with pretty definite recommendations) might be invoked to ensure the meeting of planned obligations. On the whole then French planning is not due for any notable revolution and can remain a model for democracies willing to take a programmatic view of their near future.

The real problem for the advanced democracies who are becoming more interested in economic planning is not the bugbear of obligation, but the relation between parliaments and planning commissions. Addressing the British Houses of Parliament in April last year, President de Gaulle said that the question of the day for West European countries was "how to reconcile human nature, which aspires to freedom, with development, which demands efficiency". Indeed, it is true that Europeans today demand efficiency more than any of their predecessors, efficiency in every department of their affairs and above all in the management of their national economies; and yet at the same time they have not abated their demand for liberty. Parliaments have traditionally been taken as the symbols of this latter demand, and now planning commissions are coming more and more to be seen as the guarantees of effi-

ciency. Yet there is, not a contradiction, but a measure of opposition between the working of these two institutions—even when, as in France today, the planners are not a self-appointed coterie of know-alls like a Communist dictatorship, but several thousand honorary workers and employers co-operating with a small staff of official experts in prevision.

To the extent that a nation is preoccupied with its economic development (and that is by far the greatest concern of Europeans today) and to the degree that development is governed by collaboration between planners and free enterprise, the nation's parliament is being dispossessed of its traditional role. This is not necessarily illiberal; discounting the mystique of the ballot box, a few thousand trade unionists, consumers' representatives and employers can be just as much an expression of the people's wishes as a few hundred deputies subservient to a party caucus. But it certainly represents a break with the parliamentary tradition. Without being malicious, one may see in this precisely the reason for President de Gaulle's interest in planning: it is yet another expression of his anti-parliamentarism, of his distaste for political parties. However, the question is larger than the foibles of one man. The problem of the relation between parliament and planning commission, between law and targets, is one that is going to confront all the advanced countries of West Europe as they turn more to democratic national planning as the best guarantee of their economic progress.

Economic Report from the U.S.**FOREIGN AID PROGRAMME**

By GUY SIMS FITCH

WASHINGTON, May 30.

WHEN Congress open its hearing next week on the annual foreign aid requests of the President, it will be considering a programme that is far different from those it has approved in past years. As he had indicated earlier, President Kennedy this year has recommended a programme that calls for dramatic and welcome changes in the organization, concept and operation of the U.S. foreign aid effort. It also involves expenditures that exceed by a goodly amount those estimated a few months ago. The purpose of this revamped aid effort, in the words of President Kennedy's special message to Congress, is to help the United States meet "the challenges and responsibilities" of the 1960's.

As it now shapes up, the foreign aid programme calls for outlays during the 1962 fiscal year, which begins this July 1, of \$4,500 million. This is about \$500 million above earlier estimates, with most of the increase going into economic aid. The totals proposed are \$2600 million for economic and \$1,900 million for military assistance. At least as important as the increased dollar totals, however, is the shift in operating procedure which would put development lending on a long term basis. In essence, the Kennedy Administration proposes to borrow for this purpose some \$7,300 million from the U.S. Treasury over the next five years, starting with \$900 million for fiscal 1962 and up to \$1,600 million in each of the following four years. This would have the great advantage of allowing the United States to commit development assistance funds to match the long-term development programmes of the recipient countries. It would be especially valuable to those development projects, such as power plants; transportation facilities and industrial installations, which often require a period of years to complete, from the planning through the operational stages. In the past, the normal year to year appropriations procedure has tended to complicate this aspect of the U.S. assistance task. But Congress tends to guard its annual appropriations prerogative rather closely, and it remains to be seen how much support the Administration will be able to muster for this basic reform. In addition to this change, the President also has called for a complete reorganization of the U.S. aid machinery. This involves overhauling existing U.S. aid agencies and rearranging their functions under a new central body—the Agency for International Development (A.I.D.)

With the exception of the Export-Import Bank, the Food for Peace Programme, the Peace Corps and

a few other scattered functions, A.I.D. would absorb the major agencies, such as the Development Loan Fund and the International Co-operation Administration, under one administrator. Reporting to them would be four regional administrators, serving the Far East, the Middle East, Africa and Latin America. The new set-up would make it possible to channel aid of various types—development loans, grants, technical assistance, etc. — to the places and projects where they are needed most. In this way, it would contribute to integrated national and regional development plans and thus enhance the effectiveness of U.S. assistance efforts. A.I.D., in turn, would become one of the key component agencies reporting to the U.S. Department of State, thereby ensuring its effective co-ordination with overall U.S. foreign economic policy. It is interesting to note, in this regard, that the military aid budget also would remain under the control of the State Department, although it would be administered by U.S. Defence Department authorities.

Another significant advance sought by the President is the revamping of existing incentive for channelling U.S. private investment into capital short lands, where it, too, would be able to contribute more effectively to development programmes. Basically, this involves U.S. government guarantees against loss through political upheavals, which is now available to a relatively limited degree, and against normal business losses on high-risk equity investment, which heretofore has not been available under the government's guaranty programme. In addition, in further effort to funnel capital where it is most needed, the President's proposals would provide for direct loans to private companies investing in developing lands. It is an old truism, one basically in keeping with the U.S. Constitution, that in money matters the President proposes and the Congress disposes. Hence, Congress must now approve of the President's recommendations in principle, and then must make the necessary funds available to put them into effect. Close examination of the President's new aid programme has led many experts to the conclusion that it is a carefully devised and, potentially, a highly effective instrument of U.S. foreign economic policy and international co-operation. From available reports, it appears that a number of influential members of Congress share this view. Administration officials can now be expected to use all their powers of persuasion to make sure that a majority of both Houses of Congress—the Senate and the House of Representatives—hold or come around to this same view.

WORLDGRAM

India

India's Foreign Trade in Merchandise in April 1961: The provisional figures of India's foreign trade in merchandise by all routes, sea, air and land, on private and Government accounts during April, 1961, according to information available in the Department of Commercial Intelligence and Statistics, Calcutta, are given below:-

Exports	Rs. 53.36 lakhs
Re-exports	Rs. 48 lakhs
Imports	Rs. 85.90 lakhs
Balance of Trade	Rs. 32.06 lakhs

Trade with Tibet, Bhutan and Sikkim, and the trade arising in the Andaman and Nicobar and the Laccadive, Minicoy and Amindivi Islands is not included. In the case of Nepal, airborne trade alone is covered. The value of certain consignments of private merchandise under reference to the customs for verification and of Government stores awaiting adjustment is also excluded.

Table below brings together the provisional figures for April, 1961, along with similar figures for March, 1961, April, 1960 and the revised figures for April, 1960:

INDIA'S FOREIGN TRADE DURING APRIL, 1961, MARCH, 1961 AND APRIL, 1960

(In lakhs of rupees)

Foreign trade in merchandise	For the month of			
	April, 1961		April, 1960	
	April, 1961	March, 1961	Provisional	Revised
Exports	53.36	56.96	48.12	46.20
Re-exports	43	40	46	43
Imports	85.90	81.38	82.00	98.82
Balance of trade in merchandise	-32.06	-24.02	-33.42	-53.19

Industrialisation of Jammu & Kashmir: The first meeting of the Industries Development Board of the Jammu & Kashmir Government to consider industrialisation of Jammu and Kashmir was held in New Delhi on the 29th May, 1961. At the first meeting of the Board, general discussion was held on various steps to be taken for the purpose of speeding up the industrialisation of the State and for the creation of a suitable climate for attracting potential entrepreneurs to make investments and contribute to the growth of industries in Jammu and Kashmir. Methods were discussed for simplifying procedures governing issue of approvals facilitating quick decisions for establishment of industries. Among the more important schemes considered at this meeting were — setting up of a cotton spinning mill, establishment of a number of small power loom units throughout the State, setting up of steel re-rolling mills, expeditious modernisation of the silk filature industry, expansion of worsted woollen yarn industry, setting up of a tyre retreading plant, and the establishment of a fur producing farm with a view to increasing the fur production of the State. It was also agreed that the question of suitably amending the State Aid to Industries Act with a view to affording help to all levels of entrepreneurs who have a desire to set up industrial units in the State should be considered and that efforts should be made to attract entrepreneurs to set up industrial units in the State.

U.S.S.R.

Electrical Equipment for Export: Soviet export of high-voltage and other industrial electrical equipment this year will be double the 1960 level. This year arc-welding equipment and transformers will, for the first time, be shipped to Guinea. Also for the first time, electrical equipment will be exported to Ghana. Large contracts have been signed with Cuba, where 12 electric locomotives for work in mines and arc-welding equipment will be shipped shortly. A large number of power transformers for railway electrification will be sent to India. Burmese experts speak highly of Soviet electrical equipment. Not long ago, a new contract was signed with the Rangoon Electrical Supply Company for the delivery of Soviet transformers. A French company has acquired a manufacturing licence for Soviet welding equipment.

Soviet Machine Tools Abroad: Soviet metal cutting machine tools, stamping and forging presses and other tools are used in 46 foreign countries, including Austria, Finland, and West Germany. This year a large number of Soviet metal cutting machine tools was purchased for the first time by Japan. In the last six months more than 100 lathes, milling, grinding, and other metal-working machine tools were sold in West Germany. At the Leipzig Fair, Austrian and West German firms bought 58 machine tools. Towards the close of the Fair a British firm signed a contract for the purchase of 70 lathes manufactured by the Krasny Proletari factory to be delivered in 1962. Argentine firms placed an order for some 80 Soviet machine-tools. Foreign firms and experts speak highly of Soviet machine-tools and orders for Soviet equipment are constantly increasing.

United States

Dow Chemical Company: The Dow Chemical Company has announced that it has acquired all the shares in its British subsidiary, Dow Agrochemicals Limited, in Kings Lynn, East Anglia. Dow Agrochemicals was established in 1958 for the manufacture and marketing of Dow agricultural chemicals in the United Kingdom and in several Commonwealth countries. Dow owned 74 per cent of the capital and the rest was in British hands. G. B. Branch, President of Dow Chemical International Limited S.A., said that by the acquisition of all the shares Dow will spur the development of the subsidiary and make available to it the full benefit of all the research and resources of the parent company. Dow Agrochemicals will continue to market its products in the United Kingdom in accordance with existing distribution arrangements.

Yugoslavia

Trade With Africa: Yugoslavia have concluded trade and other economic arrangements with many African countries with both that existed before the war and the newly independent ones. The former group includes Ethiopia, the Sudan, the Egyptian province of the United Arab Republic, Tunisia, Morocco and Liberia. The latter group comprises, Guinea, Ghana, and the Mali Republic. Trade and other economic relations with some countries are regulated by the Franco-Yugoslav trade agreement. This refers to the Congolese Republic (the former French Congo), the Ivory Coast, the Malagasy Republic (Madagascar), Mauritania, Niger, Senegal, Upper Volta, Cameroon, the Central African Republic, Dahomey, Gabon, and Tohad. Algeria is likewise included into this agree-

Citizens of Tomorrow

A lesson in geography for the citizens of tomorrow—men and women who will make and keep the new India great.

They study today in a modern school, a far cry from the village schools of yesterday. A large proportion of India's new schools and colleges are built to last with ACC Cement.

Cement is the strongest and most durable of all building materials.

Cement means progress

THE ASSOCIATED CEMENT COMPANIES LIMITED.

ment and special quotas set for Yugoslav exports to that country. Commodity exchange with African countries during the first quarter of 1961 is best illustrated by the following figures:

(In millions of dinars)

Yugoslav Exports ..	1,296.4
Yugoslav imports ..	2,649.8

United Kingdom

Automatic Laundry With Jetstream Conditioner: A new machine capable of drying and "shaking out" large quantities of washed linen in a continuous automatic process has been introduced by a U.K. firm. Shown at the recent International Hospital Equipment and Medical Services Exhibition in London, it can take, in one hour, just under 4 cwt. (203 kg.) of tightly-packed laundry, and can deliver it dry with the items separated and loaded, ready for ironing, on a conveyor belt. The "jetstream" conditioner, as it is known, is described as an attempt to produce flow-line, shaker drying, tumbler on the 'closed-circuit' principle.

*

British Fund Helps Tibetan Children in India: Some hundred Tibetan children whose parents have sought refuge in India are to be housed and educated in a home now being planned in Simla by the Foreign Relief Committee of Britain's Save the Children Fund. A spokesman for the Fund said in London that it was hoped, the premises would be opened within three months. Negotiations were still in progress for acquiring property, and staff to administer the project was now being recruited. The Save the Children Fund founded in 1919, is a British Voluntary Society, dedicated to aiding needy children all over the world. It was a founder member of the International Union of Child Welfare, the headquarters of which are in Geneva.

Australia

Trade Drive in South-East Asia: The Department of Trade is making a vigorous drive for export-markets, particularly in Asian countries. More than two hundred organisations have displays in the trade mission ship *Straat Banka*. The largest export-selling mission to leave Australia since World War II, it has been organised by the Australian Chambers of Commerce Export Council, the Australian Manufacturer's Export Council and the Department of Trade. During the two-months' tour, the Mission will visit Singapore, Port Swettenhan, Penang, Bombay, Cochin and Colombo.

*

Japanese Market for Australian Iron Ore: The recent expansion of the Japanese Iron and Steel Industry is opening up prospects for exports of Australian Iron Ore. The Minister for National Development has stated that the Japanese Industry's needs had outstripped the small local production of the ore. The steel output had increased by six million tons to 22 million tons last year and planning is for 48 million tons in 1970. To support this expansion Japan will have to import steadily increasing quantities of iron ore. It was forecast that established import sources would not be able to provide more than 31 million tons in 1970. This was Australia's opportunity. The conditions of export of Australian iron ore assured supplies for domestic industry from the known high grade deposits. Future Australian reserves were also safeguarded by the provision that not more than half of the high grade ore

in any other deposit could be exported. The announcement of the Japanese plans created much interest in mining circles in New South Wales. Experts predicted a mining boom and pointed out that the State had at least 11,600,000 tons of proven iron ore deposits lying under the ground, most of which had been untouched for years. In the state of Western Australia, a new public company is being formed to exploit the deposit of 30 million tons at Mount Gunsworthy, 30 miles east of Port Headlands. Production is intended for export to Japan.

France

Output of French Iron Mines: The output of French iron mines in March totalled 6,199,194 compared with 5,572,112 tons during February. Deliveries in France totalled 6,148,920 tons compared with 3,309,480 tons.

Total exports were 2,428,325 tons compared with 2,097,905 tons.

Following is the output broken down by regions:

	February	March
Output of mines in the East	5,235,226	5,806,826
Output of mines in the West	312,420	364,154
Output of mines in the Centre-South	24,466	28,214
TOTAL	5,572,112	6,199,194

*

Trade with the Republic of China: Because there is no trade agreement between France and the Republic of China, purchases are limited to essential goods including raw materials and semi-finished products. In 1960, French imports from China totalled a value of 11.2 billion old francs. Among the principle imports were the following:

	In millions of old francs
Oleaginous products	1,500
Crude silver	1,390
Raw silk	1,160
Hog's bristle	720
Wool	530
Silk fabric	280

French exports to the Republic of China totalled a value of 26 billion francs for the same period.

Poland

Ships for Soviet Union: The negotiations conducted in Moscow recently between representatives of the Polish foreign trade enterprise Centromor, the shipbuilding industry and the amalgamation of marine overhaul shipyards on the one hand representatives of the Soviet commercial enterprises Sud-import, Soviet ship owners and others have ended in the signing of a big contract. The contract envisages for the delivery to USSR in the current Five-Year Plan of 44 ships of 442 million foreign currency zlotys. The ships for the Soviet Union will be built by the Gdansk yards which were placed last year fifth on the world list of shipyards as regards the tonnage launched. The shipyards are to build for the Soviet buyers 4 types of ships.

SIX entire buildings...air conditioned by

SINGLE 480-ton WORTHINGTON Centrifugal System at

Dalmianagar— the thriving township of the booming industrial complex of ROHTAS INDUSTRIES. The handsome building above—the administrative hub of this gigantic industrial combine—the two-storeyed Chemical Laboratory, the 30-room Guest House and three Directors' Bungalows have been completely air conditioned by a SINGLE 480-ton WORTHINGTON Centrifugal System...a unique installation!

The plant room houses the Centrifugal and a 30,000 gallon chilled-water storage tank, with a 600-ton forced draught cooling tower alongside. Separate air handling units in each building provide individual temperature control and flexibility of operation. Specially designed to cope with the extreme temperature variations of Dalmianagar, the WORTHINGTON System provides year round 'engineered climate' (summer cooling—winter heating.) Here is yet another instance in which the need for high performance and economy in operation led logically to a BLUE STAR engineered WORTHINGTON installation. You too, whether your requirements are large or small, will find that BLUE STAR can serve you best in "climate control."

NEWS IN BRIEF

PUBLIC DEPARTMENT

INDIAN

Rajasthan has decided to bring 67 per cent of the rural families of the State under the fold of co-operatives by the end of the Third Plan.

India is to buy 7.19 lakh cubic feet of a special type of railway sleepers from Burma. This decision follows negotiations between the Burmese State Timber Board and a three-man Railway Purchase Mission which visited Rangoon in February. Payment will be made in Indian rupees.

The Government of India has decided to increase the current average retention price for steel payable to the Mysore Iron and Steel Works by Rs. 7.89 per ton for the period April 1, 1955 to March 31, 1960. The current retention prices of all grades of pig iron used by the works will be increased by Rs. 5.02 per ton for the same period.

Total production of saleable steel by the Tata Iron and Steel Company at its Jamshedpur works in May was lower, but the output of pig iron and steel ingots showed improvement in comparison with the April figures.

The Government of India has decided to extend the procedure under Rule 191-A, of the Central Excise Rules, 1944 for export out of India of articles under claim for rebate of duty on the excisable goods used in their manufacture to plastic manufacturers.

West Bengal has the highest level of per capita taxation, according to a memorandum prepared by the State Government. The per capita taxation is Rs. 16.4 in West Bengal.

The possibility of introducing roadtrailers in India is being considered. The South Eastern Railway is now ascertaining from industrial associations in Calcutta their views about the suitability of introducing the roadtrailer type of traffic together with their assessment of the break-up of the traffic expected.

It is reported the National Development Council has decided to place Rs. 200 crores at the disposal of Hindustan Steel Ltd. for the fourth public sector steel project at Bokaro in Bihar.

The Union Minister for Transport and Communications is considering a proposal that the Mysore Government be entrusted with the work of developing Mangalore as a major port and act as an agent of the Central Government.

The first paint pigment to be exported from India is a consignment of pythalocyanine Blue, a pure strong pigment favoured in the making of paints, lacquers and printing inks.

FOREIGN

An important contract was secured at the British Trade Fair in Moscow by Enfield Rolling Mills for the supply of £450,000 worth of unwrought copper for the Soviet Rasnoexport Company.

It is reported Greasy Wool Futures Exchange has decided to offer Japan a seat on the floor of the Exchange.

Canada's Treasury ended the first month of the current fiscal year with a deficit of \$25.5 million compared with a surplus of \$10 million in the corresponding month a year ago.

A wholly owned subsidiary plant of the Felix Company of Sweden has recently been opened at Mattersburg in Eastern Austria. The factory, which will turn out canned fruit, vegetables and meat, has been built at a cost of £700,000.

The world trade prospect for 1961 is one of gradual expansion mainly consisting of a further rise in trade between industrial countries, says the May issue of the Treasury Bulletin for Industry.

Fiji is to receive a grant of £1,143,000 to improve wharf facilities at Suva. The grant is one of 60—including 11 for research—approved under the Colonial Development and Welfare Act during April making available £2.4 million for schemes to benefit Britain's overseas territories and bringing the total of colonial development and welfare grants and loans for the first four months of 1961 to £12.1 million.

Output of man-made fibres declined again last month. Figures, published by the British man-made Fibres Federation show that 42.17 million lbs. were produced, compared with 47.52 million lbs. in March and 43.13 lbs. in February.

The U.S. is to supply 200,000 tons of wheat and flour, worth \$13 million to the Egyptian region of the U.A.R.

A small quantity of high-grade oil in addition to petroliferous gas was reported at Combargno No. 1 well in Southern Queensland. Combargno is 70 miles north-west of Cabawin, where oil was struck by Union Oil Development of America in April on a lease held by Australian Oil and Gas Company.

A huge programme for the construction of administrative buildings has recently begun in Gabon. The programme, which will cost 2,143 million francs C.F.A. includes the construction of buildings in Cibreville, Port Gentil and other cities.

The Pakistan Government will launch an export credit guarantee scheme from October next to introduce a new incentive to expand the country's export trade.

Special Article

PERFORMANCE OF THE PUBLIC SECTOR UNDERTAKINGS: 1959-60

THE Central Statistical Organisation has attempted in a brochure published recently, a consolidated picture of the financial results of no less than 54 public sector undertakings. A similar attempt was made last year and it seems that this consolidation of the financial picture of the public sector undertakings is useful for keeping a close watch on their working results. The

Third Five-Year Plan has pinned great hopes on the capacity of these units to generate sustained surpluses, as it is assumed that no less than Rs. 450 crores would be available from them for investment.

The financial results of these undertakings for 1959-60 throw a flood of light on the technique of utilisation

* Relates to 1958-59.

** Including the capital works in progress.

Note: The ratio of gross profits to Net fixed assets turns out to be 4.9 per cent when the Chittaranjan Locomotive Works, Integral Coach Factory and the Indian Rare Earths Ltd. are excluded.

of funds and their results. In this Special Article three objectives have been set. In the first place, it is attempted to find out if the return on the capital employed in these units is comparable to the yield on capital in the private sector or the prevalent Bank Rate in the country. In the second place, an attempt is made to find out if the "depreciation" policy of these units is healthy and whether proper allowances are being made currently so as not to face serious consequences later. An additional factor which is scrutinised pertains to the relationship between the total turn-over of these units in relation to the capital invested in them. At the outset the depressing finding ought to be recorded that the three indicators do not show an encouraging performance and it seems that the public funds are not being utilised efficiently. Much effort needs to be put in for raising the productivity of the capital invested.

It will be seen from the table on the previous page that the gross profits for all the 21 industrial units formed only 4.9 per cent of the total net fixed assets. If this ratio were to be corrected for total net assets, it would be around 3.5 per cent. Whatever way the return on capital may be computed, it turns out to be much below the Bank Rate even. It corroborates the thesis presented in the columns of "The Eastern Economist" repeatedly that the public sector undertakings are being run inefficiently and the return on capital employed (in terms of total net assets) is far from adequate. There is urgent need for looking into the working results of some of these units which have made a poor showing. In this category, the outstanding examples are those of Hindustan Salt Company Ltd., Bharat Electronics Ltd., and Hindustan Housing Factory

Ltd. The Hindustan Shipyard and Orissa Mining Corporation also stand almost in the same category.

The picture on sales, however, is partly blurred due to the accounting procedure adopted. For example, in the case of Chittaranjan Locomotive Works, no sales have been indicated because, according to the accounting practice, "the profitability of a unit should not be determined on the basis of the accounts maintained, since the works are not of an independent commercial unit, making sales of its products to outside consumers." For this very reason, the total figure for sales at Rs. 38.88 crores turns out to be nearly one third of the net fixed assets shown. Thus, the ratio of sales to net fixed assets does not carry much conviction because the value of total sales is indicated at a level which is almost one third of the total net fixed assets.

The twenty-one industrial undertakings listed in the table have varying durations of life and a certain amount of depreciation has been provided, with some exceptions, in almost every year of existence. The total depreciation for these undertakings turns out to be a little more than one-fourth of the total net fixed assets. This fact demonstrates that proper depreciation is being provided in general and that there need not be any cause for alarm on this account.

The broad conclusion of this analysis is that, while capital invested in the public sector industrial undertakings is significantly large, the return is not adequate. The accounting procedure does provide for sufficient depreciation, in general. On sales, no definite conclusions can be arrived at because of the manner in which the products of these units are disposed of.

† DAGGER BRAND DRILLS FOR LASTING PRECISION PERFORMANCE

Seesaw in Shipping

By CROESUS

DEMANDS for a higher allotment for shipping by the shipping interests and replies by Union Ministers almost conceding these demands, immediately followed by official denials (that the original allocation is not to be changed)—this seems to be the order in which the plea of the shipping interests for a greater allocation for this industry under the Third Plan is being seesawed, as it were, between Bombay and Delhi. Somehow or other, when in Bombay, perhaps, after listening to the cogent and fervent pleas of shipping interests, the Union Minister or Ministers concerned feel like agreeing with what is said on this subject and holding out assurances, albeit vague, that more funds than at present would be allotted. But the moment they are back again in Delhi and are face to face with the austere and awe-inspiring supercabinet, the Planning Commission, they appear to become helpless. That, at any rate, is the impression that one, who cares to follow closely the proceedings at various functions connected with shipping in Bombay and the pronouncements in the Press of the powers-that-be from Delhi, cannot help forming. I wonder whether the same story will be repeated in the wake of the assurances given to shipping interests last week in Bombay by Mr. Raj Bahadur, the Union Minister of State for Transport and Communications.

Speaking at the Annual Day Prize function of the Merchant Navy Training Ship "Dufferin", Mr. Raj Bahadur frankly admitted that there was a measure of disappointment over the fact that the allocation for shipping was much less than what the National Shipping Board had recommended. He even tried to explain why the allocation had to be lower; the resources available, he said, were limited. But, as everyone knows, this is no new discovery. However, the Union Minister gave a practical tip and an encouraging hint about how to get the allocation raised. His tip was that shipping companies, both in the public and the private sectors, should go ahead with their respective development plans and utilise the funds already allotted. "If we are able to use them up", he said, "we (that is, I presume, private sector shipping, public sector shipping and the Transport Ministry) shall be in a position to ask for more." This was also the proviso to his hint that the Planning Commission was likely to provide additional funds for the expansion of India's shipping tonnage. In other words, Mr. Raj Bahadur and his Ministry want the shipping interests fully to utilise the provision now made and thereby establish a case for further funds and thus strengthen the Ministry's hands to approach the Planning Commission again for an upward revision

of the present allocation. This is so far so good and undoubtedly serves to establish the 'bona fides' of Mr. Raj Bahadur. No one can now say that he at least is still unconvinced about the case for a higher allocation for shipping.

Be that as it may, seldom has so good a case as that of Indian shipping for higher allocation suffered by such sheer helplessness as this. Lack of resources is admittedly a formidable obstacle, but, as shipping is perhaps among the very few avenues that earn foreign exchange almost simultaneously with the outlay, it should not have been difficult for the Planning Commission to find some more funds for the expansion of our shipping. It cannot surely be argued that the demands for expansion of the shipping interests are excessive or unrealistic. As Mr. G. L. Mehta pointed out when he inaugurated the Eastern Shipping Corporation's service from the west coast of India to Japan, the other day, the rate of expansion of 100,000 tons a year recommended by the National Shipping Board (of which he has been the Chairman) is no more than the annual rate of expansion actually achieved by the Indian shipping industry during the Second Plan period. And this would have entailed an outlay of Rs. 104 crores. The Planning Commission, however, has allotted only Rs. 55 crores (according to Mr. Raj Bahadur, it is Rs. 62.5 crores). In Mr. Mehta's opinion, the present allocation can take care of an annual expansion of just 40,000 tons per year! Even on the basis of Mr. Raj Bahadur's figure, the rate of expansion would not exceed 45,000 tons per year. The least that the planners should have done was to ensure that at least the same rate of progress as that actually achieved during the Second Plan period is maintained during the present Plan period, as wisely and reasonably urged by the National Shipping Board. In doing this, it is noteworthy, the N.S.B. has nowhere suggested that the Government of India is not alive either to the needs of the Indian shipping industry or to the importance of shipping as such to the country's economy. But, as Mr. Mehta suggested—though he did not say so in as many words—the authorities in New Delhi have apparently yet to realise that all our tall talk about intensifying our export drive and augmenting our exports to around Rs. 1,500 crores a year (as some experts have suggested) would prove meaningless if we don't have adequate carrying capacity. Let them note that the inadequacy of merchant shipping is a double-edged weapon, for it will not only hinder our export drive but also cause a serious drain on our already slender foreign exchange resources.

Business Notes

Jute

A MEANINGLESS GESTURE

AFTER REPEATED dinnings into their ears for several weeks, it would appear, the authorities have condescended to relax from what all along seemed to be an

inflexible stand on their part in the matter of import of raw jute from Siam. (Has this attitude anything to do with the Siamese twins?) When the possibility of import of raw jute from Siam was suggested to them to get over the acute shortage of this raw material in the country, the Union Finance Minister apparently looked

at it only from the point of view of raising some more revenue by imposing a stiff import duty on raw jute, although he could not be unaware of the fact that we pay no import duty on the raw jute we buy from Pakistan. The Union Finance Ministry's argument presumably was that, if there was no duty on raw jute imports from Pakistan (by reason, perhaps, of a trade agreement), the same concession could not be extended to other countries. If so, the argument is both short-sighted and fallacious. In the first place, it is not Siam that is hankering to export raw jute to India, but it is we who want it badly. Secondly, there are not so many countries as could export raw jute to suggest that we would be running the risk of estranging our relations with any country by allowing imports of Siam raw jute also free of duty. Perhaps, if an import duty is imposed, Siamese raw jute interests might well complain that we are discriminating as between Siam and Pakistan! Again, it should not be forgotten that, by imposing an import duty on raw jute from Siam, we shall only be adding to the cost of manufacture of jute goods and making it correspondingly less competitive than the jute goods sold in export markets by our rivals in the field. Nothing could be more short-sighted, if not suicidal.

The Union Finance Ministry probably believes it is very ingenious in having finally agreed to refund the import duty on Siam raw jute if the shipper of Indian jute goods proves to the satisfaction of the customs authorities that a given consignment of jute goods shipped by him is manufactured entirely out of Siam raw jute. This is no relaxation but a refusal to see the obvious. It is hardly conceivable that any jute mill, let alone a shipper, could single out or separate goods manufactured out of Siam jute from those manufactured out of Indian or Pakistani jute, unless, of course, that mill runs three sets of plant, each devoted to the utilisation of only one country's raw jute. One has only to spell out this to point to the utter absurdity of the proposition. So long as we have such unimaginative bureaucracy, we can never hope to build up, not to speak of expanding, our exports.

Plantation Industry

ANOMALIES OF EXPORT DRIVE

WE HAVE ushered in the Third Five-Year Plan with our foreign exchange reserves at an all-time low. Notwithstanding the generous assistance promised by the Aid-India Club, thanks to the initiative of America, which takes care of our foreign exchange requirements, including balance of payment deficits, for the first two years, and more, we cannot afford to slacken our export drive. In this context, two things call for the utmost attention, namely the policy pursued by the Government towards exports and its attitude towards industries that produce the commodities of export.

Now tea and, to a lesser extent, coffee have been our long-standing exports for which we have fairly constant customers overseas, as, for example, the U.K. Last year's exports of tea to the United Kingdom, however, show, that, despite its buoyant economy and rising standard of living, Britain's consumption of Indian tea did not increase, presumably because of the growing competition from other tea-producing countries like Ceylon, East Africa and North America. Thus, while, on the one hand, our tea exports have not tended to rise, on the other, our tea production has registered a 20 per cent rise during the Second Plan period; a further increase of 20 per cent is envisaged during the Third Plan. This state of affairs demands

that we should redouble our efforts to expand the market for our tea. But, then, has the industry been afforded all the requisite facilities to do so?

According to Mr. W. C. Roy, Chairman, Kannan Devan Planters' Association, this does not appear to be the case. Speaking at the 76th annual general meeting of this Association, a few days ago, he expressed fears about the Government's tax policy towards the plantation industry. On the top of a number of taxes, such as the plantation tax of Rs. 8 per acre on all producing areas, the Kerala additional tax on lands, the building tax, etc. which are already being borne by the industry, Mr. Roy said, the Union Government had further increased the excise duty on loose tea from 9 nP. to 15 nP. per lb. True, some relief has been provided on export duty, but, as against the industry's request to abolish the export duty altogether, only a slender relief has been given by reducing the export duty from 53 nP. to 44 nP. per lb.

More or less the same is the case with coffee. Perhaps it is worse. For, unlike tea, coffee has had to pass through a crisis last year due to the steep fall in export prices. Recent export auctions indicate a still further fall in these prices. Thus, at these auctions, Arabica Plantation 'A' variety was sold at Rs. 170 per cwt., while Robusta was sold at about Rs. 75 per cwt., both below last year's prices. As Mr. P. J. Stephen, Chairman of Nallampathy Planters' Association told the 18th annual general meeting of that body, the present existing export prices for coffee are uneconomical. It is anomalous that, when, inside the country itself, there is a very good market for coffee, the industry should be urged to export at such uneconomical prices. This is one more case where, even when we are in a position to export, we can afford to do so only at a loss. To put it differently, here is yet another of our exportable commodity that is priced out of the world markets.

Balanced Growth

THE NAG-VIDARBHA CHAMBER'S COUNSEL

IN HIS Presidential address at the first quarterly general meeting of the Nag-Vidharbha Chamber of Commerce, Nagpur, Mr. D. C. Sutaria strongly pleaded the case for balanced growth in the newly formed State of Maharashtra. It is true that, as reiterated by the Chief Minister of the State, Mr. Y. B. Chavan, an integrated and balanced development of the entire State in general and of locating industries in what are known hitherto as the under-developed areas in the State in particular, is the considered policy of the Government. The president of the Chamber complained that their appeal that the Vidarbha area of the State should be given some priority in this respect has not recorded any impact and the State Government has paid no attention so far. "We had on several occasions suggested", he adds, "that even a fertilizer plant would be a welcome harbinger of the industrial progress which both the Central and the State Governments wish to bring about ... Nothing seems to have been done in this respect."

It may be pointed out that in the coming years of Third Five-Year Plan the base of an Agro-industrial Society has to be created wherein industrial production has also to be extended to the rural areas. In fact, the Government has realised the necessity and has established, or has plans to establish industrial estates, wherever facilities are available for small and medium-sized industries. Such industrial centres, it

may be added, have the double advantage of lower costs and proximity of the markets. They also help in reducing the congestion in the present industrial cities where living goes on becoming more and more complicated. In fact, as the President has pointed out, various kinds of resources can only be exploited if the industrial enterprises are carried to un-developed regions. As an instance it may be pointed out that the Government of India accepted the suggestion of the Chamber to make an intensive scientific survey and prospecting of the mineral wealth in the State. It is quite likely that coal and manganese resources are discovered in the region. This will save the region from a part of the expenditure on coal by way of reduced transport expenses.

Synthetic Fibre

NEW FLOATATION

THE USE of synthetic yarn has become quite popular in India. Most of the present requirements of this type of yarn, however, are met by imports. It is only natural, therefore, that new units should be set up in the country to produce this yarn. The venturing of J.K. Synthetics Ltd. (formerly known as J.K. Investment Trust Ltd.) into this field is thus welcome. The company has obtained a licence from the Government of India to establish a new synthetic filament yarn plant with a capacity of 4.8 lakh lbs. per annum. The plant is to be located at Kotah in the State of Rajasthan. The location of the plant is quite advantageous in the sense that power for the plant will be available from Chambal Grid and adequate water supplies will be available from the Kotah Barrage of the river Chambal. The company is getting technical know-how from M/s. Ing. A. Maurer of Switzerland. This is a firm of international repute in the man-made fibre industry and has wide experience in designing such plants satisfactorily in different parts of the world.

The plant and machinery required for the project have already been ordered and shipments are expected to start shortly. Total capital outlay on the plant of Rs. 178.60 lakhs is estimated to be made up of land and building (Rs. 20 lakhs), plant and machinery (Rs. 133.5 lakhs), erection expenses (Rs. 6.1 lakhs), working capital (Rs. 15 lakhs) and miscellaneous expenses (Rs. 4 lakhs). This expenditure is to be raised to the extent of Rs. 30 lakhs by loan from the Government of Rajasthan, Rs. 80 lakhs by deferred payment facilities from suppliers of machinery, Rs. 16.22 lakhs by borrowings from banks and other sources and the remain-

ing sum of Rs. 52,37,500 is to be raised by way of new issues now being offered to the public in the form of equity shares of Rs. 10 each. The subscription list will open on June 12, 1961, and will close on June 17, 1961 or earlier at the discretion of the Directors but not before June 14, 1961. The entire issue has been underwritten. In view of the soundness of the project the new issue is likely to be well received in the market.

Iron Pipes

NEW VENTURE

THE FLOATATION of a new public limited company under the name Saru Engineering Corporation Limited for the manufacture of spun cast iron pipes is another feather in the cap of the industrial house of Seth Jugmandar Dass Shital Prasad Jain of Meerut. The importance of this industrial house is, of course, already known in the field of non-ferrous metals and alloys through its concern Saru Smelting and Refining Corporation Private Limited which has established a name for such products as resin cored solder, silver brazing and other welding alloys and a large number of other non-ferrous alloys and metals. The authorised capital of the new company is Rs. 50 lakhs. The whole of this amount is expected to be raised in the market in about 6 to 8 months' time. The sanctioned installed capacity of the plant is 24,000 tons per annum.

The stage for the project has been well set at Meerut which is in a position to cater to the demands for such pipes from a wide area comprising Delhi, Punjab, Jammu and Kashmir, Rajasthan, U.P., and Madhya Pradesh. Its proximity to the West Pakistan border is also an advantageous factor for making exports to that country. The attitude of the U.P. Government is also said to be quite favourable; it is expected that the State Government will sanction the necessary electric power on the completion of Harduaganj Extension Project.

Along with the floatation of this company, another heartening development in respect of this industrial house is that Saru Smelting and Refining Corporation has been granted a licence to establish a new division for producing steel castings. The installed capacity of this division will be 3,000 tons per annum. These two projects are likely to be of great benefit to West U.P., for not only would they bring this area into the arena of heavy industries, but they would also lead to establishment of small-scale industries connected with these projects.

FROM THE CAPITAL'S CORRIDORS

THE THIRD PLAN

THE Third Plan in its final form is likely to be presented to the country by the middle of next month. Final touches are being given to it in the light of the discussions that took place at the recent meeting of the National Development Council.

The Plan, it is learnt, aims at an increase in per capita income from Rs. 331 in 1960-61 to Rs. 385 in 1965-66 in terms of 1960-61 prices. Total national income is expected to go up from Rs. 14,500 crores in 1960-61 to Rs. 19,000 crores in 1965-66 (also in terms of 1960-61 prices).

Some of the major targets fixed for achievement by 1965-66 are as follows:

Agriculture

Foodgrains (million tons)	100
Cotton (million bales)	7
Sugarcane (in terms of gur) (million tons)	10
Oilseeds (million tons)	9.8
Jute (million bales)	6.2
Tea (million lbs.)	900
Tobacco (thousand tons)	325
Irrigated area (million acres)	90
Land reclamation (additional area) (million acres)	3.3

Industry

Power (million kw. capacity)	12.7
Coal (million tons)	97
Iron ore (million tons)	32
Finished steel (million tons)	6.8
Pig iron for sale (million tons)	1.50

Cotton Textiles

1. Mill-made (million yds.)	5,800
2. Decentralised sector (million yds.)	3,500

The public sector outlay of Rs. 7,500 crores has been allocated for various economic development programmes in the following manner:

Programme	(Rs. Crores)	Amount
Agriculture, Community Development and Co-operation	1,068	
Major irrigation	643	
Power	1,019	
Village and Small Industries	264	
Industries, Minerals, Transport and Communications	3,006	
Social Services	1,300	
Inventories	200	
TOTAL		7,500

The resources for the public sector are to be raised in the following manner:

Heads	January Decision of N.D.C.	Present Estimate	(Rs. crores)
1. Balance from current revenues (excluding additional taxation)	421	550	
2. Contribution by Railways	71	100	
3. Surpluses of other Public Enterprises	449	450	
4. Loans from Public (net)	850	800	
5. Small Savings (net)	585	600	
6. Provident Funds (net)	249	265	
7. Steel Equalization Fund	160	105	
8. Balance of Miscellaneous Capital Receipts over non-Plan Disbursements	208	170	
TOTAL 1 to 8	2,993	3,040	

9. Additional Taxation including measures to increase surpluses of public interests	1,710	1,710
10. Budgetary receipts corresponding to External Assistance	2,200	2,200
11. Deficit Financing	550	500
TOTAL	7,453	7,500

The foreign exchange component of the Plan is envisaged to be met in the following manner.

	1961-62	Total Third Plan
--	---------	------------------

A. Receipts		
1. Exports	667	3700
2. Invisibles (net) (excluding official donations)	22	Nil
3. Capital transactions (net) (excluding receipts of official loans and private foreign investment)	-133	-550
4. External assistance	575	2800
5. Draft on foreign exchange reserves	—	—
TOTAL (1 to 5)	1131	5750
B. Payments		
1. Imports of machinery and equipment for plan projects	325	1900
2. Components, intermediate products etc. for raising production of capital goods	60	200
3. Maintenance imports	746	3650
TOTAL (1 to 3)	1131	5750

IRON AND STEEL IN THE THIRD PLAN

The overall targets proposed for the iron and steel industry under the Third Plan are 10.2 million tons of steel ingot capacity and 1.5 million tons of pig iron for sale. The estimates of requirements of pig iron and finished steel by 1965-66, which have provided the background for the planning of this industry, and the present installed capacity are as given in the table below. (Demand forecast is based on the assumption that the current selling price of steel will hold good for the Third Plan period).

CATEGORY-WISE BREAK-UP OF DEMAND FOR IRON AND STEEL

End-product	Estimated demand by 1965-66	Capacity in existence in early 1961
1. Heavy rails & fishplates	400	345
2. Heavy structural and broad flanged beams	550	445
3. Sleepers & crossing sleepers	200	180
4. Medium & light structurals	550	680
5. Rounds & flats including rounds for nuts, bolts and screws	2200	1305
6. Tin-plate	300	150
7. Plates 3/16" and up	650	300
8. Wires including wire ropes	400	220
9. Hoops & box strapping	50	50
10. Sheets	1200	740
11. Strips & skelp for tubes	400	188
12. Forging blooms and billets	300	132
13. Wheels, tyres and axles	100	30
14. TOTAL (1 to 13)	7300	4760
15. Pig iron for sale	1500	660-870

"You can make your factory performance optimum"

NATIONAL PRODUCTIVITY COUNCIL

Through the Courtesy of T.C.M. of U.S., Government is now in a position to provide some very useful I.C.A. publications comprising

*Series of Manuals in fields of INDUSTRIAL MANAGEMENT *INDUSTRIAL ENGINEERING & INDUSTRIAL RELATIONS *PLANT REQUIREMENT REPORTS. *FACTORY PERFORMANCE REPORTS *CAPITAL REQUIREMENT & OPERATING RATIO REPORTS *COTTAGE INDUSTRIES REPORTS *INDUSTRIAL DEVELOPMENT GUIDES etc., etc.

Information Officer, National Productivity Council, 38, Golf Links, New Delhi.

The share of the private sector in the steel target is 3.2 million tons of ingots. The existing installed capacity of Tatas and IISCO is 3.0 million tons. The expansion of capacity for steel in the private sector is expected to come from the installation of scrap-based electric furnaces which will augment the supplies of billets to re-rollers. The supply of billets to re-rolling mills from the main producers of steel is visualised at 1.0 million tons by the end of the Third Plan. As regards salable pig iron, the output from the private sector is provisionally placed at about 0.3 million tons — to be achieved through expansion of iron making capacity based on low shaft blast furnaces and/or electric smelting of iron ores.

The levels of capacity to be reached by 1965-66 under these programmes in the public sector are as follows:

(Million tons)		
Scheme	Steel ingots	Pig iron
(a) Expansion of:		
Bhilai	2.5	0.3
Rourkela	1.8	—
Durgapur	1.6	0.3
Mysore Iron & Steel Works ..	0.1	—
(b) Bokaro Steel Project ..	1.0	0.36
(c) Neyveli Pig Iron Project ..	—	Capacity to be still decided

The Neyveli Pig Iron Project on which considerable preliminary investigations have still to be conducted in regard to the process as well as the raw materials intended to be used, represents an intermediate stage towards the establishment of a steel plant of about 0.5 million tons in the Southern region. The financial provision included for this scheme in the Third Plan covers mainly the requirements of a high temperature carbonisation plant for the production of lignite coke.

The expansion programme of the Mysore Iron and Steel Works comprises mainly the spill-over expenditure on the ferro-silicon plant and provision for steel making by the L.D. process and for a light structural mill.

The layout of the new steel plant at Bokaro is being planned for a capacity of 2.0 million tons of steel ingots, but as the first phase of development it is proposed to install facilities for the production of 1 million tons. This plant is expected to specialise in the production of different types of flat products. The exact types to be produced in the first phase and the nature of the finishing facilities to be provided there-of are currently under examination.

On the completion of these development programmes, the capacity for mild steel of the public sector steel works will be raised from 3 million tons to 7 million tons, making along with the capacity of the private sector a total of 10.2 million tons of ingots.

The overall investment required for the public sector steel development programmes included in the Third Plan is estimated at Rs. 525 crores. This is inclusive of the investments required for increasing the production of lime-stone at Nandini and iron ore at Dalli Rajara and Barsua in the case of the expansion programmes. It also includes the investments required for the additional production of coal and iron ore for the Bokaro steel plant and the expenditure on townships at all the four steel works.

The total production of finished steel in the country during the Third Plan period is tentatively estimated to be of the order of 24.1 million tons, inclusive of an output of 0.3 million tons from the Bokaro steel plant

in 1965-66. The annual break-up of production is visualised as follows:

ESTIMATE OF FINISHED STEEL PRODUCTION

Year	Million tons
1961-62	3.5
1962-63	4.0
1963-64	4.3
1964-65	5.5
1965-66	6.8
TOTAL	24.1

On the basis of the above forecast of production and of the tonnages of different end-products likely to be available, shortages are expected to be significant, particularly in the initial years of the Plan period, in the case of flat products, e.g. tin-plate, sheets, skelp and plate. This will call for the formulation of a scheme of priorities for determining the allocation of flat products to different classes of consumers. Prima facie, it should be possible to narrow down the margin between the demand and the indigenous supply of steel products in short supply by free inter-change of steel ingots between the public sector plants, so as to achieve the most intensive use of the rolling mill facilities for flat products. This possibility should receive attention in production planning in the light of the situation that may obtain from year to year.

The output of the main producers of steel will include electrical steel sheets produced by TISCO and at Rourkela. Similarly, finished steels turned out by the producers operating on electrical furnace billets and by the ordnance factories will include spring steels and free-cutting steels. The level of production of these special varieties of mild steel will be related to the demand estimate for 1965-66 placed at 75,000 tons for spring and free-cutting steels and 70,000 tons for electrical steel sheets.

TOOL, ALLOY AND STAINLESS STEELS

The manufacture of tool, alloy and stainless steels has been assigned a very high priority in the Third Plan from the point of view both of the requirements over the five-year period and of the probable long-term growth of demand for these products. The demand estimates for 1965 and 1970, which have been kept in view as a guide for planning in this field, are indicated below along with the end-product pattern of the public sector project to be established at Durgapur.

PROJECTION OF DEMAND

(Tons of finished steel exclusive of electrical steel sheets, spring steels, and free-cutting steels)

Varieties	Demand in 1965	Demand in 1970	Output capacity
Tool steels ..	42,000	70,000	13,000
Constructional Steels ..	100,000	241,000	17,500
Stainless steels ..	50,000	68,000	17,000
Die and other alloy steel ..	8,000	10,000	500
TOTAL ..	200,000	389,000	48,000

The projected Durgapur alloy steel plant will incorporate some of the latest equipment and processes for the manufacture of these products developed recently in advanced countries. It is proposed to install electric-soaking pits in preference to gas-fired pits. The desirability of using sponge iron instead of scrap as the starting raw material and of introducing continuous casting facilities is expected to be kept in view in connection with the further expansion of this plant.

THE MARVEL OF THE MULTI-PURPOSE POLICY

HE PAID Rs. 288 ONCE TO LEAVE FOR HIS FAMILY Rs. 1,01,880

When a breadwinner dies, so does the family income. But when a breadwinner with a Multi-Purpose Policy dies, a new income STARTS for his family. Here is a true-life example of this amazing Policy:

● A young chemist took a Multi-Purpose Policy for Rs. 20,000 with Double Accident Benefit. Shortly afterwards his family lost him in an accident. From his Policy they receive:

- A lump sum of Rs. 20,000 (Double Accident Benefit)
- Plus Rs. 2,000 to meet the funeral, legal and other expenses
- Plus Rs. 400 a month for 2 years
- Plus Rs. 200 a month for over 21 years
- Plus bonuses due
- Plus Rs. 18,000 at the end of the Policy term.

The young man had paid just Rs. 288 in premiums. In return, his family receive a total of Rs. 1,01,880 wisely spaced out as an income for over 23 years! Had he lived he would of course have received Rs. 20,000 plus bonuses at the end of the Policy period.

Take a Multi-Purpose Policy without delay. It means unmatched security for your family.

There is no substitute for
LIFE INSURANCE

ASP/LIC-E-22

In the current phase of development, it is planned that the plant should draw supplies of pedigree scrap from the adjoining Durgapur steelworks. The outlay on the project is estimated at Rs. 50 crores in all, of which Rs. 20 crores would be the foreign exchange element.

The Ordnance Factories of the Ministry of Defence are expected to function as a second source of supply of alloy steel in the public sector. The combined output of the Ishapur and Kanpur Ordnance Factories, mainly in the category of constructional steels but including some output of spring steels as well, is estimated at 50,000 tons.

The rest of the developments in this industry are envisaged in the private sector where additional production facilities will be planned having regard to the deficits in different categories of these products still outstanding.

OIL PROSPECTING IN ASSAM

The agreement between the Government of India and the Burmah Oil Company for further exploration of oil in Assam has been signed. The agreement provides for reconstitution of Oil India Limited, a company in which the Government at present has 33-1/3 per cent share and the BOC 66-2/3 share, on 50 : 50 partnership basis. The reconstituted Oil India shall be given a licence for oil prospecting over an area of 18,000 sq. miles in North-East Assam, adjacent to its present concession area of Nahorkatiya, Hugrijan and Moran.

The following are the other main provisions of the agreement:

1. The Burmah Oil Company shall sell part of its holdings of Oil India stock to the Government at par to raise the latter's share to 50 per cent from the present level of 33-1/3 per cent.
2. The Board of Directors of the reconstituted Oil India Limited will consist of 8 members, four of whom will be Government nominees and the other four representatives of the Burmah Oil Company. The Chairman of the Board will be alternated every year between the two partners. The first Chairman will be representative of the Government. The Managing Director of the Company will be selected by the Board of Directors from a panel to be submitted by the Burmah Oil Company. The Financial Director will be selected from a panel to be submitted by the Government of India. The tenure of office of both the Managing Director and the Financial Director will be restricted to five years at a time.
3. The Burmah Oil Company will provide all the foreign exchange required for oil exploration in this area and its development at a later stage. The Government will provide the rupee finance.

4. The crude which is available from the Nahorkatiya-Moran oilfields and which will be found in the area for which the new prospecting licence is to be granted shall be sold to the Government for processing at the Nunmati and Barauni refineries. Small quantities will also be made available to the Digboi refinery whose own crude reserves are nearing exhaustion.

5. The price of crude will be fixed on the basis of FOB Persian Gulf prices, minus a certain discount, plus ocean freight, plus insurance and plus ocean loss to Calcutta. The discount will be a variable factor to be fixed in such a way as to enable the Burmah Oil Company to declare a dividend to its shareholders at the rate of 9 to 13 per cent per annum, exclusive of all taxes (even the tax on dividends). Normally, the net return to the shareholders will be 10 per cent. This, it is understood, has been done taking into consideration the long-term and heavy investment which the B.O.C. will have to make in Oil India.

6. All the expenditure which Oil India has so far incurred or will incur on exploration and development will be taken into consideration for income-tax purposes.

The agreement also provides for exchange of products between the Nunmati and Barauni refineries on the one side and the Digboi refinery of Assam Oil Company on the other. The prices which the Indian Refineries Ltd. will charge from the Assam Oil Company for its products will be the same that it will charge from Oil India Ltd.

The authorised capital of Oil India Ltd. is Rs. 50 crores. The paid-up capital is Rs. 28 crores. No increase in the paid-up capital is envisaged in the near future.

The first exploratory well in the new concession area is expected to be spudded in before the current year is out.

OIL IN THE THIRD PLAN

According to Planning Commission, a project report is to be obtained in the near future for setting up a high viscosity index lubricating oil products manufacturing plant in the public sector. The Government is also considering a proposal for setting up a similar plant in association with private enterprise. Refining of oil and manufacture of petroleum products during the Third Plan period, otherwise, will be entirely in the public sector.

The Third Plan programme for oil development also includes prospecting of oil in various parts of the country, completion of the two refineries under construction at Nunmati and Barauni and the establishment of a third refinery in the public sector to process

WANTED

A Secretary is required by a well-known representative organisation in Calcutta. Ability to work independently is required and duties will also entail attendance at meetings and the preparation of reports and statistics. Applicants with shipping experience and with either Chartered Accountant or Chartered Secretary qualifications are preferred. Attractive terms. Interested applicants to write to Box No. E.E. 1001, C/o. The Eastern Economist, UCO. Bank Bldg., Parliament Street, New Delhi-1, giving full details of experience and indication of salary required.

Cambay-Ankleshwar crude. This refinery will be set up somewhere in Western India and will have a capacity to process 2 million tons of crude per annum. External credit and technical assistance for it has been assured by the Soviet Union.

The product pattern of this refinery will be designed to cover, as far as feasible, the possible deficits

in kerosene and diesel oil.

The estimated requirements of end-products of oil by 1965-66 and the expected output from all the refineries, both in the private sector and the public sector, which are in operation at present or are envisaged to go on stream during the Third Plan period, are as follows:

ESTIMATED REQUIREMENTS OF PETROLEUM PRODUCTS

('000 tons)

End-products	Estimated requirements by 1965		Refineries in operation (private sector)	Refineries under construction (public sector)	Total production	Deficit or surplus
	As given in Draft Outline	As estimated by Oil Advisory Committee in March 61				
1. Kerosene	2,200	2,660	916	366	1,282	-1,378
2. High speed diesel oil	1,800	2,607	1,064	514	1,578	-1,029
3. Motor spirit	1,300	1,123	1,023	514	1,537	+ 414
4. Aviation turbine fuel (ATF)	300	408	—	189	189	— 219
5. Aviation spirit	60	53	—	10	10	— 43
6. Furnace oil	2,200	2,753	1,619	311	1,930	— 823
7. Light Diesel Oil	700	872	511	208	719	— 153
8. Bitumen	700	628	394	120	514	— 114
9. Jute Batching Oil	100	80	47	—	47	— 33
10. Vapourising Oil Mineral turpentine	—	130	46	—	46	— 84
10. Lubricants	500	409	21	50	71	— 338
TOTAL:	9,960	11,723	5,641	2,282	7,923	-4,214 + 414

The estimated requirements of furnace oil, however, might prove to be higher than those mentioned above if fiscal incentives are given to encourage industries situated away from coal-fields to switch-over from coal to fuel oil. The matter is under examination of the Government of India.

In common with several other countries, India is likely to face during the Third Plan period, a problem of imbalance between the output of motor spirit (gasoline) and demand for it. While exports have so far provided a outlet for surplus gasoline, its disposal in this manner is expected to become more and more difficult in future in view of the all-round expansion of refining capacity in the neighbouring countries. It is proposed to solve this problem by adopting the following measures.

1. The production of middle distillates will be increased as far as the technological advances permit. The question of increasing the production of kerosene and HSD by changing the specifications in the flash point of these two products is being examined.

2. Proper fiscal measures will be designed, as has been done to some extent in 1960-61, to check the growth of consumption of high speed diesel oil.

3. Efforts will be made to promote the use of mixed fuels which will reduce the demand of HSD and increase the consumption of gasoline. The existing diesel vehicles, it is thought, can use mixed fuels containing upto 10 per cent gasoline without any change affecting in them.

4. The surplus of motor spirit is also envisaged to be reduced or avoided by diverting the light distillate (naphtha) from which motor spirit is made, to other productive use such as manufacture of nitrogenous fertilizers and petro-chemicals. It has already been decided to use naphtha for the production of fertilizers at Trombay, Visakhapatnam, Gorakhpur and Ennore.

It is also proposed to set up a project in the public sector for the fractionisation of the Nahorkatiya natural gas to isolate ethylene, butenes and other aliphatic hydrocarbons and make them available to petro-chemical industries to be established in Assam. The residual gases are proposed to be supplied to the Nahorkatiya fertilizer factory and the power plant planned for establishment close to the petro-chemical plants.

EXTERNAL ASSISTANCE

The Aid-India Club has promised to make available assistance to the tune of 2.25 billion dollars for the first two years of the Third Five-Year Plan. Of these \$1,045 million will be available from the United States, \$364 million from West Germany, \$250 million from the United Kingdom, \$80 million from Japan, \$56 million from Canada, \$30 million from France and \$400 million from the World Bank and International Development Association. The U.S. promise of aid is subject to approval by the Congress. West Germany, besides providing aid to the tune of \$364 million, will make available \$61 million in 1963 for refinancing the Rourkela loan.

Aid to the tune of \$1,295 million will be available during 1961-62 and the rest \$930 million in 1962-63. The following are the details:

Source	(\$ million)	
	1961-62	1962-63
World Bank and I.D.A.	250	150

JWT-88 197T

Skilled hands working with the touch of steel—steel weaving in and out of fabric, making a pattern or sewing together, steel fashions the clothes we wear.

Fine needle to giant machinery in modern cloth mills, much of the textile industry's equipment is shaped from steel—tons of steel are required to produce the fabrics which clothe our millions. Soon we shall know abundance in an even greater measure—the finest textile at a price all can afford. Soon all this will be ours as there is a little more steel for each of us. Towards this end, IISCO is working—for more steel to help you and you and you—in serving you we help the Nation and that is our privilege

Another meeting of the "Club" is likely to be held in October or November. It is hoped that the five members other than the U.S.A. will be coming forth with some additional assistance to match the U.S. contribution.

HALDIA PORT

Mr. Posthuma, the U.N. expert from Rotterdam, whose services were lent to the Government of India for rendering to her advice on the Haldia Port Project, is understood to have submitted his report. He is said to have cautioned against rushing through with the Project without assessing properly the hydraulic and other data. He is also said to have expressed serious doubts about some of the premises on which the Project is based. Mr. Posthuma's report obviously is of great significance because the World Bank is likely to be influenced by it while considering a request for a loan for the Project.

Mr. Posthuma, it is further learnt, has stated in the report that an outlay of Rs. 25 to 30 crores on the Haldia Project can be justified only if the port has an assured traffic of 4 million tons. The Government of India's present estimates put the traffic to be available for this port at only 1.5 million tons. This traffic is apparently far short of the minimum required to justify an expenditure of Rs. 25 to 30 crores.

Analysing the nature of the cargo likely to be handled at the Haldia port, Mr. Posthuma doubts whether adequate provision is really necessary to handle foodgrains and oil which will be the main items of import through this port. Foodgrains imports, he says, will be of a temporary nature. They should not be taken into consideration for any firm calculations of the traffic available for this port. He is understood to have rejected the suggestion of the Union Food and Agriculture Ministry to construct a silo at the port for the storage of grains. He says even if a silo were to be constructed at the port, it would have to be on the shore, away from the rail-head and the road which would connect the port with the hinterland.

About the suggestion of oil imports being handled at this port, Mr. Posthuma's view is said to be that as long as there are no concrete proposals by any oil firm, these imports should also not be taken into consideration while calculating the traffic available for the port.

Mr. Posthuma has stressed the importance of detailed hydraulic research before a decision is taken for the development of Haldia as a port. Silting of the Hoogly near Haldia which makes the depth of the stream variable would pose a big problem, he says. Provision of drinking water will be another problem which will have to be faced, since the Project envisages the construction of a township near the port. The water of the river that passes by the port is saline and therefore not fit for drinking purposes. Tubewells, nearly 700 ft. deep, will have to be dug to secure drinking water supplies for the township.

TRADE WITH NORTH KOREA

Letters have been exchanged between the Union Ministry of Commerce and Industry and the Democratic People's Republic of Korea for fostering trade between the two countries. Under the arrangement that has been finalised between the Governments of India and North Korea during the recent visit of the Vice-Premier of the latter, trade between the two

countries will be in terms of non-convertible rupees and on balanced basis. The goods that will be available for export from India to North Korea are ferromanganese, leather goods, textiles, handicrafts, vegetable oils, mica and shellac. North Korea will be supplying to India such goods as chemical fertilizers, electrolytic zinc, high-speed and special steels, anthracite and various types of equipment. The arrangement is initially for a period of one year commencing June 1, 1961.

Agreement has also been reached on the question of establishing offices of trade representatives in the two countries for promotion of trade relations.

NEW ISSUES

Four more companies have been granted consent by the Controller of Capital Issues for the issue of capital of various categories. The following are the details:

(1) **The United Malleable Company Private Limited**, a new concern floated in Maharashtra, has been granted permission to issue capital worth Rs. 1.25 crores in the form of 1,00,000 equity shares, of Rs. 100 each, and 25,000 cumulative redeemable preference shares, also of Rs. 100 each. The preference shares will carry a dividend of 9 per cent. The capital is required for the company's scheme for undertaking manufacture of iron pipe fittings in collaboration with M/s. Union Company of Ohio, U.S.A. The U.S. company will be investing in the capital of the Maharashtra company a sum of Rs. 40 lakhs in the form of plant and machinery. The Indian promoters will subscribe shares to the tune of Rs. 20 lakhs. The rest of the issue, Rs. 65 lakhs, will be offered for public subscription after the company has been converted into a public limited company.

(2) **The New Shorrock Spinning and Manufacturing Company** has been given permission to capitalise its share premium account to the tune of Rs. 28,11,250 for the purpose of issuing bonus shares to the existing equity shareholders at the rate of two bonus shares for every five shares held.

(3) **The Machinery Manufacturers Corporation** has been granted consent to raise further capital worth Rs. 25,07,200 in the form of equity shares of Rs. 10 each for consideration other than cash. 1,90,720 equity shares will be allotted to the company's existing equity shareholders on the sub-division of the existing shares of Rs. 100 each. The remaining 60,000 shares will be given to the Managing Agents in discharge of the loan of a like amount.

(4) **The Commercial Ahmedabad Mills Company** has been granted consent to capitalise Rs. 5,77,500 from reserves and issue 2,310 bonus shares of Rs. 250 each in the ratio of one share for every five held.

The consent order in all the four cases is valid for a period of 12 months.

DEVELOPMENT OF DEEP COAL MINES

The British National Coal Board expert, Mr. Elliott, is expected here in July in connection with Indo-British collaboration for the development of deep coal mines. He will be accompanied by four others, including the Chief Geologist of the Board, the head of production and development section of the Board and a shaft sinking expert.

COMPANY AFFAIRS

PHILIPS INDIA LIMITED

The Philips factory at Loni made a significant progress in local production of various radio components and metalware parts. The Company has taken steps to produce these components on large scale not only to meet its increased requirements for the manufacture of radio sets but also to sell substantially in the market. A four band transistor set produced by the Company at Calcutta was introduced. It is designed essentially for use in semi-urban and rural areas. It offers the owner a battery operated radio set with many added advantages including low operational cost. The manufacture of polyester ballasts in this factory is yet another step forward in the field of fluorescent lighting. Polyester, according to the Directors' report, has been used for the first time in this country for the production of ballasts. By this process it has been possible to reduce the size of the ballasts and also to improve the usual life and performance. There are also plans to manufacture a large range of specialised electronic instruments on a phased programme. Another special feature of the Company's manufacturing scheme has been that constant efforts are being made to feed small scale industries with a growing volume of orders for items which may be made by the ancillary industries with the Company's requisite technical know-how.

In December, the Company acquired the land, buildings and other assets of a lamp factory in Bombay which was previously owned by the Osler Electric Lamp Manufacturing Company Ltd. — now in liquidation. This factory was lying idle since 1958 and a team of experts belonging to this Company is now engaged in putting it in working order. The licensed capacity of this factory is nearly 5 million general lighting service lamps.

During the year 1960 there was a marked rise in the sales of the Company which was essentially due to expansion schemes introduced by the Company. The sales increased from Rs. 4.91 crores in 1959 to Rs. 5.55 crores in 1960. Profit for the year, before taxation but after providing depreciation of Rs. 19.04 lakhs, amounts to Rs. 62.96 lakhs. This compares well with the profit for the previous year of Rs. 58.82 lakhs. After making provisions for taxation the Directors have recommended the transfer of Rs. 2.90 lakhs to development rebate reserve. A dividend at the rate of 12 per cent, subject to tax, has been proposed by the Directors to be paid.

ANDHRA CEMENT

There has been an improvement in the working of the Andhra Cement Co. Ltd., Madras, during the year 1960 as compared to the previous year. The production and despatches were higher and naturally the sales too increased to Rs. 1.29 crores against Rs. 91.34 lakhs during the previous year. The net profit during the year came to Rs. 11.23 lakhs which was higher than the previous year by about 25 per cent. The Directors have proposed the payment of dividend at the rate of 10 per cent on ordinary shares, subject to tax, which will absorb Rs. 7.10 lakhs.

There were, however, certain restrictive factors operating against the achievement of rated capacity of production and the Company could not avail of improved market conditions. The Directors have pointed out that coal was the biggest handicap. Due to continuing short supplies of coal it was not possible to increase the production further. As normal supplies by road had considerably suffered and the Government

were advising the industry to draw supplies by sea-railroad, the cost of coal became prohibitive.

The Directors have introduced various improvements in the working of the factory and the mechanisation schemes for handling the raw materials at the mines are nearing completion and the supply has been extended to the quarries. The mechanised units are expected to go into full operation shortly.

AMAR DYE-CHEM

During the year to December 31, 1960, Amar Dye-Chem Ltd. recorded a profit of Rs. 62.11 lakhs after making provision for taxation etc. The Directors have proposed dividend on equity shares of Rs. 100 each at the rate of Rs. 12 per share. The proposed dividend on 20,000 new equity shares was at the rate of Rs. 7.50 per share. The sales of the Company's products improved slightly and went up from Rs. 1.72 crores in 1959 to Rs. 1.76 crores in 1960.

The Directors have succeeded in getting the loan of Rs. 15 lakhs in foreign currency for expansion programme. The import application for capital goods required for TPM plant has been submitted and licence is expected shortly. Moreover, the Company has been granted licence to manufacture 250 tons of reactive dyes and 260 tons of pigment colours. The Directors stated that the licensing committee has approved the application of the Company for the manufacture of 2,155 tons of intermediates and has recommended the issue of a manufacturing licence to the Company. The Company was granted licence in 1954 to manufacture 1,000 tons of betanephthol. The Government clarified the position that the licence was valid even this day and the Directors have decided to take up this project and the negotiations are in progress.

COMMODITY NEWS AND NOTES

RICE CROP

The final estimate of rice production in India in 1960-61 is of 49,600,000 tons (in paddy equivalent), some 4,000,000 tons above that for the 1959-60 season, says the Commonwealth Economic Committee's Rice Bulletin issued in London on May 30. The estimate of production is revised upwards by some 2,400,000 tons, mainly as a result of new estimates of area and production in Orissa. The bulletin says that figures indicate that trade in rice in 1960, excluding Chinese shipments to the Soviet Union, reached a post-war peak of 5,800,000 tons; exports so far reported in 1961 show some upward tendency, consignments from Thailand being large. During 1960, Burma remained the largest exporter, shipping 1,700,000 tons—still, however, below the post-war peak figure of 1956. Consignments from Thailand, which had declined from the total of 1,700,000 tons in 1957, recovered to 1,200,000 tons. India's total imports during 1960 amounted to 222,000 tons, more than 198,000 tons of this coming from Burma.

ANOTHER 2-LAKH TON SUGAR RELEASE

The Government of India has decided to release 2 lakh tons of sugar this month. There will be no release for free sale from the factories in Uttar Pradesh, Bihar and Punjab, except a small quantity which will be released to each factory for sale at the factory gate. Allotments of sugar to Madhya Pradesh, Rajasthan, Uttar Pradesh, Bihar, West Bengal, Orissa, Madras, Kerala, Maharashtra, Gujarat, Himachal Pradesh, Assam, Manipur and Tripura from factories in the controlled region will be made only to the nominees of the State Governments. In the case of Punjab and Jammu & Kashmir, allotments will be made direct to the State Governments or their nominees. Allotments to Delhi will continue to be made on the existing basis. Allotments will be made at prices fixed under Notification No. GSR 1112/Ess. Com/Sugar dated September 15, 1960 and GSR 1/Ess. Com/Sugar dated January 2, 1961. The controlled ex-factory price for U.P. and North Bihar factories is Rs. 37.85 per maund and for factories in Punjab and South Bihar Rs. 38.35 per maund for ISS D-29 grade with the prescribed price differentials for other grades. The fixed f.o.r. destination prices in respect of allotments made to Kanpur and Calcutta

will be Rs. 38.60 and Rs. 39.85 per maund respectively for sugar of ISS D-29 grade.

TEA PRODUCTION IN CEYLON

The production of tea in Ceylon in the 12 months ending December 1960 with 473,709,149 lbs. was the highest ever recorded. The previous record was 431,129,800 lbs. in 1959. This high production figure was due to the adoption of better planting methods by both estate owners and smallholders of tea. Under the impetus given to the growers to use fertilizers and to adopt pest control measures, more and more tea growers were becoming yield conscious and reaping good results. The average yield some time back was 740 lbs. per acre. A number of estates and smallholders now get up to 2,000 lbs. per acre. The highest yield recorded for a single month last year was in May with 46,587,395 lbs. Last year 182 million lbs. of tea was shipped through Trincomalee harbour on the East Coast of Ceylon. This amounts to about 45 per cent of the total exports of tea from Ceylon.

TENTH SESSION OF THE INTERNATIONAL SUGAR COUNCIL

The tenth session of the International Sugar Council was held in London recently. The Council made a careful statistical survey, and although its forecast of import requirements this year was substantially higher than the forecast made at its February meeting, it calculated that supply and demand this year would be closely in balance on the basis of present quotas. This balance (at about 8.5 million tons) will be achieved largely because several members are expected not to fulfil their quotas, and these shortfalls are not to be redistributed under the resolution passed in February. The Council also modified the rule by which it fixed its own official price. Until the meeting the price was calculated as an average of the London and New York prices. Now the Council has decided that when these two prices differ by more than six points, the lower shall be taken and three points added to it to make the I.S.C. price. Some such change had clearly become necessary, owing to the fact that the only major supply of sugar at present available to the free market is Cuban, and this is explicitly banned from New York.

Carrier gets star billing at Shanti Theatre, Madras

We're star performers here and at many other leading theatres. Not exactly show people. We're not seen. Not even heard! But we're there all the same. Keeping audiences cool and comfortable throughout the year.

We're air conditioning people. Play to packed houses. Add to box office receipts. Get rave notices about our sound performance. About our dependable Carrier equipment. The way Voltas engineers install and service every project. No need for press agents! Theatre managers (nice people!) often wax eloquent about us. "Carrier and Voltas," they say, "are the people who know air conditioning best".

Some other cinemas air conditioned by us:

Elite, Calcutta • Eros, Bombay
Filmistan, Delhi • Liberty, Bombay
Lighthouse, Calcutta • Metro, Bombay
Minerva, Madras • Naaz, Bombay
Radha, Calcutta • Relief, Ahmedabad

MEDICINE MAN MR. AL FOIL F.G.S.P.P.

"... Fellow of the Grand Society for the Protection of Pills" said Mr. Foil, greatly impressing the awed Chemist who had never heard of the degree before. "That is just one of many honours conferred on me", continued Mr. Foil modestly, "by Pharmacists for having rendered valuable packaging service to the medicine manufacturing industry. Whatever the pharmaceutical product, be it pills or potions, aluminium foil wrapping safely seals in the prophylactic and curative properties for long periods and effectively protects them from contamination, moisture and dirt ... And that," finished Mr. Foil, "is just what the doctor ordered."

Long and extensive
experience as
Manufacturers of
Aluminium Foils for
packaging goods
in the Cigarette,
Pharmaceutical,
Confectionery, Tea
and many other industries

VENESTA FOILS LIMITED

KAMARHATI, 24 PARGANAS, WEST BENGAL
Selling Agents:

Tea Chest Lining: WILLIAMSON, MAGOR & CO. LTD., Calcutta.

Foils and Container Sheet: INDIAN ALUMINIUM COMPANY LTD., Calcutta Bombay Madras and New Delhi.

Stability for Orissa

THE verdict of the electorate in Orissa has taken the entire nation by surprise. By all competent forecasts, there was little prospect of any of the two parties, which formed the coalition, winning a clear majority, not to speak of the other parties. The outlook, therefore, appeared depressing — a coalition yielding the balance of power to the smaller parties in the first instance and its eventual replacement by the President's rule. In either case it was a prospect of instability and retardation of progressive policies indispensable for the development of the State in any sphere. The surprise is that the electorate gave an unequivocal verdict for stability. This is very likely a case of robust commonsense influencing judgment in the right direction after the experience of the futility of the coalition.

Orissa had never been a stronghold of the Congress and never since Independence had the Congress (or for that matter any other party) been returned to the legislature with a decisive majority. The roots of this imbalance are to be found in a large degree in the feudal traces left on the political life of the State by the vanishing princely regimes and, even after their extinction, today the western districts bear witness to this phenomenon. But there is the other side to the medal — the deterioration of the Congress organization. Between the first and second general elections the Congress Party's influence was on the wane. The Ganatantra Parishad derived the greatest accession of strength from it, while the Praja Socialist Party and the Communist Party also benefited in a marginal degree.

The tables have now turned. The Ganatantra Parishad has retained 37 seats as against 51 in the previous House, the Praja Socialist Party 10 with a loss of 1, the Communist Party 4 as against 9 and the rest of the candidates 7, making a combined opposition strength of 58. Some regret will be felt for the total effacement from the legislature of the Jarkhand Party, which, with its 5 in the last House, stood firmly by the Congress Party, when its fate was hanging precariously in the balance before the coalition with the Ganatantra Parishad was formed. The electorate has swept the Congress into power with a solid strength of 82 in a legislature consisting of 140.

Soon after the honeymoon was over, the coalition in operation brought the painful realisation that it was to the benefit neither of the State nor of the Congress Party. The younger element in the Congress Party was convinced of the compulsion of having to make a supreme effort to re-

trieve the position. The first stage was accomplished with infusing order in the organisational wing of the Party. The tussle between the old and the young inside its ranks persisted with a vengeance after the emergence of Mr. Bijoyanand Patnaik as the Chief of the Pradesh Congress Committee. He led a sustained and powerful offensive against the continuance of the coalition as this marriage of convenience was fast turning to be awkward. The coalition broke under the weight of the attack from the dominant element in the organizational wing.

Mr. Patnaik launched another move to secure a mid-term election as procrastination until the general election might cost the Party dearly in terms of loss of self-confidence and prestige. He argued vehemently that the opportunity must be seized, but it was obviously not unaccompanied with possible risks. The decision was made, but not without hesitation and reserve. The struggle between the young and the old created a cleavage and as many as 35 dissident Congressmen contested the election as independents, while Dr. Hare Krushna Mehtab deliberately stayed aloof.

The outcome was not altogether predictable. Mr. Patnaik's organizational capacity and mastery over the Party's electioneering machinery were valuable assets. But the significance of Mr. Nehru's personal extra attention can hardly be missed. The thirteen election meetings which he addressed were a record for a State of Orissa's size and strength of the electorate. Reliance on the popularity and influence of the top leaders may pay rich dividends, but it is short-sighted policy. However, the electorate hardly had an alternative. It could not trust the Ganatantra Parishad to deliver the goods, while the remaining parties suffered from their stature.

It is a younger generation which is being called upon to assume the reins of power in Orissa. Political immaturity and lack of experience may quite likely involve errors of judgment with their possible repercussions on the administration. Their magnitude is minimised in the advanced democracies by a build-up of the second line of leadership. In Orissa the failure of the older leadership has hastened the inevitable experiment. Since it is inevitable in other States, too, the transition can be made less abrupt, if the change is incorporated in the ministries that will be formed after the next general election. Orissa's mid-term election has this profound significance for the whole country.

India's Mounting External Liabilities

THE Reserve Bank of India periodically surveys India's foreign liabilities and assets to determine the annual inflow of foreign capital both

on the official and non-official accounts. The latest survey published in May issue of the Reserve Bank of India bulletin outlines the mag-

nitute of the foreign investments in India upto the year 1959 alongwith some preliminary estimates for 1960. The Survey indicates that since 1955, India's foreign liabilities have nearly trebled, while the assets stand reduced to half. This may be illustrated with precise figures. The total external liabilities of the Indian Union by the end of 1955, both on the private and the official accounts, including the banking sector, were Rs. 714 crores only. By the end of 1960, they had risen to Rs. 1,914 crores. The rise during the last three years was, on the average, of the order of Rs. 300 crores per annum. On the other hand, the assets indicated a steady depletion from Rs. 1,226 crores in 1955 to Rs. 641 crores in 1960. The fall in India's assets and the rise in liabilities had the net effect of accumulating a debt of the order of Rs. 1,785 crores. It was in 1957 that the Indian Union had changed over from a creditor nation to a debtor nation. While the net overall investment position at the end of 1955 indicated assets of the order of Rs. 512 crores, the scales had turned against India by the end of 1960 indicating liabilities of the order of Rs. 1,273 crores.

The increase in liabilities occurred, by and large, on account of the official sector. It is common knowledge, however, that practically all the borrowed capital went into investment in the public sector undertakings. There are clear indications, because of the heavy need for external assistance for the Third Plan period, that this position of rising external liabilities is likely to shoot up during the next five years as well.

Which are the countries that lent funds to the official sector for India's economic development during the last five years? Here the United States of America has taken a lead over all the other countries. According to the preliminary estimates, the public sector liabilities to the United States of America were as high as Rs. 615 crores in 1960 as against a mere Rs. 92 crores in 1955. The United Kingdom occupied the second position with the level of India's liabilities at Rs. 137 crores, followed by West Germany at Rs. 105 crores and the USSR at Rs. 53 crores. A significant feature is the role played by the International Institutions in respect of which this country's liabilities are of the order of Rs. 213 crores — second only to those owed to the United States.

Salesmanship in Exports

ON the basis of an analysis of India's foreign trade over the past decade, the Planning Commission has arrived at four fundamental conclusions which have been set out in detail on pages 1402-06 of this issue. Apparently, there is hardly anything new about these conclusions. They have been discussed threadbare in numerous policy communiqués issued by the Government in the recent past. Even when the disease has been diagnosed, there is something wrong with the prescription of the remedy or probably with its application; otherwise export earnings would have responded to the treatment.

The four basic points discussed by the Planning Commission, namely, curtailment in domestic consumption, mobilisation of public opinion in favour of exports, diversification of the export trade, conducting of marketing surveys abroad and making the industries more competitive miss the one basic cure of aggressive salesmanship. There is ample evidence to show that it is the lack of a concerted policy in salesmanship which has been responsible for the failure to produce

The countrywise preliminary figures for foreign business investment in the private sector are not available for 1960, but the firm figures available for 1959 indicate that the United Kingdom alone accounted for nearly two-thirds of the total business investments. Out of the total investment of Rs. 611 crores at the end of 1959, the U.K. alone was responsible for Rs. 400 crores. The I.B.R.D. and the United States came next virtually as equals with Rs. 83 crores and Rs. 82 crores respectively. The inflow of business capital when analysed according to industries showed a high preference for manufacturing industries, though petroleum alone accounted for nearly one-fifth of the total. A large number of miscellaneous industries employed nearly one-third of the total investment.

The rate of foreign investment both for the public and the private sectors was more than Rs. 350 crores per annum during the last 3 years of the Second Plan. In the Third Plan, it is likely to be a little higher than Rs. 500 crores per annum. The loans promised by the Aid-India Club for the first two years of the Third Plan and the anticipations in respect of the last three years of the Plan indicate that external assistance of the order of Rs. 2,600 crores envisaged for the Third Plan will be available. The basic fact which needs to be stressed is that the repayment of these debts is likely to be a big drain on India's future foreign exchange earnings. It is reasonable to expect that the repayment of the loans for the Third Plan will be spread over a long period to avoid a sudden and severe strain on India's balance of external payments. Nevertheless, it is here that fresh thinking needs to be undertaken now so as to prepare the country for the contingency of outflow of the capital of this spectacular size. The strategy must be planned from now on inasmuch as increasing the capacity of the economy to develop the potential to earn foreign exchange is an arduous and time-consuming task. The industrial structure of the country must be moulded afresh so as to make it export-oriented. In a subsequent article, this aspect of the problem has been discussed. In the self-sustaining economy a high priority will have to be given to the accelerated expansion of the export surplus.

helpful results in the case of both traditional and non-traditional commodities. It is defeatism to think that India's traditional exports cannot be pushed higher. In fact, even today they can capture new markets if salesmanship of the right type and order could be mobilised. The sale of tea is a case in point. It was assumed erroneously by the Tea Board that in a country like Italy there is no scope for sales; but it has been demonstrated that, with aggressive salesmanship, Ceylon has succeeded in exploiting that market. Today, no one in Italy talks of "Indian tea". It is "Ceylon tea" everywhere.

The art of salesmanship has been very well cultivated by certain other nations, particularly, Japan. All over the world, the Japanese firms have earned a unique reputation for their dogged perseverance in pursuing the sale of their products. In every major city in the world, the Japanese salesmen are to be found knocking at the doors of prospective clients till they capture orders for their firms.

The Indian industrialists have succeeded in making their entry into certain markets, but they have committed the costly blunder of not following up their sales to consolidate and expand those markets. This has been a grievous failure. In the field of the light engineering goods, Indian industrialists were able to carve out a place in the international market because of the competitive character of their goods, but a poor follow-up technique has caused a loss of the market as readily as it was acquired.

But enterprising salesmanship can produce enduring results only if the products offered in the export markets are of acceptable quality, justifying the prices demanded. Indian goods can enter and consolidate their position in the international markets on the score of competitive prices and superior quality. This is the burden of various official and non-official marketing surveys in the European countries in respect of the products

The Muslim Convention

THE present is a delicate phase in the political life of the country fraught with the danger of a recrudescence of communalism. The potential threat which it holds to the state has brought a sense of urgency in making an agonizing appraisal of the forces that have been responsible for it. The appointment of the A-ICC's Committee on National Integration and the prolonged discussions that followed its report are clear pointers to the gravity of the situation. It was inevitable that the Muslim community should feel the necessity to give a vent to its feelings.

But the Muslim convention held on June 10 and 11 can hardly be explained exclusively in terms of this phenomenon. The developments at Jabalpur and elsewhere combined to create a sense of serious apprehension in the minds of the members of this community. They obviously provided the immediate occasion for holding the convention. But there were other important factors responsible for it. The Jamiat-i-Islami saw in this situation an opportunity to make a bid to capture mass support among the Muslim community. It is common knowledge that the idea of the convention was mooted by this organisation. The Jamiat-ul-Ulema with its known secular complexion could hardly allow its case to go by default. It was virtually hustled into endorsing the idea of the convention and considerable activity went behind the curtain before an agreement was reached to send invitations to the delegates in the individual names of the leaders and not on behalf of the two parties.

The outcome has not been as embarrassing as it was apprehended. Most of the delegates, who took prominent part in the open sessions of the convention, exercised realism, moderation and restraint. There was no doubt some display of irresponsible attitudes as disclosed in the charge levelled against the Government of keeping the Muslim community economically backward under planned development. Such outburst of temper is perhaps excusable where multitudinous delegates participate in the deliberations. But it hardly represented the deeper mood of the community.

Feelings which disturbed the minds of the leaders who had assembled were freely ventilated and grievances found a prominent place. In essence, a fairer deal was demanded in the matter of education, employment in public ser-

offered to highly sophisticated consumers in these markets. While a number of individuals and delegations from this country have visited the foreign markets during the past few years, they have not, it seems, imbibed the vital lesson of attention to quality. It is unfortunate that a domestic market insulated from external competition and subject to tight supplies should divert attention partly from the markets abroad. This attitude is detrimental to the long-term stability of our export trade.

In our frantic search for an effective export drive we have got lost in too many committees, councils and delegations and tended to pay insufficient attention to business-like remedies. The establishment of export houses is a case in point. A stronger instance is the proposal of linking imports with exports. It implies an element of compulsion to export and austerity in consumption. But this price is not high for the results it will procure.

vices and in business and industry. They betray some confusion of kind. It is not at all clear how it lies within the power of the Government to entertain the grievance in respect of better placement of the members of the community in trade, commerce, and industry. These are essentially matters in which individuals have to raise themselves by their boot-straps. Likewise full and equal access to opportunities for education is available to all irrespective of any affiliations. If the present level of education of any community is not up to the national average, it is obviously a handicap handed down by the historical past.

It would appear that the demand for greater opportunities for education and larger scope for employment in the public services, presumably on the basis of reservation, has been encouraged by the policy which is being pursued by some of the State Governments in relation to what are presumed to be backward classes. If there are specific cases of discrimination shown against this community, the State Governments certainly owe a duty to investigate them and grant redress where it is due. But it cannot be ignored that the policy of reservation is repugnant to the ideal of a secular state and the transition during which it is to enure ought to be terminated in regard to all the classes within the shortest possible period of time. The crutches of concession produce a sense of diffidence and privilege, from whatever source it may be derived, creates vested interests which seek to perpetuate it.

But in its broad approach the convention took a helpful attitude in giving the right lead to the Muslim community to align itself with the forces of secularism. It denounced the communalism of all organisations of any complexion. The main resolution which the convention adopted made a fervent plea for national integration calling upon the members of the community to pull their weight in the hard struggle for its consummation. National integration is as much an emotional problem as it is a social and economic challenge. The pre-requisite of its achievement is an orientation in the outlook of all the communities in the population. The appeal made at the convention for more vigorous identification of Muslims with parties based on political and economic ideologies shows the correct way out of the present state of confusion of mind.

THE WEEK'S NOTES

Port Labour

STRIKE WITHDRAWN

THE PROJECTED strike of the port and dock workers on a nation-wide basis, which was to commence on June 15, has been withdrawn. This is a sequel to the negotiations carried on between Mr. Raj Bahadur, Minister of State for Transport, and the trade union leaders. The basis of the compromise is the acceptance of the report of the Jeejeebhoy Committee's recommendations in its report, recently released. It was in pursuance of the agreement reached by the labour leaders with the Prime Minister in 1958. If the trade unions showed unseemly haste in issuing the strike notice without exploring any other means of settlement, the Government can hardly escape blame for letting the relations deteriorate by the leisurely manner in which it was dealing with the Jeejeebhoy Committee's report after it was tendered to it. Apparently, the extreme step taken by the Union hustled the Government into releasing the report.

From the published summary, it is obvious that the Committee has spared no pains in doing full justice to its very onerous and complicated task. The Jeejeebhoy Committee has evolved a comprehensive scheme for the emoluments of port and dock labour on an all-India basis. This is not to say that there is no room left for regional modifications. Within a narrow range differences in wages, justified by regional or local conditions, are bound to result. But the outstanding contribution of the Committee is that regional disparities, which are grossly in evidence today, have been reduced to the bare minimum. Because of this objective, the distribution of benefits from the Committee's recommendations will produce varying impacts on the workers' pay-pocket at different ports. Calcutta port stands to gain utmost, while Madras and Visakhapatnam come next. On the lowest rung of beneficiaries come the workers from Bombay Port. This rectification was long overdue.

There can be no going back now on the report of the Jeejeebhoy Committee by any of the parties. Press reports indicate that a section of the trade union leadership maintains the view that the issue of basing the revised pay scales on the recommendations made by the Second Pay Commission is still open because there are divergent views about it. The divergence, if any, exists between the different unions. The Bombay Port Trust Union is opposed to the application of the Pay Commission's formula. But the Government has made its position clear that autonomous corporations or enterprises must be governed by their own pay scales.

By the very complicated and comprehensive nature of the revision of scales, precise calculations of the new emoluments will require time. But the history of the dispute utters a warning that inordinate delay in implementing the recommendations may unsettle the happy relations now established.

Geneva

ANOTHER DEADLOCK DISSOLVED

THE FIVE-DAY long deadlock at the Geneva Conference on Laos has been dissolved and the work of the conference has been resumed. The capture of Padong by the Pathet Lao forces was by any test a major violation of the cease-fire agreement and the

Western allies could not be expected to pursue the peace talks under the indirect threat of war. Effective cease-fire is an absolute pre-condition of the uninterrupted course of negotiations at Geneva, but the problem of securing such a cease-fire seems difficult.

The violation of cease-fire was indulged in by the Pathet Lao for no other purpose than that of bringing high pressure for the formation of a coalition government in Laos. It is to repeat the obvious to state that a coalition holds the key to a real solution of establishing a neutral Laos. But a coalition would hardly be a real solution, if the parties to it do not demonstrate their bona fides to observe solemn agreements. The Pathet Lao's seizure of Padong raises an important question: What sanction is there that it will respect the neutrality of the country after the coalition is formed? An international guarantee for this purpose is imperative. The Geneva conference has to hammer out a solution to this end. It would, however, be naive to suppose that the conference will have smooth sailing in the pursuit of this goal and a few more deadlocks like the last one may not be ruled out. On the very first day of the resumed session, Mr. Gromyko declared his government's opposition to vesting the International Control and Supervisory Commission with greater powers for effective functioning on the ground that it did not want to turn the Commission into a super power to guard Loatian neutrality and independence.

Kerala Speakership

CONVERSION OF CONVENIENCE

LIKE MARRIAGE, conversion of political faith has its variety. Sometimes conversion may be genuine, based on a conscientious change in conviction; but on occasions it may also be for sheer convenience. Mr. Mohammed Koya, who was elected Speaker of the Kerala Assembly on June 9, was the leader of the Muslim League Legislature Party, and he, of all the persons, was the least expected to undergo a quick metamorphosis in faith. But as soon as the Congress High Command gave the green signal to the State Congress Legislature Party to support an independent candidate of the minority community, Mr. Koya announced his change of faith — as much in the interest of his own former party as to oblige the Congress Party.

Out of 127 seats in the Kerala Legislative Assembly — with one more rendered vacant at present by the death of the former Muslim League Speaker, Mr. Seethi Saheb — the Congress holds 64, the Praja Socialist Party 17, the Muslim League 10, making a total of 91 for the coalition parties (now euphemistically called the "alliance"), while the Communist Party holds 29, the Revolutionary Socialist Party 1 and Independents 5. Looking at this balance in the strength of the parties, one may wonder whether some sort of understanding with the Muslim League is at all indispensable for the Congress at the present time. But obviously it has to keep the unpredictable stability of party alignments in the State in view. There is an immediate consideration also. The municipal and panchayat elections in Kerala which are to be held shortly seem to have weighed with the Congress in not alienating the Muslim League — and the general election is not far off. The Congress Party may create an illusion that it has observed the Durgapur directive

not to have any truck with communalist parties, but it will be for itself only. In this sorry drama, the Muslim League Party has emerged with enhanced reputation for a spirit of accommodation. Last time it gave up its claim to a ministerial seat and rested content with the Speakership of the House. Now it has shown accommodation by allowing the conversion of its leader on the plea, which its spokesmen have taken the precaution to publicise, that this price cannot be grudged in the interest of the democratic alliance.

All India Radio

THE TWENTY-FIFTH MILESTONE

A LITTLE more than half the career of the All-India Radio belongs to the post-Independence period and this in reality is the major period of its development with vitality. On the eve of Independence, the AIR operated only with 6 radio stations, but today their number has rapidly grown to 28 with 60 transmitters. As the project of installing 57 more transmitters will be completed in the near future, the AIR will serve seven-tenths of the country's population. The range of its news broadcasts in the regional languages at home covers 97 bulletins and the foreign broadcasts have now reached the figure of 16. This story of development in figures does not complete the full picture of the AIR's real achievement as it celebrates its silver jubilee. Its cultural programmes have attempted to forge some sort of unity in music, art, drama, and so on. In the domain of music, it has attained good results. It has introduced the Karnatak music to the North and the Hindustani music to the South.

But there is something to be recounted on the other side of the balance-sheet. The attempt to bring unity in diversity has proceeded in somewhat artificial directions and one cannot fail to see in it a lack of organic growth. There is the important issue of the quality of the programmes. It may even be questioned with sincerity whether the quality does not reflect the choice of some of the commentators and artists and others invited to broadcast. This weakness is not lessening, but it may threaten to increase. It would appear that one major handicap from which the AIR suffers is its basic character as an appendage to the Government. Whether it is in the field of reporting the activities of the party in office, or in the presentation of the news or other programmes where non-official commentators are concerned, there is a deep lurking fear that the views may be attributed to the Government, since they are allowed to be expressed over the AIR. The AIR has to make up a tremendous lee-way to develop its news service with initiative and enterprise to establish its independent personality. Summaries of ministerial speeches and their activities are broadcast not necessarily within the limits merited by their importance. Healthy publicity of the five-year plan projects has become a vital function of the AIR, but the adoption of the line of convenience has produced a tendency to harp on the plan targets with relatively less attention focused on progress or otherwise. The demand for the conversion of the AIR into an autonomous corporation has ceased to be a hardy annual during the discussion on the budgetary demands for lack of responsive consideration. But has it ceased to be a genuine issue?

Punjab

AGGRESSIVE DEFENCE

MR. PRATAP SINGH KAIRON'S unexpected action in rounding up fifty Akali leaders in different parts of the Punjab speaks for great indiscretion. In his Press

conference he failed to give any reasonable explanation of the circumstances which forced his hands to take this drastic step. When the opposite party is poised for an attack, it may be an appropriate strategy to launch anticipatory action by way of an aggressive defence. But there is no evidence that the Akali Dal was in a position to organise its forces for direct action or even a morcha. Mr. Kairon's assertion to the effect that internal dissensions render the Akali Party incapable of undertaking an organized move fits ill with the precipitate step he has taken. In the aftermath of the fiasco of the last Akali morcha, its ranks have still not been able to overcome their sense of frustration with their leadership. The present is one of the phases in which the hold of the Akali leaders on their followers is weak.

This may perhaps explain why Master Tara Singh hit upon the emergency strategy of fast unto death. It is some satisfaction, however, that it has been scheduled to start after a long time on August 15. A fast may very likely cause an emotional wave of agitation, but the Government can hardly allow itself to be coerced by it. Precisely for this reason, Mr. Kairon ought to have stayed his hands. He should have taken the angry, but empty, speeches made by some of the Akali leaders for what they are worth. But by taking the unwarranted and hasty step of large-scale arrests, he has provided them with the slogan of unprovoked suppression as a rallying cry.

Germany

QUEERING THE PITCH FOR TENSION

THE INSCRUTABLE character of Soviet intentions in its diplomatic moves was vindicated at Vienna. The memorandum on Germany and West Berlin, handed over to Mr. Kennedy by Mr. Khrushchev at Vienna, along with a separate memorandum on a treaty for a ban on nuclear tests, leaves little doubt that Mr. Khrushchev wanted to revive the issue of German re-unification and the status of West Berlin to create further tension and, if possible, to give a jolt to Western solidarity. There is hardly any other inferable intention behind the memorandum since Mr. Khrushchev had ceased to talk about German re-unification for quite a long time now.

There is little that is new in the proposals contained in the memorandum. Mr. Khrushchev has made it clear that, if East and West Germany do not come to an agreement on re-unification, the Soviet Union would reserve its discretion to enter into a unilateral peace treaty with East Germany. This would be preparatory to perpetuating the division of Germany. As for West Berlin, the suggestion in the memorandum for stationing of the "symbolic contingents" of the four big powers to safeguard the free status of West Berlin is tantamount to asking the Western powers to abdicate their obligations in West Berlin and to vacate their rights—obligations and rights which are grounded on solemn international agreement. West German reaction to these proposals was quite obvious and Dr. Adenauer quickly issued the official rejection of the plan. The implications of the Soviet proposal are that once a separate treaty is signed by it with East Germany, the Western powers would be driven to approaching the East German authorities for continuance of access to their protective troops in West Berlin. The question of communications with West Berlin would thus be left to the arbitrary decision of East Germany. The proposals are not calculated to help a solution of the problem.

The World Abroad

INVESTMENT IN HUMAN BEINGS

By
ODYSSEUS

IN MEDIAEVAL TIMES to be the messenger of a general was a tricky job. If you reported a victory to the emperor, he would reward you with whatever loose jewels or gold mohurs that he had handy. But if you bore news of defeat, the emperor was likely to vent his anger on you by having you executed on the spot.

I was reminded of this when I finished reading "Indian Economic Policy and Development" (Allen & Unwin, London, 1961, 16sh.) by Professor P. T. Bauer of London University. This book offers a strong and detailed indictment not only of India's planning targets but of the methods employed. Professor Bauer observes that advocates of foreign aid to developing countries have "until recently" considered it axiomatic that aid should be given regardless of the policies pursued by the recipient government. Professor Bauer says bluntly that any suggestion that foreign aid should be granted to underwrite Indian economic planning should be rejected — not because of the cost to the U.S.A. and to the West but because of the cost to India. Because such aid would push India further towards a completely socialised, totalitarian, economy, in which the range of choice of individuals is severely limited, both as consumers or producers, and in which the state is all powerful; and this political result is being promoted by an economic policy the most important parts of which do not promote either a rise in living standards or progressive modifications of an obsolete social structure, but retard them.

After some hesitation, I decided that I would be failing in my obligations to you if I did not report the Professor's arguments in some detail, because they are not put forward by some obscure crank but by a leading economist, whose views are influential. My role is that of the messenger who reports, because the Professor makes out a case, which must either be answered — or accepted.

WHAT IS "INVESTMENT"?

The Professor begins by pointing out that the widespread idea that development depends essentially on investment is responsible for enormous waste in all developing countries. By wrongly justifying all expenditure called "investment", it encourages spending regardless both of cost in terms of alternative uses of resources, and of the repercussions of their transfer. Indeed, in current talk, all expenditure, other than on current consumption or government services, is called "investment" and regarded as productive of income. This encourages (a) wasteful expenditure, and (b) a wide range of controls in the belief that they are necessary to permit a particular level of investment expenditure. These controls are likely to hinder (a) the economic allocation of resources and (b) their growth.

An even more important consequence of this obsession with investment expenditure is that it leads to the neglect of other factors which promote development, such as the expansion of resources other than capital, the spread of the exchange economy, of education, primary and technical, of the movement of persons between districts and regions, and the emergence of

the attitudes of mind needed to make a modern economy work.

The Professor is thinking here of the caste system. He readily concedes that, historically, caste served valuable social and political purposes. But it is incompatible with a modern exchange economy. It wastes talent by preventing large numbers from pursuing more productive work than that in which they are engaged; it restricts occupational mobility; it sows the spread of new ideas and methods. By restricting the tasks which individuals or groups may perform, it results in an enforced uneconomic division of labour, and in unnecessary or enforced duplication of equipment, including even simple tools, when these can't be used by members of different castes. In particular, the members of the Scheduled Castes are officially estimated at 51,000,000, but unofficial estimates, such as those of Professor R. Mukherjee, suggest that the total is nearer 70,000,000. The disabilities of such a substantial proportion of the population constitute an important economic burden.

Professor Bauer says that the Central Government is trying to relax the hold of caste by propaganda, as well as by special educational facilities for the Scheduled Castes, and by the construction of some wells for them. "But", he asserts, "the effort . . . is very limited". Moreover, the operation of various economic controls, especially the licensing of industrial and commercial activities and the restrictions on the movement of agricultural products and on the activities of traders, obstruct circulation between districts and regions and between occupations, which slows up the disintegration of the caste system, and of the uneconomic attitudes of mind that go with it. Various restrictions on emigrations also diminish opportunities for individuals to move away from some of caste's most powerful strongholds, especially in south India.

SLAUGHTER OF CATTLE

Professor Bauer notes that recent legislation has prohibited the killing of cattle in various States, including Uttar Pradesh, Madhya Pradesh, Mysore and Rajasthan. Elsewhere there are often municipal ordinances prohibiting slaughter. The Uttar Pradesh law, he says, also prohibits the sale, or transport for sale, of all beef products. Besides its immediate effects in decreasing India's already scanty food supply, the attitude promoted by these new laws restricts the scope of animal husbandry, decreases the supply of milk, and obstructs progress in agriculture. The net result is 180,000,000, or one quarter of the world's total — which compete with the people for food.

Professor Bauer estimates the number of beggars in India as one million. He points out that their uneven incidence among different ethnic groups suggests that this large number is not solely a result of India's poverty. There are no beggars among the Parsees and few among the Sikhs. The beggars represent a mediaeval attitude incompatible with a modern economy and are a burden upon it. The absence of any social stigma in begging and the popularity of religious mendicants,

cants, says the Professor, are linked with the contemplative, non-experimental, and fatalistic outlook of large sectors of India's population, and this also slows economic advance.

The Professor lists other social customs, such as the joint family system, which obliges even modestly prosperous people to share their income with even distant relatives, and severe restrictions on the activities and opportunities of women. He emphasises that his object in so doing is merely to catalogue the many factors — other than a lack of investment capital — which impede India's economic advance. He points out that, given the opportunities, Indians are just as capable of energy and enterprise as any people in the world, as is proved by the enormous commercial and industrial success of many millions of Indians who have emigrated to other countries, where such qualities as industry, thrift, endurance, and the ability to exploit economic opportunity, are not frustrated by unprogressive social structures. The outstanding success of Indians abroad, he says, "suggests both their capacity for economic advance, and also the stifling effects of their home environment."

It is equally his contention that the governments could do much to promote attitudes that help material progress, loosen the bonds of custom, and to widen the alternatives open to people by the spread of education and the improvement of communications.

It is equally his contention that the Government's Five-Year Plans, far from promoting material progress, widening social horizons, and opening up more and more opportunities for the individual to exploit, are actually serving to consolidate the forces of inertia. He condemns the planners' constant over-emphasis on investment in physical plant, and the neglect of the development of human capital, both by formal education and by modifying the traditional attitudes which restrict the activities, energies, and individual enterprise of the people.

The massive investment in establishing capacity in the heavy industries is, says the Professor, unlikely to promote development commensurate with its cost.

One reason for this is neglect of education. The development expenditure on education in the Second Plan is between one-third and two-fifths of that on the large and medium industries in the public sector. Development expenditure on elementary education is about half the cost of the three public sector steel plants; it is less than the corresponding figure in the First Plan, despite the rise in prices, the increase in population, and doubling of total planned outlay. The small expenditure on education affects not only its amount but its quality. About one-third of elementary school teachers are completely untrained, and school teachers have very low incomes and status. In contrast to its enthusiastic references to heavy industry, the Second Five-Year Plan (page 505) says that the pace of improvement in education is to depend partly on "local contributions" and "local community efforts". Under the Plan's targets by 1960-61 only 22.5 per cent of children between the ages of 11 and 14 were to receive free, compulsory, primary education. (One wonders how far this target has been achieved).

Professor Bauer would like to see a bigger educational effort linked with measures to increase productivity, especially of agriculture, because he considers that education is essential to attack the anti-economic aspects of the social structure. He also notes that India's ability to use the vast and potentially invaluable fund of Western technological and administrative knowledge, vitally important for economic advance, is substantially reduced by prevailing attitudes, especially in the rural areas.

With education, the Professor links roads as vital to social and economic advance. India's roads are inadequate in extent and in quality, and investment in their improvement is urgently necessary to widen the human contacts of hundreds of millions of villagers. I agree with the Professor that this would help to spread the exchange economy, and I add that it would also help to counter the separatist tendencies that exist in India.

Next week, I will report some of Professor Bauer's criticisms of India's actual planning. Meanwhile, don't shoot the messenger.

The European Scene

HOW TO READ THE FINANCIAL JOURNALS

From Our Special West European Correspondent

PARIS, June 10.

ONE of the perplexities of the West European business man today is the veritable avalanche of economic information that comes pouring over his desk. Financial journalism was always well developed on the Continent, where every capital has more economic dailies and weeklies than London (most of them of little value whereas none can boast single publications of the prestige and reliability of the 'Economist' or the 'Financial Times'). The Common Market has swollen this flood, and the harassed business man finds himself confronted with a rising tide of literature in four or five languages. He experiences, in the face of it, both irritation and awe because he knows that somewhere in that pile of print there is information that is absolutely vital to him, and yet he cannot hope to read half of it. The British business man is slightly better off, in that his sources of information are fewer, more dependable and more succinct, but even he could not hope to get his work done if he had to read through most of the first-class information available, plus the specialised papers that relate to his own trade, plus the foreign material (British business trades more widely than any other, and thus has more markets to watch than the "insular" North Americans or Continentals).

The Indian business man, to his loss, seems to be better off still, in that the quantity of information at his disposal is relatively modest. This is not the fault of the financial press, which probably provides most of what is available, but of the unorganised, poorly integrated and undeveloped state of the Indian economy. Even so, the volume of material now at the disposal of the Indian business man (and it is increasing regularly) is more than he can cope with unless he knows how to get the best out of it. The old system of giving the morning paper and one or two financial weeklies to a babu with instructions to underline in red ink every reference to the sort of goods the firm makes, no longer suffices because he might faithfully underscore every mention of "jute" or "diesel motors" but he would probably skip stories about money supply, plan allotments, new advances in bulk handling and the monthly foreign trade figures.

In sum, the problem of getting the most use out of the mass of business literature at hand confronts, in varying degrees, business men everywhere. I suppose the only background that could really guarantee that a business man read his financial press to the best advantage would include a degree course in economics, a year in a bank, a stockbroker's office and on the staff of a business paper, some special training on the compilation of index numbers, plus many years' experience in his own line of business. This being impossible, there must be a reader guide. Someone has written a book called "How to Read a Financial Paper," which should be compulsory for any business man who thinks such a book unnecessary. Some organs of the financial press over here have lately been looking into the question, with the aim of improving the service they provide and of assisting their readers. The leading Italian business daily conducted a readership survey to find out how people made use of its columns, and a French economic weekly has just held a round table of bankers, business men and officials to decide just what information an entrepreneur should take note of in his reading. In attempting a

synthesis, I realise I shall make the two contrary errors of telling some people what they already know, while recommending attention to indicators that do not exist in India. My excuse is that the business man must have some sort of systematic approach to that pile of print he finds on his desk, and all good systems include both the banal and the impossible, the obvious and the ideal: you start with a system and go on from there.

I have known operators in the Calcutta stock market whose system for reading the business papers was simple: you scanned the weekly Reserve Bank statement for the note supply, arguing crudely that a bigger circulation meant inflation and thus higher prices for almost everything; you kept tab of the monthly jute goods statistics and the reports of the iron and steel companies; for the rest, you relied on gossip. This is all right as far as it goes (though I hope illusions on the first point have now been removed) but it does not go far enough. Instead, the studies referred to suggest a ten-point programme for reading the business news — to which I shall add another.

The first is definitely forecasts by the Government or Planning Commission of movements in the gross domestic product over the coming year and over the remainder of the plan period, plus whatever clues they give about the likely evolution of industrial production, investments, consumption and exports. Experience has shown that these figures are not gospel truth, even in West Europe where national plans (for all that they have less coercive force than other plans) have on the whole made sound predictions. But then no one indicator, even if of perfect accuracy, is enough by itself to determine action in business; the art is to frame an opinion after studying a handful of indicators, which may contradict each other over the short run. Of that handful, the global predictions of government and its planners are definitely the most important. In many industries, no man has the right to frame an investment programme or a sales campaign unless he has taken account of official forecasts of the movement of the GNP in the relevant period, plus, if available, the other forecasts mentioned above.

The second piece of information concerns the state of business confidence. In every country some institution makes a periodic survey of the expectations of business men about (a) the evolution of the whole economy and (b) the evolution of their own branch, over the next quarter, or some such period. These are most valuable when completed by indications about the volume of investment contemplated in that period and about the likely course of demand, as well as output. Here again, such forecasts are not foolproof: a perfect sample of business men can be wrong about their affairs in the next quarter. But they are infinitely more reliable than the informal and haphazard sentiment-testing that business people indulge in all the time: "I met so-and-so last night and he thinks such and such".

The next three points all relate to the demand for labour. Statistics are published over here for the length of the average work-week, both for all industry and for special branches. Failing consolidated statistics, all the information available is valuable because variation in the last few hours of the work-week (e.g. from 48 to 46 hours) is the most important single

Steam...

Industry's greatest power

SINCE 1782, when the first Rotative Steam Engine enabled the use of steam power to motivate machinery, steam has played an ever increasing part in industry throughout the world.

Not only is steam today's most important source of power for the civilised world, but it must remain so for many years to come. Even atomic power is yet in its infancy and can only be applied as an alternative source of heat. Steam is indeed the real power of industry.

While this is but an outline of the extensive and continually growing part that steam plays in power generation and industry throughout the world, it indicates quite clearly the unparalleled importance of steam power in the industrial growth of India...and, therefore, the urgent need to manufacture vital steam-raising plant in this country to meet the demands of expanding industry.

This is one of the needs which has led to the formation of a new and powerful industrial group, ACC-Vickers-Babcock Limited (AVB). The vast technical knowledge and extensive practical experience available to it will enable the new company to make an important contribution to Indian industry—and help Indian engineers overcome some of the difficulties which have faced them for so long.

The new AVB plant is nearing completion on a 700-acre site at Durgapur. The workshops, designed on modern lines, will have built into the structure electric overhead travelling cranes with 70 tons lifting capacity. All workshops have been designed to allow for progressive expansion so that it will be possible to lift 200 tons without making structural alterations. Up-to-date machine tools are being installed. When completed, they will include a 3000 ton hydraulic press capable of bending steel plates up to 5" thick for use in the manufacture of high pressure boiler drums, and pressure vessels required for the fertiliser, chemicals and oil refining industries. The new plant will make it possible to manufacture steam-raising equipment in the high pressure range—for the first time in India.

ACC-VICKERS-BABCOCK LTD. offers the industrialist his best chance to ensure a fully integrated installation comprising the boiler plant itself and a wide range of equipment from the fuel handling and preparation plant to the ash plant and dust disposal installation.

Besides, the industrialist has the confidence that he will get after-sales service of the highest quality from AVB!

Economic Report from the U.S.

STUDY ON INFLATIONARY TRENDS

By GUY SIMS FITCH

WASHINGTON, June 6.

NOW that the United States economy has begun moving up strongly again, that old word inflation also is beginning to be heard in the land. Not that many experts really believe that inflationary forces, which could accompany a sharp rise in demand for goods and services, are an imminent threat. But they are not ignoring the possibility. This is all to the good, since, in the words of the old adage, forewarned is forearmed. Thus, in President Kennedy's recent message to Congress on meeting urgent national needs, one finds both an assurance and a caution about inflationary dangers. Assurance lies in the current availability of industrial capacity, manpower and material resources. It offers the promise of further significant increases in economic activity and demand, without setting in motion serious inflationary forces. Caution lies in the possibility that unjustified price and wage increases during economic expansion could release those forces. Such increases, the President noted, would handicap not only full recovery at home, but also the U.S. ability to compete abroad. This latter point obviously refers to the need for maintaining the high level of U.S. exports, a strengthened balance of payments and gold position and international confidence in the U.S. dollar.

Much has sometimes been made of the fact that the U.S. dollar has been losing buying power at an average annual rate of about 2.1 per cent during the past decade or so. Now comes a study by the first National Bank of New York which shows that in actuality the U.S. dollar has fared rather well. This is particularly true in comparison with other currencies. Of 43 currencies examined, the dollar ranks seventh in its annual depreciation. Of the industrialized nations, only Belgium and Switzerland have shown better records. About on a par with the United States is West Germany with all others following behind, some by rather wide margins. Clearly then, inflation has not been unique to or particularly pressing in the United States. This is especially noteworthy since

United States activities in support of the security and prosperity of the free world have tended to exert pressure on the economy and on the dollar's buying power. In addition, the rather sophisticated mixture of measures to keep business dips under control and yet further economic expansion has tended to support not only economic activity but also to push living costs up. The basic question, to many economists, thus is not whether living costs have risen but whether the rise has been moderate and how it has affected the welfare of the American people. In the light of the first National City Bank Study, one can safely say that the shrinkage in the dollar's buying power certainly has been moderate. As to economic well-being, the average American has experienced a steady rise in the purchasing power of his earnings. Over the years, increase in all types of income, but most particularly in wages and salaries, has far exceeded the loss in the dollar's value. A study by the International Association of Machinists (IAM), one of the nation's leading labour organizations, shows, for instance, that since 1938 the cost of living has more than doubled, but that at the same time factory wages have gone up from an average of 63 per cent an hour in 1938 to \$2.32 an hour in 1961. What is more, in terms of the working time it takes to earn the necessities and luxuries of life, the factory worker has made spectacular progress. Of 27 items studied by the IAM, only two—hospitalization insurance and a new automobile—cost more in working time today than in 1948. The bulk of all other goods and services—from a quart of milk to a five-room house—has become less expensive in terms of working hours. In all this, an enlightened government policy has had its influence. Through experience and widening knowledge, the U.S. Government has learned to sharpen its administrative tools so that it can stimulate economic growth while keeping inflation under reasonably close control. This certainly is one of the major objectives of the Kennedy Administration. Given the past record and the present intent, inflation should have little influence in a U.S. economy geared to continued growth.

Pectin and Tartarate from Tamarind Fruit Pulp:

A process on pectin and tartarate from tamarind fruit pulp has recently been developed at the Central Food Technological Research Institute, Mysore. Tartaric acid and its salts like potassium sodium tartarate are extensively in use in various food, pharmaceutical and chemical industries. Pectin is used for the manufacture of fruit products like jams, jellies, preserves and marmalades. Indigenous manufacture of tartaric acid, its salts, and pectin is expected to effect considerable saving in foreign exchange. Both liquid and powder pectin samples were tried in jam batches of raspberry, strawberry, grapes etc. The pectin was found to be suitable for the purpose. Major raw material required for the process is tamarind fruit pulp which is available in the country. Other raw materials, alcohol potassium carbonate, hydrochloric acid and sulphuric acid are also readily available in India. Plant and machinery required for the process consists of centrifuges, double effect evaporator, filter press, drier, ball mill, vibrating screen, distillation column, boiler, wooden vats and storage tanks. Total capital outlay for a plant producing 310 lbs. of Rochelle salt and 50 lbs. of pectin per day is estimated at about Rs. 5 lakhs. Parties interested in undertaking the commercial development of the process may correspond with the Secretary, National Research Development Corporation of India, Mandi House, Lytton Road, New Delhi-1.

Production of Machine Tools: Indian Machine Tool Manufacturers Association reports that the total approximate production of various machine tools by their sixteen leading member-firms during the month of April 1961 was as follows:

Description of Machine Tools Manufactured.	Quantity Nos.	Value Rs.
Lathes	180	22,50,880
Shaping Machines	21	1,80,165
Drilling Machines	26	1,37,960
Planing Machines	3	46,755
Grinding Machines	2	6,025
Regulators	1,151	1,78,005
Blowpipes	549	1,04,125
Eccentric Press	3	53,010
Slotting Machine	1	51,000
Press Break	1	46,425
Lathe Chucks	212	40,532
Lathe Centres	262	5,560
Polishing Lathes	2	4,790
Bandsaw Machine	1	3,600
Circular Saw Benches	5	2,750
"A" Press	2	2,200
Tool Grinder	1	1,500
Hacksaw Machines	13	42,100

France

Buyers of French Products by Geographical Regions:

The leading buyers of French products during the first three months of 1961 were as follows by geographical regions, with figures in millions of new francs (and with the corresponding figures for 1960 in paranthesis).

Franc zone	2,467	(2,772)
Foreign countries	6,320	(6,157)
Common Market members	2,910	(2,492)

Other European countries in the O.E.E.C.	1,587	(1,438)
Other European countries	359	(392)
Africa	201	(216)
Asia	442	(473)
America	777	(1,077)
Oceania	42	(51)

The leading buyers outside of the franc zone were the following countries:

Federal Germany	1,252	(1,172)
Benelux	780	(620)
Italy	577	(493)
Great Britain	472	(447)
Switzerland	412	(356)
United States	382	(678)
The Netherlands	300	(206)
Spain	146	(89)
U.S.S.R.	128	(150)
Sweden	123	(166)

Foreign Trade in 1960: In 1960, French foreign trade reached 24 milliard NF in imports and 23.7 milliard NF in exports, thus covering 99 per cent of its purchases by sales. However, allowing for the customs calculations, which include insurance and transportation costs for imports but not for exports, the balance actually shows a net surplus and a percentage of cover of 105 to 110. In 1959, imports and exports were already practically balanced with 19.06 milliard NF of imports and 18.95 of exports. The same favourable situation therefore existed as in 1960, but in the latter year the total amount of trade was definitely higher, having increased by approximately 25 per cent.

Oil and Natural Gas Production: The French petroleum industry produced 10.4 million metric tons of crude oil in 1960, as against 3.7 million in 1959 and 2.4 million in 1958. In 1960, the Lacq and Saint-Marcel natural gas deposits produced 158,916 million cu. ft. (4.5 milliard cubic metres) of natural gas, as against 91,818 million cu. ft. (2.6 milliard cubic meters) in 1959. 98,881 cu. ft. (2.6 milliard cubic meters) were marketed, as against 45,909 million cu. ft. (1.3 milliard cubic meters). Sulphur production rose from 426,000 to 785,000 metric tons. The distribution of natural gas from Hassi R'Mel is expected to begin in the near future.

Yugoslavia

Construction of a Railway Project: The "Energo-projekt" enterprise of Belgrade will prepare plans and complete blueprints for a lengthy cable suspension railway in Pakistan. This enterprise has also been entrusted with the supervision of construction of this project, situated near Karachi. The Yugoslav enterprise will also design an electric control board and give full assistance in putting the railway into operation. So far the Energo-projekt has successfully carried out a series of works in Pakistan such as the design for the Goval river hydro-system which settles the problem of irrigating some 60,000 hectares of land, the Kalni lake hydro system and the Murray hydro project.

CHOOSE Electronik STRIP CHART CONTROLLERS for detailed, long-term records... and a complete selection of control forms.

CHOOSE Electronik CIRCULAR CHART CONTROLLERS for ease of scale reading... convenient daily charts; in a full range of electric and pneumatic control forms.

CHOOSE Electronik CIRCULAR SCALE CONTROLLERS where you want readability and control check at extreme distance... without need for a record.

CHOOSE THE PROTECT-O-VANE SAFETY CUT-OFF for simple dependable excess temperature protection... can be used with any temperature control to prevent furnace shut downs and loss of production.

PSBS-H31/40

Whatever your furnace needs for control...

There's good reason why more heat-treating furnaces everywhere are controlled by Brown instruments. First, of course, is performance... sensitive, precise control. And equally important is versatility. In this varied line of instrumentation you'll find just about everything a furnace could possibly need in the way of control.

CHOOSE PYR-O-VANE CONTROLLERS where you don't need a record but do need precise vane type snap action electric control by a millivoltmeter instrument... also available with pulse-type time proportioning action, in both vertical and horizontal models.

Where on
earth is

Mogadiscio?

Frankly, till somebody in Mogadiscio ordered BINNY's cloth, we too didn't know that it was the capital of Somalia in East Africa.

Today BINNY's cloth is imported by 50 countries—superb fabrics made from cotton of the best quality and dyed with the fastest colours or so carefully bleached that the full strength of the cloth is preserved.

Rigid Quality Control* ensures maximum durability and perfect finish.

Quality Control:

Modern machines process yarn and cloth so fast that often defects, invisible to the naked eye, creep into the cloth. Quality Control is laboratory testing to eliminate defects at every stage of production. That's why BINNY'S fabrics stay smart so long.

*Testing cloth for defects

Every yard of cloth from the looms is examined thoroughly for defects before it is passed for dyeing or bleaching and finishing.

BINNY'S manufacture nearly 90 million yards of cloth every year. Here are some of the varieties they make:

Shirtings • Khaki Drills • Bleached & Dyed Drills • Towels • Anticrease Suitings • Tussores Union Fabrics • Silk Sarees etc. etc.

BINNY—a great name in textiles

The Buckingham & Carnatic Company Limited
The Bangalore Woollen, Cotton & Silk Mills Company Limited
Subsidiaries of Binny & Co. (Madras) Ltd.

Buy your requirements of BINNY'S fabrics at controlled rates from authorised BINNY Stockists who display this sign board.

The Yugoslav enterprise drew up a design for the Gubzharnval hydro-power plant and carried out a number of other design, study and irrigation and land reclamation works in Pakistan.

United Kingdom

Link between Indian and U.K. Industrial Groups: Bookers, a leading British industrial group have announced the incorporation of a company in India in partnership with the Sawhney organisation. This new company—with a capital of £450,000 of which the Booker group will hold 50 per cent—will be called the Triveni Engineering Works Ltd. Chairman of the Board will be Mr. Balmokand Shah Sawhney, who is also chairman of most of the Sawhney companies. Among the other members of the Board will be Mr. Mehar Chand Mahajan, a retired Chief Justice of the Supreme Court of India. The new company will set up a heavy engineering works to manufacture sugar machinery under licence from George Fletcher & Company Ltd., of Derby, England and Duncan Stewart and Company Ltd. of Glasgow, Scotland — both members of the Bookers Engineering Holdings group. Arrangements have also been made to manufacture industrial process turbines under licence from Peter Brotherhood Ltd. Plans are also being completed to manufacture other engineering products.

*

Plastics Production: British plastics manufacturers expect to produce more than one million tons of plastics annually by 1970. Most of this output will be converted into a wider range of consumer goods—from kitchen sinks and car bodies to toys, textiles, typewriter ribbons, pillows and, perhaps prefabricated houses. Plant extensions have been announced in the rapidly expanding fields of polythelene polypropylene and polyvinyl chloride. Considerable gains on the 1960 figures are expected next year, and manufacturers are optimistic about the future. Nearly 500 plastics firms will be showing their products at the International Plastics Exhibition at London's Olympia from June 21 to July 1.

*

Central Gold Reserves of Sterling Area: The central gold and convertible-currency reserves of the Sterling Area fell by £16,000,000 during May and stood at £1,037 million on May 31. Conditions in the foreign exchange markets during May have been very similar to those in April, it is pointed out in London and there was some pressure on sterling throughout the whole of the month. As a result, there was, in all probability, a fairly continuous withdrawal from the United Kingdom of international funds (of the "hot money" type). The effects of this withdrawal would probably account for the greater part of the fall in the reserves during May. During May the amount of assistance given to the United Kingdom by other central banks earlier in the year under the "basic arrangements" was repaid. Under the agreement, various European central banks agreed, as it were, to stockpile each other's currencies if necessary as a temporary measure of mutual support. This is some evidence of the increasing strength in the basic position of the United Kingdom's gold and convertible-currency reserves.

*

Increased Activity by the Commonwealth Development Finance Company: According to the annual report of the Commonwealth Development Finance

Company, the company had its most active year since its inception 8 years ago. The report outlines the increased activity of the company, which has led to a greater volume of investment. As a result, commitments have been accepted totalling £3,680,000 involving participation in nine new schemes, with a total capital cost of £20 million. Current commitments, including some for earlier years, are spread widely over the Commonwealth, with emphasis on Africa and Asia. Investments in India include those in Eastern India Distilleries and Sugar Factories, the Industrial Credit and Investment Corporation of India, and Indian Oxygen Ltd.

Poland

Five-Year Plan of Chemical Industry: Over 150 new chemical plants are to go into production in Poland this year. The value of the increase of the production capacity of these new installations and plants is assessed at 5800 million zlotys which equals the total value of the annual production of the chemical industry in the first year after the last war. Still bigger tasks are awaiting the chemical industry in the remaining period of the Five-Year Plan 1961-65. The industry will spend for investments upto the end of 1965 about 42,000 million zlotys, while 40,000 million zlotys, were spent in that industry for investment outlays in the whole of the past 15 year period. Fourteen new combines and large factories are to be built. A major part of the existing establishments will be considerably expanded. A recent meeting of the collegium of the Ministry of Chemical Industry examined the preparations of that industry for the implementation of these tasks, as well as the results achieved this year. Twenty new production establishments were handed over for exploitation in the first quarter of 1961, with a resulting increase of the production capacity of nearly 900 million zlotys.

Iran

Oil Industry: Iran is now the sixth largest oil producer and the fourth largest exporter in the world. The income derived from the oil industry forms the largest source of the country's foreign exchange earning. On paper it is sufficiently impressive but in terms of its contribution toward's the countries economic expansion and improvement of living standards, it is invaluable. Oil revenues of fiscal year 1960 were estimated to be in the order of £100 million.

United Nations

UNICEF Aid for Bombay Milk Scheme: The Bombay municipal milk scheme, one of the largest in the world, may get a new allocation of \$665,000 (Rs. 31 lakhs) from the U.N. Children's Fund (UNICEF). UNICEF had earlier allocated \$1 million for the Worli dairy, which is scheduled to begin operating next November. The present request, if approved, will enable the plant to increase its output from 150,000 litres to 300,000 litres a day. The Worli plant will work hand in hand with the famous Aarey Milk Colony. Together, they will provide milk for 3 million of Greater Bombay's population (now over 4 million). Under agreement with UNICEF, the Bombay authorities will distribute free milk to children and subsidized milk to poor families over five years to the value of \$2,500,000 (about Rs. 12 crores). The new allocation will bring the Fund's total contribution to India to \$30 million (over Rs. 14 crores).

NEWS IN BRIEF

INDIAN

The total electricity produced by public utility power stations in India in February 1961 was 1,377.5 million KWH of which 1,151.9 million KWH were sold to ultimate consumers.

The India-Czechoslovak Air Agreement signed at Prague on Sept. 19, 1960 has come into force as a result of the Exchange of Instruments of Ratification indicating the approval of the Agreement by each country in accordance with its legal procedures.

At present AIR has 60 transmitters, 28 radio stations with 35 studios and four auxiliary studio centres. 28 receiving centres and an educational television centre at New Delhi.

The Central Institute of Community Development, which was started to conduct orientation courses, has branched out into new fields in respect of study and research thereby foreshadowing its future growth as a National Institute of Community Development.

The Textile Commissioner in a Press Note has said that allocation to mills of American cotton stapling one inch and below under P.L. 480 are compulsory and no exemption from them will be considered.

The working of the Textile Machinery Corporation Ltd. for the year 1960 has resulted in a profit of Rs. 36.37 lakhs against Rs. 61.85 lakhs in the preceding year.

The use of Indian graphite for the manufacture of graphite brushes, crucibles, dry cells and pencils would now be possible as a result of a process for upgrading the indigenous ore developed at the National Physical Laboratory in New Delhi, says an official Press release.

It is reported export of bicycles is to be increased ten fold from 10,000 last year to 1,00,000 this year. The present output of bicycles in the country is 1.2 million.

An All-India Institute of Soil Pedology (soil science) is proposed to be set up during the Third Plan period. The Institute is likely to be located at Nagpur. The Government of India has sanctioned Rs. 60 lakhs for this purpose.

The Government of India has decided to join the International Sugar Agreement. The instruments of accession will be deposited with the British Government shortly.

FOREIGN

Albert E. Reed and Co. has established a new company, Reed Holding A.G. in Switzerland to facilitate expansion in the European Common Market and the European Free Trade Association.

The U.S. balance of payments deficit is expected to narrow to about \$1,500 million this year, compared with \$3,800 million in both 1960 and 1959, according to Mr. Gudeman, an Under-Secretary in the U.S. Commerce Department.

A surtax of five centimes a litre (4d a gallon) will be levied on petrol in Switzerland from January 1, 1962, to help the federal road programme.

It was revealed recently by the Japanese Ministry of Trade that it had decided to authorise the import of four large capacity thermal power generators with capacities ranging from 350,000 to 375,000 kilowatts from the U.S.

It is reported the South African commercial banks are co-operating with the authorities to halt the outflow of capital in line with the official policy of not restricting the repatriation of non-resident's money.

France has concluded her largest ever contract with China, the sale of 200,000 tons of barley worth about NF50 million.

The Government of Pakistan has decided to experiment from October this year in underwriting risks in the export trade not covered by insurance companies.

Iran has banned the import of luxury non-essential goods in an attempt to fight the increasingly adverse foreign trade balance. Last year imports were six times as large as exports.

Two special reports on the potential for establishing an iron and steel industry in Nigeria and on possible West African markets for such an industry are now available.

Malayan tin exports in May totalled 6,792 tons, down 522 tons, according to Straits Trading Company. Exports to the U.S. were 3,214 tons, compared with 21,611 tons in April.

Ghana is extending by two months the deadline for taking over the export of all Ghanaian timber by the recently established State-owned Timber Marketing Board, the Trade Ministry has announced.

*Special Article***THE U.K. AND THE COMMON MARKET**

By WILLIAM REES-MOGG

THE British Government through no great fault of its own is now in a position of very considerable difficulty about its European and Commonwealth policy. The Government's aim has always been to try to fulfil all its various roles. It wants to be a good European power, it wants to be a good Commonwealth power and it wants to play a responsible part in world affairs. The connection with the Commonwealth and particularly perhaps with India gives Britain a view of the world scene which at its best is broad and sympathetic in character and is not confined to the narrow interests of Britain as an off-shore island of Europe.

A multi-lateral international view cannot, however, be maintained unilaterally. When one looks at Britain's various partners one sees that their attitudes are tending to become more closely defined and to some extent more rigid.

The European Common Market should not be criticised too harshly for taking a narrow European view. Their willingness to reduce the external tariff is a sign of good neighbourliness. At the same time it is only natural that they should be excited by the idea of Europe and by their success in creating a greater degree of unity than Europe has ever had before. Nevertheless, their attitude towards British membership, while it varies from country to country, seems to suggest that they expect Britain to sign away the interests of the Commonwealth, and then negotiate to protect them only after they have been signed away.

It is clear that France has throughout been opposed to British membership of the European Economic Community under any circumstances. However, the French formula that Britain must agree to sign the Treaty of Rome as it stands is gaining ground among all the European powers. Until Britain accepted the common external tariff this was supposed to be the condition of joining Europe. Blind signature of the Treaty of Rome goes much further.

President Kennedy seems to have told Mr. Macmillan that he also thinks that Britain can reasonably be asked to sign into Europe without prior negotiation. Inevitably the rigidity of this attitude has provoked those Commonwealth countries which are most concerned about the effect of Britain joining the Common Market on their own interests. In particular, Mr. Diefenbaker has said that there ought to be another Commonwealth Prime Ministers' Conference before any further British decision on the Common Market is taken. In fact, however, just as the European attitude has moved towards the view that Britain should enter the Common Market without making terms before doing so, so has the attitude of the Commonwealth countries shifted towards a rejection of British entry into the Common Market on any terms that are in practice likely to be available.

Much of the present difficulty lies in a double misconception. Europe has little understanding of the

Commonwealth and the Commonwealth has no great understanding of Europe. The British position between the two is supposed to be that of a bridge. In fact, it is at present more like that of a piece of elastic attached to two objects which are moving away from each other. Sooner or later the elastic is likely to break.

The Commonwealth has so far failed to understand that the attraction of Europe is the centripetal quality of its organisation and that the weakness of the Commonwealth itself is that the aftermath of the process of independence has left it with an inherently centrifugal organisation. Those Commonwealth powers which do not want Britain to enter Europe are still not prepared for the decision which would make such a policy unnecessary. There never has been and there is not now a genuine Commonwealth alternative to a European trading policy for Britain.

Such an alternative should not be impossible to achieve. Even without South Africa the combined economic strength of the British Commonwealth remains very considerable. Indeed the jealousy which partly inspires the attitude both of the United States and of some European powers is a tribute to the value of the Commonwealth and to its power. As an unorganised group this is, however, largely an unused force.

A far closer policy of economic co-ordination would be possible. If it were achieved then there would be a real choice both for Britain herself and for the other Commonwealth countries. A position of strength could either be used in order to maintain the independence of the Commonwealth from other groups or to negotiate settlements with other groups on level terms. The Commonwealth and Europe, properly combined, would be a formidable and hopeful grouping of powers.

The condition of re-organising the Commonwealth must be a deliberate policy of economic co-ordination and of the expansion of inter-Commonwealth trade. This is not only a matter of expanding trade between Britain and other countries in the Commonwealth but of expanding trade between different countries of the Commonwealth. The old Ottawa system was a wheel with spokes but without a rim. What is needed is a Commonwealth economic community to which all the Commonwealth countries equally belong and which provides for trade between all of them.

Such a policy is conceivable but it is really only conceivable if the countries concerned want it. If Mr. Diefenbaker wants to keep Britain out of Europe then he must be willing to accept the only valid alternative policy. At the present moment the intransigence of France may keep Britain out of Europe anyway; in the long run the Commonwealth will only survive as a strong body if its members can make the imaginative jump from the desire for independence to the need for closer integration within a few short years of independence having been achieved.

THE BUSINESS WORLD

Port Labour Strike Staved Off

By
CROESUS

THANKS to the tactful handling by Mr. Raj Bahadur, the Union Minister for Shipping, what might have been a strike involving 75,000 workers employed by the major port trusts in the country has been averted. The strike was actually called off, by the labour unions that had served the strike notice on the first of June, on the 11th instant, that is, four days before the deadline date for the commencement of what was originally threatened would be an indefinite strike. Although it may seem as being wise after the event, that the strike would not eventuate was the opinion held by many of those who have followed the strike threat developments since the beginning of this month. In the first place, although the strike notice seemed to have the backing of all port and dock workers, there were sections, in particular workers' unions, controlled by the INTUC, which were not in favour of the strike right from the beginning. Secondly, the whole approach of the leaders of the labour unions which sponsored the strike was not such as to evoke public sympathy or support. For ostensibly, the strike began as a protest against the Jeejeebhoy Committee Report even before the Report was released by the Government. Not very long thereafter, the labour leaders began to say that they were committed to accept the Jeejeebhoy Committee Report in any case and that their objection was on the score of more fundamental issues. Thirdly, they went on importing fresh issues as the negotiations with the trustees of the Bombay Port proceeded. Fourthly, the timing of the strike notice was most unfortunate, and this naturally shifted the sympathies of the public on to the side of the authorities.

The strike leadership, however, must be given credit for having sensed the position precisely in good time and adjusted its strategy suitably. It was significant that, within a week of their strike notice, the labour leaders began saying that the "strike was the last resort the employees would take to get their demands accepted" and that "they were always prepared for talks in order to avoid a showdown." Fortunately, the same spirit of accommodation was also forthcoming from the Government side, and the fortuitous presence of the Union Minister for Shipping and the chairmen of all the port trusts in Bombay further facilitated matters by rendering possible consultations on the spot on the several points at issue. Any way, all is well that ends well.

As a result of the threatened strike, the workers have scored some points. An important gain for them relates to their grievance that, on the implementation of the Jeejeebhoy Committee's Report, certain sections of employees, particularly in the Bombay Port, who were already in receipt of wage scales higher than those

recommended by the Jeejeebhoy Committee would be left without any benefit. The Minister for Shipping readily agreed that such cases called for sympathetic consideration when the pay scales came to be revised on the basis of the Second Pay Commission's Report. Mr. Raj Bahadur even went so far as to recommend special consideration of this matter to the port authorities with a view to evolving a suitable formula for reaching the objective of spreading the benefits of the Government's orders on the Second Pay Commission's Report to all categories. Another point gained by the workers was with regard to the immediate increase of not less than Rs. 5 per month to the stevedore workers in their dearness allowance. As regards the other points that were urged by the workers also, the Minister assured sympathetic consideration by the authorities.

But, at the same time, he took a firm stand on the major demand of the workers for the revision of wages and conditions of service independently of the Second Pay Commission's Report. On this question, there was a sharp division of opinion as between the Union leaders and the Government, including the port trust authorities. The view-point of the workers on this issue was forcefully presented by Dr. Shanti Patel. He cleverly pressed into service a statement made by the Union Finance Minister in the Lok Sabha when he presented the Report of the Pay Commission. The Minister had then stated, 'inter alia', that the employees of public sector undertakings were not Government employees and that their wages and salaries should normally bear some relation to wage levels prevailing in those areas. It was contended by the union leaders that port trusts came under public sector undertakings and, accordingly, the workers in port trusts had a right to demand a revision of pay scales on a basis different from that applicable to Government employees. Both the spokesmen of the Bombay Port Trust and the Union Minister for Shipping did not agree with this view and contended that conditions of service and scales of pay in the port trusts followed the same pattern as those in government establishments. It was indeed ingenious of Dr. Patel to have brought in the question of the autonomy of public sector undertakings in support of the workers' stand. But it is a moot point whether port trusts can be classified, strictly speaking, as public sector undertakings or even as public corporations. They share some features in common with the Government, the local bodies and commercial enterprises alike. Thus, they derive their income mainly from the sale of services like local bodies and commercial undertakings and even some State Governments. Again, both in origin and according to law, port trusts constitute local authority. At the same time, it should not be forgotten that ports are centrally administered subjects under the Constitu-

tion. It is, therefore, difficult to categorically classify port trusts either as public sector undertakings like public corporations or as local bodies like municipalities

Another controversial issue that was raised in the course of the negotiations was the question of treating the affairs of each port on a regional basis. While one must sympathise with the workers in Bombay, many of whom may not stand to benefit from the recommendations of the Jeejeebhoy Committee inasmuch as their wage scales are relatively higher, even as they are, than those of their confreres in Calcutta and Madras, the proposal for regional handling is fraught with serious implications which may not be liked even by the workers themselves. For instance, if this formula is accepted and logically extended, Central Government employees, who now get the same scales of pay and allowances wherever they may be posted, would get scales of pay and allowances applicable to different

regions, say to Government employees of that region, and this would create an avoidable hornet's nest. Wisely, therefore, they have resisted this suggestion.

Finally, it is a pity that a suggestion that was mooted by the labour leaders themselves, namely a long-term agreement to ensure industrial peace, was not wholly accepted. It is to be hoped, however, that the joint declaration of the authorities and the participating unions — that ways and means should be devised to avoid precipitate action in future in the larger interests of the country — will be a precursor to the conclusion of a firm long-term agreement to ban strikes, especially on flimsy grounds, so as to ensure smooth economic development. The people of this country will have themselves to blame if such is not done, especially when the entire climate of world opinion is so favourably disposed towards the successful implementation of our Five-Year Plans.

Business Notes

Economic Power

WHERE ENSHRINED?

THE PROPOSED changes in the Memorandum of Association of the State Trading Corporation have, not unnaturally, led to considerable apprehension among the business community. If these are approved, business circles fear, the STC would turn out to be a mammoth organisation with enormous powers over trade and commerce. As Mr. Vallabhdas V. Mariwalla, President of the Indian Merchants' Chamber, Bombay, told the first quarterly general meeting of that body last week, "the apprehensions of the business community that the STC, contrary to the original assurances of Government, would be not a supplementary organisation, but a supplanting one, are verily proving true."

Basing himself on this outstanding example of the present development trend in our economy, the IMC President dilated on the much-debated question of concentration of economic power and proceeded to sound a timely note of caution, namely that there is greater danger to democracy by concentration of power in the hands of public sector organisations like the STC than in the hands of the private sector. At the same time he repudiated the view, still being held in the country's planning circles, that there is concentration of economic power in the hands of a few and that, therefore, there is need for preventing the development of monopolistic tendencies. As a matter of fact, this seems to be an obsession with some people in the Planning Commission, he said, and wondered whether, in the context of the operation and impact of the Industrial Development (Regulation) Act and also the new licensing policy, any such development was at all possible. On the contrary, the existence of too many of these regulations has not only curbed the formation of cartels and monopolies, but has made even future formation impossible. Instancing industries like paper, cotton textiles, sugar, and chemicals, the IMC President declared that there was not a single group which controlled more than 3 to 4 per cent of the national output of these commodities. Even in the case of larger industrial units that existed, the operation of the new licensing policy, he pointed out, had resulted in the reduction of their share in the national product. For instance, A.C.C.'s share in the country's cement output had gone down from 64 per cent to 30.4 per cent and of

Wimco in the production of matches from 100 per cent to 60 per cent. An analysis of the shareholdings since 1952 also indicated, he said, that there has not been much concentration even in shareholdings. Accordingly, Mr. Mariwalla concluded that the talk of curbing the growth of monopolies and cartels had, if at all, a political value, but no substantial value.

While deprecating the formation of monopolies in the private sector, the authorities have been allowing vast bureaucratic organisations to be set up which enjoy a relatively large degree of economic power, Mr. Mariwalla complained. Instead of realising the objectives of a socialist order, he observed, these created problems of a far greater magnitude. In fact, he went on to say, the concentration of economic power in the political and bureaucratic organisations would be nothing short of curtailment of democracy.

Kalol

A NEW OILFIELD

ON SUNDAY last, the small town of Kalol, nearly 15 miles north of Ahmedabad and 80 miles from Cambay, shot into prominence when the Union Minister for Mines and Fuel, Mr. K. D. Malaviya, made a dramatic announcement about oil having been struck there. The Oil and Natural Gas Commission had, indeed, been singularly fortunate in striking oil in Cambay, Ankleshwar and Sibsagar areas at no appreciable cost. Luck has favoured it once again and oil has flowed out of the very first exploratory well drilled in Kalol area.

The Kalol oilfield, according to Mr. Malaviya, is as rich as that of Ankleshwar. But how he has reached that conclusion is not known; he has preferred to keep back this information. To estimate the oil reserves of an area on the performance of one single well is perhaps a hazard which only Mr. Malaviya can go in for. In the absence of further details and in view of the effervescent statements made earlier by him about striking of oil at Cambay (scepticism is understood to have been expressed in expert circles about this oilfield being economically exploitable) and of natural gas at Jawalamukhi, one would be inclined to consider this statement of the Mines and Fuel Minister as a too effulgent one.

Having struck oil over a fairly vast area in Gujarat, it is imperative that these oilfields, particularly the

Ankleshwar oilfield, should be expeditiously developed not only to reduce the drain on the country's foreign exchange resources, but also to provide valuable material for producing energy to meet the growing demands of this region, emanating from expansion of industry and transport. This requires improving of the ONGC operations in this area, which in the opinion of some experts are pretty slow and also expensive. To take about a fortnight to drill a well to a depth of 2,500 to 3,500 ft. is an operation which obviously needs to be speeded up. That will not only reduce the cost on drilling, which is said to be about twice as much as warranted, but will also expedite exploitation of the oil reserves.

It is gratifying that the Government has already started drawing up plans for setting up a 2-million-ton refinery near Baroda to process the crude that will be available from Gujarat area. But will this project, in its preparatory stages, face the same difficulties and hurdles as many other projects—not excluding the Nummati and Barauni refineries projects—have encountered in the past? Though not strictly relevant, one may point out that even the U.N. Fertilizer Mission has criticised the inordinate delays in processing of project reports in India. It is time that these delays are avoided so that maximum advantage can be derived from the available resources. A year's delay in setting up a two-million-ton refinery will cost the country crores of rupees in foreign exchange which it can ill-afford.

Foreign Trade

EXPORT PROMOTION

AT THE 27th annual general meeting of the Maharashtra Chamber of Commerce and Industry, Mr. S. L. Kirloskar, while dealing with many problems confronting the industrial development of Maharashtra, dwelt at length on the country's export trade. He emphasised that the procedure of paying drawback on excise and import duty, granting of raw materials against exports, the setting up of Export Promotion Councils etc., to boost exports was not enough and something radical was needed to have a permanent foothold in the markets abroad. Mr. Kirloskar opined that among the export incentives, the remission of taxes on exporter's profits or turnover as is prevalent in countries like Germany, Japan and Ireland should be preferred to other methods of export incentives such as retention of exchange earnings, incentive import licences etc., because this involved no loss of foreign exchange. He further argued that if a percentage of export proceeds was allowed to be deducted from taxable income, this indirectly would mean a subsidy to the exporters to a certain extent, without involving any international complications relating to subsidies.

The other measures outlined by Mr. Kirloskar to boost exports were the imposing of a condition, wherever possible, to export certain percentage of their production while granting licences for expansion of the existing industries; exploration of foreign markets for our exports of both traditional and non-traditional goods through marketing research, allowing traders or manufacturers in certain industries to participate independently in barter deals with foreign counterparts, 25 per cent reduction in the premium rate charged by the Export Risk Insurance Corporation as has been done in the U.K.; issuing of incentive import licences in proportion to the additional efforts made by exporters to increase their exports and foreign exchange retention to the exporter on a general basis so that the

exporter can utilise a part of his earnings even for buying imports which could be sold at a substantial profit in the country; and providing of cheap credit by the Reserve Bank of India and other banks.

The appointment of Mudaliar Committee was welcomed by Mr. Kirloskar due to the fact that nothing concrete had so far been done to review and investigate the overall import and export policies as such. The terms of reference of the Mudaliar Committee are wide enough, and it is hoped, that its investigations will, perhaps, help to set the house in order.

Small-scale Industries

PROVISION OF RAW MATERIAL DEPOTS

THE MAHARASHTRA Government has recommended to the Raw Material Sub-Committee of the Union Government that raw material depots should be opened at suitable centres in the States to solve the problem of raw materials supplied to small-scale producers. In a memorandum to the Sub-Committee, the Directorate of Industries of Maharashtra State pointed out that the work of running these depots could be entrusted to registered co-operative organisations or small scale industries at district and State levels. Where such organisations did not exist, the same could be created. These organisations could place a consolidated indent for raw materials on behalf of the consumers in their respective areas, make financial and other arrangements to import raw materials and distribute them to the units on the recommendations of the State Directorate for Industries. It was suggested that the raw materials imported by the State Trading Corporation could be supplied to the State Directorate every 6 months on receipt of a consolidated list of the units indicating the half yearly requirements of individual units in respect of each imported item.

It has been observed that the shortage of raw materials posed a serious problem for the producers and attained greater dimensions for the small-scale producers who did not have significant holding capacity and could not maintain stocks of these raw materials. They had to depend on purchases from time to time and whenever there was a gap, the output suffered. The maintenance of these depots would be further helpful to the small-scale producers in procuring raw materials of the required specifications. This scheme if carried out, would help in the growth of small-scale industries which were already on the increase. As was pointed out by the State Directorate of Industries, allotment for indigeous raw materials and certificates for imported raw materials had increased from 755 in 1953 to 8,087 in 1960-61. There was, therefore, considerable scope for assistance to the small-scale producers through the establishment of raw material depots.

Aluminium

HIND ALUMINIUM'S EXPANSION PROGRAMME

HINDUSTAN ALUMINIUM CORPORATION LTD. proposes to expand its production capacity from 20,000 to 50,000 tons of aluminium ingots for which it has sought the permission of the Government of India. Mr. M. P. Birla, who presided over the second annual general meeting of the company, disclosed that the financial needs for this expansion programme would largely be met through loans and borrowings and the

company had no plans, at present, to raise fresh equity capital. The move to expand the production capacity was a sequel to the Government's policy to raise the overall Third Plan target for aluminium production from 85,000 tons to 1,25,000 tons a year. Aluminium is gradually replacing copper in industry in various ways and India is short of copper. Mr. Charles E. Thompson, alternate director in place of Mr. Edgar F. Kaiser, the foreign collaborators of the company, only confirmed these views when he pointed out that in the light of the growing industrial pace of the country, the future of the aluminium industry was very bright. He was of the opinion that India would have to double its production capacity at regular intervals. Indian bauxite, he said, compared favourably with that mined in Jamaica from which U.S. drew her main supplies. It was easier to produce aluminium from Indian bauxite.

Mr. Birla informed the shareholders that the aluminium plant would start functioning in January 1962, and the alumina plant in April 1962. Meanwhile 75 per cent to 80 per cent of the plant and equipment had already been shipped and the bulk of it had arrived at the site. About 50 to 60 per cent of premises had been completed and the remaining work would be completed in the next four or five months. The power house at Rihand Dam, the site of the factory in Mirzapur district, will be ready in about two to three months.

Iron & Steel

ACME'S SHARE OFFER

ACME PIG IRON AND CENTRIFUGAL PIPE WORKS LTD. has obtained an industrial licence from the Government for the establishment of a new undertaking to produce refined grades of pig iron, steel castings and billets of special composition. The company was

incorporated in 1959 to undertake the manufacture of special and refined grades of low phosphor and low sulphur pig iron for the production of high grade quality castings for the automobiles, machine tool industries, railways and other industries producing quality engineering goods. The scheme is proposed to be implemented in two stages. The first stage will cover the manufacture of refined grades of pig iron and the second stage will cover the manufacture of steel castings and billets by the Duplex process. An agreement has been entered into with Messrs. Campagne Generale Des Conduites D'Eau, Belgium, for securing the required technical know-how for the erection and starting of the plant at Khopoli, in Maharashtra. The plant will have a capacity of 30,000 tons and is expected to be commissioned by the end of the current year.

The authorised capital of the company is Rs. 50 lakhs, divided into 30,000 equity shares of Rs. 100 each and 20,000 shares of unspecified class of Rs. 100 each. The issued capital is Rs. 20 lakhs consisting of 20,000 equity shares. Half of this capital has been subscribed by the directors, their friends and associates. The remaining half (Rs. 10 lakhs) has been offered, at par, to the public for subscription. The subscription list opens on June 19, and will close at the discretion of the directors but not earlier than June 24.

The materials for the manufacture of refined grades of pig iron, viz. mild steel scrap, ferro-silicon, ferro-manganese, coke, limestone etc. are easily available in the country in sufficient quantities. In normal circumstances, it is expected that the company will be able to pay reasonable dividend to its shareholders. In view of all this and good market for the company's products in the expanding economy of the country, the issue is likely to receive ready response from the investing public.

A Letter to the Editor

THE S.T.C. X-RAYED

Dear Sir,

Your review (June 2) of the report of the Economist Intelligence Unit (London) does not do justice to the report as far as the manganese situation is concerned. You have stated :

"The Intelligence Unit has come to the conclusion that no blame could be attached to the STC for the decline in India's share in the world manganese ore exports since it was the outcome of a situation beyond its control."

The following extracts will show that the Intelligence Unit's view is clearly that although Indian manganese exports during the previous years were bound to decline due to major external factors, intervention and mismanagement by the STC was also a significant contributory factor to this decline.

Several excerpts could be quoted from the Intelligence Unit's report in this connection, but the following extracts should suffice :

"US importers of manganese ore are generally agreed that India was, because of the factors outlined above, bound to lose ground in the American market. They are equally unanimous in their view that the STC has, since its inception, made bad worse. The dissatisfaction felt by US purchasers with the Corpo-

ration's practices is definitely a contributory factor in the decline in US imports of Indian manganese ore during recent years" (P. 32).

"The Corporation is almost invariably bureaucratic and dilatory, waiting for trade to come to it instead of seeking it out, and has on occasion been both arrogant and apparently suspicious and resentful of its customers. But there is more to it than this. The STC has been strikingly unreliable in its deliveries, failing to ship ore as promised, shipping it where and when it pleased, holding up loading for no adequate reason. It has insisted on terms in excess of normal commercial terms in such matters as credits, port charges, etc. It is suspected of attempting to play off one firm against another, dealers against users, and has been known to treat its contractual obligations lightly if an opportunity arose to squeeze an extra advantage out of a deal already negotiated." (P. 33).

"The deterioration of India's trade is thus the inevitable result of circumstances beyond the STC's control, but the Corporation has further damaged India's position by serious mismanagement. Its reputation among American and Japanese importers is deplorable." (P. 60 — Conclusion 6).

BOMBAY,
 June 13, 1961.

Yours faithfully,
 A CORRESPONDENT

FROM THE CAPITAL'S CORRIDORS

GOODS TRAFFIC: RAILWAYS' TASK

THE Indian railways, it is understood, will have to carry an additional 15 million tons of goods traffic during the current year. This is expected to include 6 million tons of coal, one million tons of export ores, 3.75 million tons of raw materials required for the steel plants, 1.25 million tons of finished goods from steel plants and 3 million tons of other general goods mainly concerning the expanded industrial output.

To achieve this objective, the railways have started further improving the turn-round of wagons and putting all available stock (wagons and engines) to the maximum use. Besides this, efforts are being made to eliminate all avoidable detention of wagons at transshipment points or at destination stations. Arrangements are also being made to put into service from July 1, 200 additional wagons for moving coal from Bihar and Bengal coalfields to above-Moghalsarai destinations. This programme has been prepared consequent upon the completion of certain works undertaken in the recent past to expand the line capacity above Moghalsarai. To step up production of wagons, railways are expected to receive one lakh tons of steel from abroad.

The present movement difficulties on certain busy sections, like the Gaya-Dhanbad section, are expected to ease next month on completion of electrification programmes of these sections. The easing of the situation on these sections will help the railways to divert some of their steam locos to other zones where they are very badly needed.

A decision is reported to have been taken at a meeting of the Chief Operating Superintendents of all the railways, held recently at Bangalore under the Chairmanship of Mr. Kripal Singh, Member Transportation, Railway Board, to carry iron ore and manganese ore to ports of export on a high priority basis. A decision is also understood to have been taken to move expeditiously some articles of traditional exports, e.g. tea, cotton textiles, etc., to port towns with a view to helping exports and earning the much-needed foreign exchange. Mr. Kripal Singh is further reported to have asked all the zonal railways to load one ton extra in every wagon so that the overall railway capacity is increased by 4 per cent. He has been assured of full co-operation from the various chambers of commerce and industry in this respect.

The railways propose to continue during the Third Plan period according high priority to movement of goods, particularly raw materials for the basic and heavy industries and commodities of export. It is proposed to carry during the Third Plan period 245 million tons of traffic per annum, as against 154 million tons estimated to have been carried during the Second Plan period. In terms of ton-miles, the railways will be handling nearly 92,000 million ton-miles of goods traffic per annum during the Third Plan period as against 54,000 million ton-miles carried during the Second Plan period and 36,000 million ton-miles carried in the First Plan. This ambitious target of movement of goods is envisaged to be achieved through electrification and dieselisation of certain sections of the railways, through construction of some line capacity works, through modernisation processes such as interlocking of stations, and by acquisition of additional rolling stock.

PURCHASE OF STORES BY RAILWAYS

In order to help the development of small-scale industries in the country, the Railway Ministry, it is understood, has asked the administrators of the various zonal railways to purchase certain items of their stores only from small-scale manufacturers. A list of 27 items which can be manufactured by small-scale industries has been drawn up and circulated to purchase organisations of the railways. The list includes such goods as coir manufactures, fibres, metal polish, dustshield leather, padlocks, washing or laundry soaps etc. It is proposed to give some price preference — upto a maximum of 15 per cent — to small-scale producers in cases where these items are manufactured both by the large-scale industry and the small-scale manufacturers. Small-scale units which are recognised by the National Small Industries Corporation will be exempted from depositing earnest money while submitting their tenders. They will also not be required to deposit security money while receiving orders for supply.

The railways purchased goods worth nearly Rs. 1.22 crores from small-scale manufacturers during 1960-61.

INDIA'S FOREIGN TRADE OVER THE PAST DECADE

According to the Planning Commission, exports from this country over the past decade have been "stagnant". The First Plan average of Rs. 609 crores might have been smaller but for the exceptionally high exports in 1951-52 on account of the war in Korea, while the Second Plan average of Rs. 624 crores would have been higher but for the recession in 1958 in U.S.A. and Europe. In volume, exports were higher in the Second Plan by 9 per cent but, on account of less favourable unit values, this increase was not reflected in larger export earnings. The table below gives India's exports during the period 1951-52 to 1960-61.

		(Rs. crores)	
Year		Exports	
1951-52		733	
1952-53		577	
1953-54		531	
1954-55		593	
1955-56		609	
TOTAL		3043	
AVERAGE		609	
1956-57		620	
1957-58		636	
1958-59		573	
1959-60		644	
1960-61		645	
TOTAL		3118	
AVERAGE		624	

In the pattern of export trade over the past decade, two main trends could be observed. Firstly, among commodities which are directly or largely based on agricultural production (which still account for the

bulk of India's exports) such as tea, cotton textiles, new manufactures and of products like iron ore. But jute manufactures, hides and skins, spices and tobacco, these were not sufficient to offset the decline in the on the whole exports did not improve. However, traditional exports. These trends are vividly reflected significant increases were achieved in the export of by the following table:

PATTERN OF EXPORTS — 1951-60

	1950-51	1955-56	1958-59	1959-60
1. Agricultural commodities and related manufactures	496.5	489.3	453.5	473.6
Cotton & jute manufactures	250.5	181.7	153.4	180.5
2. Other manufactures	58.4	61.0	53.3	105.0
New manufactured products	8.9	8.6	12.5	25.0
3. Minerals	23.4	34.4	46.2	53.0
TOTAL	578.3	584.7	553.0	631.6

At present, Western Europe accounts for nearly 39 per cent of India's export trade, the U.K. taking 28 per cent of the exports. The share of the U.K. has remained more or less constant at this level for a number of years. The share of North America declined from 27 per cent in 1952 to 17 per cent in 1956, but increased to 19 per cent in 1960. Exports to ECAFE countries have been relatively static in recent years. The increased exports to Japan are accounted for largely by iron ore exports.

The European Economic Community's share has fluctuated between 7.5 and 8.3 per cent over the past ten years. The share of the Soviet Union and other countries of Eastern Europe increased from about 1

per cent during the first half of the First Plan to more than 8 per cent towards the end of Second Plan.

Imports from Western Europe increased during the First Plan from 30 per cent to 50 per cent; the region accounted for nearly 40 per cent of India's imports at the end of the Second Plan. Imports from Eastern Europe increased from 2.2 per cent in 1952 to 4.2 per cent in 1956, but declined to 3.7 per cent in 1960. Imports from North America, which accounted for 37 per cent of the total in 1952, declined to 12.4 per cent in 1956, but increased again to 25.2 per cent in 1960, the variation being due merely to food imports. Imports from ECAFE countries have fluctuated between 12 and 14 per cent during this period.

DIRECTION OF INDIA'S FOREIGN TRADE

(Per cent share)

	Exports			Imports		
	1952	1956	1960	1952	1956	1960
1. ECAFE countries	25.7	16.3	17.0	13.6	12.4	13.1
Japan	4.1	4.9	5.5	2.4	5.2	5.4
2. West Asia	5.7	5.8	6.5	7.7	10.8	7.5
3. Africa	3.6	3.9	2.5	3.8	4.0	4.4
4. Western Europe	29.6	39.8	38.5	30.1	50.1	40.4

7. Latin America	1.4	1.0	2.5	—	0.1	0.1
8. Oceania	4.3	4.4	3.1	2.0	1.7	2.3
9. Others	7.3	8.3	3.2	3.3	4.3	3.3
TOTAL	100.0	100.0	100.0	100.0	100.0	100.0

THE TASK AHEAD

If a substantial increase in exports is to be achieved, action has to be taken along several directions, in particular the following:

(a) Domestic consumption must be held within reasonable limits with a view to creating the surpluses for exports. Side by side with this, inflationary pressures associated with development have to be kept within bounds.

(b) In view of the increasing profits which can be earned in the domestic market once an economy begins to develop, steps to increase the comparative profitability of exports are essential. This will necessitate certain fiscal measures from time to time.

(c) In their cost structure and productivity, the principal industries and, in particular, the export industries must become competitive as early as possible. A systematic programme to this end has to be pursued within each industry. This is an essential condition

for diversifying exports and for steadily increasing the share of new manufactures and minerals in the export trade. The industrial licensing policies should also be oriented towards export promotion.

(d) Steps must be taken to mobilise public opinion in favour of exports and acceptance of the burdens involved, to enlist the co-operation of the industry and the trade in the national effort, to improve Government's organisation for market research and intelligence and commercial representation abroad, and to enlarge facilities for credit, insurance, etc.

The Planning Commission thinks that if exports over the Third Plan period do not increase significantly beyond the figure of Rs. 3,450 crores indicated in the Draft Outline, even if the external aid which has been assumed were forthcoming, there would be quite serious shortfalls in the Plan. Accordingly, on the basis of studies which have been undertaken, and assuming a large-scale effort to increase exports and reasonable

conditions of demand abroad, exports over the Third Plan period have been taken at Rs. 3,700 crores. The effort must indeed be on a larger scale. An important reason for stressing measures for increasing exports during the Third Plan is that this is the period in which exports should be built up in order to meet the much larger requirements anticipated for the Fourth Plan. Considering the requirements on account of repayment obligations of loans contracted and maintenance and development imports, it is estimated that by the end of the Fourth Plan, the level of exports would have to rise to about Rs. 1,300 to Rs. 1,400 crores per annum, i.e., to at least twice the present level. This is itself one of the essential conditions for ensuring that India's economy becomes self-reliant and self-sustained by the Fifth Plan.

It is against this background that the objective of achieving export earnings of not less than Rs. 3,700-3,800 crores over the Third Plan has been set. If exports rise to the extent envisaged, the annual level of exports over the Third Plan should rise by about Rs. 200 crores by the end of the Third Plan, and the average exports for the Third Plan period should be about Rs. 150 crores above the average of the Second Plan.

THE ALLOY STEEL PROJECT

Some more facts are now available about the Alloy Steel Plant proposed to set up during the current Plan period. The plant will be located about mid-way between the Durgapur Steel Plant and the West Bengal Government's Coke Oven Plant. It will have initially a capacity to produce 80,000 tons of ingots per annum. Based on the analysis of 1965 requirements, the following production of finished steel is planned for this plant by the end of the Third Plan period.

INITIAL PRODUCT-MIX (Finished Steel)

(Tons per year)

Steel	Sections	Billets	Sheets	Forgings	Total
Tool	8,000	2,100	2,300	600	13,000
Constructional	12,000	3,000	1,000	1,500	17,500
Stainless and heat-resisting	2,500	500	14,000	—	17,000
Die blocks	—	—	—	500	500
TOTAL	22,500	5,600	17,300	2,600	48,000

Provision has been made in the layout of the plant for its expansion to a capacity of 3,00,000 tons per annum or more.

The total capital cost of the project is estimated at Rs. 38.4 crores, based on current international prices and Indian construction costs. This does not include the cost of engineering services and custom duties. Also not included in this estimate is the expenditure to be incurred on provision of facilities outside the plant boundary, cost of land, cost of construction equipment, escalation of prices etc.

The cost estimate, however, provides for a number of special features which in the long run would improve the efficiency of the plant, lower production costs and the investment on expansion. As customary in all modern steel plant designs, considerable excess capacity has been provided in the high cost primary mills so that their throughput can be raised to 3,00,000 tons ingots by operating additional shifts when required in the near future. Similarly, the area of land to be developed and design of utilities and roads and rail networks would enable expansion of the plant and diversification of its activities. The first phase expansion of

the plant to 1,60,000 tons capacity would, thus, require an additional investment of only about Rs. 15 crores.

The foreign exchange component of the initial outlay of Rs. 38.4 crores will be nearly Rs. 19 crores.

Preliminary estimates of production costs have been made for nine typical types of steel. The works production cost (excluding fixed charges) ranges from Rs. 1,200 per ton for constructional steel bars to Rs. 4,000 per ton for stainless sheets and Rs. 8,000 per ton for high-speed steel bars.

NON-FERROUS METALS IN THE THIRD PLAN

In the field of non-ferrous metals, aluminium is expected to continue to retain its dominant position during the Third Plan period. A target of 87,500 tons annual output by 1965-66 has been fixed for this industry. It is envisaged to be achieved in the following manner:

- (1) Expansion of the capacity of the Indian Aluminium Company's Hirakud plant by 10,000 tons per annum and of its Alwaye plant by 5,000 tons per annum.
- (2) Establishment of a smelter at Rihand having a capacity of 20,000 tons per annum.
- (3) Establishment of a smelter at Koyna having a capacity of 20,000 tons per annum.
- (4) Establishment of a smelter near Salem having a capacity of 10,000 tons per annum.
- (5) Expansion of the plant of the Aluminium Corporation of India by 5,000 tons per annum.

All these projects are in the private sector and have already been cleared by the Government for implementation.

In view of the rising demand for electrolytic copper and relatively meagre possibilities of substantially increasing its domestic production during the Third Plan period, the Planning Commission thinks further expansion of the capacity for aluminium production desirable. The amount of such expansion would mainly have to be determined by the pace at which it is considered feasible from the technological angle to substitute aluminium for copper over the next five years, though the possibility of exporting aluminium would also be a relevant consideration. The additional foreign exchange needed for developing further capacity would be quite considerable if, as seems almost certain, arrangements would also have to be made for the connected power facilities. The attractiveness of new proposals for further expansion of aluminium production would depend largely upon the extent to which they can provide for these additional foreign exchange requirements.

Production of electrolytic copper in India is expected to commence in the near future with the commissioning of the Indian Copper Corporation's plant at Ghatsila. A firm time schedule for the installation of the copper smelter associated with the scheme for the exploitation of the Khetri and Daribo copper deposits is still to be worked out. The likely contribution from this smelter in the Third Plan period cannot, therefore, be accurately forecast at this stage.

Production of zinc is expected to start by the middle of the Third Plan period with the commissioning of the zinc smelter based on zinc concentrates from the Zawar Mines, Rajasthan.

FOREIGN AID

Although the terms on which the Aid-India Club members will be making available to this country their future credits remain undisclosed, indications are that these credits will be repayable in about 40 years and that they will carry interest at the rate of 2.5 per cent

per annum. No repayment will be required to be made during the first five years from the date on which a particular credit is drawn upon.

The three Western European countries which are members of the Club may find it difficult to grant credit at such low rate of interest. To obviate this difficulty one method talked about here is that they may make an outright grant to India corresponding to the difference between the rate of interest at which money would have been borrowed by them and the rate at which it is lent to India.

MANUFACTURE OF AUTOMOBILE TYRES AND TUBES

Taking into consideration the expansion envisaged in road transport under the Third Five-Year Plan, it

is estimated that requirements of automobile tyres and tubes by 1965-66 will be of the order of 4.5 million numbers each. A capacity of 2.94 million numbers of tyres and 2.998 million numbers of tubes has already been licensed. There is, thus, scope for installing additional capacity in this industry.

Four new manufacturers of automobile tyres and tubes are expected to start production in the near future. Some of the existing units have also intimated to the Government their intention to increase their capacity.

The following table gives the existing installed capacity for the manufacture of automobile tyres and tubes, the additional capacity that has already been licensed and further expansion envisaged by the existing units.

PRODUCTION OF AUTOMOBILE TYRES AND TUBES

(In unit numbers)

Name of the Unit	Existing annual capacity on 3-shift basis	Additional capacity licensed & under implementation	Further expansion capacity envisaged/under implementation	Total of 2, 3 and 4
(1)	(2)	(3)	(4)	(5)
1. Dunlops, Shahganj	6,51,600	49,000	—	7,00,600
2. Dunlops, Ambattur	1,34,400	54,200	2,00,000	3,88,600

The foreign collaborator of Universal Tyres Ltd. is Semperit of Austria. The company proposes to pay for part of the foreign exchange expenditure in Indian rupees. To meet the rest of the foreign exchange expenditure, a loan from Export-Import Bank will be sought. P. John Zacharia has arranged foreign collaboration with the United States Rubber Company of New York. Synthetics and Chemicals will be securing financial and technical collaboration from Firestones of U.S.A.

HEAVY POWER EQUIPMENT AND HIGH PRESSURE BOILERS PLANTS

Agreement has been signed between the Heavy Electricals (India) Ltd. and Messrs. Technoexport of Czechoslovakia for the preparation of detailed project reports for the Heavy Power Equipment and the High Pressure Boilers Plants proposed to be set up during the Third Plan period.

Under the first phase of development, the Heavy Power Equipment Plant will manufacture 12,000 KW. and 25,000 KW. steam turbines and generators capable of producing 620,000 KW. of electrical power. The High Pressure Boilers Plant will turn out every year 12 boilers to suit 50,000 KW. turbines. These projects will also cover the production of various types of ancillary equipment.

The total cost of the two plants, according to rough estimates, is placed between Rs. 35 and Rs. 37 crores,

exclusive of the expenditure to be incurred on building of townships near the plants. The value of the products to be turned out annually by both these plants in the first stage is likely to be of the order of Rs. 20 crores.

The two projects are covered by the economic collaboration agreement signed between India and Czechoslovakia on November 24, 1959, under which the Czechoslovak Government agreed to give to this country a credit of Rs. 23.1 crores.

HEAVY MACHINE TOOL PLANT

An agreement has also been signed between the Heavy Engineering Corporation and Messrs. Technoexport of Prague for the preparation of a detailed project report for the Heavy Machine Tool Plant to be set up at Hatia, Ranchi. The agreement provides, among other things, for the visit of Indian engineers to Czechoslovakia to take part in the preparation of the project report. The project report is expected to be ready by the first week of December this year.

The Heavy Machine Tool Plant is the third project proposed to be set up near Ranchi by the Heavy Engineering Corporation. The other two projects are the Heavy Machine Building Plant and the Foundry/Forge Plant. The Heavy Machine Tool Plant is being designed to produce 10,000 tons of different types of heavy machine tools per annum. For the first time in India,

this plant will be turning out machine tools weighing as much as 180 tons each.

The project is estimated to cost nearly Rs. 15 crores, excluding the cost of construction of quarters for the staff. A 60-acre piece of land has already been selected for locating the project. When in full production, the annual output of the plant will be worth nearly Rs. 8 crores. Trial production is expected to begin in 1965-66.

ROURKELA STEEL PLANT'S EXPANSION

The project report on the expansion of the Rourkela Steel Plant is understood to have been finalised after scrutiny by the International Construction Company, the Union Government's consultants for the project. Tenders for the supply of equipment for the expansion programme are expected to be called shortly. The bulk of the equipment will be secured from West Germany and Austria, the latter supplying LD process equipment. On account of certain difficulties in the delivery of some items of equipment from these two countries, such items are likely to be obtained from the United Kingdom or the United States.

The project report for the expansion of the Durgapur Steel Plant is expected to be ready shortly. Tenders for the supply of equipment for this plant will be invited when the project report has been considered by the Government.

The capacity of the Rourkela Steel Plant is envisaged to be increased by 0.8 million tons per annum and that of the Durgapur Plant by 0.6 million tons.

PETROLEUM NAPHTHA PROJECT

The Government, it is understood, has approved the Esso Standard Oil Company's Petroleum Naphtha Project. A factory is proposed to be set up adjacent to the company's Bombay refinery to undertake the manufacture of ethylene, propylene, butylene, butadiene, benzene and some other liquid products. A new company will be floated to undertake the project. Indians will be offered 40 per cent of the equity capital of this venture.

TWO MORE NEW ISSUES

Two more companies have been granted consent

by the Controller of Capital Issues for raising capital. The details are as follows:

(1) **The Uttar Pradesh Hotels and Restaurants**, a public limited company, has been granted permission to issue capital worth Rs. 40 lakhs—Rs. 32.5 lakhs in equity shares and Rs. 7.5 lakhs in preference shares—for cash at par. This issue will be in addition to the capital of Rs. 7.5 lakh in equity shares and Rs. 2.5 lakhs in preference shares already issued under the Exemption Order.

(2) **Messrs. Wellman India (Private) Ltd.**, a new company proposed to be incorporated in Maharashtra, has been accorded consent to issue capital worth Rs. 22 lakhs in ordinary shares of Rs. 10 each at par. Of these, shares to the extent of Rs. 10.78 lakhs (49 per cent) will be offered to Mr. Arthur G. Wellman of the United States for considerations other than cash and against supply of machinery. The balance of the capital (Rs. 11.22 lakhs) will be offered to Indian nationals for cash. The proceeds of the issue will be used for the manufacture of synthetic fibre tops.

The consent order in both the cases is valid for 12 months.

BRIEFS

An aluminium plant, having an annual capacity of 25,000 tons, is proposed to be set up in Madhya Pradesh. Negotiations are at present being carried on to secure technical help for this project from Yugoslavia.

There are plans to set up a phosphorus plant at Mangalore. Technical co-operation for this project is being secured from East Germany.

An agreement has been reached with Davy Ashmore to set up a plant to manufacture vessel plates and heavy structurals. The pact is expected to be formally signed in the near future.

The Indian railways loaded on an average nearly 6,000 wagons with coal per day during the month of April, 1961, as compared to about 5,900 wagons during the corresponding period in 1960. The average loading in Bengal and Bihar coalfields registered an increase of nearly 13 per cent over the loading in the corresponding period in 1960.

COMPANY AFFAIRS

SWADESHI COTTON

The directors of Swadeshi Cotton Mills Company Limited, Kanpur, in their annual report for the year 1960 have pointed out that the conditions facing the textile industry during the first half of the year under review were materially different from those in the second half of the year. While the movement of cloth in the first half of the year was quite satisfactory the movement in the second half was extremely slow. In the second half of the year the Government announced that a reduction in cloth prices was called for. This naturally caused uncertainty in the market with consequent adverse effect on the movement of cloth. As a result of the negotiations between the Government and the Indian Cotton Mills Federation, the prices began to be stamped on cloth from September, 1960. Thereafter the Government asked for further reduction in cloth prices. Owing to these uncertainties, movement of cloth during the later part of the year was much below the normal. The stocks at the end of the year were, therefore, higher than were originally expected. The movement of yarn, however, was more or less regular.

The year under review was marked by an extremely difficult cotton supply position. The quantity and quality of the crop were seriously affected by untimely rains during September — November, 1959. In keeping with their policy of modernising the Capital Equipment of the Company, the directors have made additions to the fixed assets of the Company of a total value of Rs. 56.40 lakhs out of which a sum of Rs. 53.79 lakhs represents additions to plant and machinery alone. This policy is being continued in the current year as well.

The working of various units of the Company has generally shown better results. Sales during the year increased to Rs. 10.86 crores against Rs. 10.53 crores in the previous year. After making usual adjustments there was a profit of Rs. 1.08 crores. A sum of Rs. 50.13 lakhs has been separated towards depreciation for the year under review as well as for the previous years. Provision for taxation absorbs Rs. 25 lakhs and that for development rebate Rs. 9.55 lakhs. An interim dividend on preference shares of Rs. 100 each was paid at the rate of 7.8 per cent subject to deduction of income tax and on preferred ordinary shares of Rs. 10 each at 5.2 per cent subject to deduction of income tax. Now the directors have proposed the payment of dividend on preference shares at the rate of 0.77 per cent subject to deduction of income tax, on preferred ordinary shares of Rs. 10 each at 5.51 per cent subject to tax and on ordinary shares of Rs. 10 each at 5 per cent, subject to taxation.

UNITED PROVINCES SUGAR

In the report for the year to September 30, 1960 auditors of the United Provinces Sugar Company Limited, have pointed out that no provision was made for the liability in respect of cane purchased during the years 1958-59 and 1959-60 based on the formula prescribed by the Government. The directors have said that such provision could not be made because the Government has now referred the matter to the Tariff Commission and the final report is awaited. The crushing during the year started on November 9, 1959 and finished on May 30, 1960, with a total crush of 48,74,283 maunds of cane at recovery being 9.45 per cent, which is considered satisfactory. Of the total cane crushed 3.94 lakh maunds were supplied from Company's farms. Cane price was increased from Rs. 1.44 nP. per maund to Rs. 1.62 nP. per maund at the factory gate and from Rs. 1.31 nP to Rs. 1.50 nP at outstation.

During the year under review net profit of the Company after providing for depreciation and other usual charges comes to Rs. 7.66 lakhs. The directors have recommended the payment of a dividend at the rate of 15 per cent for the year under review subject to deduction of taxation which will absorb Rs. 2.40 lakhs. A sum of Rs. 2 lakhs is transferred to development reserve, and Rs. 76,000 to development rebate reserve.

INDIAN STANDARD WAGON

During the year to March 31, 1961 the directors of the Indian Standard Wagon Company Limited have pointed out that the output of the Company remained restricted due to an inadequate quantity of matched steel received by the Company both from indigenous and overseas sources. The directors had anticipated that by 1961 there would be marked improvement, but they were still not very hopeful, though there was no reason for any concern. At times considerable quantities of steel were supplied and remained in the works, but this could not be utilised for want of the matching steel.

The result for the year under review appears to be less favourable than last year but having regard to the fact that last year there was credited to profit and loss account the sum of Rs. 10.93 lakhs in respect of previous year, the results are about the same. The apparent anomaly in as much as there is an increase in the provision for income-tax is because profit sharing bonus in the case of this Company is only allowed on the payment basis. Unfortunately, in October, 1960 the Labour Union refused to accept the bonus offered.

The profit for the year to 31st March, 1961 after providing for taxation, depreciation and all other charges and transferring to various reserves, amounts to Rs. 13.36 lakhs to which is added the balance brought forward from the previous year, making available an amount of Rs. 13.85 lakhs. The directors have recommended the payment of dividend at the rate of 28.5 per cent on ordinary shares subject to deduction of tax.

TRADE PROMOTION

... is our business

Australia, New Zealand, and Fiji offer opportunities to exporters and importers and the International Division of the Bank of New South Wales can help those interested.

The Bank's complete banking service includes such specialized facilities as trade and industrial enquiries, economic and trade information, and a complete travel service. The Bank, through more than 1,000 branches and agencies, is closely and constantly in touch with industry, business, and agriculture in the areas it serves.

COMMODITY NEWS AND NOTES

ANNUAL WOOL TRADE OF INDIA

Seaborne imports of raw wool recovered somewhat in the fourth quarter of 1960 to 442,000 lbs. This brought the total for the year 1960 to 3.5 million lbs. or 37 per cent more than in 1959, receipts from Australia rising by 28 per cent to 2.2 million lbs. Imports of wool tops fell by 22 per cent between the two latest quarters to 3.2 million lbs., bringing the total for 1960 to 14.9 million lbs. or 2 per cent less than in 1959. Imports from U.K. were 11 per cent lower at 8.0 million lbs. but those from Australia rose by 11 per cent to 5.0 million lbs. Yarn imports more than doubled during the fourth quarter, although they were well below the level of a year ago. The total for the year came to only 2,10,000 lbs. or 68 per cent less than in 1959. Imports of wool fabrics during the year under review rose by 20 per cent to 1,83,000 lbs.

LEAD AND ZINC CONSUMPTION IN U.K.

Consumption of lead in U.K. in all forms during April was 30,805 tons, a fall of 6 per cent compared with March's 32,601 tons, says the British Bureau of Non-Ferrous Metal Statistics. For zinc the figures were 27,271 tons consumed in April, down 14 per cent from the March level of 31,844 tons. Total consumption of lead in the first four months of this year amounted to 124,981 tons, 219 tons less than in the corresponding period of 1960. Stocks of refined lead were up by 628 tons; they totalled 66,311 tons on April 30, compared with 65,683 tons at the end of March.

WORLD PRODUCTION OF JUTE

The world production of jute, which is concentrated to the extent of 95 per cent in India and Pakistan,

according to the reports of the U.S. Department of Agriculture, amounted to a total of 1,968,000 tons in 1960 as compared with 1,880,000 tons in 1959. Pakistan's share of this was 1,020,000 tons, in the previous year 973,000 tons and that of India 853,000 tons with 8,25,000 tons in the previous year. The world consumption of jute increased year by year in spite of the strong competition of fibres similar to jute and the uses of other expedients for the storage and transport of goods. At the end of the financial year 1959-60, stocks were as good as cleared. This fact and the fear of a smaller crop have forced the price of jute to rise steeply.

U.S. STEEL PRICES

It is gathered from the magazine Iron Age that President Kennedy's economic advisers are making a study of steel prices to determine if price increases can be justified. But just how far the counsel of advisers will go in studying steel prices is not yet determined. The President is expected to have the findings in his hands by the autumn. This would be at about the time the steel industry's wages go up by 7 to 10 cents an hour. The findings of the study could easily lead to Administration pressure on the industry to stave-off an increase and, based on past practice, advisory economists can be expected to lean towards evidence against higher steel prices. At the same time, price cutting in stainless steel has also dampened any chance of a steel price rise in the near future. Continuation of price cuts, coupled with the fact that steel mills and steel service centres both continue to overlook some "extras" or special charges, is hardly the atmosphere for steel price increases, the magazine Iron Age maintains. In addition, many large steel users say they would resist higher prices.

JUNE 23, 1961.

Seventh in the Common Market?

ON June 13, Mr. Harold Macmillan, Britain's Prime Minister, informed a tense House of Commons that Mr. Duncan Sandys would be deputed on a special mission to visit the Commonwealth countries for consultative talks on Britain's entry into the European Common Market. Mr. Sandys' one-man mission was later expanded into a three-man mission by the addition of two of his senior Cabinet colleagues. Their visits are to commence early next month. In 1956, Mr. Harold Macmillan, Britain's Chancellor of the Exchequer, put for the consideration of the Commonwealth countries the proposition of their participation in the original plan for the creation of the European free trade area, to be coextensive with the OEEC, in case Britain decided to join it. Much water has flowed under the bridge since then. The original proposal did not materialise, but the OEEC was split up into two regional trade divisions—the European Common Market and the European Free Trade Association, which followed after an interval as a weaker defensive organization. But doubts continued to be entertained about the feasibility of the Common Market emerging as a forceful organisation.

All these clouds of scepticism about the success of the Common Market, however, have been totally dispelled and the alliance has raced ahead with a confidence and dynamic vigour which have taken even its optimistic advocates by surprise. Tariff reductions have been advanced and, partly, their benefit has been extended to the outer tariffs as a gesture that it is outward-looking. The European Economic Community is gaining in industrial strength at a rate which would have been regarded before as incredible. Britain, by contrast, is finding her industry in a state of virtual stagnation and the gulf dividing her from the Common Market is getting rapidly wider than the geographical measure of the English Channel.

The economic case for Britain to join the Common Market is becoming increasingly irrefutable. But the European Economic Community's goal of integration transcends the economic domain. It is here that emotion threatens to get the better of reason. It

would be an oversimplification of the issue to state that the conflict in Britain over joining the Common Market is a conflict between emotion and reason. But as a broad assessment there is considerable validity in it. There can hardly be much doubt where Britain's choice will eventually lie—the ayes will have it.

In 1956 Mr. Macmillan found it the most convenient course to hold joint consultations at the Commonwealth Finance Ministers' Conference. This was perfectly understandable since the discussion was to be in broad theoretical terms. On the present occasion, however, Mr. Macmillan is reluctant to accede to the desire of Mr. Diefenbaker that the issue be considered at an emergency session of the Commonwealth Prime Ministers. An open discussion at a comprehensive forum may tend to concentrate effort on a common front, which, by its very nature, ought to accommodate the maximum possible demands for safeguards. Quite likely, the deeper implications of Britain's entry may be thrashed out at such a conference and there may be undisclosed apprehension entertained by Mr. Macmillan that the political aspect is also uppermost in the mind of Mr. Diefenbaker. In any event, such comprehensive deliberations are being eschewed as prejudicial to the British case at the present moment. Unanimity is lacking among the Common Market Six on the nature of Britain's participation and the attitude of France in insisting on implicit endorsement of the Treaty of Rome by her is no secret.

Separate discussions by Mr. Sandys and his two colleagues with the individual members of the Commonwealth may help to sift their claims and agree upon minimum conditions of each after the members are apprised of the limit of concessions to which the Common Market Six are prepared to go. This is a reasonable conjecture on the assumption that Mr. Macmillan is in a position to brief his colleagues from personal knowledge. But he has not taken the public into confidence on this specific issue and he may be right in adopting this course to avoid embarrassment in later negotiations. But the chances also are that, in the absence of any such brief from their chief, the visiting Ministers may have to accept from the

individual Prime Ministers an assortment of demands for safeguards.

Britain cannot treat lightly her ultimate and enduring economic link with the Continent, but, at the same time, howsoever tenuous the Commonwealth link may seem to be, she finds herself politically and economically under an obligation to maintain it. The direct implication of the Commonwealth link, in the context of her participation in the Common Market, is the preservation of at least the minimum of the preferential tariffs with reference to each member of the Commonwealth, to avert the likely risk of disruption of the structure of their export trade with Britain, involving dislocations in their economies. Where the preferential import tariffs on strategic Commonwealth goods entering the British market would be lower than the internal tariffs of the

Common Market, reservation for such preferential rates of duty would be essential.

It cannot be pretended that the Treaty of Rome is a puristic document aiming at free trade direct. The exclusion of the domestic policies of the Six, governing agricultural protectionism, from the application of uniform internal tariffs is a glaring reservation. Besides, there are negotiated exceptions with regard to individual items for some countries. This recognition of the principle of reservation is the basis for the expectation that the essential preferential import duties for individual Commonwealth countries will be safeguarded. In the case of India duty-free entry into Britain of her tea and a prescribed quota for grey cloth, duty-free, illustrate the typical reservations which are vitally necessary for the preservation of her export trade. In addition, safeguards for some items of exports of the Commonwealth countries to the Continental Six may be indispensable.

Men Without Jobs

ONCE again attention has been focused on the tormenting problem of unemployment—and quite rightly Mr. Nanda, the Union Minister for Planning, Labour and Employment, has made an anxious reference to it. The backlog of the unemployed in India at the beginning of the Second Plan was estimated to be a little more than 5 million. According to the preliminary estimates based on the latest census, the unemployed at the end of the Second Plan are estimated to be around 9 million. Even if the Planning Commission underestimated the volume of unemployment at the beginning of the Second Plan, the fact remains that the Second Five-Year Plan did not succeed in reducing the pressure of unemployment. On the other hand, the number of men without work nearly doubled and has rightly caused great concern.

What has been the aim of India's five-year plans in regard to the creation of new jobs? The First Five-Year Plan outlined a programme which envisaged "maximum production, full employment, attainment of economic equality and social justice" as the four basic objectives. The Second Five-Year Plan placed "the increase in national income" in the front rank, followed by rapid industrialisation with particular emphasis on the basic and heavy industries. Expansion in employment opportunities occupied only the third place. It was, however, clear even at that stage that the backlog of the unemployed would slightly increase instead of diminishing during the Second Plan. In 1957-58, when the Plan had to be slashed because of the paucity of foreign exchange resources, the estimate of new jobs likely to be created was reduced substantially from 8 million to 6.5 million. It was obvious even at that time that the backlog of the unemployed at the end of the Plan might be between 7 and 8 million. But the census has turned the apple cart and has enhanced the number to 9 million, indicating that a highly explosive situation existed in the country. Mr. G. L. Nanda, the Union Minister for Planning and Labour and Employment harped on the same theme at Kanpur on June 18, when he said that "the increasing population was a big and expanding challenge and if no suitable solution was found, the internal peace of the country would continue to be disturbed. So long as there was a single person unemployed, all talk of social justice was useless because the unemployed received nothing and remained an outcast."

The draft outline of the Third Plan published by the Planning Commission in June 1960 again under-estimated the new entrants by about 2 million. Whereas the Plan indicated that the total increase in the new entrants in the employment market might be of the order of 15 million, it is now estimated that their number would swell to 17 million. Coupled with the backlog of the 9 million unemployed from the Second Plan, the Third Plan is required to provide jobs for 26 million. This is indeed a stupendous task and has unquestionably confounded the planners.

A large number of solutions has been offered, mostly short-term, but it seems that even the Planning Commission does not have faith in their capacity to produce the desired results. Take, for instance, the provision of Rs. 150 crores for rural work in those areas which have heavy concentrations of the men without jobs. This is obviously a short-term plug to close a big hole. Similarly, the proposition to increase the construction activities in the country all-round is another solution of the same kind which suffers from very serious limitations, especially in regard to the availability of raw materials for executing the projects.

Whatever stop-gap solutions are applied, they may provide only temporary relief. Attention needs to be diverted to long-term solutions. First in this category lies a programme of family planning which alone can reduce the pressure of population and unemployment. It is a lamentable fact that the family planning programme during the last decade has fared miserably and with the present allocations in the Third Plan, the battle for creation of employment may not be won. Before the "magic pill" is discovered by the U.S. scientists—and India's ex-ambassador Mr. Chagla is reported to have made a strong plea for it in one of his speeches in the U.S.A.—it is necessary that all the available technical knowledge on the subject should be pressed into service for curtailing the rate of rise in the population. If necessary, the financial allocation in the Third Plan may be enhanced.

The second long-term solution relates to the priorities of investment in the Third Plan wherein the emphasis on heavy industries needs to be redressed. This is a fact which is too well known

to the Planning Commission. In the Fifth Chapter of the Second Five-Year Plan, the Planning Commission has stated: "In the light of the emphasis placed on heavy industries, the scope for a varying pattern of investment is only marginal in character and any further adjustment of priorities may not yield much larger results in terms of employment." It is common knowledge that heavy industries absorb a stupendous amount of capital and do not offer employment opportunities commensurate with the size of the investment. The same amount of capital invested in medium and small industries is likely to generate more than double the volume of employment created by heavy industries. *The Eastern Economist* has repeatedly urged rectification of the emphasis on heavy industries. Reports have already appeared in the Press that the final decision has been made to include the Bokaro plant in the Third

Plan. Could it not be deferred in favour of labour-intensive industries which would be effective in relieving the pressure on the employment market?

But it is obvious that inside the Planning Commission the advocates of central emphasis on heavy industries have carried the day in their ideological zest, utterly unmindful of the "explosive situation" created by mounting unemployment. Will the Planning Commission show the courage to face the problem in a spirit of realism and alter the scale of priorities in industry on the basis of their employment generating capacity in order to strike a rational balance between the need to achieve self-sustaining growth in the economy on the one hand and the need to mitigate the explosive character of the situation on the other?

The Flare-up in Assam

THERE is a cruel irony in the situation in which the ugly forces in defiance of law and order have reared their head in the Cachar district. The Sangram Parishad had suspended its agitation in favour of securing legal recognition for Bengali as a parallel official language with Assamese throughout the State. It could very well have seen reason not only to suspend but to call off this prolonged agitation. But though its action came somewhat too late, it helped to create an atmosphere conducive to the return of peace in the Cachar district. It is most tragic that in these circumstances the flare-up should have occurred and violence resulting in seven persons being killed and several injured should have taken place. The Shanti Parishad, which has been responsible for organising the mob of villagers 10,000 strong for the march on Hailakandi, has been set up as a counter-blast to the Sangram Parishad. But by resorting to rank lawlessness it has made a complete mockery of its name. If this is the Shanti Parishad's idea of bringing about peace, it is evidence of a crust of linguistic intolerance still holding its own in this troubled State.

The Assam Government deserves credit for the promptitude and firmness with which it acted in suppressing violence and restoring peace and order. Troops were called without loss of time and curfew was clamped on the affected area swiftly. This stern action prevented any possible spread of a wave of violence and bloodshed of which Assam has still a fresh memory.

But it is surprising that the State Government was taken unawares by this recrudescence of terror in a town in the Cachar district where it was expected to keep close vigilance. A march by as big a crowd as 10,000 strong cannot be a sporadic event. From all indications, it was a premeditated and organised attempt at using violence against the Bengali-speaking population of the town. The motive which impelled the organisers to mobilise force was resistance to the amendment to the Assam Official Language Act to which the State Government stands committed. No other motive seems conceivable in this case. If so, it speaks for the great inadequacy in the State Government's machinery of procuring intelligence at a time when there is every reason to be on the alert and not the least justification for giving quarter to complacency.

This incident reveals a serious gap in the precautionary measures which the State Government as well as the Central Government seem to have decided upon in the light of last year's protracted language riots. To strengthen the intelligence units was an important precaution dictated by the exigency created by their aftermath. It was necessary to set up a network of telecommunications between the capital, the district headquarters and the important cities in areas which were the strongholds of linguistic agitators. The proposition is worth considering whether the State Government should not accept the Centre's intelligence service until it is able to set up its own of the requisite efficiency. No chances ought to be taken until normalcy is fully restored.

A theory has been advanced that the mob which marched against the Bengali population at Hailakandi consisted largely of illegal immigrants pouring into Assam from East Pakistan. This seems a far-fetched theory because the immigrants are quite unlikely to possess the resources necessary to organise violence on such a scale. If any of them were procured as hirelings, it only speaks for the planning which went behind this march of law-breakers. Assam is tormented by a multitude of problems among which two require careful attention in the short run. They are the resettlement of returning Bengali evacuees during last year's riots and effective measures to prevent the infiltration of illegal entrants from East Pakistan. Any attempt at this critical stage in the life of the State to give a communal complexion to this flare-up (and there are some indications of it) will hamper the delicate and difficult task of the enforcement of the rule of law.

It is the first and elementary duty of every Government to give protection to the life and property of the minority. But recurrence of incidents of the type that took place at Hailakandi will be damaging to faith in the Government's capacity to discharge it. There is also urgent need for the different sections of the population of Assam to cultivate a spirit of goodwill and tolerance in linguistic matters. But the guardians of law and order cannot wait for this transformation to take place and restore respect for law. Above all, the first demonstration of firmness which the Government ought to make is to implement the Shastri formula and amend the Assam Official Language Act at the earliest opportunity.

A DELHI DIARY

POZNAN: COME TO THE FAIR

AFTER more than a month's absence, for which I must apologise profusely, I can still only appear by remote control. I am proud, however, to be able to write on the date of the inauguration of Poland's great international Fair, June 11. I trust my readers will accept in place of accustomed fare some brief remarks on what it is to come to Poznan and get the first mighty impact of the industrial advances that Poland has made in the last five years. A little less than half of the Poznan Fair is occupied by Polish Exhibits or stalls which to me were far more interesting than those of the USA, USSR, UK, Germany and China combined. Perhaps this is the industrial translation of that profound remark of Robert Louis Stevenson that it is better to travel hopefully than to arrive!

HOW NOT TO ARRIVE

The word 'arrive' raises a less comfortable train of thought in my mind and I might as well get it out at once. Unwisely, I chose Berlin as my point of entry; I am told those gifted with vision choose Vienna which has so far graduated out of Cold War tensions that it threatens to be the new Summit Conference choice of the world. From Berlin there are chapters of discomfort. One cannot go from Tempelhof, the Western Berlin airfield into Eastern Europe. One has to get transported from there to East Berlin. This is by means of a taxi with a double fare since the taxi counts on returning empty. When depleted of West German marks, one then has to find some East German marks to pay the bus fare from the air terminal in East Berlin to the East German airport of Schönefeld. Also one has to obtain a departure and entry visa for ten Deutschmarks more, even though one does not stop in East Germany. The rate of the East German Deutschmark for this purpose is for prestige—and I suppose good economic reasons—parity though, at almost every exchange office in West Berlin, the rate is 4.87 East DM's to one West DM. The bus travels nearly empty for about ten miles to the airport; one carries one's own case there, and almost the only smile one meets is when one encounters the Polish hostess of the Polish airlines. Why, I keep asking myself, is Poland much more cheerful than East Germany?

I do not speak in a querulous mood; on another occasion I shall have something to say of Berlin, that tragic tale of two cities. But, for the present, the point that I am making is the extraordinary warmth that one feels in being in Poland. I was only one of about 200 journalists expected at the Poznan Fair, of which 67 foreign journalists had arrived all in a rush on the first day. The extraordinarily detailed manner in which every problem was individually resolved—board, lodging, transport, tours, guides—and above all tailor-made information could, I suggest with great respect be copied by Delhi at the Industrial Fair proposed this year. The people in Poznan are gay and cheerful, whether in the Fair or outside. The flags are all out and today is a Sunday but I cannot believe that any other day would be different. There is music (sometimes a little too continuously) broadcast throughout the Fair; but there is also a great Philharmonic Orchestra here supported largely by local effort and music manages to live in harmony with some of the grim factories in the area. Poznan was severely mauled in the last year of the War with the Russians and Germans battling three weeks for this key city on the road to Berlin. There is a great monument in the cemetery built on the hill from which German guns dominated the city. Behind the monument the great trench used

can still be seen. But of the War one hears practically nothing. The Poles are looking forward not back; perhaps that is really the secret of perspective in human living and an excellent prescription for us in India. When one nurtures wrongs, one loses opportunities; when one seizes opportunities, one gets, by a curious law of nature, an escape from a sense of grievance. What, in official documents, is called the "dynamic"—happy word!—of each section of the economy rests, I expect, on the "dynamic", all-embracing and enduring, of a happy outlook on the future!

POLAND'S INDUSTRIAL ALPHABET

I shall never be able to command all the magic letters of Poland's new industrial concerns. They continue to multiply and, according to Biblical prophecy, to replenish the earth. Thus POLSERVICE has just branched out of CEKOP, the extraordinary monolith which offers complete plants and arranges full power houses. Not, indeed, that CEKOP makes everything in Poland; it buys out parts for power houses, for example of about 15 per cent — perhaps turbines, perhaps other parts as circumstances direct and by no means from socialist countries only. They are buying increasingly from the U.K. now which is fourth in Poland's list as a trading partner, the first two being the U.S.S.R. and the East German Democratic Republic. But let me get back to the Polish Industrial Alphabet on which my preliminary researches were conducted. In strictly alphabetical order they are ANIMEX (for import and export of animal products), ARS POLONA (for cultural affairs, books, music, — and postage stamps!) CEKOP (the great industrial giant — to which I attach its new daughter POLSERVICE), CENTROMOR (for ships and shipbuilding), CENTROZAP (for export-import of steel products), CETEBE (for textile products) CIECH (for chemicals) and so on and so forth. I am still at 'C', I, therefore, say no more but attach names only. Here they are in alphabetical order: COPEXIM, DAL DESA, ELEKTRIM, FILM POLSKI, HORTOX, IMPEXMETAL, METAEXPORT, MINEX, MOTOIMPORT, PAGED, PETROLIMPEX, POLCOOP, POLIMEX, PRODIMEX, ROLIMPEX, RUCH, SKORIMPEX, SPOLEM, TEXTILIMPORT, UNIVERSAL, VARIMEX AND WEGLOKOKS! The last but not least means something or other about coal and exports hard coal, metallurgical coal and briquettes from hard coal. I conclude on a note of dismal prophecy. The Ministry of Fuel will soon be talking to WEGLOKOKS on the possibility of coal supplies to Western India. Happily that will not exhaust the possibilities of economic co-operation; who, having seen the Fair at Poznan, can doubt that this co-operation is only just beginning?

THE INDIAN PAVILION

The size and inadequacy of the Indian Pavilion at the Poznan Fair is (alas!) only one instance of the kind of mistake which India makes in choosing her points of display abroad. Handlooms and tea were there but the former were far less happily selected than in any room of New Delhi's Emporium. Tea, which has definite possibilities was not made on the job here than anywhere else in Europe. For expenses of display could be financed in rupees and the market can be made to expand rapidly. My friends, with great tact, always drink tea in my presence. But why, oh why, was the Swastika allowed to appear on the products of an oil mill? A Polish friend seeing this made polite enquiries as to how this had come about not one word about its inappropriateness after the battle of Poznan!

ARGUS.

THE WEEK'S NOTES

The Congo

TOWARDS CONCORD

THE AGREEMENT signed by the UN Secretary-General with Mr. Kasavubu on June 12 for economic aid to the Congo is a good augury for straightening out the tangled affairs in that country which are now happily becoming much less confused and amenable to settlement. In terms of this agreement \$10 million will be withdrawn from the small balance outstanding in the Special Congo Fund for outlay on urgent programmes of economic reconstruction. Experience hitherto has proved that much of the United Nations financial aid to the Congo has been wasted on the army and the administration without setting right their disorder and inefficiency. Now with hopes of establishing normal conditions, the aid granted is expected to be put to fruitful use. But the Special Congo Fund is rapidly dwindling. Russia has refrained from making any contribution to it and the only hope of strengthening it lies in the Western powers undertaking to replenish it. The atmosphere is improving to induce the Western powers to be liberal in their provision of aid. Nevertheless, what the Special Fund can do has its obvious limitations.

There are positive achievements to be recorded such as the establishment of the UN command over the Kamina base and, what is very significant, conclusion of an agreement on the control of the supply base at Matadi port. The UN troops are to move at Matadi without arms so that no further trouble would arise and supplies for the military personnel sent on behalf of the United Nations will flow with regularity.

Colonel Mobutu continues to be the main trouble-maker. His stunt about the "plot" to kill him (and his later addition of the names of two important Ministers as the projected victims) as well as his attempt to bring the Indian Embassy into disrepute by charging it with complicity in the plot have utterly failed. But he has demonstrated the potential to foment trouble in Leopoldville. This nuisance apart, the atmosphere is now becoming clearer for summoning the Parliament. This is certainly a major step towards rapprochement between the Centre, the Katanga regime and Mr. Gizenga's regime. The last two are not parties to the agreement forged at Coquilhatville. Nevertheless, latest indications are that the climate is now becoming propitious for reconvening the Parliament and Mr. Gizenga is said to have given his consent on condition that the legislature is convened under security measures for which the UN would be solely responsible. The latest developments in Katanga, however, give a picture of confused situation.

The PSP

THE DRAFT ELECTION MANIFESTO

WHOEVER WERE responsible for preparing the draft of the election manifesto of the Praja Socialist Party were obviously labouring under the misapprehension that condemnation of the ruling party 'ipso facto' proved the case of the P.S.P. to eradicate the ills for which the former is held entirely responsible. The Indian electorate has enough common sense and at least some political maturity to appreciate the real import of election manifestoes. The P.S.P. should have learnt the necessary moral from a series of reverses which it suffered in recent elections.

The economic programmes briefly set out in the draft manifesto are either unvarnished imitations of what the Congress Party has been proclaiming or they are platitudinous repetitions of familiar promises, or they amount to high-sounding declarations without setting out, at least in some measure, how those promises are to be substantiated. The emphasis on the concentration of economic power and the need for manipulation of industrial licensing and fiscal policies to break the concentration is not a whit different from the pronouncement made on this issue by Congress Chief Ministers at the recent meeting of the National Development Council. The P.S.P. wants association of rural population with the expanding industrialisation, but it is silent on the issue whether heavy industries ought to be built on a priority basis to achieve the self-sustaining stage in the growth of the economy without unduly protracting the period of external assistance. It does not say how the two objectives are to be harmonised. The tax policy of the Congress Government has been condemned as iniquitous and presumably the implication is that the incidence of indirect taxation is rapidly increasing. If economic expansion is to proceed at a fast rate, how would the P.S.P. draw a policy for taxation as the main plank for raising resources for development? Social security requires as its pre-condition the production of wealth, but the attempt to give lopsided precedence to it at this stage is to ignore that pre-condition.

The statements on foreign policy and defence serve only to make the confusion in the P.S.P.'s thinking on these issues worse confounded. Does the P.S.P. really mean that the Chinese and Pakistani aggression on Indian territory is to be vacated by open war? If not, how does it propose to substitute the policy of the Congress Government? Obviously, it does not suit the interest of the P.S.P. to investigate the progress or failure of agricultural co-operatives in operation. But proceeding on the assumption that co-operative agricultural communities will be a complete success, it goes on to extend the assurance that the party will aim at combining agricultural work with a preparedness for defence. What precisely this means has been left conveniently to the imagination of the electorate.

Kerala

EVACUEE RESETTLEMENT

THE GOVERNMENT OF KERALA would have been spared loss of prestige if it had not allowed itself to handle the problem of the resettlement of evacuees in the Amaravati forest reserves tactlessly. So far as the intentions of the Government are concerned, the plan for resettlement was properly conceived. But it was not properly publicised by taking the public into confidence. This tactical blunder has resulted in a windfall to the Communist Party in the State. Mr. A. K. Gopalan, Deputy Leader of the Communist Group in the Lok Sabha, resorted to a fast to espouse the cause of the evacuees. Fast as a weapon of political coercion is to be condemned no matter who practises it. But since it is practised by different political parties, including the ruling party, it was a serious blunder to arrest Mr. Gopalan for attempt to commit suicide and then to persuade him to give up the fast and release him when his condition grew critical. These blunders can only prove costly on election eve.

As many as 2,200 families which were to be uprooted from the Ayyappankoil forest area (which they had illegally occupied), for clearing it to construct the reservoir for the Iddikki Hydel Project, were to be resettled in the Amaravati reserve forest area. Only 500 were settled and a backlog of 1,700 remained to be cleared. The heavy monsoons in the coastal area accentuated the hardships of the families awaiting rehabilitation. Fuel was added to the fire by the Communist leaders by inciting the evacuees to accept nothing short of five acres of land per family. This was a fantastic claim as it is inconceivable that so much land could at all be found in this excessively populated State.

In terms of the compromise which has been arrived at between the Government and organisers of the settlers, the work of resettlement is to be expedited in an orderly manner, one acre of cultivable area is to be provided per family, a loan of Rs. 100 and a grant of Rs. 50 per family are to be provided to enable the settlers to start cultivation and in the intervening period employment is to be created by starting relief works. In addition, medical and educational facilities are also to be provided. The terms of compromise are in essence the same as the programme originally contemplated by the Government. The compromise notwithstanding, the Government needs to be vigilant in supervising the progress of resettlement, lest a handle is given to trouble-shooters to start mischief.

Southern Rhodesia

THE PROPOSED CONSTITUTION

THE WHITE PAPER issued on June 13 on the proposals for a new constitution for Southern Rhodesia has failed to win a favourable reception. It is principally the work of Sir Edgar Whitehead, the Prime Minister of Southern Rhodesia, and Mr. Duncan Sandys, the Secretary of State for Commonwealth Relations. The pre-condition of its acceptance is approval by the electorate on a referendum, which, in this case means approval predominantly by the white population of this self-governing territory. But acceptance of the constitution at the referendum cannot be taken for granted and, in the event of its rejection, Sir Edgar's United Federal Party will have no choice but to resign. The Dominion Party which has a likely chance to succeed in that event will make a change for the worse. Sir Edgar has evidently staked much on the referendum, but there is a distinct reluctance to go as far as the situation demands in the light of the deadlock that was created in the aftermath of the Monckton Report.

The real opposition to the proposals in the White Paper comes from the majority African population and it is an opposition which will need to be reckoned with. For the first time after the constitutional reform of 1923 granting internal self-government, Africans are given representation on the legislature. They are to send 15 elected members to the House. But the British representation has been increased from 30 to 50, with the result, that, in the House of 65, the Africans will be under a permanent handicap of remaining in an ineffective minority of 15. The franchise is based on high standards of qualification and there is force in the criticism that they withhold the right to vote from a large section of the African population.

There is the declaration of rights, a further guarantee that no written law will sanctify discrimination on

the ground of race, colour, or creed. A constitutional supervisory council of 12 is to guard against any discrimination and there is the right of appeal in succession right up to the Privy Council. But the legislature can override the Council in appropriate cases and, furthermore, discriminatory laws may be enacted if they are justified on the ground that they are in the interest of the country. Only a two-thirds majority of the House can block action to override the decisions of the Council. But since Africans will be in a minority of 15 which is short of one-third by 7, this majority of two-thirds may not be difficult to be obtained. The White Paper has a slender chance to resolve the deadlock and, if offer of partnership to Africans is underscored as its central virtue, that partnership has been bitterly criticised by African opinion as subordinate partnership.

Legislative Proceedings

PROTECTION TO THE PRESS

THE PRINCIPLE of absolute immunity to the Press in the matter of publication of proceedings of legislatures has not found acceptance. But there cannot be any two opinions that the Press should be free from the fear of legal action so long as it makes substantially accurate reports of the proceedings of the legislatures. This is a public service which it ought to perform in a democracy, but the extent of its ability to perform it is conditioned by the protection granted by law. When this point was urged before the Press Commission, it recorded its considered view that the balance of advantage lay in extending to the Press the safeguard of legal protection. The Parliamentary Proceedings (Protection of Publication) Act 1956 was the first piece of legislation which conferred on the Press the privilege of qualified immunity. The qualifications levied were that it cannot extend to cases where the publication is made with malice or where it is not for the public good. No exception could be taken or was taken to the two restrictions. Among the States, Orissa was the first to follow suit. Its legislation also kept the qualifications to the reasonable limits.

The Maharashtra Government is introducing in its forthcoming session the Maharashtra State Legislature (Protection of Publication) Bill which purports to confer the privilege on the Press. The State Government was moved to act in this matter by a private member's Bill introduced in the last session, but withdrawn on the Government's assurance to bring a comprehensive measure for this purpose. Surprisingly enough the assurance has been observed in letter but violated in spirit. The so-called immunity of the Press from legal proceedings has been hedged with a number of restrictions. The protection to the Press does not extend to the reporting of such matter as is ordered to be expunged by the Chairman of the Legislative Council or the Speaker of the Legislative Assembly. Any reporting which involves criminal defamation, incitement to any offence under the law, contempt of court or which affects the maintenance of law and order or which is repugnant to public morals or decency — these complete the list of restrictions elaborately enumerated in the Statement of Objects and Reasons, which proudly claims that the Bill closely follows the pattern of the Parliamentary Act of 1956. Comment is unnecessary where protection is reduced to its travesty. Nothing will be lost if this official Bill is withdrawn and the status quo maintained.

The World Abroad

CONTROLS SLOW INDIA'S PROGRESS

By
ODYSSEUS

PROFESSOR P. T. BAUER, of London University, in his important new book, "Indian Economic Policy and Development" (Allen & Unwin. London. 1961. 16s.) offers criticisms of Indian planning, which I am reporting in some detail, because the Professor's standing among Western economists is such that if official India does not accept his criticisms, they had better get a reply out quickly.

Professor Bauer observes that private enterprise is "more closely" controlled by the government than in most other developing countries outside the Communist orbit. The government controls capital issues, allocation of raw materials, imports, exports, and foreign exchange transaction with all foreign countries, even those with the sterling area. These controls reflect, says the Professor, both the government's reaction to the shortage of resources—which is the result of the over-ambitiousness of their Plan—and also the government's intention to determine the economic pattern. They encourage some industries, discourage others. In general, the controls obstruct the most efficient (a) use, and (b) growth, of resources; they cannot take account of differences in the circumstances, opportunities, and resources of different firms. They, therefore, inhibit the growth of the more efficient and protect the less efficient. Because of India's diversity of social and economic resources, blanket measures increase the economic waste caused by these controls. The restrictions on the supply of consumer goods retard the progress of production for the market by decreasing inducements to produce for cash sale.

These measures are usual accompaniments of attempts to repress inflation, or to secure to the government the resources required for particular aims, and of the desire to determine officially the economic pattern. In India, there are, in addition, other more drastic official controls over private enterprise. The government has power, notably, to license the establishment, extension, change of location, or the production of a new article, of all substantial enterprises. It can prescribe prices, methods, the volume of production, and the channels of distribution, can prohibit an enterprise from reducing its output or its capacity, can remove directors and executives and replace them by its own appointees without right of compensation. I need not elaborate the scope of the Industries Development and Regulation Act, the Essential Commodities Act, nor the Supply and Prices of Goods Act, with which you are familiar. The present point is—how do they strike outside observers?

WHAT FOREIGNERS THINK

Sir Theodore Gregory in "India on the Eve of the Third Five-Year Plan" (Associated Chambers of Commerce of India. 1961. Price Rs. 5) says that, at the moment, the threat of large-scale nationalisation, implicit in these Acts, is not taken too seriously by business men, but, he says, it is important to underline the words "at the moment". A shift of opinion to the left would at once revive fears of nationalisation, even if the present over-all distribution of power among the political parties were unchanged. If, however, at the next election there were a large gain in Communist representation, still more if the Communists secured a

majority, the situation would be serious. "What is to be feared at the moment," says Sir Theodore, "is not the threat of a further general nationalisation, but the doctrinaire use of existing powers by the state." If the government wanted to harass an individual, or if it were generally suspicious of industrialists, these Acts offer wide scope for interference. It is important to ask, says Sir Theodore, whether such legislation is not in itself more dangerous to the national economy by creating apprehension than the evils that it is supposed to check. Sir Theodore goes on to refer to the time, expense, and delays, caused by the need to refer to a multitude of authorities for all kinds of permits.

Another sympathetic observer, Mr. Paul Bureau, editor of "The Statist" of London, described these Acts as giving the government power of life and death over any individual enterprise. Indians told him that the law was, of course, only meant to be used against rascals, not honest men. "That may be true," said Mr. Bureau, "but it is there as part of the law and could be used by another administration to stifle the life out of any organisation that they dislike."

Professor Bauer makes the point that such close controls over private enterprise are not necessary for the extension of the public sector. If unnecessary, why are they there? Their effect has often been to increase the profits of existing enterprises by shielding them from competition by new entrants and they have created controlled sellers markets, and market-sharing agreements. Indeed, they have strengthened previously existing private market-sharing schemes—or have made them unnecessary! In certain sectors, the operation of controls has secured large windfall profits to the recipients of controlled supplies, as the market prices of these resources were often far higher than those at which they were allocated. Thus controls have been welcome to existing firms. These points should incidentally, be remembered by those interested in promoting anti-monopoly legislation in India. It would be ironical if firms were prosecuted for market-sharing practices created by previous legislation.

However, even to firms which benefit by them, these laws are mixed blessings. Along with the rest of the economy, these firms suffer by the retardation of economic progress. Moreover, the close control of all their activities, including production methods, raw materials purchase, and output disposal, helps to spread the idea that private firms are functionless automatons, and this makes more plausible political demands for their expropriation. The controls also facilitate the replacement of individual firms by state organisations. Business men may welcome controls which protect them from competition, but they should realise that these controls prepare the ground for their displacement. ("Will you walk into my parlour?" said the spider to the fly).

Socialists profess solicitude for small business men, but Professor Bauer points out that India's extensive controls, and the universal licensing of the establishment, extension, and modification of workshops, and trading enterprises bear especially heavily on medium and small size enterprises. Many of these firms are

efficient low-cost producers or distributors, but their managers do not understand the intricacies of the law, cannot afford prolonged disputes, and are easily overawed by authority, so that the multiplicity of India's controls hamstring the enterprise and progress of the smaller men.

And, of course, the waste of official time, manpower, and resources, in administering the mazes of these controls and licenses is a burden on the economy the size of which no one has yet dared to estimate.

SAVINGS DIVERTED TO CONSUMPTION

India's controls, says Professor Bauer, have almost certainly affected the supply of saving and investment. The refusal to set up new enterprises or to extend existing ones may not set resources free for other uses and may eliminate savings that would otherwise have materialised. Saving is often undertaken for specific objects and if these are frustrated, the money may be diverted to consumption or to buying gold or silver. This is particularly likely in times of inflation.

India's heavy taxation also helps to protect established firms by deterring new entrants and preventing the accumulation of reserves by newer firms. But at the same time it removes much of any advantage that they may derive from the reduced competition. Taxes are now so high that they bear harshly on those established enterprises which don't find a way of evading them.

The exclusion of private enterprise from important spheres of industrial activity, and the burden of taxation, are major deterrents to the inflow of private foreign capital. "This," says Professor Bauer, "has now been reduced to a trickle, and is largely confined to those foreign enterprises which for some reason are

in a specially privileged position." What is New Delhi's comment on this?

India's comprehensive labour legislation, which provides for minimum wages, maximum hours, compensation for dismissal, compulsory arbitration, and profit sharing, is regarded as part of planning. It applies to agriculture, cotton manufacturing, motor transport, rice and oil milling, tanning and tobacco manufacture, etc., etc., and is effectively enforced in industry. For most industries, minimum wage rates are fixed for entire states, with populations up to 70,000,000. Professor Bauer observes that minimum rates raise wages above what they would otherwise be and by inflating industrial costs impede progress. His thesis is a variation of the proposition that unfair shares lead to bigger shares for all. The legal necessity to pay heavy compensation for dismissal, regardless of the reason for dismissal, inflates costs and retards progress. There are, says the Professor, several major industries, notably jute manufacture, where re-organisation and re-equipment are necessary, and would be economic but for the heavy capital cost of compensation for dismissals. Yet the Plan emphasises the need of the jute and cotton textile industries to modernise!

Labour legislation which raises costs contrasts paradoxically with the Plan's emphasis on industrial advance. It has presumably been enacted to demonstrate that India is as progressive as Western industrialised countries, but it disregards its effect on (a) industrial advance in India and (b) the fate of those who fail to secure employment at the regulated rates. "It is instructive," adds the Professor, "that the Government itself is exempted from the liability to pay compensation to personnel dismissed from enterprises that it takes over." Any comment from New Delhi?

The European Scene

TOO MUCH TO EAT

From Our Special West European Correspondent

PARIS, June 17.

THE Western world has too much food. An article on this page on March 10 sought to explain how this had come about, forecast that the food surplus would worsen over the next four years, and drew attention to the proposal for a "food bank" which would pool the West's excess and lend or give it to developing countries. It could not be foreseen in March that matters would become critical so quickly to the point where the food glut lies behind much of the news that fills the papers this week. It lies behind the stories of peasant rioting in Brittany; behind the tumultuous debate in the Commons about Britain's entry into the Common Market; behind the appeal of Mr. Diefenbaker, the Canadian Premier, for a Commonwealth conference on Britain's connection with Europe; behind the announcement that France will stall further progress with the Common Market unless the Six write the beginnings of a joint agricultural policy; and finally (though this list is not exhaustive) behind the voyage to Washington of the Common Market's agricultural expert, M. Mansholt.

Mr. Macmillan found himself at the point of intersection of these tangled threads this week in the Commons — sitting on the same bench, incidentally, where Anthony Eden made his best speech some years ago about the world food shortage! Mr. Macmillan was at the heart of the problem of the West's food surplus because he is confronted with a puzzle that seems insoluble: how to co-ordinate the interests of a large number of economies every one of which is producing too much food itself and/or lives by exporting manufactures to others that are food-surplus. His assignment is to get Britain into the Common Market, i.e. into an association of nations that is already embarrassed by a food surplus when it adds up its own output and the imports from countries that buy its traditional exports. To get in, he must take with him, naturally, the farming community of his own country which is subsidised to produce still more food and which is largely represented by his own political party. But he must also safeguard the interests of Britain's dearest friends, her own daughter-communities — Canada, Australia and New Zealand — all of whom export a food surplus. Lastly, he must do so without further increasing American anxieties about sales of wheat and tobacco in West Europe — a problem that had taken M. Mansholt to Washington in the same week. He has to solve this puzzle without damaging the interests of the Common Market's farmers, because otherwise his application will not even be considered. While he was speaking in London, France threatened to paralyse the six-nation association unless her peasants' markets were widened, so there would be no thought of expanding the association to include Britain's farmers and her overseas food suppliers, thereby adding to the food surplus.

Mr. Macmillan's quandary is not just his own, nor peculiarly a British dilemma; it is the problem of all the West, more exactly of North America, West Europe and Australasia, or virtually of all the advanced democracies apart from Japan. It comes to a head in London because Britain is the largest food importer and the trading nation with the closest connections with all the rest of the group. Taken as a whole, this group of nations has too much food and it is bound to have more and more in the years ahead because its agricul-

ture is becoming increasingly productive. It cannot sell its surplus outside the area because no one can afford to pay the prices it must ask, if its farmers are to enjoy living standards comparable with its other citizens. France, for example, just sold a little barley outside the area (it got rid of less than one-sixth of its surplus to China, Morocco and Tunisia), but only at immense commercial loss. Worse, it adds to its internal surplus by buying food from Latin America in exchange for manufactures. For a time, it seemed that the growing surplus could be marketed inside the area by dividing it up into separate compartments; the Commonwealth food trade system, centred on Britain, and the Common Market, which would exclude Commonwealth food and take France for its granary.

The rapid increase of agricultural output soon threatened this compartmentalisation. Even by staying outside the Common Market, for example, Britain could not absorb all the butter produced by her own farms, by New Zealand and Denmark. While even if West Germany gave absolute preference to French foodstuffs, the Common Market would within a few years reveal itself too small to hold the Continental excess, and French farmers would have to find regular overseas markets. Now that there is the suggestion to break down this compartmentalisation, by making Britain the connection between the Continent and the Commonwealth while continuing to trade freely with the USA, there is the prospect of pouring all the West's agricultural produce on to the one market; thereupon the seriousness of the surplus becomes more evident than before.

One is not forgetting that, as the economics textbooks tell us, a surplus (or a scarcity) exists only at a certain price: lower (or in the case of scarcity, raise) the price, and the unbalance disappears. However, for the well-fed peoples of the West it is unlikely that even large falls in food prices would lead to increased consumption; certainly not in the case of cereals. As for lower prices securing increased purchases by non-Western countries, the fall would have to be catastrophic before countries like India could consider buying western food — and even then, they would have nothing to buy it with, being short of foreign currencies and unable to boost their exports. Anyhow, prices will not fall below costs, and the high cost of producing food in the West is the result of deliberate policy, aimed at giving the farmers a share of Western prosperity. When the prices of potatoes slumped this month in France, the Breton peasants sabotaged the railways and scrawled "No Inequality" on the walls, meaning that they were not going to accept markedly inferior living standard to that of urban workers.

It might be answered that the solution is then to have fewer peasants; with less people on the land, farmers' individual revenues could be maintained and the source of the chronic food surpluses attacked directly. Actually, this is far from certain. Some Western countries have reduced their farm population to 10 per cent of the total, and cannot envisage reducing it further, and yet they still have a food surplus because of spectacular increase in agricultural productivity. Besides, for numerous social reasons, no community will consent to see its farming class wiped out; even predominantly industrial nations like Britain and West Germany deliberately keep a farm sector alive by subsidies. In France, further steady reduction of the rural

population is likely but the migration to the cities cannot go as fast as increases in the productivity of the land, and it cannot go beyond a certain point without changing the very nature of French society in ways that no one thinks desirable.

In sum, the cost of producing food in the West is, socially, a minimum cost, and at the selling prices that this entails, there will be a chronic excess supply, which will grow constantly for at least a decade yet. As far as the Continental Six are concerned, the worst consequences of this excess (such as current peasant unrest in France) can be obviated for a time if the Common Market fulfils its original function: if it adopts a joint agricultural policy that consists in using the region's own food output in preference to imports, and shuts out foreign food. The America's, north and south, would be the main losers by that arrangement; the losses of German industrial exporters, who would see their markets for manufactures contract in the Americas, might be compensated by bigger sales in France and Italy. Strict adherence to that policy (which is what Paris is demanding today, referring to the letter of the Rome Treaty) would damage Latin America, virtually preclude any compromise with Britain — and it might not even relieve the Common Market's surplus for more than a few years.

A solution that aimed at taking care of the Common Market's surplus for a longer period and at the same time sought to meet Britain's difficulties, while safeguarding the interests of her food suppliers with-

out further hurting the Americans, could only be based on taking the West's food surplus as a whole and deciding what to do with it. The question cannot be dealt with at a national level; subsidising farmers and selling their excess at a loss. The two regional solutions, the Commonwealth trade system and the Common Market, are probably inadequate in the long run and anyhow the question is now raised of their fusion. The problem is posed on the Western plane and the advanced democracies must consent to see it as a whole: they have more food than they can eat, they cannot reduce their production of food and they cannot sell the excess outside on commercial terms. Yet the "outside" consists of nations that are hungry, many of whom the West wants to assist, both on humanitarian grounds and in order to preserve them from falling into Communist control. The solution that suggests itself — a food bank to distribute Western surpluses — is not just a short-term stopgap but a progressive policy with long-term possibilities. Adequate cheap food is what many developing nations need most to ensure their industrialisation. And when they are sufficiently industrialised, they will be able to buy Western food surpluses; they will have to, in many cases, because their climate will always be unsuitable to cultivation of temperate-zone foodstuffs such as soft wheat, dairy produce, etc. The problem which takes its acutest form in Mr. Macmillan's puzzle about how to marry several surplus economies in one agricultural market can only be resolved by widening the question to the issue of the West's relations with the developing countries.

*Improved MOIST-O-GRAPH
measures regain...
controls automatically*

The electronic Moist-O-Graph takes the guesswork out of regain control. In addition to measuring regain for fibres and filament, regardless of blends or sizes, it provides automatic control that helps speed up production and improve quality in the slasher room; increase efficiency in the weaving room.

Honeywell is the recognized world's leader in the design and manufacture of automatic control equipment. An organization of more than 30,000 persons, with factories in the United States, Canada, France, Germany, Holland, Japan and the United Kingdom, Honeywell products are used in scores of widely diversified fields.

Honeywell products—more than 13,000 of them—fall into these three principal categories:

Heating and air conditioning controls and control systems for residences and industrial, commercial, public and educational buildings.
Instruments and instrumentation systems, process controls and control systems, valves, precision switches and data processing systems for business and industry.
Precision electronic instruments and control systems for aircraft and missiles.

A TRIBUTE TO QUALITY & FASHION

THE PRESSURE ON THE POUND

By

PAUL BAREAU

THE pressure on the pound in the foreign market has recently gained considerable and ominous strength. It has even led to rumours of devaluation and, though these can be disregarded as utterly groundless, there is no doubt that the underlying position gives cause for some concern and demands vigorous remedial measures. Speculation against the pound has momentarily been checked by the remarks of Mr. Per Jacobsson, Managing Director of the International Monetary Fund, made in Switzerland a few days ago, at which he stressed that the present structure of international exchange rates was not in danger; but fine words butter no parsnips and it will need more than reassurances, even from so eminent an authority as this, to re-establish foreign confidence in the pound.

The forces that are pulling against it derive both from normal commercial transactions and from capital movements. This is the time of the year when sterling should be strong and the reserve of the Exchange Equalisation Account fortified for the customary seasonal pressure in the autumn. Unfortunately, the balance of payments of Britain, and of the sterling area as a whole is still in deficit. As far as Britain is concerned there has been a considerable improvement on the performance of 1960 when the current balance of payments was allowed to deteriorate to the point at which a deficit of £344 million was incurred. It takes a considerable time and effort to fill a gap of that magnitude and it is all too likely that the figures for 1961 will again show a deficit, though a much smaller one than that for 1960.

Equally serious is the fact that the sterling area as a whole remains in deficit with the non-sterling world. In past years there has normally been a happy coincidence which ensured that while some members of the sterling club were in deficit others were in surplus. Today the majority, and certainly the most important members, are all "in the red". This is true not only of Britain but of Australia, New Zealand, South Africa and — need I add — of India, Pakistan and Ceylon.

Heaped on this deficit as an adverse influence on the reserve there has been a steady and considerable outflow of foreign capital that had previously been invested on short term in the London market. This "hot money" that streamed in last year to the tune of about £600 million had veiled the ugly realities of the balance of payments. This year it has been streaming out. It has done so partly because interest rates outside Britain have become more attractive and partly because confidence in sterling and in the whole structure of exchange rates has been somewhat undermined by the revaluation of the mark and the guilder earlier this year. It should be added that a further blow to confidence in sterling has been the evidence of dithering which the British Government has provided on the crucial decision whether or not to join the European Common Market.

The effect of these adverse influences on the gold and foreign exchange reserve would have been far greater had it not been for the temporary relief provided by way of inter-central banking co-operation, which has taken the form of considerable acquisitions of sterling by the central banks of Germany, France and other countries of Europe. Had it not been for

this form of assistance, it is probable that the gold reserve instead of falling by £122 million over the past four months, would in fact have shown a decline of rather more than £300 million.

It is not only on the external front that evidence of pressure on the pound has been apparent. It is also showing ominous signs of weakening in its domestic purchasing power. After a longish period of relative stability, the cost of living is rising again at the rate of about 5 per cent a year. Some basic prices, those of bread, beer and tobacco, have recently risen. Railway fares are about to go up. The fear that this may lead to another round of wage demands is accentuated by the exceptional scarcity of skilled labour. A most significant development in the labour situation occurred last month when the total of unemployed fell to a figure that was 54,000 less than the number of unfilled vacancies notified at the Labour Exchanges. This is overfull employment with a vengeance. This "reverse gap" is the kind of symptom of overstretch in the economy which the Bank of England and the Treasury tend to regard with keen interest. It may well herald corrective measures designed at one and the same time to check inflationary pressures at home and to restore confidence in sterling.

As far as the external aspects of this position are concerned, there is no need for immediate fears. There is plenty of ammunition with which to defend the pound sterling in the exchange markets. The new mechanism of inter-central banking co-operation will continue to function. It is probable that before long Britain will draw considerable amounts in foreign currencies from its quota with the International Monetary Fund. Before long, too, the Fund itself will be reinforced as a result of the plans that are now being prepared to give it the right to borrow scarce currencies from its member countries. Barring some catastrophe, sterling seems to be safe and in a position to withstand the autumn storms that can be expected to blow with some severity this year.

These, however, are essentially superficial and short-term relief measures. More basic correctives will have to be applied. It seems unlikely that these will include the repetition of the 7 per cent Bank Rate that proved so effective in 1957. The authorities do not want to re-attract the hot money which such high rates of interest would bring with them. What is more likely is that the Chancellor of the Exchequer will at the first opportunity bring into play the new economic regulators for which he asked in the last Budget. The most important of these is the power to raise, or lower, by 10 per cent the whole range of customs and excise duties, and purchase tax. The power is not his yet because the Finance Bill has not been enacted. It will, however, pass into law next month and unless there is a sudden and as yet quite improbable improvement in the situation, Mr. Selwyn Lloyd will probably decide to increase these internal taxes by say 5 per cent. That would reduce the pressure of domestic demand and would certainly help to release resources for export. It would, needless to say, be highly unpopular and would be received with howls of dismay; but these would be nothing to the howls that would go up later if nothing were done and the pound were ultimately left to face the inevitability of another devaluation.

a leaking roof - or flooded floor...

...will drive business from your door

Certainly there is no need for this to be so. In fact, why live or work under damp, miserable conditions—why allow your property to deteriorate around

you? Have it protected from dampness of ceiling, walls and floors, from acid and alkali action, by Shalimar Tar  bituminous based protective materials.

*Economic Report from the U.S.***ENCOURAGEMENT OF PRIVATE ENTERPRISE**

By GUY SIMS FITCH

WASHINGTON, June 14.

OFTEN overlooked in President Kennedy's new foreign aid programme are those elements having to do with the encouragement of private enterprise and investment. They are embodied in two proposed types of activities; government guarantees of private investments, and feasibility studies of potentially productive private investment opportunities abroad that would contribute to the development aims of the programme. Generally, the same two types of guarantees that have been offered by the government in the past are in the President's newly proposed legislation. One has to do with specific risk guarantees, those against losses for specific purposes, which have been issued by the U.S. International Co-operation Administration (I.C.A.) for some years. The other is a more general type of all-risk guarantee, which has been available in limited form through the U.S. Development Loan Fund (D.L.F.) for the past three years.

The specific risk guarantees have applied in the past to private investment losses incurred abroad through expropriation, currency inconvertibility and war. The new programme would add losses due to civil strife connected with war, revolution and insurrection, and losses due to local government action that adversely affected the American business investment involved. The all-risk guarantee would carry the aid programme into new ground. It would go beyond existing authority, and would have the U.S. government consult with private investors in advance of an investment, and would permit the government to share any loss in the investment up to 45 per cent of the total. The government would not be liable, of course, if the loss were traceable to such factors as mismanagement or fraud. In practice, it should be noted, the U.S. Government has not as yet had to make good on any of its guarantees. As for the feasibility studies, these already are

being carried out by the I.C.A. to some extent, but the intent now is to encourage private companies to do more of this pre-investment work themselves. The Administration is requesting the modest sum of \$5 million for this purpose, through which it is hoped that greater private interest may be stimulated in investing in important development projects abroad. In drawing up these private investment aspects of the aid programme, it was deemed desirable to find new ways of getting private investment into developing areas. This was considered a significant objective not merely for the additional capital resources it would help bring to developing lands, but also for the needed managerial and technical skills that would accompany them.

A factor in this is the recognition that not very many private companies would normally be interested in investing in countries in the very early stages of development. Expansion of the private enterprise elements of the aid effort thus could be one way of inducing needed private investment, which has a good deal to contribute to economic development around the world. In fact, in some countries and in some economic sectors, private activity might well be preferable to government activity as a development stimulant. Involved is a determination under the aid programme of specific activities in specific lands which could best be promoted through private rather than government funds. This is, of course, a rather small part of the Kennedy Administration's large and comprehensive aid programme, with its primary emphasis of government funding. Nor does this mean that government aid would or could thereby be reduced. The feeling, however, is that the encouragement of private investment abroad in the ways contemplated constitutes a useful approach, one well worth exploring though still largely experimental. If successful it would help make the entire U.S. aid programme more effective.

India today is caught up in the feverish activity of industrial advancement. Projects are planned...dams are being built...all through the night we hear the ceaseless hum of men and machines at work. In the world of today, the economic development of a nation is gauged by her machines...and the STEEL consumed by them. In dams and bridges, in the railway and automobile industry. In the manufacture of the thousands of consumer goods, STEEL is necessary—absolutely necessary! And so steel has come to be indicative of the economic development of a country...indicative of what a country is worth in cold hard cash.

WORLDGRAM*India*

Central Revenues for April 1961: The revenue realised from items on which duties are levied and collected by the Central Government, in the month of April, 1961 amounted to Rs. 57.66 crores. The corresponding figures for the month of April, 1960 were Rs. 50.30 crores. Following are details of the revenue realised under various heads:

(In lakhs of rupees)

Revenue Head	April	
	1961	1960
1. Customs	14.85	11.44
2. Union Excise Duties excluding Coal Cess and Salt Cess	35.12	31.00
3. Corporation Tax	2.43	1.52
4. Income Tax	4.53	3.96
5. Estate Duty	13	15
6. Taxes on Wealth	24(P)	45
7. Expenditure Tax	2(P)	3
8. Gift Tax	5(P)	6
9. Railway Passenger Fare Tax	—	1.10
10. Opium	29	53
TOTAL	57.66	50.30

P—Provisional.

Increasing Corrosion Resistance of Steel Surfaces: The National Metallurgical Laboratory, Jamshedpur, has developed a new process for aluminising steel surfaces thus providing corrosion and heat resistance properties to such surfaces. Aluminised steel could be used to replace galvanised steel in sheet, strip, wire, tube and hardware coating plants as the import of zinc for galvanising forms a serious drain on India's foreign exchange resources. About 30,000 tons of zinc per year, representing more than half the total annual imports, are employed for galvanizing steel sheets and other ferrous products. Aluminised steel has bright prospects of replacing galvanised steel in commercial and farm buildings, rolling shutters and silo covers because aluminium coatings are much superior to zinc coatings when exposed to industrial and highly humid atmospheres. Resistance to fire damage is also better in aluminized steel as compared to galvanized steel. Most of the raw materials for aluminising steel such as hydrochloric acid, linseed oil and commercial aluminium are available in India. Parties interested in taking up the commercial development of the process are invited to correspond with the National Research Development Corporation of India, Mandi House, Lytton Road, New Delhi.

ing, has been granted consent for issue of further capital of Rs. 20 crores by the Controller of Capital Issues. The issue will be in equity shares of Rs. 1,000 each, for cash at par to be subscribed by the Central Government. The consent is valid for 12 months. The Heavy Engineering Corporation has at present a paid-up capital of Rs. 8.14 crores, all in equity shares. The Corporation will utilise the new issue for the development of the manufacture of heavy capital equipment.

Re-import of Goods Sent Abroad for Repairs: The Government of India have simplified the procedure and further liberalised the concession available for relief in customs duty payable on article re-imported to India after they have been sent abroad for repairs. The concession which was so far confined to items of machinery and scientific instruments and apparatus is now available for other equipment and articles as well. Since the identity of the articles so re-imported has to be established, the facility will not be extended to articles (e.g. sewing machine needles) where a positive identification is not possible. All such articles will be exempt from so much of the duty as is in excess of the duty leviable on the fair cost of repairs (whether such cost is actually incurred on not) insurance and freight charges both ways. Claim for such exemption must be accompanied by a certificate from the Development Wing of the Commerce and Industry Ministry to the effect that the repairs are such as cannot be carried out within the country. In their own interest, importers should apply and obtain the certificate before the goods or articles are exported for repairs. In order to claim the concession, it will no longer be necessary for importers to approach the Ministry of Finance (Department of Revenue). They may apply direct to the Collector of Customs of the port where the goods or articles in question are re-imported together with the certificate (referred to above) granted by the Development Wing. For admitting the claim for duty relief, the importer will have to satisfy the Collector of Customs that: the identity of the goods has been established, the goods have been reimported within one year of their being sent abroad for repair; the ownership of the goods during the period has not changed and the duty drawback has been given on the export of goods.

United Kingdom

British Collaboration for Making Welded Rolling Stock: Under an agreement recently signed between the Metropolitan-Cammell Carriage and Wagon Company of Birmingham, England and Southern Structurals, of Madras, the Indian firm will soon be producing welded rolling stock instead of riveted carriages. This agreement will mean an extension of the Madras plant. The British firm, under the agreement is to secure a substantial shareholding in Southern Structurals. One effect of the agreement will be to make it possible for the Indian firm to utilise the knowledge and experience of Metro-Cammell in the design and manufacture of railway rolling stock.

Heavy Engineering Corporation: The Heavy Engineering Corporation, a Government-owned undertaking,

Level of Employment: Civil employment in Britain increased by 54,000 to a total of 23,764,000 during April,

according to estimates recently published by the Ministry of Labour in London. Two-thirds of the increase was accounted for by the rise in the number of women in employment. The latest total for employment is very near the record figure reached in the autumn of 1960. A significant aspect of the latest increase is seen in London to be the fact that employment in the manufacturing industries increased by 22,000—over half of this increase occurring in the metal, engineering and vehicles groups of industry.

France

Increase in Productivity: According to a study made by the National Statistical and Economic Studies Institute, the annual output of France for the years 1949 to 1960 increased on an average of 5 per cent; exports increased 8.3 per cent; household consumption 4.4 per cent; and administrative consumption 6.9 per cent. The potential household consumption increase was considerably hindered by the increase in civilian demand and, in particular by the increase in exports. The National Statistical and Economic Studies Institute also noted that the number of active persons available to the productive economy between 1949 and 1961 remained almost the same as a result of the social flexibility of the economy. In eleven years the number of active persons decreased by 15 per cent in the domain of agriculture and increased by 5 per cent in that of industry and other services (not including household help). The number of civil servants increased by 16 per cent during the same period, with the highest rate of increase in the field of National Education (+68 per cent) followed by the postal, telegraph and telephone services (+20 per cent). These governmental increases are types of investments which will help the future growth of productivity in France.

Italy

Building of Akosombo Dam on the Volta River: President Nkrumah on the 12th of May this year informed the Parliament of Ghana that after a very careful study of the various offers for the construction of a dam on the Volta River, that of the Italian firm 'Impersit' had been accepted. This decision was very enthusiastically acclaimed by the Assembly and was given very wide publicity in the local press. Twenty-seven enterprises from different countries had tendered for the following projects: the construction of the large Akosombo dam on the Volta River, of the reef type, 113 meters in height and 640 meters long, with a capacity of 8,300,000 cu. m.; a lesser dam, reef type, having a capacity of 350,000 cu. m.; a power station for a total final installed output of 768,000 KW, the work of preparing the catchment area, forced conduits and return canal, spillways etc. entailing a total of 1,370,000 cu. m. of earth excavation, 3,400,000 cu. m. of rock excavation (quarry excluded) and 2,00,000 cu. m. of work in cement concrete; the erection of all the electro-mechanical machinery of the power station, forced conduits, the sluices etc. The duration of the work is expected to be 5 years (middle of 1961 to middle of 1966) and the cost will be about 16 million pounds.

Yugoslavia

Production of New Products: Yugoslav factories will turn out more than a thousand new products this year. Electrical manufacturing industry will start producing 22K.V. high voltage generators, develop and

enrich its production by new types of refrigerators, television sets, and other electrical appliances. The car manufacturing industry will also expand the variety of its products. This young Yugoslav industry in addition to producing passenger cars and motor cycles, will this year start serial production of vehicles such as small lorries, 4.5 ton lorries, and mopeds. The Yugoslav shipbuilding industry, which has already achieved great success in selling its products abroad, is to start producing ocean going ships. Besides, many factories, such as those of rubber and food industries will introduce automation and more up-to-date methods of packing, and will also considerably expand the variety of their products. Such expansion of production is a result of the increase in the purchasing power of Yugoslav consumers and of requirements in economy.

Germany

Electrical Engineering Industry's Record: No industrial branch in all Germany ever experienced during one year production expansion on such a scale as the electrical engineering industry did in 1960. With products of total worth of 4,870 million dollars it achieved an absolute production record last year and surpassed its own production level of the previous year by 20 per cent. Three gigantic halls at this year's Industrial Fair in Hanover gave an impressive cross section of the industry's production. The electrical boom continues. During the first three months of 1961 production exceeded that of the same period last year by 16 per cent. Automation triumphs, above all in electrical engineering. This was amply proved at the Industries Fair.

United Nations

UNESCO Report on Children's Education: Only about 60 per cent of the world's school-age children are actually in school, according to a report prepared by the United Nations Educational, Scientific, and Cultural Organisation (UNESCO) for the U.N. Children's Fund (UNICEF). Although there has been an increase in school enrollment since the end of World War II, the progress falls far short of the goal prescribed in the U.N. Universal Declaration of Human Rights. The report shows that in mid-1957, of a total world population of 2½ billion, 341,453,000 or 12.4 per cent, were enrolled in schools on all levels. However, the percentage of enrollment in North America was 23.5; Europe, 15.5; U.S.S.R., 16.0; Oceania, 19.4; while in Africa only 7.2 per cent of the population was enrolled, in Asia, 10.3 per cent, in South American, 13.1 per cent.

World Bank

Loan For Hydroelectric Projects in Ceylon: The International Bank for Reconstruction and Development has lent the equivalent of \$15,000,000 as aid in a \$32,500,000 programme for the expansion of hydroelectric installations supplying power in Ceylon. The loan will be used to add 75,000 kilowatts of capacity, and to extend the distribution of electric power in western Ceylon, the most populous and industrially active part of the country, and will make it possible to meet the rapidly increasing demands for electric power in the area during the next five years. The projects form part of the electric power system operated by the Department of Governmental Electrical Undertakings. The loan is the third the Bank has made to aid in developing the Department's system.

My choice
of a truck?
DODGE
of course

Bhaiya, I have been a truck operator long enough to know that there can be no two opinions about the superiority of Dodge trucks. For instance take Axles. A Dodge vehicle is fitted with Timken axles now known as Rockwell-Standard which have a world-wide reputation. These axles have great load carrying capacity and are absolutely dependable—which means a great deal to us truck operators.

There are several other superior features, besides. Taken together they lead to only one conclusion, namely, that the Dodge is a great truck. It is great in hauling power, great in endurance, great in earning capacity. You'll make Dodge your truck, too, I am sure.

NEWS IN BRIEF

INDIAN

The Iron and Steel Controller notified recently that import licences for stainless steel sheets will not be issued to utensil makers, and their requirements will be met from barter imports.

The plan to export about 1.5 lakh tons of sugar to Pakistan and some West Asian countries is nearing finalisation. Dispatches are likely to begin early next month.

It is reported besides oil, there is a possibility of finding coal deposits in the proposed site for Gujarat's capital.

The yield of groundnut crop in Madhya Pradesh for the current season has registered an increase of 29.8 per cent over that of last year, according to the final forecast of groundnut crop.

Export of black buck (white variety, dead or alive, or part thereof or product therefrom) will not be allowed, the Joint Chief Controller of Exports announced recently.

Under the State Bank of India scheme of credit facilities to small-scale industries in the country, loans totalling Rs. 9 crores had been sanctioned to 2,633 units upto the end of March this year.

The Forest Research Institute, Dehra Dun, has devised a plant for the distillation of camphor from the leaves of camphor yielding ocium by a cheap cottage-scale unit without the use of a steam boiler.

India will be among the countries taking part in the 'Jashan' Exhibition to be held in the Afghan Capital, Kabul, from August 23, 1961. The Indian Trade Pavilion at the Exhibition will display a wide range of goods which India can supply to the Afghan market.

The State Trading Corporation will be given allocations for the import of copra during the current licensing period (April-September 1961). This will be in addition to the allotments of copra which are being made to crushers and soap manufacturers.

It is reported the State-owned Hindustan Machine Tools Factory will shortly enter the overseas market.

The Government of Kerala has decided not to accept the recommendations of the Administrative Reforms Committee to abolish the State Revenue Board.

FOREIGN

The foreign exchange allowance for Turkish nationals travelling abroad has been increased to \$200 per year. Applicants will have to pay a surcharge of £T4½(357d) per dollar in addition to the official exchange rate. The proceeds will be used to set up a stabilisation fund at the central bank.

The U.S. business investment in new plant and equipment is expected to turn upward in the third quarter. This would be the first quarter to rise in more than a year, the U.S. Government said. But for 1961 as a whole, outlays of this kind were still expected to be 3 per cent below last year's level.

The heavy plant division of the Associated Electrical Industries has established a service department, with headquarters in Rugby, to co-ordinate after-sales service for all its products.

After several months of negotiations, the Bonn Government has signed an agreement for the extension to Turkey of a DM 200M credit for the implementation of specific development projects.

El Al Israel Airlines has announced a low-priced excursion fare from England to Israel. A 23-day tourist excursion fare is available at £119 14s for the summer and £110 5s in the winter—a decrease of over £22 and £31 respectively on the normal tourist fare of £141 15s.

Russia will provide Ghana with equipment, material and technical assistance under a technical aid agreement signed recently. Soviet technicians are expected to arrive next month for a survey tour under the agreement.

It is reported Ghana is to have a multi-purpose long-term investment bank, the 'Ghanian Times,' President Nkrumah's ruling party mouthpiece disclosed recently.

Metropolitan-Cammel Carriage and Wagon Company of Birmingham, and Southern Structurals, of Madras, have signed an agreement to collaborate in the building of railway wagons in India for the Indian railways.

West Germany has promised to give economic and technical assistance to Morocco, a Moroccan spokesman revealed recently.

Imperial Chemical Industries has acquired rights from a Swiss company which will enable it to manufacture exprolactam and nylon 6.

Maharashtra Land Ceiling Bill IMPACT ON SUGAR INDUSTRY

By CROESUS

PRESIDING over the 22nd Annual General Meeting of the Deccan Sugar Factories' Association, Bombay (DSFA), Mr. F. Edwards, President of the Association, made a fervent plea to the President of India not to give his assent to the Maharashtra Government's Agricultural Land Ceilings Bill which now awaits his assent "unless the bill is modified to exclude the cane farms of joint-stock sugar factories from its purview." In a detailed representation on the subject that has already been made to the President, Mr. Edwards said, the DSFA has pointed out that "the Act in its present form is not only detrimental to the sugar industry in the Maharashtra State, but will have consequences completely contrary to the nation's interest." However, there would still appear to be a considerable section of public opinion which does not think that there is anything wrong about the Maharashtra Land Ceiling Bill. It is just as well, therefore, that the DSFA Chief availed himself of the occasion to explain how the proposed legislation is not in the best interests of the country. What Mr. Edwards said requires to be widely read in order to appreciate the sound reasoning behind the determined protest of the Deccan Sugar Factory interests to the legislation in question. In the context of the outlook for sugar exports and the need for implementing the recommendations of the Central Wage Board for the Sugar Industry, the observations of Mr. Edwards are of particular relevance.

Maintaining that "the problem of finding foreign market for Indian sugar will always be with us while the cost of making sugar remains so very high", Mr. Edwards referred to the very low price obtainable in the world market and the large surplus stocks of sugar that have accumulated with the sugar factories here. Such large accumulations not only impose a heavy strain on the financial resources of the factories concerned but also present the problem of finding storage space for these stocks. The statistical position of sugar that he indicated brings into bold relief the gravity of the situation. According to him, the opening stock of sugar of November 1, 1960 was 5.5 lakh tons; together with the current season's estimated production of 30 lakh tons, the total available supplies would aggregate 35.5 lakh tons. On the basis of the offtake from factories, internal consumption during the five-

month period November—March 1960-61, namely 8.10 lakh tons—which incidentally is slightly higher than the position last year—Mr. Edwards estimated the current year's consumption to be about 21 lakh tons, which means that, after allowing for a carry-over of five lakh tons, there would still be left a surplus of 9.5 lakh tons to be disposed of by export. But, as Mr. Edwards pointed out, Indian sugar can be sold in the foreign markets only at a loss and the total loss which would have to be incurred in exporting the surplus 9.5 lakh tons would be colossal. One would expect that, in these circumstances, all efforts would be directed towards narrowing the gap between world sugar prices and Indian sugar prices by bringing down the present high cost of sugar production in this country. The only obvious way of reducing the cost of sugar production in India is to increase the cane yields and produce better quality cane with higher sucrose content. One cannot vouchsafe that even these steps would bring down Indian sugar prices to the level of world sugar prices, but, then, prospects of selling sugar in such high-price markets as the U.S.A. at least would be relatively brighter. One may ask whether a policy such as that outlined under the Maharashtra Land Ceiling Legislation will contribute towards such a consummation or defeat the very objective. If the answer is the latter, then clearly the land ceiling policy of the Maharashtra Government is against the nation's interest.

Perhaps in a socialistic pattern of society which continues to pay lip sympathy to the concept of mixed economy it is not always the most efficient unit of the industry, especially if it is in the private sector, that will stand to benefit. On the other hand, it seems, the more efficient a unit, the greater the burden that it will be called upon to shoulder. This is amply borne out by the experience of the joint-stock company-owned sugar factories in Maharashtra. These factories, as any one who has carefully studied the comparative figures of cane yield per acre, sugar recovery, and the tonnage of sugar produced per acre will readily concede that the average yield of cane per acre of farms held by the sugar factories in Maharashtra is more than twice the average cane yield in the State and nearly four times the average for the whole of India as the following table shows:

	Yield of cane per acre in tons (1958-59)	Average percentage recovery of sugar from cane (1958-59)	Average tonnage of sugar per acre of land (1958-59)
1. Average yield of cane farms held by sugar factories in Maharashtra	54.70	11.46	6.27
2. Average for the whole of Maharashtra	25.48*	11.46*	2.92
3. Average for Madras	24.35*	9.01*	2.19
4. Average for U.P.	11.20*	9.60*	1.08
5. Average for all India	14.66*	9.84*	1.44

(*Figures taken from Sugar Manual for 1959 published by the Sugar Technologists Association of India.)

If the sugar factories in Maharashtra are thus able to produce more sugar per acre, and that at a lower cost per ton than sugar factories anywhere else in India, the explanation is that (1) sugar factories in Maharashtra have large compact cane-growing farms of their own, (2) that these farms are under their own control, (3) that the factory owners manage these farms very efficiently and also on the most modern scientific lines. But for all these outstanding achievements, the reward that they have had is the State's land legislation which deprives these factories of not only ownership and control but also management of their cane farms. Warnings such as these have fallen on deaf ears: "If these cane farms are taken away from the sugar factories and handed over to some other agency such as co-operative farming societies as provided in the Act, it would do irretrievable harm not only to the sugar industry in the State but to the economy of the country as a whole". . . . "The handing over of these cane farms which are being managed very efficiently on the most modern scientific lines to joint farming societies consisting of a multitude of small cultivators and landless labour must have a detrimental effect on the productivity of the cane farms, the quality of cane produced, the timely and regular supply of ripe cane in adequate quantities to the factories, and will inevitably lead to a lower production and higher cost of sugar." . . . "The facts conclusively prove that, if the cost of growing cane and manufacturing sugar is to be reduced to a minimum, with a view to cutting the loss involved in the export of Indian sugar or reducing the price to the consumer to induce him to use more sugar, the cane farms operated by sugar factories must be exempted from the purview of the Land Ceiling legislation". . . . "It is, therefore, in the National interest that the full control of the farms must be left in the hands of the factories. In fact, this is an absolute

necessity, if production and efficiency are to be maintained."

Even the impact of the proposed legislation on the implementation of the Report of the Central Wage Board for the Sugar Industry has obviously escaped the attention of the authorities of the Maharashtra Government. As Mr. Edwards pointed out, as a result of land ceilings legislation passed by the Maharashtra Government which deprives the sugar factories of their extensive cane farms, the situation so far as the sugar factories in Maharashtra are concerned has radically changed since the publication of the report. Given the legislation, the paying capacity of the sugar industry of Maharashtra would be no better than that of the sugar factories in the north and central regions. If this is so, it is debatable whether there is any justification in burdening the sugar factories in Maharashtra with higher rates of wages than those prescribed for factories in the other regions as suggested by the Central Wage Board for the Sugar Industry. It is true that, in deference to the appeal made by the Union Food Minister, the DSFA Committee has decided to ask its members to implement the Wage Board's recommendations, but if the Maharashtra Land Ceiling Legislation receives the assent of the President—as it now seems to have done—and becomes law in the form in which it stands now, many of these factories might revise decision and refuse to implement the Wage Board's recommendations. In short, looked at whether from a purely domestic point of view—the cost of sugar to the Indian consumer—or from an international point of view—the cost of sugar to the export market—the enforcement of the Maharashtra Land Ceiling Legislation in its present form will have serious repercussions, repercussions which are certainly avoidable. But will the powers-that-be take a realistic view?

Business Notes

Rural Credit

CO-OPERATIVES AND THE SMALL FARMER

ONE MORE rural credit survey—the Report on the Rural Credit Follow-up Survey—has established that the growth of co-operative credit has not made any significant impact upon the life of the small farmer. The second of the surveys in this series conducted by the Reserve Bank of India, the present one covered selected districts from 12 States. The bulk of the rural credit in these districts, we are told, was provided by professional moneylenders and well-to-do agriculturists. In nine out of 12 districts, it is stated, the major part of the borrowing was provided by the moneylenders, the proportion so financed actually exceeding 70 per cent in six of them. In five districts, nearly 45 per cent of the borrowings were obtained at the usurious rate of more than 18 per cent per annum! The proportion of borrowing with such high rates of interest was relatively larger among medium and small cultivators, which is to be expected.

Although the proportion of the total borrowings obtained from the rural credit co-operatives rose from 2 per cent for 1951-52 to 12 per cent for 1957-58, the Report has mentioned that the growth on co-operative credit was not at all impressive in all the selected districts. Thus, the borrowings during 1957-58 from co-operatives as a proportion to the total borrowings of cultivators were 19 per cent in Chengalpat and 38 per cent in Sorath. In Deoria, Sagar, Nizamabad, Bangalore and Burdwan districts, the percentage of borrowings varied from 2 to 7 per cent, whereas, in Jaipur, Quilon, and Mongyr districts, the co-operative move-

ment was practically undeveloped and the co-operatives accounted for between 1 and 2 per cent only of the total borrowings!

The reasons for the poor performance of the rural credit societies, according to the Survey, were, in some cases, the overall governmental supervision which left no initiative to individual members, and, in others, the failure of the co-operative departmental officials concerned properly to scrutinise and determine the credit limits to individuals as well as to societies. Most of the small-sized societies were not even in a position to employ full-time secretaries. There were 9,924 primary credit societies in all the 12 districts, out of which only 310 were large-sized societies whose financial position was sound and performance satisfactory. But for these, the rest of the credit societies were small in size and in an almost dormant state, according to the Survey Report. Out of a total of 158 selected small-sized societies, as many as 30 were dormant, while in the case of 74, the total loans advanced during 1957-58 did not exceed Rs. 5,000.

The performance of the marketing co-operatives also was equally disheartening. More than one per cent of the marketable surplus was sold through co-operatives only in two districts, while the proportion was even less in other districts, the reason being the inability of these co-operatives to discharge the role of a market functionary. The headquarters of some marketing societies were not located in the market centres, and there was no proper study of the normal marketing channels and techniques by these societies. Though the nature of functions to be performed by different types of co-operatives was clearly defined in

the Integrated Scheme of Rural Credit, the Report has indicated that there was still no clearcut allocation of functions as between the different types of existing co-operatives. There were also defects in the organisation as well as in regard to representation on co-operatives, which were, according to the Report, the main retarding factors in the progress of the co-operatives in the country.

World Bank and IDA

FINANCING CONSTRUCTION OF THE ROSEIRES DAM

IT AUGURS well for the economy of the Republic of the Sudan that an amount of \$32.5 million has been jointly made available by the World Bank and the International Development Association (IDA) for the construction of the Roseires dam on the Blue Nile. In the financing of this project the World Bank's share is a loan of \$19.5 million and the IDA's of a credit of \$13.0 million. The previous loans made by the World Bank to the Sudan were for the development of the Sudan Railways and for the Managil Extension to the tune of \$39 million and \$15.5 million, respectively. The present loan raises the total lending of the World Bank to the Sudan to \$74 million. The present loan is for a term of 25 years and bears interest at 5½ per cent per annum including the one per cent commission which is allocated to the Bank's Special Reserve. International Development Association's credit on the other hand is for a term of 50 years, interest free, and is repayable in foreign exchange. Incidentally, this is IDA's second credit; the first one of \$9 million was extended to Honduras for road development. In the case of the IDA, amortisation will begin after a ten year period of grace and in the case of the World Bank loan, amortisation will begin in July 1968.

The Federal German Government is also lending a hand in the construction of this dam and has agreed to contribute towards its foreign exchange cost through a long-term loan equivalent to \$19 million.

It goes without saying that the construction of the Roseires Dam would revolutionise the agricultural economy of the Sudan. Not only will this dam make it possible to bring nearly 900,000 acres under irrigation for the first time, but would also greatly increase yields and diversify crop production in other areas where water supplies are at present inadequate. The water stored by the Roseires Dam will in fact more than double the supplies available for irrigation in the Sudan during periods of seasonal shortage. As a result other crops would be grown in addition to long staple cotton. On the whole it would help in raising living standards and bringing about an increase in national income.

Ashok Leyland

SATISFACTORY PROGRESS

SIR A. RAMASWAMY MUDALIAR, Chairman, Ashok Leyland Ltd., had a satisfactory progress to report to the shareholders of the Company at its 12th Annual General Meeting held last week at Ennore, Madras. The Chairman said that it was not only the manufacturing programme that was proceeding apace, but sales too had maintained an upward trend. During

1960, the Company commenced the marketing of industrial engines. The output of Comet chassis for the year 1960 was 43 per cent in excess of that for 1959 and it was, therefore, possible to recommend the same dividend as previously. The increase in the authorised capital of the Company to Rs. 10 crores, the Chairman maintained, had already been approved as a preliminary step towards the ultimate financing of the proposed expansion programme. Regarding this programme, it was encouraging to note, that a good progress had been achieved and it was possible that with the installation of plant and machinery in the new shops production might commence in the second half of 1961. Ennore Foundries Ltd. was likely to meet all the Company's requirements of iron castings by the end of the year.

The position in regard to exports was equally satisfactory. In 1960, 24 comet chassis were sold to the Ceylon Transport Board. The Chairman stressed that efforts to secure export business would now be continued because it was not only advantageous from the country's point of view but also from the Company's as the Government of India provided additional foreign exchange to manufacturers who secured overseas business to be utilised for the import of materials not available from the indigenous sources.

National Rayon

PROGRESS OF THE PULP PROJECT

AT THE 14th Annual General Meeting of the National Rayon Corporation Ltd., Mr. Kasturbhai Lalbhai, Chairman of the Company revealed that the Board of Directors have decided to recommend this year and hereafter payment of dividend on Preference Shares at Rs. 5.55 per share, free of company's tax, with a view to placing them in the same position as they were before the enactment of Preference Shares (Regulation of Dividends) Act, 1960 and amendment to Section 18(3D) of the Indian Income-tax Act. The amount of Excise Duty, the Chairman stated, paid during 1960 was Rs. 68.59 lakhs, about Rs. 4.70 lakhs more than that paid in the preceding year.

Referring to the progress made in regard to the Company's Rayon Grade Pulp Project, the Chairman opined that a suitable site at Nanjangud (Mysore State) has been selected for the location of the Pulp Plant. The Mysore Government has under its consideration a proposal to reserve Coorg, Kollegal and Mysore forest areas for the exclusive exploitation by the Company of the bamboo and several other soft wood resources in those areas suitable for the manufacture of pulp. The Mysore Government is of the opinion that there is adequate supply of water in the neighbourhood which it will consider making available at concessional rates for the first five years, and that the electric power required for the operation of the company's plant could also be made available. One of the company's directors, Mr. R. J. Chinai, the Chairman pointed out, is now in the United States exploring possibilities of raising a dollar loan to cover the foreign exchange needs on deferred payment terms acceptable to the Government and for obtaining technical know-how and engineering and other related services.

It is also encouraging to find that an industrial licence for the expansion of Tire Cord Plant has been obtained and additional Spinning Frames will be pressed into service for the manufacture rayon yarn.

CIMMED have pleasure in
Announcing
their collaboration with
ENSHU WEAVING MACHINERY CO. LTD. JAPAN
for the manufacture in India of
sakamoto
■ **AUTOMATIC LOOMS**

We shall now be able to offer you
the latest design in Loose Reed, Fast Reed and
Special-purpose looms upto 120" reed space to
enable you to modernise your weaving
shed and successfully compete
in the Export market.

FROM THE CAPITAL'S CORRIDORS

BOKARO STEEL PLANT

IT is now quite certain that one-million ton integrated Bokaro Steel Plant is to be taken up during the Third Plan. It is gathered that Aid-India Club meeting at Washington considered the inclusion of the proposed plant which means an expenditure of nearly Rs. 235 crores including Rs. 100 crores in foreign exchange which will be made available under the Aid-India programme. It appears that the U.S.A. is likely to finance it. In this connection Prof. Galbraith, the U.S. Ambassador in New Delhi, gave a hint and it is understood that he was taking active interest in the financing of this fourth steel plant in the public sector. He was busy arranging loans from Export-Import Bank and Development Loan Fund. Although the final picture as to the country from which the purchase of equipment and technical know-how is to be obtained has not emerged, the Government of India has already got a report prepared from an Indian firm of consulting engineers — Dastur and Company — about the details of this plant and the necessary background for its construction.

According to this preliminary report on the proposed integrated steel plant, the planning of the plant has to be done on a long-term basis. And naturally an assessment beyond the Fourth Plan has been attempted, which clearly indicates that the steel requirements are certain to rise rapidly. It is estimated that the existing plants could be expanded to produce about 8 million ingot tons by 1965, which would still leave a short-fall of 3 to 4 million tons. It is thus vital that the construction of the Bokaro plant be started in 1961 so that it could begin production by 1965.

It is proposed that the Bokaro plant would have a strong raw materials base, good road-rail connections and adequate water and power resources. And, in view of the large future requirements, Bokaro would be designed for expansion to the maximum economic size. Accordingly large modern blast furnaces, steel-making units and rolling mills have been selected to produce two million ingot tons initially with provision for future expansion to eight to ten million tons. If desired, the initial Bokaro construction can be phased so that one million ton capacity would be in operation by 1965, the remaining capacity becoming available in the following year.

The 1965 steel requirements of 12 million ingot tons (9 million tons finished steel) has been analysed by main product categories, which shows that the demand for flat products would be 3.3 million tons, merchant sections 2.8 million tons, structurals 1.5 million tons and railway materials and miscellaneous products 1.4 million tons. An estimate of the production in 1965 indicates that even after the possible expansion of existing plants there would still be a shortfall of about 1.7 million tons in flat products and about 0.6 million tons in merchant sections, whereas the requirements of structurals and railway materials would be met.

Due to the large shortfall in flat products it is proposed that India's second strip mill should be installed at Bokaro which, like Rourkela, should initially produce sheets and plates exclusively. A further analysis has been made of the short-fall in flat products

by categories from which the product-mix for Bokaro has been assessed as shown below:

	(In thousand tons)			
	Consumption 1957	Estimated demand 1965	Short-fall 1965	Proposed Bokaro product-mix
Hot-rolled sheets	240	1,000	530	470
Cold-rolled sheets	150	700	350	300
Galvanised sheets	280	500	300	150
Tinplate	113	400	170	150
Plates	112	700	330	300
TOTAL:	895	3,300	1,680	1,370

An alternative product-mix has also been considered consisting of about 800,000 tons of flat products and about 700,000 tons of billets for re-rollers to enable them to make better use of existing facilities.

A comparative estimate of deposits of principal raw materials is given in the report which shows that limestone and coking coal are likely to be restricting factors to future steel expansion unless action is taken to conserve known reserves and to locate new deposits:

Raw Materials	Reserve	Total steel production possible from available resources
	(million tons)	(million tons)
Iron ore	20,000 (approx.)	10,000 (approx.)
Manganese ore (marketable grade)	60	3,000
Coking coal (washed)	1,600	1,200
Flux limestone (upto 6% insolubles)	100	200

The Bokaro plant is to be located on the Bihar coal-fields and within 240 Km of the Singhbhum-Bonai-Keonjhar iron ore range. It is proposed that the Sasangda deposits of this range be developed for the supply of about 3.3 million tons of ore for the initial two million tons production. The annual requirement of about 3.12 million tons of coking coal would consist of a blend of high, medium and low volatile coals. These coals have ash contents ranging from 18 to 25 per cent and cannot be used without washing.

Available data indicate that there will be a shortfall in the production of refractories. Constructional

... PASSENGER FROM DELHI WRITES.....

... the staff there is always very helpful and very obliging. It is a real pleasure to deal with them I congratulate you on the excellence of your office organisation and the smoothness of the KLM fights

ex Karachi by DC-8 jets

Sincerely yours

KLC-40C

requirements of the Bokaro plant are estimated at 145,000 tons and the operational requirements at 120,000 tons per year. A survey of the steel scrap position in India in 1966 indicates that about 1.7 million tons of 'prompt industrial' and 'obsolete' scrap will be generated (excluding plant scrap of about 2.5 million tons from the integrated steel works). It is estimated that about 400,000 tons of scrap would be generated at the Bokaro plant, which would be fully utilised at the works itself.

In order to conserve our limited low-volatile coking coal resources, the use of high volatile coal in the blend is proposed. A Robins-Messiter system together with a stockyard is proposed for stocking, bedding and reclaiming ore. In addition, arrangement has been made for drying of ore prior to screening of the fines for sintering as this is considered essential under our monsoon conditions.

It is proposed that the requirements of iron for steel-making at Bokaro (1.82 million tons per year) be met by three blast furnaces. From a study of various steel-making processes, two alternatives emerge for adoption at Bokaro—basic top-blown oxygen converters (LD process); or basic open-hearth with ladle desilicising. The installation and operating costs of the LD process are appreciably lower than the open-hearth and the type of steel products visualised for Bokaro—flat products — are very well suited for LD. The quality of our fluxes and dolomite for brick-making though not as good as desired, are considered adequate. Accordingly, three LD converters of 120 tons capacity each (two operating) are recommended to produce two million ingot tons steel annually. One 1,150 universal mill has been proposed to roll two million tons of ingots annually and with minor modifications the mills would be capable of rolling three million tons of ingots.

The total capital cost of the plant is estimated at about Rs. 215 crores based on current international equipment prices and Indian construction costs. Customs duty, engineering and spares have been excluded in order to make this estimate comparable to the published figures of capital costs of the other new steel-works. These items would add another about 10 per cent to the cost. Also not included are expenses connected with the development on off-site facilities, such as the township, new mines and quarries, washeries, etc.

The above capital cost includes a number of special features such as extensive materials preparation including selective coal preparation, ore bedding and drying and sinter plant. This plant is likely to be an improvement over the already set up plants in various other ways. In preparing this project cognizance has been taken of the Government's desire to make the Bokaro Steel Plant as nearly Indian engineered and constructed as possible. It is estimated that only about 25 to 30 per cent of the equipment could be supplied from indigenous sources, as the Ranchi Heavy Equipment Plant may not be in full production before 1964-65. The low proportion of indigenous manufacture emphasises the importance of augmenting the existing forge-foundry and equipment manufacturing activities and initiating new facilities including an additional heavy equipment building plant.

For the purpose of determining the labour component of the operating costs, a total force of about 12,000 is estimated, comprising 120 senior engineers, 620 engineers, 5,540 operators and skilled workers and 5,900 semi and unskilled workers.

EXCHANGE FOR SUGAR MACHINERY

It is gathered that the Government of India will make available nearly Rs. 8 crores worth of foreign

exchange to two consortiums manufacturing sugar making machinery during the next four years. Six firms, it may be added, were licensed for the manufacture of complete sugar plants. They had formed themselves into two consortiums in order to pool their resources. The sugar factories to which these plants were to be supplied by these consortiums were also selected. The Government had made a special allocation of foreign exchange for the import of components and raw materials required for the fabrication of complete sugar plants by these consortiums for a total amount of Rs. 495 lakhs. The consortiums, in their turn manufactured two plants valued at Rs. 170 lakhs, both of which have gone into production. Six plants, valued at Rs. 510 lakhs are, at present, being fabricated to be commissioned by the end of 1961.

For the first batch of complete plants, the consortiums was allowed foreign exchange at the rate of Rs. 20.2 lakhs per plant for the import of components etc. This amount was reduced to Rs. 18 lakhs per plant for the following units and has now been fixed at Rs. 16 lakhs, per plant. It is also considered necessary to import "spares" of the value of Rs. 1.5 lakhs per every completed plant. This allocation is placed at Rs. 27 lakhs. The consortium has also been asked to manufacture ten complete sugar plants to be supplied to ten licensed sugar factories by 1962-63 crushing season. The foreign exchange required, therefore, will be Rs. 175 lakhs; Rs. 160 lakhs for plants and Rs. 15 lakhs for spares.

Licenses have also been granted for forty-seven parties for expansion of their existing units. These expansion schemes will involve import of components for the manufacture of equipment worth Rs. 663 lakhs. The components will be imported from the United Kingdom Rs. 169 lakhs, West Germany Rs. 169 lakhs, Switzerland Rs. 84.5 lakhs, the U.S.A. Rs. 44.25 lakhs, East European countries Rs. 255 lakhs and other countries Rs. 43.25 lakhs.

DISTRIBUTION OF COAL

Several measures have been adopted by the Government of India to improve coal supplies to areas distantly situated from the Bengal-Bihar coalfields which produce about 80 per cent of the total output of coal. The most important measure is to encourage the movement of coal by coastal shipping. At present about one million tons of coal move from the Calcutta port to the coastal States in the South every year. This movement is being encouraged and will be stepped up progressively to about two million tons per year. Coal will now be carried by coastal shipping to the ports on the Western coast such as Cochin, Bombay and Saurashtra. Some of the consumers in Gujarat State are obtaining their supplies by the rail route through Mughalsarai and the proposed movement to these consumers by the sea route would supplement the movement taking place through Mughalsarai.

Movement of coal by the sea route is comparatively costlier and in order to reduce the disparity between coal carried by sea route and that carried by rail route, a system of subsidising the movement of coal by the former route has been introduced. To meet the expenditure on this account a cess of 80 nP per ton has been levied on all coal despatched from Collieries with effect from June 8, 1961, so that, including the existing cess of 88 nP per ton, the total cess will now be Rs. 1.68 per ton.

Besides, stress will be laid on greater movement of coal from the outlying fields such as Madhya Pradesh, Orissa and Andhra Pradesh, which would further reduce the pressure on movement from the Bengal and Bihar coalfields.

POLISH FIRM FOR COAL OUTPUT

An agreement was signed recently between the National Coal Development Corporation and the Polish firm, CEKOP, for the development of deep-shaft mine project at Sudamdih in Jharia, in Bihar. According to the agreement, the Polish firm will prepare a project report for a colliery in Jharia consisting of two mines — a deep-shaft mine and an incline — with a common surface plant. The surface equipment will include a coal washing plant besides workshop, coal bunkers, etc. The planned output of raw coal from the mines is 7,500 tons per day. The underground mine is situated 12 miles from Dhanbad railway station and nearly 3 miles from Patherdih railway station with an area of 1.75 miles along the strike and nearly 1 mile along the dip. The area consists of 14 coal seams of varying thickness of 4 to 60 feet with a total reserve of nearly 250 million tons and with an ash content of 10 to 28 per cent.

ASSISTANCE FOR BARAUNI REFINERY

Russia has agreed to supply equipment and machinery and provide technical assistance for the erection and commissioning of the Barauni refinery. According to the agreement, Russia has reduced the cost of equipment by Rs. 80 lakhs. It has also agreed that equipment and materials worth Rs. 120 lakhs will be substituted by the indigenous manufacturers. This has meant a saving of foreign exchange to the extent of Rs. 2 crores. Another important alteration made in the project report is that lubricating oil will be produced at the refinery and not jute batching oil as proposed by Russia earlier.

The estimated value of the contract — the last in the series — is about Rs. 14.5 crores, besides the rupee expenditure to be borne by the Indian side. The Soviet Government has given a credit of Rs. 17.8 crores for Barauni refinery. According to the contract signed, the refinery is to be completed in three stages. The first million tons capacity is expected to be completed by December, 1962. In the second stage, 1.5 million tons capacity will be created by April, 1963 and in the final stage which involves manufacture of lubricants, by the end of 1963.

JAPANESE CREDIT

Seven firms have already applied for Japanese yen credit during the Third Plan period. They relate to the following industries:

Industry	Amount (in lakhs)
H. T. Wires	Rs. 23.40
Viscose Rayon	60.00
Textile Auxiliaries	2.48
Wire Ropes	45.40
Paper	10.00
TOTAL	Rs. 141.28

SWISS CREDIT

The allocations made so far for various purposes under the Swiss credit are as follows:

	(Rs. lakhs)
Textile machinery	80
Printing machinery	40
Turbo-alternators for the sugar industry	60
Capital goods for private industry including machine tools	200

The Swiss credit is available only to finance 90 per cent of the value ex-factory in Switzerland.

AVOIDANCE OF INTER-STATE COMPETITION

It is felt generally by the State Government representatives that any tendency on the part of the applicants to create conditions of competition among State Governments for attracting their projects has to be discouraged. It has, therefore, been decided by the Government of India after detailed discussions that (a) any tendency on the part of the applicants seeking change of location, to create conditions of unhealthy competition amongst different States in the matter should be discouraged. (b) In genuine cases, where a change of location was desired on technical grounds or for reasons of economy, the change of location should be considered sympathetically. (c) Where location has been a necessary ingredient in making a decision to grant industrial licence, the application for change should ordinarily be turned down and the applicant should be asked to submit a fresh application for the consideration of the Licensing Committee. (d) Application of change of location (in cases where one of the State Governments concerned do not agree to the change) should ordinarily be submitted for advice, to the Licensing Committee together with the views of the State Governments concerned.

FERTILIZER DISTRIBUTION

On the recommendation of the Fertiliser Distribution Enquiry Committee, the Ministry of Food and Agriculture, it is understood, has accepted that a Central Fertilizer Marketing Corporation be set up to take over the duties now performed by the Central Fertiliser Pool. This will be in addition to the Fertiliser Corporation of India, which is a purely production organisation. The Marketing Corporation, with generally the same aims as the Fertiliser Pool — the welfare of cultivators and increased agricultural production — will be an autonomous body. This is to improve the distribution of fertilisers and to streamline the machinery connected with the indenting, allocation and distribution of fertilisers. It is also stressed that prices of fertilisers and prices of agricultural produce should be so related as to make it profitable to the farmer to use fertilisers.

HIGH DENSITY POLYETHYLENE

A licence for the domestic manufacture of high density polyethylene was issued to Alkali & Chemical Corporation of Calcutta for manufacture of 8,500 tons of polyethylene at Rishara in West Bengal. This was in addition to two other licences issued earlier, one to Union Carbide India, Limited for expanding its existing capacity to 20 million pounds at its factory at Trombay, Bombay and the other to Duncan Brothers of Calcutta to manufacture 4,000 tons of polyethylene in a new factory in Assam.

AID FROM NETHERLANDS

India is likely to receive financial assistance from the Netherlands for the execution of the Third Plan. It is gathered that though the final decision as to the quantum and nature of credit has not yet been taken, the Netherlands Government has expressed its willingness to help India. Assistance by the Netherlands, it is understood, would be outside that of the Aid India Club, because of its theoretical objections to the Club's scheme of bilateral credits.

Credits have to be negotiated between India and each individual country, although the broad decision about the overall assistance was taken by the members of Aid India Club jointly. The Netherlands laws permit only budgetted amount to be used for extending multilateral assistance.

COMPANY AFFAIRS

TRAVANCORE RAYON

The production of Rayon in the Travancore Rayon Corporation Ltd. declined slightly during 1960 and was somewhat short of full capacity due to, among other things, unexpected problems encountered in production and also difficulties and delays in obtaining the necessary spare parts owing to the stringent foreign exchange position — and consequent idle capacity. The production of both plain and moisture proof cellulose film showed upward trend. The directors have reported that by the commissioning of the latest high-speed cellulose film plant in October 1960, the capacity for production of cellulose film has gone up to 10 tons per day. The sulphuric acid plant was started over a year ago and has enabled the company to be self-sufficient in its requirements of this item and also leaves a surplus for sale outside. Sales of all the products were steady and registered a rise of 11 per cent over the previous year. During the year under review the profits were recorded at around Rs. 61.62 crores after providing for depreciation (Rs. 36.47 lakhs), development rebate reserve (Rs. 15.7 lakhs), gratuity reserve (Rs. 1.5 lakhs) and after paying excess duty (Rs. 23.95 lakhs). A sum of Rs. 27.30 lakhs has been provided for taxation. The directors have recommended the payment of additional dividend for 1959 on the preference shares at the rate of 1.50 per cent. Dividend on preference shares was paid at the rate of 6.5 per cent and dividend on equity shares is paid at the rate of 20 per cent for the year under review. A sum of Rs. 10 lakhs was transferred to general reserve.

Towards the latter part of 1962 the company's cotton linter plant is scheduled to go into production with an output capacity of 10 tons of linter pulp per day. Provision is also being made to enable increase of the output to 20 tons per day. This project will stand in good stead by lessening the dependence of the company on imports, and by providing quality pulp for yarn and film. The company got permission to instal 6 more rayon spinning machines. In order to arrange the necessary foreign exchange, the directors approached the Industrial Finance Corporation and hope to finalise order for machinery as soon as the financial arrangements are completed.

BINOD MILLS

The Directors of the Binod Mills Company Ltd. have reported that the operations of the company were quite satisfactory during the year to December 31, 1960. The demand for cloth remained steady during the year. The prices showed an upward trend during the first half but the voluntary price cut in September and again in December adversely effected the profits in the latter part of the year. The profit of the company subject to depreciation and provision for taxation came to Rs. 33.53 lakhs. After making the usual provisions there was a balance of Rs. 8.87 lakhs out of which the directors have recommended the payment of a dividend at the rate of Rs. 12.50 per share of Rs. 100 each subject to taxation which will absorb Rs. 7.50 lakhs. The directors have reported that of the loan of Rs. 20 lakhs sanctioned by the National Industrial Development Corporation Ltd., Rs. 17.82 lakhs had been received and the balance was expected soon. During the last two years the management of the company had been following the policy of expanding and maintaining the export markets of the company's products. In view of this policy the exports during the year under report were more or less maintained at last year's level and it appeared that the products of the company proved

popular with the foreign consumers. The total sales in 1960 were of the value of Rs. 54.04 lakhs and the total percentage of exports to total production of cloth was nearly 21 per cent. The export incentive earned by the company was nearly Rs. 8.18 lakhs during 1960 as against Rs. 5.66 lakhs during the previous year.

INDIAN SUGARS

During the year to September 30, 1960 the Indian Sugars and Refineries Ltd. crushed 1.53 lakh tons of cane and produced 16,006 tons of sugar with an average sugar recovery of 10.42 per cent as against 1.85 lakh tons of cane producing 17,647 tons of sugar. Even though the total cane crushed was less, because of the higher sugar recovery, there was higher realisation of sugar. Sale proceeds were recorded at Rs. 2.05 crores as against Rs. 1.96 crores during the previous year. The company gave bonus of Rs. 8.055 per ton of sugarcane to the cane suppliers under the Sisma formula. The distillery produced 86,740 gallons which was an improvement over the previous year's output of 57,036 gallons. The sale of spirit also was better than in the previous year.

The year's working results show a net profit of Rs. 15.29 lakhs. The directors have recommended the payment of dividend at the rate of 7½ per cent subject to taxation on preference shares and at the rate of 14 per cent subject to taxation on equity shares. The accounts of the subsidiary company, Salar Jung Sugar Mills Ltd. also show some improvement. In spite of the reduction in quantity of cane crushed compared to the previous year, the sugar produced remained almost the same. Some improvement was also recorded in the working of another subsidiary company, Manjula Confectionery (Private) Ltd.

COMMODITY NEWS AND NOTES

MOVEMENT OF COAL

Government of India have recently adopted several measures to improve supplies of coal to areas distantly situated from the Bengal/Bihar coalfields which produce about 80 per cent of the total output of coal. States situated northward of Mughalsarai such as Uttar Pradesh, Delhi, Rajasthan and Punjab, are served by these coalfields. The total goods traffic in the direction "above Mughalsarai" is at present about 2,600 wagons per day and coal comprises about 1900 of these wagons. The aim of the Railways is to step up movement of coal in this direction by upto 200 wagons per day from July next availing of progressive electrification of sections in the coalfields area etc. The movement of coal by coastal shipping is also to be stepped up. At present about one million tons of coal move annually from the Calcutta port to the coastal States in the south. This movement is being augmented and will be stepped up progressively to about two million tons per year and coal will now be carried by coastal shipping to the ports on the western coast such as Cochin, Bombay and Saurashtra ports. Some of the consumers in Gujarat State are obtaining their supplies by the rail route through Mughalsarai and the proposed movement to these consumers by the sea route would supplement the movement taking place through Mughalsarai.

Movement of coal by the sea route is comparatively costlier and in order that the consumer may get his supplies at almost the same cost at which he would have got these if the movement had been by the all-rail route, a system of subsidising the movement of coal by sea has been introduced. To meet the expenditure on this account a cess of 80 nP. per ton has been levied on all coal despatched from collieries with effect from 8-6-1961, so that, including the existing cess of 88 nP. per ton, the total cess will now be Rs. 1.68 per ton. Hitherto the movement of coal by coastal shipping was only to the extent of about 12 to 14 ships per month. With the introduction of the above measures and as more and more ships become available, Government propose to increase the above to 30 sailings per month. Besides the above measures, stress will be laid on greater movement of coal from the outlying fields such as Madhya Pradesh, Orissa and Andhra Pradesh. This would further reduce the pressure on movement from the Bengal and Bihar coalfields.

TRADING IN JUTE GOODS

With continued favourable weather conditions, the next season's jute crop is reported to have made very satisfactory progress, and consequently the prices of jute and jute goods have been gradually receding since

May 1961 from the extremely high levels prevailing earlier this season. In view of the easier conditions ruling in the markets, and the prospects of an early return to normal price levels next season, the Forward Markets Commission recently concurred in the resumption of hedge trading in jute and jute goods with effect from June 15, 1961. As a further step in restoring normal trading conditions in the jute markets the Forward Markets Commission has, with effect from June 13, 1961, withdrawn its orders issued in November 1960 imposing special margins on purchases of raw jute and certain standard constructions of jute goods on transferable specific delivery contracts. The Commission has also withdrawn the restrictions imposed in November 1960 on the number of transfers of pucca delivery orders issued against transferable specific delivery contracts in certain standard constructions of jute goods. The Commission has, however, directed the East India Jute and Hessian Exchange Ltd., Calcutta, to continue in force the procedure of registration of transferable specific delivery contracts and the submission of trading returns in these contracts by members of the Exchange.

SUPPLY OF NEWSPRINT FOR NEW PUBLICATIONS

Attention is invited to remark (7) against S. No. 44/V of Section II of the current Red Book, according to which the requests of Actual users, who might bring out new newspapers during April, 1961—March, 1962 for allotment of newsprint both indigenous and imported will be considered subject to specified conditions. Owing to foreign exchange stringency, supplies of newsprint have had to be restricted. Allotments to individual newspapers of newsprint both indigenous and imported are, therefore, strictly rationed according to their minimum requirements. Since availability of newsprint is limited, it is notified for general information that those publishers and/or printers of newspapers and periodicals, who wish to start new publications should, in their own interest, get a clearance in advance from the Chief Controller of Imports and Exports, New Delhi, regarding availability of newsprint for their publications. Applications by intending publishers for obtaining advance clearance regarding availability of newsprint for their publications should be made to the Chief Controller of Imports and Exports, New Delhi, who will consider them in consultation with the Registrar of Newspapers. If any newspaper or periodical commences publication without getting the necessary clearance from the Chief Controller of Imports and Exports, there would be no guarantee that newsprint for that publication would be available from indigenous sources or allowed to be imported from abroad.

Company Meetings

ASHOK LEYLAND LIMITED, MADRAS

Twelfth Annual General Meeting

CHAIRMAN'S REVIEW

Speech delivered by Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon), Chairman, Ashok Leyland Limited, to the Shareholders at the Twelfth Annual General Meeting of the Company held on 15th June, 1961 at Ennore, Madras.

Gentlemen,

I have great pleasure in extending to you a cordial welcome to the 12th Annual General Meeting of your Company.

The Directors' Report, Audited Balance Sheet and Profit and Loss Account for the year ended 31st December, 1960 have been circulated to you, and with your permission, I shall take them as read.

As the Balance Sheet and Profit & Loss Account have disclosed to you, 1960 may be considered to have been a reasonably satisfactory year. The output of Comet chassis for the year was 43 per cent in excess of that for 1959 and it has, therefore, been possible for your Directors to recommend the same dividend as previously. That is, the increased capital has been as profitably employed as has been the case for some years.

It is probable that in retrospect 1960 will have proved to be a memorable year. Not only has the Factory maintained progress with the Manufacturing Programme while increasing production and sales by an appreciable percentage, but also the foundations have been laid for the expansion of output to which I referred in speeches at the last Annual General Meeting and at subsequent Extraordinary General Meetings. It will be appropriate for me to give a brief history of the steps which have been taken during the year to ensure that our output will keep pace with the sales demand. In February, Messrs. S. Markland and D. G. Stokes, Directors of Leyland Motors Ltd., visited the Factory and has discussions with your Directors regarding the proposed expansion programme; and arising from these discussions, decisions were taken in the same month to ask your approval to an increase in the Authorised Capital to Rs. 10 crores. In February also, following representations made at an earlier date to it, the Government of India approved Leyland Motors' share of the Company's capital being increased to 60 per cent. In April, you approved at an Extraordinary General Meeting the proposal to increase the Company's Authorised Capital to Rs. 10 crores as a preliminary step towards the ultimate financing of the proposed expansion programme. In this month, your Directors also decided to apply to the Government of India for their approval of a programme to increase the production of Comet chassis to 5,000 per annum and in addition to tool up for an annual production of 1000 '600' type engines which are used in chassis heavier than the Comet. It was also proposed to add 20 per cent extra productive capacity to provide for the manufacture of spare parts required for the maintenance of vehicles in service. In July, an application was made to the Controller of Capital Issues for consent to the issue of Rs. 172.25 lakhs capital for the provision of buildings and plant and equipment to cover the first phase of the expansion scheme. Following a resolution taken at a Board Meeting held in October and the receipt of a Consent Order regarding the proposed new capital issue early in November, you approved at an Extraordinary General Meeting held at

the end of November, the issue of Rs. 172.25 lakhs capital of which Rs. 139.10 lakhs was offered to Leyland Motors to bring their shareholding to 60 per cent of the total issued capital of Rs. 497.25 lakhs. Messrs. Leyland Motors took up this offer and this decision will provide the necessary foreign exchange for the purchase of plant and equipment.

Coincident with the successive steps taken to provide the necessary capital for your Company's expansion, planning commenced in regard to the design and layout of buildings and of machine tools and other equipment to be accommodated in them. A contract was let in April for the steel work for the main building extension which will add 125,000 sq.ft. floor area for additional machine shops, assembly shops, etc. This addition with other building works, including the extension to the Canteen, a new Training Centre and improvements to office accommodation will bring the total covered area to 12.65 acres. A contract for the builder's work for all these new buildings was let in August. The precaution of placing early orders for steel work and other building construction resulted in erection of the new buildings commencing before the year end. I am pleased to be able to report to you today that such good progress has been made that it will be possible for the installation of plant and machinery in the new shops to commence in the second half of 1961. This fits in with the promised deliveries for machine tools and other equipment which will be shipped progressively from July 1961 onwards.

At your last Annual General Meeting, I reported to you that the establishment of a Foundry in collaboration with Messrs. Leyland Motors Ltd., in which this Company would have 25 per cent of the capital and Leyland Motors 75 per cent, had been approved by Government and at that time I anticipated full scale production of castings might commence in the first half of 1961. Certain unavoidable delays occurred and actual delivery dates of major items of equipment have been later than was originally promised. I am pleased to be able to inform you, however, that by the end of this year, Ennore Foundries Ltd. will be in a position to meet all your Company's requirements of iron castings; and progressively from that time onwards, surplus capacity will become available which will be utilised for the production of castings for other manufacturers. Mr. West, Vice-Chairman of Leyland Motors and Chairman of West Yorkshire Foundries Ltd., accompanied by Mr. F. Grimshaw, Leyland Motors Ltd's General Works Engineer, visited your Factory in November, the principal object of their visit being to acquaint themselves at first hand with the progress being made with the erection of the Foundry. I am sure you will agree with me that we are fortunate to be able to depend on the advice of Mr. West who is acknowledged to be one of the leading authorities on Foundry Practice.

In my speech at the last Annual General Meeting, I referred to a levy of excise duties which occurred on the 1st March, 1960; and I expressed the hope that the incidence of such duties on the development of

road transport would be carefully studied and that such a study might lead to the abolition or at least the lowering of these duties. It can only, therefore, be considered most unfortunate that far from lowering excise duties, they have since been increased. The 1961 Finance Bill provided for additional import duties and excise duties which will still further increase the price of materials used in the manufacture of motor vehicles; and probably necessitate a corresponding increase in the retail price of the Comet chassis. The Finance Minister met a deputation from the Association of Indian Automobile Manufacturers when the latter represented to the Minister the seriousness from the point of view of the Industry's welfare of the latest levies. The Minister could not give hope of any reduction in duties.

During 1960, the Company commenced the marketing of industrial engines. To enter the market for industrial engines entails producing Comet engines additional to those required for use in the Comet chassis. With tooling available, it was not practicable to achieve a very high output and the total sales of industrial engines amounted to 162. Our incursion into this market, however, has demonstrated that there is a good demand for industrial engines with the performance characteristics of the Comet; and that there will be a similar demand for the heavier engines which are about to come into production. It is possible, therefore, to anticipate that as soon as it is practicable to increase the output of engines additional to those required for the Company's own chassis, there will be considerable revenue from the sale of industrial engines.

For some time now, your Directors have had in mind the importance of export and attempts have been made to secure an entry into overseas markets. These efforts have been to some degree successful and your Company's export business commenced with the sale of 24 Comet chassis to the Ceylon Transport Board during the 1960 year. Efforts to secure export business will be continued because it is not only advantageous from the country's point of view but also from the Company's, as the Government of India provides additional foreign exchange to manufacturers who secure overseas business which can be utilised for the import of materials which are not available from indigenous sources.

It is my custom at your Annual General Meetings to attempt to give some idea of what the future holds as well as to review the results of the previous year. I do not think that apart from one particular issue to which I will refer a little later, 1961 will be very different to previous years. It will undoubtedly be a difficult year because there will be a high level of expenditure on new buildings and new plant which will not immediately give rise to a corresponding increase in output. Nevertheless, it is hoped that production will again show a substantial increase on the previous year. In addition, I can anticipate with confidence that further progress will be made in the deletion of imported components and materials and, as I have already stated earlier in this speech, castings will be eliminated from materials to be imported. Towards the end of the year, new machine tools and equipment will be received in increasing volume and buildings being ready for its immediate installation, it will come into use without delay. Production, therefore, will be on a rising curve as the 1961 year approaches its end, but the new plant and machinery will not have any really appreciable impact on the output of chassis until 1962. 1961, therefore, is likely to be a period of transition from low level production with

the exclusive use of standard machine tools to higher volume production with an increasing use of special purpose machine tools; and the installation of the latter will commence during the current year.

I have referred to one difference which will distinguish 1961 from other years. This is the change in the financial year end from 31st December to 30th September. This decision was made by your Directors in order that the Company might fall in line with our Associates, Messrs. Leyland Motors Ltd., whose financial year is from 1st October to 30th September. The current year, therefore, will be of nine months duration from 1st January to 30th September when a Balance Sheet and Profit & Loss Account will be prepared for the year ended 30th September 1961. Thereafter, the financial years will run from 1st October to 30th September inclusive.

I have already referred to visits from Directors of Leyland Motors and I must once again place on record the invaluable advice both with regard to the work of the Factory and its expansion which we receive from them. I am sure you will desire me to convey to them and above all to Sir Henry Superriour our thanks for all the help and guidance received.

I must also take this opportunity to recognise the enthusiastic help and co-operation that has been extended to your Directors by the Officers, staff and workpeople both on the factory side and on the administrative office side. I should like to convey our thanks to all of them.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

THE NATIONAL RAYON CORPORATION LIMITED

Shri Kasturbhai Lalbhai's speech delivered at the Fourteenth Annual General Meeting held on 15th June, 1961.

Gentlemen:

I have great pleasure in welcoming you this afternoon and placing before you for adoption the Fourteenth Annual Report of the Directors and the Statements of Accounts for the year ended the 31st December, 1960. These were circulated to all the Shareholders and so must have been in your hands for quite some time now, and, I believe, I have your permission to take them as read.

2. The Statements of Accounts have been drawn up in conformity with the provisions of the Companies (Amendment) Act, 1960. The figures for the preceding year, which are also published alongside, have been suitably recast to bring them in line with the new provisions.

3. Before I proceed to deal with a few items in the accounts which, in my opinion, require some elucidation, I wish to say that your Board of Directors have decided to recommend this year and hereafter payment of dividend on Preference Shares at Rs. 5.55 per share, free of Company's tax, with a view to placing them in the same position as they were before the enactment of the Preference Shares (Regulation of Dividends) Act, 1960, and amendment to Section 18 (3D) of the Indian Income-tax Act. With this objective in mind, we considered the following two alternatives:—

- To increase the dividend to Rs. 6.25 per share instead of Rs. 5.55 as required under Preference Shares (Regulation of Dividends) Act, which would, after deduction of Company's tax at 20 per cent, leave Rs. 5.00 per share; and
- To fix up dividend at 5 per cent free of tax.

The second alternative could not be considered as the Preference Shares (Regulation of Dividends) Act requires that the dividend should be increased in the case of our Company by 11 per cent. If the first alternative is adopted, the return on Preference Shares will vary with the Company's tax rate, whenever such a variation is decided upon by the Government, and in the event of the Company's profits not being taxable in any year, for any reason, the Company will, nevertheless, have to pay a dividend at 6.25 per cent. Your Directors have, therefore, decided to recommend the fixing of the dividend at Rs. 5.55 per share without the deduction of Company's tax, but subject to the statutory deduction at source of tax under the Income-tax Act.

4. Coming to the Statements of Accounts, the reasons for lesser sales turnover in Rayon Yarn and Waste have already been given in the Directors' Report. The total sales of Chemicals and other miscellaneous materials have increased from Rs. 37.00 lakhs to Rs. 46.11 lakhs. This is due to the increased production of Caustic Soda and Chlorine at the Company's ancillary plants which made available a larger quantity of these two Chemicals for sale. Apart from this, the consignment of Caustic Soda, which was imported earlier and remained unused for some time, was sold off on a 'no loss, no profit' basis with the necessary sanction of the Government.

5. The amount of Excise Duty paid during the Report Year was Rs. 68.59 lakhs, about Rs. 4.70 lakhs more than that paid in the preceding year. This duty was paid at the lower rate for the first two months of the year 1959 and at the enhanced rate for all the

subsequent ten months, whereas duty was paid at the enhanced rate for all the twelve months of 1960 on the entire production.

6. The Managing Agents' commission has been computed on the sliding rate of commission approved last year by the Central Government and stood substantially lower at Rs. 9.80 lakhs as against Rs. 18.90 lakhs paid in the preceding year. The amount of Depreciation deduction under Section 349 (4)(k) of the Companies (Amendment) Act, 1960, was arrived at by applying the rates prescribed in the Income-tax Rules to the written down value of the assets as shown in the books of the Company at the close of 1959.

7. The Inventory for raw materials is comparatively lower and stood at Rs. 30.59 lakhs as against Rs. 60.25 lakhs at the end of the preceding year; this may be attributed in the main to the stricter import control policy of the Government arising from the difficult foreign exchange position. Nevertheless, special provision has been made for the necessary raw materials sufficient for the trial runs as well as for uninterrupted operations of the additional Spinning Frames which will be pressed into commission shortly and of the Tire Cord Plant which is expected to go into production later in the year.

8. In the Finance Act of 1961, Excise Duty on Rayon Yarn has once again been raised from 90 nP. to 150 nP. per kilogramme for 120 and 150 denier, and from 130nP to 225 nP per kilogramme for 100 denier. Excise Duty has been imposed on Caustic Soda to the extent of Rs. 40 per metric ton, while the duty on Sulphur has been raised from 5 per cent to 10 per cent *ad valorem*. Having decided to levy these duties, the Government seem also to be anxious to hold the price line and with this end in view, the Textile Commissioner held a series of conferences with the Rayon Spinning and Weaving Units to see how much and by whom the increased levy has to be absorbed. Representations were made at these conferences that the rayon spinning industry was unable to bear the additional burden because the cost of production had already gone up consequent upon the revision and upgrading of scales of pay to the workers, imposition of Excise Duty on Caustic Soda and raising of the Import Duty on Sulphur. The Textile Commissioner after going fully into the matter, however, decided that 60 per cent of the increased Excise Duty on Rayon Yarn has to be absorbed by the Rayon Spinning Units and 40 per cent has to be passed on to the Rayon Weaving Units.

9. The Textile Commissioner has also fixed the prices for Rayon Yarn to be charged to the consumers and the price differentials between the different grades in each of the deniers at 15 nP per kilogramme at each stage, so that the difference in price between the first grades and the reject is not less than 60 nP per kilogramme. The distribution of the indigenous yarn continues to be done as hitherto through a Distribution Committee appointed by the Textile Commissioner. About 83 per cent of our production is being reserved to the powerloom sector to whom allocation cards are being issued every quarter and the balance is to be made available to the handloom sector, ancillary industries, doublers and twisters to whom it is also proposed to issue allocation cards in the near future. About 88 per cent of our production is being directly sold to the consumers and 12 per cent through established dealers based on their previous purchases from us.

10. With the present rate of growth of industries in Maharashtra State, the demand for power is increasing rather rapidly. It now appears that it has become somewhat more difficult to get additional power both for the existing industries as well as for the new industries which are coming up in Maharashtra State, and in particular, in the Bombay area. With the growth of industries in this region, perhaps the power shortage may become more acute till the Koyna project goes into regular operation at its rated capacity. I am sure, Maharashtra Government is conscious of this problem and necessary steps will be taken by them to see that the industrial growth in this region is not delayed for want of electric power. In the past, to meet power shortage, Maharashtra very wisely implemented a decision to staggering the holidays and working hours of the industry. Among other measures for making power available to the expanding industry in Bombay region, perhaps staggering of working hours may be considered. If this is done, then large quantity of power will be available to the industry in this area immediately.

11. I am pleased to inform you that some progress has been made with regard to the Company's Rayon Grade Pulp Project. A suitable site at Nanjargud (Mysore State) has been selected for the location of the Pulp Plant. The Mysore Government have under their consideration a proposal to reserve Coorg, Kollegal and Mysore forest areas for the exclusive exploitation by us of the bamboo and other soft wood resources in those areas suitable for the manufacture of Pulp. The Mysore Government are of the opinion that there is adequate supply of water in the neighbourhood which they will consider making available at concessional rates for the first five years, and that the electric power required for the operation of our Plant could also be made available. One of your Directors, Shri R. J. Chinai, is now in the United States exploring possibilities of raising a dollar loan to cover the foreign exchange needs on deferred payment terms acceptable to the Government and for obtaining technical know-how, and engineering and other related services. I am also pleased to inform you that we have obtained an Industrial Licence for the expansion of our Tire Cord Plant, and necessary steps will be taken for its early implementation.

12. The relations with the Labour continues to be satisfactory. In the month of March 1961, bonus equivalent to 1/4th of the total earnings during the year 1960 was declared and paid, but the Labour Union has made a demand for payment of bonus equivalent to 5/12th of the total earnings. This matter is now pending before the Assistant Commissioner for Labour.

13. I must say a word in conclusion about the workers and the staff who by their efficient work have contributed in a large measure to the smooth running of the plant and the satisfactory working of the organisation.

14. With these observations, I commend the Report and Statements of Accounts for adoption, and propose the following Resolution:

RESOLUTION

"THE FOURTEENTH ANNUAL REPORT AND THE STATEMENTS OF ACCOUNTS FOR THE YEAR ENDED THE 31ST DECEMBER, 1960, BE AND THEY ARE HEREBY ADOPTED."

Thank you, Gentlemen.

27 factories

Twentyseven Factories in twentyseven Countries. Twentyseven Productive enterprises in which experience is gained. Twentyseven observation posts that watch each technical advance, investigate, develop and apply the same.

The fruit of all this immense amount of knowledge and experience is contained in just a small piece of carbon paper, in just one inked ribbon, and in that sheet of Stencil Paper, all products of the House of Kores.

If you buy equipment that is going to cost you a great deal of money, then the knowledge that you are buying from a firm with a world-wide reputation gives you that very comfortable feeling of safety. For just the same reason, it is preferable to choose 'KORES' when you need Carbon Paper, Ribbons and Stencils.

In this way, you will preserve and add to the distinction of your organization by sending out letters that are clear and legible and which leave behind them as a fitting memorial copies which are clean and clear.

On behalf of twentysix Kores Companies.

KORES (INDIA) PRIVATE LTD.

Banking in the Third Plan

"TREND AND PROGRESS" this year is in the commanding position to survey the developments in banking during the Second Five-Year Plan and to take a pre-view of its expansion in the Third. It gives an award of meritorious performance to the nation's banking system on an evaluation of the services rendered in the Second Plan. A promise of a similar responsive performance is forecast for the current Plan.

It makes the estimate that, an investment target, which is 50 per cent higher in the Third Plan than in the Second, would throw upon the banking system the heavy burden of handling double the volume of business. It is quite apparent that the diversification of different types of services the banks have now undertaken and the accent they have placed on providing half of their total credit for industrial finance will be continued and intensified in the current Plan. Their resources from deposits will, of course, rise substantially, but whether the rise will be commensurate with the requirements of the market demand, it is difficult to be confident. The recurrence of stringency can hardly be eliminated. Deficit financing is to be restricted to Rs. 500 crores and the balance of payments gap may be accentuated at intervals. These two factors, among others, may react adversely on the growth of deposits. The fundamental objective ought to be to minimise the frequency and impact of stringency.

A policy for banking in the context of the Third Plan can be of practical value to the extent that it is given a functional orientation. It would be an improper assessment of *Trend and Progress* to characterise its attempt to focus attention on the liquidity factor as a lopsided preoccupation. But it would be hard to escape the impression that the prominence and elaborate treatment given to it in this document disclose some lack of perspective about the relative priorities needed in the current quinquennium. The immediate task of the banking system has been defined by it as further strengthening of its financial position to which no exception can be taken. But the reasoning which subsequently follows may not necessarily be accepted as a correct analysis of this problem: "Such a strengthening can be brought about in two ways, both no doubt integrally connected, one with a fairly long term influence and the other a nearer impact. The first relates to the build-up of sizeable capital funds while the second concerns the size of liquid assets."

The ratio of the capital funds (paid-up capital as well as reserves) to deposits deteriorated between 1956 and 1960 from 7 per cent to 4 per cent, whereas during the first decade of planning it fell from 9 per cent to 4 per cent. This is largely attributable to the phenomenal rate of expansion in bank deposits and it is generally in keeping with the global experience of the effect of post-war inflationary finance. A build-up of the capital funds raises the complex problem of larger reten-

tion of profits for reserves and smaller dividend distribution, which would make investment in bank shares unattractive in the face of other competitive issues of equity capital of which there is no dearth. Improvement in the capital funds is essentially a long-term and gradual process and it is significant that *Trend and Progress* has refrained from indicating what should be the fair capital-deposits ratio.

Expansion of liquid assets has been stressed as a short-term function, which it is not, if the progressive pressure of demand for bank credit and the recent decline in the rate of the growth of deposits are taken into proper account. Cash balances play a minor role in liquid assets, while non-cash liquid assets, comprising chiefly investment in government securities, constitute their dominant component. The experience of the banking system in 1960 graphically illustrates the influence of factors outside its control in reducing the size of non-cash liquid assets. Investments declined in 1960 by Rs. 157 crores and even if allowance is made for the fact that this order of decline has been accentuated by the change in the procedure regarding PL 480 counterpart fund deposits—between July and December last year there was a transfer of Rs. 72 crores to the Reserve Bank by means of sales of government securities in which these deposits were invested by the State Bank of India—the decline stands in sharp contrast with the increase in investments in 1959 and 1958, which, however, was inflated by the PL 480 funds. It ought to be remembered that banks reduced their investments last year to compensate for the slow expansion of deposits.

But more significant than that, there was an artificial contraction of deposits which could, otherwise, be utilised by banks at their discretion. The impounding of additional deposits was fixed at the ostensible rate of 25 per cent from March 11 and 50 per cent from May 6. These rates were enforced against each bank individually with the result that, taking the decline in the deposits of some banks and the increase in the larger ones in the same stride, the overall impounding was much higher. *Trend and Progress* makes the startling revelation that between March 11 and November 11 (when the additional reserves were reduced to 25 per cent from 50 per cent) immobilisation of the additional deposits of the system as a whole was of the high magnitude of 90 per cent. Here is a case where the effect of even the modest growth of deposits was nullified to the extent of 90 per cent for purposes of lending and a marginal volume of 10 per cent of the increased deposits was kept at the disposal of the banks. Quantitative restrictions on bank credit produced a far deeper impact than they superficially disclose. It would be well to learn this moral from their very first application last year.

Even in the short-term of the Third Plan period, improvement in liquid assets seems extremely difficult to achieve, if banks are to perform their

INDUSTRIAL IBCON CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL

function of providing adequate credit. The frontal attack must be launched on broadening the base of deposits. That is the realistic way of fortifying the financial strength of the banks. It admits of no alternative. In the Second Plan a substantial proportion of the additional deposits was attracted from places with a population below 50,000 and the process of tapping this source can be intensi-

fied further. As many as 1,400 townships—newly sprung up—are not served by banks. To make the drive for deposits successful, it is essential to launch the scheme of deposit insurance as early as feasible. It has the additional advantage that it will impose, by virtue of its inherent technique, a minimum discipline in the matter of the utilisation of deposits.

Laos: The Limited Accord

AT long last some progress has been made towards resolving the Laos crisis. The three Laotian Princes — Prince Souvanna Phouma, Prince Boun Oum and Prince Souphanouvong, representing the three factions in the country — announced at Zurich on Friday last that accord had been reached between them on setting up a provisional coalition government, unification of their armed forces and building up of a neutral Laos, free of the protective umbrellas of both the Western and the Eastern blocs. Consequent upon this agreement, the right-wing Premier Prince Boun Oum has revoked his earlier decision to boycott the Geneva Conference; his delegation has taken its seat at the Conference table. The Zurich agreement should evoke some optimism that peace would return to war-torn Laos at an early date, but how early it is hazardous to guess.

None of the practical issues of the Laotian situation have, however, been resolved by the Zurich accord. The vexed questions who should head the coalition government and on what principles the armed forces of the country are to be integrated into a national army remain to be solved. Again, though 15 days' time-limit has been set for resumption of talks on the formation of the provisional government, no deadline has been fixed for the agreement to be concluded. The person to head the coalition government is supposed to be nominated by King Souvang Vathanna. But he has to make his choice after consultations with the three factions in the country. A good deal of speculation is going on as to who would head the coalition government, but the chances are that the choice will rest on Prince Souvanna Phouma, who is considered to be the only personality at this moment round whom the various factions would rally.

The formation of the coalition government will, of course, not solve all the problems of Laos. It may usher in a temporary peace during which the cease-fire can be made effective and a single delegation to the Geneva Conference selected. The testing time will come when the unification of the armed forces is attempted. It is not for the first time that an agreement, in principle, has been reached on integration of the various warring forces in Laos into a national army. But all earlier attempts have failed due to the intransigence of the Pathet Lao. Under the conditions obtaining in Laos today, the Pathet Lao may not

stand in the way of the unification of the armed forces under one banner, since after the recent hostilities it has had the upper hand and it now controls 60 per cent of the Laotian territory, included in which are some of the most strategic areas. But will the right-wing forces be prepared to allow the Pathet Lao to wield a dominant position in the national army? This is a big question mark which will decide the fate of restoration of lasting peace in Laos. Then again there is the issue which faction should hold the defence portfolio; Captain Kong Lea of the leftist forces and General Phoumi Nosavan of the right wing are both aspirants of this key post.

While there may be a reasonable chance of the situation in Laos stabilising to some extent in the near future, the ultimate solution of the Laos problem depends upon the success of the Geneva Conference and the measures to be taken by the Soviet Union and China on the one hand and the U.S.A. and her western allies on the other to keep Laos out of the two power blocs as a neutral nation on the pattern of Austria. On this, protracted negotiations have been held since May 16, but without much success.

Though the two power blocs agree on the fundamental principle that Laos should be a neutral country on the periphery of the Communist world in South-East Asia, there are wide differences of opinion between them on how to guarantee this neutrality. The Chinese chief delegate's speech at Geneva early this week has dampened the prospects of an early accord on this crucial point. He has called for whittling down of the powers of the International Control Commission stationed in Laos to supervise the cease-fire. The I.C.C. has a vital function to perform in Laos today and its continuation with increased powers is an imperative which cannot be easily overlooked, especially in view of the subversive activities from across the northern frontier of the country. To prove its genuineness in arriving at an amicable settlement of the problem, the Communist bloc will do well in agreeing to enlarging of the I.C.C.'s powers to make it really effective in the performance of the task assigned to it. Lack of proper supervision in the initial stages can make Laos an easy prey for the leftist forces, which despite declaration of truce as long back as May 3, have not refrained from continuing the fight.

Capital Accumulation and Economic Growth

AN analytical study of the trends in economic development in both the industrialised and the developing countries during the 'fifties has just been released by the Economic and Social Council of the United Nations. Attention has mainly been focussed on the role played by capital formation in accelerating the process of economic development. It has been demonstrat-

ed on the basis of statistics collected for the period 1950-59 that despite a few exceptional cases, there is a close correlation between the rate of economic development and the rate of capital formation. The rate of economic growth has been noted to be high in the case of countries where the percentage of output allocated to investment has been relatively large.

The average rate of growth in developing countries has been more than 5 per cent per annum although Israel and Jamaica have demonstrated rates of rise of more than 10 per cent per annum. In the list of 32 developing countries, the Indian Union occupies a very low position because of its slow rate of growth in gross domestic product during the 'fifties. It may come as a surprise to some people in this country that Burma had a rate of rise in domestic product double of that witnessed in India. Whereas in the case of the Indian Union, the rate of growth in domestic gross product was only 3 per cent, Burma showed a rise of 6 per cent per annum. Also, the rate of capital accumulation in Burma was more than double of that in India. The average rate of gross capital formation as a percentage of gross domestic product in all the 32 countries was 16.4 with no less than four cases having a rate of more than 25 per cent, while India was at the bottom of the list with 8 per cent.

The pattern of saving, particularly the relative shares of foreign and domestic savings, in a developing economy is a pertinent factor for its rapid growth. Great reliance is usually placed on foreign savings. In the case of Israel, Jamaica, Cyprus, China (Taiwan), Greece, Korea (Republic), Panama and Chile, it is the inflow of capital from abroad which has been instrumental in accelerating capital formation, but in the case of the Indian Union the story is entirely different. Seven parts out of eight in the case of India have been ploughed back from within the economy

during the 'fifties, and only one-eighth of the total saving has come from abroad.

The Domestic saving is again dependent upon both private and governmental resources. Private saving in most of these countries has been more important than government saving for determining the level of total net domestic saving. Where there is a great tendency for total saving to rise, both public and private sectors have responded equally. In the case of the Indian Union, governmental saving is estimated to be nearly one-fourth of private saving.

According to Professor W. W. Rostow, an economy is supposed to have attained the stage of take-off, if the rate of productive investment is 10 per cent and the economy possesses one or more substantial manufacturing sectors with a high rate of growth. The existence of a political, social and industrial framework with capacity for exploiting the impulses to expansion is also essential. It is usually taken for granted that the Indian Union possesses a substantial manufacturing sector with an encouraging rate of growth and also conditions exist, both political and social, for taking advantage of the impulses of expansion. It is only the rate of productive investment which is supposed to be lagging. If the estimate made by the National Council of Applied Economic Research holds good, namely, that the Indian economy attained a rate of saving of 10 per cent in the first two years of the Second Plan, then the Indian economy may have already attained the take-off. But this is problematical.

Domestic Air Fares

THE announcement made by Dr. P. Subbarayan, Minister for Transport and Communications, last week about the increase in the fares on certain routes of the Indian Airlines Corporation is to be welcomed for its realism. Fares on the Vickers Viscounts, which operate on the trunk routes, are to be put up by 10 per cent and those on the Dakotas, plying the feeder services, are to be raised by 5 per cent from October. So far no decision has been taken on the alteration in the fares on the Fokker Friendships and on the Skymasters operating the night air mail service. There is a case for charging a moderate increase on the night air mail service, but perhaps the status quo will be maintained in respect of the five Fokker Friendships which operate short distance service in the less developed Assam and the eastern region.

Much of the criticism against the revision of the fares appears to be uninformed. Normally, there is an attitude of sentimental opposition to increases in the rates charged by public utility services run by the State and it is overlooked that they ought to be operated on a commercial scale earning a modest revenue for the exchequer. A very significant fact about the financial working of the Indian Airlines Corporation that is completely overlooked by the critics of the increase in fares is that the tax-payer has had to bear until the year 1959-60 the burden of subsidy. It was only in the year 1959-60 that under the influence of a dynamism in management a new chapter was opened by the IAC in its financial history, putting the prolonged phase of heavy losses behind.

The last annual report of the IAC makes a pointed reference to the certainty of a substan-

tial increase in the salary and wage bill. Perhaps, this important fact was uppermost in the mind of Dr. Subbarayan when he attributed the rise in fares to this factor. This clarification could at best be taken as illustrative, but the influence of other important factors cannot be overlooked. It would be a serious mistake to attempt to disprove the justification for the increase by arguing that the expanding volume of passenger, cargo and mail traffic, which is evidenced by the half-yearly reports, can be relied upon to absorb the higher cost of staff.

There are other cogent reasons which leave no alternative but to increase the fares. The IAC has reached a saturation point in its services on the trunk routes and it has become a matter of annoying experience that ten days' advance booking has become the normal limit. The demand for air travel is generally created by the urgency of business and it is of the essence of an airline's service that it should be capable of providing bookings at short notice. Uncertainty over a continuous period of time will earn for the airlines a bad reputation for unreliability and if only because of this sad consequence lucrative custom will be lost to the railways. The foreign tourist is indifferently treated and there are indications that part of the foreign tourist traffic may be lost. The IAC is in urgent need of an addition of Vicker Viscounts and sooner rather than later a decision will have to be made on the replacement of the Dakota fleet. Besides, operating costs are going up. If resources are not provided for this programme of expansion and rationalisation, the initiative shown by IAC's management in exploiting the sales potential and the tempo it has created for this drive will be lost. The choice lies between progressive profitability and a relapse into the era of subsidies.

THE WEEK'S NOTES

Kuwait

THE IRAQI CLAIM

GENERAL KASSEM has acted rashly in putting a claim to Kuwait as an integral part of Iraq. In his haste he obviously did not pause to ponder over the serious risk of miscalculation. An out-dated Turkish map showing Kuwait as a part of the Basra Province is certainly a rotten thread on which to hang this adventurous claim. It is too apparent that not this piece of evidence buried in history but the tempting oil wealth of Kuwait is the real force which has motivated General Kassem's action.

The treaty of June 19 last, whereby the full status of sovereignty of Kuwait was recognised by Britain and the agreement of 1899 was terminated, brings about a radical change in the international status of Kuwait. If the last week's agreement between Britain and Kuwait retains the responsibility of Britain for the protection of Kuwait from external aggression or internal subversion, that is a pact of a military nature which has been voluntarily entered into and it cannot be regarded as subtracting from the sovereignty of this State. Saudi Arabia and Jordan have lost no time in making declarations of full support to Kuwait and the United Arab Republic has also recognised the sovereign status of Kuwait and opposed General Kassem's claim. It is true that Kuwait's economy depends on the uninterrupted supply of food and fodder as well as a large number of workers from Iraq. But to that extent Iraq also depends upon Kuwait for the market for her surplus goods and employment of her nationals. General Kassem can hardly strike at this soft point without the possibility of injuring the interest of his country's economy.

A state of emergency has been declared in Kuwait; but in view of the prompt and staunch support announced by Kuwait's neighbours, it is unlikely that aggression will occur in the immediate future. Kuwait has presented her application for membership of the Arab League and, when it comes up for consideration, a first rate controversy will be provoked. At the present moment the indications are that General Kassem's precipitate action has created a crisis which holds a threat of a fresh crack in the Arab League.

Orissa

A NEW CHAPTER BEGINS

THE PRESIDENT'S rule imposed on Orissa on February 21 last was brought to a close after a period of nearly four months, when, on June 23, the new Cabinet of seven Ministers, headed by Mr. Bijoyanand Patnaik, was sworn in. Prior to this interlude, Orissa was under the regime of the Congress-Ganatantra Parishad Coalition which had a tenure of 21 months—certainly a long one for partners with substantial differences of outlook. It is a pointer to a period of stagnation in administration and economic reform, on which the coalition, by virtue of the orthodox social and economic philosophy of the Ganatantra Parishad, could not initiate any forward-looking policies.

As Orissa returns to Congress rule after 25 months, it looks with a new hope of dynamism being infused in the life of the State. The new Cabinet with young blood gives promise of making an earnest effort to fulfill this hope. It is being put on a hard trial. One has to look, however, at some of the pronouncements made by Mr. Bijoyanand Patnaik about the projected programmes of policy and reform. In parts, they are undoubtedly well conceived, while in respect of others, it is difficult to be sure that they are so. Mr. Patnaik's idea of the type of industrial orientation that should be given to this backward State lacks realism and it ignores the fact that it should extend beyond agriculture. He has in view a project with an outlay of Rs. 30 crores

for the establishment of a network of more than 300 medium-sized factories in the Panchayat samiti jurisdictions under the ownership of the local bodies for the manufacture of agricultural implements. The entire scheme is jejune. Efficient management by the local bodies and readiness of the landlords or tenants to switch over to mechanised equipment, though simple in construction, seem to have been presumed — wishfully.

But the new Government's agrarian policy is certainly well-conceived and it would meet a long overdue reform to which the Congress Party stands firmly committed. The Orissa Tenants' Relief Act expires on June 30 and it is to be given an extended lease by the promulgation of an ordinance with the intention of putting it permanently on the Statute Book. One of the reforms that will be incorporated in it is to bring within the application of the Act the 200,000 acres of land owned by the privileged class of the former princes. This reform, however, is bound to meet with tough resistance from the princes and big landlords and it is here that the Patnaik Ministry will be put to a severe test. Orissa has considerable potential mineral and forest wealth and the Ministry could profitably examine the possibility of giving priority to the exploitation of these natural resources which can yield quick results.

Angola

MASS MURDER AND MUTILATION

DR. SALAZAR'S armed forces are literally indulging in murder and mutilation on a mass scale in Angola. His renewal of the reign of terror with redoubled determination is only an indication that, so long as he holds power in Portugal, he will not allow the colonial grip on Angola to be relaxed. Two weeks have passed since the UN resolution called upon Portugal to stop the campaign of suppression and Dr. Salazar has retorted with vengeance. The Five-Power Committee appointed by the UN will have little chance of entering Angola. The number of persons killed and mutilated, though not possible to estimate, is running into several hundreds. The information gathered by the Baptist Missionary Society and some further light thrown by the World Council of Churches corroborate the fact of killings and maimings on a substantial scale.

The NATO powers are now painfully realising that pose for which they were never intended to be used and which cannot be defended. Norway alone among the NATO allies has shown the forthright attitude in refusing sale of ammunition to the Portuguese Government. The British attitude, by contrast, is amazing. The British Press is increasingly realising the awkward position in which Britain is landed by her Government's obsession with the legalistic position. To supply the two warships to Portugal at this juncture is certainly a very queer way of viewing contractual obligations in a situation like this. A typical reaction to the attitude taken by the British Government at the Security Council is illustrated by the "Manchester Guardian's" agonising observation that, "Bri ain's acquiescence in what amounts to genocide by her ally is becoming a national disgrace." In the absence of the threat of direct intervention, which is obviously to be ruled out, positive measures can be adopted to bring pressure on Dr. Salazar's regime. The first step in this direction would be for the NATO powers to decline to supply armaments to Portugal. Such a course would be justified on the simple reason that armaments are likely to be abused in Angola. The Five-Power Committee's inability to proceed to Angola will necessitate another meeting of the Security Council at which abstentions from voting must be eliminated and further pressure exerted on Portugal before thought is given to the extreme remedy of application of sanctions.

The World Abroad

PARADOXES OF INDIA'S PLANNING

By

ODYSSEUS

IN VIEW of India's need for foreign aid if her five-Year Plans are to succeed, I suggest that New Delhi should reply to the criticisms of its planning in "Indian Economic Policy & Development" (Allen & Unwin, London, 1961, Price 16sh.) by Professor P.T. Bauer of London University.

The Second Five-Year Plan, according to the Professor, is a series of glaring paradoxes. There is the massive expenditure on heavy industry, when the economic demands for its products is problematic. There is the neglect of education when the needs are evident and pressing. There is the comparatively small expenditure on agriculture, and also the restrictions on the movements of agricultural products, in the face of the manifest, urgent, and, indeed, desperate need to increase agricultural productivity, and to widen production for the market. There are the severe restrictions, or complete prohibitions, on the supply of certain categories of both imported and even locally produced consumer goods, in the face of the urgent need both to raise living standards and to provide incentives to get agricultural production out of the villages and into the market. There are the restrictions on the extension of efficient industrial capacity and the subsidies for inefficient cottage industry and co-operative production and distribution, in the face of the manifest need to economise resources and satisfy wants at low costs; and in the face also of official statements on the importance of industrial progress and the raising of living standards. There is the exclusion of both private Indian and foreign enterprise and investment from a wide range of industrial and commercial activity, in the face of the urgent need to encourage advance on as many economic fronts as possible. There is the neglect of roads, the official restrictions on setting up road transport enterprises and on the movement of agricultural products, in the face of the urgent need to widen markets and to facilitate, indeed positively to speed up, the movement of men, ideas, goods, and services. There are the severe restrictions on setting up all enterprises, in the face of the need to widen opportunities against the background of India's social structure, in which so many anti-economic elements persist. And all these measures and policies not only adversely affect the standard of living but also restrict the potential demand for the output of the extensive, and expensive, capacity created by the plans for heavy industry.

How, asks the Professor, explain these paradoxes? Is it merely that the planning is inefficient? Or is it that the primary aim of the Plan is not economic improvement but the total suppression of private enterprise and the creation of a wholly officially controlled economy?

When economic development is advocated, the normal implication is that the planners want to raise living standards and to increase the flow of goods and services desired by the people, and not simply to increase the output of particular kinds of physical commodities—such as steel plants—regardless of their contribution to the satisfaction of the people's wants.

But Professor Bauer contends that major elements of India's planning are inconsistent with the objective of improving the living standards of the masses. The unplanned inflation of the Second Plan was the opposite of effective planning. It is not efficient to plan for more than you can achieve. Economic development is not promoted by a bold plan which can't be fulfilled, the failure of which leads to crude stop-gap measures,

which impose hardship and frustrate constructive enterprises.

BIGGER AND BOLDER PLANS

Professor Bauer says that it is characteristic that unsuccessful planners call for bigger and bolder plans and for wider and more extensive powers. Both the lack of success in planning, and also the actual and continued poverty of India, are used as evidence of the allegedly insufficiently ambitious planning, and as arguments for bolder, bigger, more ruthless plans. "There need be no limit to this process, since success or failure of planning, and economic advance or stagnation, can all be adduced as arguments for more ambitious planning."

It is often argued in India, as in other developing countries, that large-scale, and indeed over-ambitious, plans are needed to rouse the enthusiasm of the masses. But to kindle hopes which are certain to be disappointed is, in the not so long run, likely to strengthen popular mistrust of the government and its policies, even if the government subsequently does adopt more constructive measures. Popular confidence in the government is likely to be destroyed by restrictions on the movement of people and goods, the sudden and unexpected introduction of extensive and close controls, the imposition of heavy taxation, and recurrent bouts of inflation. All this increases the difficulty of introducing effective and appropriate policies.

Professor Bauer argues that the individual exertions of India's illiterate masses are not likely to be influenced by the proclamation of grandiose plans. The Community Development Programme, the part of the plans most directly involving the masses, has, the Professor asserts, met with practically no effective response. Direct incentives, wider opportunities for making, selling, and buying, improved knowledge and skills and greater freedom of movement—these are the inducements which influence and enable people to share in and to promote economic advance to multiply wealth. But Indian planning does the exact opposite by its restrictive measures, its relative disregard of agriculture, and transport in rural areas, and of the social and economic disabilities of very large groups, and by its massive concentration of resources in heavy industry.

Professor Bauer suggests that a striking, and symptomatic, defect of Indian planning is that it neglects the presence, and implications, of the large backward subsistence sector, and of the need to expand the exchange economy as an instrument, and a condition, of economic development. This neglect leads the planners (a) to concentrate on activities which do not promote economic development and (b) to fail to organise social and educational advance.

Indian planning is also hampered by an uncritical belief in (a) the special efficiency of investment expenditure as an instrument of economic growth and (b) the special economic merit of manufacturing industry, or of particular types, such as heavy industry at one extreme and cottage industry at the other. It fails to recognise the transfer of resources, that is, the cost, involved.

FRENCH PLANNING CONTRAST

The persistence of patently inappropriate policies in Indian planning suggests that its aim is not so much economic advance as the achievement of economic self-sufficiency and the extension of the government's economic power.

Some, as in France, advocate economic planning in order to make the best use of resources for economic growth. While the government naturally exercises complete control over the plans of France's nationalised industries, the plans of the private sector are the result of joint voluntary consultative Working Groups in each industry. The real secret of the success of French planning has been that it relies on the team spirit aroused in these unpaid voluntary groups, which created co-operation with the government, goodwill, emulation, and, above all, made it seem natural to all French industrialists that stagnation is abnormal, growth normal.

But, in other countries, some advocate economic planning for the power over society which it gives, and Professor Bauer observes that the paradoxes of India's planning are largely explained by the fact that its overriding aim is the establishment of Socialism. This does not wholly explain the paradoxes, because some of the cruder notions behind planning are not necessarily corollaries of Socialism (e.g. neglect of roads and education). Nevertheless, Indian economic policy promotes a highly centralised, closely controlled economy. Nor is this surprising, since the official "Draft Plan Frame" laid down the Plan's first two objectives as "to attain a rapid growth of the national economy by increasing the scope and importance of the public sector and in this way to advance to a Socialist pattern of society; and to develop basic heavy industries for the manufacture of producer goods to strengthen the foundations of economic independence."

What have these objectives to do with raising the living standards of the masses? They attach no value to consumers' choices or to individual liberty, and the

type of Socialism aimed at seems, to the foreign observer, that of the monolithic Communist state.

This impression is strengthened by the circulation in India of a memorandum intended to assist the formulation of the Second Plan, in which one of India's most influential economists said: "...What I do suggest is the need for a thorough review of the Constitution with a view to seeing that it facilitates rather than hinders recourse to planned economy and a Socialist pattern of society."

It is noteworthy that Professor Bauer's criticisms coincide with many of those offered by Sir Theodore Gregory in his authoritative and careful study, "India on the Eve of the Third Five-Year Plan" (Associated Chambers of Commerce. Price Rs. 5).

It is often argued that if the West will not aid India, she will be absorbed into the Soviet sphere, and the balance of power tilted against freedom. But this argument may henceforth cease to cause so much alarm if it becomes clear that India's goal is a People's Democracy. If India is to be lost to the free world in any case, the West may be led to ask itself why its hard-earned savings should be used to promote a rush job.

This is the final article in a set of three outlining Professor Bauer's criticisms of planning in India. I have reported them because his viewpoint on the problems of growth is representative of ideas increasingly held among Western economists. The real trouble with India's planning, and indeed with much planning elsewhere, is that it is largely based on outworn theories of saving and investment which date from the inter-war years of depression. In future articles I hope to outline some of the latest thought on the subject.

The European Scene

A GERMAN PRESIDENT IN PARIS

From Our Special West European Correspondent

PARIS, June 24.

PRESIDENT Luebke went back from Paris this week with a better recollection of his State visit than his predecessor in the West German presidency, Professor Heuss, took back from London. Without being so hypocritical as to give M. Luebke the enthusiastic welcome that they lately gave President Kennedy and the Belgian king, the Parisians managed to convey the extent of their attachment to the Franco-German reconciliation. It is quite definitely the notion of reconciliation that they are attached, and not to the German people itself. That is to say, there is no warmth of feeling between the two nations and every demonstration of amity is accompanied by the embarrassed sentiment that it is a case of "in spite of", a fellowship dictated by the impossibility of any other course. This only means that it is a **marriage de raison**, and every Indian knows that an arranged marriage can prove as solid a union as a love-match. The time for sentiment will come later, when the generation born in 1940 comes to power, when the mood of a Germany without Adenauer is known and when there are no more Eichmanns to catch and try.

Incredible as it may seem, France has never before received the visit of the head of the state whose neighbour she has been for a thousand years, except for the wartime tour of Hitler. Even in the era of Briand and Stresemann, when it was optimistically believed that the "brawl on the Rhine" was finished, it would have been impossible to invite a German president to Paris. The archivists of the foreign affairs ministry in Bonn have diligently searched back for the only approximate precedent: the visit of Sigismund, emperor of the Holy Empire, to Charles VI in 1415. (The German emperor sought to mediate between France and England, to prevent a resumption of the Hundred Years War). Kings of Prussia and petty German princelings came often enough to Paris, but once the Germans were united, friendship across the Rhine was excluded.

President Luebke's visit, then, marks an epoch but does it really disprove the rule? — for the Germans today, precisely, are not united and the chief magistrate of Bonn still comes as the representative of only a part of the German nation as it would be in the event of a peace treaty. In his person, France welcomed only a crippled and truncated Germany, deprived of its capital, Berlin, and of all the land east of the Elbe, not to mention all the Germanic peoples of Central Europe that it was once a German ambition to unite. Before seeing in this circumstance the reason for French willingness to co-operate with Germans, one should recall that the reconciliation was a French initiative and it came soon after the war when it was not realised that Russia would seek to maintain the division of Germany indefinitely. In extending the hand of peace across the Rhine, the governments of the Fourth Republic imagined that it was with all the Germans that France would have to co-operate, those of the eastern as well as the western zones; and the offer contained no reservation about acceptance of the Oder-Neisse line, a condition that has been made explicit only lately. Moreover,

France contributed to the rebuilding of Germany by ceding the Saar freely, at a time when the economic recovery of West Germany had proceeded far enough to show that she would not be dealing with an invalid Weimar Republic. Finally, she has consistently opposed, with more verbal vigour than some others, the severance of the links between Berlin and the Federal Republic. All these decisions, it might be noted, were taken by the precarious cabinets of the Fourth Republic, more exposed to the public mood than the present regime.

So if it is with a truncated Germany that France is now united, this is not by design, any more than the West Germans foresaw that the France with whom they accepted to co-operate would soon be deprived of the empire that gave her much of her international status a decade ago. The reconciliation was not the result of a calculation by each side that the other was henceforth too small to be dangerous but rather (which is something quite different) of the realisation that their ancient quarrel was henceforth a small affair that it would be dangerous to perpetuate in a world where much bigger issues were at stake. It is true that their harmony has been facilitated by the amputations they have suffered. A France cured of her colonial distraction and a Germany exorcised of her hope of expansion in the east and obliged even to adjourn her reunification indefinitely can co-operate more easily than the imperialist nation-states that parted company in the 19th century. This is not because their territorial contraction has been accompanied by a contraction of their ambitions, but because their ambitions for once coincide: the construction of a vast economic unit on what land remains to them.

No one who knows how the young people of West Germany and France think today could accuse them of lack of ambition, unless one persists in conceiving national ambition in outdated terms. Their elders often do just that. Leaders of the refugee parties and the irredentists find young Germans callously indifferent to the fate of the "lost lands" and insufficiently enthusiastic about the prospect of reunification. The settlers, part of the army and the colonial party find young Frenchmen criminally indifferent to the break-up of the empire, and especially to the loss of Algeria. Their minds are elsewhere, where they see the widest horizons. It is not callousness but realism to build one's plans on the certainty that France's imperial possessions are lost as irrevocably as Germany's eastern lands, and — however painful it may be — to extend this to cover even Algeria, even East Germany. Illusions on these two points are slow to die, for it is not imperialism or colonialism that made France want to keep Algeria within her sovereignty after liberating the rest of her empire, and it is scarcely irredentism that makes Germans desire the restoration of East Germany to the republic.

Yet, however respectable the motives behind them (and at the risk of shocking many readers, I should say that French loyalty to the French community in North Africa has been as honourable as German care

almost any surface can be painted **BRIGHT** with **SHALIMAR SUPERLAC** SYNTHETIC ENAMEL

for the victims of the East German dictatorship), these illusions must now be sacrificed. It is clear that, despite the efforts of President de Gaulle to smooth the transition, the liberation of Algeria will eventually be complete and will entail the expulsion of a community that has had Algeria for its home for well over a century, and the gradual loss (gradual on the most optimistic hypothesis) of French interests in North Africa. It is equally clear that East Germany will never be reintegrated into the German community as we know it. To win back the East Germans, otherwise than by the refugee movement that is bringing thousands of them each week to the west, the mass of the German nation would have to surrender not only its connection with the western world and its present economic system, but its independence too; in other words, East Germany will be absorbed into Germany only if Germany consents to be absorbed into the Communist bloc.

President de Gaulle was not simply putting a brave face on these disasters when he welcomed President Luebke this week by saying that "the time has now come when France and Germany have many great things to do together". For, on the restricted space that is left them, and in concert with their nearest neighbours, they have the opportunity to build "a new America" — and one in which European culture will not suffer the sea-change that affected it in its translocation to America. This enterprise is already well begun, and it is virtually condemned to succeed. When it is said that the Franco-German reconciliation, symbolised by

President Luebke's visit, is the foundation of Continental unity, this is true but not if it implies that the venture depends on the fraternity of those two nations. On the contrary, it is the imperious need to proceed with the venture that condemns them to fraternal relations.

Not even in the diplomatic rhetoric of State occasions is it pretended that Frenchmen and Germans have fallen on each other's necks in forgiveness and vowed to build a new Europe. One saw many windows in Paris this week where only the French tricolour flew, for the thought of putting up the German colours was too much for people whose memory stretches back a few years. But at least the French flag was out, for even those people knew that the new start in co-operation with yesterday's enemy was cause for rejoicing. The reasons for Continental unity lie much deeper than the emotional connections suggested by the term "reconciliation". That is why one will believe in the chances of Britain wholeheartedly joining this constructive enterprise not simply when Londoners can give a German president a warmer welcome than President Heuss received, but when the political and economic necessity of unity are recognised on the other side of the Channel. So far, we are only at the point where the commercial advantages of a sort of British link with the Common Market are being admitted. It is a long way from seeing a commercial advantage to confessing the impossibility of any alternative. That is the distance that still separates Britain's approach to the Common Market from the attitude that unites its two principal members.

NOTES FROM WEST GERMANY

THE WESTERN POWERS AND BERLIN

BERLIN figured so prominently at Vienna that it naturally became front-line news again. It was made clear that neither the United States nor Soviet Russia is prepared to make any compromise. In the meantime, Khrushchev has formulated his old proposals made new in a memorandum and in a speech over the radio, stressed his preparedness to conclude a separate peace treaty with East Germany. This memorandum furthermore demands the liquidation of the present status of Berlin as well as the ratification of the borders of Germany such as agreed between the Four Powers at the end of the war. The memorandum refuses a self decision of East Germany by free elections, under international supervision, about the partition of Germany. Soviet Russia and the Communist regime of East Germany know that free elections would be very unfavourable to them. The great majority of the East German population are no communists.

West Berlin is a symbol, the last bulwark of the free world in a communist area. Therefore, the United States as well as Great Britain and France should emphasize their responsibility to protect the present status of Berlin.

IS THE COMMON MARKET EXPANDING?

The Parliament of the Western European Union (WEU) discussed the political and economic prerequisites and consequences if Great Britain joined the Common Market (c.f. "The Eastern Economist", June 2) in a four-day meeting in London. Officially, Great Britain still declares its solidarity with EFTA (European Free Trade Area) which is not so stable as is the Common Market. The member countries are Portugal, Denmark, Norway, Sweden, Finland, Austria and Switzerland. In the meantime, the other nations too, more or less openly, discuss their relations with the Common Market. Denmark's Foreign Minister had official conferences with West Germany and was prepared to join the Common Market in case Great Britain would do the same. The Swedish Minister of Commerce, Mr. Lang, visited Bonn recently and pointed out — as did Austria — that Sweden, being a neutral country, could not join any supranational military organisation. This maxim would, however, not contradict a possible membership with the Common Market. Switzerland, on the other hand, stressed the point that it would never agree to sacrifice the independence of its agriculture to an international co-operation of this type.

The great difference between the Common Market and the EFTA is the fact that the latter does not interfere with the national competence of their member states. The Common Market countries, however, agree to free trade and a free movement of labour. The industrial production of the Common Market nations increased by 8 per cent during the first quarter of 1961 as compared with 1960. France had the highest increase.

INDIA REPRESENTED AT HANDICRAFT FAIR

The German handicraft is famous for its efficiency and the annual Handicraft Fair naturally receives great interest and consideration. Dr. Erhard himself opened it this year in Munich. India is one of the 36 nations which were represented in this Fair. A special show of "Handicraft Training for Developing Countries" was organized. At this Fair, the international congress of the "Trade and Handicraft in Developing Countries" was represented. The importance of the international congress was stressed by Dr. Von Brentano, Minister of Foreign Affairs, who emphasized the co-operation between the German handicraft and the developing countries by sending German handicraft experts abroad and by making financial contributions.

For the current fiscal year the Federal Republic has subscribed DM 4 billion for developing countries. West German development aid is not tied to any political conditions whatsoever. Dr. Von Brentano mentioned that the Communist Bloc contributed only one-fifteenth of the development aid to the Free Western World between 1954 and 1959. Moreover, he said that West Germany should open her markets for the products of the developing countries.

BETTER SELECTION OF FOREIGN TRAINEES

West Germany trains 5,000 foreigners in industry at present. The experience gained so far has proved that a more careful selection is necessary to avoid loss of money and disappointment on both sides. The German Chamber of Trade and Industry, therefore, prepared the following programme to safeguard proper selection of foreign engineers and technicians who came to study in West Germany:-

1. Within his own country, the applicant has to prove basic knowledge in mathematics, practical mechanical experience as well as good knowledge of the German language. This examination has to be passed either at one of the German training centres or at a Goethe Institute, or at a Chamber of Commerce in the respective country.

2. Every engineer or architect has to undergo practical training. If a foreigner applies for a technical college or technical school he has to prove that he has successfully completed his practical training. He should furthermore be able to freely discuss a problem connected with his sphere of work and to give practical examples in this field. This lecture would be the prerequisite for admission to a technical college.

These proposals would guarantee that only those foreigners who can make the best use of the West German training facilities get admission to these training centres.

NEW TRAINING CENTRES

To meet the shortage of skilled labour in developing countries West Germany spent DM 42 million during the past four years to equip 48 training centres in 28 pilot projects with machines, tools and teachers. In general, the developing countries provide for sites and buildings. According to the principle of self help, the Federal Republic transfers the projects to the recipient countries and withdraws after a certain period of time. These centres for electrical, mechanical, auto-mechanical, woodwork training are concentrated in the Near and the Middle East. There are four schools in Afghanistan. Ceylon has received a repair shop for motor cars. The training and production centre in Okhla provides for training of 200 apprentices who will find work in small industrial estates. In Cairo, a technical school is being built up and fifty Egyptian engineers, who are presently being trained in West Germany, will later on lecture at this school. Projects for technical assistance amounting to DM 73 million will be extended to Africa and Latin America.

TWO MORE GERMAN PIPE-WORKS FOR INDIA

Following the delivery of the pipe-welding-works, Rourkela, which has now started mass-production of pipes for the Assam-Barauni Indian petrol-pipeline, the Mannesmann-Meer AG has now received two further orders from India for pipe-works. As has been stated by the Company, one of the two plants will be built in Bombay for the Zenith Steel Pipes Ltd., being part of the Birla Combine, and the other plant will be erected in Ahmedabad for the Bombay Steel-Tubes Ltd. Both plants are to produce gas and water pipes continually. The annual output will be about 25,000 tons working two-shifts.

*Economic Report from the U.S.***WORLD TRADE IN COTTON TEXTILES AND APPAREL**

By GUY SIMS FITCH

WASHINGTON, June 20.

PROGRESS is being made in the U.S. Government's search for an international solution to the difficult problem of world trade in cotton textiles and apparel. This progress is being advanced through a meeting here this week among representatives of the United States and seven other major consuming nations to discuss ways of working out agreed levels of imports. This is to be followed by another and broader meeting to be held in Geneva under the auspices of the General Agreement on Tariffs and Trade (GATT), and to include both exporting and importing countries. Such a meeting was approved in principle last week by the GATT council, and will be convened as soon as the necessary preparatory work can be completed. It would, hopefully, arrive at some workable international agreement for world trade in cotton textiles and apparel. All this is an outgrowth of President Kennedy's proposal of last May for an international conference to deal with textile imports, with the expressed hope that arrangements could be arrived at that would avoid undue disruption of trade patterns and domestic industries. To this end, the U.S. Department of State has been discussing with other interested governments the possibility of such a conference and the issues involved.

In his May statement, the President also pointed out that the U.S. textile industry has other recourses as well, including appeal for import relief under existing U.S. legislation. Such an appeal has been made, and the U.S. Office of Civil and Defence Mobilization (OCDM) currently is studying the industry's allegations that burgeoning imports have been disrupting its normal markets and have been endangering the national security. It should be noted that one recourse has nothing directly to do with the other. Both the State Department and the OCDM have been proceeding with their own responsibilities. But the State Department hopes and believes that the matter can be worked out satisfactorily on the international level and thus provide an adequate alternative to unilateral U.S. import quotas, if OCDM should recommend such quotas to the President. The Department views textile import quotas as contrary to the continued U.S. efforts throughout the post-war period to effect a liberalization of U.S. and world trade policies. Unilateral imposition of quotas on cotton textiles, moreover, would mark the first time the United States took such a step in connection with non-primary products.

Widening rather than restricting the opportunities for trade around the world obviously benefits all nations. There is a special importance in this with regard to the United States, which has maintained a relatively large favourable trade balance on its merchandise account. This balance is basic not only to the U.S. position, but also the U.S. ability to help support the security and economic advancement of other free nations. It would be one in which consuming nations, particularly those that now severely limit purchases from other countries, would ease their restrictions on imports perhaps according to some agreed-on formula. A growth element, which would permit consuming countries to increase their imports, would have to be built into such a formula. This is based on the rising trend of world textile consumption.

It would be an agreement, too, in which producing nations, particularly those in the developing or low-income category, would accept a commitment to control their exports so as not to disrupt the industries of the consuming nations and the orderly expansion of the international textile trade. Since the agreement would be confined to cotton textiles and apparel, measures would have to be taken to prevent participants from getting around it by substituting other fibres. A mechanism would have to be found, too, for dealing with non-participants. There is no thought at this time, apparently, that the agreement would go into the question of prices. What makes the cotton textile situation particularly urgent is the fact that it is labour-intensive industry, requiring relatively little in the way of capital investment. Hence it is an industry into which nearly emerging and developing nations tend to move quickly and ambitiously. The result is a rapidly rising textile output, with its potential for disrupting normal trade patterns. The idea, then, is to allow for suitable and orderly growth in textiles production and exports, without restrictive quotas and without serious external or internal market disruptions. Any other course, it is felt, might tend to frustrate the economic progress of the developing nations and the large amounts of financial assistance tendered by the industrial nations.

ANNOUNCEMENT

The following Annual Numbers of **THE EASTERN ECONOMIST** are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Re. 50/-.

The Ashoka Hotel

AT NEW DELHI

**LIGHTING BY PHILIPS**

Occupying an area of 20 acres, the Ashoka Hotel—the largest project of its kind in India—stands out as another shining example of Philips specialised lighting.

The lighting is so essentially a part of the whole conception that it presents an architectural masterpiece which belies the fact that it is achieved by artificial means.

Philips exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy through maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience, research and development to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible plus of Philips' international experience and know-how.

PHILIPS

quality lighting

CLOSER CONTROL OF FLOW AND LIQUID LEVEL

...with Honeywell's Differential Converter

USE THIS mercuryless remote transmitter for practically any application requiring precise high-speed measurement of flow or liquid level.

Accurate to within 1%, it's equally fast in response up the scale or down.
Range is continually adjustable in the field.

Honeywell is the recognized world's leader in the design and manufacture of automatic control equipment. An organization of more than 30,000 persons, with factories in the United States, Canada, France, Germany, Holland, Japan and the United Kingdom, Honeywell products are used in scores of widely diversified fields.

Honeywell products—more than 13,000 of them—fall into these three principal categories:

Honeywell

H First in Control

PIES-77/11-4

Heating and air conditioning controls and control systems for residences and industrial, commercial, public and educational buildings.

Instruments and instrumentation systems, process controls and control systems, valves, precision switches and data processing systems for business and industry.

Precision electronic instruments and control systems for aircraft and missiles.

India

Development of Sudamdih Mine in Bihar: An agreement between the National Coal Development Corporation and the Polish firm — CEKOP — for the development of deep-shaft mine project at Sudamdih in Jharia, in Bihar, was signed recently. Under the agreement the Polish firm will prepare a project report for a colliery in Jharia consisting of two mines — a deep shaft mine and an incline — with a common surface plant. The surface equipment will include a coal washing plant besides workshop, coal bunkers etc. The planned output of raw coal from the mines is 7,500 tons per day. The under-ground mine is situated 12 miles from Dhanbad railway station and nearly 3 miles from Patherdih railway station with an area of 1.75 miles along the strike and nearly 1 mile along the dip. The area consists of 14 coal seams of varying thicknesses of 4 to 60 feet with a total reserve of nearly 250 million tons and with an ash content of 10 to 28 per cent.

Good Year Tyres Equity Shares: The recent offer of Goodyear India Limited to the public of 4,00,000 Equity Shares to raise Rs. 68,00,000 is significant from three aspects. It has produced the second largest number of shareholders of any public company in the private sector in India. Secondly no prior allotments were made to directors, friends or employees, all the shares being offered to the Indian public. Although the issue was oversubscribed by about 25 times, letters of allotment and regret with balance of refunds to unsuccessful applicants, were all posted within two months of the closing date, indicating the prompt efficiency with which the entire issue was handled. Offering Equity Shares of Rs. 10 each at a premium of Rs. 7 per share, the Company received applications totalling Rs. 17 crores against the requisite subscription of only Rs. 68 lakhs. This reflects the Indian investor's confidence in Goodyear management. 89,000 applicants were reviewed and processed, representing a total of about 10 million shares from which 49,231 applicants were allotted shares.

United States

Loan to Air-India International: The United States Government has announced approval of a loan of \$8.1 million (Rs. 4 crores) to Air-India International Corporation towards meeting part of the cost of two Boeing-707 Intercontinental Jet Aircraft. The credit has been channelled through the U.S. Export-Import Bank. A Boeing-707 jet plane can carry up to 144 passengers. It has a speed of 600 miles per hour and takes 23 hours to fly from Bombay to New York, less time than it requires an express train to travel between Bombay and New Delhi. Air India at present has four jet aircraft. The addition of two more planes will go a long way to meet Air India's goal of operating an all-jet air fleet. As the operation of piston-engined aircraft is becoming increasingly non-competitive, the Corporation is planning to retire its Super Constellation planes and replace them with jet airliners. Three of the jet aircraft in service were bought with credits extended by the World Bank and certain commercial banks in the United States. The fourth plane, which entered service in April 1961, was financed in part by a loan of \$4.1 million extended by the U.S. Export-Import Bank.

IDA Loan to India for Highway Development: The International Development Association, an affiliate of the International Bank for Reconstruction and Development, has granted a credit of Rs. 60 million to India for highway development. This is the first credit granted by IDA to India. This credit will finance half the amount which will be spent on national highways during the first 3½ years of the Third Five-Year Plan which began on April 1, 1961. The funds will be used mainly for the construction of about 660 miles of highways, including 19 major bridges, which will open up some of the less developed parts of India, improving connection between important agricultural and industrial centres and relieve traffic congestion in the vicinities of the two principal cities and ports of Calcutta and Bombay. The credit is for a term of 50 years interest-free. It is repayable in foreign exchange on amortisation to begin after a 10 year period of grace. Thus the first payment will be due on August 15, 1971. Thereafter, 1 per cent of the principal will be repayable for 10 years and 3 per cent will be repayable annually for each of the final 30 years. A service charge of ¾ per cent annually on the amounts disbursed and outstanding will be made to meet IDA's administrative costs. At present India has 3,93,000 miles of roads consisting of national highways, state, district and village roads; the 15,000 miles of national highways constitute a network of main roads connecting the centres of population. About 8 per cent of the national highways are one-lane roads built to standards that require heavy maintenance.

U.S.S.R.

Work Started on Tatevskaya Hydro-Electric Power Station: Work has begun on the Tatevskaya Hydro-Electric Power Station on the Vorotan Mountain River in Armenia, the first of a series of seven hydro-electric power stations. Three of them will lie on the territory of neighbouring Azerbaijan. The new series of stations will be a major power base of Armenia. The Tatevskaya Hydro-Electric Power Station will be one of those functioning with highest pressure in the Soviet Union. Its building is going up in a deep gorge of the river near the border between Armenia and Azerbaijan. The construction of the station stretches over more than 30 kilometres in the Zangezur Mountains. The water driving the turbines will come from a height of 600 metres through an inclined 2-kilometer long pipeline. Arched dams exceeding 70 metres in height will be built. A more than 18-kilometre-long tunnel is to be dug. A series of reservoirs will be built on the Vorotan River, each holding about 200,000,000 cubic metres. The Tatevskaya Hydro-Electric Power Station, the first in the series on the Vorotan River, will be commissioned at the end of the Seven-Year Plan period (1965). At present this Trans-Caucasian Soviet Republic produces 50 per cent more power than this enterprise.

Second Blast Furnace at Karaganda Steel Works: The second gigantic blast furnace at the Karaganda steel works, which will be the biggest in the U.S.S.R. after the famous Urals Steel Works was commissioned recently. The commissioning of the second blast furnace concludes the construction of the first section of this enterprise.

100,000 KW Gas Turbine: Blueprints Ready: Design of a 100,000 kilowatt gas turbine was considered recently at the State Committee for Automation and

Engineering under the U.S.S.R. Council of Ministers. The blueprints for this turbine, unmatched in world turbine building practice, have been prepared by special lists of the Leningrad Metal Plant and the Kharkov Turbine Works. The specialists, who took part in the discussion of the project, noted that its implementation would open up broad prospects for Soviet power engineering.

United Kingdom

Plastic Industry: To meet the rapidly increasing technological demand for the U.K.'s plastics industry, the Former Research Association of British Rubber Manufacturers has extended the scope of its activities. Under the new title of the "Rubber and Plastic Association of Great Britain" the organisation will cover the requirements of both the rubber and the plastics industries. At a recent technical meeting in London, there was an exchange of views between officials of the Research Association and representatives of plastic firms. Various proposals were made for future work programmes. These included standardisation of test methods; productivity studies, particularly in moulding and fabrication; liaison with other research associations and laboratories on such common problems as toxicity and a study of plastic rheology, i.e., the science of flow of metal, and the critical study of elasticity, viscosity and plasticity.

Ghana

Production of Oil: Ghana reached another milestone in its industrial progress when the Nzima Oil Mills (IDC) Ltd., started production of oil early this year. The Nzima Oil Mills, I.D.C. subsidiary company

is located at Esiama, a village near the President's birth-place. The £1,42,000 mills produced 60 tons of oil during the first month of operation. This was increased to 180 tons in the second month and the production has now reached 200 tons a month. Prospects for exporting this oil are bright. The company has already exported 25 tons of crude oil to a firm in the United Kingdom for trial. If it proves favourable there it would mean that the company's oil will travel outside Ghana to many foreign countries. It is hoped to start the manufacture of soap in future and the turnover from the soap factory will be 600 tons of house-hold soap a year.

Construction of Oil Refinery: Preliminary work on the Tema Oil Refinery is in steady progress and it is envisaged that Ghana will produce its own petrol and kerosene early 1963, said Dr. Franco Fidora, General Manager of the Ghanaian-Italian Petroleum Company Ltd. Mr. Fidora revealed that the refinery will erect a distillation unit and a catalytic preforming plant and, when completed, the refinery would treat 1½ million tons of crude oil in any given year, and would produce gasoline, kerosene, diesel oil, fuel oil, and bitumen, both for home and overseas markets. The Refinery would also produce liquefied petroleum gas for domestic uses. The General Manager emphasized that the refinery would give employment to about 500 Ghanaian technicians, arrangement for the fifty of whom to be given specialist training in Italy are being made. While Ghanians were in training, the company would place its engineering and technical skills at the disposal of Ghana. The agreement for the Oil Refinery between the Ghana Government and GHAIIP in December, 1960 involved an investment of 8½ million pounds.

NEWS IN BRIEF

INDIAN

For promoting the horse-breeding industry in the country, the Government of India have decided to permit import of horses within a limited amount of foreign exchange, which has been set apart for this purpose.

An agreement for the manufacture of high quality tape-recorders at the Bharat Electronics in collaboration with the Nippon Electric Company of Japan was signed recently.

Almost one-third of the 146 State Bills that received the assent of the President last year were meant to introduce land, agricultural and tenancy reforms.

The Government of India have decided to extend the benefit of compulsory contributory provident fund under the Employees' Provident Funds Act to industries engaged in cinemas including preview, theatres, film studios, film production concerns, distribution concerns dealing with exposed films and film processing laboratories.

Sikkim has 161,080 persons, 77,163 females and 83,917 males, according to the provisional figures based on the 1961 census. The population has gone up by 16.96 per cent or 1.70 per cent per annum in the last decade.

The All-India Handicrafts Board is enrolling exporters of handicrafts under the Union Government's general scheme of registration to develop further confidence among foreign importers of Indian goods and build up lasting trade relations.

FOREIGN

The U.K. had a deficit on its current balance of payments of £56 million in the first quarter of 1961. This is an improvement on the £117 million deficit in the last quarter of 1960, but slightly worse than the £37 million shortfalls for the same period a year ago.

The United Arab Republic has announced an important change in its system of marketing cotton. From September 1, all cotton business is to be transacted in terms of the "metric cantar", which will consist of 50 kilograms (or roughly 110 pounds).

The 1961-62 world cotton crop may top this season's estimated 46.9 million bales by as much as 5 per cent, the U.S. Agriculture Department forecasts.

According to the Commerce Department, Personal incomes in the U.S. climbed in May for the third consecutive month, establishing a record high. Payments to individuals ran at a seasonally adjusted annual rate of \$413,700 million.

Dutch life insurance business showed unprecedented growth during the first quarter of 1961, with new contracts exceeding Fls. 1,400 million (£140 million), an increase of 27½ per cent over the corresponding quarter of last year.

Three F. 27 Foker Friendship passenger aircraft have been ordered by the Portuguese East African Airline. The order is worth some Fls. 7.5 million. Delivery date is August, 1962.

Special Article

FREEDOM FROM HUNGER

IT was in October 1960 that the General Assembly of the United Nations adopted a resolution with the objective of making available the food surpluses of the developed countries to the food deficient countries through the channels of the United Nations. This resolution endorsed the 'Freedom From Hunger' campaign of the FAO; the Director-General of the FAO has now issued a comprehensive report entitled "Development through Food—a strategy in surplus utilisation," setting out his recommendations for giving a practical shape to the U.N. resolution.

That more than half the world's population is under-nourished is a well known fact. The degree of disparity in per capita income and consumption in a few selected countries is brought out in the statistical table on the next page. This fact is also illustrated in another way in the graph below which shows that the continents which have surplus agricultural output in relation to population are North America, Latin America, Oceania and Western Europe; on the other hand, the population in the Far East, Africa and the Near East far exceeds the total availability of agricultural production. This also shows the manner in which food and other agricultural products need to be moved in order to bridge the gap between the needy and the surplus countries.

The assistance from the surplus to the deficit nations has continued to flow for the last many years, though the total volume has been far short of the needs. The volume of public economic aid during the last decade has been estimated at about 0.4 per cent of the gross national product of the developed countries. Obviously, this is a very small fraction of the total annual income of the prosperous nations and to expect a distribution of about one per cent of the total gross national product of these nations for the under-

nourished countries is not an extremely high target. In fact, in all current international discussions this figure is being commonly quoted for stepping up the volume of help from the surplus to the deficit countries.

In order to step up the pace of economic development in the deficit countries, the volume of investment needs to be steadily increased. The importance of raising the volume of capital accumulation in these countries has been discussed at great length in the World Economic Survey for 1960 and comments on that survey have already been presented in a leading article in this issue on page 1468. The experience of the last decade has shown that while investment is being raised in these countries, the demand for food takes a steady upward course as a result of increasing investment. It is at such a juncture that "food aid" can be used as additional capital in its original sense of a subsistence fund.

The Director-General's report, however, stresses the economic development of the under-developed countries through food surpluses obtained from the developed nations. The vicious circle of poverty, hunger and stagnation can be broken in the backward countries only through social and economic development and food aid is expected to play a very important role in aid programmes. It has been suggested that like all other aids, food aid should also be made a part of the overall development programme of the receiving countries.

To meet the pressure on food supplies, it is suggested by the Food and Agriculture Organisation that national food reserves should be created on the same lines as planned by the Indian Union for its Third

REGIONAL SHARES OF WORLD¹ POPULATION AND AGRICULTURAL PRODUCTION, AVERAGE 1957-59
(Production data based on price-weighted aggregates)

* Excluding U.S.S.R., Eastern Europe and Mainland China. * Excluding Mainland China.

Plan period. In the case of countries where agricultural production is still a gamble of the weather, these reserves will be found extremely useful in keeping the inflationary pressures in check and in continuing the process of economic development unabated.

It is estimated that over the next five years something like 12,500 million dollars worth of commodities may be made available for distribution. According to the expert group appointed by the Director-General for putting forward concrete suggestions in order to implement the United Nations resolution, the annual aid now runs at \$3,600 million and should be raised to \$5,000 million per year. This, however, does not include the international arrangement for emergency food relief.

The Food and Agriculture Organisation, therefore, will be for this purpose a co-ordinating body acting as a link between the suppliers of surplus food and the recipients of the same in an effort to utilise it for economic and social development. It will continue to operate as hitherto as an international agency assisting the individual countries in the hour of chronic food shortages and also acting as an intermediary between the donors and the recipients. The FAO will control and administer the international emergency food reserves and will also evaluate and report from time to time on programmes of surplus food utilisation. The other wings of the United Nations are also expected to closely co-operate with FAO in this humanitarian task. Happily, the United States Government has already proposed to set up a fund of \$100 million in the shape of commodities and cash for the sake of putting all these suggestions into practice, and this is

indeed a significant and encouraging step. It seems that the dream of pushing the economic and social development of the poor countries through food surpluses is likely to take a concrete shape in the near future.

INCOME AND CONSUMPTION OF CEREALS PER HEAD IN SELECTED COUNTRIES 1957-58

BOOK REVIEWS

INDUSTRIAL ROUND UP

Major Industries of India Annual, 1959-60: Edited by M. P. Gandhi, and Published by M/s. M. P. Gandhi & Co., Nanabhay Mansion: Sir P. Mehta Road, Fort, Bombay 1: Pp. 372: Price Rs. 15.

This 9th volume of the Annual is not a mere collection of articles. It reads like a running commentary of the saga of industrial progress in India since Independence. It bears the distinctive marks of Mr. M. P. Gandhi's personality. His Annuals have gained fame in the business and industrial circles of India for their high quality in the treatment of the subject as well as presentation. In the Annual under discussion, there is a long galaxy of contributors beginning with the Prime Minister of India. The other contributors are Mr. Lal Bahadur Shastri, Mr. Manubhai Shah, Mr. S. K. Patil and Mr. Shriman Narayan. The leaders of business in the public sector as well as the private sector have also made their valuable contributions. There is hardly any important industry which has been left out. The articles on India's foreign trade by Mr. K. B. Lal and Mr. K. P. F. Khilnani are of great interest. Equally interesting is the provocative article on the Tourist Industry in India, which is slowly coming up in earning the valuable foreign exchange for this country.

RAILWAYS

Indian Railways Annual, 1961: Published by Ministry of Railways, Government of India: Price Rs. 4.

Indian Railways Annual 1961 in its 268 pages contains a variety of material on the Railway operations in India and in some foreign countries. Articles have been suitably illustrated with the help of graphs and

tables. Although most of the articles are informative, there are some critical articles too, a feature less common in Government publications. Mr. K. Santhanam, a former Minister of State for Railways, for instance, has criticized the Third Plan Transport allocation by the Planning Commission and has advanced some practical suggestions as well. Among other interesting articles are "Erhard's Economic Philosophy in Indian Setting" by a former Chairman of the Railway Board, Mr. K. B. Mathur and "Milrail for Moving the Tail" by Brig. Rajendra Singh. Notable amongst the contributions is a factual article by the President of U.S. Railroad, Mr. Daniel P. Loomis.

THEORETICAL ECONOMICS

Advanced Economic Theory: By Mr. T. N. Sachdeva: Sudha Publications, New Delhi: Pp. 276: Rs. 8.50.

During the last ten years or so, economic theory has registered considerable strides in various directions. Economists like Mrs. Joan Robinson, Mr. Harrod, Mr. Colin Clark, have contributed new ideas towards the advancement of the subject. Mr. T. N. Sachdeva, it seems, has taken pains to bring all these recent advancements into one volume for the convenience of those who want to be acquainted with these developments without going through this dispersed knowledge. Certain topics like problems of pricing a planned economy, the application of Keynesian economics to under-developed areas, static versus dynamic economics and micro versus macro economics have been dealt in fair details. The section dealing with welfare economics and theories of population would be of interest to even a general reader.

Who Contaminates Whom?

By
CROESUS

FROM the time those two brilliant articles of Mr. G. D. Birla about his impressions of Russia appeared in two leading Indian dailies, there have been a number of reactions, some complimenting Mr. Birla on his admirable objectivity and others expressing surprise at his seeming gullibility. What I am surprised at is that anyone should try to interpret what has been stated in these articles as the firm convictions of the writer. Apart from the carefully selected titles of the articles — perhaps suggested by the writer himself — which make it clear that they are just impressions, there is the fact that Mr. Birla did not go to Russia on a study mission but only as an invitee of Mr. Khrushchev and spent hardly ten days, not to speak of his not knowing the Russian language. But, I suppose, just as all reactions about Russia and the Russians, any reactions about whatever is written about them also are essentially subjective, the slant varying from unqualified adulation to outright condemnation, depending upon one's own likes or dislikes. But if one cares carefully to sift the essence from Mr. Birla's two articles, even if they are only impressions, certain conclusions — really significant — clearly emerge. They are that the Russians have made remarkable progress in science and heavy machine-building; that, despite all this progress, the standard of living in Russia cannot be considered high enough (in that, although essential food like bread — not meat — is cheap, education free, and rent but not accommodation, reasonable, not all the necessities of life are available, and if available, only at exorbitant prices); that many western countries have begun to build up their trade with Russia; and that India too, while not necessarily subscribing to communism, should develop her trade relations, especially when there is scope for doing so.

Now, there are two distinct schools of opinion about the desirability or otherwise of trading with Russia, one school saying that all relations, including trade relations, are taboo — "to contact is to be contaminated", this school argues — and the other contending that, inasmuch as a complete trade blockade is inconceivable, the better course is to trade and compete with Russia and her satellites, notwithstanding the several handicaps involved. There is yet another school which is averse to having any trade with Russia at this stage, because, according to this school, the Russian economy is now almost on the verge of collapse and any trade with that country which enables it to purchase its requirements, especially of consumer goods, would be like giving a timely and healing shot in the arm of Russian economy. In other words, this school feels, any trade with Russia today would tantamount to pampering the sworn enemy of the capitalist countries.

Since it is admittedly difficult to determine which of these three viewpoints is right, I thought of availing myself of the Press Guild of India's reception to

Mr. Birla last week to find out what Mr. Birla himself thought of these, and I must say I was not disappointed, although I was disappointed that the Bombay Press did not get out of Mr. Birla all that it might have got, had it directed the questions more purposefully and perhaps also more responsibly.

Be that as it may, to the first of the three viewpoints mentioned above, Mr. Birla's answer was categorical. Replying that he was interested in spreading capitalism, Mr. Birla said: "I am an Indian and interested in promoting our trade with all countries, including communist countries. I feel our system is so good that, if we came in contact with the communists, we will contaminate them." This is certainly a new approach, the pros and cons of which are sure to be hotly debated both in communist and non-communist circles. Hitherto, the fairly widely held notion was that it was only the communists that had something appealing to sell — especially to have-nots — or somebody to "contaminate", if not convert, but probably, for the first time now, the argument is being seriously put forward that the capitalist countries also have something to sell and, if they can deliver the goods, they can win over the people in communist countries. Whether it is all so simple as this or not need not detain us, but few can deny that closer contacts help better understanding and that better understanding will at least serve to plant some doubts in the minds of Russians that the capitalist system could not be as bad as they have been taught. Furthermore, let it not be forgotten that those Russians who have been allowed to see the outside world have been influenced by, if not impressed with, what they have seen with their own eyes in the capitalist countries.

Secondly, Mr. Birla seemed to me to convey the impression that, when many western countries, not excluding the U.S.A., have begun earnestly to explore the Russian market, in spite of ideological differences, India would not be well advised to lag behind. He believes that the possibilities of increasing India's exports are immense; apart from traditional items like textiles and leather goods, India can export many other things such as furniture, sugar, paper and textile machinery. In other words, the field could at least be explored energetically, unlike before. Hitherto, trade with Russia has been inhibited by a number of considerations such as the imponderability of the Russian costs of production, the need to channel trade only through official sources, the existence of rupee payment agreements, as in our case, and so on. Also the experience of many countries trading with Russia does not appear to be uniformly happy. Some have found, for instance, that what they sold to Russia at a given price was subsequently re-exported by her at a cheaper price to their customary markets, while others have found that they cannot depend upon Russia to be a

steady customer, for, if she purchases her requirements of a commodity from some country this year, there is no guarantee that she will do so next year also, in spite of continued cordial relations between those countries and Russia. And, in so far as India is concerned, there is the further difficulty of whether, in the prevailing conditions, the authorities will allow the imports of certain categories of goods that Russia may be able to export and also permit the export of those goods that she may be willing to import. In short, building up trade with Russia does not appear to be very easy. When holding an Indian Industries Fair in Moscow, as Mr. Birla has proposed, therefore, all these factors require to be borne in mind and provided for. No purpose would be served, for example, if we display at this Fair goods which our Government may not allow us to export to Russia when the latter asks for them.

The third point is a highly controversial one and it is difficult to substantiate it even if it is true. As Mr. Birla told the Press Guild of India, although Russia may not be able to overtake the U.S.A. in indus-

trial production in the near future, one cannot under-rate Russia's capacity to go ahead, provided there is no war. This proviso, however, is very important, inasmuch as Russia is at present spending as much as 25 per cent of her national income on defence, and that is certainly proving to be a great handicap to a more accelerated pace of economic advance by her. Moreover, it is no use counting on the probable collapse of the communist economy and piously hoping for that to happen, on the one hand, and, on the other, to behave in a way that would work precisely in the opposite direction, that is sustain the communist economy, as seems to be happening today. In other words, rightly or wrongly, it does not look as though the capitalist countries have made up their minds that they cannot co-exist with the communist countries. Evidently the communists have succeeded in completely confusing the leaders in capitalist countries and sedulously encouraging them to hope that co-existence is possible, while, at the same time, feeling convinced, even as Lenin was, that this must need be a transitory stage in the inevitable eventual march towards communism.

Business Notes

Currency

DEVALUATION OF THE CANADIAN DOLLAR

TO INDIANS whose Government is striving hard to attract foreign private investments, Canadian Finance Minister's announcement last week that in order to restrict flow of foreign private capital into the country, his Government had decided to devalue the dollar and to reduce interest rates may appear to be ironic. But to those who are conversant with the problems of Canada's economy the move is scarcely surprising. The Canadian dollar, which is a floating currency, has for an appreciable time now been overvalued, taking into consideration the country's balance of trade position. Canada's trade deficit for nearly three decades has been covered by heavy inflow of private foreign capital, particularly from the United States. Mr. Fleming's move apparently is directed towards making the Canadian economy self-reliant.

The decision to devalue the Canadian dollar to a "significant discount" over the U.S. dollar—no parity has yet been named—will obviously help in increasing Canada's exports and restricting her imports. But how far this step can go in restoring the balance in the economy, which during the past two or three years has witnessed a curious phenomenon of recessionary tendencies breeding unemployment alongside rising prices, is a point on which it is hazardous to pass judgment. The flow of private foreign capital is primarily dependent upon two factors: the safety of funds and the return which an investor will get on his capital. Canada is one of those few countries where climate for foreign investments is very congenial, both because of political stability and prospects of expansion in the economy. To the private U.S. investor Canada will probably remain for a pretty long time to come attractive field for investment even though the return which he may be able to get might go down. This is primarily because, apart from the safety of his funds, an average American investor would not like to go far away from his neighbourhood for seeking avenues for investment.

The lowering of interest rates will apparently lead to a boost in the Canadian economy which at none-too-distant a day might raise profitability in industry and trade to the levels obtaining before the decision to devalue the Canadian dollar was taken. This introduces an element of speculativeness and, contrary to the expectations of the inflow of foreign capital dwindling, may lead to increase in the inflow if for no other reason

than for the fact that when the exchange rates go up again the foreign investors can make some quick money.

The Canadian Government's decision, apart from the imperativeness of correcting the imbalance in the economy and making it more and more independent of foreign capital investments, has probably been impelled by the imminent possibility of Britain's joining the European Common Market. Since Canada's export trade to a very great extent is directed towards Britain, the latter's joining the "Inner Six" will obviously affect her adversely.

For India, Canada's decision will perhaps prove to be of some benefit. If the flow of U.S. private capital into Canada is obstructed by Mr. Fleming's move, some of this capital may find its way to India, which offers good opportunities for foreign capital investments.

Burmah-Shell Refineries

SOLID CASE FOR EXPANSION

THE REASONING advanced by Mr. L. D. Mudie, Chairman, Burmah-Shell Refineries Ltd., at the company's eighth annual general meeting for the expansion of the company's production capacity from 3 to 4 million tons is sound, logical and to the point. But it is unfortunate that the Government does not see eye to eye with it. Apparently, the points in favour of expanding the company's production capacity are many. Not only is the company prepared to meet all the foreign exchange cost of the expansion programme, but is also prepared to modify the Refinery Agreement of 1951 in case expansion is permitted. The Government, however, seems to think otherwise and is not inclined to mix up issues of expansion and modification of the Refinery Agreement.

At the Oil Advisory Committee meeting in May this year, it was agreed that the demand for petroleum products in 1966 would be of the order of 14.14 million metric tons including the provision for international bunkers, representing a crude oil equivalent of about 15.27 million metric tons. Against this, the total output of petroleum products by the refineries in the private sector is 6.4 million metric tons. The three public sector refineries to be commissioned during the current Plan period are expected to produce 4.75 million metric tons. This, obviously, shows that there would be substantial gap between demand and supply at the end of the

Third Plan. Allowing that some imports would be necessary in all circumstances, there is need to augment the refining capacity in the country to keep the drain on our foreign exchange resources to the minimum.

Mr. Mudie underlined that the revised cost estimates recently submitted by the Burmah-Shell to the Government of India showed that additional million tons of refining capacity would cost only Rs. 2.83 crores, a fraction of the cost of constructing a new refinery of comparable capacity. Besides, to find, produce, refine and distribute one million tons of oil, it would involve a capital investment of Rs. 60 crores. And if an increase of 7 million tons in consumption over the Third Plan is to be considered, capital investment of Rs. 400 crores will be called for. A question may be asked here: will the Government be in a position to earmark such a huge sum including foreign exchange component for oil industry in the Third Plan? Moreover, there is the time factor. Again, the properties of crude oil differ widely, which means that every type of oil cannot be used at any refinery. Keeping all these points in view, it is imperative that the Burmah-Shell refineries be allowed to expand. In return, what may be asked for is that Indians be allowed to participate in the equity capital. This certainly is fair and can go a long way in removing the feeling that foreign refineries are taking away sizeable amount of profits.

New Issue

UNIVERSAL CABLES LTD.

Satna, in Madhya Pradesh, will soon have a plant for the manufacture of heavy industrial cables. Universal Cables Ltd. will shortly be putting up a factory for paper insulated lead covered power cables—PILC cables, as they are called. The Government of India has granted to the Company a licence for manufacturing 624 miles of these cables every year. Although there are two other companies, besides, which manufacture this very type of cables, the combined production of the two plus the potential production of the Universal Cables would still fall very much short of the demand for such cables in the country, let alone the Third Plan target of 4,000 miles per year. The Company has finalised the collaboration terms with the world's biggest cable manufacturers—British Insulated Calender's Cables, Ltd., London. Messrs. Birla Gwalior Private Ltd. are to be the managing agents.

Universal Cables Ltd. has, at present, a paid-up share capital of Rs. 35 lakhs which will be increased to Rs. 105 lakhs by the issue of equity shares of the value of Rs. 35 lakhs to the existing shareholders and a further Rs. 35 lakhs to the public. The entire issue has been underwritten by the Investment Corporation of India Ltd. Incidentally, this is the first Birla enterprise to be underwritten by the Investment Corporation of India—a Tata concern. The total expenditure of the project including cost of building and plant and machinery (Rs. 170 lakhs) and working capital (Rs. 80 lakhs), is estimated to reach Rs. 250 lakhs. The difference between the total investment required (Rs. 250 lakhs) and the total capital issued (Rs. 105 lakhs) will be met out of loans from the ICICI, Bombay, and the Commonwealth Development Finance Company of the U.K. (Rs. 80 lakhs), which will take care of the foreign exchange component of the project, and bank borrowings. It is expected that the factory will be commissioned some time in 1962, and, when the factory goes into full production, the total sales value of the Company's products would be of the order of Rs. 3 crores, which, on the basis of the experience of other cable companies, may be expected to yield a handsome return to the shareholders. The subscription list will open on July 3 and close on July 8.

Engineering

SHORTAGE OF TIN-PLATE

MR. K. C. MAHINDRA, Chairman of the Metal Box Company of India Ltd., pointed out at the annual general meeting that although the company registered a significant increase in sales to the extent of 17 per cent, it was facing a serious problem on account of a shortage of tin-plate, the most important raw material for the manufacture of containers. The company was not allowed to import tin-plate in sufficient quantities. The Ministry of Commerce and Industry has its policy to reject without reference to the Licensing Committee applications of the manufacturers of tin containers except where the fabrication is to be done by the packers themselves. The Chairman pointed out that the packers could not instal highly complicated machinery and normally a large number of packers purchased containers from producers of containers. This policy can definitely hamper the progress in the can-making industry the significance of which can never be underestimated. For reasons of simple hygiene as well as efficiency in the export market it is necessary that quality containers are available even to small producers of packet materials.

Another factor which should make the imports of tin-plate comparatively easier for the manufacturers of containers is that the steel plants in the country are not yet in a position to supply tin-plate in sufficient quantity. Rourkela is not expected to commence tin-plate production until the end of this year and by that time the demand for tin-plate would have risen further. As long as substantial expansion of production capacity is not put into effect, the import bill for tin-plate has to be tolerated. A realistic import policy should, therefore, be pursued.

Travancore Rayon

DRIVE FOR EFFICIENCY

MR. A. R. RAMANATHAN, Chairman of the Travancore Rayons Ltd., at the annual general meeting of the company highlighted the significance of establishing an export market for cellulose film. He was of the opinion that even in the face of severe competition, it was possible as well as necessary for the Indian producers to operate in the foreign market. To achieve this, he said, the Indian labour had to improve its efficiency so that costs could be competitive and at the same time remuneration for the labour was higher. The company made a time and motion study in some of its departments and found that the efficiency in certain departments was only about 30 to 35 per cent. This clearly indicates time-loss due to various factors. Similar conclusions were drawn in a special article published in "The Eastern Economist" on February 17, 1961. Labour efficiency factor has, therefore, to be paid sufficient attention, so that the productivity of Indian labour improves and the costs can be competitive.

The Chairman referred to various expansion schemes taken in hand by the company. Mr. V. V. Giri, Governor of Kerala, for instance, performed the opening ceremony of the company's third plant for the production of cellulose film. The cotton linter plant of the company is scheduled to go into production by the latter half of 1962. It will produce 3,600 tons of linter pulp and this capacity can be doubled when necessary. The Government of India has sanctioned the company's application for increasing its rayon yarn output by 5 tons per day and the company is making negotiations to implement this scheme. With this the total production capacity of the company will increase to 13.6 tons per day.

FROM THE CAPITAL'S CORRIDORS

U.S. AID FOR BOKARO STEEL PLANT

PROFESSOR JOHN KENNETH GALBRAITH, U.S. Ambassador in India, stated at a press conference here last week that his country was contemplating to extend financial assistance for setting up the Bokaro Steel Plant. There was a good deal of sympathy in the United States, he said, "both for the need and for the plant itself." Subject to the priorities of the Indian Government, to the passage of the new Aid Bill by the U.S. Congress and to negotiations with appropriate contractors, the prospects of U.S. assistance being available for this plant were "favourable", he added.

"The basic decision to have the Bokaro Steel Plant in the public sector is, of course, accepted", said Mr. Galbraith. As regards participation by other members of the Aid-India Club in this plant, he stated: "It would be somewhat premature to make a final statement on this, but the preliminary discussions that I had in Washington (Professor Galbraith was there only recently) had to do with American financing of the foreign needs of the project. Where aid to India is concerned, one does not want ever to be exclusive."

Professor Galbraith disclosed that during his visit to Washington he had had discussions with the Administration on the subject of Calcutta region development as also on the programme of the Ford Foundation in this regard. "This is a matter of very much interest to me personally and something on which we hope to do something useful."

SATISFACTION AT AID-INDIA CLUB MEETING

The U.S. Ambassador expressed considerable satisfaction with the results of the recent meeting of the Aid-India Club which has offered assistance to the tune of \$2,225 million to enable India to meet her foreign exchange needs during the first two years of the Third Plan. He indicated that a considerable part of America's contribution in the first year would go to finance maintenance imports.

Commenting further on the Aid-India Club meet. Professor Galbraith observed: "It does indicate that a substantial measure of the resources for the first year will be available and the prospect of a good start for the second year. This is, however, not something which we can look upon with unqualified approval. Some considerable part of the funds made available are for relatively short times and on relatively high rates of interest. This means that in the period immediately ahead, there will be a substantial increase in the claims upon India's foreign exchange earnings for debt service. This, it would seem to me, would mean two or three things. First, there must be a great emphasis on export earnings. Second, through the Third Plan, there will have to be continued attention given to two terms. One should not confuse aid with purely commercial credits and, if the aid to India were to limit itself to purely commercial rates of interest, the burden of debt service would soon become intolerably high. This is something which, in my view, would have to be watched in the future."

It is the U.S. view, the Ambassador went on, that in the initial period of development India requires long-term loans, the rates of interest being low or zero.

MAINTENANCE IMPORTS

Replying to a question, Professor Galbraith said \$200 million out of the \$545 million which the United States contemplated to provide during the first year of the Third Plan would be available for meeting balance of payments deficit on account of maintenance imports. "This type of aid", he said, "is just as important and as useful as that which goes in the building of concrete,

brick and mortar structures. Indeed, in certain stages of development, provision of working capital is more important than fixed structures."

Professor Galbraith further stated that the possibility of the United States entering into a long-term agreement with India for the import of sugar was "certainly not ruled out." "We have allocated a very substantial quota for the coming year," he said, "and I hope if India continues to be an exporter and if the sugar crop continues to be good, we will continue to buy some of it."

THREE AGREEMENTS

Professor Galbraith also announced the signing of three agreements between the Governments of the United States and India; two dealing with the provision of technical assistance for stepping up coal and steel output and the third one dealing with imports by India of some non-ferrous metals.

Under the agreement dealing with the provision of technical assistance for increasing coal output, the U.S. Government will make available to India the services of eight engineers. Five of them will work with the National Coal Development Corporation on its plans to develop new mines in the Ramgarh coalfield, Bihar State, to obtain an annual production of 1.5 million tons of washed coal. The project includes the construction and operation of a coal washery. The other three experts will be associated with the Neyveli Lignite Corporation, Madras State. The Corporation has plans to extract 3.5 million tons of lignite yearly by 1964 and later to step up production to 6 million tons. Assistance under this agreement will be nearly Rs. 20 lakhs — \$300,000 in dollars and the rest in rupees.

The agreement concerning provision of technical assistance for the steel industry envisages continuance of the existing training programme of Indian engineers in the United States under the auspices of the U.S. Technical Co-operation Mission. As many as 295 Indian engineers have already been trained under this programme. Another 300 engineers have been trained in America under a Ford Foundation programme. With the Government of India's decision to double the present capacity of steel plants from 3.3 million tons to 6.6 million tons, and to add another steel plant, it is now estimated that an additional 1,400 personnel will have to be trained. Hindustan Steel Limited is embarking upon a training programme within the country. The United States Technical Co-operation Mission will make available a Chief Training Adviser and three training advisers to assist in this task. The latter will be assigned to the Rourkela Steel Plant. The project involves a total rupee and dollar expenditure of \$176,000 (Rs. 8 lakhs).

The third agreement provides for a loan of \$20 million (Rs. 9.5 crores) to India for the import of non-ferrous metals. This loan will be channelled through the U.S. Development Loan Fund and will be repayable in rupees. It will enable India to make full use of the additional industrial capacity created in the recent years.

The loan will be utilised in the United States for procurement of aluminium, copper and zinc. It is expected that much of the metal will be processed into final form at plants in India. Resulting products will be used mainly on projects in the fields of power, transportation and communication.

AID FROM CONSORTIUM

Further details are now available of the assistance offered by the Aid-India Club members for the first two years of the Third Plan. The aid from the six

members of the Club and from the World Bank will be available in the following manner:

(1) **Canada:** Of the \$56 million aid promised by Canada for 1961-62 and 1962-63, \$18 million will be available in each of the two years as grants under the Colombo Plan. (This will be in addition to wheat grants which India is receiving from Canada). The remaining \$20 million will be available in two equal instalments to finance purchases of capital equipment in Canada. The period of maturity of either of these two credits will be negotiated as they are made available and will probably be in the range of 15-20 years. No decision has yet been taken in regard to the rates of interest payable on these loans or on grace periods to be allowed for their repayment.

(2) **France:** France will make available to India credits equivalent to \$30 million—\$15 million in 1961-62 and \$15 million in 1962-63—to finance the import of capital equipment from there. The period of repayment will be 10 years from time of delivery of the equipment. The rate of interest will be negotiated in the case of each in individual order.

(a) **West Germany:** The West German \$425.25 million credit (including \$61.25 million available in the third year of the Plan) will be forthcoming as follows:

- DM 230 million (\$57.50 million) for refinancing of Rourkela credits falling due in 1961-62 — repayment to be spread over 12 years, including a 4-year grace period; rate of interest 5½ per cent.
- DM 85 million (\$21.25 million) for refinancing of Rourkela credits falling due in 1962-63—terms still to be negotiated.
- DM 245 million (\$61.25 million) for refinancing of Rourkela credits falling due in the three years 1963-64 to 1965-66—terms still to be negotiated.
- DM 100 million (\$25 million) credit for disbursement in 1961-62—repayment to be spread over 20 years, including a 6-year grace period; rate of interest 5½ per cent.
- DM 170 million (\$42.5 million) credit for disbursement in 1961-62—terms still to be negotiated.
- DM 415 million (\$103.75 million) credit for disbursement in 1962-63—terms still to be negotiated.
- DM 176 million (\$44 million) for commitment in 1962-63 and disbursement in subsequent years—terms still to be negotiated.
- DM 280 million (\$70 million) credit for financing expansion of Rourkela Steel Plant in 1963-64 and following years—terms still to be negotiated.

With respect to DM 330 million (\$82.5 million) i.e., one-third of the credits for disbursement in 1961-62 and 1962-63, the German Government is ready to reduce the rate of interest to 3 per cent and to extend the grace period from 5 years to 7 years. The total period of repayment cannot, however, be extended beyond the present limit of 20 years.

(4) **Japan:** The Japanese aid of \$80 million is available for utilization in the following manner:

- \$40 million credits are to be extended to the public sector in India—repayment to be spread over 15 years, including a 5-year grace period; rate of interest to be related to the prevailing rate of interest on IBRD loans and at present assumed by the Japanese Government to be around 6 per cent.

- \$40 million credits are to be extended to the private sector in India—repayment to be spread

over 15 years, including a 5-year grace period; rate of interest as under (a).

Credits to the extent of \$50 million can be drawn upon in 1961-62 and to the tune of \$30 million in 1962-63 so long as there is actual placement of orders by India for such amounts.

(5) **United Kingdom:** The British assistance of \$250 million is available as follows:

- £30 million (\$84 million) loan signed in May, 1961—repayment to be spread over 25 years, including a 7-year grace period; rate of interest to be the rate at which the U.K. Government can borrow for comparable periods at the time the drawings are made, plus a service charge of ½ per cent.
- £10 million (\$28 million) loan signed in May, 1961—repayment to be spread over 25 years, including a 5-year grace period; rate of interest as under (a).
- £20 million (\$56 million) loan for financing extension of Durgapur Steel Plant—repayment to be spread over 25 years; rate of interest as under (a). (This loan may include private participation to the extent of £5-6 million, and the grace period will be decided when the position with regard to such participation is clear.)
- Additional loans of £13 million (\$36.4 million), of which £5 million (\$14 million) will be committed in 1961-62 and £8 million (\$22.4 million) in 1962-63, to be disbursed in the years in which the commitments are made — terms not yet negotiated, but assumed to be the same as under (a).
- Loans totalling £16.4 million (\$46 million) to be committed in 1962-63 for disbursement in subsequent years—terms not yet negotiated, but assumed to be the same as under (a).

(6) **United States:** The United States commitment is for provision of \$545 million aid in 1961-62 and \$500 million assistance in 1962-63. It is contemplated that much the larger part of these commitments would be in the form of loans extended on terms comparable with those proposed for the International Development Association. Part of the remainder would consist of loans from the Export-Import Bank, whose two most recent loans to the Government of India have been for periods of 16 years, including a 6-year grace period, with interest in one case at 5½ per cent and in the other case at 5½ per cent. U.S. loans would be related to the purchase of U.S. goods and services with provision for review in hardship cases. In addition to these commitments, the United States has already undertaken to assist India's Third Plan by making available surplus commodities worth about \$1,300 million.

(7) **I.B.R.D. and I.D.A.:** The commitments of I.B.R.D. and I.D.A. are for credits to the tune of \$250 million in 1961-62 and \$150 million in 1962-63. The terms of I.B.R.D. loans will vary according to the date at which each loan is made and the nature of the project. Maturities on loans made to India in the past three years have ranged from 10 to 25 years, including grace periods of 3 to 6 years. The present rate of interest on I.B.R.D. loans is 5½ per cent. Repayment of I.D.A. credits will be spread over 50 years, including a 10-year grace period; credits to be interest-free with an administrative charge of ½ per cent.

The representatives of Austria, Denmark, Norway, and Sweden are understood to have said at the last meeting of the consortium that their Governments were unable at this stage to enter into any definite commitments. The Austrian delegate is said to have indi-

cated, however, that his country was considering a contribution to India's Third Plan.

The commitments indicated at the meeting are tentatively estimated to result in the following disbursements:

Country	Total Commitment	To be disbursed in		
		1961-62	1962-63	1963-64- 1965-66
Canada	56	13	27	16
France	30	1	4	25
Germany	425	125	125	175
Japan	80	17	27	36
United Kingdom	250	70	70	110
United States	1,045	225	350	470
I.B.R.D. and I.D.A.	400	75	140	185
TOTAL	2,286	526	743	1,017

In addition to the Japanese promise of aid of \$80 million, Japan has indicated that it would be prepared to make available further credits to the tune of \$21 million for financing Japanese exports of capital goods to India. Disbursements of these credits are likely to be as follows: \$6 million in 1961-62, \$10 million in 1962-63 and \$5 million in the three years to 1965-66.

REQUIREMENTS

On the assumption that in the first two years of the Third Plan new overseas orders for projects would amount to above \$3,000 million, the Government of India had estimated the overall balance of payments deficit at the equivalent of \$684 million in 1961-62 and \$884 million 1962-63, after allowing for all aid committed up to January 15, 1961. The consortium meeting noted that, if disbursements of additional aid from the consortium were in line with the estimates set out above, the deficit still to be covered would be about \$150 million in 1961-62 and \$130 million in 1962-63.

The consortium members will meet again in autumn this year to review the position further.

Stress is understood to have been laid at the last meeting of the consortium on liberalisation of trade policies by its members to help India to step up her exports to these countries. At the same time, it was pointed out, that the main responsibility for the promotion of her exports was that of India herself, and there was considerable scope for the adoption of more vigorous action in this field.

Stress was also laid on the need for aid to be extended in a form which added as little as possible to India's foreign exchange repayment obligations and the members of the consortium are understood to have given assurance that they would give due consideration to this point in deciding the terms on which aid would be made available by them.

MANUFACTURE OF COAL MINING MACHINERY

The Coal Mining Machinery Plant, proposed to be set up during the current Plan period at Durgapur with technical collaboration from Prommasheexport of U.S.S.R., will have a capacity to produce per year 45,000 tons of machinery worth Rs. 24 crores. Initially this plant was envisaged to have a capacity to produce 30,000 tons of machinery per annum valued at approximately Rs. 15 crores.

Some of the major items which will be manufactured at this plant are: coal cutters (1,715 tons), loaders (1,371 tons), conveyors (22,500 tons), haulages (3,815 tons), electrical winders (1,167 tons). Production of such items as booster fans, pumps, automatic cage keeps, safety hooks and oil drilling rigs and other equipment for oil exploration and boring of wells is also envisaged. The plant is scheduled to be commissioned during the later half of the Third Plan.

Manufacture of haulages and conveyors is proposed to be stepped up in the private sector as well. There are four units at present in the private sector licensed to manufacture coal cutters, haulages, conveyors and winders. Their output by 1965-66 is expected to go up to about Rs. 1.5 crores a year. Some other units which produce conveyors not only for coal mining, but also for other purposes, too are expected to expand their production.

As regards manufacture of coal washery equipment whose requirements are expected to be of the order of Rs. 5 crores per annum by the end of the Third Plan period, it is proposed to set up at least one more unit, if not more, in addition to the one already licensed to undertake this manufacturing line. The unit which has already been licensed to produce coal washery equipment is in the private sector. It has entered into collaboration arrangements with a U.K. firm. It is expected that by 1965-66 this unit would be turning out coal washery equipment worth Rs. 1.75 crores.

For setting up a new unit, the Government has under consideration a scheme from Messrs. Bird and Co. (Private) Ltd., Calcutta, who propose to have collaboration arrangements with McNally Pisburg, U.S.A.

INDO-NIGERIAN ECONOMIC CO-OPERATION

Broad understanding has been reached between the Government of India and the Nigerian Economic Mission, which arrived here last week, on furtherance of trade between the two countries. In a joint communique issued at the end of the three-day talks which the Nigerian Mission had with the Indian Government, it was stated that there was enough scope for both the countries to increase their trade with each other. India has shown interest in buying from Nigeria non-ferrous metals, while Nigeria has expressed keenness to import manufactured goods and machinery, particularly for small-scale industries, from India.

The Nigerian Mission, the communique further states, sought the help of India in matters of training of Nigerian nationals, particularly in oil technology. The Government of India has assured the Mission that it is prepared to provide every assistance in this regard. Nigeria is expected to inform the Indian Government about its requirements in the near future and will probably invite a survey team from here for this purpose.

The Government of India has also assured the Nigerian Mission that it will consider sending of expert teams in other fields as well such as irrigation and agriculture. A team of railway experts has already gone from here to Nigeria to help her in organising her railway system.

COMPANY AFFAIRS

SHREE VALLABH GLASS WORKS

Following the rapid expansion in construction and automobile industries, the demand for sheet glass in this country has increased considerably. The Tariff Commission has estimated the total demand for sheet glass at about 110 million sq. ft. in 1960, while the internal production is placed at only about 85 million sq. feet which is clearly inadequate. Any addition to manufacturing capacity for sheet glass is accordingly to be welcomed. The promoters of Shree Vallabh Glass Works Ltd., who proposed to set up a Rs. 1½-crore plant have already acquired an area of one lakh sq. yards at Anand in Gujarat. While the machinery and equipment, as also the technical know-how, will be supplied by Messrs. Industriefen and Maschinen, GMBH, Garmisch-Partenkirchen, West Germany, the Industrial Credit and Investment Corporation of India has agreed to grant a foreign exchange loan equivalent to Rs. 37.19 lakhs to enable the Company to import the necessary plant and machinery. The proposed factory, which is expected to be commissioned by 1962, will be producing 22 million sq. feet of sheet glass 2 to 12 million, 5.2 million sq. ft. sheet glass 12 to 20 million, besides 6 lakh sq. ft. rolled and figured glass and wire cast glass, 8 lakhs of glass building blocks, three lakh pieces per year of pavement glass tiles and 4 lakh pieces of glass roofing tiles. According to the promoters, the manufacture of glass sheets in Western India will not only help meet the country's demands but also reduce the the present cost of transport from Calcutta to Western India which is as much as 20 per cent of the sale price.

SHREE GOPAL PAPER

Shree Gopal Paper Mills Ltd. during the year to December 31, 1960 recorded increased output of paper at 20,247 tons as against 19,011 tons during the previous year. The mills, it appears, registered a sound level of working efficiency which was also reflected in the sales of paper and stationery which was recorded at Rs. 4.30 crores as against Rs. 4.27 crores during the previous year. The directors have reported that the price of imported machine furnishings as well as indigenous chemicals and stores registered an increase. There was also some difficulty in respect of coal supplies but the Company did manage adequate supplies to maintain its production. The new paper machine of the Company was commissioned during the year although it could not run to its full capacity, perhaps for want of sufficient power. It is reported that production from new pulp mill was also not satisfactory. The matter was taken up with the suppliers of pulp who sent their expert engineers from Germany.

During the year under review the Company made a gross profit of Rs. 1.03 crores against Rs. 1.16 crores in the previous year. This was partly due to lower sales of hydrogenated oil — Rs. 39.11 lakhs during the year under review against Rs. 49.76 lakhs during the previous year. After making provisions for tax and depreciation, the directors have proposed to transfer Rs. 19.50 lakhs from dividend equalisation reserve and Rs. 5 lakhs from general reserve. Dividend on cumulative participating first preference shares at the rate of 7.80 per cent plus 2 per cent per annum subject to deduction of tax will absorb Rs. 73,500. Dividend for the year on second preference shares at the rate of 9.10 per cent per annum subject to deduction of tax will

absorb Rs. 6.82 lakhs. Dividend for the year on ordinary shares at the rate of 17.67 per cent per annum subject to deduction of tax will absorb Rs. 22.41 lakhs.

The Directors have reported that on the recommendation of the Tariff Commission, a substantial cut in prices came into force from January, 1960, which has meant a substantial cut in the profits of the Company. The real impact is perhaps more than is reflected and is to a great extent offset by increased production, the output of superior varieties of paper and higher efficiency and economy achieved by the Company.

TELCO'S DEBENTURE ISSUE

The Tata Engineering and Locomotive Company Limited has been granted consent to the issue of 50,000 five per cent per annum debentures of Rs. 1,000 each, repayable on six months' notice or after October 1, 1970 at the option of the Company but not later than September 30, 1975. The consent is valid for 12 months. The Tata Engineering and Locomotive Company Limited has a paid-up capital of Rs. 9,99,91,200. The Company will utilise the new issue for financing the schemes of expansion in the existing lines of manufactures.

LARSEN & TOUBRO

The Directors of Larsen and Toubro Ltd., view with satisfaction the overall results of the Company and its subsidiaries for the year to March 31, 1961. The total sale invoiced by the Company amounted to Rs. 3.51 crores as compared to Rs. 3.21 crores for the previous year. Income from commissions, compensations, and other sources amounted to Rs. 19.48 lakhs as compared to Rs. 17.18 lakhs for the previous year. During the year the Company issued further 3 lakh equity shares at par whereafter the Company's paid-up capital was at Rs. 1.25 crores. In the course of the year the Company acquired 3,12,500 shares at Rs. 10 each of M/s. Utkal Machinery Ltd., Bombay, and further 2,550 shares at Rs. 100 each of M/s. Christensen — Longyear (India) Ltd., Bombay. In December 1960 the Company obtained a loan of Rs. 20 lakhs through the Chartered Bank Bombay from the Refinance Corporation for Industry Private Ltd., Bombay, for the purpose of financing machinery for the manufacture of electrical switchgear and petrol dispensing pumps. Negotiations were also completed for the production in the Company's Powai workshops of equipment for sulphuric acid, and super phosphate plant, of drilling equipment and diamond bits, and of lubricated taper plug valves, all in collaboration with overseas manufacturers of equipment. The Directors have reported that Company's subsidiaries, Alu Capsules Ltd., India Crown Cork Company Ltd., Engineering Construction Corporation Ltd. and Viking Transport Ltd. recorded satisfactory results.

Profit during the year was recorded at Rs. 18.03 lakhs after making necessary provision for depreciation, taxes and development rebate reserve. The Directors have recommended Rs. 2.50 lakhs to be transferred to general reserve fund and Rs. 1 lakh towards dividend equalisation fund. Dividend on preference shares of Rs. 100 each has been declared at the rate of Rs. 6.50 per share subject to taxation. Dividend on equity shares of Rs. 10 each has been declared at the rate of Rs. 1.80 per share subject to deduction of tax.

Company Meetings

THE METAL BOX COMPANY OF INDIA LIMITED

REVIEW BY THE CHAIRMAN, MR. K. C. MAHINDRA

The Twenty-eighth Annual General Meeting of the Metal Box Company of India Limited will be held on Wednesday, the 19th July, 1961, at 59-C, Chowringhee Road, Calcutta.

The following is a copy of the Review by the Chairman, Mr K. C. Mahindra, which has already been circulated to members.

SALES

We have concluded another satisfactory year, with a rise in sales from Rs. 830 lakhs to Rs. 970 lakhs, 17 per cent over the last year, but of this increase some Rs. 52 lakhs or 6 per cent represents an increase in the price of raw materials, largely due to the substantial excise duties imposed last year on two of our basic materials—tinplate and aluminium. The Company's sales emphasis during the year has been on earning or saving foreign exchange. A substantial expansion in exports was achieved following vigorous promotional efforts. Calcutta No. 2, a factory devoted to foreign exchange saving products, viz, industrial components and machinery (previously imported) and plastics (made from local materials) achieved an 85 per cent increase in turnover. For the rest of the business the net increase was 8 per cent reflecting the steadily growing demand for packaged goods.

The Company has maintained its position despite increasing competition due to its continued ability to offer high quality products and service. Production resources, however, were extended in the latter half of the last calendar year, as a consequence of a temporary deterioration in the flow of tinplate supplies which was beyond our control. We are aware and sincerely sorry that our customers in certain areas were seriously inconvenienced during this period. However, towards the end of the financial year the position improved and customer goodwill has, by and large, been regained.

I feel constrained to repeat the emphasis I laid in my review last year on the question of pilferproofing. Newspapers report almost every day the widespread extent of adulterated and spurious products in the country, possibly affecting the health of the nation. The consumer package of which we offer such a large variety is perhaps the only sure means of beating the traffic in spurious goods. Typically its brand name is indelibly marked by lithography applied direct on to the metal; once factory-sealed it is tamperproof. The extension and improvement in the range of these packages is constantly engaging the engineering and research resources of your Company, but the high price, inflated by indirect taxation, of such essential packing materials as tinplate, aluminium and polyethylene favours the use of bulk packings. Since the product is dispensed loose from these, they constitute a standing invitation to adulteration and substitution.

The change-over to the metric system during the year provided some challenges to our production and marketing departments, but with the assistance of the Indian Standards Institution to the industry and the enlightened co-operation of our customers, our tasks have so far proved simpler than we anticipated.

PRODUCTION CAPACITY

It is necessary for me to reflect here on the factors governing the operation and growth of a Company like

ours, at a time when there appears to be an insufficient appreciation, by the planning authorities, of the role an efficient container-making industry can and needs to play in India's developing economy. Owing to lack of foreign exchange and insufficiency of home production of tinplate, your Company is unable to expand and diversify its production of containers using this metal as base. It is not realised that the production of apparently simple cans and closures, to the absolutely consistent quality standards essential for modern packaging systems, necessitates a complex industry employing engineering and technological skills of a high order. How complexity is rendered simple is told in the short illustrated story of a prawn can published with this review.

This impression of insufficient appreciation is reinforced by a list issued earlier this year by the Ministry of Commerce & Industry which includes, amongst the manufacturing licence applications which may 'ordinarily' be rejected without reference to the Licensing Committee, those concerning tin containers, collapsible and rigid tubes, 'excepting' where the fabrication is to be done by the packer himself. This policy decision is misconceived. It is vain to expect a packer to install the highly complicated and automated machinery required for producing Open Top food cans or lithographed General Line tin-containers and tubes to modern quality standards, for he will not have the requisite volume over which to spread the costs of expensive installation and overheads. Except in the case of plain unlithographed cans, usually large ones where freight considerations are over-riding, packers almost invariably find it to be in their own interest to buy their containers from specialists who through larger scale operation and continuous technological improvements can offer a better and more efficient product which will satisfy the requirements of the home demand as well as the highly competitive export markets.

This has undoubtedly been the experience in such countries as Britain, the United States, Japan, Canada, France, Germany, Holland, Australia and Malaya. To quote but one instance, over the last seven years Japan has developed her annual canning of processed food-stuffs from 700 million labelled cans, mostly unlacquered and undecorated, to 2000 million cans, most of which now are either internally coated with protective lacquer or decorated outside with process-resistant lithography. This spectacular advance, both technological and quantitative, could not have taken place but for the existence of a progressive, responsive, and highly organised can-making industry. I suggest that Indian packers, and food-packers in particular, need behind them a well-equipped and equally capable can-making industry, as an essential pre-condition to their playing their proper part in conserving food which at present goes to waste. Your Company aims at providing this service of supply backed by its Research Laboratories and can-closing machinery building operation in Calcutta. It is rational that packers of food—or, for that matter, of pharma-

ceuticals and other packs—should devote their energies and talents to developing the quality and volume of their production, rather than diverting them to the specialised business of can- or tube-making.

Nor should the package-makers' role in developing the country's export markets be underestimated. It is a simple fact that Indian manufacturers will only succeed in selling their products abroad if they are packaged to international standards. In this context it is necessary to stress the important point that high quality in the can-making industry is achieved by complex mechanised methods, justified only by a large volume. High quality in these markets is essential for competition there is fierce and we are up against foreign manufacturers who have all the advantages stemming from a massive volume of domestic production. For these reasons it is not possible to produce a utility standard for the domestic market and a higher standard for export. The quality standards in an exporting nation must be such that its products in the domestic market are increasingly worthy of exporting. Only if they are well packaged can consumer goods exports grow as they should; approximately Rs. 4 crores per annum of such exports are made possible today by your Company's packages and there is room for massive growth if we analyse the factors favouring exports correctly and act accordingly.

I, therefore, hope that the authorities, in the interest of superior and more economical supplies in the home market and the more vigorous development of exports, will take a realistic view in their licensing policy for India's container-manufacturing industry.

RAW MATERIALS

The overall availability of tinplate throughout most of the year was maintained at a satisfactory level. The crisis that developed at mid-year in Bombay was due to the delayed shipment of plate procured from overseas under DLF arrangements. Although every effort was made to achieve maximum production from the resources available, the operational efficiency of our Bombay factory was thereby adversely affected for several months.

Although the year opens with a satisfactory stock level, the outlook for the current year cannot be without anxiety. If Tatas proceed with the planned closure for overhaul of their billet mill, The Tinplate Company of India will be required to obtain their tinbar from unfamiliar sources. It is not difficult to visualise the manufacturing problems that could ensue. Rourkela is not expected to commence tinplate production until the end of the year and the continuing gap between indigenous supply and current demand can only be met by imports. This is not a situation which allows complacency in the face of the critical foreign exchange position.

Looking beyond the current year, Rourkela will provide only short-term relief, as the demand for tinplate is rising at a rapid rate. The National Council of Applied Economic Research have estimated that by the end of the Third Plan tinplate demand will have reached 250,000 tons and we have no reason to disagree with this estimate. It is believed that to meet this the Government of India contemplate licensing production capacity of 320,000 tons. Until a really substantial expansion of production capacity is put into effect, the import bill for tinplate will be heavy, notwithstanding the considerable efforts being made to utilise alternative packaging materials. Meanwhile, if the means of providing adequate imports are not found, the effect on the many industries dependent on tinplate containers for their packaging will be far-reaching with corresponding repercussion on the economy as a whole.

The Company's consumption of aluminium, although to an extent limited by availability, again

increased. Arrangements have since been made to procure a somewhat larger tonnage during the present year. Compared with the prices ruling elsewhere, the cost of Indian aluminium is very high. As the additional sources of supply now planned come into production this is a factor which will require the industry's consideration if the use of aluminium as a packaging material is to be properly developed.

Supplies of deep drawn mild steel were obtained during the second half of the year in sufficient quantity to allow increased production of industrial components. The outlook for the current year is at present uncertain but every possible effort is being made to ensure availability either from DLF, rupee payment or barter sources. It is to be hoped that the Company's representations on this score will not be ignored as the range of components now produced for the automotive, electrical and other industries represent in most cases direct saving of foreign exchange.

Co-operation between the Company's Research Laboratories and the suppliers of ancillary materials continued fruitfully during the year. As a result the Company's usage of wholly indigenous materials has broadened satisfactorily as quality has been brought up to the required standards.

DEVELOPMENT

The Company's Technical Development Section contributed significantly during the year to the improvement of manufacturing methods and the design and introduction of new products.

Calcutta No. 2 at which the Company's development projects are concentrated had a satisfactory year of consolidation. In the Plastics Works the range of products has been extended.

The expansion of machinery building facilities was continued. The range of plant for customers' use was increased and a start has been made on the building of replacement equipment for internal use. Foreign exchange savings are directly proportionate to the output of this section.

A small expansion of the Bombay factory building was completed and occupied while construction of an additional floor to the Bombay administrative block was started. These additions will facilitate improved plant layout and develop to the full the existing Worli site.

The transfer of plant to Faridabad was largely completed during the year; only a small reforming operation now remains at Azadpur. The availability of power did not improve as anticipated and in order to work a day shift generating equipment had to be installed.

BOARD CHANGES

In April 1961 Mr. R. W. Westbrook retired to return to an appointment in the United Kingdom. A member of the Board for fifteen years and Managing Director for the last three, he had served your Company with great loyalty, enthusiasm and skill for over twenty-five years. It was with regret that we said farewell to him.

The Board have appointed Mr. H. K. S. Lindsay as Managing Director and Mr. J. N. de N. Cochrane-Barnett as Deputy Managing Director. Both have wide knowledge and experience of the Company's affairs. Mr. Lindsay has been a Director since 1951 and Mr. Cochrane-Barnett since 1957.

EMPLOYEE RELATIONS

Good relations between management and employees have continued: it is gratifying that the latter and their representatives have as much faith in bipartite negotiations as the former. In pursuance of the Company's policy of keeping well abreast of area practices, agreements were concluded on the reclassification of occu-

pations, wages and salary, dearness allowance, and other conditions of service. Regrettably the daily rated employees in Madras constitute a solitary exception to this pleasant picture: for the third consecutive year no bipartite negotiations have been possible notwithstanding the settlement of a five year agreement covering the revision of salaries and grades with the Madras monthly rated employees.

Training remains an important feature of personnel policy. During the year the Company strengthened its own training arrangements and took every available opportunity for its staff to participate in suitable outside seminars, productivity teams and courses calculated to improve job knowledge, performance and potential for promotion. The scope of this activity has covered literally every category of personnel from the Daily Rated Worker to the Managing Director. The latter, for example, attended the ILO/NPC Conference of Industrial Leaders convened for "heads of organisations of national importance" in the public and private sectors. Other participants in outside courses were two members of top management in the NPC's Three Day Seminar

on Top Management; one manager at The Administrative Staff College in Hyderabad; three in advanced management courses; sixteen in courses for middle and junior management and salesmen. Nineteen of our Indian managers and technologists went abroad; three to programmes sponsored by the NPC and sixteen under training, one holding a short-term appointment, with our U.K. associates. Arrangements have been concluded under which the Company's training staff were able to commence regular residential courses of two to three weeks' duration for managers, management trainees, salesmen and foremen. So far thirty-four have undergone residential courses, twenty-eight men other training courses. The Company has continued to support the Workers' Education Scheme: Calcutta No. 1 has been the most active, their Unit Level Centre has now trained its third batch of workers.

It is gratifying for me to record the valuable co-operation of the Company's employees in our growing activities and I thank them and management for a year of hard and constructive work.

THE NEW GREAT INSURANCE CO. OF INDIA LIMITED

SPEECH OF MR. AMBALAL KILACHAND

Mr. Ambalal Kilachand presided over the Eighteenth Annual General Meeting of the Shareholders of the Company held at Baroda on the 23rd June, 1961, in the unavoidable absence of the Chairman, Mr. Tulsidas Kilachand. In his speech, Mr. Ambalal referred to some of the problems facing the Insurance Industry.

REMOVAL OF RESTRICTIVE REGULATIONS

He appealed to the Executive Committee to recommend to the Government to review the Insurance Act as a whole, remove all the provisions such as restriction on commission etc. and to enact new Insurance legislation in a simplified form based more or less on the laws prevailing in a highly developed country like the United Kingdom as, in his views, it was the existing restrictive regulation which hampered the smooth working of the Insurance Industry.

QUANTUM OF EXPENSES LIMIT

Mr. Ambalal also appealed to the authorities to re-examine the provisions of Section 40C of the Insurance Act and Rule 17E of the Insurance Rules pertaining to the quantum of expenses which were fixed over ten years ago at a time when the cost of living and the prices of commodities were very much lower, and to effect the necessary changes in the formula by making it more flexible, so that the Industry could conduct the business smoothly under the present-day conditions.

COMPULSORY CESSIONS TO APPROVED REINSURERS

Mr. Ambalal then referred to the passing of the Insurance (Amendment) Act whereby Government have made it compulsory for all Insurers in India to reinsure a certain percentage of their business with the Indian Guarantee & General Insurance Co., Ltd., in addition to the reinsurance already being placed with the India Reinsurance Corporation which had been formed a few years ago at the instance of the Government by Companies working in India who subscribed to the Corporation's capital and also undertook to reinsure with it a certain agreed percentage of business. He mentioned that Companies were spreading out their liability in as wide a geographical area as possible and were getting reciprocity to the fullest extent, particularly in the Fire Department, which had enabled them to build up a profitable reciprocal portfolio. On the other hand,

they would be receiving only 50 per cent reciprocity from the India Re. and the Indian Guarantee. As the main object for which the Amendment Act was passed was to conserve and earn foreign exchange, and with a view to making good to the companies the reduction in reciprocity, Mr. Ambalal felt that the India Re. and the Indian Guarantee should concentrate on bringing to the Indian Market an increasing volume of profitable business from abroad.

COMPANY'S BUILDING

Mr. Ambalal took the opportunity to mention that there had been certain unavoidable delay and difficulties in starting the construction of the Company's Building but once we surmounted these initial handicaps, the building would be completed as quickly as possible.

COMPANY'S ACCOUNTS

Dealing last with the departmental accounts, Mr. Ambalal stated that the gross direct premium for the year 1960 was Rs. 48,14,879 in Fire, Rs. 37,24,835 in Miscellaneous Insurance, and Rs. 38,20,963 in Marine, whilst the net premiums were Rs. 42,24,023, and Rs. 31,99,405 and Rs. 19,50,504, respectively. After providing for losses and expenses and reserves at 50 per cent in respect of Fire and Miscellaneous Insurance and 100 per cent for Marine, and after adding the balance brought forward from the previous year, the net amount to the credit of the Profit and Loss Appropriation Account in all was Rs. 3,20,736. The Directors had transferred Rs. 40,000 to the Staff Gratuity Account and had proposed to pay Twelfth Dividend on Ordinary Shares at Rs. 2-50 per share less deduction of tax, amounting to Rs. 2,50,000.

N.B.: This does not purport to be a record of the proceedings of the Annual General Meeting of the Company.

THE TRAVANCORE CEMENTS LIMITED

NATTAKAM, KOTTAYAM

Speech Delivered by the Chairman

SRI C. S. LOGANATHAN

At the Fourteenth Annual General Meeting

Held on 23-6-1961

Gentlemen,

I have great pleasure in welcoming you all to the fourteenth Annual General Meeting of our Company.

The audited Balance Sheet as at 31st December, 1960 and the Profit & Loss Account for the year ended that date and your Directors' Report have been in your hands for some time and with your permission I shall take them as read.

Our net profit for the year 1960 is Rs. 5,21,843. Even though the operation of the factory during 1960 had been as efficient as possible, the cost of production had been high due to various factors which were beyond our control. The major increase in the cost is that of fuel, while other items like spare parts, hardware materials, lubricants, packing materials etc. have also become costlier inflating the cost.

As we are not getting our entire requirements of coal by rail, which is the cheapest mode of transport, we have been forced either to get part of our requirements of coal by steamer, which is very expensive, or use Furnace Oil, a very costly fuel. During 1960, due to the serious problem posed by the unsatisfactory coal supply position, we were forced to operate the factory more than half the time with Furnace Oil. If we had been enabled to obtain our entire requirements of coal by rail route and thus avoiding the use of Fuel Oil and Seaborne coal, our profit would have been more by about Rs. two lakhs. The Government of India is seized of the coal transport situation and there is a proposal of Government arranging supply of coal by steamer under a subsidised freight scheme, but it has not been put into practice so far.

The price of cement payable to each producer is fixed by the Government of India based on the cost of production and the price for our cement was last fixed in June 1958 and is in force till 30-6-1961. We have submitted to the Tariff Commission all facts and figures relating to our cost of production to revise the price payable to us from July 1961. The Tariff Commission will be holding meetings with the Cement Producers shortly to finalise their enquiry and submit their recommendation to Government for the revision of cement price.

While the cost of naked cement is usually revised once in three years, the cost of packing payable to the producers was revised once in three months — based on the actual cost of gunnies without altering the F.O.R. destination price of packed cement. When the price of gunnies shot up by about 60 per cent from the fourth

quarter of 1960, the Government felt that it was impossible to accommodate the increase within the then existing F.O.R. destination price and it was not possible for the industry also to run without an enhanced packing allowance. Under the circumstances the Government permitted the producers to use second-hand bags up to 30-6-1961 for packing cement with effect from 1-1-1961 which was not permitted till then. We are now allowed Rs. 18 per tonne of cement as packing cost as against Rs. 13 fixed for the fourth quarter of 1960. We are trying our utmost to collect as many second-hand bags as possible to avoid any loss under this item and it is hoped that the Government will permit the producers the use of second-hand bags even after 30-6-1961, the time limit fixed at present.

I am also very happy to report that our White Cement sale is gradually increasing and the users of our "Vembanad" brand cement are very much satisfied about the quality of our cement.

It was felt an Association of the Cement Manufacturers is necessary to promote and protect the Industry, to solve the various problems facing the Industry and to have a common policy of all the Cement Manufacturers in the interest of the producers, Government and the public, I am now glad to inform you that an Association of the Cement Manufacturers has been formed and your Company is also a member of this Association.

By the implementation of the recommendations of the Central Wage Board, the salaries and grades of the Operatives and Staff have been fixed on an All India basis and although we as an uneconomical unit do not produce so much quantity of cement as other cement companies produce, yet we are paying the same salaries and wages paid by others as recommended by the Central Wage Board and the employees of our Company are in par with the employees of other Cement Companies in India in the matter of their salaries. I am very glad to inform you that the Labour-Management relations have been cordial during the year 1960.

Gentlemen, I thank you all for coming here to attend this meeting.

I now request that the Directors' Report and the audited Accounts for the year 1960 may be taken up for consideration and adoption.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

BURMAH-SHELL REFINERIES LIMITED

Statement by Mr. L. D. Mudie, Chairman, at the Eighth Annual General Meeting held on 26th June, 1961.

Gentlemen:

1. The Directors' Report and Statement of Accounts for the year are before you. The crude oil intake of the Refinery was 366,035 metric tons more in 1960 than in 1959, with income from refining increasing from Rs. 10.91 crores in 1959 to Rs. 12.33 crores in 1960. As from 1st January, 1960, your Company ceased to benefit from the relief provided under Section 15(c) of the Income Tax Act and in consequence, has had to set aside Rs. 2.61 crores for taxation on 1960 profits as compared with Rs. 1.90 crores charged in the 1959 accounts.

2. An interim dividend of 15 nP. per rupee was declared and paid in November 1960 on the paid-up ordinary share capital absorbing Rs. 207.3 lakhs and the Board now recommend a final dividend of 5nP. per rupee which will absorb a further Rs. 69.10 lakhs; Income Tax at 20 per cent will be payable on these dividends.

3. I do not think further comments are required in respect of the details of our 1960 Statement of Accounts which are set out fully in the documents already circulated to you. I would now like to take this opportunity to give a few figures regarding the growth of Oil demand during the last five years under the dynamism of the Second Plan period and also project this picture into the Third Plan to see what contribution your Company has to make in this context.

4. In the process of the many-sided development through which the Indian economy has been passing, Oil has effectively played its part. Total inland oil consumption will have risen to about 7.8 million metric tons in 1961 from 4.9 million in 1956, a 59 per cent increase during this period. The percentage rise in consumption has varied from product to product; thus, demand for High Speed Diesel Oil will have risen by 162 per cent, while the demand for Furnace Oil will have gone up by 57 per cent, that for Light Diesel Oil by 48 per cent, Lubricants by 47 per cent and Kerosine by 36 per cent.

5. There appears to be much support for the view that we should provide for an annual compound growth rate of about 12 per cent during the Third Plan period, as compared to the rate of 10 per cent experienced in the Second Plan. These projections will naturally require revision at regular intervals, but it is generally recognised that energy is an essential overhead of economic growth and the growing importance of oil in the Indian pattern of energy consumption has been well demonstrated during the last decade.

6. At the meeting of the Oil Advisory Committee held in May this year, a figure of 13.55 million metric tons was agreed as the likely inland demand in 1966. Including the provision for international bunkers, total demand for refined petroleum products will be about 14.14 million metric tons representing a crude oil equivalent of about 15.27 million metric tons. The Oil Advisory Committee will review their forecasts at regular intervals and experience may well show an upward revision is necessary. Your Company attaches much weight to these figures, for with such targets before us, the exchange of ideas and plans between the public and private sectors is greatly facilitated, thus

leading, it is hoped, to an understanding that a full contribution from both sectors is essential, if the task ahead is to be completed in time.

7. While opinions may differ in regard to priorities, one incontrovertible fact emerges, namely that to meet a demand of the order of 15 million metric tons of crude equivalent by the end of the Third Plan, investment on a large scale in all phases of the business is required not only now but as a recurring need into the long-term future. The Oil Industry is highly capital intensive and experience has proved that to find, produce, refine and distribute to the consumer 1 million tons of Oil calls for a capital investment of approximately Rs. 60 crores. It is apparent, therefore, that an increase in consumption by about 7 million tons over the Third Plan period calls for a capital investment of some Rs. 400 crores if this increase alone is to be assured.

8. Investment is only one aspect of the problem. Equally important is the time factor; here, there are no short-cuts. There is no way of finding oil without drilling; the risk of failure is great and even successful ventures take many years and consume much money before the fruits of success in the form of commercial production of crude oil are ready to reach the consuming market.

9. From the moment of inspiration, to engineer, construct, staff, and bring on full stream a new refinery, is the work of years.

10. The distribution of oil presents its own special problems in a country the size of India; here is a railway system doing a magnificent job but nevertheless unable always to cater for the full traffic. The road system is still in the development stage. An oil distribution net work must therefore provide innumerable upcountry storage points to ensure the smooth flow of supplies throughout the country.

11. I am convinced that for prompt, effective action to meet these challenges there is need for a massive effort, attacking the problem from as broad a front as possible, and enlisting help from all who are willing to contribute, on terms which are reasonable and still in keeping with the avowed objectives of Indian economic development.

12. In his speech at this meeting last year the Chairman said that provided we were permitted to go ahead with our expansion proposal there might be room for further modification in the terms of the 1951 Refinery Agreement in addition to the Duty Protection which we had agreed to forego.

13. Arising from the above statement the Ministry of Steel, Mines & Fuel informed the Company that the question of revising the Refinery Agreement and a proposal to expand the capacity of the Refinery would have to be treated quite separately and that it would not be desirable to link them together. This letter was dated 14th September, 1960.

14. In February this year the Company received an official reply to its original proposal for the expansion but in this instance Government stated that they were unable to consider any proposal for the expansion

of the refinery in terms of the 1951 Agreement. The letter went on to state that, as the total refinery capacity likely to be available by the end of the Third Five-Year Plan period would be about 10.75 million metric tons and product demands at that date had been variously indicated as 10 to 14 million metric tons per annum, Government had decided, subject to reconsideration in the light of a more accurate forecast of product demand by the Oil Advisory Committee, that further increase in refining capacity in the Private Sector was not considered necessary. As mentioned earlier, the Oil Advisory Committee has now estimated product demand in 1966, including international bunkers, at about 14.14 million metric tons.

15. Revised cost estimates, which have more recently been communicated to Government, show that the additional million tons of refining capacity will cost only Rs. 2.83 crores, a fraction of the cost of constructing a new refinery of comparable capacity, and that the project to manufacture Lubricating Oil, now stepped up from 60,000 to 100,000 metric tons capacity per annum, will cost Rs. 6.47 crores. The total cost of the two projects has therefore been reduced by Rs. 2.28 crores and I would remind you that there will be no request to Government for foreign exchange, which will be provided from our own resources.

16. Despite the cool reception which these proposals have received so far I feel they are so sound and their acceptance is so much in the country's interest that we should be optimistic about the final outcome.

17. It will perhaps be useful again to refer to the sustained increase in Middle Distillate production and reduction in yield of Motor Spirit achieved by your Company between its commencement of operations and the year under review.

	1955	1960
Motor Spirit (% production on crude intake on weight basis)	22	14.9
Middle Distillates (% production on crude intake on weight basis)	33.5	45.1

18. Continued improvements in manufacturing techniques increased Crude throughput, as already stated, by 366,035 metric tons to a total of 2,843,010 metric tons in 1960, producing an additional 295,000 tons of essential Middle Distillates and only a marginal extra quantity of Motor Spirit. This represents a substantial contribution towards minimising the import of deficit products. Today your Refinery is operating at a rate equivalent to an annual Crude intake of 3 million metric tons and this further achievement is in logical conformity with the concept of utilising the country's capital assets to the maximum—a cardinal principle in a capital hungry world.

19. While there will be a critical period of product imbalance with a considerable surplus of Motor Spirit following the commissioning of the Gauhati and Barauni Refineries, there are encouraging indications in the longer term. One favourable factor is the development of chemical and fertiliser industries based on a light petroleum feedstock and in this connection a contract has been concluded by our Marketing Associates with F.A.C.T. for the supply of naphtha to their Fertiliser Plant at Alwaye. Also of interest is a contract recently signed by our Marketing Associates with the Fertiliser Corporation of India for the supply of 50,000 metric tons of refinery gas annually to their Trombay Plant.

20. Before I close, I would like to refer to four further points of interest.

21. During last year, negotiations were undertaken with Government for permission to manufacture Jute Batching Oil and I am happy to report that the necessary licence has now been received and the Refinery has already commenced production of a high quality which conforms to the very special requirements of the Jute Industry.

22. Our Marketing Associates are in negotiation with the Oil and Natural Gas Commission for processing at our Refinery indigenous crude from the Ankleshwar oilfields. Many important details have yet to be settled, but the Railway Authorities have in hand the laying of sidings at the refinery site to handle this crude oil traffic in tankwagons.

23. Your Company offered to train 18 operators for the Gauhati Refinery and also to accept two of their senior staff for study visits. These offers have been accepted and training will commence shortly.

24. Your Managing Director, Mr. G. B. S'anger, was honoured to accept the invitation extended to him last year by the Council of Scientific and Industrial Research to serve as a member of the Governing Council of the Indian Institute of Petroleum. I have no doubt that he will bring to bear on the deliberations of the Council his wide experience in the Oil Industry acquired over many years in different countries.

25. It remains for me to thank the Managing Director and those who worked for him for the considerable achievements of the year under review. The encouraging financial and technical results referred to earlier are the result of their hard work and ingenuity and in the full expectation that these qualities will be with us in the years to come, we look to the future with confidence.

CHANGE IN BOMBAY REPRESENTATIVE'S ADDRESS

Please note that our BOMBAY OFFICE has moved to:

**United Commercial Bank Bldg.,

THE TRAVANCORE RAYONS LIMITED

Speech delivered by Sri Ar. Ramanathan, Chairman of the Travancore Rayons Limited, at the Fifteenth Annual General Meeting of the Company held at Rayonpuram on June 28, 1961.

Dear Shareholders :

I am happy to extend to you all a warm welcome on the occasion of this Fifteenth Annual General Meeting of your Company. With your kind permission, I propose to take as read the Annual Report and Accounts for the year ended December 31, 1960.

TEMPO OF PROGRESS MAINTAINED

The results of the year 1960 show that the tempo of progress has been well maintained. The working for the year has resulted in a profit of Rs. 61.62 lakhs, after providing a sum of Rs. 36.47 lakhs for depreciation, Rs. 15.70 lakhs for Dev. Rebate Reserve, and Rs. 1.50 lakhs for gratuity reserve, and after paying Rs. 23.95 lakhs as excise duty.

DISTRIBUTION OF REVENUE

With the balance of Rs. 2.29 lakhs brought forward from the previous year, the total profit amounted to Rs. 63.90 lakhs and your Directors recommend the following appropriations:

	(Lakhs)
(1) Provision for taxation	Rs. 27.30
(2) Additional dividend for 1959 on the Preference shares, @ 1.5%	0.75
(3) Dividend on Preference shares for 1960 @ 6.5%	3.25
(4) Dividend on Equity shares at 20%	20.00
(5) Transfer to General Reserve	10.00

The balance of Rs. 2.61 lakhs will be carried forward.

The dividends, both preference and equity, when declared, will be paid subject to the statutory deduction of 30 per cent at source as per Sec. 18(3D) of the Income Tax Act.

Having regard to the expansion of the Company which has already taken place, it is only legitimate that you should expect higher returns on your capital. But, you will appreciate that the heavy Development Rebate Reserve we had to set apart during the period under review, the need for more funds for expansion and rehabilitation, the steep rise in the excise duty on rayon and imposition of excise duty on cellulose film, have underlined the need for great caution and conservatism. Hence, your directors have been obliged to maintain the equity dividend at the last year's level.

The Central Government have, in their last budget, increased the excise duty on rayon steeply, by 66-2/3 per cent and also imposed an equally high excise duty of 20 per cent ad valorem on our cellulose film. Further, by a recent notification, the spinning units have been asked to bear 60 per cent of the increase in the duty on rayon, and pass on only 40 per cent to the consumers. This, coupled with the fact that the cost of manufacture of rayon yarn is already going up on account of increase in the cost of raw and auxiliary materials bearing excise duty, is harsh and I share the view that this rather exceptional treatment to rayon yarn producers alone is not fair. The profits earned by a few units because of certain initial advantages should not lead the Government to a wrong impression; and it has also to be remembered that rehabilitation of machinery at the current increased prices will involve

the rayon yarn manufacturers in considerable capital expenditure. I would appeal to the Government to reconsider their decision taking all facts into consideration.

FINANCIAL POSITION

As all of you may be aware, the Preference shares (Regulation of Dividends) Act, 1960 has been put on the Statute Book and, according to it, the preference dividend has been increased to 6.5 per cent subject to the statutory deduction of 30 per cent tax. The benefit of this increased rate has already been given in respect of the 1959 dividend also. The financial liability to the Company on this account has gone up by Rs. 75,000 per annum.

You will notice that your directors have transferred a sum of Rs. 10,00,000 to General Reserve, bringing this Reserve up, to Rs. 70,00,000. Together with the sum of Rs. 26,55,000 under Development Rebate Reserve and the Gratuity Reserve of Rs. 4,00,000, the total reserves stand at Rs. 1,00,55,000 which is about 67 per cent of the paid up capital of the Company. The Debenture and loan liabilities to the Kerala Government have been completely wiped out as on date. You will appreciate this is a good achievement, especially as the amount originally borrowed was as much as Rs. 96,00,000. Besides, we have made fixed capital additions to the tune of about Rs. 95 lakhs during the last year.

PRODUCTION

The production of your factory, as a whole, has been satisfactory and the upward trend has been maintained during the year under review also. In October 1960, a third plant for production of cellulose film was opened by His Excellency the Governor of Kerala, Sri V. V. Giri. This machine is a modern, high speed machine. With the installation of this third machine, the total production capacity for film has risen to 10 tons per day. I might say with confidence that the Travancore Rayons can, not only meet the entire demands of the country for cellulose film, but also export some quantity. The sulphuric acid plant, which was commissioned over a year ago, has helped the Company to become self-sufficient in its needs of sulphuric acid, leaving also a surplus for sale outside.

THIRD FIVE - YEAR PLAN AND EXPORT PROMOTION

We have now just entered the Third Five-Year Plan, which has as its target a total investment of Rs. 10,200 crores, of which Rs. 6,200 crores will be in the public sector and Rs. 4,000 crores in the private sector. The principal aim of the Third Five-Year Plan is to secure a marked advance towards self-sustaining growth. Increasing efforts will have to be made to develop the basic and heavy industries and machine-building capacity. This leads to the need for large foreign exchange during period of such development. It is heartening to find that the progress which the country has made so far and the way the monies have been usefully spent, have infused great confidence in the outside world and many friendly countries are coming forward to help India with foreign aid. At the same time, it is obviously quite necessary that the means of increasing exports have to be developed to the greatest extent possible. You will be pleased to know that your Company is also making a modest beginning in this direction.

The establishment of an export market for our cellulose film is being seriously pursued, although this may mean that, for the time being, some loss may have to be suffered in facing the severe competition by long-standing and established industrial countries with vast resources and advancement. But, for ultimate success in this endeavour, Indian industries will have to keep abreast of the latest technological progress and, what is more, the efficiency of the Indian labour will have to improve quite a lot. I am one of those who believe in giving to labour an increasing share of the Industry's fortunes, but production has, obviously, to precede distribution. Production of quality goods at cheap cost is the need. It is an acknowledged fact that at the moment the productivity of the Indian labour is very low, compared to other advanced countries.

EXPANSION PLANS

The expansion plans of your Company are progressing well. I have already referred, earlier, to the inauguration of a third cellulose film plant. The cotton linter plant, about which I mentioned at the last General Meeting, is scheduled to go into production by the latter part of 1962. To start with, we will produce 3600 tons of linter pulp per year. Provision is being made to enable increase of the output to 7200 tons per year. This project will stand us in good stead by reducing our dependence on imports, by saving foreign exchange for the country and by giving superior quality pulp and, hence, better quality yarn and film.

Our application to the Government of India for licence for increasing our rayon yarn by 5 tons per day has been sanctioned and negotiations are in progress for implementing the scheme. The increase in capacity is expected to take effect only from the end of 1962 or early in 1963 as all the necessary formalities, import and erection will take time. With this increase,

our total capacity for rayon yarn will rise to 13.6 tons per day.

INCREASE OF CAPITAL

To meet the rupee funds which may be needed to meet all these expansion schemes, your directors are considering the issue of further capital but they have not so far come to a definite decision. I have thought it better to mention this at this Meeting as there is considerable speculation in the market regarding this.

LABOUR RELATIONS

Your Company has done its best to foster cordial relations with labour, but I regret to inform you that despite the 1958 long-term agreement (which will expire on December 31, 1961), more demands have already been made on the company and in certain cases the management had to yield, thereby imposing additional burden on the Company. Recently, a Time and Motion Study was made in a few departments, and it is found that in certain departments the efficiency is only about 30 to 35 per cent, and in some 40 to 45 per cent.

With this state of affairs, and especially now, when the company is called upon to meet heavy tax liabilities, it is to be seen how efficient the factory's working results will be in the future. The wastage of valuable materials and indifference to work is more evident not only in the lower cadre of employees but also at the middle management level. I hope that all concerned will appreciate the position; and if better production and quality are not maintained, they will only be killing the goose that lays the golden egg. I now propose that the Directors' Report, balance-sheet and Profit and Loss Account for 1960 be approved and adopted.

NOTE: This does not purport to be the report of the proceedings of the General Meeting.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS.

No subscriptions are invited on the basis of this announcement. Intending subscribers should obtain from the Registered Office or any of the Bankers or brokers referred to hereunder, copies of the Prospectus, and the Forms of Application.

Consent of the Central Government has been obtained to this issue by an Order of which a complete copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed with regard to them.

A Licence was obtained from the Central Government for the establishment of this new industrial undertaking at Bombay, a copy of which is also open to public inspection at the Head Office of the Company. Subsequently, a fresh Licence has been obtained from the Central Government for the change of location to Satna, a copy of which is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this Licence the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements or opinions expressed in regard to it.

A copy of the Prospectus, along with documents attached thereto, has been delivered to the Registrar of Companies, W. Bengal, as required, by Section 60 of the Companies Act 1956.

The shares of the Company are already quoted on the Delhi Stock Exchange. Applications have been made to the Calcutta and Bombay Stock Exchanges for permission to deal in and for official quotations of the shares of the Company.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON MONDAY THE 3RD JULY, 1961, AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON SATURDAY, THE 8TH JULY, 1961 OR EARLIER AT THE DISCRETION OF THE DIRECTORS, IF THE ISSUE IS FULLY SUBSCRIBED, BUT NOT BEFORE THE CLOSE OF THE BANKING HOURS ON WEDNESDAY THE 5TH JULY, 1961.

UNIVERSAL CABLES LTD.

after allotment.

Rs. 10/- PER SHARE.

BORROWING POWERS

The Directors may borrow and secure the payment of money for the purposes of the Company within the limitation imposed by Section 293 of the Companies Act 1956 in such manner and upon such terms and conditions in all respects as they think fit.

OBJECTS AND PROFITABILITY OF THE COMPANY

The particular immediate object is to manufacture Paper Insulated Lead Covered Power Cables with an annual capacity of 624 miles.

India's dynamic growth under the First and Second Five-Year Plans and the progressively increasing tempo under the Third Plan is associated with the rapid expansion of electricity in the country in which cables play a vital role. If power is not available in ample sufficiency to meet demand, a very serious restriction on the proper growth of all industries will occur and its effect will be even more seriously felt in the processing industries which offer the greatest scope for increasing employment. Equally, if agricultural improvement and rural development take place as they should, there will be a vast and important demand for increasing quantities of power for villages and agricultural development. Therefore, a concern such as this, should do well in a country which has huge electrical programme in hand. The phenomenal progress of electricity has led to a corresponding demand for cables.

Power development has been given top priority in the Third Five-Year Plan. It is proposed to increase the total generating capacity of power from 5.8 million KW at the end of the Second Plan to 13.4 million KW at the end of the Third Plan. It is expected that 25,000 additional towns and villages will be electrified during the Third Plan period bringing the total to 44,000.

POTENTIAL DEMAND

Distribution of this power load to consumers — industrial and domestic — would involve heavy requirements of Paper Insulated Cables. The production target of these cables at the end of the Third Five-Year Plan has been laid down at 4,000 miles per annum. Indigenous production in 1960 was only 570 miles and there is, therefore, a considerable gap between supply and demand. Hitherto, a major requirement of these cables was being met by imports from foreign countries, which have had to be severely curtailed owing to the shortage of foreign exchange. Therefore, there should be no difficulty in selling the company's total output.

The industrial advancement of a country is measured in terms of per capita consumption of electric energy and from this point of view, our present consumption of electricity is awfully low. Both in the 'take off' stage as also in subsequent plan periods, rapid industrialisation would mean a substantial increase in the production of PILC Cables to bring the energy to the consumers and, as such, prospects for future expansion of this industry are excellent.

The Company has also been investigating the prospects of production of other electrical items used for the dissemination of electric energy and on the basis of such investigations application for the required Industrial Licence under the I.D.R. Act has already been made.

Production in the normal course is expected to commence by December 1962. The Directors hope that barring unforeseen factors, they will be in a position to pay a reasonable dividend on the equity capital.

TECHNICAL COLLABORATION

British Insulated Callender's Cables Ltd. of U.K. are the foreign technical collaborators in this project.

They are specialists in this line and as is well-known, are the largest manufacturers of cables in the world. The U.K. collaborators will assist in setting up the Factory and shall provide technical assistance, know-how, use of patents and processes to ensure that the Company's products are of the highest quality. British Insulated Callender's Cables will send technicians from U.K. to the Company's Works to train Indian personnel and also to assist in the production. B.I.C.C. will keep the Company in the fore-front technically and would permit employees of the Company to be trained in their U.K. factories and laboratories.

The Central Government's approval has been obtained for their appointment.

TERMS OF APPOINTMENT OF PROPOSED MANAGING AGENTS

Subject to the approval of the Central Government and of the Company in General Meeting, it is proposed to appoint Messrs. Birla Gwalior Private Limited as the Managing Agents of the Company for a period of 10 years with effect from 1st April, 1961 on the following terms as to remuneration:

A Commission at the sliding scale ranging from 10 per cent of the net profits of the Company on the first Rs. 10 lakhs down to 4 per cent or any sum over one crore of rupees in any Financial Year or part thereof computed in the manner provided under Sections 349 and 350 of the Act.

In the case of absence of inadequacy of the profits in any financial year, a minimum remuneration of Rs. 50,000/- to be paid in eleven monthly instalments of Rs. 4,000/- and the balance sum of Rs. 6,000/- to be paid at the end of the last month of each financial year.

LOCATION

The Plant shall be located at Satna in the State of Madhya Pradesh. Satna is geographically well situated and enjoys all the facilities of rail and road transport. The site has excellent facilities in regard to power and water and sufficient land is available to provide for the present needs and also for future expansion. A Railway Siding already exists near the site which shall be extended to our Works at a small cost.

INTEREST OF DIRECTORS

All the Directors will be interested to the extent of any shares subscribed by and allotted to them in the Company.

Shri M. P. Birla is a member and Director of M/s. Birla Gwalior Private Ltd., the proposed Managing Agents of the Company.

Shri H. P. Barat is a partner of M/s. G. M. Pyne, one of the Underwriters and Brokers named in the Prospectus.

Shri S. K. Birla is a member of M/s. Birla Gwalior Private Ltd., the proposed Managing Agents of the Company.

None of the Directors has any interest in any property acquired by the Company within 2 years of the date of this Prospectus or proposed to be acquired by it.

UNDERWRITING

The entire issue of Rupees Seventy Lakhs has been fully underwritten, the names of the Underwriters and the amount of the shares underwritten by them being as stated below:

Names	Amount Underwritten (Rupees in Lakhs)
-------	---

1. M/s Investment Corporation of India Ltd. 22.00
'Ewart House,' Bruce Street, Bombay-1.

2. M/s. G. M. Pyne, 8.00
14, India Exchange Place, Calcutta-1.
3. „ Navalchand T. Shah, & Co., 8.00
102, Stock Exchange New Building,
Dalal Street, Bombay-1.
4. „ Chimanlal J. Dalal & Co., 8.00
Stock Exchange New Building, Dalal
Street, Bombay-1.
5. „ Devkaran Nanjee & Co. 8.00
Horniman Circle, Bombay-1.
6. „ Batlivala & Karani, 8.00
Union Bank Building, Dalal Street,
Bombay-1.
7. „ A. B. Pandit & Co., 8.00
32, Apollo Street, Bombay-1.

In the opinion of the Directors, the resources of the said Underwriters are sufficient to discharge their underwriting obligations.

UNDERWRITING COMMISSION

A commission at the rate of 2.5 per cent shall be paid to the underwriters in the case of 3,50,275 Equity Shares offered to the Public and also a commission at the same rate shall be paid on such Equity Shares which are not taken up by the existing shareholders or their nominees and are allotted to the Public.

BROKERAGE

Brokerage will be paid by the Company to members of the recognised Stock Exchanges and to banks at the rate of 1 per cent on the nominal value of the aforesaid Equity Shares offered to the Public in respect of the shares allotted against applications bearing their stamps. No brokerage is payable in respect of the shares which may be allotted to the existing shareholders and/or their nominees as right shares.

Brokerage on the same basis will be payable to the Underwriters who are also brokers to this issue in respect of the shares, allotted against applications made or procured by them provided that the relative forms of application bear their respective stamps, and in such case no brokerage will be payable to any other party in respect of the shares so allotted.

CAPITAL REQUIREMENT

Capital out-lay for the project is given below:-

	Rs. (in lakhs)
Land	3.00
Buildings	28.50
Plant and Machinery	135.97
Preliminary Expenses	2.53
Working Capital	80.00
	250.00
The above sum will be met in the following manner:-	
From Equity Share Capital	105.00
„ Foreign Exchange Loans ICICI and CDFC (under negotiation)	80.00
„ Borrowings from Banks	65.00
	250.00

The minimum subscription in respect of the present issue on which the Directors will proceed to allot is Rs. 70/- lakhs which is the total amount of the present issue offered to the existing members and to the public.

IMPORT LICENCE AND FOREIGN EXCHANGE

The Company has made an application for import licence for the requisite plant and machinery.

Applications have been made to Messrs. ICICI, Bombay, and Messrs. CDFC, London, for foreign exchange loan to the value of Rs. 80 lakhs, and the same are under their consideration.

INSPECTION OF DOCUMENTS

The following agreements and documents can be inspected at any time during the usual business hours at the Registered Office of the Company until seven days after the opening of the subscription list:

1. Copy of the Memorandum and Articles of Association.
2. Licence No. L/5(6)-17/EEI/61 dated 31st January, 1961, issued by the Government of India under the Industries (Development and Regulation) Act and Rules in favour of the Company.
3. Licence No. L/5(6)-30/EEI/61 dated 24th May, 1961, issued by the Government of India for change of location.
4. Consent Order No. R. 42-CCI/61 dated 9th May, 1961, and an amendment letter No. R. 42-CCI/61 dated 14th June, 1961 issued by the Controller of Capital Issues in favour of the Company.
5. Correspondence exchanged between the Underwriters and the Company containing the terms of the Underwriting Agreement.
6. Draft Managing Agency Agreement with M/s. Birla Gwalior Private Ltd.
7. Technical Collaboration Agreement to be executed by the Company with B.I.C.C.
8. Balance Sheet and Profit & Loss Accounts for the last five years.

APPLICATION AND ALLOTMENT

Applications must be for 25 shares or multiples of 25 shares. All applications must be made on the form accompanying this Prospectus which can be had from the Company's Bankers and Brokers. All appli-

cation forms properly completed must be lodged together with the amount payable on application with any of the following Banks or at their branches mentioned below:-

BANKS IN BOMBAY

1. The State Bank of India.
2. The United Commercial Bank Ltd.
3. The Central Bank of India Ltd.
4. The Bank of Baroda Ltd.
5. The Bank of India Ltd.

BANK'S MAIN OFFICES AT:

Calcutta, Bombay, Delhi, Madras, Ahmedabad, Rajkot, Poona, Bangalore and Bhopal.

The remittance should be made by cheque or draft drawn on any Bank in the aforesaid towns (i.e. Calcutta, Bombay, Delhi, Madras, Ahmedabad, Rajkot, Poona, Bangalore and Bhopal) only and deposited with the above Banks or their above Branches.

Cheques or drafts should be drawn in favour of any of the above banks. A/c. The Universal Cables Ltd. For the applicant's protection cheques or drafts should be crossed 'Account Payee only'. A separate cheque or draft must accompany each application.

Allotment will be notified by the despatch of an allotment letter, but the Directors reserve the full uncontrolled right of accepting or rejecting any application in whole or in part in either case without assigning any reason. Where an application is rejected or not accepted in full, the whole or any balance of the application money received will be refunded within two months from the date of the closing of the Subscription list, to the applicant, in which event Bank commission, if any, will be payable by the applicant.

ISSUE OF SHARE CERTIFICATES

Certificates for shares allotted in terms of this offer will be ready for delivery in exchange for the letters of allotment within nine months after the date of allotment.

DESIGN...

for finest performance

Of all aspects of industrial endeavour the most intriguing is thermo-dynamics, for it is this medium that provides industry with its greatest power—steam. Therefore, wherever high pressure steam-raising plant is used, there is a story...a story of experience, analysis and design.

Varying Conditions

Wherever new steam-raising plant is to be installed, either for generating power or in industry, it is essential that skilled investigation and analysis be carried out to ensure that the plant is *tailor-made* to give optimum performance under varying local conditions and requirements.

Fuel

Having established the purpose for which the steam power created will be required, it is necessary for the design engineer to identify the type of fuel to be used, either oil, gas or coal. Coal is by far the most widely used fuel, but its thermal content varies and it is therefore necessary to make an analysis to establish the percentage of principal heat-producing elements present. The thermal content of fuel has an important bearing on the designing of the kind of plant to be installed. Generally low-grade coal is used with anything up to 50% ash content. It should be remembered that steam must be raised as economically as possible.

Waste fuel

Particular attention has to be given to industries that wish to use waste material as fuel. For instance, the sugar industry absorbs vast quantities

of waste material in the form of bagasse for fuel; again in the pulp and paper industry it is now the practice to combine the processes of chemical recovery and steam raising by burning the 'black liquor' from the digestors in a special type of boiler unit. Of course, these industries cannot keep their steam-raising plant functioning entirely on waste materials. So, in their designing and planning, the technicians and design engineers must allow for varying fuels to be used and at the same time achieve optimum performance.

Powerful Ally

The new and powerful industrial group of ACC-Vickers-Babcock Ltd., with its vast resources of technical knowledge and the rich, wide experience of its partners, will undoubtedly prove a powerful ally in achieving the high target set by the government for the installation of boiler and thermal power plant during the third Five-Year Plan. AVB will be able to draw on the finest engineering minds to study, design and draw up plans that will *tailor-make* not only vital steam-raising plant but also heavy mining and cement-making machinery which will help meet the exigencies of industrial expansion and, in addition, ultimately contribute towards the earning of foreign exchange through export.

The AVB industrial plant at Durgapur is in the final stages of erection. Here, in Durgapur, all the advanced technical knowledge of AVB will be utilised to the fullest extent to ensure that each project is designed for the finest possible performance.

...a Powerful Partnership for Progress

A Year of Significant Achievements

THE calendar year 1960, with all its trials and tribulations, must still be reckoned a magnificent economic success. This is because the national income of the Indian Union has responded splendidly to a successful agricultural year in 1960-61, and daring statisticians, willing to predict the national income for 1960-61, before the year is over, are inclined to believe that the figure will be of the order of Rs. 13,110 crores at 1952-53 prices. Per capita income will pass, they say, the Rs. 300 mark. The instruments of this success are both agriculture and industry, but particularly agriculture. Foodgrains production is for the first time believed to be reaching the 75 million ton mark which was the first target of the Second Five-Year Plan. Industrial production has risen nearly 10 per cent within the year, at least reckoned until August; the great pace-makers were iron and steel, general engineering and chemicals, with the old retainers, cotton textiles and jute, running disappointingly low in terms of the rate of rise. All in all, a spurt of dynamism of this order has carried the Second Plan — or at least the revised (reduced) Plan — to a triumphant conclusion.

Beneath the happy general conclusion that national income has reached the revised (and reduced) target, there are less comforting factors to note and inwardly digest. The first of these is the precarious position of foreign exchange, greater than any other weakness in our armour, as we approach our Third Five-Year Plan for which the gap, inclusive of repayments, is reckoned at Rs. 2,000 crores. During the year — in fact in September — sterling balances reached an all time low of Rs. 139 crores and, while they have recovered owing to gifts from Germany and a special allo-

cation of Rs. 6.67 crores from the U.K., the prospect is by no means happy. It may be, however, that the target set for Rs. 180 crores at the beginning of the Third Plan might be achieved because of the favourable seasonal character of the next three months. Nevertheless, the future of all import policies is bleak if one of the tests of rigour is to be found in the availability of "untied" credits. Of such credits, there is an increasing scarcity which is now, likely to be made more difficult by the United States balance of payment crisis.

Next to foreign exchange, there is the behaviour of prices during the year. The general index of wholesale prices reached an all-time peak of 122.5 in October, 1960, recording a rise of nearly 8 per cent on the average 1959-60 figure. It has since declined; the large stock of wheat under P.L. 480 and the favourable agricultural year, which includes an excellent rice crop, holds out the hope that this is more than the current seasonal effect on the prices. Nevertheless, it was noted during the year that food no longer dominated the index. Industrial raw materials and manufactures both rose steeply, the former more than the latter, and fuel and power also exhibited an uncomfortable rise. All in all, the inflationary elements of the economy remain, and have not been cushioned by any acts of official policy.

Not, indeed, that the Reserve Bank of India has been inactive during the year. On the contrary, it has been more than active in imposing a restriction of bank deposits and regulating advances. The total effect at the moment has not been great, but experiment and trial and error at least show a likely sense of respon-

sibility which should be subdued. What has militated against the Reserve Bank's effort has been a jolt to the banking system, first with the failure of the Palai Bank, and then with a number of withdrawals which seem to suggest that the general public is by no means so sure of the banking system as earlier in the year. The banking system is, of course, basically sound. But this has not prevented a steep decline in the rate of rise in deposits and, in some months, there has actually been a fall.

If the factors counted above stood by themselves they would cause some little concern. Standing next to India's Third Five-Year Plan, which shows no disposition to contract, and is occasionally driven upward both by enthusiastic States as well as the exigencies of transport and power, which cannot be resisted, one

might argue that the problems of resources is now likely to be acute both on the foreign exchange and rupee account. It does no good to pretend, because the Second Plan is fulfilled, that the Third Plan is half done. The fact is that the problems with the Third Plan are far more serious than the Second and the order of the magnitude of the new effort required by the country has not been appreciated. Perhaps, it is as well that the country should put itself in a frame of mind of a continuing crisis. Unless a crisis effort similar to that produced by a state of war takes hold of the minds of those responsible for economic policy, it is difficult to see how 1961 can be even as good as 1960. Yet, in the mirror of India's expectations it is deemed to be much higher. It also cannot be forgotten that an election in 1962 has been arranged further to display popular discontent on the year's failures.

Agricultural Production

THE most notable event of the year 1960 in the sphere of agriculture was the conclusion, by the Union Minister for Food and Agriculture, of the massive deal with the Government of the U.S.A. for the import of 17 million tons of foodgrains against rupee payment. It is an indication of the correct comprehension at long last of the problem of food supply under a developing economy. In the form of this agreement, the Government of India has taken the essential step of providing a strong initial support for the country's agricultural plan. The two-fold objectives of this massive deal, it has been stated, are to help the Government of India effectively to implement its agricultural plan for reaching a target of 110 million tons of foodgrains by the end of the Third Plan and to hold the price line so as to contain inflationary pressures. If we could achieve these objectives, India would really make a remarkable advance in her march towards economic progress. However, as the Vice-President of the Indian Merchants' Chamber, Bombay, aptly said in June, 1960, when Mr. S. K. Patil returned to India after signing the PL 480 Agreement in Washington, this is not easy enough, for "the magnitude of the problems in reaching the objectives is not only great, but the path towards progress is intricate and we have to cross several hurdles and break many barriers."

Despite the attention it has been receiving, agriculture has continued to pose many challenging problems. Almost since Planning began in this country in 1951 and even before, for that matter, agricultural development has started receiving high priority. In the first Plan, for example, nearly 34% of the Plan investment was devoted to agriculture and allied activities. Unfortunately, presumably swept off their feet by the results of the First Plan, the authorities made a departure in the Second Plan and accorded more emphasis to industry than to agriculture. From 14.8 per cent in the First Plan, investment in agriculture was reduced to 11.3 per cent in the Second Plan. This inadequate allotment to agriculture and the unfortunate seasonal failures in 1957-58 combined to create a situation which forced the powers-that-be to revise their attitude towards agricultural production. Fortunately—or is it unfortunately?—compelled by the rapidly rising population forced upon them by the rapidly rising population (estimated to reach 480 millions at the end of 1966), the authorities were not slow to accept the suggestion of the Ford Foundation Team to Plan for a foodgrains output of a minimum of 110 million tons. This is also what has been provided for under the Third Five-Year Plan, but the Planning Commission has provided for an investment of only Rs. 2,000 crores on agriculture and allied schemes. Even this investment does not mark a significant advance over the position under the Second Plan. Apart from the outlay, there are other aspects, technological, administrative and distributive, which call for concentrated thought and attention.

Judging from the latest available estimates one gets the impression that, by and large agricultural production has been maintained. The index number of agricultural production (1949-50=100) which was 132.3 for 1958-59, has dropped to 127.2 in 1959-60 and, on the basis of available estimates for 1960-61 so far, it can be safely assumed that there will be a rise in output, subject to only unforeseen factors, such as floods and draughts. Under individual commodity groups, the year is expected to end up with a record output of as much as 75 million tons, but this still falls short of the Second Plan target of 80 million tons. Although there has not been any great fluctuation in acreages under foodgrains, except in wheat, thanks to improvements effected in agricultural practices and greater use of fertilisers, overall production has not been adversely affected to an appreciable extent. With more and more acres being brought under the Japanese method of cultivation, the latest rice crop is expected to rise from 29.3 million tons in 1959-60, and cross even the peak level of 30.5 million tons recorded in 1958-59. The prospects of wheat crop are also considered promising. The latest foodgrains stock position with the Government (2.7 million tons) is the highest in recent years. With comfortable stocks thus, and the recent reversion to a freer movement of foodgrains, there has been a significant fall in cereal prices generally and of rice prices in particular, as is clearly reflected in the index number of prices. The latest All-India Index for the foodgrains group is 120.2 as against 121.4 a year ago. In coarse cereals, like jawar and bajra on the other hand, there were perceptible declines, both in acreage and output, but the position improved in the case of maize. Presumably because of the relatively poor 'rabi' harvest in pulses, the total All-India position of pulses supplies in 1959-60 was slightly affected (by a little over 5 per cent), though not to such an extent as to upset the overall position seriously.

In commercial crops, whereas the position of oilseeds, except castor seed and linseed — even here to a very small extent only—in 1959-60 was more or less unchanged, there was hardly any improvement in jute; actually, there was some deterioration. But the latest estimates of cotton production disclosed by the Union Minister for Commerce and Industry in the Lok Sabha reveal a marked recovery from the low level of 37 lakh bales in 1959-60 to nearly 50 lakh bales in the current season. Other commercial crops like sugarcane and tobacco, which registered appreciable gains in 1959-60 over the previous year, have continued to maintain their position. In sugarcane, demand has more than kept pace with supplies as a sequel to the increased demand for cane generated by the steady additions to the existing number of sugar factories. Thanks to this admittedly encouraging development, the Indian Sugar Industry today can boast of a sizable export surplus.

Industrial Production

THE record of Industrial Production in 1960 must be regarded as eminently satisfactory, considering the several handicaps that industries continued to experience, not to speak of the new difficulties that arose during last few months. Owing to the further deterioration in our foreign exchange reserve, the policy of enforcing drastic cuts in imports was tightened still more and, at the rate at which our foreign assets have been declining, there does not appear to be any near prospect of a reversal of this position, except to the extent of inflow of foreign aid. Perhaps the most pronounced hurdle in the way of maintaining industrial production in the year under review came from the series of credit restraints imposed by the Reserve Bank of India. The resulting cut in the availability of funds, on the one hand, and the rise in prices of raw materials, wages, etc., on the other, operated like the two blades of a pair of scissors to affect industrial production adversely. Industrial output was also hit by the loss of man-hours due to unrest in certain sectors of industry, notably the jute and the basic metal industries.

Notwithstanding these handicaps, however, it is gratifying to note, the seasonally adjusted General Index of Industrial Production (base 1951=100) touched an all-time peak of 170.9 in August. It is not known whether this level has since been maintained, but the probability of some setback, consequent on the decline in production of jute goods and cement, especially, the former because of the acute shortage of raw jute, cannot be ruled out. The controversy with regard to textile prices and repeated price reductions—there were three reductions, all in the latter half of the year—must also have affected, to some extent the output of cotton textiles. Even so, it is a safe bet to affirm that the overall industrial production for the whole of 1960 would register a rise of about 15 points as compared to the previous year.

The actual trend of production in some of the major industries during the year under review may now be noted. To take first cotton textiles, which is our biggest and largest organized industry. The overall production of this industry in the first eleven months of the current calendar year, which it was at one time apprehended might hardly be maintained because of difficulties of short supplies of cotton, etc., actually showed an increase of 106 million yards over that for the corresponding period of the previous year. The eleven-month total amounted to 4,597 million yards, as against 4,491 million yards for the corresponding period of 1959.

Although almost every industry has been complaining of inadequate and indifferent supplies of coal, the total coal production in the country for the first ten months of the current year was higher than in the previous year at 42.9 million metric tons; the corresponding total for 1959 was 39.6 million metric tons. For the major part of the year, however, coal production was plagued by anxieties and uncertainties about the size of the targets of production of the private and public sectors, respectively, in the Third Five-Year Plan. But, towards the close of the year, the Govern-

ment of India outlined a more realistic approach to the question and also revised the target figures. Even after the revision, it is true, the quota is weighted heavily in favour of the public sector, but, then, private collieries have been allowed an opportunity to raise more coal than under the original dispensation.

According to the Indian Sugar Mills' Association, the total sugar production in the country for the season 1959-60 (November 1959-October 1960) amounted to 24,20,000 tons, as against 19,18,000 tons for the 1958-59 season. (These figures exclude 51,000 tons produced prior to November, 1960, for the season 1960-61, as against the corresponding figure of 31,000 tons in the preceding season for the 1959-60 season's account.)

Although the installed capacity of the cement industry during the Second Five-Year Plan period has fallen woefully short of the original target—9.5 million tons as against 16 million tons!—the average monthly level of cement production during 1960 has throughout been higher than in 1959. But for the indifferent supplies of coal, both as regards quality and timely arrival, cement production might have been considerably higher. As it is, the estimated total production under review would be a little below 7.6 million tons.

As regards steel production, again, the monthly average output of finished steel as well as of pig iron in 1960 was higher than either in the previous year or in 1958. But even this record would have been excelled, had there been no difficulties with regard to raw materials and transport which handicapped this industry particularly.

Contrary to apprehensions of a decline in total production of jute goods in 1960, because of difficulties regarding availability of raw jute, the monthly average level of jute production was more or less maintained. During some months, the monthly average even crossed the 90,000-ton level, but the level of production during the last quarter might not show the same trend. Even so, the total production for 1960 could be estimated at over one million tons.

There was a further increase in the level of production in several new industries, particularly chemicals and general engineering industries. The overall increase in these industries in 1960 as compared to the previous year must have been considerable. But, as is well known, this will not materially affect the economic structure unless production in the organised industries also keeps pace. The extent to which the continued prevalence of the many difficulties experienced by the major industries affected the overall industrial production during the year under review in particular and for the whole of the Second Five-Year Plan period generally should soon be available.

The production of lead-zinc ores in India during Jan-Sept. 1960 was 1,15,000 metric tons, as compared to 1,21,000 metric tons in the corresponding period of the preceding year, according to the Indian Bureau of Mines. Similarly, the production of lead metal during the first nine months of 1960 was only 2,441 metric tons as against 3,028 metric tons in the corresponding period of 1959.

Transport

RAILWAYS

DESPITE the Central Government employees strike in July, which did not leave the railways unaffected (the lifeline was maintained though by a few loyal transport men), the year 1960 will go down in the annals of India's transport history as a memorable year. All forms of transport not only received pro-

minent — though not as much as each of them, specially shipping deserve — attention, but also recorded achievements.

To take the Railways first. Although not reaching the original targets with regard to freights and passen-

INDIAN LABOUR

FACTORY EMPLOYMENT 1950-1959

gers carried, the Indian railways, it can now be safely stated, will be more than able to achieve the revised targets. Thanks to the visit of the World Bank Mission to study the transport position in India and the \$70 million loan made by the World Bank in July last, it has been possible for the Railways to cover the greater part of the foreign exchange required for the final year of their programme under the Second Five-Year Plan. It is gratifying to note that the railways' own contribution is expected to result in a saving of about Rs. 90 crores. As against the original foreign exchange estimate of 893 million dollars, the latest figure is \$718 million as a result of the increased availability of railway equipment in India. According to the Second Five-Year Plan, it may be recalled, the targets to be reached were to raise freight capacity from 114 million tons to 162 million tons a year and to increase passenger capacity by about 15 per cent. The programme also included the acquisition of 2,161 locomotives, 8,836 passenger cars, and 1,11,739 goods wagons, besides the doubling of 1,300 miles of mainline track, the replacement of 8,000 miles of track, the construction of 830 miles of new lines, particularly to give access to coal and iron ore fields, and the electrification of 886 miles of main lines in regions of high density passenger and freight traffic. As against Rs. 900 crores (+Rs. 225 crores by the railways themselves) of investment envisaged for this programme, actually, Rs. 870 crores were expended during the first four years of the Plan, while, in the current and final year of the Plan, another Rs. 230 crores is expected to be expended making a total outlay for the entire period of Rs. 1,100 crores.

The railway finances also fare much better than the Union Minister for Railways had anticipated when he presented the Budget for the current year. Evidently he must have felt that if he did not paint a gloomy picture as he did, he would not get the supplementary changes on freights proposed by him accepted by Parliament. Anyway, in the event, the railways' earnings for the seven months ended October, 1960, aggregated Rs. 253.36 crores, as against Rs. 235.87 crores for the corresponding period of 1959, thanks to an all round increase. Thus passenger traffic receipts rose from Rs. 73.54 crores in 1959 to Rs. 77.4 crores during the current year and those from other coaching from Rs. 13.84 crores to Rs. 15.05 crores. Earnings from goods traffic, as well as others, also improved from Rs. 144.14 crores and Rs. 4.35 crores, to Rs. 155.94 crores and Rs. 4.87 crores, respectively. These results are unquestionably gratifying, considering that the Indian railways have had to bear the additional incidence of the Pay Commission's recommendations to the tune of Rs. 13

crores annually. Thus, by and large, the Indian railways bid fair to end the current year on an optimistic note, as also to complete the targets laid down under the Second Plan.

Among the other important developments in relation to our railways during the year under review, mention must be made of the revision of the Railway Convention. Following the recommendations of the Railway Convention Committee, 1960, the rate of contribution by the railways to the Central Exchequer is to be raised from 4 per cent to 4.25 per cent on the capital-at-charge. At the same time, the annual loss on the working of the strategic lines (estimated at Rs. 1.15 crores) is to be borne by the General Revenues, while the rate of dividend payable on the capital-at-charge of portions of the North-East Frontier Railway is to be only at the average rate of borrowing of the Government until such time that the line becomes productive or the next revision of the Convention, whichever is earlier. Although Parliament has ratified the recommendations, there has been sharp public criticism that the rate of dividend payable by the railways to the exchequer was not raised more substantially. Another recommendation of the Railway Convention Committee which has evoked criticism is the proposal to merge the passenger tax at the existing rates with passenger fares as from April, 1961. To compensate for the resulting loss of revenue to the States, a subvention of Rs. 12.5 crores per annum is proposed to be paid by the railways to the States for the next five years, 1961-66.

With the approaching end of the Second Plan period, the programme of the railways for the Third Plan naturally assumes interest. If the rehabilitation of the railways, which had suffered much damage on account of the War and the Partition, was the main purpose of the First Plan, extensive development to match with the building up of basic industries like coal, steel and cement, on which emphasis was laid by the planners, formed the principal objective of the Second Plan. The programme of the railways under the Third Plan also envisages a continuation of the latter, with special regard to the requirements of the further industrial development during the Third Plan period. With this end in view, a total outlay of Rs. 890 crores (plus Rs. 330 crores to be found by the railways out of their own resources) is contemplated, and this is expected to provide for an increase in passenger train miles from 124 million at the end of 1960-61 to 143 million by 1965-66, and freight carried from 162 million tons to 235 million tons.

ROADS

ROAD transport must be said to have come more into its own during the year 1960 than even last year. There has been a steadily growing appreciation of the role of road transport, as witness the statement of Mr. Raj Bahadur, Minister of State for Transport and Communications, at the All-India Conference of State Transport Commissioners and Controllers, held in Bombay recently. He then categorically declared that the case for the expansion of road transport industry had been accepted and that, as a corollary to it, expansion and improvement of roads would follow automatically. The increasing importance given to roads is also evident from the fact that the National Council of Applied Economic Research has been asked to undertake an investigation into the relationship between road transport and industrial development, not to speak of the reported recommendation of the Neogy Committee on Transport Co-ordination urging a larger role for road transport. Also of significance to road

transport interests is the reported complaint of Mr. Raj Bahadur himself about the non-implementation still of many of the Masani Committee recommendations. These recommendations have ere now been accepted by the All-Indian Transport Conference. Mr. Raj Bahadur was also critical of the meagre allocation for road transport, although he seemed to want to mollify the Planning Commission for having said so by hastening to add that the Commission had agreed to a target of 60,000 commercial vehicles by the end of the Third Plan. When this target is reached, according to him, it will bring the road transport industry to the "take off" stage, that is a stage after which it can expand to any extent.

Road transport interests also have been critical of the Third Plan allocation to roads of only Rs. 250 crores (excluding local road development programmes) which is the same as that provided for under the Second

Plan. Many were under the impression that the experience of all the transport difficulties that developed during the Second Five-Year Plan would leave their impact and provoke the authorities to demand of the Planning Commission a greatly increased allocation. But neither this, nor the fact that the target for roads fixed under the old Nagpur Plan has been reached would appear to have made any impression on the Planning Commission. It is, therefore, doubtful if the declared aim of the Third Plan to consolidate and extend the achievements under the Nagpur Plan will be fulfilled. Of course, no one expected the Planning Commission to accept in toto the Chief Engineers' Twenty-Year Plan, but provision could have been made for at least a fourth of these targets to be completed by 1966, and the finance needed therefor earmarked for the purpose. Instead, the amount allotted for roads, namely Rs. 250 crores, falls short of the estimated finance required, that is a fourth of the total outlay contemplated by the Chief Engineers, namely Rs. 325 crores. Road transport circles wonder whether, with an outlay of only Rs. 250 crores, the Planning Commission's targets of 20,000 miles additional surfaced roads (which is less than either in the Second Plan (22,000 miles) or in the First Plan (24,000 miles) will be possible of fulfilment. While allotting funds for roads, the Planning Commission, which glibly talks of providing additional employment and has failed to realise its targets under two successive Five-Year Plans, should at least have taken into account the large employment potential of road building in deciding upon the allocation.

As important as the roads are the vehicles that have to use these roads. In addition to raising the surfaced road mileage from 144,000 at the end of March 1961 to 164,000 at the end of March 1966, accordingly, the Third Five-Year Plan provides for the production of 30,000 passenger cars, 60,000 commercial vehicles (inclusive of 4,000 vehicles by Ordnance Factories) 10,000 jeeps and station-wagons, and 48,000 motor vehicles, scooters and three-wheelers, nearly every one of which, again, is considered to be on the low side. What seems worse is the meagre allocation of foreign exchange to facilitate this programme. Have the authorities made sure that what they have provided for will enable the manufacturers to utilise their installed capacity fully? The question that inevitably arises then is: how far will road transport be able to supplement the railways in transporting all the traffic that is estimated to be offered during the Third Five-

Year Plan of some 300 million tons, even after making allowance for the transport of 80 million tons of goods by bullock carts and 18 million tons by water transport? This, incidentally, does not take into account over 225 million tons of feeder traffic to railheads and 20 million tons of feeder traffic to waterheads.

We may slightly digress at this point to refer to the proposed scheme of small car manufacture by the Government of India. In spite of all that Mr. Manubhai Shah, Union Minister for Industry, has been saying in Parliament and outside, it is difficult for us to resist the feeling that a venture like this, involving avoidable foreign exchange without the certainty of a commensurate benefit to the country, is at best a luxury that we can well afford to postpone to more propitious times.

Taking all circumstances into consideration, the fact stands out, however much the Government may try to disabuse the fear that it is partial to the railways in the matter of allotments of funds under the Plan, that, even in Free India, we do not appear to have got over the pre-independence complex of rail-road conflict. There can be no question of a conflict between road and rail transport, and not until we have a fully co-ordinated programme of all forms of transport development can we hope to tackle successfully the problem of overall economic development. It must not be forgotten that no amount of spoon-feeding any one form of transport at the cost of another, even if it be the railways, which is admittedly the country's single largest national undertaking, will compel the consumer to prefer the latter to a readily available and relatively more economic type of transport. This undoubtedly explains the pronounced preference lately for road transport, especially for carrying goods over certain routes. An irrefutable evidence of this preference was provided by the Chairman of the Hindustan Levers at the last annual meeting of the company when he disclosed to the shareholders that, whereas, in 1950, the company's normal method of despatch of finished goods was by rail, last year, as much as 50 per cent of its despatches were made by road! The simple explanation for this diversion from the railways is the saving, both in the average transit time and in the relatively greater safety to cargo, guaranteed by road transport. When will the powers-that-be realise that our roads are as great a national asset as any other form of transport, not excluding the railways, and accord to them the same treatment and facilities as they are only too ready to extend to the railways?

SHIPPING

If roads have not received adequate allocation under the Third Five-Year Plan as stated above, the allocation of only Rs. 55 crores for shipping in the Third Plan is not only atrocious but hardly sufficient to meet the requirements laid down by the country's highest authority on shipping, the National Shipping Board. It will be recalled that the National Shipping Board recommended a target of 14.2 lakh tons (to be reached by 1965-66) made up of 10.8 lakh tons for overseas trade (as against Rs. 6.13 lakh tons at the end of 1960-61) and 3.4 lakh tons for the coastal trade as against 2.92 lakh tons at the end of the Second Plan). In other words, the additional tonnage to be acquired to reach this target amounts to 5.2 lakh tons (G.R.T.). In addition, it felt, provision should be made to the tune of 1.7 lakh (G.R.T.) for replacement of overaged ships. The cost of all this is estimated at Rs. 118.8 crores. The Planning Commission, has, however, estimated that, with its provision of Rs. 55 crores plus Rs. 4 crores likely to be available from the Shipping Development Fund and the contribution of Rs. 7 crores from the shipping companies (that is, a total of only Rs. 66 crores),

about 2 lakh G.R.T. could be added, after meeting the replacement requirements during the Third Plan. This means that, as against 5.2 lakh tons recommended by the National Shipping Board, the Planning Commission has contented itself to provide for only 3.7 lakh tons G.R.T. The net addition, therefore, during the so-called "take off" Plan period will be no more than a net addition of 2 lakh G.R.T., as against an addition of 4.25 lakh G.R.T. during the Second Plan. No wonder the Indian shipowners bitterly complain that they have little to enthuse over the shipping targets under the Third Plan. No other than Mr. G. L. Mehta, Chairman of the National Shipping Board, has himself observed: "Considered from the point of view of national security, or integrated national transport system, or augmenting their foreign exchange resources, by all accounts, shipping deserves a high priority than the authorities in Delhi are prepared to give it."

What our national interests now require, according to another great authority on shipping, Mr. M. A. Master, is that the Government should accept the targets recommended by the National Shipping Board and im-

plement the recommendations of the Rail-Sea Co-ordination Committee. The Government should also shed some of its mistaken beliefs such as that the offering of higher rates of freight to Indian ships or giving them financial assistance is an act of flag discrimination, or that the tanker trade and the tramp trade need be

retained only for the public sector. It is his contention that every encouragement, including economic rates, should be given to Indian shipping to enable it to build a balanced tramp fleet. This is but an elementary piece of justice to those who carry on the business of shipping, as he says.

AVIATION

BY far the most heartening feature about our aviation is that, as a commercial proposition, it has at last turned the corner. It is no small satisfaction to find that the Indian Airlines Corporation has emerged from an era of depressing losses to a period of uninterrupted profits, however small. Three years ago, when the Corporation suffered a loss of more than a crore of rupees, the Corporation officials still seemed to believe that the worst was not yet over. But, fortunately, these prophets were proved false, and there was a favourable turn in the tide of the fortunes of the Corporation almost from the very next year. While, in the first year itself after the peak year of losses, there was a sizeable decline, in the second year thereafter, there was actually a small profit; in the current year, again, the record seems to have been further improved upon.

For the Air-India International, the year 1960 marks its proud entry into the Jet Age. In April, 1960, A.I.I. introduced fast, long-haul, large-capacity Boeings on the India-U.K. route. Before very long, Air India

will have acquired four Boeing 707 Inter-continentals. In the wake of the acquisition of the Boeings has come also an intensive jet training programme for A.I.I. pilots. After experimenting with deputation of teams of flight crews and ground personnel for training abroad, A.I.I. has now a Boeing 707 simulator of its own, by the use of which it hopes to be able "to cut down training cost and the actual time required to check out a pilot by at least 40 per cent and also provide the best in the familiarisation of the crews."

A great landmark in the history of aviation not only for India but world aviation generally is the growing co-ordination of schedules of a number of airlines and the free interchange of tickets among them. While, towards the end of 1959, an agreement to this effect was reached between A.I.I., B.O.A.C. and Q.E.A., this year has seen a similar agreement among a number of continental air services with offices in this country. These agreements have undoubtedly benefitted the travelling public.

Foreign Trade

THERE was a further increase of Rs. 37.49 crores in the country's adverse balance of trade for the first ten months of 1960, as compared to the corresponding period of the previous year. Last year also, it may be recalled, the gap between our imports and exports had widened (to Rs. 59 crores) over the preceding year. The slightly lower increase in the adverse balance of trade during the year under review was the net result of the further restrictions on imports and some improvement in our exports, as also in the terms of trade for the greater part of the year. The performance in 1960 was a slight improvement over the previous year in yet another respect, in that, although imports in 1960 also continued to increase at a faster pace than exports, the pace of such increase was slightly retarded; as against an increase in imports of over 11 per cent and an increase of exports of only 2 per cent in 1959, the increases in imports and exports in 1960 were of the order of 9 percent and 3 per cent, respectively.

The total imports for the period January-October 1960 amounted to Rs. 761.72 crores; as against Rs. 701.84 crores for the same period of the previous year, or an increase of Rs. 59.88 crores. Exports, including re-export, also improved from Rs. 495.92 crores in 1959 to Rs. 518.21 crores, representing an improvement of only Rs. 22.29 crores for the same ten-month periods. Unlike in 1958 or 1959, there was not even one month in all the ten months of 1960 for which figures are available when the balance of trade happened to be in favour of India. As a result, the gap between imports and exports over the period amounted to Rs. 37.49 crores, having risen from Rs. 206.02 crores in 1959 to Rs. 243.51 crores in the year under review.

A detailed analysis of the composition of our imports shows that, by and large, there has not been much difference as compared to 1959, except perhaps in the case of food imports. Here, too, while imports of wheat declined over the latest official half-year (by Rs. 26.77

crores) those of rice registered an increase of Rs. 2.91 crores over the same six-month period). But it is significant that the food, beverages and tobacco group as a whole accounted for a sizeable decrease (of about 28 per cent) during the half-year ended September 1960. As expected, there was a further increase in maintenance imports of raw materials, semi-manufactures and manufactured goods alike. The main items that accounted for an increase in imports in 1960 were raw cotton and jute, oilseeds and crude rubber, mineral oils (excluding petroleum products), base metals, sulphur and organic chemicals, coal tar dye-stuffs and medical and pharmaceutical products. The relative improvement in exports generally during the year under review was due partly to the increased offtake by India's main importers, especially, the U.K., the U.S.A., Canada, Japan and Egypt, and by Italy and Germany, and partly to the higher prices that the traditional exports of our country commanded in these markets, at any rate during the first half of the year. As the year progressed, however, the latter advantage tended steadily to decline, if not disappear altogether.

Among the individual items that registered increases in exports, mention may be made of cotton textiles, especially to the U.K., jute bags, spices, non-essential vegetable oils, oilseeds, iron and steel scraps, rayon goods, and Indian films. In certain items such as iron ore, sillimanite, tobacco (unmanufactured) and coir mattings, despite an increase in the volume of exports, there was a decline in value. On the other hand, notwithstanding a decline in the volume of exports in tea, hides and skin, leather and leather manufactures, thanks to the better prices realised, there was a perceptible improvement in value.

It has become fashionable in official circles these days to stress diversification of exports and make too much of the increase in the exports of non-traditional items. While both these trends are to be certainly welcomed, these need not necessarily be accompanied

by a slackening in our efforts to maintain, if not increase, our traditional exports, as seems to be happening, unfortunately. Informed business circles estimate that a more imaginative policy with regard to imports, of raw jute can bring in a spectacular rise in the export of jute goods. Exports of tea, textiles and hides also could be improved further, according to them. Similarly, it is stated, a rational and more liberalised policy of imports of certain items of plant and machinery could yield a sizeable foreign exchange for the country.

While the developmental and other requirements of our predominantly industrially-biased economic plans have brought down our foreign assets to the lowest level consistent with safety, the Third Five-Year Plan, which envisages a further increase in total investment of over 50 per cent as compared to that under the Second Plan, does not hold out prospects of a reversal of this pattern of trade. It has been estimated by the Planning Commission that, during the Third Plan period, India would need to import Rs. 1,900 crores worth of machinery and equipment for the Plan projects, besides components, intermediate products, etc. valued at Rs. 200 crores. To these must be added imports required for the maintenance of the economy estimated at Rs. 3,570 crores, although maintenance imports during this period have been assumed to work out at a slightly lower annual average rate than during the Second Plan period, thanks to increases in production of certain items within the country itself, such as caustic soda, soda ash, carbon black, iron and steel, and aluminium. Our total export earnings during the Third Plan period, on the other hand, are not expected to yield more than Rs. 3,570 crores, which is the value of just our maintenance imports. Other means must, therefore, be found to finance repayment of the loans to the tune of Rs. 500 crores during the period and also developmental imports of the order of Rs. 21,100 crores. The Third Five-Year

Plan would thus be even more dependent than either of the first two Five-Year Plans on foreign aid. It is still "aid and not trade" and not "trade and not aid", as many would want.

(Rs. crores)

	Imports	Exports (including re- exports)	Balance of Trade

Prices

OF the many disquieting features in the economic scene of 1960, the price situation gave perhaps the utmost cause for concern, notwithstanding the fact that the powers-that-be made determined efforts to remove the main causes, including a cut in the volume of deficit financing. Not only was the deficit finance for the current official year — 1960-61 — placed much lower than in previous years, but, for the whole of the Third Five-Year Plan period also, the extent of deficit financing has been sought to be kept down at only Rs. 550 crores. Another realistic approach of the authorities was the decision to go slow with State Trading even when official spokesmen were declaring it as the avowed policy of the government. Also in line with this realistic trend was the decision, albeit belated, to do away with food zones. On the top of all these was the satisfactory overall food production, in spite of floods and droughts in some parts of the country. But the most decisive factor was the massive 17-million-ton foodgrains deal with the U.S. Government, not to speak of the much smaller but the latest deal with Burma to import 30,000 tons of rice.

The index of wholesale prices (1952-53 = 100) showed a rise of 6.5 per cent for the 11 months ended November, 1960, as compared with a rise of only 3.6 per cent for the corresponding period in 1959. There was a particularly sharp increase in the industrial raw materials index which rose from 130.9 to 148.0. The rise here was practically continuous, except for a slight break between June and August. The increase in the

index number of prices of industrial raw materials was naturally reflected in the index numbers of intermediate products as well as of finished goods. The former for November 1960, was as much as 16 points higher than the index number for the corresponding month of 1959; the index number of finished products also went up by almost a like extent, that is, by nearly 15 points. The indices of liquor and tobacco and fuel, power, etc. also registered further increases. But the index number of food articles closed the year ended November, 1960 at 120.2, that is 1.3 points lower than that for November, 1959. However, the decline came only after July, for which month actually the index number was as high as 124.0, after having declined earlier, the lowest level recorded having been in March, when the index number stood at 117.

As prices continued to rise in the face of an increase in industrial production, the expansion in money supply was regarded as the villain of the piece, and this provoked the Reserve Bank to take further measures to control credit. Not finding the selective controls employed by them all along as effective as they had anticipated, the authorities resorted to quantitative credit restrictions and even wielded the weapon of variable reserve ratios, for the first time, on March 11, 1960, when 25 per cent of the deposits accruing to the scheduled banks after March 12 were impounded with the Reserve Bank (this was, of course, over and above those required to be maintained under the Reserve

Bank Act normally). Hardly two months had elapsed (May 6, 1960) when this percentage was doubled.

The Reserve Bank also sought to restrict scheduled banks' access to the lender in the last resort. Accordingly, as from October 1, ceiling limits were fixed for borrowings at the bank rate, with quotas for each bank (at 50 per cent of the average of the reserves required to be kept under Section 42(1) of the Reserve Bank of India Act); over and above this limit, borrowings were charged at progressively higher (penal) rates of interest. The banks were also required to raise their lending rates by at least half per cent with the minimum lending rate at 5 per cent. However, in anticipation of the busy season (some critics say this

is an admission of failure of the measures) the credit restraint was slightly relaxed.

The Consumer Prices Index also moved in line with the trend of wholesale prices. Starting the year at 168 (August 1939 = 100) the index number declined by a point in March, but, thereafter, it went on rising steadily, except for the slight setback of one point in September, to reach 174 (provisional) for October last. There was thus an increase of six points over the first 10 months of the year which, incidentally, compares favourably with the extent of increase recorded in 1959. This is at best a statistical solace, for, actually, the common man feels today more oppressed by the rising costs of living than ever before.

Banking

THE year 1960 will go down in history as a memorable year for monetary restraint and discipline. A series of monetary measures was enforced during the year to arrest the market expansion in money supply and bank credit which had its impact on the stock and commodity markets as well as on the general price level. On March 11, 1960, the Reserve Bank tightened the existing credit control measures and wielded, for the first time in Indian monetary history, the weapon of variable reserve ratios. By the latter regulation, the scheduled banks were compelled to keep with the Reserve Bank 25 per cent of the increase in deposit liabilities subsequent to March 11, 1960. This was in addition to the customary balances with the Reserve Bank of India of 5 per cent of demand and 2 per cent of time liabilities. This measure was tightened further on May 5, 1960, when the percentage of additional deposits was raised to 50 per cent (this was, however, brought down again to the level prevailing prior to May 6, 1960). Also, on the eve of the slack season, the Governor of the Reserve Bank informally asked the banks—which seems to have become a hardy annual with him for this part of the year—to effect a reduction of Rs. 100 crores in bank credit. He is also believed to have indicated to some of the bigger banks

even the broad order of contraction of credit which each of them could conveniently bring about. But, presumably, as these measures did not result in any significant reduction in credit, the Reserve Bank resorted to restriction on scheduled banks' recourse to the Bank to a minimum and levered up the lending rates of scheduled banks. On September 11, 1960, for example, quotas were fixed for each scheduled bank, borrowings within which limit only being allowed at the usual rate; borrowings beyond the quota were to be charged penal rates of interest at progressively higher rates. Also, effective from October 1, 1960, scheduled banks were required to raise their average lending rates by half a per cent with a fixed minimum of five per cent. It is too early yet to say whether these measures have had the desired effect, but money market circles already seem convinced that the game has not been worth the chase, although they concede the severe limitations of the conditions in India in which these measures have to be operated.

The changes in money supply and in scheduled banks' data during the year and during the busy and slack seasons are seen in the following table:—

MONEY SUPPLY AND SCHEDULED BANKS' DATA
(in crores of rupees)

Items	Outstanding as on December 9, 1960	1959	1960	Variations during 1959-60		1959-60	
				Busy season	Slack season	Busy season	Slack season
I Money Supply	2728	+170	+207	+291	-111	+277	-80
(a) Currency	1900	+147	+146	+220	-57	+201	-89
(b) Deposits	828	+23	+61	+71	-54	+76	+3
SCHEDULED BANKS							
II A Liabilities							
1. Aggregate Deposit							
Liabilities (net)	1892	+254	+65	+116	+106	+131	-28
(a) Demand	773	+23	+56	+66	-53	+70	+7
(b) Time	1119	+231	+9	+50	+160	+61	-35
2. Borrowings from Reserve Bank of India	24	+1	+12	+25	-13	+30	-27
B. Assets							
1. Cash & Balances with the Reserve Bank of India	135	-5	+21	-15	-21	+30	+3
2. Investments in Govt. securities	674	+150	-113	-3	+178	-52	+104
3. Bank credit	1120	+99	+156	+182	-79	+189	-20

During the year under review, there was a further rise in the rate of expansion in money supply and bank credit. Money supply with the public moved up by Rs. 207 crores (or 8.2 per cent) to Rs. 2,728 crores on December 9, 1960, the date for which the latest data are available. This may be compared with a rise of Rs. 170 crores in 1959 (or 7.2 per cent). The increase in currency with the public was of the same

order as last year at Rs. 146 crores, while that in deposit money was more at Rs. 61 crores than in the previous year of Rs. 23 crores.

Scheduled bank credit registered a rise of Rs. 156 crores during the year to Rs. 1,120 crores. There was a record expansion of bank credit during the 1959-60 busy season. It was of the order of Rs. 189 crores.

which surpassed even the previous year's record rise of Rs. 182 crores. The contraction in credit during the subsequent slack season, on the other hand, was only nominal at Rs. 20 crores, as compared to Rs. 79 crores and Rs. 118 crores, respectively, in the 1959 and 1958 slack seasons. The smaller decline in credit was accounted for by a sharp rise in advance against non-seasonal securities, such as cotton and jute textiles and iron, steel and engineering products; this rise served to offset the usual decline in advances against seasonal commodities, such as raw cotton, raw jute, food grains, sugar, oilseeds, etc.

Technically speaking, deposit liabilities of scheduled banks registered a smaller rise of Rs. 65 crores (demand Rs. 56 crores and time Rs. 9 crores) at Rs. 1,892 crores, compared to a rise of Rs. 254 crores (demand Rs. 23 crores and time Rs. 231 crores) in 1959. But this was really due, in the main, to the change in the accounting procedure of the deposit accruals arising out of PL 480 imports. With effect from May 12, 1960, it may be noted, these counterpart funds,

which were till then being deposited with the State Bank of India, are being deposited with the Reserve Bank of India. Beginning from July, 1960, the past accumulations of these funds with the State Bank of India also are being transferred to the Reserve Bank of India in monthly instalments of Rs. 12 crores each. Inasmuch as these funds were being invested by the State Bank in Government securities, the new procedure is naturally reflected in the fall in investments of scheduled banks by Rs. 113 crores to Rs. 674 crores, as compared to a rise of Rs. 150 crores in the previous year. Owing to more funds being impounded by the increased reserve requirements, the liquidity of banks showed a rise over the year of Rs. 21 crores to Rs. 135 crores, compared to a decline of Rs. 5 crores in 1959. Thus, the cash ratio improved from 6.2 per cent to 7.4 per cent. The increase in bank credit, coupled with a decline in deposits, put up the credit-deposits ratio from 52.8 per cent to 61.1 per cent. The investments-deposits ratio, however, declined from 43.1 per cent to 36.8 per cent.

Work Study and Minor Irrigation Works

THE current issue of "The Eastern Economist" Blue Supplement deals with the application of what has come to be called "work study" in relation to minor irrigation works in the four southern States of the Indian Union. Only the four southern States have been chosen because it is there that tanks exist in abundance, and it would seem that, in most cases, they admit of the utilisation of the simple principle which has proved most effective in reducing capital costs in tank maintenance in the country. This principle is the utilisation of revolving fund to do desilting, which reclaims a portion of the tank bed, the sale of which provides most of the resources for the desilting operation. In one particular case, that of Hebbal tank in Mysore State, the process has been finally completed and the original project triumphantly vindicated. Something like a minor miracle has been achieved. Whereas the original estimate by leading Mysore engineers suggested that for desilting of the minor tanks of the Mysore State alone over a hundred crores of rupees would be required in the form of a fund, it now transpires, using the new principles—fully explained in the following article, "Hebbal, A Case History"—a revolving fund of Rs. 5 crores might be sufficient. This discovery has been made by the application of inspired commonsense to a particular challenge, and calls for no superior engineering knowledge or mystifying technological courses in work study and management.

The moral is, that great savings of capital in a country which is desperately short of capital, and great additions to employment in a country which is desperately in need of employment, need not wait in every case upon the receipt of foreign exchange and technological know-how from abroad. Collectively, the desilting of India's tanks and the maintenance of canals will accomplish as much as all our irrigation under

"major" works in the first two Plans. This is a sobering and, at the same time, an exciting thought. Not indeed, that major irrigation works can be abandoned, since they have flood control and power implications no less than irrigation potential. But quite an issue of planning is involved in the choice of irrigation works and the extension and maintenance of minor irrigation works when capital is desperately short and foreign exchange even more so. One of the most interesting results of the present developments effected under the inspiration of the Committee of the Plan Projects has been a recognition that major headway can be made in the economy of both foreign exchange and rupee capital so far as irrigation and building are concerned.

The current Blue Supplement deals only with the problems of minor irrigation works, but it very far from exhausts even the sub-section of construction. Seeing the remarkable economies that have been effected in this area, one is tempted to argue that the whole field of construction, particularly, factory buildings and dams might come within the orbit of similar capital-saving suggestions. Indeed, a remarkable instance has already been put in operation in the factory of Heavy Electricals at Bhopal.

In publishing this first Blue Supplement on the application of these methods to minor irrigation works "The Eastern Economist" wishes to pay belated tribute to the remarkable work which is being inspired by the Organisation and Methods Division in the Home Ministry, the Economy Division of the Finance Ministry and the Committee on Plan Projects. One of the most dramatic achievements of the Second Five-Year Plan is the creation of this unit, small and unpretentious, but effective beyond description.

Hebbal: A Case Study

THE Minor Irrigation Team of the Committee on Plan

Projects in its report on minor irrigation works in Mysore State has suggested that desilting of the tanks be combined with reclamation of land. The advantages of this would be that there will be saving in evaporation losses on reducing the water spread by reclamation of the land near the foreshore. The lands so reclaimed will be available for cultivation. It would also increase the capacity of the tanks which will provide more assured water to the ayacut and restore the ayacut which might have gone out of tank cultivation due to the siltation of the tanks. The present position is that there are 35,000 tanks in the integrated State of Mysore. Some of these tanks have got water spread many times more than the ayacut commanded by them. On account of considerable siltation in these tanks, their effective capacity has been considerably reduced with the result that the settled ayacut cannot be irrigated properly. The team has suggested that the reclaimed land wherever it belongs to the Government should be sold and the returns thus obtained be utilised towards taking up similar schemes on other tanks. In this way a revolving capital fund is expected to be created which will enable the restoration of tanks to a greater extent than what is possible at present.

For experimental purposes two tanks, namely, Hebbal and Sulebele were chosen and work was started on these in April 1959. So far as Hebbal tank is concerned it has a capacity of 107 units with a water spread of 180 acres and an atchket of 169 acres. In case of this tank where the full tank level is not being raised the total quantity of earth to be desilted is the equivalent of 7.6 units giving an actual gain in the capacity of the lake of 2.49 units. The area to be reclaimed is 41 acres. The area released for cultivation (vide map below) is near the Agriculture College and is expected to fetch a price of Rs. 4,000 to Rs. 5,000 per acre. In case of Sulebele tank the full supply level of

the tank is being raised by 2 ft. by increasing the height of the main bund. This is being combined with reclamation of some marginal lands. The original capacity of the tanks was 74 units and the present capacity is 26.5 units. The new capacity would be 61.5 units. In this particular case the increase in capacity is mainly due to raising of the full supply level. An area of 39 acres is proposed to be reclaimed on this land. In the two tanks where experimental work had been taken up a jack bund 4 ft. above full tank level is being put on the periphery of the land reclaimed. Thus some silt from the bed of the tank is put in the jack bund above the full tank level, which adds to the capacity of the lake. The question is whether the jack bund is desirable or not. The jack bund constructed on the side of the valley from where the water enters the lake will serve to guide the water but on the foreshore there is a possibility of this jack bund obstructing the drainage of marginal lands.

It may be noted that tanks in Mysore State not only store water to be utilised directly for irrigation but also help in raising ground water-table downstream of the tank. This raised ground water-table comes in handy in doing irrigation by means of open wells. This aspect is quite important as the existence of a tank in many cases has enabled more irrigation to be done than obtained by direct flow from the tank. The progress so far at Hebbal tank is that about 7,500 c. yds. of silt have been removed and about 41 acres of land has been reclaimed in the foreshores of the tank thus reducing the evaporation losses by about 26%. At Sulebele tank about 1,19,400 c. yds. of silt has been removed from the tank bed and about 16 acres of fertile land has been reclaimed in the foreshore of the tank. The balance of area will be reclaimed in 1961 and land raised to the required level when the water level goes down. The outlay so far incurred is Rs. 1,10,000 against an esti-

mated cost of Rs. 1,22,500. Evaporation losses are said to have been reduced by about 37½%. Though the cost of reclamation is Rs. 1,500 per acre, it is found that the adjoining lands are worth Rs. 8,000 to 9,000 per acre.

The team has further suggested that before any reclamation or desilting work is undertaken, a contour survey not only of the tank but of the marginal lands for some distance above the full tank level should be made. This will help in selecting the land for reclamation. In a tank where water is coming from all sides of the foreshore the construction of a jack bund may cause obstruction to drainage of the surrounding lands. Careful observation should be made of the flow of water into the lake where reclaimed lands have been surrounded by jack bund. Where no jack bund is built the reclaimed land should be raised and given a reverse slope to prevent the fresh earth from washing into the tank. Along the periphery a strip of about 20 ft. put

under grass as soon as the earth work is finished. The desilting should be as far as possible be done from the lowest level corresponding to the sill level of the irrigation outlet. But this may increase lead considerably, where work is done by the manual labour, the borrow-pits should be about 50 ft. away from the periphery of the reclaimed land. These borrow pits dug preferably to sluice sill level should be connected with the deeper part of the lake so that they will get drained as the lake level goes down. The cheapest methods for desilting should be adopted and the desilting work should be started in good time. The use of suitable wheel-barrow where lead is long should be considered. In view of the results of the experiments so far conducted the team holds the opinion that the scheme of desilting-cum-reclamation may be implemented according to a phased programme for the restoration of large number of tanks in the State forming an integral part of the Irrigation schemes in the Third Five-Year Plan.

Minor Irrigation in Madras State

MINOR irrigation has received greater attention in Madras State than in many other States of the Indian Union for the simple reason that the average rainfall in the different districts of this State has been very low, ranging below 38" and going as low as about 32" in more than half out of its thirteen districts. Another compelling factor is the marked concentration of large-scale irrigation works which has tended to be confined in the Western region of the State. The State Government has shown great energy, determination and drive in preparing schemes for different types of minor irrigation works and implementing them. It will be news to many that the benefits of technological aids have been carried in the realm of minor irrigation and Madras State can boast of the highest number of electrically operated pumps for well irrigation in this country. An important feature of minor irrigation development in Madras is a high degree of correspondence between schemes of expansion or revival adumbrated in the Second Plan and their execution. The State Government has a clear picture of its requirements of restoration, consolidation and development of minor irrigation programmes. This picture has been made still clearer by the neatly prepared technical report of the Minor Irrigation Team, appointed by the Committee on Plan Projects.

Trends in the fluctuating conditions, which different types of irrigation works have undergone from time to time in Madras State, disclose that the pattern of irrigation has become fairly well-defined and fixed (though not inflexible), owing to experience extending over the centuries. The most outstanding feature of river valley irrigation in Madras is that the rivers flowing through the State, whose waters are exploited to irrigate land, have their sources in Mysore State. Nevertheless, a large degree of understanding, co-operation and accommodation in constructing works on these inter-State rivers was generally not lacking. As far back as 1892, the pre-reorganization States of Madras and Mysore concluded an agreement to define the limits within which irrigation works could be undertaken by Mysore State in the various river valleys because these inter-State rivers offer additional scope for expanded irrigation and held a promise of increasing the benefit to Madras State, situated as it is in the relatively disadvantageous position to enjoy riparian rights as the sources of the rivers are located Mysore State.

The pattern of utilization ought to be surveyed in brief. For several centuries past the anicut systems have been in vogue and water has been used to the

maximum availability for cultivation. The Grand Anicut and the Upper Anicut across the Cauvery are conspicuous instances of this system being in use over a very long time. The rivers from whose waters acreage in excess of 1,00,000 has been irrigated by means of the anicut systems are Cauvery (15,12,489 acres), Vaigai and Periyar (2,49,000 acres), Palar (1,72,746 acres), Tambaraparani (1,16,000 acres) and Vellar (1,06,230 acres).

Dams and channel systems have been constructed in relatively recent times with emphasis on large reservoirs and naturally they have been selected on the western side of the State to draw upon the waters of the Mettur, Lower Bhavani, Amaravathi, Krishnagiri, Satnur and Vaigai. The scope for sites for locating large reservoirs is now fairly exhausted and not much development in this direction can be expected.

In the flat regions of the State, water has been drawn from streams through the device of open channels. These inundation canals are largely used for feeding the tank systems and irrigating small areas. About 283 tanks were supplied by 58 channels of this type and they protected a total ayacut of 1,00,555 acres. Wherever beds of streams possess ample deposits of sand and also allow good surface flow of water, spring channels are dug below the belt from time to time. This type of irrigation is highly developed in the district of North Arcot and Chingleput.

Utilization of subsoil water is easily a popular means of minor irrigation because in Madras State, as in the rest of India, well irrigation is in vogue from time immemorial. But with the availability of power, lift irrigation from well water by means of power-driven pumps has been making remarkable strides. There is an aggregate of 7,09,004 wells in the State, of which the major proportion is privately owned, but as many as 4,214 wells are under Government ownership. An outstanding feature of well irrigation in Madras State is that among the private wells as high a number as 5,45,246 are pucca masonry wells. Well irrigation claims 21.2 per cent of the total irrigated area of the State. There are extremes in Madras in the matter of availability of lift irrigation facilities, depending upon the range of rainfall. In Coimbatore District, where total rainfall is as low as 28.21" per annum, wells have to be dug deep and wide, some of them being 100-150 feet deep.

Madras has captured the pride of place in the matter of rural electrification. By the end of the Second Plan at least half of the villages will be electri-

fied and total rural electrification is envisaged in the Third Plan. One of the most tangible benefits of rural electrification, which goes directly home to the peasant, is the utilization of electricity as motive power for well irrigation. The remarkably rapid extension for power lines from the State Electrical Grid has been responsible for giving an unprecedented impetus to the use of pump sets for well irrigation to replace the uneconomical, and cumbersome traditional mode of lift irrigation. Under the State Electrical Grid, 75,000 pump sets for well irrigation were electrically operated early in 1959 and by March this year a total of 1,00,000 pump sets under the same grid will be completed, in toto.

On the sea coast, where fresh water is available and sea water does not injuriously affect the areas, sandy regions get the benefit of installation of 'filter points'. This system of filter points on the coastline was started about 10 years ago and in the First Five-Year Plan 2,671 filter points were sunk, each point serving an area of 10 acres.

Easily the most outstanding feature of minor irrigation works in Madras State is the ancient system of tanks across the streams. Towards the end of 1959 there were as many as 32,318 tanks in the present Madras State out of which Ramnad District claimed the highest number of 6,686 tanks. A clear idea of the spread of the system of tanks in Madras State can be gathered from the following tabulation:

Name of District	Area in sq. miles	Number of tanks	Total Rainfall (Inches)
Madras	49.74	—	50.78
Chingleput	3,060	2,909	46.70
South Arcot	4,208	2,917	46.78
North Arcot	4,654	3,421	38.01
Salem	7,058	2,550	32.33
Coimbatore	7,090	127	33.61
Tiruchirappalli	5,505	5,656	34.70
Tanjore	3,738	859	44.39
Ramnad	4,825	6,686	31.71
Madurai	4,869	4,326	31.92
Tirunelveli	4,338	2,929	29.83
Nilgiris	989	—	74.45
Kanyakumari	640	1,107	40.00

Although tank irrigation has been the most familiar minor irrigation in Madras State, absolute and positive conclusions cannot be drawn merely on the basis of the above table. This is for the obvious reason that the thirteen districts in the State do enjoy, at least many of them, the benefit of other minor types of irrigation as well as of the major irrigation schemes. But certain broad inferences can be suggested. Where rainfall is very poor, as in Ramnad and Madurai Districts, the number of tanks which are sunk is conspicuously large. But we get the contrary case of Coimbatore district where the rainfall is low at 32.61", but, even so, the number of tanks is of the marginal order of 127—a little more than one-eighth of the number of tanks in Tanjore which enjoys fairly high rainfall of 44.39". South Arcot, Kanyakumari and Chingleput illustrate districts with relatively high rainfall, accompanied also by a large network of tanks. The explanation of the large number of tanks in spite of comparatively good rainfall is to be found in the popularity, economy and tangible results from tank irrigation.

But about tanks it would be an error to be guided about their present effective contribution to irrigation merely by their number. Most of the tanks until recently were zamin and as such they have fallen into

a condition of great disrepair owing to uninterrupted neglect and absence of escape arrangements. Over the decades, quite a large number of tanks have suffered serious deterioration due to continuous silting which has rapidly diminished their storage capacity. However, attention has been focused on improvement of these tanks and their full restoration and, in some cases, their resuscitation has been or is being taken in hand.

The immediate problem is to provide more facilities than the existing ones of small irrigation works in order to step up agricultural production in general and food production in particular. In this problem, restoration of storage capacity of tanks to its maximum by undertaking repair programmes etc. is certainly entitled to priority and in fact it has received it at the hands of the State Government. The Government has in its possession very useful documentary information in respect of tanks in the form of Memoirs. These Memoirs have been prepared several years back, and therefore, the work of planning schemes of restoration is being considerably facilitated. However, there is one handicap. Large irrigation sources, which belonged to zamindars, and are now taken over from them by the Government, have no Memoirs compiled in respect of them. To take this work in hand and bring it up-to-date is quite essential and it has already been started. In one respect data about tanks in Madras are incomplete. The ratio of waterspread area of tanks to area of ayacut is not available, but some sample surveys have been carried out. They cover 245 tanks which show that the ratio of waterspread to ayacut in the case of these 245 tanks works at 1 acre waterspread to 1.30 acres of ayacut. In Andhra State, which formerly formed part of Madras State, this ratio was the same, i.e., 1 acre of water spread to 1.30 acres of ayacut. The Team therefore has assumed that the ratio of 1:1.30 which has been worked out in the case of the 245 tanks may be taken as representative of the tanks in the State in general. On this basis the 33,687 tanks which have an ayacut of 22 lakhs may be presumed to have a waterspread area of 17 lakh acres. This large waterspread acreage raises problems of losses through evaporation as well as percolation. However, research into prevention of evaporation losses is in the experimental stage in India and this problem cannot be given priority at the present time.

The Madras Government has already started projects of desilting in selected tanks. At the present time, this work is being carried out on an experimental basis, but experience gathered so far and factual data compiled in its course are bound to prove of considerable help in strengthening and accelerating the programme. It is precisely in this sphere of restoration of tank capacity that concentrated effort and liberal outlay ought to be expended. Other works of improvement of minor irrigation projects are of relatively lower priority. At the present time the main purpose of the scheme of desilting is to restore the storage capacity of tanks and to bring the benefits of irrigation to rapidly increasing areas within the reach of tanks. Reclamation of land is not now included as the major objective of the tank improvement programmes. But the conviction is gaining ground that desilting and reclamation should be pursued as integral parts of a joint programme. The Team has strongly recommended that tank improvement projects should be given a positive re-orientation in the direction of desilting-cum-reclamation programmes. This would mean that the silt which is removed from the tanks would be used for raising the fore-shores of the tanks. This operation would result in deepening the tanks and reducing their size. Simultaneously with a reduction in the size of the tanks, it would be possible to reclaim areas of land now lying under them. The current costs of irrigation in the

State are high and on this score desilting is justified as providing extra irrigation.

Undoubtedly of great significance are certain estimates made by the State Government and the Team about the boost which desilting-cum-reclamation of tanks would give to food production. On the assumption that reclamation works would bring about 15 per cent of the land now lying under the tanks for cultivation, it would be possible for Madras State to release something like 2.5 lakh acres of cultivable land. Making the most conservative estimate that 1 acre would yield 1 ton of food grains, 2.5 lakh acres of land liberated from tank coverage would yield 2.5 lakh tons of foodgrains.

The benefits accruing from the joint operation of desilting-cum-reclamation schemes have so much impressed the Team that it has argued a strong case for strengthening the hands of the State Government in undertaking it on a bigger scale than at present. This scheme eliminates costly operations of acquisition of land for cultivation, saves large areas on the margin which are now water-logged by reclaiming and using them for irrigation and, above all, it makes possible to meet the outlay on the schemes by means of sale of reclaimed land — nearly 15 per cent now going to waste under the tanks.

To reduce current high cost of desilting schemes by combining reclamation with it, the Team has made

a very valuable recommendation. At the present time desilting-cum-reclamation schemes cover patta lands and the result is that, while the pattadars of the fore-shore land get permanent improvements to their lands by reason of the permission they grant to the Government to deposit the earth on their lands, the costs of the operation are borne by the Government. The Team has laid great stress on the fact that, since the beds of tanks also include peramboke land (government-owned land), reclamation should cover paramboke. The object is that such reclaimed paramboke could be put up to sale at high prices chargeable for irrigated land to meet a good part of the cost of the tank improvement schemes. In fact, extension of desilting-cum-reclamation schemes to paramboke lands is the most conspicuous and important recommendation made by the Team. This would expedite the completion of the operation of restoration of tanks to full capacity. Also, another suggestion has been made by the Team to the effect that the State should exercise the right of imposing the betterment levy in the case of patta lands which benefit from the scheme. As an alternative to the betterment levy it has suggested that a contribution lower in rate than the betterment levy should be recovered from the pattadars for the benefits they would receive from desilting operations. Reclamation of paramboke land now covered by tanks, it is urged, should be accomplished according to a phased programme during the Third Five-Year Plan. Schemes of other types of minor irrigation improvement have also been indicated.

Minor Irrigation in Andhra Pradesh

IN May last year, the report of the Minor Irrigation Team appointed by the Committee on Plan Projects for study and investigation of the minor irrigation works in the State of Andhra Pradesh was released. The main recommendations of the team were:

- to implement the Master Plan of restoring old tanks.
- to utilise the subsoil water as well as the drainage water from the existing irrigation works as an extra source of minor irrigation,
- to recover the capacity of tanks lost due to silting by raising the tank levels and adopting wherever feasible the Desilting-cum-Reclamation Scheme in order to reduce the area of submergence; and
- to revise water-rates to rational limits.

An attempt is made here to analyse the major recommendations of the Team.

Fiftythree per cent of the total irrigated area in Andhra Pradesh is covered by minor irrigation sources such as tanks, wells, etc., the rest of the 47 per cent being covered by major irrigation canals. The irrigated area, whether through major or minor sources of irrigation, constitutes hardly one-fourth of the total cultivated area. This may be illustrated with reference to the facts as they were at the end of the fiscal year 1959-60. Out of a total geographical area of 66.6 million acres, the cultivated area was 27.9 million acres—less than half of the total area. Out of the 27.9 million acres of cultivated land, the irrigated area was only 6.788 million acres. It will be seen thus that only 10 per cent of the total geographical area of the State was under irrigation.

The minor irrigation of these areas is predominantly carried out with tanks, which total 58,527 in number. The major crop raised is that of paddy.

Most of these tanks are under the supervision and control of the State. The Public Works Department looks after all tanks with an ayacut of 200 acres or more. The Revenue Department looks after the smaller tanks with ayacuts less than 200 acres. In the Telangana area of the State, all tanks with an ayacut of 100 or more acres are looked after by the ryots, but they are under the overall supervision of the Revenue Department.

The dependence of the State on the tanks for purposes of irrigation is too obvious to demand any amplification. It is necessary, therefore, to keep these tanks in good shape for increasing the output of paddy and other crops. In the Andhra region, not all the tanks are in good shape and they are much below the P.W.D. standard. So far only 40 per cent of the tanks have been improved so as to bring them upto the P.W.D.'s standards. Surveys need to be carried on for the remaining tanks for estimating the volume of repair needed in their case. Some of these tanks are in a very dilapidated condition, primarily because they were taken over by the State from the zamindars in 1950 and have not been looked after properly since then. There are no records available how these tanks were built and what their original standards were. In order to bring them to a level of efficiency fixed by the Public Works Department, it is imperative that systematic surveys of these tanks should be conducted so as to fix the standards up to which they are to be brought. Happily, in certain districts of the Andhra area, surveys of these tanks have already been taken in hand while in the other districts, the regular Public Works Department staff are supposed to be looking after.

A Master Plan has been prepared for the reclamation of these tanks. According to this Plan, a sum of Rs. 16 crores will be needed for the complete restoration of all the tanks and bridging the gap in irriga-

tion between "settled ayacut and actual irrigation". For the Telangana area, the estimated cost is Rs. 5 crores, while the cost for the Andhra region is estimated at Rs. 11 crores. The Second Plan provided for the Telangana region a sum of Rs. 1.6 crores and for Andhra region a sum of Rs. 0.7 crores. Total expenditure thus comes to Rs. 2.3 crores while a balance of Rs. 13.7 crores is needed for restoring all the tanks to P.W.D. standard. The entire task cannot be done in the Third Plan. A part of it, say, nearly 50 per cent will have to be done during the Third Plan, and the balance will be completed in the Fourth and the Fifth Plans.

The table below shows a detailed analysis of the manner in which estimates have been made in regard to the restoration of tanks under the Master Plan. The estimates are set out district-by-district, showing the total cost on the approximate basis of Rs. 160 per acre.

The Team has put in a strong plea to recover the capacity of the tanks lost due to silting. It has been suggested that in the case of such tanks, the level should be raised by building bunds, and waste-weirs. In order to reduce submergence, the desilting-cum-reclamation scheme which has been successfully practised in Madras, may be adopted. Another way to minimise the process of silting in the tanks is to cultivate crops in the areas surrounding the tanks.

Available statistics in regard to the development of irrigation between 1952-53 to 1957-58 show nearly 15 per cent rise in total irrigated area within six years.

MASTER PLAN FOR RESTORATION OF TANKS IN ANDHRA PRADESH

Grand Total			49,711		7,112	1,704	58,527	29,86,886

Major increase has occurred in irrigation by tanks wherein the rise is of the order of 50 per cent; as against the irrigation of land by tanks at 1.9 million acres in 1952-53, it has risen to 2.7 million acres in 1957-58. It is anticipated that after the Third Five-Year Plan, large additional area will be brought under irrigation, both under minor and major. The major projects of Nagarjunsagar and Siddeswaram on river Krishna and Pochampadu Inchampalli and Ippur projects on river Godavari are anticipated to give a push to the process of irrigation in the State.

While it is necessary to conserve the available water resources available for irrigation in the State, the fact remains that a large cultivable area is likely to remain outside the irrigation pattern. In the case of such areas, possibilities of maximising agricultural output in terms of value needs to be explored. The team analysed the problem of return from various crops to the cultivator and came to the conclusion that non-paddy crops like maize, groundnut, cotton, ragi, wheat, vegetables and fodders yielded equally good returns per unit of area as compared to paddy. While the per acre return from paddy crop was estimated by the Agricultural Department at Rs. 40 to 70, the corresponding yields for other crops were:

Wheat : Rs. 60 to 90
Onions : Rs. 80 to 100
Tobacco: Rs. 140 to 300

Lift irrigation in the State also provides a good scope for irrigation. Pumps can be installed at the

existing successful wells, at the sites of new wells, in the low lying canal areas and in the streams. Lift irrigation, however, depends for its spread on electrification of the rural areas. Until electricity penetrates into the rural areas, diesel engine pumps could be pressed into service. Co-operatives could be encouraged for setting up these pumps so that even the small farmers could make use of these facilities.

Both these suggestions, namely, changes in the cropping pattern and lift irrigation will be advantageous in more than one way. They will not only bring more area under irrigation but will also provide larger income to the cultivators, higher revenue to the Government, increase the value of land, minimise the chances of water logging and institute improved utilisation of water which has hitherto not been exploited to the maximum.

Minor Irrigation Works in Kerala Economy

IN a State like Kerala which lies on the wind-ward side of the Western Ghats and where the minimum rainfall is about 60 inches, provision of irrigation facilities may sound an odd proposition. But since time immemorial need for providing irrigation in this State has been felt and not a few irrigation works have come down to the present day from the olden times.

The necessity of providing irrigation facilities in Kerala arises out of two factors. Firstly, though total rainfall is pretty heavy in all the districts of the State, its distribution over various months of the year is not uniform. Over half the annual rainfall is concentrated in the "Viruppu" season which starts in May and ends in August. Nearly one-third of the yearly rainfall is received in the "Mundakan" season, from September to December. The first four months of the year, from January to April, are mostly dry. The second imperative calling for provision of irrigation facilities is that the main crop that is produced in this State is paddy which requires large quantities of water to mature.

There are six types of minor irrigation works that

have been made use of in Kerala. The oldest type perhaps is the **spring-fed tanks**—large ponds excavated beneath ground-water level so as to tap the natural springs at the upper end. From these tanks water is let out at the lower end and fed to paddy fields during the times when rains fall. These tanks in reality are open wells which look like tanks because of their largeness, shallowness and presence of canal sluices at the lower end. Many such tanks lie across natural drainage valleys. To avoid breaches by storms, sometimes a part of the storm flow above a certain level is admitted into these tanks from the upper end and allowed to escape at the lower end through a "waste-weir."

The second type of minor irrigation works that have also come down from old times are **diversion weirs with channels**. They carry a good flow from May to February because of too heavy monsoons and deep soil mental.

Lately, of course, these two types of irrigation works have started yielding place to **lift irrigation** for which the topography of the State is eminently suited.

able. Kerala's is a land whose topography is predominantly undulating with alternating hills and valleys; it is very seldom that vast contiguous stretches of cultivable land are available in the mid-land portions of the river basins. There are a large number of small plots located on the fringes of the rivers and spread all over the State. These blocks of land cannot be commanded by flow irrigation schemes because of the intervening low levels. Lift irrigation from adjoining rivers or streams, however, provides a ready answer for cultivation of these tracts.

The latest type of minor irrigation works to arrive in this State are **surface reservoirs** whose designs have followed more or less the pattern obtaining in the neighbouring States of Mysore and Madras.

In the areas bordering the numerous lagoons, estuaries and the back-waters that lie in the coastal region of the State, the problem of irrigation is slightly different. Most of the land in this region is below the mean sea level. It is flooded by fresh water brought over by the rivers in the monsoon season and is subsequently inundated by salt water when the river flow dwindles. The problem of this region has been tackled in two ways; firstly, by construction of works which act as **salt water barriers** and secondly, by diverting inflow of monsoon waters.

In some of the low-lying tracts in the State, which get flooded during the monsoon season, attempts have been made to provide some sort of **drainage** system. These last two types of irrigation works have not yet made much headway as the cost of their construction has been considered to be too heavy.

An idea of how provision of irrigation facilities in Kerala has progressed during the recent years can be had from the table given below. But still there is much scope for providing irrigation facilities in the State and harnessing of the monsoon flow that goes waste.

LAND UNDER IRRIGATION IN KERALA STATE

(In acres)

Sources of Irrigation	1951	1956
Government Canals	317,874	327,871
Private Canals	68,074	68,113
Tanks	72,286	77,400
Wells	25,726	28,499
Other Sources	259,628	309,380
TOTAL	743,388	811,063

In the middle of last year, the Minor Irrigation Team, appointed by the Planning Commission, submitted a report on a future irrigation programme for the Kerala State. The report contains a number of useful suggestions which if carried out can yield much fruitful results.

PROGRESS OF IRRIGATION IN KERALA STATE

Comparative Benefits from Second and Third Five-Year Plans

	Second Five-Year Plan Provision			Third Five-Year Plan Provision		
	Cost in lakhs of rupees	Gross area in thousand acres*	Additional food production in tons	Cost in lakhs of rupees	Gross area in thousand acres*	Additional production in tons
1. Medium Irrigation	133.68	182.00	29,300	340.00	136.00	45,300
2. Minor Irrigation	72.00	84.00	10,500	230.00	92.00	23,000
3. Lift Irrigation	28.63	38.00	4,750	230.00	184.00	46,000
TOTAL	234.31	304.00	44,550	800.00	412.00	114,300

* Received from C.E. (Irrigation) P.W.D., Kerala State. It has been clarified that gross area is twice the net area, since two additional crops are grown.

Among the minor irrigation works, the Team has laid great emphasis on lift irrigation. This it has done taking into consideration not only the favourable topographical features of the State, but also due to the fact that there is a large potential of hydro-electric power there which can be cheaply made available for this type of irrigation. To keep the operational costs of lift irrigation within bounds, the Team has suggested that pump sets for installation should be selected with a view to rendering most optimum performance under the particular condition of discharge and lift involved. The requirement, in the opinion of the Team, is likely to be mostly for lifting large quantities of water over small heads. For these conditions, the Committee thinks mixed flow or axial flow type pumps might be more satisfactory than centrifugal pumps. The Team has further recommended that pipe conduits and overhead ducts supported on trestles might be preferred to open channels.

The Team's suggestions for improvement of spring-fed tanks are equally noteworthy. It has recommended that to avoid silting of these tanks, wastage of land in their construction, evaporation losses and contamination of water in them, it would be appropriate that resort should be taken now to underground tapping of the springs by means of open jointed pipe-drains placed within a reverse filter, cutting across the springs and acting as a "percolation gallery." About the diversion weirs, the Team has suggested that attempts should be made to provide them with control gates as sometimes the increase in the flood levels due to afflux above these weirs is resisted by the people whose fields are submerged. The Team thinks that diversion weirs with channels are feasible in Kerala on a large scale and if these are backed up by storages, the benefits derived would be considerably enhanced. The Team has laid great stress on provision of appropriate drainage facilities in the low-lying tracts in the State and construction of salinity control works in the areas bordering lagoons, estuaries and backwaters of the West Coast.

The realisation is growing in the Kerala State for having minor irrigation works in preference to medium and large projects. This is evident from the following table.

Under the Third Plan it is proposed to increase the area under minor irrigation works, including lift irrigation, by 276,000 acres, whereas the additional area to be brought under irrigation by medium projects will be only 136,000 acres. This emphasis has obviously to be welcomed as minor irrigation works are easier to execute and cost much less than the medium irrigation projects do. They are particularly useful in this State for supplementing water supply from the monsoon rainfall during the first and the second paddy seasons.

Policy for Plantations

THE central argument of this Blue Supplement is that a greater sense of urgency must be brought to bear upon the formulation of a policy for plantations in the immediate future than what has been evinced in the Draft Third Five-Year Plan. A special characteristic of the plantation industry is that whether it is taken in its segment of tea or of coffee or of rubber, it does not admit of short-term planning. By its inherent nature each segment of the industry imperatively requires long-term planning because, if the technical jargon is to be used, the period of gestation is long. Essentially, therefore, planning for the plantation industry is a matter for perspective planning. It would be presumptuous to claim that the Draft of the Third Five-Year Plan has given full weight to this factor.

Easily, tea commands the first rank among the plantation industries. Tea will remain one of our major exports. The fact that it is a traditional export, but accent is now to be shifted partly to diversification of our export trade, will not make any mentionable change in the position which it occupies. This is not to suggest that Indian tea has got an assured place or share in the world market. Its position is being assailed to our detriment and this susceptibility to competitive onslaughts from other countries needs to be cured. India has the advantage of an expanding and large domestic market, which will sustain the industry and enable it to absorb the shocks of intermittent phases of depression in the export market. It is, therefore, of the utmost importance to expand and strengthen the home demand. Ceylon has demonstrated in the post-war period that, in matters of production as well as export, she could steal a march over India without extraordinary effort. This would indicate that the growth of Indian tea industry suffers from lack of an energetic policy and it would not be wrong to say it lacks an element of aggressiveness. A rational policy for tea requires, first, emphasis on quality, second, on competitive prices and also on intelligent publicity.

India's coffee industry has expanded at a reassuring rate, considering the fact that the popularity of this beverage was confined until before the last war to the South. An imaginative policy of propaganda during the war has succeeded in creating partiality for coffee in the other parts of the country too. The price of coffee needs to be made attractive. The truth of the matter is that what goes under the innocent name of "fringe benefits" to labour has raised the production costs of coffee and taxation has lent its weight to pushing up prices. The share of Indian coffee in the world export market is very modest. More recently, the decline in the export price of coffee and the move towards integrated policy adopted by the Latin American countries — the major producers — have combined to give a set-back to India's exports.

During the period of planning, between 1951 and 1960, the production of natural rubber in India increased from 24,206 tons to 50,694 tons. Expressed in terms of percentage, this is an increase of 108. No conclusion should, however, be drawn that it is a phenomenal increase for the very simple reason that the base is low. The hard reality of the situation is that if the scheme of replanting of rubber estates prepared by the growers in 1948 had been accepted, India would not have been driven to importing large quantities of raw rubber in a period of growing strain on her foreign exchange resources. This fact underlines the moral that domestic output is out of alignment with demand and that policy for expansion at the end of the decade should be planned boldly and imaginatively now. Something like 135 items of manufacture, which are beginning to come into importance in our industrial production, require rubber as one of their major materials. The demand for rubber is bound to go on shooting up. Meantime, production of synthetic rubber also demands parallel attention. In sum, policy for rubber requires to be conceived on an integrated basis.

Indian Tea's Falling Markets

BY V. I. CHACKO

WHAT qualities in the product, what organization and salesmanship in marketing, what kind of economic environment and what art and device in securing consumer response are required in the foreign markets for Indian tea? Whatever they are, they have never had a long-term, comprehensive and integrated consideration at any level in India in the past two decades.

Tea is the largest earner of foreign exchange for India and the most advanced segment of Indian agricultural enterprise. It has had an organized existence for over a century and the industry enjoys a standard of cultural care and marketing far superior to that of any other agricultural crop in India. More fiscal extraction is made from each rupee of tea earning than from any other industrial product. For all its apparent achievements and standing, strangely enough, it attracts less fresh investment and entrepreneurial interest than any other known industry in India with the probable exception of coal.

Some clue to the active forces which have played in the development of the tea industry must be looked for in its long past. It was in 1823 tea was found growing wild in Assam. By 1839 the first small consignment of Indian tea was sold in the London market. By 1857 only 3 per cent of the 69 million lbs. consumed in Britain was imported from India. The quantity was 2 million lbs. In 1900, out of the total British import of 249.5 million lbs; 138 million lbs or 55 per cent of it came from India. It was 60 per cent of the Indian production of tea in that year when all but 7 million lbs. were exported. In 1904, India displaced China as the world's largest exporter of tea. In 1934 when the world agreement on tea was reached, India was by far the largest exporter and the major partner in the International Tea Market Expansion Board set up in 1935.

TABLE I

TEA SITUATION IN THE WORLD MARKET

Year	Indian production (in million lbs.)	World production	% of world production
1935	394.4	918.7	42.9
1953	605.3	1464.1	41.3
1954	642.1	1663.7	38.6
1955	668.1	1725.3	38.7
1956	667.0	1810.5	36.8
1957	678.9	1771.2	38.3
1958	713.7	1948.7	36.6
1959	716.1	1984.7	36.1
1960	696.2	1980.0*	35.1

*Provisional

The Second World War and the subsequent political changes distorted the tea map of the world. Indonesia lost its pre-war production status, India lost some 74,000 acres by partition and East Africa became a factor of importance on the world tea market. If in 1904 India became the largest supplier of tea to the world market, it was exactly fifty years later that tea became India's No. 1 export. Today, at the pinnacle, tea is faced with a threat it never did in the entire course of its long history. Paradoxically, it is at a time when the industry produces India's leading export commodity that its economic base was being assailed more relentlessly than at any other time.

Among the many developments of the fifties the one having the most decisive effect on the future of Indian tea is the attitude, activities and organization of market promotion. Successful production, efficient management of the crop, skillful placing of the produce on the market, none of these by themselves or collectively will substitute the activities needed for building up consumer acceptance of the produce. The tea industry, depending as it does on a mass market, recognized this fact early enough and it was the first organized industry to concert measures for market promotion, at the beginning by voluntary efforts and since 1903 with statutory backing. In 1935, the participating countries joined together to set up the Inter-

national Tea Market Expansion Board with its headquarters in London. The withdrawal by India from this body in 1952 left 13 separate and worldwide campaigns hanging in the air. The following table shows India's position in the world market relative to her share in world export in 1935, 1953 and subsequent years up to 1960:—

TABLE II

INDIAN EXPORT AND ITS SHARE IN WORLD MARKET

Year	Indian Export (in million lbs.)	World Export	% of world Export
1935	329.6	842.04	39.1
1953	500.6	1039.2	48.2
1954	447.9	1096.6	40.8
1955	367.5	991.8	37.1
1956	523.5	1178.1	44.4
1957	442.6	1129.5	39.2
1958	505.9	1236.2	41.0
1959	472.5	1185.6	39.8
1960	421.6	1200.0	35.0*

(Source: Tea Statistics)

To take our closest rival in the tea market, Ceylon in 1935 exported 212 million lbs. as against India's 330 million lbs. Of the combined total, 38.9 per cent of the export were Ceylon's share as against 61.1 per cent of India's. By 1959 Ceylon had increased her share of the combined total to 44 per cent and India's was reduced to 56 per cent. Quantitatively Ceylon raised her export in the 25 years since 1935 by 171 million lbs. as against 142 million lbs. reached by India. But what is significant is the differential shifts in their relative export positions. Since 1952, after the Indian disappearance from the I.T.M.E.B., Ceylon increased her exports by 69 million lbs. in seven years when India achieved an increase of only 57 million lbs. Taking production, Ceylon achieved a 90 per cent increase by 1959, over 1935, as against India's 80 per cent, but during the seven years 1952 to 1959 their increases in production were by 16 per cent for India and by 30 per cent for Ceylon.

Tea has always been an export industry although a large home market has been developed in India over the past half a century. In 1959 it was estimated that 243.6 million lbs were retained for home consumption and this figure may have gone up to 274.6 million lbs. in 1960. The following figures give an idea about the growth of internal consumption although occasionally, as for instance in 1955 and 1956, figures relating to retained quantities have been distorted by other causes.

TABLE IV

GROWTH OF INTERNAL CONSUMPTION

(in million lbs.)

Year	Production	Export	Retained
1939	466.1	337.4	128.7
1946	579.3	333.3	246.0
1951	629.2	454.1	175.1
1952	614.4	414.8	199.6
1953	614.6	500.6	114.0
1954	651.5	447.9	203.6
1955	678.4	367.5	310.9
1956	680.6	523.5	157.1
1957	685.2	442.6	242.6
1958	713.7	505.9	207.8
1959	716.1	472.5	243.6
1960	696.2	421.6	274.6

There are two lines of thinking about an export policy for tea which have alternated in importance from time to time. One was that the internal market is all important and that tea as a primary commodity

of international trade in the colonial era, has no great role to play and national attention must be concentrated on manufacturing industries. The other line of thinking which has suddenly become prominent is that the tea industry must maximise its exports irrespective of the consequences of such a policy on the internal market.

Any quantitative increase in exports to a market which is not prepared to accept it can add little to India's external trade income and may only help to weaken the world tea market. A restrained export policy which allows only that quantity the world market could easily absorb might improve the tone in the market, but its benefit may accrue to the produce of other countries who are able to sell at lower prices. A rational export policy therefore clearly hinges on a preparation of the export market for the acceptance of increased Indian tea. In other words, Indian tea should be promoted in the world market to create that acceptance and production and export policy should be tied in to keep up with the growth of both the export and home markets.

A historical perspective of past errors in assumption, practices and experience is necessary to correct future conduct whether in policy or practices. This is as true in framing a sound tea policy as in the framing of any other policy. The setting up of the Indian Tea Cess Committee in 1903 was a turning point in the industry's history. So was its participation in the International Tea Agreement and in the I.T.M.E.B. When India withdrew from the Board in 1952 it was stated that the Government's policy was to promote Indian tea as such in the world markets. In fact, tea promotion between 1897 and 1935 was on the basis of country of origin and this was given up in 1935 for the reason that with the rise in packet teas there was no purpose in propagating teas by countries of origin. The Government's withdrawal from the I.T.M.E.B. in 1952 signified that it was intending to go back to a principle for which the world market was not prepared for a very long time to accept. How far the Government took this purpose seriously is open to doubt as in 1953 it agreed to a joint campaign in the USA with the US tea trade, Ceylon and Indonesia for the promotion of tea without reference to countries of origin. This sound decision was followed by similar joint councils in Canada, West Germany and elsewhere.

No campaign was however considered necessary either jointly with other producing countries or alone for India in the world's principle markets viz., Great Britain; or in other markets like Australia, New Zealand, Egypt and the Middle East for several years. As Table III shows, our exports to UK have dropped from 354.9 million lbs. to 282.6 million lbs in 1959 and was 260 million lbs. in 1960. India's exports to Australia and New Zealand have practically remained stationary at about 8 million lbs. over the eight years; we lost ground in Eire, Canada and USA, and but for special exchange agreements, it is doubtful whether Egypt and Iran would have been better buyers of Indian tea. Indian tea seems to have lost its hold in its traditional markets, as it has in the world balance of tea production and export. As against India's exports to these markets, their individual imports should indicate whether tea has generally lost ground in any of these.

TABLE IV

IMPORTS FOR CONSUMPTION IN
MILLION POUNDS

	1953	1954	1955	1956	1957	1958	1959
UK	492.8	542.2	499.3	513.6	594.0	588.3	518.3
Eire	16.4	25.7	26.0	13.0	27.5	19.1	22.2
New Zealand)	74.7	75.6	66.6	67.6	78.2	74.6	74.2
Australia)							
USA	108.1	114.7	105.2	100.5	102.4	103.4	109.6
Canada	45.8	44.9	42.5	46.2	46.8	44.5	45.5
West Germany	8.0	10.5	12.0	13.3	13.4	13.8	14.0
Iraq	26.8	27.9	29.2	28.8	29.2	27.1	34.2
Iran	7.3	10.2	22.3	16.1	29.4	25.6	20.7
Egypt	44.4	35.9	37.9	31.2	34.7	50.5	42.8
Total	824.3	887.6	841.0	830.3	955.6	946.9	881.5

3 years average: 850.9 852.9 875.6 910.9 928.0

It is clear that even a minor shift in UK imports determines to a great extent the total world tea position and in that particular market we have not had a propaganda organization from 1952 to 1960. The total world export of tea has increased from 1039 million lbs to very nearly 1200 million lbs by 1960 but India did not gain by this increase.

Was it a mistake to have suspended tea propaganda efforts in 1952 or was India's loss in the world market due to other causes? Less skilful marketing? Higher prices? Lower quality? Perhaps some or all these defects may have been present in varying degrees in different years. But it is doubtful if anyone can overlook the fact that tea lacked a steady, long-term and comprehensive economic and promotional policy. The thinking required for forging that kind of policy has to come from different groups from the producers, from the Board and the Government.

It is clear that a concept of static production against the demand for maximization of exports would lead to the argument that internal consumption should be held in check in order to maintain exports. Those who argue that the home market should be vigorously expanded without accepting that total production should increase very markedly are surprisingly enough adherents of the static concept as are the maximisers of export. The arguments have only to be juxtaposed in order to show that the solution lies in vastly expanded production. With that we enter into the domain of tea economics, the facts of which must be considered before any sound policy can be framed to achieve the expansion required. But, before the question of propaganda can be further discussed it is useful to know quite clearly whether the policy in

respect of production and export is based on sound grounds.

TABLE VI
CROP LEFT OVER FOR DOMESTIC CONSUMPTION
AFTER EXPORTS

	(in million lbs.)				Average of last 3 years
1939	..	..	..	..	89
1949	..	..	..	..	189
1953	..	..	..	..	206
1954	..	..	..	..	173
1955	..	..	..	..	173
1956	..	..	..	..	207
1957	..	..	..	..	222
1958	..	..	..	..	235
1959	..	..	..	..	203
1960	..	..	..	..	231

Whereas production increased by 230 million lbs in the interval of 20 years, domestic consumption increased by about 200 million lbs. The figures relating to 1960 are likely to lead to errors as the North suffered an exceptionally bad drought and crops were heavily down during the year. Taking the maximum output of North and the South at 564 (1959) and 170 million lbs. (1960) respectively (total 734 million lbs.) the increase in production was 268 million lbs. or about 68 million lbs. more than internal consumption increase in the 20 years. During the same period Ceylon increased her exportable production by 180-million lbs. The question of an export drive is tied up with a production drive and this realisation may bring about a whole series of changes in land, labour and fiscal policies. That does not of course dispose of the hard core problem of market promotion.

Once the imperative need for the maximization of export is accepted and tea is recognised as undoubtedly the principal export commodity of India for many years to come, its corollary, the maximisation of production, will be a requirement difficult to reject. There is considerable resistance to the idea that the internal market should be expanded. This resistance is understandable but it cannot be overcome unless it is recognized that the whole object of greater production and export might be defeated by the ever present instability of an imbalanced dependence on the world market. The home market could provide the balance and stability that an enlarged export and production effort entail in tea economy. Paradoxical as it may seem, the bigger the home market, the larger the export effort, because that effort will rest on a large and stable home base.

One of the best things that can happen to India is to raise a crop of skillful articulators, publicists and propagandists skilled in all arts connected with the sale of goods and ideas. An export drive will make great demands on such talent and it must be home grown. Experience in the promotion of home market provides for the creation of a reservoir of such talents. But talents do not flower and bloom under conditions of control and regulation, by rigid adherence to rules and procedures. It requires a different kind of environment and climate. The organization of a propaganda drive for tea provides the opportunity for building up a large domestic market on which can rest our export drive. Then our export drive can be powered with the talent and experience gained in the home market.

Once the policy regarding propaganda is decided upon it is desirable to recognize that the actual conduct

of market promotion work is totally different to line administration in character, tempo, functions, talent and work methods and it requires a very high degree specialization. Modern publicity harnesses many talents and skills to make itself effective and nothing can make the propaganda drive more a costly failure than a non-recognition of these facts. Publicity is costly, but it has also to be planned on a long-term basis. Unless a long-term plan is carried through despite apparent lack of spectacular results, it is better not to initiate one. Those who often point to the US campaign as a very costly one which achieved no result forget two essential facts of that market. In 1900 the US consumption of black tea was 3 per cent of its total consumption. In 1958 the percentage of

black tea consumed was 97 per cent of the total tea. This transformation was achieved by sustained propaganda for black tea. Another factor is the powerful drive conducted on behalf of other beverages which makes the tea effort a relatively minor one in that market.

Let us look at the cost of market promotion. Assuming that our 700 and odd million lbs. of tea fetch an average of Rs. 2.50 per lb. and market promotion costs about Rs. 70 lakhs annually, the outlay per pound on this account is 1 nP. or 1/250 of the value of the produce. Consumers are wooed at much greater cost by other commodities in the world market. Indian tea deserves the backing of far greater resources in talent and money than it has received if it is to hold its own and move ahead in the sixties.

The Plantation Boards

THERE are those who view the Plantation Boards as highly useful to the industry with all their defects and those who look upon them as an unavoidable fifth wheel in the affairs of the industry. Both these views, in all probability, are of course, like their kind, a little away from the truth. Whatever the differing views there is no doubt that the origin, growth and present activities of the Tea, Coffee and Rubber Boards provide a unique record of achievements and failures, frustrations and fulfilments. Any serious student of modern industrial organisation in India is not likely to overlook the special position occupied by the Boards as a factor in the development of these industries.

The first statutory committee to be set up for a commodity was 59 years ago in tea. It took many years of agitation and representation by tea interests before the Government of India enacted the Indian Tea Cess Act, 1903 by an Order in Council. The Tea Control Act of 1934, the Indian Coffee Cess Act of 1935 and the Rubber Control Act of the same year were the original statutes governing certain aspects of the plantation industry. These original enactments have of course undergone several amendments, the latest being the consolidating Act of 1953 when the Tea Act was passed in place of the Tea Control Act and the Indian Central Tea Board Act. This was followed by the amended Coffee Act and the Rubber Act of 1955.

During this period of 52 years, the role and character, even, perhaps, the purpose of Statutory Commodity Boards have undergone great and fundamental changes. Were these changes in the right direction? Are the purposes of the industry better served by them? These are matters on which considerable differences of views will continue to exist but there can be no question that, if the Boards are controversial, they are also, as an experiment both in organisation and functions, of great interest.

Historically, the initiative for the creation of these Boards came from the producers. They would not have been able to express with any force a demand for the setting up of an organisation of this nature, were they not themselves organised. In seeking statutory support for certain industrial needs, the producers of tea were admitting the limits of free and voluntary organisations. There were certain areas of managerial functions in the tea industry which required statutory sanction.

Producers of tea in India recognised the need for publicity on behalf of their produce as early as in the late eighties of the last century. They organised campaigns by voluntary subscriptions only to find that the recognition of a need is one thing, but the acceptance of the burdens involved is another thing. It was the failure of voluntary subscription as a method of financ-

ing the tea propaganda campaign which led to the request for legislative compulsion.

The object of the original Tea Cess Act was merely to take power to collect a duty of custom on the tea exported and the responsibility of the Government ended when the proceeds of the cess were handed over to the Committee set up to handle it. That Committee consisted entirely of representatives of producers of tea. There is of course nothing in common between the original Tea Cess Committee and its functions or of the Tea Cess Act and its simple object and the present Tea Act and the composition, character and functions of the Tea Board. The same is true of the other two Boards. In 1935 when the Rubber Control Act was placed on Statute the object to be served was control over planting and export which could not be undertaken satisfactorily by voluntary regulation. Similarly, when the Coffee Market Expansion Act came into being in 1942, it enabled action to be taken in an area where voluntary efforts by the producers would not have succeeded.

In 1947, when the Rubber (Production and Marketing) Act and the Coffee Market Expansion Act were permanently placed on Statute, certain fundamental changes took place. They enlarged the scope and functions of these Boards and placed on them responsibility for labour welfare, collection of statistical information pertaining to the crops, regulation of prices, organisation and conduct of agricultural research etc. Representation on the Board was widened further than the war time changes found necessary. Representatives of labour, consumers, the Governments of the States and the Centre and of the trade were included. Even then, the essential character of the Commodity Boards remained as producers' Boards although their position was considerably diluted. As it always has been before, long established producer associations were organically linked with the Boards by means of leaving the nomination of producer representatives to them under the Statutes. This allowed well-organised producer bodies to participate actively in the process of making decisions which would eventually affect their members by the fact that their nominees would have the backing of their deliberations and decisions on important issues.

The Statutes were themselves a fine blend of checks and balances which allowed the maximum latitude for autonomy, the normal management of its affairs by the Board itself, but providing for sufficient reserves of powers of scrutiny and check in the hands of the Government should the exercise of the autonomy be abused. These Acts seemed to recognise from the very beginning that the establishments that will grow up with the Boards will be a factor to be reckoned with. So, in order to ensure that those whose affairs the Board takes power to manage or regulate and whose interest in the working of the Board is constant and

whose presence is nearer to the Board establishment were given powers of appointment, control and discipline over them with the exception of the executive head of the establishment. Here the responsibility for appointment and his removal had to be shared with the Government. It was also provided that these executive heads could, if they felt the need, hold up the implementation of a Board decision until they obtained the view of the Government. This was sufficient break on any impetuosity on the part of the Board. The cess levied on the commodity for financing the Boards was available to them and they could use the fund in such manner as they thought fit for any purpose covered by the Act but the accounts were available to the Government for scrutiny and the Budget of the Boards had to be submitted to the Government. Without hampering the necessary freedom of action and scope for initiative, the Government was in a position to prevent any abuse of autonomy.

There are two basic assumptions in the successful operation of such autonomy. One is that the Boards will exercise their powers with restraint and public responsibility and the other that sufficient vigilance will be exercised by the Government in order to ensure that transgressions do not take place. This is a particularly difficult undertaking for the Government which is faced with its vast and multifarious responsibilities and interests, by the shortage of administrative staff which could devote themselves to this task with intimate understanding of the industry and the great distance that separates the Government from the Boards and the industry. If things go wrong it is only natural for those responsible for the control of the Boards to think that they do not have adequate power, not that they have not used the powers adequately. As for the Boards, it was equally natural to think that their conduct and decisions are satisfactory to themselves so long as they have not attracted objections from the Government, the controlling authority under the Act. What is by itself satisfactory to the Board or the producers need not of course be satisfactory to the public outside. A case in point is that of the Coffee Board, the members of which must have thought themselves highly responsible and public spirited when they held down the internal price of coffee against a rising world market and capped it by reducing the internal release price in 1950 and by resisting demands for export in 1952. The unfortunate fact was that the public knew nothing about this and went under the impression, as was to be expected, that the producers and the trade having a numerical majority in the Board has been exploiting their dominant position to serve their own interests. An autonomous body enjoying certain legislative privileges has a public responsibility. To ignore it, even if all its actions can be justified later by proper evidence, is to court disaster as was proved in the case of the Coffee Board.

The third phase in the evolution of the Plantation Statutory Boards was in 1952. At the close of that year three Bills replacing or substantially amending existing Statutes covering Coffee, Tea & Rubber were introduced in Parliament.

Rubber in the Next Fifteen Years

OUR difficulties in the way of building up greater export market are well known and public and Government attention are equally focussed on them. But a drain on our foreign exchange earnings is worse than our inability to expand the export trade. That is what is becoming painfully clear in the case of rubber. Rubber shortage is a bigger issue today than it was ten years ago when the Tariff Commission was first seized with the subject. It will loom much larger ten years from

There were five separate provisions which fundamentally altered the autonomous character of these Boards. The statutory recognition of producer associations contained in the original Acts was removed thereby eliminating the organic link between the representative bodies of producers and the Boards. This has great significance in that the Boards, composed as they were of several different interests, became on the one hand advisers to the Government on plantation matters and on the other served as the instrument of control exercised by it over the industry. The producers found themselves without direct contact with the Government whose decisions affect them so vitally.

Another change of significance was the withdrawal of the right of the Boards to be consulted by the Government on matters affecting the Boards before decisions are taken. The third important change was in the composition of the Boards and the powers of nomination taken over by the Government. Within this, separate nominations were provided for large and small grower representatives thereby introducing, possibly unintentionally, a conflict of interests among the producers themselves within the Board.

The fourth important provision was the taking of power by the Government to set aside, cancel, modify or substitute any decision taken by the Board. The sweeping range of the operation of this provision was of enormous effect on the autonomous character of the Boards. To this must be added the organic effect of the Government taking power to appoint and fix the terms of all Board officials drawing a salary of Rs. 1,000/- or above per month and the appointment of a paid Chairman over the Board.

The cumulative effect of these various and far reaching changes was to render the Boards capable of exercising their autonomy with very restricted areas and only to the extent expressly permitted by the Government. It was natural for growers to oppose the changes although they had no idea of the enormous responsibility assumed by the Government by the changes. Without fully appreciating it, the Government lost the practical experience, self-reliance and initiative of the producers which were the dynamic factors in the successful working of these Boards. As for the producers much of their criticism suffered from the limitations inherent in a situation where it was not possible to separate the defects of administration as distinct from the defects of the constitution. It is possible perhaps to some extent to mitigate the defects of constitution by imaginative handling, but the Government suffered from the handicap that its officers were no longer on the Boards and did not therefore have the opportunity of intimate participation in their deliberative processes.

A proper appreciation of the defects of administration, organisation and legislation will greatly help to make these Boards the effective instruments they should be and will in any case give a better recognition to some of the practical problems faced by the Boards to both the producers and the Government. Changes, if necessary, would then be easier.

now and unless steps are taken now, it will be an intractable problem fifteen or twenty years from now.

Modern industrial progress is too heavily dependant on rubber and world rubber consumption has been rising over the years much faster than natural rubber production. India is sweeping forward over a wide industrial front and the 125 and odd items of rubber manufactures now produced in the country require an

ever increasing volume of raw rubber. Given below are the figures relating to the production and consumption of rubber in India over a period of 15 years:

RUBBER PRODUCTION AND CONSUMPTION

(In tons)

Year	Production	Consumption
1946	15,672	14,037
1947	16,449	17,000
1948	15,422	19,719
1949	15,587	19,662
1950	15,599	19,177
1951	17,148	24,206
1952	19,863	23,166
1953	21,136	24,582
1954	21,493	27,736
1955	22,481	30,151
1956	23,444	34,666
1957	23,767	38,634
1958	23,348	42,639
1959	23,397	47,461
1960*	21,744	50,694

* Figures upto November only.

Taking into account only natural rubber consumption, the shortfall was 15,510 tons in 1959. In 1970 it may be 57,000 tons and in 1975, 1,08,000 tons. That is, assuming that indigenous production by then would be 65,000 tons, an increase by 40,000 tons as against the actual of 9,000 tons achieved in the preceding 15 years. We have of course to take account of the programmed replanting of 52,500 acres with high yielding material between 1961 and 1966.

Whatever the doubts about the future, one point is clear: if any increase is to be achieved, it has to be in the course of the next ten years by measures taken from this year. This gives the issue an immediacy and urgency which cannot be overlooked. When it is remembered that the growers had put up through the Rubber Board a replanting scheme in 1948 and if that scheme was implemented, today India would not have been importing large quantities of raw rubber. The country cannot afford another mistake of the same kind when the volume of shortage is going to be 1,08,000 tons instead of the 4,300 tons it was in 1948.

The progress of rubber production in India will have to base itself on the established rubber industry. There are over 300,000 acres under rubber, most of it in Kerala State. All these 3 lakh acres have not begun to yield and there are wide differences in the yields of the tappable area. Very nearly 200,000 acres are under ordinary seedling rubber of relatively low yield and its replacement raises many practical problems. Producing trees, however low the yield, contribute to the total output and provides some immediate income to its owners. Cutting down at too fast a rate would throw many growers out of a livelihood, create sudden problems of supply of high-yield planting material and the accumulation of enough resources out of production to support the subsidy scheme. The replanting subsidy scheme is financed out of a fund created from a cess collected from produced rubber. Any sharp fall in rubber production would reduce the income from the cess and consequently the resources available for financing replanting. So, replanting has to be planned with a proper balance between these various factors, such as the availability of planting material, the extent of pro-

duction loss, the loss of cess proceeds and the extent of endurable income loss to the growers. Investment in new rubber means a waiting period of seven to nine years after the outlay of capital and rubber does not offer such glittering rewards to investors as to attract outside capital. So many of these handicaps peculiar to rubber must be overcome before re-planting on any large scale can be considered. Even here, there is a physical limit to the tempo of replanting effort that can be made.

During the past two years the Government has been taking a closer look at the rubber problem and it has taken a number of steps towards facing up to the future. One was to settle on the price issue. August last the price of rubber as recommended by the Tariff Commission was accepted without any marked change. In October, the Government announced an increase in the rate of subsidy. Early this month it has notified a new rate of cess to be collected at the manufacturers' end. The proceeds of this cess will be sufficient for financing the subsidy scheme within its present scope. The Kerala State Government has announced a scheme of assisted new planting with its target at 300,000 acres. It has launched a sizeable planting scheme of its own. In addition, the Government of India has granted licence for two factories to produce synthetic rubber with an aggregate capacity of about 45,000 tons. One of the two factories is expected to reach a production level of 25,000 tons by the end of 1964. These various measures must be considered together for obtaining an appreciation of the steps taken to meet the challenge of the yawning rubber gap faced by the country.

If India is short of rubber, what is the world picture? The total world output of rubber was estimated at 3,780,000 tons consisting of both natural and synthetic in 1960. During 1960 stockpile sales by UK and USA accounted for 160,000 tons thus making a total of 3,850,000 tons available for consumption. This does not of course include East European synthetic rubber production. The excess of supply over demand was reckoned to be 90,000 tons, a relatively modest figure compared with the size of world production and consumption. Since 1948 world production and consumption increased steadily, more of both synthetic and natural being consumed, but most of the increase taking place in the former.

CONSUMPTION OF RUBBER BY PRINCIPAL CONSUMING COUNTRIES

(In tons)

Year	Consumption	Increase or decrease over previous year
1948	1,902,500	
1949	1,887,500	- 15,000
1950	2,302,500	+ 415,000
1951	2,327,500	+ 25,000
1952	2,355,000	+ 27,000
1953	2,427,500	+ 72,500
1954	2,515,000	+ 87,500
1955	2,942,500	+ 427,500
1956	3,035,000	+ 92,500
1957	3,142,000	+ 107,000
1958	3,227,500	+ 85,500
1959	3,647,500	+ 420,000

Increase in 12 years .. 1,745,000

In this total consumption the share of synthetics increase was from 28 per cent in 1948 to 44.4 per cent by 1959. In other words, whereas natural production increased from 1,370,314 tons to 2,028,848 tons or by 656,534 tons, synthetic rubber increased by 1,089,466 tons, from 532,186 tons to 1,621,652 tons.

The current has been strongly against the natural product and the 'per capita' usage of rubber and the percentage increase of synthetic in each of the important consuming countries listed below are significant:

PER CAPITA USAGE OF RUBBER IN LBS.

(Figures are estimates)

	Total Rubber Per Capita			% of Synthetics of the Total		
	1957	1959	1960	1957	1959	1960
USA	19.2	20.6	20.6	63.2	65.9	69.0
Canada	11.9	13.0	13.3	53.8	56.4	60.0
Australia	11.4	12.7	13.3	31.1	32.9	40.0

France	9.4	10.0	10.5	27.0	33.2	39.9
West Germany	8.0	8.9	9.5	25.7	33.8	39.4
Russia	Estimated at 6-7			Estimated at 65-70		
Netherlands	4.8	5.7	5.9	20.0	26.2	26.7
Italy	3.6	3.6	4.4	23.8	28.2	36.0
Japan	3.5	4.6	5.0	9.1	16.8	20.0
Brazil	1.4	1.8	—	2.1	19.2	—
India	0.199	0.240	0.253	8.7	10.1	13.0

India has the problem of reconciling the rival claims of natural and synthetic both in usage and pricing. The natural product with several inherent handicaps and a long time to fructify from the time of investment is no match for synthetic which is produced under controlled factory conditions. It is a striking and significant fact that for the volume output of 25,000 tons, it took the rubber planting industry more than half a century, which the Firestone-Khilachand factory proposes to produce in three years. So long as the

physical shortage continues all available supplies of both kinds of rubber will be readily consumed. But as the total indigenous supply of both rubbers reaches current consumption, the exercise of manufacturer's choice of one or the other will become progressively more marked and more consequential for both. If world trends are any indication, price will be the final determinant and there the factory produced rubber has a powerful advantage. Those who believed fifteen years ago that the Common GS-R cannot form more than 30 per cent of the rubber weight of a product have disappeared. Isoprenes, although small in output today, are capable of competition both in quality and price with natural. Once synthetics begin to be used in volume in any product or by any manufacturer, it will be very difficult to wean him away from its convenience relative to price and use habit.

It is believed by many that so long as there is a shortage, the present rubber policy will be good enough and there is no need to worry about what might happen 15 years or so from now. On the contrary, the emergence of a synthetic rubber producing industry poses new problems from now on. If by 1964 a quantity of synthetic equal to the output volume of natural can be expected, the total absorption will have to be on a 50-50 basis, the shortfall being covered by imports according to manufacturers' needs. Unless there is a price advantage in favour of natural, the Indian manufacturing industry would become so familiar with the use of synthetic at 50 per cent of the total, and when the rubber replanting and new planting programmes mature, the consumers' choice may be in favour of his established use pattern in their manufactures and with strong preference for the lower priced raw material. If by 1965 internal plantation rubber production is 40,000 tons and synthetic production 25,000 tons, a situation would have emerged where the consumer's preference would begin to be exercised. There are other problems. The Rubber Board is undertaking research affecting the rubber plant and its cultivation and care. But there is no research work connected with rubber as a product, methods to condition it to the new uses, specially with synthetics, into the economics of the industry and in familiarising the grower with the wider world of rubber. So, we come to the hard question of whether India has an integrated rubber policy for the years ahead.

Indian Coffee

INDIA at present occupies an insignificant place in the world coffee market. But a notable feature during the past few years has been that her coffee output as well as exports of the commodity have recorded a near-phenomenal growth. During the last 15 years, coffee production in this country has almost trebled. In 1947-48, it was only of the order of 15,800 tons. In 1959-60, it increased to 48,533 tons. During the current year the production is anticipated to rise to new peak of about 52,000 tons. This remarkable increase in coffee output in India has resulted from not only increase in area under this crop, but also due to increase in yield per acre which has gone up from 181 lbs. to nearly 450 lbs.

Side by side with the increase in production, both the domestic demand and exports of coffee have shown considerable increase. In the fifties, internal consumption has gone up from 18,000 tons to around 29,600 tons. Increase in exports during this period has been nearly ten-fold.

The main stimulus to increase in coffee production

in India has come from the attractive export prices which Indian coffee had been fetching right up to 1958-59. Indian coffee has all along been sought for by various foreign countries because of its high quality. But the recession in world prices during the past one and a half years, which has led to the principal coffee exporting countries of Latin America to come together to form an International Coffee Agreement, has created a ticklish problem for the Indian coffee industry. Due to fall in prices on the world market, Indian coffee, which due to increased labour cost and heavy taxation has become more and more costly, has had to be sold at a loss. The coffee industry in this country is, thus, facing a rough weather which needs to be counteracted by appropriate remedial measures.

The loss on coffee exports can best be obviated—or at least mitigated considerably—by bringing down the cost of production through expansion of output. And a pre-requisite for expansion in production is to increase domestic consumption for which there is, of course, tremendous scope.

A suggestion is often put forth that the Indian

consumer, who during the past few years when Indian coffee fetched a high price on the world market was being subsidised through below-cost-of-production prices fixed arbitrarily by the Coffee Board, should be called upon to bear a slightly greater burden. But how far it is feasible is a moot point. Coffee drinking people in this country are a vocal lot, they are bound to resist any increase in price of this beverage. In the circumstances, it appears that the only way to increase coffee consumption in the country is by means of some adjustments in tax burden which has been growing from year to year.

For drawing up an appropriate coffee policy it is also imperative that coffee producers should be more closely associated with its marketing than is the case at present. Then they will have a proper forum to discuss their problems and have a say in policy decisions.

GROWTH PATTERN OF COFFEE INDUSTRY IN INDIA

A Hard Core for the Third Plan

ONE purpose of this Blue Supplement is to present the Eastern Economist's view of modifications required in India's Draft Third Five-Year Plan to meet an order of priorities which is recommended on the basis of a more practical rendering of India's foreign exchange and rupee position than is currently available in planning documents. It is not impossible that all the foreign assistance envisaged, namely, Rs. 2,200 crores net, will be available, but it would be quite foolish to launch on a rate of expenditure with such a high foreign exchange component without a more satisfactory underwriting of foreign exchange than has yet been obtained. Secondly, as distinguished between productive and non-productive schemes, there are elements of choice particularly in the fields of the social services which it is wise to settle now before rupee expenditure is incurred and inflationary potential built up which might be difficult to control because of the absence of a cushioning of consumer goods production in the early years of the Plan.

In other words, there is attempted a re-phasing of certain sections of the Plan in order that potential inflationary expenditure may follow on what might be called a deflationary movement in production. This is effected by throwing forward agricultural production, particularly by stressing minor irrigation works and fertilizers which are quick producers of agricultural commodities, especially foodgrains, sugarcane and cotton. This section of the revision of the Plan is thus a re-phasing of expenditure balancing social service expenditure against increments of agricultural pro-

duction. It is not believed that the industrial picture can be re-phased in anything like the same way since, in any case, most of the new projects will take three to four years to come to fruition and many of them are already impeded by the absence of foreign exchange. On the other hand, largely because of this very absence of foreign exchange, an order of priority is decided in industrial projects any way. So far as the industrial sector is concerned, the re-phasing has been done entirely on the basis of the availability of foreign exchange and the income generating capacity of a given foreign exchange expenditure. The projects have been re-arranged in such a manner that the industrial projects are ranked according to both foreign exchange and income generation and a middle course is adopted which, it is believed, on the basis of a judgment, might well provide an initial programme of action.

In the result there is developed a "hard core" for India's Third Plan which is marginally different from the presentation in India's Draft Outline and National Development Council meeting papers. It is hoped that it will provide a constructive basis for action as against a catalogue of projects and an estimate of resources which cannot, unless placed in a certain order, be effectively translated into action. This "hard core" is balanced against a new pattern of resources and the setting of receipts and expenditure is designed to contain inflationary pressures to within a rise of ten per cent in five years. This is not a counsel of perfection, but it is still, perhaps, in the tradition of having the best of all possible worlds.

The Pattern of Priorities for a Hard Core

The Budget of the current year has made clear that the investment figures of the Third Plan cannot possibly stay where they are. This is largely because the pattern of new taxation is itself distorting the price level, and since the cost of living will also be affected, wage rises are certain to occur for which an inadequate provision has been made in the Plan. In the Leading Articles on the Budget in this issue of *The Eastern Economist* there have been presented certain estimates of the rate of rise over the next five years. It is considered that a minimum rise on investment at least will be 10 per cent on the rupee element in the Plan. This would include the enhanced customs duties on imported machinery. But it does not take into account any rises in prices which might take place abroad in respect of capital equipment. It is not likely, on the evidence currently available, that foreign prices will, over the period of the Plan, fall significantly. If they did, there would be an offset to the rupee rise in the Plan which is considered inevitable.

If only for the reason that the investment targets of the Plan will now be altered in financial content by something like 10 per cent, a new order of priorities would be decreed, since the Finance Minister made it clear that the financial commitments with the Plan would be limited to 7,500 crores presumably at current prices. *The Eastern Economist* does not take so rigid a view of the financial element in the Plan, although it is recognised that even the raising of 7,500 crores of rupees has made provision for a foreign exchange allocation of Rs. 2,400 crores which cannot so lightly be assumed. There are, however, two elements which decree a rendering of the Plan some what different from that appearing in the Draft Outline. The first of these is the belief that the foreign exchange forthcoming for the Plan should not be assumed at this figure or rather that there should be a priority in respect of a figure of 2,000 crores of rupees leaving over other projects which might require the balance. On the other hand, a new priority has now been introduced by the factor that since the current pattern of taxation and the cost of living are related, a 10 per cent cut in the rupee expenditure of the Plan is now necessarily involved.

These considerations provide the principles on which the "hard core" has now been prepared. In the first place, in regard to schemes which involve

foreign exchange, a list has been drawn out for those elements which should stake a high claim for Rs. 1,700 crores of foreign exchange made available. As a consequence the foreign exchange demands in the Plan are conceived to arise in respect of (a) hard core involving Rs. 1,700 crores; (b) a figure of 200 crores additional mostly from DLF funds has been provided for components and raw materials outside the Plan and (c) another Rs. 100 crores for developmental imports. In other words, a figure of Rs. 2,000 crores in all has been assumed as the foreign exchange component for the Plan, but Rs. 1,800 crores only on strictly capital or development, as distinguished from maintenance account. The second has been to cut out rupee expenditure to the extent of about Rs. 800 crores. Some of this arises automatically as a result of having cut out the foreign exchange component in composite schemes, that is, schemes which involve both foreign exchange and rupees. This has allowed a reduction of expenditure of Rs. 400 crores. Besides there are schemes mostly of an unproductive nature which have been reduced by about Rs. 500 crores, in order to enable the Plan to be contained within the financial limit of about Rs. 11,000 crores, after providing for the rises in prices believed necessary as a consequence of the taxation policy of the Centre and the States and of the consequential effects in the cost of living, necessitating rises in dearness allowances and in industrial costs generally. Broadly, the picture which now emerges is that the "hard core" in real content will be about 10 per cent less than that of the original Plan with the foreign exchange component about 20 per cent less than that provided. The actual figures as revised will then appear as in the table below.

The articles which follow present the build-up of the elements of the "hard core" under sections of agriculture, industry, transport, power and tertiary sectors.

This will be the broad pattern of the hard core, but this does not necessarily imply that orders need to be placed just in this order. The point that broad schemes which may obtain a relatively low priority in the ranking in each section have already had their foreign exchange underwritten has tended to change priorities. This does not, however alter the total content of the Plan, although it might alter the rate of generation of income produced.

PROPOSALS FOR A "HARD CORE" FOR THE THIRD PLAN

A Hard Core for Agricultural Development: 1961-66

CONSEQUENT upon the discussions the Planning Commission has had with the State Governments in the past few months, the various agricultural development programmes of the Third Five-Year Plan are expected to aim at an increase of 24 million tons in foodgrains output, 2.5 million tons (in terms of gur) in sugarcane production, 2.7 million tons in oilseeds output, 1.9 million bales in cotton production, 2.2 million bales in jute yield and substantial increases in protective and supplementary food output over the current year's production. Compared to the targets fixed in the Draft Outline of the Plan, the new targets envisage a slightly lower additional production of foodgrains and slightly greater output of cotton, sugarcane and protective and supplementary foods.

Agricultural Production Targets in the Third Plan

	1960-61 Output Estimate	Draft Outline Target	New Target Envisaged
1. Foodgrains (million tons)	76	100-105	100
2. Sugarcane (Gur) (million tons)	8	9-9.2	10.5
3. Oilseeds (million tons)	7.1	9-2-9.5	9.8
4. Cotton (million bales)	5.1	7.2	7
5. Jute (million bales)	4.3	6.5	6.5*

*Excluding mesta which may provide additional one million bales.

To achieve these targets, a total expenditure of about Rs. 2,730 crores—Rs. 947.4 crores in the States, Rs. 125 crores at the Centre, Rs. 656 crores on major and medium irrigation works (including flood control and drainage schemes), Rs. 200 crores on setting up of fertilizer factories and nearly Rs. 800 crores to be invested by the farmers themselves—is envisaged. The expenditure in the States will be spread over the various developmental programmes in the following manner:

Head of Expenditure

(Rs. Crores)

Agricultural Programme	
1. Agricultural Production	182.6
2. Minor Irrigation	170.6
3. Soil Conservation	58.1
4. Animal Husbandry	45.2
5. Dairying and Milk Supply	27.6
6. Forests	43.5
7. Fisheries	20.8
8. Warehousing and Marketing	8.6
TOTAL	947.4
Co-operation and Community Development	
1. Co-operation	68.6
2. Community Development	294.9
3. Panchayats	26.9
TOTAL	947.4

The above outlay in the State Plans shows an increase of Rs. 97.4 crores over the provision made in the Draft Outline. The outlays on major and medium irrigation works, on setting up fertilizer factories and on the schemes included in the Central Government programmes and the private sector remain

practically the same as envisaged in the Draft Outline.

The new targets of outlay are expected to result in expansion of area under irrigation by about 26.1 million acres, in extension of dry farming to an additional area of 22 million acres, in reclamation of land to the extent of 3.3 million acres, in soil conservation over an area of 10 million acres, in reclamation of saline and alkaline lands covering an area of 2 lakh acres and extension of flood control and drainage measures to about 7 million acres. The area under improved seeds is anticipated to increase from 55 million acres to 151 acres. Consumption of chemical fertilizers is expected to go up to about 1.45 million tons and of urban compost and rural compost by 5 million tons and 148 million tons. Green manuring is expected to be resorted to over an additional area of 39 million acres. The following table gives estimates of benefits which will result from the various revised agricultural development programmes compared to those included in the Draft Outline. (See details on pages x and xi)

Benefits accruing from Various Agricultural Development Programmes

Development Programme	Unit	Draft Outline	Provisional Estimate
1. Irrigation			
1.1. Major and medium irrigation	million acres	13	12.8
1.2. Minor irrigation			
(a)-Agriculture	"	10	10
(b)-C.D. Programme	"	3.5 to 4	3.3
Total (a) & (b)	"	13.5 to 14	13.3
1.3 Total—Irrigation	"	26.5 to 27	26.1
2. Soil conservation, land reclamation etc.			
2.1 Soil conservation on agricultural lands	"	13	10
2.2 Dry farming	"	40	22
2.3 Land reclamation	"	1	3.3
2.4 Reclamation of saline and alkaline lands	"	0.4	0.2
2.5. Flood control, drainage and water logging	"	5.0	7.0
3. Area under improved seeds			
3.1 By end of 1960-61	"	N.A.	55
3.2 By end of 1965-66	"	150	151
4. Consumption of chemical fertilizers			
4.1 Nitrogenous (N) million tons	1		1.01*
4.2 Phosphatic (P ₂ O ₅)	"	0.4 to 0.5	0.4
5. Organic and green manures			
5.1 Urban compost	"	4.5	5
5.2 Rural compost**	"	72.0	148
5.3 Green manuring**	million acres	50	39

*Requirements for plantation crops, estimated at 0.04 mill. tons (N), are in addition to this figure.

**These are necessarily rough guesses.

There can be little quarrel over the targets currently contemplated for agricultural production during the Third Plan period. Ambitious though they are, they are the minimum which have to be attempted if a modest advance is to be made towards better living and if the developing industrial sector is not to be starved of the essential raw materials. Food grains output target, however, appears to be slightly on the low side; it will barely suffice for consumption in 1965-66 at the rate of 17.4 ozs. of cereals and 3.6 ozs. of pulses per adult unit per day and the minimum seeds, animal feed and stock requirements.

The financial resources that might eventually be available for agricultural development under the Third Five-Year Plan, according to the estimates of *The Eastern Economist*, however, will be of the order of about Rs. 2,640 crores, of which the outlay in the public sector will be of the order of Rs. 1,840 crores. This represents a shortfall of about Rs. 90 crores in the outlay contemplated at present in official circles. In terms of the foreign exchange component and rupee resources the shortfall is expected to be of the order of Rs. 20 crores and Rs. 70 crores respectively.

How can this sum of money be saved without much affecting the developmental effort which is required to achieve the contemplated targets? To find an answer to this question, it is necessary to analyse the various agricultural development programmes and to fix proper priorities for them to indicate which of these should be included in the hard core of the Plan and which would be left out to be financed if the shortfall mentioned above is made good by some fortuitous circumstances.

Obviously, the first programme to be included in the hard core is the stepping up of fertilizers output and their distribution. This is due to fact that application of fertilizers is the quickest way to increase agricultural production. A sum of Rs. 200 crores, with foreign exchange component of nearly Rs. 104 crores, has been earmarked for setting up new fertilizer factories under the Third Plan. This expenditure automatically qualifies itself for inclusion in the hard core. In the opinion of this journal, this provision may not even be enough. Firstly, in all probability, consumption of fertilizers in 1965-66 is likely to exceed the current estimates by a good margin—say about 2 lakh tons. Secondly, the anticipated increase in the consumption of organic and green manures may not materialise if for no other reason than for the fact that the requisite amount of organisational effort in this direction may not be forthcoming. This shortfall will have to be made good by increased use of chemical fertilizers.

The second on the priority list is to be the programme for improved seeds and farm implements multiplication and their distribution. Here too, the view of *The Eastern Economist* is that the demand for them will exceed the estimates and further sums, mainly rupees, may have to be provided for this programme.

Next on the priority list comes the provision for irrigational facilities. Here, however, some adjustments are possible in the proposed outlay. The Draft Outline contains a provision of Rs. 650 crores expenditure on major and medium irrigation works out of which Rs. 470 crores are earmarked for projects continuing from the Second Plan period, Rs. 100 crores for new projects to be undertaken and Rs. 80 crores for flood control, drainage, anti-water-logging and anti-sea-erosion schemes. In the revised estimates of the State Plans outlay, a sum of Rs. 170.6 crores is provided for minor irrigation works. Taking into consideration that 3.5 million acres potential created by the major and medium irrigation works under the

Second Plan still remains unutilised and that the new schemes included under this head will contribute to extension of irrigation facilities over an additional area of only 2 million acres, out of which only 5 lakh acres will be benefiting during the Third Plan period, this journal is of the view that the new major and medium irrigation works should be undertaken within an outlay of Rs. 50 crores instead of Rs. 100 crores. The stress in the Third Plan should be on execution of minor irrigation works (they are easy to complete with rupee resources and only small foreign exchange cost and yield quick results) for which another Rs. 20 crores should be provided. New major and medium irrigation works, as far as possible, should be undertaken when they form an integral part of the power projects. This is necessary because it is the only head of expenditure under agriculture which contains substantial unnecessary foreign exchange component. Foreign exchange to the extent of Rs. 15 crores can be saved under this head by properly phasing the new major and medium irrigation works and those continuing from the Second Plan period.

There is, of course, little scope to cut soil conservation, flood control, drainage and anti-water-logging schemes. Delay in their execution will only create greater difficulties at a later stage. Land reclamation, however, can be at a slightly slower pace than envisaged. Some foreign exchange, say about Rs. 1 crore, can be saved under this head.

The remaining saving of Rs. 3 crores in foreign exchange under agricultural development schemes has to be effected in the allocations proposed for animal husbandry, dairying and milk supply and forests schemes. This can be done by slightly going slow with these schemes so that they spill over to Fourth Plan.

The increased funds (almost all in rupees) required for minor irrigation and improved seeds and farm implements multiplication should be drawn from the provision made for community development; this allocation can conveniently be scaled down by about Rs. 44 crores. The hard core for agricultural development programmes (excluding the expenditure to be incurred by the Union Ministry of Agriculture and the Peasantry) which thus emerges is as follows:

Development Head	Total Outlay	Rupee Outlay	Foreign Exchange Component
1. Fertilizers	200	96	104
2. Improved Seeds & Farm Implements, Land Reclamation, Plant Protection, Package programme, Organic manures etc. (States' Schemes)	190	187	3
3. Major & Medium Irrigation, Flood Control & Anti-water-logging	600	565	35
4. Minor Irrigation	190	186.8	3.2
5. Soil Conservation	58	57.5	0.5
6. Animal Husbandry, Dairying & Milk Supply, Fisheries	80	73	7
7. Forests	40	39	1
8. Warehousing & Marketing	10	9.9	0.1
9. Co-operation & Panchayats	95.5	95.5	—
10. Community Development	250	250	—
TOTAL	1713.5	1559.7	153.8

Outlay on fertilizers has been taken account of in the hard core for industrial projects. So the net hard core outlay for agricultural programmes (excluding the expenditure of Rs. 125 crores to be incurred by the Union Ministry of Agriculture and Rs. 800 crores by the peasantry) comes to Rs. 1513.5 crores, of which foreign exchange component is Rs. 49.8 crores. The total outlay should be of the order of Rs. 2,438.8 crores of which the investment component will be Rs. 2,025 crores. The foreign exchange cost should not exceed Rs. 55 crores.

With the rapid progress that Indian agriculture

will be making during the Third Plan period, it is also essential that some provision should be made in the Plan for price support schemes, especially for foodgrains. A sum of Rs. 150 crores approximately will be required for this. But this amount, constituting a revolving fund, should be found, in consultation with the U.S. Government, from the rupee proceeds of the P.L. 480 foodgrains. The foodgrains purchased under the price support schemes will ultimately form the reserve which will replace the P.L. 480 foodgrains envisaged to be kept as buffer stock.

A Hard Core for an Industrial Plan: 1961-66

THE draft outline of the Third Plan released in July, 1960 estimated the requirements of foreign exchange financing for the projects both in the public and the private sectors at Rs. 2,600 crores. The largest share of foreign exchange at Rs. 1900 crores, according to the draft outline, was needed for machinery and equipment for projects. Another sum of Rs. 500 crores would be needed for development imports; the external assistance for components, intermediate products etc. for increasing the production of capital goods within the country was computed at Rs. 200 crores. While the Planning Commission based its estimates on the latest available quotations for plant and equipment, etc., it was stated in certain business circles that the Plan's estimates of foreign exchange requirements were on the lower side and that rising trend in prices of capital goods in the international markets had been ignored by the Planning Commission while making these estimates. The papers presented by the Planning Commission to the National Development Council early this year indicated that some of the estimates given in the draft outline did require revision. The revised figures along with the figures given in the draft outline of the Third Plan are set out in the statistical tables on pages xii and xiii.

The total increase in the cost of the industrial projects (including minerals) in the public sector is estimated to be Rs. 177.4 crores from Rs. 1479.8 crores to Rs. 1657.2 crores. New projects estimated to cost Rs. 185 crores were also added by N.D.C. Most of these new projects consist of the advance preparations for new projects likely to mature in the Fourth Plan. Among the projects carried over from the Second Plan, the Trombay Fertiliser Project is estimated to cost more by Rs. 3 crores. This will cause an additional strain on India's foreign exchange reserves by Rs. 1.65 crores. The cost of new projects for which external credits are already assured, wholly or in part, is anticipated to rise by Rs. 47 crores. Here, Heavy Machine Tool Factory is estimated to cost more by Rs. 3 crores, Bhilai Steel Plant (expansion) by Rs. 8 crores more, Durgapur Steel Plant (expansion) by Rs. 21 crores more, Rourkela Steel Plant (expansion) by Rs. 10 crores more and the Mysore Iron and Steel Works (expansion) by Rs. 5 crores more. The additional burden of foreign exchange due to rises in cost is likely to amount to Rs. 30.45 crores.

The new projects in the Third Plan for which foreign credits have not been arranged so far indicate a rise in cost by Rs. 91.9 crores. Major rise in cost is anticipated in the case of Bokaro Steel Plant from Rs. 200 crores to Rs. 235 crores. The other important projects which are likely to cost more are "Townships", Alloys and Steel Plant, Security Paper Mill, expansion of Hindustan Cables, N.I.D.C., expansion of Praga Tools etc. The additional cost in foreign exchange is estimated at Rs. 47 crores. Thus, it is seen that the additional cost for all these projects is likely to result in adding to the burden of foreign exchange

requirements by about Rs. 80 crores.

In the case of minerals the total cost is expected to rise by Rs. 35.50 crores. Here the projects which are likely to cost more are Briquetting and Carbonisation Plant, expansion programme by Oil India, expansion of Thermal Power Plant at Neiveli, new programme for National Coal Development Corporation, expansion of Singareni Collieries, exploitation of Panna Diamonds, Kolar Gold Mining Undertakings and Huthi Gold Mines. The foreign exchange component in the case of all these projects is likely to be Rs. 15 to 20 crores. In other words, between July 1960 and January 1961, according to the estimates of the Planning Commission, the cost of the industrial projects rose by Rs. 100 crores in foreign exchange.

It is essential that a priority list be so prepared as to allocate foreign exchange for yielding the maximum return. The table on page xiv indicates the industrial projects by their rank in priority as disclosed by the total income generated both by the direct and indirect approaches. In this list, the Bhilai Steel and Rourkela Steel Plant expansion programmes take the top place followed by the three new fertiliser factories, the two heavy electrical plants and the Durgapur Steel expansion plan. Next come fertiliser plants at Trombay and the Andhra Fertilisers. This table clearly indicates that almost all the projects shown here are in the top priority category. The only project from this list which could be deferred for the time being is that of the Watch Factory.

Another table on page xv shows the foreign exchange component for the major plants in the public sector. There are certain projects like Hindustan Machine Tools and the Durgapur Fertilisers where the foreign exchange component is of a very high order i.e., above 75 per cent of the total cost. Then follow other categories with the foreign exchange component ranging between 60 to 70 per cent. In this category are included the Praga Tools, Heavy Machine Tool Plants, Precision Instruments Plant, Hindustan Cables (Expansion), Heavy Electrical Plants etc. The plants which need foreign exchange less than 30 per cent of their total cost are raw film project, heavy structural works and heavy machine building (expansion). There are also certain unclassified projects for which precise cost of foreign exchange is not available.

The upshot of this discussion is that there are certain projects which stand in a low priority because of the income and the foreign exchange factors. It is suggested that they, for the time being, be kept outside the hard core so as not to jeopardise the successful implementation of the important projects. The list on the next page gives the projects to be kept outside the hard core.

Name of the Project	(Rs. Crores)	
	Total Cost	Foreign Exchange Cost
1. Watch Factory	2.00	1.00
2. Bokaro Steel Project	235.00	141.00
3. Second Shipyard	10.00	5.00
4. Security Paper Mill	5.50	2.20
5. Expansion of Hindustan Ship-yard at Vizag (expansion and subsidy)	10.00	5.00
6. Townships	25.00*	—
7. Industries other than Steel	22.00*	13.20
8. Advance Action for the Fourth Plan	10.00	8.00
9. Central Ropeway Schemes	16.00	16.00

Transport and Communications

THE Draft Outline of the Third Five-Year Plan is frankly apologetic about the great inadequacy of the allocations of financial resources made to the different sectors of transport. In so far as communications are concerned, it would appear that no apology has been advanced for the simple reason that, excepting for postal, telegraphic and cognate communications, the expenditure envisaged is quite marginal, namely, Rs. 5 crores for tourism and Rs. 7 crores for broadcasting. Postal and like communications in the Third Plan have been conservatively provided for and any reduction in them is physically impracticable because the postal communications plan as envisaged in the Draft Outline is itself insufficient to take the load of developing traffic. A smaller plan for posts and telegraphs would be arbitrary, regardless of the clear prospect of repeated interruptions of the full official and business postal and telegraphic communications.

The central conclusion which emerges from this Blue Supplement is that the inescapable prospect of a shortfall in the financial resources—foreign exchange as well as rupee resources—for the Third Five-Year Plan does not brook any delay (now that the Third Plan is about to be finalized) in reconciling ourselves to the reality that the whole Plan, adumbrated in the Draft Outline together with the subsequent enlargement of the outlay to Rs. 7,500 crores, cannot be executed and its reduction to the core must be worked out. An attitude of expectancy about a massive improvement in this prospect would be tantamount to depending upon a wishful hope that something may turn up after all. The imperatives of objective planning and precision as regards priorities ordain that the exact dimensions of the core of the Third Plan should be clearly defined. The argument of this Blue Supplement is that the foreign exchange component of the outlay in the Third Plan ought to be cut down by Rs. 400 crores or thereabout, if the programmes are to be drawn up for implementation in a realistic manner.

In addition to the foreign exchange saving due to the cutting out of the above public sector projects, the savings from the slashing of the private sector projects may yield Rs. 75 crores. Thus, the total saving of foreign exchange in the industrial and mineral sectors would be of the order of Rs. 330 crores.

POWER

The draft outline of the Third Plan provided Rs. 925 crores for investment on power projects in the public sector as against Rs. 50 crores in the private sector. The public sector investment target has now been revised upwards to Rs. 1019 crores. The foreign exchange component for the power projects is likely to be around Rs. 300 crores. Because of the vast pressure of demand from every State, cut is not possible in this case. In fact, the target of doubling power generation capacity from 5.8 million KW at the end of the Second Plan to 11.8 million KW at the end of the Third Plan is not likely to meet the demand completely in any of the States. In certain States such as Gujarat, industries may have to fall back upon furnace oil due to the shortage of power. The cost of the programme of nuclear power generation included in the Plan is not known but it is expected that 300,000 KW would be provided by this source. The cost per unit in this case is likely to be higher than in the case of Thermal Power, and, it seems, it is being encouraged more for reasons of prestige than for any other.

The question that is posed, in so far as transport is concerned, is: What economies or cuts in the foreign exchange outlay on the transport plan are practicable and at what points should they be applied? The foreign exchange component of the transport plan is marginally provided for in the Draft Outline and amounts to an overall figure of Rs. 300 crores. In exploring the possibilities of effecting economies in the expenditure of foreign currency in the transport development plan, a basic consideration which compels first attention is that the transport plan cannot be cut in a majority of the programmes for two reasons. First, any reduction in the provision of transport for domestic traffic is ruled out because such a reduction will create a greater degree of acute shortage in transport capacity than is half-heartedly confessed in the Draft Outline and such reduction will stultify the progress even of the development projects which are recommended in this Blue Supplement for inclusion in the core as representing the irreducible minimum. Second, the transport development plan, contrary to the popular assumption, is essentially a plan to be financed by rupee resources. In the entire outlay of Rs. 1,450 crores proposed for transport development in the Draft Outline as much as Rs. 1,150 crores is the share of rupee resources.

Then again, a substantial portion of the foreign exchange outlay of Rs. 300 crores is required for development of transport in the sector of non-domestic traffic. If any cuts are to be applied to the transport plan as an unavoidable obligation, those cuts ought to be applied to sectors of the transport plan which relate to overseas transport. Our ambition to take our rightful place in international transport can be deferred, but not expansion of domestic transport capacity. In effect, the position as regards the revision of the transport component of the Third Plan to the core amounts to this that if a cut cannot be escaped at all in transport, it should be applied in a modest measure to the expansion of shipping and civil aviation. Shipping and civil aviation can bear a cut in foreign exchange

not because their programmes are excessive but because the dire need to save on foreign exchange indicates this as the choice of the lesser evil. It is on this reasoning that the subsequent picture of the development of the different sectors of transport is being drawn.

Railways constitute the lifeline of the nation's internal communications. Carriage of traffic over long distances, in bulk and with the open knowledge that wagon capacity on return journeys in many cases is to be kept either fully or largely unemployed—these are the distinctive characteristics of railway transport which are practically beyond the reach of any other mode of inland transport. Railways do need a fair proportion in their revenue earnings drawn from short or medium-distance non-bulky traffic which bears high freight rates. In so far as the Third Plan is concerned, it can be safely presumed that not road-rail coordination but imaginative planning of transport capacity for the mounting volume of goods will be the real problem. If the railways suffer decline in revenue and admit financial setbacks or stagnation, as experienced in the last two years of the Second Plan, the major cause of this state of affairs is not the volume of traffic offering but gaps in financial management. The argument need not be repeated that recurring bottlenecks for a wide range of industries and other users of transport from time to time have thrown revealing light on the lack of flexibility of railway managements to manoeuvre distribution of wagon supply. Excuses of wagon shortages may be justified—but only to a fractional extent.

In the Third Plan of the railways, provision was made for additional traffic of 81.5 million originating tons, including the traffic for the Bokaro Steel Plant. Elsewhere in this Blue Supplement a forthright proposal has been made that the construction of the fourth steel plant in the public sector at Bokaro should not be taken up as now proposed, but it should be thrown forward to the Fourth Plan. On this assumption the additional traffic expected to be offering to the railways in the Third Plan would amount to 73 million originating tons. It cannot be argued by any stretch of reasoning that the railway plan should be cut down marginally because traffic for Bokaro will not materialise. There is a serious flaw in the estimation of the volume of additional traffic for railways fixed at the figure of 73 million tons. In important categories of traffic, the output at the factories is presumed to be the yardstick of the traffic which will require movement by rail. This is to equate traffic for transport movements with factory output which is patently wrong. It is wrong because it ignores multiple movements which go to increase the volume of traffic making an increasing draft on transport capacity. Then, the broad scheme about the additional traffic is that 70 per cent of the extra traffic to be moved by the railways will be for coal, iron and steel, cement and other heavy industries, while only 30 per cent is earmarked for miscellaneous traffic. The provision for miscellaneous traffic is utterly inadequate and since miscellaneous traffic emanates from a large number of essential industries, progress of production is likely to be jeopardised.

There is another factor to be borne in mind about the railway development plan. All told Rs. 1,300 crores are provided for the Railways' Third Five-Year Plan, out of which Rs. 890 crores will be required for development, Rs. 350 crores will be provided by the depreciation reserve fund and the residue will be supplied as an additional obligation by the Development Fund. The total contribution of the Development Fund to the Third Plan is roughly placed at Rs. 115 crores. This outlay has been so nicely balanced as between the different programmes specified in the Draft Outline that it does not admit of any modifications or even readjustments. As a normal rule, the limit of age indicating the point

of replacement for different types of rolling stock is raised to 45 years for locomotives and wagons and 36 years for passenger coaches on the broad gauge while 40 years on the meter gauge and 45 years on the narrow gauge is the limit prescribed for each category of rolling stock. These limits do not rule out the feasibility of retaining in service stock that has crossed them. These criteria give sufficient indication of how rehabilitation is very parsimoniously provided for.

There is a most noteworthy feature of the railway development plan which must be highlighted and for which unqualified credit must be accorded to the Railway Ministry and the indigenous plants in the public as well as private sectors which have readily cooperated with the Railway Ministry. The foreign exchange component of the development expenditure for the railways is being cut down at a remarkable rate by a strenuous effort to develop indigenous capacity for manufacture of railway rolling stock and other equipment. In the Second Plan, the original provision of foreign exchange for the railways was Rs. 425 crores which was afterwards revised to Rs. 385 crores as indigenous production gathered momentum. Economy in the expenditure of foreign currency for railway development thus became possible in the first revised estimate to the extent of Rs. 40 crores. Now a further economy of Rs. 53 crores has been effected, bringing the foreign exchange expenditure in the railway plan to Rs. 332 crores. Thus, the railways succeeded in contributing to a saving of Rs. 93 crores in foreign exchange.

But the prospect for the Third Plan is even much more impressive. In the Second Plan foreign exchange expenditure was of the order of Rs. 332 crores, out of a total outlay of Rs. 1,122 crores. In the Third Plan the aggregate outlay will be about Rs. 1,300 crores in which the foreign exchange component will be as low as Rs. 130 crores. The significant conclusion which needs well-merited publicity is that, in spite of the growing size of the overall development outlay, foreign exchange expenditure on railway expansion will be reduced from 30 per cent in the Second Plan to 10 per cent in the Third Plan. Even before the emergency to cut down foreign exchange outlay in the Third Five-Year Plan could be envisaged, railways have followed an imaginative policy of reducing it on a massive scale. There is no case whatsoever for any pruning in the small amount of Rs. 130 crores which the railways require by way of foreign exchange in the Third Plan.

Road transport has been given an allocation of Rs. 250 crores for development. It is ironical that, while the size of the Third Plan was stepped up from Rs. 7,250 crores in its outlay in the public sector to Rs. 7,500 crores, road development did not receive any share in the increased allocation; on the contrary, a cut of Rs. 20 crores has been applied to the road plan reducing its outlay to Rs. 230 crores. Expert estimate shows that road transport services have to remain content at the present time with carrying only 10 per cent of the nation's freight traffic measured in terms of ton-miles, although they have the potential to accept a larger responsibility. The twenty-year plan for road development, prepared by the Chief Engineers for the period beginning with the Third Plan, has suggested development outlay of Rs. 5,200 crores out of which Rs. 590 crores are suggested for the Third Plan and a steeper increase in the remaining three five-year plans. Not even half of this allocation is being granted to road development. The Draft Outline not only admits unequivocally that the allocation of Rs. 250 is insufficient but makes a positive commitment that provision of additional funds would be made provided resources become available. Far from waiting for the prospect of higher resources, the first opportunity has been taken to apply a cut of Rs. 20 crores.

Even in the Third Plan road transport is receiving a cavalier treatment. The whole subject of roads is cursorily dismissed in the Draft Outline, in so far as the physical target is concerned. It is only stated that about 20,000 miles of surface roads may be added in the Third Plan, while the mileage to be added under local road development has not been estimated. Road development has a very small component of foreign exchange expenditure. With the rupee resources position also getting very tight and requiring economy, the question of making higher allotment for roads does not arise. But considering the limited capacity of the railways in the Third Plan to take care only of important traffic, it is essential that the original allotment of Rs. 250 crores should be restored. There are a number of projects in the State plans which can bear either elimination or postponement so as to provide the restoration of the cut of Rs. 20 crores for roads. The issue of reducing the size of the road plan does not, therefore, arise.

Shipping and development of ports and harbours go together. Including the contribution of internal resources of the ports, allocation in the Third Plan for port development is placed at Rs. 85 crores. The primary aim of the Third Plan is to improve and rationalize the existing port capacity. Increase in the capacity of the major ports will be small—from 38 million tons at the end of the Second Plan to 41 million tons at the end of the Third Plan. After the heavy congestion in the major ports and deadlock in clearing machinery etc. imported from abroad, technical schemes were drawn up in the Second Plan for improvement and modernisation of port facilities with the help of experts whose services were obtained under the Colombo Plan. It is essential that the order of priorities fixed in the port programme should be maintained and no axe should be applied to the foreign exchange expenditure on port development.

Shipping and civil aviation are two sectors of transport which present some scope for foreign exchange economy at a critical time when such economy has become inevitable. It is in this context that the proposal here made for a small contribution from transport to the saving of foreign exchange should be understood. It is not in the least suggested that shipping does not deserve or require a higher outlay than that of Rs. 55 crores from the Exchequer as settled in the

financial scheme of the Draft Outline. Certainly shipping does require a larger development plan. This is for the reason that India's share in her overseas shipping trade is increasing at a snail's pace.

One point about shipping requires clarification and emphasis in the interest of removing an erroneous assumption. It is ordinarily presumed that building of ships at the Visakh yard goes to reduce foreign exchange expenditure on new ships on a substantial scale. The truth of the situation is that at the present time the foreign exchange component of ships built at Visakh is as high as more than 80 per cent, because, at this stage of development, marine engines and similar costly components are only assembled at Visakh from imported supplies. This is not to belittle the importance of the Visakh yard nor to minimize its achievement. But in an assessment of the Third Plan in order to revise it to the core, possibilities of economizing foreign exchange become a dominant consideration. In view of this consideration the difference between home constructed ships and ships purchased abroad is not very large. From this angle postponement of establishing the second yard at Cochin will not cause any serious injury to the nation.

Then there is the other factor to be taken into account that part of the shipping fleet caters to overseas transport movements. This should be increased as fast as possible. It is true that the period of gestation in the shipping industry is nominal and foreign exchange spent on acquisition of a ship is reimbursed in about seven years. Then there is the consideration that if India does not acquire her own ships, she will have to pay larger amounts for freight services in foreign exchange. But where the overriding consideration is to effect foreign exchange economy in the next five years, the counterbalancing factor to be taken into account is that, many of the ships, for which orders will be placed on foreign shipyards, will be delivered after a long time, whereas foreign exchange commitments for them will have to be made right now. These orders can be put off on a partial scale. Similarly, the plan for development of civil aviation which is highly foreign-exchange-intensive can bear a cut. Shipping and civil aviation between them may make a contribution of Rs. 25 crores to the cut in the foreign exchange outlay in the Third Plan to readjust it to the core.

The Tertiary Sector

AN attempt will be made in this article to examine to what extent the tertiary sector can contribute to the economy in the outlay of rupee and foreign exchange resources. This examination excludes transport and communications as they have been treated in a separate article elsewhere. The expenditure on social services assumes some significance because of the absence of a cushion for consumer goods production in the early stage of development of the economy with an accent on heavy industry. This is, of course, not to underestimate the importance of social services as such. Nevertheless, some pruning in the allocation of financial resources made to the tertiary sector in the Draft Outline has become inevitable in the light of the shortfall now envisaged.

Social services get Rs. 2,525 crores (Rs. 1,725 crores for social services and Rs. 800 crores for inventories including both the private and public sectors), including education, health, welfare programmes, etc. It is proposed that Rs. 490 crores should be cut down from the total outlay of Rs. 2,525 crores on social services,

so that the total expenditure comes to Rs. 2,035 crores. The estimate of foreign exchange requirements for implementing the social service programmes in the Third Plan is estimated at Rs. 80 crores. In view of acute foreign exchange scarcity, it would be advisable to cut down the foreign exchange component of the social service plans by Rs. 30 crores, so that the total foreign exchange requirement for social services is not more than Rs. 50 crores. The issue for determination is where the axe should fall. An attempt is made in the following paragraphs of likely heads that may be revised downwards.

Education in the Third Plan gets a total provision of Rs. 500 crores, out of which Rs. 370 crores go to general education and Rs. 130 crores to technical education. Nothing, of course, can be reduced from technical education in view of the country's vast programme of industrialisation in the near future, but the expenditure on general education which has gone up from Rs. 213 crores during the Second Plan to Rs. 370 crores offers some scope for economy. This increase in educational expenses is due mainly for

the emphasis on provision of facilities for free and compulsory education for the age group of 6 to 11 years as provided in the constitution, already the time limit, originally set, had to be extended for a variety of reasons. The target is to raise the number of pupils at the primary stage from 33 millions to over 50 millions. For implementing this programme more than 4,00,000 additional teachers will be necessary. While universal education and a high percentage literacy is desirable in a free country, it should not be overlooked that the country is not able to providing 4,00,000 efficient additional teachers, especially in view of the poor quality of teachers in the primary schools that are to be found at present. It is unlikely that the better type of people would be drawn into the profession of teaching primary classes at pitifully low salaries that they receive.

An attempt was already made to raise the standard of education by raising minimum qualifications for recruitment of teachers in primary schools. The result was that very often the revised upward qualifications had to be ignored and recruitment had to be made from those individuals who did not satisfy these qualifications, especially in some of the educationally backward States. No one grudges if education in its true spirit can be given to most, if not to all, but one would like to be sure that education, which is the preparation for life, is helpful to the recipients. The question of benefit derived out of education is specially important in view of the huge cost involved. All present indications point towards a situation where it is unlikely that both the quantity and quality of education can be achieved within the short period of five years; especially in view of the fact education and trained teachers require a period of gestation to be available. So, it is proposed that the expenditure on education, especially on general education, be reduced by Rs. 200 crores by way of rupee expenditure. Of course, the full brunt of the axe need not fall on primary education, but a portion may also be taken away from secondary and university education programmes in view of the large number of educated unemployed in the country. It is frankly admitted by the planners that it would not be possible to raise the number of science students adequately in the Third Plan due to certain bottlenecks, such as number of trained science teachers and science laboratories, etc. It follows naturally that all the expansion proposed in the Plan will result in large number of university graduates with general education. This flow of university graduates with general education will, of course, only add to the country's already overwhelming problem of unemployment and the consequent frustration and indiscipline that are to be found in the society today. So, while sympathising with the aspiration of the younger generations to have higher education in the field of humanities, it is proposed that their problem should not be accentuated any further at both the individual's and the nation's cost. It is proposed

that a saving of Rs. 10 crores in foreign exchange, out of a total saving of Rs. 100 crores under the head, should be effected.

The next important item that receives an allocation of Rs. 300 crores is health. While the importance of health to existence is obvious, still it would be essential to cut down expenditure under this head by Rs. 130 crores, consisting of Rs. 120 crores in rupee expenditure and Rs. 10 crores in foreign exchange. The cut can be made in expenditure on primary health units, hospitals and dispensaries and in education and training. In the field of health also, it is not expansion that is called for at the moment but the consolidation and improvement of quality and efficiency of our public health and medical services.

Under social education, the Third Plan proposes to have a large number of literacy centres, community centres, reading rooms, libraries at a considerable cost. It has been noticed that some of the community centres and libraries have been established at places where they have no use. For example, it was found in a tribal village near Ranchi that the youth had no time for either recreation or studies as they were busy from morning till dusk in the nearby town for eking out an existence. It has also been observed that many of the centres, once established, either die a natural death in course of time, either because they are not located at proper places or because the centres are used for purposes other than what they are meant for; for example, for entertainment of marriage parties or as gambling booths. This is, of course not to deny the need for a large number of literacy and other centres where they are utilized rightly; but in view of the limited funds there can be no conniving at waste of expenditure. It is proposed that Rs. 60 crores should be taken out of the expenditure under this head.

Similarly Rs. 100 crores are earmarked for the welfare of backward classes. The whole of this outlay could be eliminated on the ground of judicious management of the programmes. It is felt that the backward classes would naturally gain significantly by the general improvement in the country brought about by various measures in different fields of development activity, which cover the backward classes as well.

Thus, it is proposed to cut down a total amount of Rs. 490 crores under social education. Out of this amount, Rs. 30 crores relate to foreign exchange and Rs. 460 crores to rupee expenditure. In the foregoing paragraphs, it has been explained that Rs. 200 crores should be deducted from education (including Rs. 10 crores of foreign exchange); Rs. 130 crores from health (including Rs. 20 crores by way of foreign exchange); Rs. 60 crores from social education (rupee expenditure); and the entire amount of Rs. 100 crores from the welfare of backward classes (rupee expenditure)—thus making a total of Rs. 490 crores consisting of both rupee and foreign exchange resources.

India and China: Shifting Currents

IN this Blue Supplement, 'The Eastern Economist' attempts a comparative assessment of the economic strength of India and China at the present time as an aid to the appreciation of the deeper implications of the political dispute between the two countries over their common boundary. This is an ambitious undertaking, largely because an assessment at a point of time is dangerously arbitrary. It fails to capture the trends of the years preceding and, perhaps what might be worse, it may fail to catch the spirit of progress in the years ahead. Nevertheless, a decision, arbitrary and imperfect, has still to be made, for relations between India and China are sorely strained and there are both strategic and journalistic reasons for making an assessment of the manner in which the two countries stand in relation to one another today. Their relations to one another cannot, of course, be presented in isolation. The trends of growth over the last few years and some guesses in regard to future trends must necessarily be included. In this respect the potential aid that India will obtain from her friends abroad and the aid that China will obtain from Russia need at least cursorily to be examined.

'The Eastern Economist' produced an Annual Number exclusively devoted to this theme in 1957 and, therefore, there is some justification for choosing only the period after 1957 for the current economic assessment. It is true that the last year tends to favour India in a comparative assessment. This is because China has had one of the most serious droughts in her history whereas India has had one of her most favourable years. Both agricultural and industrial production are running at their peak in the Indian Union and

at a fairly low point in terms of recent Chinese claims. Nevertheless, the fact remains that the Indian system of administration or ordered economic life has shown a steady capacity to rise, while the Chinese claims to the effect that their system has abolished the gamble in the rains have been abundantly disproved. In effect, we still live at the mercy of chance. But it would appear at first sight that the ravages of chance have been greater in China than in India. It may also be that the disorganisation caused by a leap forward and a sudden leap back are psychologically dangerous for all countries determined to ignore human capacity and the limits of endurance.

If there is a moral to be drawn from this survey, it is, firstly, that in political terms at least on the border dispute, India's assessment of her rights has much more documentary proof than has the Chinese case. Here the evidence is largely based on the remarkably able report of the officials of the Government of India and the People's Republic of China on the boundary question. In the economic sphere there is less documentation and reliance of necessity has to be placed on some non-official sources operating in Hong Kong particularly the assessment of Professor Stuart Kirby on contemporary China for 1958 and 1959. All that can be said here is that the conclusions are as good guesses as any that can be made; the honesty of purpose of authorities concerned should not be called in question.

If this brief study convinces the Indian people that they need not be unduly cast down by the comparison or unduly fearful of a clash on issues of high principle, it will not have been in vain.

POWER GENERATION IN THE THIRD PLAN

The Tension Over the Boundary Dispute

POST-WAR HISTORY will not find any parallel to the surreptitious claims advanced by China against India in respect of the common frontier between the two countries. This frontier has been demarcated by the Himalayas and over the centuries no controversy was raised about this natural alignment. But in September 1959, a full decade after its establishment, the People's Republic of China woke up to the realisation that hundreds of square miles of its territory were incorporated in India and ought to be regained. Five years prior to that in 1954, Mr. Nehru pointedly brought to the notice of Mr. Chou En-lai wrong descriptions in Chinese official maps of certain areas which were parts of the Indian territory. Mr. Chou En-lai's explanation was that those maps were of little consequence and his government had no time to revise them. The unquestionable implication was that no dispute existed about the boundary.

But China gave a shock to India in 1959 by occupying by military force 12,000 square miles of Indian territory on the plea that the area belonged to China. This was the manner in which she gave a practical demonstration of how she intended to observe the Panchsheel agreement of 1954 with India with its central emphasis on peaceful existence and respect for the territorial integrity of the other party. Soon afterwards the Chinese government made the second discovery that not 12,000 but 50,000 square miles of territory were to be recovered from India. The climax came when China put forth the fantastic demand that the entire boundary running across the Himalayan watershed from west to east over a length of 2,400 miles should be surveyed jointly and delimited. Indeed, in retrospect, the Chinese might be amazed how they excelled themselves in this exercise of aggrandisement.

Having occupied by force the territory which she considered strategically essential for establishing an uninterrupted and fully consolidated line of communications between Tibet and Sinkiang, China agreed to settle the dispute by negotiation. The fact-finding preliminary part of the negotiations was entrusted to the teams of officials nominated by the governments of the two countries. From the report submitted by the officials to the two governments, it is clear that copious evidence has been adduced by India to corroborate her position. Chinese evidence, particularly documentary evidence, is quite meagre, vague and in several respects remotely inferential. China has shirked tendering precise information and has offered elucidation hardly of half of the points raised by India for clarification by her. Where queries were replied, the answers were mostly evasive. The Chinese side has felt no qualms of conscience in shifting the ground behind its contentions to suit expediency. This technique of shifts had a most telling chain reaction.

Among the three sectors of this frontier, the Western Sector is the most crucial from the view-point of China. Here it is that China wants to tighten up her stranglehold on Tibet and Sinkiang by means of an uninterrupted strategic line of communications. A wealth of documentary as well as other factual evidence produced by the Indian side proved that the present Indian alignment was recognised for centuries as the traditional boundary between Ladakh and Tibet. In so far as Sinkiang is concerned, the documents produced by India conclusively show that from the sixth century at least the southern boundary of Sinkiang lay north of the Kuen Lun ranges. It was only towards

the end of the last century that Sinkiang's southern limit was stretched up to these ranges. The conclusion which emerged from these historical facts is that the Aksai Chin Plateau and the Lingzi Tang plains never formed parts of Chinese territory. But it is precisely these parts which China is now claiming as her own. The evidence produced by China was that of a document purporting to show the contemplated establishment of an administrative sub-division by Sinkiang which never came into existence. On the contrary, Indian documents conclusively prove that the Aksai Chin plateau was administered by the Governments of Ladakh and Kashmir. Details are available about the exercise of the basic administrative authority of assessment and collection of revenue.

The hollowness of the Chinese claim is graphically shown in relation to Ladakh. The Chinese side has been repeatedly contending that throughout Ladakh has been an integral part of Tibet at least as recently as the middle of the 19th century. But in a separate context the Chinese assert the ancient character of what according to them was the alignment between Ladakh and Tibet. It is still more interesting to find the Chinese adducing evidence which showed that Ladakh was independent of Tibet in the 17th and 18th centuries. These somersaults make a graphic exposure of how China has been shifting her ground to suit expediency and how in that process her claim has been thoroughly discredited by her own evidence.

The Chinese denial of the status and authority of Tibet to enter into treaties or international agreements with any country has further laid bare this game of somersaults. It is true that China withdrew from the Simla Conference of 1914 which resulted in the agreement on the McMahon Line between India and Tibet. But the Chinese Government could not explain how China acknowledged the Tibetan representatives' plenipotentiary status on a par with China's at the conference table. Her stout denial of Tibet's treaty-making power was conveniently erased by her from memory in a fit of opportunism. Representatives of Tibet, acting independently in their country's own right to make treaties, became parties to the commission for the settlement of the boundary dispute which involved Nilang-Jadhang. China produced Tibetan documents during these boundary discussions with India to prove her contention in the present dispute. When confronted with the question how they reconciled the production of this evidence with their dogmatic denial of Tibet's treaty-making power, they were completely non-plussed.

The Middle Sector of the India-China border shows China at her weakest in the demand for delimitation of the boundary. The Himalayan watershed is the indisputable natural dividing line between the two countries and, furthermore there is irrebuttable evidence of ancient chronicles and uninterrupted tradition describing the Indian alignment in a very precise manner. By contrast, China has been utterly unable to produce any proof of tradition or custom which would lend even a colour to her claim to the territory now disputed and claimed by her. And the same position holds good in regard to the Eastern Sector to the boundary. On the Eastern Sector ancient chronicles and the rule of ancient Indian dynasties establish the Indian case. For more than a century and a quarter at least, Indian political authority has been exercised over this area.

None of the official maps produced by China dates anterior to 1950—the second year of the establishment of the People's Republic of China. A reference has been made at the outset to Mr. Chou En-lai's explanation about the inaccuracies in some of these maps.

China has now added two new dimensions to the boundary dispute. The Chinese officials, obviously acting under a strict brief, declined to discuss any questions relating to the boundary of the Kashmir State lying to the west of the Kara Koram Pass. The diplomatic implication of this refusal is quite plain—China does not recognise Kashmir's accession to India. She is sounding "Azad" Kashmir for boundary negotiations. More astounding is the shift in position now made by China as regards Sikkim and Bhutan. The Government of China had unequivocally and categorically recognised the validity of the Convention of 1890 which expressly acknowledges the responsibility of India for the external relations of Sikkim. In so far as Bhutan is concerned, a similar blatant shift has been made by her. She declines to acknowledge India's right and responsibility to settle the boundary of these two kingdoms on their behalf. At a Press Conference held in New Delhi on April 25, 1960, Premier Chou En-lai unequivocally stated in reply to a question that "China respects India's relationship with Bhutan and Sikkim." Later on the Chinese official text of the Press conference, published in the "Peking Review", interpolated the word 'proper' between the words 'India's' and 'relationship'. This is flatly contradicted, among other independent evidence, by a tape-recording of Premier Chou En-lai's statements at the Press conference.

China is seeking to make virtue out of her agreements of boundary settlements with Burma and Nepal. In particular, she is harping on the major settlement, among these two, with Burma. No basis for comparison, much less for parallelism, exists. The boundary alignment between India and China is demarcated by the Himalayan watershed and by the Kuen

Lun ranges to the extreme west. Surthen it is sanctified by ancient tradition and custom. Nevertheless, there is one moral to be drawn from the Burmese agreement—complete vindication of Burma's stand that China's "claim" over 25,000 square miles inside Burma was untenable. It speaks for the Chinese tactics of aggressive claims without the least regard for history and truth.

China's entire strategy in the border dispute which she has chosen to create cannot fail to convince any impartial assessor of the situation; that she is not interested in negotiating suitable adjustments of the frontier at points where the position is not clearly settled. Her interest lies in keeping the tension alive for an indefinite time for a variety of ulterior motives. This is plain from the new dimensions which she is gratuitously adding to the dispute. India's case, however, cannot be safeguarded on the strength of reason and argument, where the opposite party has no intention of respecting the technique of an amicable and just settlement by negotiation. India must recognise this fact and always be on the alert to defend the integrity of her frontier territory.

In the final resort, what sustains the capacity of a country to defend itself against aggression is its economic potential in general and industrial as well as agricultural potential in particular. The capacity of China under her system of regimented mobilisation of her resources has been exaggerated and a misleading image has been created that she is forging ahead with economic development uninterrupted by set-backs. The wide publicity given by her to the "big leap forward" has been instrumental in creating this impression. An attempt to analyse how India is steadily building up her economic and defensive strength and what is the reality about China's "astronomical" progress in augmenting her economic as well as aggressive potential has been made in the subsequent portion of this Blue Supplement.

The Pattern of Economic Growth

During the last decade, impressive experiments in economic growth have been conducted both in India and China with the primary object of raising the standard of living of the people. In the case of China, the Communist Government has imposed controls on every aspect of the life of the people while planning in the Indian Union has been operated through a democratic Government. Great interest attaches to the measurement of the rate of economic growth in both countries, though the manner in which figures are put out by the Chinese Government makes the comparison extremely difficult, though not impossible. In fact, even in the most discouraging year, the Chinese figures tend to depict a very optimistic picture of the economy. The computers of national income have indeed a very hard task to perform.

On the basis of official figures, the per capita income in India and China is compared. The results for the period 1952-59 are set out in the table alongside. It will be seen that till 1955, the per capita income in China remained below the level of per head income in India. From 1956 onwards, the Chinese figures show a very optimistic trend indicating, in some years, a rise of even 20 per cent. During the period under review, while the rise in per capita income in the case of the Indian Union has been of the order of about 1 per cent per annum, the Chinese rate of growth has been more than 10 per cent per annum. Naturally, this comparison tends to cast doubts on India's democratic process of

economic growth under its five year plans. Either Indian planning is defective or the Chinese figures are not worth the paper on which they are printed.

PER CAPITA INCOME IN INDIA AND CHINA

Period	China (Mainland)		India	
	National Income Million Indian Rupees	Population (In Millions)	Per Capita Income (In Rs.)	Per Capita Income (In Rs.)
1952 ..	123,560	569	217	256
1953 ..	141,562	583	243	266
1954 ..	149,326	595	251	268
1955 ..	159,270	608	262	268
1956 ..	179,381	621	289	276
1957 ..	192,004	643	299	287
1958 ..	257,278	669	386	285
1959 ..	312,851	695	450	277

The official Chinese statistic indicating the rate of growth of national income and the fixed investment for the period 1950-58 are given in the following table. National income during this period seems to have risen at more than 12 per cent while gross investment as percentage of national income has risen around 19 per cent. Capital-output ratio at 1.5 seems to be extremely low in view of the fact that the Chinese Five-Year Plans laid considerable emphasis on basic and heavy industries. The experience in the free world has been around 3:1. There seems to be some deliberate distortion in these figures.

There are no independent means of checking the production figures publicised by the Chinese official sources. The pronouncements of some of the experts, however, throw a flood of light on their faith in objective economic analysis. This is amply clear from the following quotation of Mr. Chia, head of the Statistical Bureau:

"Statistical work is a weapon of class struggle and

of political struggle; our statistical reports must reflect the great victory of the party's general line and the progress of all the works guided by the party. They certainly should not be a mere display of objective facts."

The disastrous failure in the agricultural field during the last three seasons has, however, brought about a change in attitude towards the compilation of statistics. Voices are now being heard in official circles of a realistic approach to the collection of statistics because it is now realised that without the knowledge of an honest and factual position of the economy, no five-year plans can be successful. The manner in which the figures for food production in 1958 were revised shows that the Chinese Government may introduce an element of error of anything from 10 to 50 per cent. This is the basic difficulty in comparing the true rates of economic growth in China and India.

The Public Sector

The process of socialisation came to completion in China in the year 1956 when the private sector was almost eliminated. The table below shows the sector-wise distribution of national income and clearly demonstrates that the private sector, indicated as the individual sector, was reduced to 7 per cent of the economy in 1956. By 1961, the private sector, it seems, was completely wiped out. The pride of place was

occupied by the co-operative sector, followed by the state-owned undertakings and the joint state private undertakings. In the case of the Indian Union, the share of the public sector has gradually risen since independence from 5 per cent of the total national income to nearly 10 per cent of the total income. The private sector of the economy in the Indian Union still generates 90 per cent of the total national income.

CHINA: SECTOR-WISE DISTRIBUTION OF NATIONAL INCOME

(Percentages)

Year	State-owned economy	Co-operative economy*	Joint State-private economy	Capitalist economy	Individual economy
1952	19.1	1.5	0.7	6.9	71.8
1953	23.9	2.5	0.9	7.9	64.8
1954	26.8	4.8	2.1	5.3	61.0
1955	28.0	14.1	2.8	3.5	51.6
1956	32.2	53.4	7.3	..	7.1
1957	33.2	56.4	7.6	..	2.8

* From 1955 onward most of the "Co-operatives" were transformed from the "elementary form" (co-operatives proper) to the "advanced form" (collectives in fact).

CHINA (Mainland)

RATE OF GROWTH OF NATIONAL INCOME & GROSS FIXED INVESTMENT

	National Income	Investment		
1950-53	12.2	49.9	12.5	1.0
1953-58	12.4	21.7	22.5	1.8
1950-58	12.3	31.6	19.1	1.5

The Growth of Population

MAINLAND of China is the most populated country in the world. Before the census of 1953, official and non-official estimates had placed its total population at 450 million. The disclosure that Chinese population in the year 1953-54 was as high as 583 million came as a sensation to the outside world. In line with the pattern of distribution of population in other developing countries, China revealed that the population in the rural areas was seven times the population in the urban areas. In precise terms, about 13 per cent of the population was distributed in the towns, while the rest of the 87 per cent was in the villages.

The most significant factor revealed in the recent vital statistics is that the birth rate has shown only a marginal fall while the death rate has indicated a steep decline, with the cumulative effect of raising population at more than 2 per cent per annum. Currently, the population of China is estimated at about 700 million, and the official policy is for putting no restraint on rising numbers, by way of family planning or "planned parenthood". The official pronouncements indicate that contraceptives and other techniques of family planning are available in all the major hospitals in China, but they are designed more to help the ailing mothers in spacing children rather than to encourage birth-control.

In the case of the Indian Union, the rise in population as revealed in the latest census, has alarmed the planners in view of the fact that the country is dedicated to "Planned Parenthood" and all possible attempts at keeping the birth rate in check have proved abortive. It is feared that the calculations made in regard to the possible rise in the standard of living in the Second

Five-Year Plan may go wrong because of the unexpected increase in population. It has also tended to aggravate the employment position, and much concern has been caused by this distressing rise in population.

The essential difference between the policies pursued by the two countries is that whereas China, by and large, does not believe in restricting the growth in population and, according to present reports, is expecting to employ and feed a population of 1,000 million by 1981, the Indian Union expects by gradually raising the standard of living of the people and by giving wider publicity to family planning techniques, to keep the population of the country within control. The present estimates indicate that by 1981 India's population would not exceed 583 million. The family planning techniques in India have not proved very effective so far, but this is engaging the attention of the Government of India and it is likely to claim larger shares of financial outlay in India's future five-year plans.

Development of Agriculture in India and China

IN 1959, China sprang a big surprise on the world by claiming that her agricultural production in 1958, as also her industrial output, had staged a strident advance. Production of foodgrains was claimed to have gone up to 375 million tons and of cotton to 3.35 million tons from 185 million tons and 1.64 million tons, respectively, in 1957. Output of soybeans was said to have increased in one year by 24 per cent, of groundnuts by 56 per cent, of cured tobacco by 115 per cent and of hemp by 8 per cent. These estimates were subsequently revised drastically downwards and 1958 output of various agricultural commodities was put at: foodstuffs 250 million tons, cotton 2.1 million tons, soybeans 10.5 million tons, groundnuts 2.8 million tons, cottonseeds 4.2 million tons, tobacco 0.38 million tons, tea 0.14 million tons, compared to 185 million tons, 1.64 million tons, 10.25 million tons, 2.57 million tons, 3.28 million tons, 0.39 million tons and 0.11 million tons respectively, in 1957.

This sharp increase in China's agricultural production in 1958 naturally attracted world-wide notice. In Western countries, of course, doubts were expressed whether even the revised production figures represented correct estimates. In view of the experience of the past two years, it appears that these estimates were still rather on the high side. Afflicted by severe drought in various parts of the country and storms, floods and typhoons in the coastal areas, Chinese agricultural output is said to have gone down appreciably during 1959 and 1960, with the result that there is being felt a widespread shortage of food in the country. Writing in the June 11, 1961, issue of "The Observer," the Special Correspondent of this paper reported from Hong Kong that Communist China, which was energetic and disciplined in 1958, has been reduced to a somewhat seedy image of its former self. "In Canton thieves operate openly, stealing food and other comforts brought by visitors from Hong Kong for their relatives in the interior, and the police do little to stop them. In other cities, beggars importune in streets flanked by dirty buildings and half-finished blocks on which no work has been done for months.... In the people's communes hungry and disgruntled farmers have stolen food, raided communal grain stores, even organized minor riots, and there are bands of peasants in revolt or in hiding to avoid reprisals in the hills of Kwangtung and Shantung." Even Communist authorities and administrative cadres are said to "have been filching food, dealing in black market which has sprung up." In Shanghai, they are said to be taking bribes in exchange for travel papers which enable Chinese to escape to Hong Kong and Macao in search of food. "Food rations have been drastically cut and people receive on tickets only 4 oz. of sugar a month, half a litre of cooking oil (if they are lucky), a few ounces of pork and a little fish. Green vegetables have been almost unobtainable until recently. Even when quantitatively sufficient, the diet is dull and debilitating. On the free market at which peasants may sell their own produce, an egg costs 1s. 6d., a chicken a guinea and a rabbit 15s."

This alarming picture of food shortage in China is confirmed by some other facts too. China, whose net food exports amounted to as much as \$33.5 million in 1957, \$25.5 million in 1958 and \$25.8 million in 1959, is reported to have already contracted to import this year about 4.5 million tons of cereals from Australia, Canada and Burma. Large supplies of foodstuffs are also being sent by Chinese nationals abroad to their friends and relations on the mainland; according to some dealers in Hong Kong about 100,000 lbs. of food was being sent to China daily early this year from abroad by means of post parcels through Hong Kong

alone. Parcels of food are said to be entering China from Macao as well.

No authentic foodgrains output figures for the year 1960 are yet available, but the Peking authorities put this year's production at less than that of 1959 and 1958 but more than the output in 1957. This means that food output in 1960 was between 185 and 250 million tons; latest reports suggest that it has been very near 185 million tons. This along with the export figures should provide a clue whether the claim of 250 million tons of food production in 1958 was justified or not. The area affected by natural calamities in 1960 was reported to be 99.84 million acres which, if the previous experience is any guide (as the following table shows), should have yielded about 35 to 40 million tons of grains:

DAMAGE DONE TO CHINESE FARM OUTPUT BY NATURAL CALAMITIES (1953-59)*

	Area affected (million acres)	Loss in grain production (million tons)	No. of persons affected (millions)
1953	15.83	7.5	34.35
1954	30.25	8.85	62.23
1955	19.03	6.35	36.22
1956	38.33	12.20	74.34
1958	16.67	n.a.	n.a.
1959		n.a.	n.a.
1931 (flood alone)	28.30	n.a.	52.70

* Liang-Shih (Foodgrains, Monthly), No. 7, July, 1957: JMJP, February 17, 1959, p.2; and China Today, January 30, 1960.

If the 1960 production is estimated to be a little more than 185 million tons, the total food production under normal weather conditions during this year would have come to about 225 million tons. Taking account of the fact that owing to the 1959 drought in some parts of the country, the production in 1960 would have been slightly lower, the maximum output that could be realised in 1960 would thus come to nearly 235 million tons and that too after a good deal of further progress in application of modern technology to farming. The 1958 figure of 250 million tons foodgrains output thus is obviously an over-estimate. The same should apply more or less to the other agricultural crops.

Compared to India, it is claimed in Communist circles, that Chinese programme of agricultural regeneration is far more effective. But is it so? Except for one fact that there is regimentation in China and the authorities can compel people to do whatever job they like—the case in point is the organization of communes—while in the democratic set-up in India the element of compulsion is not there, the various methods applied to improve agricultural production in the two countries are more or less the same—abolition of landlordism, greater use of fertilizers, extension of irrigation facilities etc. The rate of growth of the Chinese agricultural economy as the table on the next page shows has not been much out of tune with the rate of development in India.

AGRICULTURAL OUTPUT—RATE OF GROWTH

Compared to 1948-52 average output, rice production in India has gone up by 53 per cent, wheat output

by 62.5 per cent, sugarcane production by nearly 33 per cent, groundnuts output by 50 per cent and cotton production by slightly over 70 per cent. In China, agricultural production had gone up upto 1957 at the following rate: Rice 49.2 per cent, wheat 48.6 per cent, sugarcane 132.9 per cent, groundnut 24.9 per cent and cotton (lint) 88.9 per cent. 1958 figures are suspect and no data is available for 1959 and 1960. The serious fall in production in 1959 and 1960 will counterbalance to a very great extent whatever advance there had been in 1958. Production of tobacco and tea in China showed a marked increase of 219.4 per cent and 77.8 per cent as compared to 23.5 per cent and 11.1 per cent in India. But it may be pointed out that cultivation of tobacco and tea in India has to be regulated keeping in view the demand in the export market.

Agriculture both in India and China still remain, despite all the developmental efforts of the past 10 years, a gamble in rain. The steady improvement which the Indian agriculture has made, as is evidenced by the sustained foodgrains output around 75 million tons in the past two or three years despite vagaries of weather, is an indication that the heavy investment that has been effected in Indian agriculture in the past few years has started yielding fruit. In the next few years the results forthcoming may be spectacular. In China, on the other hand, the 1958 advance in agriculture has not been maintained.

AGRICULTURAL OUTPUT: RATE OF GROWTH (BASE: 1948-52)

INDIA			
	% change of 1957 over 1948-52	% change of 1958 over 1948-52	% change of 1960 over 1948-52
Rice (paddy)	+13.6	+38.6	+53.0

Tobacco	+219.4	+211.5	
Tea	+77.8	+122.2	
Cotton (lint)	+88.9	+141.9	

It is said that the output in China in 1959 and 1960 had fallen due to natural calamities, but this is perhaps more due to the fact that the Chinese methods of regimentation and coercion to form communes have gone awry. The smokescreen of widespread droughts,

floods and storms has perhaps been devised, or at least the effect of these natural calamities has been grossly exaggerated, to camouflage the failure of the policies and to divert the attention of the Chinese peasantry and the Western world from the real causes of failure. The communique issued at the end of the 9th plenary session of the 8th Central Committee of the Chinese Communist Party in January last makes an oblique reference to the growing realisation on the part of the Chinese authorities that their agricultural policy has not been an unqualified success. A new emphasis has come to be placed on increasing agricultural production in China and all resources are being diverted to this end. The communique says: "In view of the serious natural calamities that affected agricultural production for two successive years, the whole nation in 1961 must concentrate on strengthening the agricultural front, must carry out the policy of taking agriculture as the foundation of the national economy and of developing agriculture and grain production in a big way by the whole Party and the whole people must step up support for agriculture by all sectors and occupations and must exert the utmost effort to win a better harvest in agricultural production." Millions of people from all walks of life are reported to have gone to the countryside to help raise farm output. This is perhaps an admission of the fact that agriculture in China had come to be neglected under her Second Plan.

From the steps that the Chinese authorities have taken in the recent past to increase agricultural output it appears that realisation has dawned on them that the real causes of fall in farm production during the past two years have been failure of Communes and wholesale application to all parts of the country of some experiments which had proved successful in particular areas under particular weather conditions. The number of Communes during the past two years instead of going up has come down. There were 26,000 Communes in China in 1958. Their number decreased to 24,000 in 1959 and is reported to have gone down further in 1960. There has also been relaxation in the rigid system of the Communes that exist today inasmuch as peasants have been given marginal lands to give them incentive to raise subsidiary foodstuffs by following sideline occupations such as poultry farming, vegetable growing and pig rearing. The "individualism" of the peasantry is today recognised as a major problem in the writings of the Chinese leaders. This really shows that Communes have not been successful as such. There has been of late reversal to co-operative farming in many cases.

Greater flexibility has also been imparted to production programmes. Regional advisory centres have been set up to draw up production plans taking into consideration the local conditions. The production "brigades" and Communes have also been allowed to make their own decisions on sowing of crops.

China's "Great Leap Forward" of 1958 has, thus, proved to be elusive. In view of the malnutrition and under-nourishment of the peasantry during the past two years, which has bred disease, particularly dropsy, it is to be seen whether the Chinese agriculture can recover during the next two or three years. This depends, of course, not a little on the behaviour of weather. But largely it is dependent upon how far the Chinese authorities will go to modify their agricultural development policy. China in the coming two or three years may be able to raise her agricultural production to somewhat more than the 1957 level. By that time Indian agriculture would have further consolidated its position. If the massive investment that has gone into India's agrarian economy during the past one decade starts yielding the spectacular results which are expected, the rate of growth of Indian agriculture during the 15 years from 1951 to 1965 may easily outstrip the rate of growth of China's agricultural economy.

India and China : Industrial Production

WHILE it may be an interesting exercise to study industrial growth in India and China and to compare the conditions and the extent of progress in various sections, it may be remembered that no sound basis exists to compare the rates of industrial advancement in the two countries. One very important, though not the basic, reason for this is that the official index of industrial expansion published by China is constructed in such a manner that comparison with other countries is impossible. The base year selected is pre-war which tends to present an inflated picture of the present production. Moreover, instead of taking the net output, gross output is taken for the purpose of constructing the index numbers. There is naturally considerable amount of double-counting which inflates the figures, in some cases, by three-folds. It may be observed from the graph below that China's index of industrial production touched a fantastic figure of 1,553 for 1960, with pre-war base. On the other hand, the index calculated in India is scientific and takes into account only the net output of industries and naturally the figures reflect the real state of the industry. India's industrial expansion during the First Five-Year Plan (1951-56) registered an overall increase of nearly 40 per cent. and during the Second Plan period (1956-61) the output improved by nearly 55 per cent.

It may also be added that by and large, the dissemination of facts and figures has sufficient political significance for China. Naturally, therefore, no really reliable data are available. But from whatever sources the facts are gathered, it can safely be concluded that the Chinese industrial growth has been substantial, though only in selected industries.

CHINA

GROSS INDUSTRIAL PRODUCTION

STRESS ON CAPITAL GOODS

The first picture that emerges from this comparison is that the Indian industrial expansion has been broad-based and balanced while the Chinese development has been fairly selective. In this connection it may be added that China has been trying to build a heavy base on which to construct an industrial structure with the purpose of developing a "military potential". When this fact is kept in view, it is not difficult to explain why the heavy capital industries have gone ahead at a tremendous rate in China while the same rate has not been attained in India. The Chinese planners have adhered urgently to the principle of concentrating their nation's economic resources on the development of capital goods industries. During 1953-57, for instance, the annual average rate of increase came to nearly 25.4 per cent for capital goods, and 12.8 per cent for consumer goods both calculated in gross value at 1952 prices. The emphasis on heavy industry was more pronounced in 1958 for which year the increase in capital goods was reported to be over 100 per cent and that in consumer goods around 34 per cent, both calculated in gross value at 1957 prices. There was, therefore, a considerable change in the composition of industrial output: the share of capital goods stood at about 40 per cent in 1952; it increased to nearly 57 per cent by 1958.

The table on the next page gives the picture of output of various important industries in India and China in 1959. It appears that as far as the capital goods were concerned India stood at a comparative disadvantage; coal output, for instance, in India was nearly 48 million tons while it was 242 million tons in China; similarly electric power generation was about 14,556 million kwh. in India as compared to 41,500 million kwh. in China. The picture for steel output was also similar. Pig iron output in 1958 was nearly 3 million tons in India while it was around 20 million tons in China. For cement though the figures are not so divergent, the Chinese output was reported to be nearly double that of India's in 1959.

LEAP IN THE DARK

Here a very important fact has to be considered. This rate of increase achieved by China was not dependable because the leap forward had a political significance for the Chinese. It was quite likely that their figures did not have even a broad 'proximity' to the substantive achievements. In the case of coal for instance, it was gathered from various sources that after 1958 output improved only in the small pits where the Chinese retained equipment of the simplest types and there was, as was reported, no systematic exploration for future exploitation of coal. Quality of coal produced was very inferior.

Reproduced below are the official figures which were to prove that China had achieved world status in respect of coal production. In 1958 China's coal output surpassed that of Britain and in 1960, that of the United States, so that it was second only to Soviet Union:

	(Million tons)
1956	110
1957	130
1958	270
1959	340
1960	400

On close analysis, it was revealed that in 1958 the large coal mines produced 153.9 million tons and medium and small mines 116.1 million tons. In 1960 the modern large mines produced 138.8 million and the medium and small sized mines, 261.2 million tons. If that was true, the output from the quality mines actually decreased and the leap was in respect of poor quality coal only. Taking into account the fact that 15 to 20 per cent of dirt or rock content of the coal was normal in China, these contents must be higher in the case of small pits because they operated with primitive methods. Even if a 30 per cent dirt and rock were to be accepted, the actual output would be:

	(Million tons)
1958	190
1959	242
1960	280

It was reported that the number of small coal pits was approximately 1,00,000 which provided sufficient proof for this downward revision. It may also be added that this haphazard expansion of output meant an utter disregard of the nation's resources which when exploited properly could be utilised more economically.

'NATIVE STEEL'

The same was the state in respect of iron and steel output which received tremendous amount of publicity. For 1958, iron and steel output figures announced by the State Bureau of Statistics were 13.7 million tons of iron and 11.1 million tons of steel. Included in these figures were low quality iron and steel produced by small units using indigenous methods. These figures were, therefore, not comparable with the results of the previous years. 1958

figures for pig iron and ingot steel were revised downward to 9.5 million and 8.0 million tons respectively which excluded "native iron and steel" accounting for nearly 30 per cent of China's iron and steel production. It may be observed that India's target of 6 million tons capacity by the end of the Second Plan, which has nearly been achieved, was a far superior instance of planning. There was practically no waste. No "error and correction" methods were applied at the cost of nation's resources.

INDUSTRIAL OUTPUT 1959

	China (Mainland)	India
Electric power (m. kwh.)	41,500	14,556
Coal ('000 tons)	347,800	47,784
Crude Oil ('000 tons)	3,700	442
Pig Iron ('000 tons)	20,500	3,068
Ingot Steel ('000 tons)	13,350	2,420
Cement ('000 tons)	12,270	6,936
Sulphuric Acid ('000 tons)	740(a)	297
Caustic Soda ('000 tons)	270(a)	70
Chemical Fertilisers (excl. A. Nitrate)	1,330	636
Locomotives (Numbers)	350(a)	1,250*
Motor Vehicles (Numbers)	20,000	38,488
Cotton piecegoods (million metres)(b)	7,500	6,569
Paper ('000 tons)	2,130(b)	299
Sugar ('000 tons)	1,130	2,117
Vegetable Oils ('000 tons)	1,250(a)	322§

* Relates to the plan period. (a) Relates to 1958. (b) Including handicraft production. §Only Vanaspathi production is taken into account.

CHINA: INDUSTRIAL PRODUCTION: 1939-1960

In the case of the cement industry too the apparent rate of increase was substantial in China. Between 1952 and 1957 the output increased from 2.3 million tons to 6.8 million tons and between 1957 and 1960 it almost doubled. It has been noticed that here too, the real output was significantly lower because it included output from factories which produced the low quality material. This was evident from the fact that cement was still below standard and the completion of a number of river valley projects in China was delayed owing to the shortage of quality cement.

Heavy industry on the whole was developed in China on a liberal scale without taking into account the raw materials that were required. In the case of steel, for instance, no attention was paid to the availability of iron ore. Moreover, this stubborn insistence on rapid expansion of heavy industry continued while no attempt was being made to lay the foundation for a proportionate growth in transport. Rail transport limited the possibilities and caused a serious threat to the development of industry in China. Such bottlenecks were not unknown in India, but they never assumed any serious proportions.

CONSUMER GOODS

When a comparison is attempted in the case of consumer goods, it is observed that India has always maintained a steady upward trend in production while China had to face 'famine' conditions in respect of various consumer goods during the last decade of her

planning. Desperate shortages of vegetable oils, cotton piecegoods, sugar and similar items which entered the daily schedule of the consumers were reported from time to time. The explanation is not hard to find. The table below sets out the per capita production of the more important consumer items. It seems that against per capita output of 17 yards of cloth in India, China lags behind with just 12.9 yards. In the case of sugar, where non-centrifugal sugar is also taken into account in both the cases, the comparison is startling. Against nearly 23 lbs. per capita in India, sugar available in China is to the extent of 3.5 lbs. only. This explains the sugar 'famine' in China, reports about which were received quite recently. The output of consumer goods, it seems, was a question of priorities and political decisions.

PER CAPITA PRODUCTION

Items/Unit	India	China
Cotton cloth* (Yds.)	17.0	12.9
Sugar (Lbs.)	31.9**	3.5
Salt (Lbs.)	16.6	34.8
Tea (Lbs.)	1.7	0.5

* Including cloth produced in the de-centralised sector.
** Including Gur and Khandsari production.

India and China : External Assistance

EXTERNAL assistance, mainly in the form of capital equipment and technical know-how, has been one of the crucial factors in the economic development of most, if not all, under-developed countries of the world that have industrialised themselves. India and China are no exceptions to this rule. The dependence of China on Soviet Russia for economic development is admitted in Chinese official statements in no uncertain terms. It is admitted in the Chinese Five-Year Plans that Soviet assistance was "systematic and all-comprehensive." The Chinese planners admit that Soviet Union has supplied the best equipment, and a large number of experts for "industry, agriculture, forestry, water conservation, geology, education, public health and other departments." In no less than 156 industrial projects, the U.S.S.R. assisted the Chinese "throughout the whole process from start to finish, from geological survey, collecting basic data for designing, supplying equipment, directing the work of construction, installation, and starting production and supplying technical information, right down to directing the work of the manufacture of the new products". The Peking Review stated recently that the Soviet Union had sent at different times more than 10,000 outstanding specialists to assist China. This explains the reported encouraging achievement of China in the field of industrial development during her First Five-Year Plan. But lately, Soviet assistance to China has been drying up fast according to information received from certain quarters.

Any factual Chinese study is, of course, heavily handicapped because of the veil of secrecy that has been thrown over Chinese statistics. Still indications of the volume of foreign aid that China received from Soviet Russia upto 1957 is available from the United Nations publications. The period after 1957 is some-

what shrouded in mystery, perhaps for calculated reasons. It is now no longer a secret that the Soviet credit to China has been dwindling in recent years; for example, the amount has gradually fallen from 1,657 million yuan in 1955 to 117 million in 1956 and to only 23 million yuan in 1957, according to the "Economic Survey of Asia and the Far East", 1957. This may also explain the "agriculture-is-the-base" campaign of the Chinese Communist Party calling for a strengthening of the agricultural front in 1961. Recently, millions of industrial and office workers were mobilised throughout the country for farm labour. The fast receding Soviet assistance may have prompted China to devote her energies and resources on agriculture which does not require much of foreign capital equipment and technical know-how.

The volume of aid received by China from Russia from 1953 to 1957 amounted to only 3,119 million yuan against a total expenditure of 85,633 million yuan during the period of the Chinese First Five-Year Plan; that is, China received only 3.6 per cent of her total expenditure by way of foreign aid. India, on the other hand, received 12.1 per cent of her total investment in the public sector by way of foreign assistance during the First Plan period; similar figures for India's Second and the Third Plans amount to 29.9 per cent and 34.9 per cent respectively. Figures for China's Second Five-Year Plan are again shrouded in mystery. But it is difficult, if not impossible, to believe that the Soviet assistance to China amounted to only 3.6 per cent of her total expenditure during China's initial industrialisation push, started and continued throughout her First Plan period. This quantum of Soviet aid to China is all the more doubtful because of the official admission of "systematic and all-comprehensive" assistance received by the Chinese people

to carry out their 156 industrial projects. This quantum of aid can only be explained in two ways. Either, the system of calculating Soviet aid to China excludes some vital items; or, the quantum of Soviet assistance to China is purposely played down to "serve the political programme". What that political purpose is is only known to the Chinese. There is a belief in certain quarters that now the Chinese do not want to advertise their performance as they did previously and thus set in competition in economic assistance from the U.S.S.R. by other Asian countries. Since the estrangement of feelings between China and India, both China and Russia seem to be exercising great caution. The veil of secrecy woven around Soviet assistance to China may have also been prompted by the Soviet Union's desire to prevent the world from comparing their assistance to an Asian Communist

country in relation to that advanced to other uncommitted nations. Or, it is very likely that the Communist Bloc wants to prove superiority of 'their' system by claiming at a later date spectacular and exaggerated achievements of the Chinese economy achieved through their central planning and 'with little or no external assistance'. That is why the amount of external assistance received by China is kept a closely guarded secret.

Whatever the facts and whatever the reasons for such well-guarded hush-hush over external assistance figures of China, there is no doubt that India, with sizeable receipts of foreign aid, is proceeding on the right path. All indications point to the possibility that India would continue to receive larger amounts by way of external assistance and continue to accelerate her rate of economic growth.

INDUSTRIAL PROGRESS IN CHINA* (Mainland): 1953-59

Items	1953	1954	1955	1956	1957	1958	1959	1959 (Planned)
