At a two-day meeting last week, the Committee of the Federation decided that resolutions for this session should be drafted on (1) Third Plan, (2) export promotion, (3) streamlining of administrative machinery, (4) transport capacity and movement bottlenecks and (5) coal production and movement.

The Committee also finalised a communication to be addressed to the Government of India on price regulation and return on capital. The Federation, it is learnt, has already taken up with the Union Ministry of Commerce and Industry the point that the recommendations of the price fixing authorities do not always take note of the needs of the industry to provide for a fair return to the investors and for rehabilitation and expansion of plant and equipment after meeting the growing operational expenses.

SETTING UP OF UNIT TRUSTS

The Reserve Bank of India, it is learnt, has sent a note to the Union Government on the establishment of investment and unit trusts in India. The note is now said to be under examination of the Union Ministry of Finance.

COMPANY AFFAIRS

THE BHOPAL SUGAR

The Chairman of the Bhopal Sugar Industries Ltd. has pointed out that the Madhya Pradesh Government fixed the ex-factory price of sugar but Government nominees were not in a position to lift sugar at the controlled ex-factory prices. Ultimately the selling part was left to the Company with the result that it had to compete with imported sugar from U.P. and Bihar, which is sold at a price lower than that fixed by the Madhya Pradesh Government for the Company's sugar. The Chairman adds that there has been no change in the minimum price payable for sugarcane which has been maintained at Rs 1.62 per maund. Pursuant to the provisions of the Sugar Export Promotion Act the factory was asked by the Export Agency Division of the Indian Sugar Mills' Association to sell internally 1515 bags of sugar out of the season's production. An amount of Rs 81,450 being the estimated loss on the same, the Company has adjusted by reducing the value of 1515 bags from the stock as on September 30, 1960.

Regular crushing was started on December 23, 1959, the duration of the season being 99 days as against 103 last year. The total quantity of sugarcane crushed was higher at 72,608 tons against 70,092 tons last year. The average recovery was maintained at 10.11 per cent against 10.10 per cent last year. The average yield from the farms of the Company was lower at 30.88 tons per acre as against 32.48 tons of last year. The profit and loss account for the year to September 30, 1960, shows a net profit of Rs 11.44 lakhs after providing for depreciation to the extent of Rs 2.03 lakhs and cess on sugarcane to the extent of Rs 2.37 lakhs. The Directors have recommended the provision of Rs 4.50 lakhs towards taxation. A dividend at the rate of 5 per cent on preference shares (subject to deduction of tax at source in accordance with the provisions of the Finance Act, 1960 and subject to increase that may be permissible under the Preference Shares (Regulation of Dividends) Bill 1960] absorbs Rs 62,500. Dividend on equity shares of Rs 10 each fully at Rs 2.25 (subject to deduction of tax) will absorb Rs 3.94 lakhs. A sum of Rs 1.50 lakhs is transferred to General Reserve.

The Government of India has approved the application of the Company for extending the crushing capacity of the factory from 750 tons to 1250 tons. According to the first phase of the expansion programme the crushing capacity has been increased to 1000 tons per day by additions of new machinery worth approximately Rs 7 lakhs. The machinery has already been installed and will be brought into use during the current season. This will result in efficient crushing of cane during a short period and higher recovery.

SENDRA & CHURULIA AMALGAMATION

The Directors of the Sendra Coal Company Ltd. have under consideration a scheme of amalgamation whereby the undertaking of Churulia Coal Co. Ltd. will be amalgamated with the Sendra Company in consideration of the issue by the Company to the members of Churulia Coal Co. Ltd. of one Ordinary (Equity) Share of Rs 10 in the Company for three Ordinary (Equity) Shares held of Rs 4 each in Churulia Coal Co. Ltd. The scheme of amalgamation will be contained in a scheme of arrangement to be effected between Churulia Coal Co. Ltd. and its members with the sanction of the Calcutta High Court under Section 391 of the Companies Act, 1956.

The question of the undertaking of Churulia Coal Co. Ltd. by the Sendra Company will enable the Sendra Company to carry on its business on a wider basis as both the companies now function as investment companies and the profit earning capacity of the Sendra Company is thereby to be increased. The Directors are of the opinion that the proposed scheme of amalgamation will be beneficial to the Company. The basis of exchange of shares was arrived at after consideration of the break-up values and present stock market quotations of the issued shares of both the companies and the record of dividends declared. Both the Companies belong to the same group within the meaning of Section 372 of the Companies Act, 1956, as the majority of the Directors of Sendra Coal Co. Ltd. constitutes a majority of the Directors of Churulia Coal Co. Ltd.

SANDOZ PRODUCTS

Dr S. Radhakrishnan inaugurated the new Pharmaceutical Plant of Sandoz Products Pvt. Ltd. at Kolshet, near Thana recently. The Sandoz factory is licensed for the manufacture in India of several basic pharmaceutical products, the most important of which are calcium and ferrous gluconates, and for the local finishing of all Sandoz specialities. The Vice-President pointed out that this collaboration between Switzerland and India in the development of this much needed industry, should be welcomed. He added that all efforts should be made to train Indian personnel in the making of drugs.

Company Meetings

THE SCINDIA STEAM NAVIGATION COMPANY, LTD.

Address of Shri Dharamsey M. Khatau, Chairman, The Scindia Steam Navigation Co., Ltd., delivered at the 41st Annual General Meeting of the Shareholders of the Company, on the 22nd February, 1961.

In his address to the Shareholders of The Scindia Steam Navigation Co., Ltd., at the 41st Annual General Meeting, Shri Dharamsey M. Khatau, Chairman of the Company, referred to the performance of the Company during the year ended 30th June, 1960, that while the cargo carried was higher by over two lakh tons and the freight earnings were higher by over Rs. 1.75 crores, as compared to the previous year, there was a fall in the net earnings due to the low level of freight rates and increased expenditure directly attributable to the increased calls made at different ports, charter hire and direct expenses by way of stevedoring, marine and canal dues. Excluding the provision for special depreciation amounting to Rs. 101 lakhs and not taking into account the surplus on sale of assets of Rs. 6.74 lakhs, the working of the Company showed a profit of Rs. 74.53 lakhs which, under the depressed conditions in the shipping industry the world over, could not be regarded as unsatisfactory.

The Dividend proposed is 60 nP. per share, subject to deduction of tax, to be paid out of the General Reserve.

The low level of freight rates in the overseas trades, the Chairman remarked, was due to severe impact of general depression in shipping, continued low level of tramp rates and the increased competition by tramp and liner vessels which called at Indian ports en route while engaged in international trades not directly connected with India. There was also the competition offered by tonnage bringing foodgrains and fertilizers to Indian ports which could offer to carry cargoes on the way back without regard to economic rates of freight. Shri Khatau, confirming the recent arrangements between different Liner Companies engaged in the India/U.K.-Continent trades, referred to the discussions between the Scindia Company, India Steamships and the other Conference colleagues and observed that the shipping services have been reappraised in the light of modern developments and measures aimed at co-ordinating the services of the Member Lines taken to ensure the best utilisation of ships employed and to provide optimum coverage for loading/discharging ports. This he added was a scheme of rationalization no different from what is normally followed in any other well-organised group of industries and was meant to give a more satisfactory and efficient service.

Referring to the criticism levelled against the efforts made by under-developed countries in the matter of expanding their national shipping, by the General Council of British Shipping recently, Shri Khatau said it was unfair to foist the responsibility for the present day difficulties experienced by shipping the world over on countries like India. Shri Khatau stated that the difficulties presently experienced by shipping in the international field had been brought about by over-acquisition and over-building of tonnage year by year by traditional maritime nations who should have had a better appraisal of the situation and should have taken precautions to adjust their tonnage from year to

year to the world trade requirements. He instanced an increase in tonnage by some of the countries as under:—

Tonnage as at 1st July each year:

	(in millions of G.R.T.)				
	1948	1955	1958	1959	1960
World Total	80.3	100.6	118.0	124.9	129.8
Of Which					
U.K. & Northern Ireland	18.0	19.3	20.3	20.8	21.1
U.S.A.	26.9	23.9	23.1	22.8	22.3
Countries of Europe other than Scandinavia & U.K.	8.1	14.7	18.5	19.6	20.1
Scandinavian countries	7.3	11.7	14.7	16.3	17.2
Greece	1.3	1.2	1.6	2.1	4.5
Liberia	—	3.9	10.1	11.9	11.3
Panama	2.7	3.9	4.4	4.6	4.2
Japan	1.0	3.7	5.5	6.3	6.9

In commenting on the future trend, Shri Khatau referred to the decrease in the world laid-up tonnage from 8.7 million G.R.T. in October 1959 to 3.3 million G.R.T. in January 1961, but observed that the rates of freight had however not registered any increase to justify an inference that the imbalance between world tonnage and world trade had been sufficiently adjusted.

Dealing with the coastal and adjacent trades Shri Khatau referred to the diversion of salt and coal cargoes by rail, delays to coastal shipping both at loading and discharging ports owing to slow dispatch consequent upon the inefficiency of unloading operations and lack of wagons. These factors coupled with restricted loading due to unsatisfactory drafts in the Hooghly River meant a considerable wastage of shipping tonnage employed on the coast. These problems, he said, had been placed before the National Shipping Board and also before the Neogy Committee. He urged the need for a proper co-ordination of all modes of transport and an early solution of the difficulties which the coastal shipping had to face.

Referring to the tonnage programme, Shri Khatau said, that efforts had been made to improve the efficiency and competitiveness of the Company's services by adding new and recently built vessels to the fleet.

Shri Khatau stressed the urgent need for establishment of War Risk Insurance Scheme by the Government of India by which it would be possible to save foreign exchange presently spent abroad. He pleaded for an early adoption of the proposals before the government. Shri Khatau referred to the increasing cost of building new tonnage and rise in the cost of operations and pleaded for a suitable policy in the matter of economic rates of freight for shipping either employed in the coastal or international trades. He said, in making this plea the ship-owners asked for nothing more than what was conceded to every shore industry of importance. Shri Khatau further emphasised the need to bring about the expansion of Indian tonnage on a planned basis so as to ensure maximum

utilisation of the available tonnage and to avoid wasteful and unhealthy competition between Indian Lines and with this end in view, he pleaded that further licensing of vessels should be only for routes either new or not adequately covered by Indian Lines presently. In referring to the operations of the subsidiary companies Shri Khatau stated that B.S.N. (1953) Pr. Ltd., which operated on the Konkan coast had made a further loss of Rs. 6.95 lakhs, which brought the cumulative loss to Rs. 28.63 lakhs. He hoped that the Government of India will arrive at an early decision on the report recently submitted by the Konkan Shipping Services Committee. The Scindia Workshop Pr. Ltd., showed a small net profit of Rs. 1,673. Shri Khatau referred to the acquisition of one of the Ship Repair Firms in Bombay by the Government and urged that there should be no change in the usual practice of the Government Shipping Corporations to invite tenders from all the workshops for ship repair work and to entrust to the lowest tenderer as hitherto, thus ensuring that the Corporations enjoyed the benefit of economic repair costs. Operation of the Jalanath Insurance Ltd., he observed, had brought an increase in insurance premium by about Rs. 1.88 lakhs and added that effective from 1st January 1961 the Company had been able to enter into reciprocal treaty arrangements in the U.K.-Continent and Far Eastern Countries which would benefit the Company further.

In conclusion Shri Khatau thanked Dr. Subbarayan, the Minister for Transport, Shri Raj Bahadurji, Minister of State for Shipping, the Secretary to the Ministry of the Transport, and the Director General of Shipping and his Officers for their efforts in furthering the cause of Indian Shipping. He further thanked all the Company's patrons, shippers and consignees at home and abroad and looked forward to their increased support to the Company's services.

THE INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA LIMITED

Statement by the Chairman, Shri G. L. Mehta, circulated to the Shareholders with the Directors' Report and Accounts for the year ended December 31, 1960

The Annual General Meeting of the Shareholders of the Corporation will be held at the Registered Office of the Corporation, 163, Backbay Reclamation, Bombay 1, on Thursday March 23, 1961, at 4 p.m.

I have great pleasure in welcoming the Shareholders to the new premises of the Corporation, to which the Corporation's registered office was transferred in May, 1960, and in placing before them the Sixth Annual Report of the Board of Directors of the Corporation for the year ended December 31, 1960.

2. In many ways, 1960 marked an important stage in the planned development of India. After the foreign exchange difficulties in 1957 and 1958, the country was able to consolidate its position in this sphere, thanks partly to the aid of friendly countries. Industrial production increased by about 15 per cent over the level reached in 1959—the result of completion of earlier efforts. Available reports indicate a favourable situation as regards agricultural production. Credit which appeared plentiful at the beginning of 1960, however, became subsequently scarce. Inflationary pressures in the economy have been largely contained. The situation has improved sufficiently to embolden Government to plan on a larger scale for the Third Plan period, an effort underpinned by the successful negotiation of a large and long-term agreement for the import of food grains and other agricultural commodities from the U.S.A.

TRENDS IN INDUSTRIAL FINANCE

3. Of more immediate interest to this Corporation were developments in the field of industrial finance. The upsurge in investment to whose beginning I had referred in the last year's statement, assumed much larger proportions during 1960. This upsurge was reflected in the capital market both in the number of new issues floated on the market and in the heavy over-subscription of these issues of capital and the premiums quoted on new shares. A gratifying aspect of this trend was the widening of interest in industrial shares, as evidenced by the large number of applications made for the issues. I would also refer to the fact that the interest apparently was confined to variable dividend securities rather than to fixed interest bearing securities. Considerations of growth appear to have outweighed considerations of yield.

4. This phenomenon has, however, to be interpreted with some qualifications. It is likely that a part of the demand for the new issues was based on short-term considerations of quick capital appreciation, as frequently happens in a rising market. Moreover, with investors failing to secure required shares in one issue, it was often the same applicant and perhaps the same money chasing successive issues. Besides, as over-subscription became a common phenomenon, people may have tended to apply, even with borrowed funds, for larger amounts than their investment requirements,

in order to ensure at least a part allocation on their application.

5. But even after allowing for staggering of new issues, double-counting of many applications and inflation of demand, it is possible to infer that there was a substantial increase in genuine investment demand for industrial securities. The upsurge has proved to be transient as the results of more recent issues indicate; nevertheless, the shift in investment habit, once acquired, is likely to have an enduring impact, although the intensity of its manifestation is bound to vary with market psychology and the general climate.

6. There are one or two aspects of this phenomenon which are of importance from the view-point of sound industrial development. There seems to be a strong demand for equity participation in industrial enterprises, more so where there is foreign collaboration. In this connection, I should like to welcome the recommendation of the Committee appointed by Government to invite, as an experiment, minority public participation in a few selected public sector companies. The success of this experiment, however, will depend upon the choice of issues, their timing and the care bestowed on details as well as adequate preparation for ensuring satisfactory public response. Unduly high expectations about public subscription to such issues should not be entertained in the initial stages; the benefits of this policy will be realised over a period of years.

7. In the private sector also, it is necessary that the present opportunity be used to improve the gearing of share capital. There are various factors which appear to favour an increasing resort to debt-financing in private industry. A smaller equity base considerably improves the profitability of a company. Very often, the amount of equity capital fixed is based not on the requirements of the project but on the financial resources of the entrepreneur, with the result that where an entrepreneur takes up a very large project and tries to retain controlling interest, he keeps the equity low and seeks to obtain the balance of the cost of the project by means of borrowing. Most finance institutions also cater to supplying loan capital rather than providing assistance in the form of underwriting of or subscribing to share capital. Finally, foreign exchange, because of its shortage, is available mostly by way of loan capital (except to the extent financial participation is forthcoming from foreign collaborators) instead of being purchased with rupees raised on the capital market, as was previously the case.

8. I cannot help feeling, however, that excessive reliance on loan obligations in the capital structure,

particularly of new companies, has its risks which entrepreneurs are, in their optimism, prone to overlook. Such borrowings lead to an accumulation of interest charges in the early non-productive (construction) years of a new enterprise, which can be avoided by raising equity. Moreover, while in prosperous times it may be apparently easy to service debt obligations, when the winds of competition blow, such enterprises would be hard put to meet their growing commitments. Further, the existence of debt obligations may reduce the capacity of a company to borrow in difficult times when borrowing alone may be possible and becomes unavoidable.

9. It would, therefore, be prudent for private industry to raise the required resources by way of share capital when circumstances permit. Times like the present should be used to strengthen the capital structure rather than to seek capital appreciation by keeping equity low. Financial institutions should have the necessary flexibility for providing assistance in this direction.

10. I am aware of the fact that there are different views on this subject. Undoubtedly, the capital structure appropriate for a company depends upon several factors such as the nature of its business, the magnitude of its requirements, the stability of its operations over a period of time, and the climate of the capital market. What I have tried to indicate are some of the considerations relevant to sound finance which should not be overlooked when we desire not merely rapid but also healthy industrial development.

WIDENING OF THE FINANCIAL MARKET

11. The investment market is being broadened by the expansion of the functions of finance institutions. Many commercial banks have started giving medium-term loans; the existence of the Refinance Corporation should further strengthen this development. Commercial banks have also entered the underwriting field. As regards finance for small industries, the benefit of the guarantee scheme operated by the Reserve Bank of India, available to commercial banks, has been extended to State Finance Corporations.

12. The widening of the financial market is also indicated by the growing practice of giving guarantees. Guarantees are now being given by one set of financial institutions to another: as, for example, by commercial banks on behalf of Indian borrowers to foreign financing agencies like the Export-Import Bank and the Development Loan Fund as well as to Indian financing agencies; or by finance institutions on behalf of Indian purchasers to foreign suppliers of machinery as by the Industrial Finance Corporation for deferred payments.

13. ICICI's contribution to these developments has to be judged in relation to its resources: it is, therefore, more qualitative than quantitative. ICICI has always kept in view a broader objective, namely, to help foster the growth of a capital market in India. To this end, it has consistently tried to keep in touch with other finance institutions, to exchange information on matters of common interest and to take up joint underwriting and other financing operations. We have done joint financing also in respect of foreign exchange loans thereby augmenting the foreign exchange resources available to the country. We have done so in cases where we could have met all the requirements ourselves and although it was not necessary to invite other institutions to participate. We consider such operations to be also in the interest of ICICI in so far as they help to reduce risk by spreading it.

ICICI'S OPERATIONS

14. ICICI's own operations during 1960 reflect some of the trends noted earlier, ICICI benefited from the upsurge in investment activity in the country, as shown by the total volume of assistance, Rs 13.43 crores, sanctioned by it. A large proportion of this assistance was in the form of foreign exchange loans since, with the acute scarcity of foreign exchange, ICICI became an important source of foreign exchange for industry. At the same time, as a result of its policy of limiting its stake in any one unit (which, in view of foreign exchange shortage, often took the form of foreign exchange loans) and because of the buoyancy of the share market (which reduced the need for underwriting and encouraged other finance institutions to take up such business as became available), ICICI's own rupee operations, although higher than during 1959, tended to grow less rapidly. With indications of hardening money conditions and a slackening of demand for shares, ICICI's rupee operations during 1961 may well rise further.

15. The amount of gross assistance sanctioned by ICICI during 1960, as already mentioned, was Rs. 13.43 crores to 44 companies, consisting of rupee assistance of Rs. 5.81 crores and foreign exchange assistance of Rs. 7.62 crores. Of this, an amount of Rs. 11.21 crores was sanctioned to 39 companies for new projects. A finance institution is a catalyst in the sense that it helps bring into being investment much larger than the amount of its own assistance. For example, the total amount of investment in the new projects of the 39 companies assisted by ICICI in 1960 would be Rs. 55.22 crores (of which Rs. 43.69 crores would be for fixed assets)—almost five times the figure of ICICI assistance. The foreign exchange component of the fixed investment of Rs. 43.69 crores was Rs. 17.84 crores, of which ICICI provided about 40 per cent; the balance of the foreign exchange requirements was met from Government releases of foreign exchange to the companies concerned, participation by foreign collaborators and deferred payment terms given by suppliers. The turnover of these projects when completed is estimated to amount to about Rs. 39 crores.

16. The companies financed this total fixed investment of Rs. 43.69 crores by raising ordinary share capital of Rs. 18.75 crores, preference share capital of Rs. 2.15 crores and long-term loans of Rs. 21.22 crores; working capital requirements of Rs. 11.53 crores were more than fully covered by bank credit and internal cash accruals of Rs. 13.10 crores. I would like to add that the larger reliance on long-term loans in these cases was partly due to the fact that a substantial part of the requirements was in foreign exchange which, except in the case of cash licences or foreign participation, can be obtained only by way of loans; besides, old companies can more safely go in for preference shares or loan commitments than new companies.

NEW LOANS TO ICICI

17. With the increasing tempo of ICICI's operations, it was found necessary to augment our resources, particularly of foreign exchange. The Second Loan from the World Bank was fully committed during 1960, much earlier than originally anticipated. I am glad to report that during the last year ICICI obtained a further foreign exchange loan of U.S. \$20 million from the World Bank. This is the third and the largest foreign exchange loan obtained by ICICI, the first two being of U.S. \$10 million each. We are grateful to the World Bank for its increasing confidence in this Corporation. I would take this opportunity to thank the distinguished

President and the staff of the World Bank for their understanding and co-operation. We are also obliged to the Government of India for its helpful attitude, and particularly for its guarantee to the World Bank in regard to the Third Loan.

18. ICICI has also successfully negotiated during the year a loan of \$5 million from the Development Loan Fund of the United States Government. Some formalities remain to be completed in regard to this loan, and it is hoped the agreement would be signed at an early date. I take this opportunity to thank the officials of the Development Loan Fund for this loan and for the interest they have evinced in the activities of this Corporation.

WORKING RESULTS

19. Reflecting the rising tempo of operations, the Corporation's profits before tax increased from Rs. 50.66 lacs in 1959 to Rs. 62.80 lacs in 1960. After providing for tax (Rs. 26.94 lacs), the balance carried to revenue appropriation account is Rs. 35.66 lacs in 1960 against Rs. 28.23 lacs in 1959. As required by Clause 163 of the Corporation's Articles of Association, we have set aside Rs 9 lacs out of this to the General Reserve; we have also transferred the entire amount of realized profit on investment, being a sum of Rs. 24.87 lacs (net), to Capital Reserve.

20. The directors recommend a dividend at the rate of 5.75 per cent. After deduction of tax at source, this leaves in the hands of shareholders an amount slightly above 4 per cent. Thus we have been able to restore to the shareholders the cut in dividend necessitated by the change in the system of company taxation. We have represented to the Government that the present tax system bears heavily on finance institutions of which there are about twenty at present,

which do not benefit from the various tax incentives like development rebate and tax holiday made available to manufacturing concerns. It would therefore be equitable to extend to these institutions tax concessions as has been done in some countries. In view of the need to encourage the saving and investment habit in the country and in recognition of the catalytic impact of finance institutions on industrial development, I trust the Government will see its way to extending these reliefs to finance institutions.

GENERAL

21. I should finally like to refer to two matters of general interest to investors, in which ICICI played an important role. A legislative measure of considerable importance to the investor—the Preference Shares (Regulation of Dividends) Act 1960—was enacted during the year under review. While the Bill was under discussion, your Corporation, as a matter of public service, jointly with other institutions, made representations to the Finance Minister as also to the Select Committee. The Government has seen its way to grant some relief to shareholders as a result of these efforts.

22. I had referred last year to the proposal to form an Investment Centre. I am glad to report that the Indian Investment Centre has now been set up in New Delhi. ICICI has played a prominent part in its establishment. The Government has chosen five Members of the Governing Body of the Centre from among the Directors of ICICI; I have the honour to be the first Chairman of this body. I have every hope that, as a result of the Centre's activities, the flow of foreign investment to India will increase.

23. The staff have carried out their duties loyally and efficiently. I take this opportunity to thank them for their valuable services.

§Includes Rs. 40 crores on account of extra provision for imported steel.

**Included under item 8 above.

AND MAHARASHTRA'S FACTORY FARMS ARE INDIA'S BEST!

The Sugar Industry in Maharashtra State is an agro-industry working at **PEAK EFFICIENCY**. The average yield of cane per acre of **Factory Farms** in Maharashtra is twice the average cane yield in the State and nearly four times the average for the whole of India. This efficiency is progressively going up because of:-

- * Progressive management with high initiative and drive.
- * Unceasing research and experimentation, and scientific cropping schemes.
- * Adoption of latest techniques and timely operations, with the utmost economy in the use of water and manures.

For further particulars please write for our factual Booklet.

EXCLUDE FACTORY FARMS FROM THE PROPOSED MAHARASHTRA LAND CEILINGS BILL

For the sake of agricultural productivity

Life Insurance spells benefits to the security of an individual. But it also spells benefits to the economy of a nation. By investing its funds in agriculture and industry, LIC stimulates vigorous national development.

In fact, by the end of 1958, LIC had Rs. 76 crores invested in such industries as sugar, paper, cement, jute, cotton, textile, iron and steel, engineering, chemicals, pharmaceuticals, shipping, transport, plantations, etc.

With more funds at its disposal, the more will LIC have for investment. Employers everywhere will be working towards greater prosperity in every way by spreading greater insurance-consciousness among their employees.

There are several group schemes which LIC offers to industrial establishments. Ask a Life Insurance Agent to explain the Salary Savings Scheme, the Group Insurance Scheme and the Superannuation Scheme.

NATURAL KHASI SILLIMANITE

THE SUPER REFRACTORY

Specially suitable for lining furnaces, kilns or tanks, Sillimanite has natural advantages over any other manufactured refractory, bricks or blocks.

With its low thermal expansion at 1600°C, Sillimanite lasts longer and reduces replacement costs. Sillimanite bricks of 8" (or even 6") thickness will give better service, cut down the load on furnace structure, fuel and increase the melting area.

CRUSHED NATURAL SILLIMANITE

Unlike other refractories, Natural Sillimanite needs no calcination before use in ceramics or brick and block making. Sillimanite crushings are extensively used in manufacturing Ceramics for sparking plugs, fuses, etc.

Electric elements for fires, hotplates, immersion heaters, muffle furnaces, etc.

Scientific Apparatus, e.g.
Pyrometer sheaths, Crucibles, Extruding Dies.

Sizes Available—
1"-5x5—10x10 mesh.

...so many important words have passed—words that have changed the course of many lives. A needy student has heard that he is getting a grant for higher studies; a shipment of steel for a building project in the Punjab has been arranged; personal problems of a worker have been sorted out; a vital piece of scientific research originated here; and plans for a great thermal station, now a reality, once lay scattered on its surface. The desk stands in Bombay House, Head Office of the Tata organisation.

Tata's contributions to the growth and development of the country cover steel, textiles, electric power, chemicals, and motor trucks, soaps and edible oils, hotels, machine tools, radios, air conditioning and other engineering products, insurance, cement, industrial investment and finance, social science and scientific research.

man's faith

Faith that makes man aspire, strive ...
awakening him to tasks in the early-glow of dawn,
That melts rock, shapes granite; transforms
still waters to surging power.

A faith in the living future:
in a world that offers a little more—
a little less of the care, a little more of the joy.
Faith that gives meaning to life.

Today, as in the past, our products help to make homes
cleaner, healthier, happier. But today we are also working for ...
Tomorrow, when the evergrowing urge for better living
will demand still greater efforts. And we shall be
ready with wider service, new ideas, new products ...

Today and Tomorrow... Hindustan Lever serves the home

THE JAVA BENGAL LINE'S OFFICE AT CALCUTTA

LIGHTING BY PHILIPS

When one enters the recently renovated offices of the Java Bengal Line in Calcutta's premier business area, there is an almost breathless hush of amazement at the unusual elegance which presents itself. The reason is, at once, obvious. The evenly spread out and gentle lighting lends an atmosphere of dignity and efficiency.

And naturally, the lighting is by Philips.

The diffuse and even high level lighting, free from shadows and glare, has been achieved through recessed fluorescent lamp fittings. These Philips' exclusive fittings produce lighting that totally eliminates eye-strain and increases staff efficiency.

Philips' exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy by providing the maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience as well as research and development aimed to meet the evergrowing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible plus of Philips' international experience and know-how.

FREE: For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.

PHILIPS

Carry **11** tons on the ASHOK LEYLAND COMET TRACTOR-TRAILER unit

Ashok Leyland Comet 118' wheelbase tractor and Mahindra Owen's "Gama" semi-trailer combination unit.

The power-packed Ashok Leyland Comet tractor combines with the "Gama" Semi-Trailer manufactured by Mahindra Owen Private Limited to offer you these unique advantages:

1. Carries 11 tons, at no extra fuel or running cost per pound.
2. Negotiates easily sharp bends and steep gradients because its turning circle is about half that of the normal two-axled vehicle.
3. If you have two trailers for each tractor, one can be on the move while the other is being loaded. You save the time wasted between the loading operations.

As its weight is distributed over three axles, the Ashok Leyland Comet tractor-trailer unit is easy on the roads.

Ask for further particulars from our dealers.

ASHOK LEYLAND COMET
-precision built to give lasting service

ASHOK LEYLAND LIMITED, Ennore, Madras

Carries 7½-ton payload

Carries 11-ton payload

A trailer carries the goods

Meanwhile the other is loaded

NEARING ACHIEVEMENT

India's ambitious Durgapur Steelworks project is well on the way to completion. ISCON, the consortium of famous British engineering and electrical manufacturing companies, has been most successful and the end of the job is in sight.

Rolling mills, melting shop, blast furnaces, coke oven batteries and cooling towers have transformed the skyline. The birth of this new industry has already brought new employment to West Bengal. A steel city has been carved from paddy fields and jungle by people of two different nationalities and background, but working as a team with a single purpose. The result is a triumph for British industry and a better tomorrow for the people of India.

THE NEED OF THE HOUR...

India's economic development needs more foreign exchange. Gigantic development projects under the III PLAN demand more, and ever more, dollars, sterling

We, on our part, are happy to shoulder our responsibility. Today our Diesel Engines and Pumpsets are going abroad, to every continent, regularly, to earn valuable foreign exchange. More and more of our products, Engines and Pumpsets, shall go across the seven seas, to send back dollars, pounds sterling... so the need of the hour shall be met.

Tea goes out...exchange comes in helped by **TATA-MERCEDES-BENZ** trucks

TEA earns India over Rs. 125-crores of foreign exchange a year, and it is significant that on the long roads from the steep, green slopes of Assam and the Nilgiris, you will see more TATA-MERCEDES-BENZ trucks than any others taking this vital cargo to the docks. Taking half the world's tea towards half the world's kitchens is a non-stop job...that's why tea-exporters prefer TATA-MERCEDES-BENZ trucks.

The star that hauls a fortune

Courage with Confidence

"COURAGE with Confidence" was a leading article in *The Eastern Economist* Special Budget Number two years ago when Mr Morarji Desai introduced his first Budget. It could, more appropriately, be the description of the Budget which he introduced last Tuesday for the financial year 1961-62. 1959 was a mid-Plan year and one might have been tempted then—as indeed the Finance Minister allowed himself to do in 1960-61—to relax unduly after the pressures of the first two years of the Plan. 1961-62 again is a year before the elections and there were confident predictions that the Finance Minister, acutely conscious of political currents, would subdue his economic obligations to his political imperatives. All those who judged the Finance Minister, wrongly on this occasion, as a creature of expediency have done him a grievous wrong. In the event he has subdued all political temptations to play to the gallery and has faced squarely, even a little harshly, the supreme responsibilities of preparing the Indian nation, both psychologically and materially, for the responsibility of the Third Five-Year Plan. There was a powerful display of both courage and confidence in his Budget speech, noted for its directness and clear understanding of the Plan's larger objectives of which finance is only the means. As fire draws fire, his courage and faith have awakened a splendid response. This is proof that the Indian people are prepared for the sacrifices which he has demanded from every group. It is an error to assume that the Indian people are not equal to the destiny which they have proudly given to themselves.

In the two articles which follow an attempt has been made to highlight the Budget proposals in terms of two major elements which must dominate the economic scene. These are incentives for production on the one hand, and the containment of prices on the other. Here it is necessary only to assess the stewardship of the Finance Minister over the year which has ended, and the economic philosophy with which he approaches the next exacting round. In one respect he should be cheered forthwith. The original Budget provided an overall deficit for the year 1960-61 of Rs 153 crores. The deficit is expected now to come down to a meagre Rs 15 crores, all on revenue account. In other words, the whole of the capital programme has been financed without deficit financing as such, although there is some little doubt as to whether or not the method of the Reserve Bank's taking out long-term securities and increasing currency, and the utilisation of P.L. 480 funds is not an indirect form of deficit financing. Nevertheless, the basis of *The Eastern Economist's* criticism last year that the Finance Minister in an inflationary situation was deliberately budgeting for further inflation has been disproved by the volume of "overall" deficit financing. He is not the villain of the considerable price rise that has taken place. One of the most intriguing questions in Indian economic discussion now is: how did the steep price rise come about? With production at its peak and deficit financing negligible, where is the villain of the piece? An attempt, by no means final, is made in special articles in this issue to locate the demon of inflation.

The dilemmas which a Finance Minister in the Indian Union faces today are at least threefold. In the first place, he is obliged to arrange for a sub-

stantial rate of development to assist the "take-off" of the Indian economy, but is firmly admonished against any material price rise; in other words, production and prices cannot be allowed to rise together. Secondly, in the difficult process of finding resources his capacity to tax must be exercised with supreme discretion so that the uneasy balance between town and country and the classes and the masses is not imperilled. Thirdly, and not the least important, as the Finance Minister clearly showed in his Budget address, the climate must be made attractive not only for Indian private initiative, but also for the entry of foreign capital. This is a formidable array of objectives and only a supreme skill could have enabled the Finance Minister on this occasion to accomplish the rare combination of practical balance with political imagination.

During the last two years the criticism has been made—for the most part justly—that the Finance Minister was unduly hesitant in using the weapon of taxation on a wide enough basis to harness to the Plan not merely the resources of middle class urban dwellers, particularly those who paid income-tax, but also the very large number of lower income groups who, in the villages, were almost outside the realm of contribution. There has been an undue bias in favour of taxing the income-tax groups in the towns and recoiling from the thought of placing burdens squarely on the masses, whether in the towns or in the country. This bias has been completely removed this year by taxation on practically all items of necessity—tea, coffee, betelnuts, tobacco, medium quality cloth, silk, rayon, matches and kerosene. It is true that token gestures to the rural areas have been made, particularly in regard to kerosene, of which the inferior varieties used in rural areas are exempted; there are also certain limits on taxation of cotton yarn used for handloom industries. But the great sweep of the taxation proposals has now blurred the old dichotomy between the urban and the rural areas and the classes and the masses of the Indian people. The total effect has been, like all great instruments of unification, to produce not resentment but appreciation.

Because in this Budget the Finance Minister emerges as a courageous leader of the whole nation, refusing to be intimidated by the fear of the loss of votes and by the recriminations of those who argue that he is burdening the poor in order to protect the rich, and because he has employed the corrective to excessive deficit financing and inadequate taxation, he should be marked out as a notable Finance Minister. The present Budget shows that he is also possessed of far greater calibre and that, faced with the responsibilities of the highest office next to the Prime Minister of the country, he can place the country's interests before his personal popularity and minor advantages to his party. Thus there has emerged not merely an impersonal document of great worth; there has also been with this Budget a notable accretion of strength in India's top leadership. We are not so happily placed in regard to this capacity to abstain from "leadership from behind" that we should fail to applaud the great display that the Finance Minister has made of political courage with economic confidence.

The Budget and Production

THE sweep of the Finance Minister's taxation proposals, including the reduction in the development rebate and concessions to foreign technicians, are obviously invested with an impact on the structure of costs and incentives in Indian industry. At first sight, the Stock Exchanges have assumed that the absence of direct taxation was itself so strong a bull point that the heavier import duties on capital goods, the reduction by five per cent of depreciation allowances on assets installed after March 31, 1961, and the higher taxation on earned incomes over Rs. 1 lakh could well be taken in the stride of rising profits. This is a view which calls for much more detailed examination.

On the one hand, the imposition of a very large number of excises on finished goods will, to some extent, reduce the market and consequently, at least in those industries operating under increasing returns, there will be a rise of manufacturing costs per unit. Secondly, there are significant duties on many raw materials—caustic soda, dyes from coal tar, paints, vegetable products, copper and zinc and fuel—for example. Thirdly, capital costs are directly increased for expanding units by a revenue duty of general machinery from 10 to 15 per cent. In the case of instruments, the rise is from 40 to 50 per cent. In a Special Article elsewhere in this issue it is argued that the rise reflected in the general index of prices might be of the order of 0.98 per cent. For industries which are to import their plants after March 31, 1961, there is a higher customs duty and, for both imported and indigenously fabricated plants, there is a loss of development rebate up to 5 per cent. It would be wholly wrong, because of the jubilation in the absence of a change of corporate tax, to ignore the point that industry has suffered losses which might have been similar effect to a straight rise in corporate tax.

First calculations suggest that the rise in 'costs' might result in a fall of about 5 per cent of gross profits. With the corporate rate of tax of 45 per cent, the Government might lose about Rs. 24 crores from Corporation tax, while shareholders would lose about Rs. 24 crores. In effect, the yield of "direct" taxes of Rs. 3 crores (unless it is an under-estimate of its own account) is likely to be largely negated so far as actual realisation goes because of the fall they induce in corporate profits.

The view that is being canvassed that these burdens on industry, — particularly the rise in duty on machinery and the reduction in the development rebate—are on revenue grounds insignificant is justified. But there are two factors which must be borne in mind in respect of both measures. So far as the general public is concerned, at least a token gesture was required to indicate that corporate profits would bear some of the large burden which is necessarily involved in the financing the Plan. It is unthinkable that the corporate sector would possibly have argued that all taxation should be indirect. And it is difficult to raise personal direct taxes much further, even though the Finance Minister has done so in respect of earned incomes over a lakh of rupees. These are measures which are not primarily designed to raise revenue, but are token offerings to the gods that preside over the socialist pattern of society. It is wise for Indian industry to re-

cognise that token gestures of this kind will need to be made in every year of the Third Plan in order that the Finance Minister should be able to withstand the criticism that all his taxation is regressive and is designed to hurt the poor.

The question which is important is not whether the taxation is material from the revenue point of view or whether it raises the costs of industry (it certainly will) but whether, on balance, it is such that it will not hinder the broad pattern of India's industrial growth. It is in this context that one must view the Finance Minister's other proposals. In the context of the building up of self-reliance and opportunities in Indian industry one must welcome the new duties placed in the way of the imports of capital goods. This is not primarily because of the shortage of foreign exchange; for if foreign exchange is not available, the goods will not be imported. The enhanced Revenue duties on capital goods are designed to raise internal costs for machinery, thereby giving additional incentives to producers of machinery, on the one hand, and, secondly, — and this may well be much the more important of the two—to give incentives to managers to extract as much as they can from existing equipment. A Special Article published in *The Eastern Economist* of February 17 over the name of Mr. Morris J. Solomon pointed out that in some of India's best engineering factories, the utilisation of machines is something less than 50 per cent of working time. There was argued a case for the reorganization of work adding, if necessary, to labour, but subtracting from plans for capital additions to the extent that productivity could be built into existing equipment. This does not eliminate the need for capital goods; some will be necessary to secure a balance with increasing production because there are some machines on which productivity will advance faster than on others. Nevertheless, the emphasis is now, fairly and squarely, on restraint on import of certain capital goods and the utilisation of those that are already in the country. It is quite true that substantial imports of capital goods in certain areas—particularly transport, power and fertilisers — is unescapable, but the idea that applications for capital goods should be liberally licensed begins at the wrong end. It is one of the virtues of the Budget that it makes an attempt to drive home this point by creating disincentives for capital goods imports. In a sense, the reduction of the development rebate is also a step in the same direction. The temptation has always been great to have as high a development rebate as possible, and therefore, to increase fixed assets in some cases unduly. Reluctantly, in the case of the development rebate reduction, more positively in terms of the increased duty on capital goods, *The Eastern Economist* applauds the Finance Minister's attempt to divert industry's attention from the amassing of capital goods to the better utilisation of existing plants. Viewed in this context the criticism of the President of the Federation of Indian Chambers of Commerce and Industry is mistaken.

Apart from the opportunities that exist for much greater productivity from India's engineering plants and in many others, there is the great opportunity which the Third Plan provides for the expansion of the markets where selling can be imaginatively done. We cannot, it is true, be oblivious of the real difficulties in marketing with a significant price rise as in medium grade 'A'

cloth, and a very large number of items such as rayon, synthetic fibres, paper and paper board, plastics and cellophane, refrigerators, air-conditioning machinery and so on. But the rise in prices should be a challenge to India's salesmen to develop techniques of "hidden persuasion" which have in this country been conspicuous by their absence. At second round, the money released by planned expenditure will be seeking outlets in consumption goods, notably the new range covered by travel, durable goods and entertainment. What Indian industry loses by a higher cost structure and a higher selling price it can offset by certain expansion of markets.

A last factor in the Finance Minister's approach to industrial production should not be ignored. These are the measures to foster private

foreign investment by changes in the rates of tax for minority share holdings and also by permitting foreign technicians to have an exemption for twentyfour months after the initial period of thirty-six months after arrival in the country. A Special Article elsewhere in this issue deals with the character of the changes in terms of taxation of foreign companies which are either subsidiaries or minority shareholders of Indian companies. It is possible that particular industries, such as cotton textiles, may not share in the general growth. No Finance Minister can ensure that measures designed for the economy as a whole will be completely impartial in the fruits they bestow on different industries in the country; he can only ensure "overall" progress; this he can claim to have done.

The Paradox of Prices

NOT a little surprise has been caused by the revised figure of deficit financing by the Government of India in the year 1960-61. It was ordinarily assumed that the overall deficit estimated in the original budget at Rs. 153 crores had been incurred, and this was the prime cause of the rise in prices between 5 and 6 per cent in the General Index. Current estimates are incomplete but provisional estimates of the Research Section of *The Eastern Economist* are to the effect that at 1952-53 prices the national income of the Indian Union might be represented by a figure of Rs. 13,100 crores. Real income might have increased by 7 per cent, although in the Economic Survey issued with the Budget papers, the figure of 6 per cent is suggested. For prices to have risen by between 5 and 6 per centage points with a rise of real national income of about 7 per cent has suggested that an evil monetary factor must have operated to raise prices. If, on the other hand, the overall deficit is now only Rs. 15 crores instead of Rs. 153 crores, there was the concealed prime mover of inflation within the year.

It is extremely likely that the paradox of prices thus presented can only be explained in terms of the operations of the Reserve Bank of India and the banking system, so to speak, inside themselves. The Central Government's figures have not, so far as treasury bills are concerned, been operative in creating new money. Indeed, the increase in Government indebtedness to the banking system in the calendar year of 1960 is reckoned at only Rs. 25.6 crores (completely compensated by a loss of Rs. 26.9 crores in foreign exchange assets) as against Rs. 247 crores in 1959 and Rs. 417 crores in 1958. What has brought about a variation in money supply has been primarily the marked change in the increase in private indebtedness to banks, mainly due to the increase of bank credit which in the year 1960 was Rs. 246 crores against only Rs. 128.80 crores in 1958-59 and Rs. 21.8 crores in 1958. The Economic Survey makes the good point that, while expansion in credit was, to a large part, in response to increasing requirements of trade and industry, the rate of increase has been "on the high side." The prime inflationary factor in the Indian economy is now not money in circulation but bank advances. In order to obtain the money for advances the banks reduced their investment by nearly Rs. 154 crores in the calendar year 1960 while their time liabilities increased only by Rs. 10 crores as against Rs. 236 crores in 1959. In other words, the banking system, hard pressed for resources, sold Government investments of

the order of Rs. 154 crores to create money supply of the order of Rs. 217.4 crores, the difference between the two figures being met by a rise in the ratio of advances and the bills discounted to deposits. This factor, namely, that the money supply is now primarily in the hands of the banks, has justified the concern expressed by the Reserve Bank of India on the rate of rise of advances. But the concern might have been much more effective if, instead of curtailing good advances, it had shown some more positive means of raising deposits.

For an expansion of economic activity obviously some increases in money supply are necessary. But that the increases in money supply this year have been excessive is shown by the extent of the price rise. The Economic Survey makes the point that over the whole five-year period, while real income seems to have risen by about 19 per cent, money supply has risen by about 35 per cent. It would seem that India's money supply is increasing, roughly, at twice the rate at which real income is increasing. The Table below shows the position year by year and indicates that the inflationary component, while fluctuating, has been substantial in every year. There, in fact, has been no year in which the percentage increase in money supply has not been greater than real national income. But the last year has been significant in that, for the first time in the five years, it was not the public, but the private sector which was generating marked increases in money supply.

It is not likely in these circumstances that currently the taking up of securities by the Reserve Bank (and the issue of corresponding currency to some extent) or the utilisation of PL 480 funds is the true villain of the piece. In the current year with a target of Rs. 235 crores of public borrowings in India and Rs. 96 crores of PL 480 funds, it is unlikely that the sources of inflation are contained within the Capital Budget. They are much more related to advances of the banks uncompensated by rises in deposits. To state that money supply in the banking system has been the major operating factor in the rises of prices is by no means to argue that advances can be curtailed. Economic activity is now at a level which requires banking activity to be sustained and while certain small curbs on unwise banking advances can be made, great damage can be done by a blanket control of advances by the Reserve Bank of India. This is the time to consider much more the other alternative which is the extension

of the banking habit, if necessary, by compelling all salaried income groups to receive payments by cheque and by generating confidence in the banking system. Perhaps the system of deposits insurance could be effectively worked to allay concern such as arose with the liquidation of the Palai Central Bank. While substantial energy is thrown into the market borrowing programme, the attempt to revive the rate of rise in deposits has been both half-hearted and ineffective. Yet surely, here, more than anywhere else, since the banking system is creating new money nearly twice as fast as the rise in notes in circulation, one needs to consider an urgent and positive campaign. No better indication can be found of the interdependence of the private and public sectors than this marriage of policies, designed to raise general savings as well as banking deposits, as the main weapon against inflation.

The Budget, Prices and the Third Plan

THE first thought of those who are looking upon the Budget in terms of its repercussions upon the Third Plan must be an anxious enquiry as to how a philosophy which extends so considerably into the range of indirect taxation and, therefore, induces a rise in prices will alter the basis of the Plan on which tentative investment estimates "at constant prices" have already been agreed. One of the great weaknesses of India's Five-Year Plans is that they have been conceived in terms of these "constant" prices; no allowance has been made for a rise in prices even though everyone knows that these rises are inevitable. In point of fact, therefore, the Plan underestimates both investment and income at current prices which, if the budget of the current year is any guide, will rise steadily throughout the five years.

In a Special Article elsewhere in this issue a detailed calculation has been made in regard to the effect of the budget proposals on the structure of prices likely to result from the impositions in the Budget. It will be seen that the rates at which they impinge on different elements in the Wholesale Index of Prices are different. The percentage rise in respect of food articles (vanaspati, tea, coffee and betelnut) comes to 0.41 per cent of the index for food articles. For liquor and tobacco, the rise is substantial at 6.34 per cent, but the weightage is correspondingly lower. For fuel and power there is a rise of 0.85 per cent because of the kerosene and diesel oil. For intermediate and manufactured goods (cotton yarn, rayon yarn and metals) the figure is 4.3 per cent. For finished manufactured articles the figure is substantial at 2.11 per cent. This covers the duties on textiles, caustic soda, dyes, paints, patent medicines, machinery, matches, paper and pottery and glass. Put together and allowing for the weightage of each of these groups of the general index of the whole of sale prices, the taxation proposals provide for a rise of 0.97 per cent or nearly 1 per cent in the coming year.

The General Index of Wholesale Prices is not a full reflection of the rise in costs. The cost of living is bound to be affected. The Economic Survey makes the point, as against a general index of rise of between 18 to 20 per cent in the Second Five-Year Plan, the cost of living rise was somewhat lower between 14 to 15 per cent depending on the area chosen. If one assumes that the cost of living corresponding to the taxation proposals will rise by 1 per cent each year, one would pro-

At the end of	Money Supply		National Income*	
	Actual (Rs. crores)	Index Numbers (Base = 1955 : 100)	Actual (Rs. crores)	Index Numbers (Base = 1955 : 100)
1955	2,047	100.0	10,480	100.0
1956	2,179	106.4	11,000	105.0
1957	2,275	111.1	10,890	103.9
1958	2,350	114.8	11,690	111.5
1959	2,521	123.2	11,750	112.1
1960	2,739	133.8	12,513	119.4

* At 1948-49 prices.

bably not be unduly pessimistic. It is not conceivable that a rise of this order should take place without any compensation in wages. In the textile industry in Ahmedabad compensation is complete, and in Bombay's textile industry it is 90 per cent. But the position has now been reached all over the country that wage rates, following sometimes on Wage Board awards, must rise at least at the conclusion of the current awards. Thus wages will rise on account of dearness allowance by between half to one per cent as a result of the taxation proposals. It is not unlikely that this will be superimposed on an independent rise of about that order due to the difficulties of financing greater investment with stringency in the banking system and great difficulty in finding capital resources for loans, even though deficit financing is now substantially lower at Rs. 64 crores.

If, therefore, in the current year one assumes a rise of prices implicit in the system of 2.5 per cent one would not be unduly pessimistic. In the following years of the Plan the rises must be greater in proportion to the much larger element of indirect taxation which must appear. If we assume that in the next year and the year after, the taxation was 50 per cent higher, namely, that there would be Rs. 80 crores more in each of the two years in the Centre with corresponding rises in the States, one might allow for a rise of about 4 percentage points in 1962-63 and 1963-64. Thereafter, while indirect taxation will not need be very great, inflation will persist; higher consumer goods production will be offset by greater producer goods investment, since the building up of the investment programme will take place in the last three years. One can, therefore, assume at best that a rate of rise of 2.5 per cent will be restored for the last two years of the Plan. In other words, the rate of rise of prices for the five years of the Plan might be 2.5 per cent, 4 per cent, 4 per cent, 2.5 per cent, 2.5 per cent making 15.5 or 16 per cent rise for the period of the Plan. This will naturally be distributed unevenly over the years depending on the taxation proposals just as in the current Budget the manufactured group with a 2.1 per cent rise has taken much more than the food group which has taken only a 0.4 per cent rise. Nevertheless, the costs of the Plan, which will be dependent much more on manufactured goods and on industrial raw materials, will be

(Continued on page 635)

OIL

—lifeblood of industrial civilisation

Oil means easier life—for oil powers and lubricates machines, planes, ships, trains and trucks, easing the burden of man.

Oil means brighter evenings—for oil keeps giant electric turbines and generators running, and also feeds the lantern of the villager.

Oil means more food—for oil powers tractors which give more food from less land.

Oil means healthier life—for petroleum insecticides destroy germ-carrying insects, adding more years to man's life.

Oil means diffusion of knowledge—for oil lubricates printing presses and makes printing inks, making communication of ideas easier.

Oil means all this—and a great deal more!

Oil is playing a major part in India's march towards economic expansion. Through its major operations—refining, marketing and exploring for oil—Stanvac is participating in the country's efforts.

STANVAC—participating in India's progress

The Pattern of Additional Taxation 1961-62-1965-66

THE budget for the year 1961-62 contains proposals for additional taxation of the order of Rs. 63 crores. This fresh impost will not come as a surprise to those who have been watching closely the discussions on the Draft Outline of the Third Plan during the last six months. Early in January this year some of the papers presented to the National Development Council clearly indicated that the additional taxation earmarked in the Draft Outline may have to be increased because of the incessant demand from the States as well as the Union Ministries to extend the sizes of their allocations. It was, for example, decided that the development programmes in the Third Plan estimated to cost about Rs. 8,000 crores would be approved, while the financial outlays would not exceed Rs. 7,500 crores. The gap of Rs. 500 crores would be filled in the coming years through "unknown sources" which were not clearly visible at that time. It was also proposed that the additional taxation target during the Third Plan should be raised from Rs. 1,650 crores to Rs. 1,710 crores. The share of the States for additional taxation was placed at Rs. 610 crores. They were supposed to raise this sum in the following manner:

Year	Additional Taxation (Rs. crores)
1961-62	40
1962-63	115
1963-64	135
1964-65	150
1965-66	170
Total	610

The Planning Commission made no attempt to indicate the manner in which Rs. 1,100 crores would be raised by the Centre. The Budget for the year 1961-62, however, gives a clue as to the manner in which this sum may be realised. The Finance Minister has attempted to spread the impost of these additional taxes on a very large number of commodities and products. It is probable that some of them during the next five years may not be able to bear this additional burden and would need relief in the interest of their healthy growth. It is, therefore, assumed that the additional taxes imposed this year may yield not more than Rs. 300 crores during the five years of the Plan. This also assumes that the growth factor in relation to the commodities which have come under the purview of fresh taxation will be balanced by the concessions needed by them. The programme for fresh taxation by the Centre may, therefore, be phased in the following manner:

Year	Additional Taxation (Rs. crores)
1961-62	60
1962-63	140
1963-64	230
1964-65	300
1965-66	370
Total	1,100

The additional taxation will not impose a burden which may look excessive by international standards. The tax revenue, for example, will rise from only 8.5 per cent in 1960-61 to 11 per cent in 1965-66 of the national income. The basic reason for this percentage being pegged down to a low level is the vast agricultural sector in the Indian economy which does not share the increasing burdens of taxation. Time and

again proposals have been made in regard to increasing the taxes on agricultural incomes but they have never progressed beyond the discussion stage. Unless this vast section comes in to share the increasing burdens of taxation, there are no prospects of raising this ratio to a level which may be comparable to some of the developed countries in the world.

Hitherto, taxation in this country has been inflationary all along. The proposals for the current year's budget, for example, are likely to raise the index of wholesale prices by one per cent. Coupled with the inflationary impact of taxation lie other major factors such as the increase in money supply and various shortages, including the transport bottleneck, which will all contribute to the steady increase in the price level. It is clearly shown elsewhere in this Number that the inflationary pressures are written into the economic system, in view of the ambitious character of the Third Five-Year Plan which has been proposed.

Ninety-five per cent of the additional taxes proposed in the new budget would be realised from customs and Union excise duties. Strangely, the burden is evenly distributed between the excise duties and the customs revenue. The tax revenue since 1948-49 shows an unmistakable trend, as disclosed in the table below. It will be seen that in the year 1948-49, the total revenue to the Central Exchequer from indirect taxes was less than half of the total tax revenue. In absolute figures, it was Rs. 177 crores only out of a total tax revenue of Rs. 359 crores. In 1960-61, the percentages of indirect tax rose to 67.3 out of a total tax revenue of Rs. 849 crores. In the budget year the fresh impost of custom duties and excise duties has raised this percentage to nearly 69. In other words, the additional taxation target of Rs. 1,100 crores in the Third Plan is likely to depend heavily on the indirect taxes, especially the excise duties and customs. There is a general impression that the customs may not be able to bear as much pressure as the excise duties.

It is true that the Finance Minister has tried to diversify the impact of the new taxes. It is also true that he has imposed heavier burdens on the comparatively higher income groups. It is feared, however, that fresh burden of as much as 20 per cent on such items as refrigerators, radio sets, air conditioning machinery etc. may curtail the demand for these products and hamper their growth in the short period.

REVENUE FROM TAXATION

4. Ratio of (2) to (3)	49.31	67.34	68.82

The Budget and Corporate Taxation

THERE are three significant changes in the Budget which affect the finances of corporations in the Indian Union. The first of these is the change in the import duties of capital goods (mostly machinery) which have been raised on an average by 5 per cent. There are currently roughly three rates of duty on capital goods imported: one of 5 per cent on items required for certain plants and another of 10 per cent on other machinery and a higher rate up to 40 per cent on electrical instruments, appliances, etc. In the case of the first two categories, the rate of rise is 5 per cent and in the latter 10 per cent (vide Table I below).

The second effect of the Budget on corporate finances arises from the development rebate. Except for ships which have 40 per cent of development rebate and which remains unaltered, other companies lose on new installations after 31st March, 1961, by 5 per cent from the rate of 25 per cent enforced at present. On imported goods there will be an inflation of cost, but the Finance Minister has argued that the loss is not significant. This assumes that practically all the capital goods are imported. This by no means indicates that the current machinery production is filling

so much of the bill as capital goods imports are increasingly difficult. Finally, there is a third element the significance of which will need some little time to examine. This is the change in the rate of super-tax on dividends paid on inter-corporate investment, whether Indian or foreign, and whether on a majority basis or a minority basis, shown in the following Tables II and III. It is a significant subtraction from the difficulties which have arisen. All in all, one might argue that these changes have the effect of encouraging private foreign investment which has also been achieved by the tax relief on royalties and by the increase in the period of tax-free income to foreign technicians. It may be that what larger corporations have lost in terms of depreciation allowances may be obtained by the additional concessions where they have foreign partnership. Broadly, one might argue that the corporate taxation picture, although less favourable than it was before the Budget, has been substantially unchanged and that on balance the measures the Finance Minister has chosen, partly because they encourage foreign investment and know-how and partly because they are obviously an alternative to a rise in the corporate taxation, are the best that corporations might have expected under the circumstances.

TABLE I

DETAILS OF PROPOSALS FOR THE CHANGES IN BASIC CUSTOMS DUTIES

S. Item in No. the tariff schedule	Brief Description of the article	Present Rate of Duty		Proposed Rate of Duty		Additional annual revenue expected (in lakhs of rupees to the nearest lakh)

8. On any other income.	20	43	63

THE BUDGET, PRICES AND THE THIRD PLAN (Continued from p. 624)

substantially higher than those in the Planning documents. If one assumed provisionally the rise will be 16 per cent over five years, but generated in the manner in which it has been phased above, one can assume that the total outlay of the Plan would rise by about 10 per cent. The effect of this will be substantially to raise the burden on the rupee element by over 10 per cent, though the foreign exchange component will remain largely unaltered. The increased customs duties are payable in rupees. In other words, the rise in the Plan might conceivably be of the order of Rs. 700 to Rs. 800 crores in the public sector and about Rs. 400 crores in the private sector. These are substantial figures and, if the physical targets of the Plan remain unaltered, a new inflationary impulse will impart itself to the system. For these reasons it is argued in the Blue Supplement in this issue that the hard core of the Plan must provide, in any case, for a reduction of Rs. 500 or Rs. 600 crores in rupee expenditure. This is designed to absorb at least half the increase in prices which are implicit in a system of taxation which is so largely indirect, and which will affect the cost of living thereby inflating labour costs.

All in all, the picture, therefore, so far as the Plan is concerned is that the pattern of taxation

unfolded in the current Budget is one which increasingly changes the financial estimates of the Plan and calls at once for corrective action. The lines of this corrective action have been indicated in the Blue Supplement in this issue.

**RISE IN THE GENERAL INDEX OF
WHOLESALE PRICES**

Group	% Change	Weightage	
(1)	(2)	(3)	(2) x (3)
Food Articles	0.41	50.4	20.7
Liquors & Tobacco	6.24	2.1	13.3
Fuel & Power	0.85	3.0	2.6
Manufactures	2.11	29.0	61.2
			97.8

or 0.98 per cent rise in wholesale prices.

*playing
a part in your
everyday
life...*

The tasty, appetising meals which you relish are made possible through the application of DMC fertilisers and other products.

Our quality products play their role in boosting food production. Our fertilisers and other products now readily available, guarantee better harvests... more yield per acre. To the nation this also means a great stride towards self-sufficiency... a saving in foreign exchange; bigger profits to the farmer and a higher standard of living for all.

Almost every day quality chemicals and fertilisers leave our factories to play their part in making your life easier and more economical.

The Cement Marketing Company of India Private Limited

but
we know
where
we're
going...

Sea and sky and sand...and fringing the shore the swaying palm trees. A scene of timeless beauty, and incidentally, one of nature's most efficient distribution set-ups.

The palm tree casts its fruit into the open sea to be carried away with the ebb tide, and to be washed up again on some distant shore, so that one day, there will be palm trees there, too.

DISTRIBUTION is our business too. But we at Voltas have this advantage over nature...we know where we're going! Nothing is left to chance. No matter where our customers are, they are certain of getting the goods and services they require.

Voltas have, over the years, built up a highly adaptable and trusted distribution system to move goods manufactured anywhere in the world, to anywhere in India.

Our stocks-sales-service-engineering organisation is nationwide, and covers every important distribution and consumption centre. Voltas give you...

What is wanted • Where it's wanted • When it's wanted

** Effect of budget proposals.

Additional Taxation and Wholesale Prices

TO wipe out the entire anticipated deficit of Rs. 66.60 crores in the revenue budget, the Finance Minister has cast his net wide for fresh taxation. Additional customs and excise duties have been imposed on a very wide range of commodities—the largest number to be affected in a single budget in the post-Independence period. The imposition of these additional indirect taxes is bound to be reflected in prices. An effort has been made in this article to evaluate the impact of these additional taxes on the wholesale price index and the pattern in which the price rise is likely to affect the cost of living of different classes.

Most of the articles that have been taxed find a place in the Wholesale Price Index prepared by the Economic Adviser to the Government of India. The percentage change in the price that can result on account of additional taxes has been calculated in each case and by applying the weightage of each item in each group the impact on the wholesale price index has been estimated. It may be observed from the table below that in the Food Articles Group the taxed items constitute just 10 per cent of the total weightage. Liquor and Tobacco is the only group in which all the items have been taxed—though only one-sixth of the weightage has been applied in the case of liquors because only the customs duty has been increased. In the case of the Fuel and Power Group the taxed items constitute about 14 per cent. Moreover, only superior quality kerosene has been taxed which warrants application of only one-fourth of the weightage assigned to it. The industrial Raw Materials Group remains practically unaffected by the new taxes. In the Manufacturers Group items constituting about 50 per cent of the weightage have been taxed.

Easily, the maximum pressure is likely to be recorded in the group—Liquors and Tobacco. The increase in their prices is likely to be to the extent of 6.33 per cent. The second group most affected is Manufactures where the price rise has been estimated to the extent of 2.11 per cent. Then comes the Fuel and Power group with 0.85 per cent and last of all is the Food Articles Group where the likely rise is of the order of 0.41 per

cent. The overall rise in the Wholesale Prices Index due to these additional taxes has been estimated to be around 0.98 per cent or nearly one per cent.

It ought to be underlined that there are two factors which make the price rise look more modest than what it actually may prove to be. In the first instance, there are several items like refrigerators and air-conditioning machinery, radio sets and chemicals which have been taxed, but they do not appear in the Wholesale Price Index at all. Moreover, many items of capital goods that have been taxed are likely to inflate prices of many end-products. Similarly, sympathetic price rise is quite likely to be recorded in the case of substitutes on which additional taxes have not actually been imposed. The net result will be that on account of additional taxation, the Wholesale Price Index may record an increase of 1.5 per cent.

A scrutiny of the entire list of items which have been proposed to be taxed in the budget discloses that two types of consumers will be vitally affected. The increased taxes on matches, kerosene, tea, spices, cardamoms, betel nuts and tobacco are bound to affect the structure of the cost of living of the working class, the lower middle class and middle class to a significant extent. Higher taxes on textiles, drugs and medicines, paper, pottery and glassware are likely to affect the cost of living mostly of the urban middle classes. All these items form an important part of the family budgets of the upper class too, but in percentage terms they constitute a small proportion. Still more items have clearly been taxed with a view to extracting more money from higher income groups. For instance, the incidence of customs duties on brandy, gin and other spirits and of the excise duties on various types of tobacco products, refrigerators and air-conditioning machinery and wireless receiving sets, and to a large extent, china and porcelainware is likely to fall on higher income groups. In addition to this, there is a distinct group of capital goods like hardware, aluminium and other metal products, electrical instruments, paints and chemicals the impact of the additional tax on which is bound to be diffused widely without making its impact fall acutely on any one class in particular.

Commodity	Unit	Present price Rs.	Additional tax Rs.	% rise	Weightage	Price increase

General Index of Wholesale Prices						0.98

(a) only custom duty increase, weightage applied is half, (b) custom duty only, (c) custom duty likely to affect one-sixth of the consumption, (d) only superior kerosene, above 15 degree affecting only one-fourth of the consumption, (e) odd types of items, (f) few types of paper, weightage applied is one-fifth only.

IN SERVICE LIES SUCCESS...

DAIRY & REFRIGERATION

Pioneers in dairy engineering, L & T have installed 44 modern dairies all over India, and now manufacture various items of plant and equipment.

EARTHMOVING & AGRICULTURAL EQUIPMENT

L & T have supplied to various projects earthmoving, land-clearing, excavation, logging and dredging machinery.

HEAVY PLANT

Paper machines, spray drying installations, sulphuric acid and solven extraction plants, and flour mills have been supplied to a number of industries.

ELECTRICAL EQUIPMENT & SWITCHGEAR

For hydro-electric and thermal power stations, L & T supply high quality electrical equipment, including substations and distribution installations.

DRILLING & MINING

To the Neyveli Lignite Project and other mining schemes L & T have supplied Bucket Wheel Excavators and Spreaders, drilling equipment and turbine pumps.

CIVIL ENGINEERING

L & T undertake various civil engineering works including designs. 'Turn-key' jobs, involving supply and erection of machinery and plant are an L & T speciality.

MANUFACTURE

At Powal Works, L & T manufacture various types of plant and equipment—Dairy, Chemical and Pharmaceutical machinery, Switchgear, Petrol Pumps, Cooling Towers, etc.

INDUSTRIAL APPLIANCES

Pharmaceutical machinery, automatic refrigeration controls, process control instruments, power saws, welding alloys and up-to-date bottling installations supplied to numerous concerns.

ERECTION

At Rourkela, L & T have erected 3 Blast Furnaces, a 'Pig' Casting machine, and the Rolling Mill Buildings—the more recent of the many erection contracts executed.

SERVICING

IN SERVICE LIES SUCCESS

The slogan sums up our view of the function we perform. In the world of commerce, lasting success comes only to those who are willing and competent to give service, as well as goods, to their customers. Every piece of equipment we supply is backed by a service organisation designed to keep it working at highest efficiency.

HEPOLITE
WELLWORTHY

INDIA PISTONS PRIVATE LIMITED,
Sembiam, Madras-11

IP-1104

Pistons do much of the engine's hard work and naturally the quality of a piston means a lot. In India Pistons' product, quality is built in, ensuring superior performance, less bore-wear and full power.

Manufactured to the exacting standards of their associates in the United Kingdom, India Pistons' products—Hepolite, Wellworthy and Covmo—reflect the tradition of unvarying quality.

When changing next, just remember India Pistons. There are pistons and rings to suit every type of engine.

National Rayon *spins yarn from the bounty of nature*

Fashionable fabrics at a low cost—that is the promise of Nature's bounty when spun into Rayon by NRC.

There is bounty of another sort as well: Rayon makes subsidiary chemicals which are vital to many diverse industries; it provides full-time employment to 500,000 workers; affords invaluable training and experience to chemical engineers and technicians, and conserves India's foreign exchange.

This bounty is truly a gift well-timed for this country.

Public Loans

IN the scheme of rupee resources for the Third Plan, public loans are second in the order of importance, coming next only after additional taxation. But, while the resources from public loans have been put at Rs. 850 crores, as against Rs. 1,650 crores from additional taxation (including surpluses of public enterprises) and the gap between the contribution of the two is nearly as wide as the size of the former, it cannot be taken for granted that the loan target is pitched at a practicable level. The element of uncertainty that threatens to beset the loan target ought to be fully recognized.

In the Second Plan, the climate for market loans was unusually propitious. The estimate of public loans for the Third Plan at Rs. 850 crores, or only Rs. 50 crores above the Second Plan target, is indicative of the fact that excessive optimism about the capacity of public loans to attract funds for the Third Plan has not been entertained. Now, in the light of the progress of the loan programme for the current year, it is obvious that even the feasibility of achieving the target of Rs. 850 crores has been thrown into serious doubt. During 1960-61 the budget took credit for public loans of Rs. 250 crores including Prize Bonds of Rs. 25 crores. But actually two loans of the value of Rs. 175 crores were floated during the current year, yielding total subscriptions of Rs. 180.70 crores. The Prize Bonds netted in only Rs. 12.5 crores. Excluding conversions to the tune of Rs. 74.6 crores and repayments of Rs. 33.40 crores, the net receipts amounted to Rs. 85.20 crores.

For the budget year the Finance Minister has taken credit for public loans of Rs. 235 crores, including Prize Bonds expected to bring Rs. 10 crores. Deducting the loans maturing during 1961-62 valued at a total of Rs. 137.50 crores, the net yield from market loans is estimated at Rs. 97.5 crores. Against the background

of the current year's difficult experience, it cannot but be emphasized that the loan programme for the budget year is pitched high.

It is essential to analyse the factors that weighed with the Planning Commission in fixing a high loan target for the Third Plan at Rs. 850 crores. The Draft of the Third Plan frankly emphasizes the fact that market loans of Rs. 800 crores in the Second Plan included a substantial proportion of subscriptions by the State Bank of India out of the P.L. 480 deposits. But in view of the transfer of P.L. 480 counterpart funds to a special account, opened in the Reserve Bank in the name of the US Embassy, these funds will no longer be available to bolster the public loan issues in the Third Plan. By implication, the Draft assumes that, in spite of the loss of support of P.L. 480 funds to market loans, the gap created by this loss would be filled and excess contributions of Rs. 50 crores would also be made. This is apparently on the hypothesis that the climate for real contributions to public loans would improve.

The assumptions behind this anticipation of improvement have not been specified in the Draft. All that the Draft says is that there would be a flow of subscriptions from the institutional investors, particularly the Life Insurance Corporation and the provident funds as solid contributors. Hope was also pinned originally on popular enthusiasm for the Prize Bonds. But the estimate of Prize Bonds for 1961-62 shows that on second thoughts it is realized that their potential contribution was miscalculated on the high side and the miscalculation is being corrected in the very first year of the Third Plan. There can be little quarrel with the assumption made in the Draft about the increasing quantum of the subscriptions from the Life Insurance Corporation and the provident funds. But it would be a

**THACKERSEY
FABRICS**

THACKERSEY GROUP OF MILLS
SIR VITHALDAS CHAMBERS,
APOLLO ST., BOMBAY 1.

misreading of the changing trends in the rupee resources position to expect that other institutional investors would find it feasible to extend massive support to the programme for market loans. Perhaps, it would not be wrong to presume that the firmness which the Finance Minister has shown in resorting to a higher proportion of additional taxation in the budget year than was anticipated in most quarters was due to an appreciation of the tight outlook for other rupee resources. This reappraisal could have been applied to the loan programme.

Banks were undoubtedly substantial contributors to the impressive success of the loan programme in the latter part of the Second Five-Year Plan. Their response to the loan issues sprang essentially from their liquidity and the overall easy conditions which prevailed in the money market until the end of the fourth year of the Second Plan. But during 1960-61 the situation took a turn in the direction of stringency and there can be little doubt that the drastic credit control policy, enforced with three successive revisions by the Reserve Bank, added to the deterioration in the market situation. The credit curbs clamped on the banks and the extraordinary measure of impounding of bank deposits with the Reserve Bank forced the banks to run down their investments in Government securities. The Economic Survey, 1960-61, underlines the fact that whereas at the end of the calendar year 1959 Government securities held by the banks recorded an increase of Rs. 152 crores above the previous year, at the end of 1960 they declined sharply by Rs. 150 crores below the previous year's level. The quantitative curb was directly

responsible for large-scale disinvestment of Government securities.

Stringency in the money market is getting progressively worse. Scheduled banks are feeling the direct impact of that stringency as reflected in the trends of their deposits. The peak in the deposits of scheduled banks was passed at Rs. 1,968 crores in August 1960 after which the downturn started and it continues in spite of the prevalence of the busy season. In the middle of February 1961, the volume of deposits of scheduled banks was Rs. 1,865 crores and their advances were of the order of Rs. 1,260 crores. Thus, stringency is demonstrated by a steep rise in the advances-deposits ratio to 67.6 per cent in mid-February which compares with the ratio of 56.4 per cent a year ago. It is apprehended to reach 70 per cent shortly. Considering the pressure of rising demand for bank credit, to be generated in the Third Plan, it would be an error to expect strong bank support to loan issues.

The experience of banks is not isolated; on the contrary, it is typical of the overall tightness in respect of rupee resources for development. In the Third Plan the stiff outlook of inflationary pressures on the economy makes it all the more imperative that deficit financing ought to be pegged firmly at Rs. 550 crores. The loan target, at whatever level it is fixed, can be an aid to minimizing the size of deficit financing only to the extent that it attracts real savings. But notional fulfilment of part of the market loan programme with support lent by the Reserve Bank would only serve to conceal the full magnitude of deficit financing. The ambitious loan target for the Third Plan carries this risk.

in MIDDLE EAST, SOUTH EAST ASIA AND
AFRICA.

EVERY MACHINE IS FULLY GUARANTEED.

Answers may vary, but one thing is certain—production has more than doubled in the last seven years. From 23,943 tonnes in 1952-53 to 49,380 tonnes in 1959-60. Our target? 80,000 tonnes by the end of the Third Plan.

Exports are on the upgrade. From only 2,200 tonnes in 1952 to 14,500 tonnes in 1959. India consumed 27,570 tonnes in 1958 against a mere 8,500 tonnes in 1939.

This increased production is due to continuous scientific research and improved methods introduced in coffee cultivation. The result—delicious Indian Coffee whose distinctive aroma is preferred by connoisseurs all over the world.

JAY ENGINEERING WORKS LTD., CALCUTTA-31

Small Savings

THAT the small savings movement will have to play a crucial part in financing the Third Five-Year Plan is evident from the Budget Speech of the Finance Minister. Given the limitations in an under-developed economy of taxation as such or by way of profits of public enterprises, the efforts to mobilise savings from the public no doubt will have to be quite substantial. The importance of it was realized in the First Five-Year Plan and a target of Rs. 500 crores was laid in the Second Five-Year Plan. On an average the target for small savings for the Second Plan period was placed at Rs. 100 crores a year. The contribution of small savings to the success of the First Five-Year Plan may be judged from the fact that collections increased from Rs. 33 crores in 1950-51 to Rs. 65 crores in 1955-56. The total collections in the First Plan amounted to Rs. 241 crores. At the end of the Second Plan the total collection is expected to be Rs. 390 crores. Although this is much short of the target, progress realised every year is encouraging in the sense that it is difficult to build up a psychology of savings in an era of rising prices when alternative investments like investments in commodities, goods, gold, shares, property etc. are apt to be more profitable. The various schemes at present in operation are Post Office Savings Banks, 12-year National Plan Savings Certificates, 10-year Treasury Savings Deposit Certificates, 15-year Annuity Certificates, Cumulative Time Deposit Scheme, Prize Bonds etc. It is expected that the Prize Bonds will yield a good sum of Rs. 12.5 crores by the end of March 1961. There is no doubt that these bonds have a great attraction for a large mass of the people and with more intensive and co-ordinated efforts on the part of both non-official and official organizations particularly in the States, it should be possible to raise more money through this source. The amount of net collections through the various schemes enumerated above under the Second Five-Year Plan is as follows:—

	(In crores of Rs.)				
	56-57	57-58	58-59	59-60	60-61 (up to Jan. 1961)
Post Office Savings Bank	31.28	17.98	20.18	27.72	19.00
Cumulative Time Deposits	...	...	0.05	0.76	1.38
National Savings Certificates	19.07	—22.26	—25.77	—20.96	—15.84
10-year Treasury Savings Deposit Certificates	3.01	5.12	5.22	9.39	11.58
National Plan Certificates	9.00	—2.25	—2.10	—1.24	—0.84
National Plan Savings Certificates	...	71.44	81.34	68.90	51.52
15-Year Annuity Certificates	0.37	0.55	0.54	0.49	0.45
Total	62.73	70.58	79.46	85.06	67.25
Deduct :					
Encashment of Post Office Cash Certificates, Defence Savings Bank and Defence Savings Certificates	—1.21	—1.02	—1.01	—0.75	—0.54
Net	61.52	69.56	78.45	84.31	66.71

It will be observed from this table that small savings during the last three years have shown encouraging results. The net collections last year aggregated to Rs. 85 crores and in the first ten months of the current year net collections have exceeded the collections for the corresponding period last year by Rs. 19 crores, and there is every likelihood that a target of Rs. 100 crores may be achieved for the first time by the end of March, 1961. Statewise collections is given in a table on page 660.

The increase in the small savings brought about in the last few years is partly to be attributed to the inducements provided to investors by the Government of India. For instance, the rates of interest on the various types of small savings securities were increased in 1957-58 and facilities were provided for withdrawal by cheques in Post Office Savings Banks. A new scheme of Cumulative Time Deposit Scheme was introduced with effect from 2nd January, 1959. This is intended to cater for those who have regular incomes and who wish to save every month. The scheme provides for monthly deposits in all Post Offices doing Savings Bank work for a period of 5 or 10 years, at the end of which they are repayable with compound interest, yielding a return, free of income tax and super tax, of about 3.3 per cent per annum in the 5-year account and 3.8 per cent per annum in the 10-year account. The maximum limits upto which an individual can make deposits under the scheme is Rs. 200 per month in a 5-year account or Rs. 100 per month in a 10-year account. The limits for joint accounts are double those of single accounts. The cumulative Time Deposit Rules have been amended to enable the legal heir to a deceased depositor to claim a lump payment of a proportionate sum instead of having to wait till maturity of the deposit. Treasury Savings Deposit Certificates have been made transferable subject to certain conditions and investments by Provident Funds in Treasury Savings Deposit Certificates have been allowed to be made without limit. A new Pay Roll Scheme has been introduced for the benefit of the employees in large establishments, factories, etc., permitting deductions to be made from the wages with the consent of the employees for investment in small savings with a view to step up collections under the scheme. A new series of Annuity Certificates of the denomination of Rs. 1,330 has been introduced with effect from January 2, 1960, and scheduled and co-operative banks have been authorised to receive subscriptions for the Treasury Savings Deposit Certificates on a brokerage basis. A Gift Coupon scheme has also been introduced which enables a person to purchase attractive coupons of given denomination in suitable attractive envelopes to be presented to the donee who can have them exchanged for 12-year National Plan Savings Certificates of like denomination. The advantage of this is claimed to be that it would help check the tendency towards extravagance in cash especially on occasions which do not serve well either the individual or the society. To make the scheme popular in the rural areas the assistance of the Community Development Administration has been sought.

Encouraged by the results of the previous years, the Finance Minister now has proposed to raise Rs. 105 crores in the year 1961-62. In all Rs. 585 crores is to be raised by the end of the Third Plan. Without belittling the progress or the efforts of the Government to raise more resources, it is to be pointed out that the target of Rs. 117 crores a year is definitely on the high side. If only Rs. 390 crores could be raised in the Second Five-Year Plan in spite of all the inducements provided to

investors and with the setting up of the Advisory Boards, it is wondered how a target of Rs. 585 crores could be achieved in the Third Plan. The expected realization of Rs. 100 crores in 1960-61 is partly due to the fact that the banking industry was under stress and strain last year and for that reason investors thought it safe to invest in small savings securities than to go in for the banks. This performance is not likely to be repeated with the banking structure now having regained confidence. This, of course, goes without saying that a greater intensification of efforts will be required and procedural complications and difficulties in encashment involved in the existing small savings scheme will have

to be eliminated further. The fact by no means can be ignored that banks now offer more attractive terms and advantages to all classes of savers. Not only will there have to be a close examination of the strata reached so far by the small savings movement both in urban and rural areas, but a concerted drive will have to be made by the State Governments and the non-official agencies to bring into the small savings movement all the areas and classes uncovered so far. The appointment of the Chavan Committee in this context to step up small savings is a heartening development and the findings of this Committee will be watched with great interest.

Skilled hands with a proud tradition

Mastery in the skilled art of printing is the proud tradition of Indian craftsmen from the time of Mohenjo-daro. Today, dyes produced by the Mafatlal Group help keep up this tradition...blend present fashions with an art as old as the land itself.

Alive to the nation's growing needs, the Mafatlal Group strides forward hand in hand with the country's economic and industrial progress. Today, the Group produces a wide range of products — textiles, jute, sugar, dyes and chemicals — for all types of people throughout the land.

The Birthday Gift

Mother stitched a pair of trousers for his birthday and sent them to the laundry so that they would look fresh, crisp, new. But they shrunk—she had forgotten to look for the label 'Sanforized'!

If only she'd taken a little more care in the selection of the fabric, these trousers would have retained their immaculate fit even after many, many washings.

Make certain you get the full measure of value of the material you buy—

Look for **'SANFORIZED'** on the label

and your clothes will never shrink out of fit!

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information: 'Sanforized' Service, 95 Marine Drive, Bombay 2

You'll be safe with

Fashionable fabrics at a low cost—that is the promise of Nature's bounty when spun into Rayon by NRC.

There is bounty of another sort as well: Rayon makes subsidiary chemicals which are vital to many diverse industries; it provides full-time employment to 500,000 workers; affords invaluable training and experience to chemical engineers and technicians, and conserves India's foreign exchange.

This bounty is truly a gift well-timed for this country.

P.L. 480 and Inflationary Pressures

THE Central Budget for 1961-62, the first year of the Third Plan, will be hailed in knowledgeable circles as a move in the right direction. The Union Finance Minister has shown foresight and courage in picking everybody's pocket in an election year. This was necessary. If the big push forward, promised in the Draft Outline of the Third Plan is to show itself in the Central Budget presented to Parliament, it could not be otherwise. Against a target of Rs. 1,100 crores for the Centre in additional taxation in the Third Plan, the Budget proposals aim at Rs. 61 crores in 1961-62. The State Governments, among themselves, may raise Rs. 10 crores or so.

The United States Government has so far entered into five agreements with the Government of India under Public Law 480 for the supply of U.S. surplus agricultural commodities. According to these agreements, the rupee equivalent of the dollar cost of these commodities plus 50 per cent ocean freight costs is deposited in the U.S. Government Title Account in India. A major portion of these rupee deposits is made available to the Government of India as loans and grants for mutually agreed development projects, and the balance is kept by the U.S. Government partly for their own uses and partly for giving loans to U.S. firms or their affiliates for investment in India. So far a total amount of Rs. 1,096 crores has been made available allocated under PL 480. Out of this amount, Rs. 510 crores are given to the Government of India as loans and Rs. 368 crores as outright grants; the rest of the amount is partly kept for U.S. uses and partly for advancing loans to U.S. firms or their affiliates for investment in India. Though the terms and conditions of the loans from rupee proceeds are determined in each case by mutual agreement between the two Governments, the loans that are negotiated so far are repayable in 40 years in 73 semi-annual instalments beginning after four years of the disbursement of the first loan and they carry a rate of interest of 3 to 5 per cent per annum. The loans can be repaid either in rupees or dollars at India's option in all cases, except loan agreement relating to the second P.L. 480 agreement under which the repayment is to be made in rupees only.

Such outlay from the P.L. 480 counterpart funds adds to the monetary circulation in precisely the same way as conventional deficit financing. Moreover, the revised procedure for the deposit of P.L. 480 funds with the Reserve Bank of India has the effect of complicating the pattern of transactions in the Capital budget of the Central Government. Before the new procedure was introduced in May 1960, the P.L. 480 funds were deposited with the State Bank of India, which invested them in Treasury Bills or dated Government Securities. Under the revised procedure, the P.L. 480 funds are deposited directly with the Reserve Bank, which invests them in special securities of the Government of India. The Government is also receiving Rs. 12 crores per month from the past deposits of P.L. 480 sale-proceeds with the State Bank of India. Under the revised procedure, investments in special securities during the current financial year have amounted to Rs. 240 crores—Rs. 108 crores on account of transfers from the State Bank of India and Rs. 132 crores due to net fresh accruals. The addition of Rs. 240 crores into the Capital accounts of the Government of India has brought down the net expansion of ad hoc

Treasury Bills (deficit financing) in the current financial year from Rs. 153 crores in the budget estimates to Rs. 15 crores in the revised estimates. Does it really amount to a contraction in deficit financing?

These transactions can be looked at from another angle. The Rs. 240 crores invested in the special securities are funds which would otherwise have been invested by the State Bank in the Government of India Securities and other market loans. This fact is important. The Government planned to raise Rs. 225 crores through market loans during the current financial year. But in reality they have floated two loans of a total value of Rs. 175 crores. The shortfall of Rs. 50 crores, however, is only national. Had the Government left the P.L. 480 funds with the State Bank, the latter would presumably have invested enough in the new market loans for the borrowing target of Rs. 225 crores to be achieved. In other words, the revised procedure has substituted the special securities for a larger issue of the market loans and a larger expansion of ad hoc Treasuries. The interesting point is whether deficit financing in the current financial year is, in fact, limited to Rs. 15 crores of expansion in Treasury Bills or extends to those Rs. 15 crores plus the Rs. 240 crores of special securities?

The Reserve Bank's investment in special securities, according to the Finance Minister, will be Rs. 96 crores and the net expansion of Treasury Bills will be about Rs. 64 crores in the budget year. The admitted overall deficit in 1961-62 is thus Rs. 64 crores.

Deficit financing of the order of Rs. 64 crores during the budget year appears to be reasonable. It would be wrong to argue that if the entire deficit, at current rates of taxation, in the revenue budget had not been wiped out and a little more of deficit financing had been resorted to, monetary stability would not have been endangered. The real emphasis and discipline laid down must be appreciated. It is one of the postulates of the Third Plan that inflation ought to be kept under control by limiting deficit financing and the Finance Minister has reiterated it. Taxes on consumption are in theory disinflationary; but to what extent they will in fact discourage consumption is a moot point. By casting his net very wide to cover the large number of import duties and excise taxes, Mr. Desai has tried to keep the incidence of the duty on individual items low. But the cumulative effect of some of the taxes, specially those on articles of mass consumption like cloth, kerosene, coffee, tea, betelnuts and tobacco, may well be to raise the cost of living. This question has been discussed in another article in this Number. It is, of course, understandable that the Finance Minister in search of additional revenue, with little scope for raising direct taxes, had to choose as many new commodities as possible for indirect taxation. But the effects of these taxes on some of the new industries have to be watched so that the taxes may not have any serious repercussions on particular industries.

A little analysis of the possible effects of the new tax proposals will be instructive. The increase in indirect taxation proposed in the budget for 1961-62 is expected to secure an addition of about 10 per cent to

the total revenue from Customs and excise duties in this budget year at the existing rates. Raising indirect taxes on so many commodities would have meant a much larger revenue in any industrially advanced country of Western Europe or the United States, but the comparative smallness of the result contrasted with the largeness of the effort is a pointed reminder to India of the long way she has to go before she can join the ranks of the economically developed countries. Apart from this imbalance between the efforts and results, indirect taxes even on final consumption goods lead to a rise in prices which is always greater than what is warranted by the rise in taxation; and the effects of the indirect taxes on intermediate and capital goods tend to take cumulative form. In the case of current budget proposals, excise duties are raised on such articles of mass consumption, specially lower middle class consumption, such as tea, coffee, cigars and cigarettes, betelnuts, kerosene, matches, vegetable pro-

ducts, cotton fabrics, powerloom fabrics, and woollen, silk and art silk fabrics, and on such intermediate goods as diesel oil, paints and varnishes, rayon and synthetic fibre and yarn.

The majority of the new excise duties along with their countervailing import duties as well as the proposed additions to the existing rates of Customs duties are either on raw materials or intermediate goods or capital goods. The net result of all this is the real possibility of a rise in the cost of living, specially for the urban classes. Along with it the danger of wage earners and salaried workers demanding an off-setting rise in their remunerations with the consequent threat of an inflationary spiral is something to be reckoned with. The effective way to avert the threat of an inflationary price and wage spiral is to get the energetic cooperation of all sections of the community to step up production.

LIFTING THE LOAD FOR FOREIGN TRADE

The pressures of economic development are heavily weighted on our foreign exchange position. Exports must grow to improve our trade balance.

Jag Fleet—a powerful factor in our expanding Shipping—has from the very beginning looked far ahead and moved forward in this race for progress.

The Jag Fleet:

- Largest Tramp fleet in India.
- Two 12,700 d. w. t. modern fast vessels under construction in Japan.
- Oil Tanker—the first of its kind to be owned by India.

THE GREAT EASTERN SHIPPING CO. LTD.,
60 Mahatma Gandhi Road, Bombay 1.

Alas! I am no longer needed!

**India-built PHILLIPS and
HERCULES are proving the high
quality of Indian manufacture abroad!**

Our exports do more than earn foreign exchange; they help to foster confidence in foreign lands that India can make goods comparable to the best they're used to from the West.

Abiding Partnership: Such a favourable image is owed in no small measure to the abiding partnership between Murugappa & Sons and Tube Investments which has produced outstanding results. Our factory units producing ERW steel tubes, cycles and cycle components are being enlarged in capacity to serve both our growing internal and export needs.

There is in evidence today, as a measure of contribution to our national economy, a cycle made by T. I. Cycles in every five on the road. Our TRU-WEL tubes are

helping to stabilise the indigenous manufacture of cycles at a high level. These tubes are further contributing to the building up of other light engineering industries which require steel tubing combining great strength with exceptional lightness.

We look back with pardonable pride on the role we have played in developing our national economy and are happy to have a continuing opportunity to share in the unlimited task ahead of building up a free and prosperous India.

External Assistance and the Third Plan

A HEAVY draft of foreign assistance is written into the Third Five-Year Plan which, according to the latest directive of the National Development Council, is to be of the size of Rs. 11,600 crores in respect of financial outlay and Rs. 12,100 crores in terms of physical targets. The Draft Outline envisaged external aid requirements of the Rs. 11,250 crores Third Plan at Rs. 3,200 crores. Of this, Rs. 600 crores were expected to be the cost of foodgrains imports under PL 480 required to keep food prices under control and inflationary pressures within limits. Of the remaining Rs. 2,600 crores, Rs. 500 crores were considered to be necessary to cover the balance of payments deficit, Rs. 1,900 crores for financing the import of machinery and equipment for the projects included in the Plan and the balance Rs. 200 crores for meeting the cost of imports of components, intermediate products etc., for increasing the production of capital goods within the country.

The magnitude of foreign assistance component of the Third Plan is stupendous indeed; it is slightly more than twice that of the Second Plan. An attempt is made in this article to assess how far our expectations of foreign aid of the stipulated order are likely to be fulfilled.

The total foreign assistance under-written so far by friendly countries for the next Plan is as follows :

	(Rs. crores)
(1) Credit authorised by the Soviet Union (Rs. 178.58 crores + Rs. 59.53 crores)	238.11
(2) Czech Credit	23.10
(3) Yugoslav Credit	19.05
(4) Polish Credit	14.30
(5) West German Credit	28.34
(6) Credit authorised by the United Kingdom	6.67
(7) PL 480 Loan from the United States for import of 17 million tons of food grains	635.57
Total	965.14

If the PL 480 Loan is excluded (as provision for it to the tune of only Rs. 600 crores had been made in the Rs. 3,200 crores foreign assistance component), the total aid authorised so far comes to Rs. 329.57 crores, as against Rs. 2,600 crores taken account of in the Draft Outline of the Plan. To this, however, must be added the amount of U.S. Exim Bank Loan II announced in December last and the loan made available by this agency to A.I.I. Together, these two loans amount to Rs. 25.76 crores. The quantum of external assistance still needed for execution of a Rs. 11,250 crores Plan thus comes to Rs. 2,244.67 crores. And that too on the assumption that "other factors" remain unchanged.

In the recent past, however, two important developments have taken place which should warrant an upward revision of the external assistance component of the Third Plan. In the first place, the size of the Plan has been increased from Rs. 11,250 crores to Rs. 11,600 crores. It may further be stepped up to Rs. 12,100 crores if the physical targets recommended by the National Development Council are to be adhered to.

* West Germany has offered an initial long-term credit of Rs. 45.5 crores for the first year of the Third Plan. The announcement was made in New Delhi on Thursday by Dr. Hans Wilhelmi, West German Minister for Federal Property, now on a visit to this country. Dr. Wilhelmi also stated that the Federal Government would help India to raise a further credit of Rs. 51 crores in Germany to meet the estimated foreign exchange component of the Rourkela Steel Plant's expansion programme.

Secondly, the recessionary trends in evidence in the United States at the time when the Draft Outline was prepared, and which presumably influenced to some extent the estimates of foreign aid requirements of the Third Plan, are also not likely to persist for long. The significance of this factor lies in the fact that a major part of the future loans from the U.S.A. will be in the form of "tied" credit which will necessitate purchases of machinery and equipment to be financed with these loans in that country. These two factors may push up foreign assistance requirements of the Plan by about Rs. 200 crores.

Two counter-balancing factors are also there to be taken note of because they might reduce the foreign aid requirements to some extent. The first of these factors is the attempts being made to defer repayment of some of the loans contracted during the Second Plan period. The second one is the stepping up of customs duties on machinery and equipment imports. In his taxation proposals, Mr. Morarji Desai has put up the statutory rate of the duty on these items from 10 per cent ad valorem to 15 per cent ad valorem so long as it does not come in conflict with the commitments under the General Agreement on Tariffs and Trade. He has also raised the concessional rate of duty at present applicable to certain types of machinery from 5 per cent ad valorem to 10 per cent ad valorem. The net effect of these two factors may be a reduction of about Rs. 50 crores in the amount of external assistance required for the Plan. The uncovered gap thus comes to Rs. 2,394.67 crores or nearly Rs. 2,400 crores.

Will fresh foreign assistance to this tune be forthcoming during the next five years? Official circles appear to be quite optimistic about it. Their optimism emanates from the fact that during the last three years of the Second Plan, average authorisations of foreign assistance to India for her economic development have been of the order of nearly Rs. 400 crores per annum. They also appear to depend on the change in outlook of some of the wealthier nations of the world who have increasingly come to realise that they owe a moral responsibility to the under-developed countries to help them in raising the standard of living of their people. Then, it is sometimes argued that India's credit-worthiness having been established, the judicious manner in which this country has utilised foreign assistance in the past (both the Three Wise Men's Mission and the Hoffman Team have given a good chit to India in this respect) will evoke greater response from the friendly countries. It is suggested in these quarters that there is not likely to be any shortfall in the quantum of foreign assistance envisaged in the Draft Outline of the Plan; if there is any shortfall, it will be only of a marginal nature.

"The Eastern Economist," however, does not share this view, notwithstanding the fact that the United Kingdom, in addition to the Rs. 6.67 crores loan already made available for the Third Plan, has offered an initial assistance of Rs. 40 crores for the first year of the Plan and hints have come from West Germany and Japan that they may make available in the next five years aid to the tune of Rs. 250 crores* and Rs. 95 crores respectively.

The picture of external assistance that might be

available to India during the Third Plan period will become clear only after the April meeting of the Aid-India Club at which the quantum of aid to be supplied by the United States, Canada, West Germany, the United Kingdom, Japan and some other countries of the "Free World" who may become the members of this Club (notable among them are France, Italy, Sweden, and Netherlands) will be decided. On the deliberations of this meeting also depends the quantum of assistance which will be made available by the World Bank and its affiliate the International Development Association.

In the opinion of this journal, the total amount of foreign assistance that might be available for the Third Plan on Government-to-Government basis and from World Bank and IDA, including what has already been under-written, will be of the order of only Rs. 1,900 crores. Another Rs. 400 crores might be available in the form of private foreign investment and aid from private agencies for expansion of some public sector industrial units. This will leave a gap of nearly Rs. 429 crores in the external assistance component of the Plan.

This assessment has been made after taking into consideration the following three factors: (1) the balance of payments difficulties being faced by the United States; (2) the changing pattern of aid, whereby major part of the loans in future will be in the form of "tied" credit; and (3) the growing competition for securing aid. The United States, it is well known, is facing an acute balance of payments problem; both gold and silver in heavy quantities are flowing out of this country. From the recent utterances of President Kennedy it is quite clear that the U.S. Government would like the West European nations, especially West Germany, to undertake the task of extending aid to the under-developed countries in a greater measure. But West Germany has been resisting this pressure. The balance of payments difficulties may not affect U.S. lending programme to any marked degree, but they will definitely hamper extension of aid in the form of grants or "untied" loans. The growing competition for securing aid, especially from the African and Latin American countries, is likely to affect the quantum of aid to be made available by the World Bank and the International Development Association.

This heavy shortfall in the external assistance component of the Plan will surely create a crisis which could have been weathered if we had a comfortable cushion in the form of sterling holdings as was the case at the beginning of the First and the Second Plans. The following table shows that our foreign assets are

at near rock bottom; they can be drawn upon only to the extent of about Rs. 35 crores.

INDIA'S STERLING BALANCES

(Rs. crores)

Last Friday	Foreign Securities	Balances Held Abroad	Sterling Balances
1955	686.88	48.30	735.18
1956	447.30	82.61	529.91
1957	275.23	22.42	297.65
1958	164.68	24.17	188.85
1959	163.01	50.13	213.14
1960	128.01	23.72	151.73
1960 January	163.01	43.98	206.99
February	163.01	35.80	198.81
March	163.01	34.11	197.12
April	163.01	17.60	180.61
May	163.01	9.54	172.55
June	143.01	14.47	157.48
July	128.01	25.22	153.23
August	123.01	23.52	146.53
September	123.01	16.17	139.18
October	123.01	19.74	142.75
November	123.01	16.96	139.97
December	128.01	23.72	151.73
1961 January	128.01	19.66	147.67
February	128.01	31.49	159.50

The above analysis obviously calls for fixing the hard core of the Third Plan which can be seen through with an external assistance (apart from the PL 480 Loan) of the order of Rs. 2,300 crores out of which about Rs. 1,700 crores will be available for new development projects. An attempt has been made in the Blue Supplement included in this issue to fix this hard core. To complete the Plan in its present dimensions will require herculean efforts to step up exports.

Ballabgarh—

the home of GOODYEAR in India

21 miles from Delhi, in East Punjab, the little village of *Ballabgarh* has been unaffected by time and progress. Today, however, it is humming with Goodyear's constructional activity and a new industrial town is emerging.

the revolutionary 3-T unit, which is an exclusive method developed by Goodyear after five years of research and an investment of five million dollars.

This 59th factory is part of the programme of Goodyear to place before all its overseas organisations, the benefits of its experience, resources and technical skill, for which the name "GOODYEAR" stands.

Goodyear, the world's largest tyre company, is investing six crores of rupees in building the most modern tyre factory — including

AND MAHARASHTRA'S FACTORY FARMS ARE INDIA'S BEST!

The Sugar Industry in Maharashtra State is an agro-industry working at **PEAK EFFICIENCY**. The average yield of cane per acre of Factory Farms in Maharashtra is twice the average cane yield in the State and nearly four times the average for the whole of India. This efficiency is progressively going up because of:-

- * Progressive management with high initiative and drive.
- * Unceasing research and experimentation, and scientific cropping schemes.
- * Adoption of latest techniques and timely operations, with the utmost economy in the use of water and manures.

- * Huge investment in land development and heavy mechanisation.
- * Rigid pest and disease control and eradication measures.
- * Highly qualified and experienced technicians.
- * Close co-ordination between farm and factory.

Nowhere else in this country are sugar-cane farms so efficiently organised for high productivity as they are presently in the Factory Farms of Maharashtra. *Facts about cane yields mentioned in the Govt. Statistical Companion and White Paper are misleading as the factories' own farm yields have been mixed up with the cultivators' poor yields to prove lesser averages.*

For further particulars please write for our factual Booklet.

For the sake of agricultural productivity

EXCLUDE FACTORY FARMS FROM THE PROPOSED MAHARASHTRA LAND CEILINGS BILL.

OUR ACHIEVEMENTS COMPETE WITH THE WORLD'S BEST

Issued in the public interest by **GODAVARI SUGAR MILLS LTD.**,

The Dollar and the Pound Sterling AWAY FROM COMPLACENCY

By WILLIAM REES-MOGG

IT already seems likely that the period of General Eisenhower's Presidency will be looked back upon as one of the decades of American complacency. Like the 1920's, the era of "Coolidge prosperity", the 1950's may be seen as a time when the basic economic problems were hidden by a high level of current comfort.

The simple certainties of President Eisenhower's own economic beliefs, his faith in balanced budgets, and in traditional financial policy, certainly did not result in any existing new economic thought in Washington. The pattern which emerged was one which the whole world reluctantly became accustomed to. In the last years of the Eisenhower administration it included a weak dollar and a general sluggishness in the American economy.

This was so acceptable to the American people that there can be no doubt that they would have elected Eisenhower to a third term if it had been constitutionally possible for them to do so. As it was they came within a few thousand votes of electing Mr. Nixon to succeed him. President Kennedy's administration has started with the need to convince the American people of the urgency of the economic problem it has to face. This may count for some of the anxiety which the new President has expressed in his message to Congress. It does not by any means account for all of them.

Both in Washington and in London, though not on Wall Street, there is an increasing fear of the apparent momentum of the present American recession. The latest figures show that output in January was 8 per cent below the level of a year ago. There are now more than 5½ million Americans out of work, and of these 600,000 have been out of work for so long that they have exhausted their unemployment benefits.

The latest prospect for the motor car industry is considerably more depressing than the forecasts which were made at the beginning of the year; there are still record stocks of motor cars waiting to be sold. As against this Wall Street still enjoys a real mood of optimism and has rapidly overcome the long expected bout of profit taking. No doubt Wall Street does represent a real attitude of confidence among businessmen.

The President is asking Congress to act immediately on his programme to stop the recession which is still meeting substantial conservative opposition. There are five major measures which he is asking Congress to pass. The first is a \$400,000,000 Bill for aid to the depressed areas. President Kennedy himself was extremely shocked when he discovered the deplorable conditions in West Virginia during his campaign in the primaries. The second Bill provides \$990 million for additional unemployment compensation which would help the 600,000 whose compensation has run out.

The third measure provides \$305 million to help the children of unemployed people.

These are all humane and sensible measures which would help to alleviate distress and put more purchasing power into the American economy. The other two measures involve an increase in the minimum wage from \$1 an hour to \$1.15 and ultimately to \$1.25. The final measure is a Bill to raise pensions from April 1.

Taken together these Bills provide the beginning of a major new programme of social reform in the United States. They also provide very powerful re-inflationary force to set against the momentum of the recession. President Kennedy has certainly accepted the admirable economic maxim that in matters of economic policy it is deeds and not words which count.

What will be the effect of the new American policies on the rest of the world? It looks as though the measures combined with the reviving confidence of American businessmen will in fact stop the recession. Otherwise a serious American recession would obviously damage the economy of the whole world; it would have a particularly serious effect upon commodity prices which already show signs of weakness.

The success of President Kennedy's policies has already been the revival of confidence in the dollar. This in its turn could put some pressure on sterling. Already the £ has fallen below \$2.80 and a small dollar premium has reappeared on the London Stock Exchange. In 1960 Britain was able to afford an unfavourable balance of payments while accumulating stocks of imported goods. In 1961 the British Government will have less room for manoeuvre in economic affairs.

Inevitably a more efficient American economy provides both a sounder basis for world trade and a stronger competitor in world trade. No country can expect to have all the advantages of the strength of the United States without having to face up to the liabilities as well. The question still remains, how far can the new administration carry through its policies? Even if the new social measures plus \$4,000 million of tax rebates will ride out this recession there is still the need to provide for the long-term growth of the American economy.

It was there that the Eisenhower administration failed. An American economy that was expanding vigorously would provide the best possible opportunity for the expansion of other countries, both the highly developed industrial powers and the under-developed powers of the world. Fortunately it is clear that President Kennedy is approaching this problem in the right sense and with the right degree of determination.

Move to Convertibility

By PAUL BAREAU

THERE has been a tendency to underplay the recent announcement by Great Britain and nine other countries to make their currencies fully convertible in accordance with the rules of the International Monetary Fund. This belittling of a move that concerns the major currencies of Europe was probably due to the official commentary issued in London which stressed that this was little more than the formal recognition of an already existing situation.

It is true that sterling and the other currencies concerned have in fact been convertible for non-residents since December 1958; but this was convertibility with many reservations. The collective moves that have just been made and which in technical terms involve the acceptance by these ten countries of the obligations of convertibility as set out in Article VIII of the Funds' agreement, and their abandonment of the protection of Article XIV, represents the passing of a memorable milestone.

When the articles of the International Monetary Fund were being drawn up during the course of the Bretton Woods meeting in 1943, the British delegation led by the late Lord Keynes still had ringing in its ears an admonition by the Governor of the Bank of England, then Mr. Montagu Norman, to the effect that they must not forget that "we must get from here to there — from the tight exchange controls with which we shall end the war, to the goal of freedom of payments towards which we shall be striving". After the World War I grave mistakes had been made in endeavouring to get back far too quickly to what was then called "normalcy". Mr. Montagu Norman himself had been guilty of some degree of impatience, not to say rashness, in urging that sterling should go back to the gold standard, not only as quickly as possible but on the basis of the old

1914 parity. He had learnt his lesson and wanted to ensure that the mistake would not be repeated after the World War II.

The wisdom of that advice was enshrined in Article XIV which provided that for a transitional period, the minimum of which was set at five years, any country joining the International Monetary Fund had the right to maintain the control of exchanges and other restrictions on external payments which it operated at the end of the war. All member countries except those of the dollar bloc chose to arrange their payments affairs in accordance with this article.

As so often happens, the provisional became far more permanent than had been expected. The transitional period has stretched well beyond the anticipated five years. The provisional arrangement also produced one very useful offshoot. This was the annual consultation between the Fund and every member country which chose to maintain restrictions on its current payments beyond the said period of five years. These consultations proved so useful both to the Fund and to the countries with which the consultations were made, that it has been decided by the countries which have just left the provisions of Article XIV, to continue these annual reviews of their affairs with members of the IMF staff, even though they no longer need do so.

For most member countries the rigour of exchange control has been easing for many years. For Britain and eleven other European countries, all members of the Organisation for European Economic Co-operation, the most fateful step of all was taken in December 1958, when their currencies became convertible for non-residents. This meant that non-resident holders of these currencies could use them for normal commercial

The breath of industry

Oxygen — feeding the flame that knifes through steel, welding enormous broken castings and bubbling through molten metal to make pure steel — the flow of Oxygen in modern industry never ceases. From tiny workshops to the great steel plants and shipyards, wherever there is metal to be worked, Oxygen is on the job.

The comforts of life are spreading

Rising standards of living are finding their way into the remotest village and are coming within the reach of people with quite modest means. Consider Kerosine, for instance, which by bringing illumination to the humblest home is playing a part in this welcome development. By the end of the Third Plan, Burmah-Shell estimates

that demand for Kerosine will be around 2.9 million tons, or well over 800 million gallons a year. There can be no question that the first priority should be the exploration and production of indigenous crude oil; the second priority must be to expand refining capacity in India. Oil is essential to economic growth and Burmah-Shell believes that

for tomorrow's needs we must act today

operations without any let or hindrance from exchange control.

This step was also followed by a gradual but by now almost complete dismantling of the discriminatory restrictions on imports. There could be no justification in maintaining restrictions say on imports into Britain payable in dollars and allowing those payable in French francs, since the sterling payable for each would be fully convertible, and since each currency was from the British point of view as "hard" as the other.

It is this state of affairs which has now been formalised but which at the same time has been taken a step further. Convertibility under Article VIII of the International Monetary Fund cannot be limited to non-residents but must apply to all. It does not, however, apply to capital transactions. A member of the IMF, accepting all the obligations of its Articles of Agreement, may maintain as rigid a control as it wishes, over capital transactions whether of its own residents or of foreigners.

The problem which then arises is that of distinguishing between what is a capital and a current transaction. The line of demarcation is far subtler than is generally supposed, for a current commercial transaction can readily be converted into a capital operation — as for example when an exporter fails to repatriate the foreign exchange proceeds of his sale abroad. That is why Great Britain, which has chosen to accept the full obligations of Article VIII of the Fund but wishes to retain control over capital transactions, is more or less compelled to continue some kind of control over current transactions. These restrictions, as for example, those on the amount a British tourist can take out of the country and on the remittance of the

proceeds of export trade, are not intended to restrict current payments but prevent current transactions becoming the vehicle for an export of capital.

The most important implications of this collective move to Article VIII are those for the International Monetary Fund itself. The change increases the number of currencies that can be freely drawn and repaid to the Fund. Any currency can be withdrawn from the Fund but according to its rules all repayments have to be made in terms of a fully convertible Article VIII currency, or in gold. There has in consequence been considerable reluctance on the part of member countries to withdraw certain currencies, such as German marks, even though they were in very short supply and urgently needed, because it was known that repayment would have to be made not in marks but in US dollars, or gold. That deterrent has now been removed in respect of these ten currencies, including marks, French francs, and indeed all European currencies of any importance.

This should both strengthen the Fund and make it more flexible in its operations. It will provide a useful adjunct to the other and even more fundamental proposals for reinforcing this international institution which have been discussed during the Anglo-American talks in Washington, at which the British delegation was led by Sir Frank Lee, the Permanent Secretary to the Treasury. So far no hint has emerged either from Washington or London about the results of these conversations, but it will not be long before other countries are drawn into the debate and preparations made for an international conference which may well match that of Bretton Woods eighteen years ago in its significance for the future shape of the international payments system.

Incentives for Top Management

By

DR. ROBERT N. MCMURRY & MR. LAWRENCE E. DE NEUFVILLE

It has often been said that there is nothing new under the sun in human behaviour. And it is also believed that the same applies to human organization whether its purpose is for political or for economic ends. Those who attended the 1960 management seminars in India presented under the auspices of Personnel & Productivity Services of Bombay, will recall that the claim is not to have made new and startling discoveries in the fields of human behaviour and human organisation, but only to have put forward in a systematic and useable form the basic principles that underlie—as it is believed they always have, in every culture—the outward behavioral patterns that show themselves in any locality or at any period of history or economic development.

It is, therefore, a mistake to believe that Indian management, for example, has problems which have never existed elsewhere. Nor is there any foundation for a belief, sometimes expressed in India, that the State-owned enterprises in the Indian public sector are in themselves novel or call for novel or unique management practices. Certainly it is interesting and healthy that India has chosen to follow the standard pattern of limited companies for its government-held enterprises—a recognition, surely, of the similarity that exists between operations in the public and private sectors.

The choice of limited companies for the public sector means, too, that it is mistaken to equate India's

state-owned enterprises with state-owned industrial operations in the Communist bloc. India's parallel is with the West. Hindustan Aircraft, for example, is similar to the French aircraft companies which have been government-owned since the war. Like the French companies, it has a national monopoly in the airplane construction field. Hindustan Steel, on the other hand—being no monopoly, but in competition with private sector steel companies—resembles the Volkswagen plant in Germany, the Renault plant in France, or the Italian government-owned automobile and shipbuilding group of enterprises. Indian Refineries, again competitive, has its parallel in Italy and in Great Britain.

As the above examples show, it is equally false to equate India's government-owned enterprises in the industrial field with such monopoly operations in the public-service field as the railways. It is this false analogy which led Professor J. K. Galbraith, President Kennedy's choice for Ambassador to India, to warn against "post-office socialism" and its concomitant inefficiencies. Yet his warning, first given to the Indian Government in a confidential report prepared two years ago (and only recently made public) seems to have gone to a large extent unheeded. Post-office socialism, as one may define it, continues to show itself in two principal respects in the government-owned sector:

First, the state-owned companies are so organized in their management that operating decisions must be taken by Boards, rather than by individuals.

B.E.W. provide the sinews for industry

BEW manufacture all types of plant and structural steelwork (and erect them at site), fabricate tanks and vessels, make ferrous castings upto 10 tons and non-ferrous castings upto 15 cwt., and manufacture spares for a wide range of industrial plants.

There has been no disposition to limit the Board of Directors to its normal function of long-range policy-making. Second, the members of management of state-owned companies are compensated, even at the highest levels, on a Civil Service Basis with no bonus or incentive based upon particularly effective and/or profitable operation.

It is considered, it will never be possible to solve the first problem (except on paper) until the second problem is solved. It is one thing to establish that a particular decision or area of decision belongs to one man alone, and that where co-ordination with others is involved he alone has the responsibility to co-ordinate. It is a horse of another colour to bring into existence an effectively operating system where those who are empowered to take individual decisions actually are willing to do so.

This is because, as a world-wide truth, a man expects to be rewarded if he takes a decision of considerable risk and it turns out successfully, just as he expects to be punished (at least by the withdrawal of esteem) if the decision is unsuccessful. In the public sector, as it is now operated in India, the punishment is present—in the sense of criticism in Parliament or from the Ministry, which may even result in demotion or removal—but the reward for successful individual decision is almost entirely absent. In terms of money, it is totally lacking; in terms of advancement, almost entirely—since most advancement is by seniority; in terms of esteem alone, there may be some reward for initiative in decision-making. Public esteem, however, is more ephemeral by far than money in the bank or advancement in status or position.

Essentially, then, the problem is this: will a man take the risks of individual decision in the public sector when the reward is close to zero and the potential punishment large? Is it not far more likely that he will seek to avoid individual responsibility by hiding behind group decisions, and thus continue unworried in the enjoyment of his steady Civil Service income? Unquestionably this is what happens in every bureaucracy, and unquestionably an industrial operation cannot be run on bureaucratic lines without degenerating into post-office socialism. Efficiency demands individual authority and responsibility, not on paper but actually exercised. Human nature demands incentives to take the risks involved.

These facts are widely recognized. State-owned enterprises in Western Europe offer incentives to management that are identical and highly competitive with the incentives offered in the private sector. Even in Eastern Europe and Russia where, as explained, the conditions for state-owned business are different from those in India, very strong incentives are offered to managers. One who is successful can earn substantial money bonuses as well as qualify for such hard-to-get perquisites as an individual car and individual living quarters. This is particularly interesting because Russia, having no competition between the public and private sectors, originally endeavoured (like India today) to have management without incentive. Experience proved that only incentives could produce risk-taking managers, and that business could not be efficiently run (even without competition) except where individuals at the top are willing to take decisions involving risk.

The conclusion is that the problem in Indian public-sector enterprises is not that they are being run by men from the Civil Service, but that these men continue to be treated as civil servants in terms of compensation even after they have made the transition to business management. This ensures, because of the factors of human personality, that public-sector enterprises will be run as bureaucracies—and as bureaucracies they will not be competitive on equal terms with the incentive-based managements of the private sector.

INDUSTRIAL FINANCE CORPORATION OF INDIA

[Incorporated under the Industrial Finance Corporation Act, 1948 (XV of 1948)]

HEAD OFFICE:

Reserve Bank Building, Parliament Street, New Delhi.

BRANCH OFFICES:

Liberty Building,
8, Marine Lines,
BOMBAY.

P-11, Mission Row
Extension,
CALCUTTA.

38, Whites Road,
Royapettah,
MADRAS.

AUTHORISED CAPITAL: .. Rs. 10,00,00,000
ISSUED AND PAID-UP CAPITAL: .. Rs. 5,00,00,000

TOTAL LOANS OUTSTANDING
(AS ON 31-12-1960) .. Rs. 40,17,18,961

AUTHORISED BUSINESS

- Granting of medium and long-term loans in Rupees as well as, by arrangement with the Development Loan Fund of the U.S.A. Govt., in foreign currency, to existing public limited companies or registered cooperative societies engaged in, or new ones proposing to engage in, the manufacture preservation or processing of goods, or the generation or distribution of electricity or any other form of power, or mining, or shipping or hotel industry; also subscribing to debentures of such companies and cooperative societies; the Corporation has the option to convert at its discretion the loans granted by it into share capital.
- Guaranteeing of loans raised by aforesaid industrial concerns (i) which are floated in the public market and are repayable within a period not exceeding twenty five years and (ii) from scheduled banks or state cooperative banks.
- Guaranteeing loans raised from or credit arrangements made with any bank or financial institution in any country outside India by aforesaid industrial concerns in foreign currency.
- Underwriting the issue of stock, shares, bonds or debentures by aforesaid industrial concerns;
- Subscribing to the stock or shares of aforesaid industrial concerns;
- Guaranteeing of deferred payments in respect of import of capital goods from abroad or their purchase in India by aforesaid industrial concerns;

PURPOSES FOR WHICH LOANS ARE SANCTIONED:

Purchase of new or second hand machinery, renovation or modernization or replacement of worn-out or obsolete machinery, purchase of land for factory site, and construction of factory buildings.

IMPORTANT TERMS AND CONDITIONS OF LOANS

- SECURITY:** First charge of all the fixed assets such as land, buildings, plant and machinery & fixtures. Raw materials, stock-in-process and finished goods will not be mortgaged and will, therefore, be available for raising working capital from elsewhere.
- MARGIN:** Generally 50% of the value of total assets including those to be acquired with the loan. This margin may be reduced to 40% in case of industrial concerns importing plant & machinery under the U.S. Export-Import Bank Loans or other foreign currency loans (tied credits) taken by Government from foreign governments or financial institutions abroad where the cost of imported plant and machinery is 60% or above of the total capital cost of the project. The margin may be further reduced to 35% in special cases.
- INTEREST:** The current rate for rupee loans is 7% per annum and for foreign currency loans 8½% per annum with a rebate of ½% in each case for punctual payments of principal and interest on the due dates. Defaulted instalments will carry compound interest.
- REPAYMENT:** Will be spread over upto 25 years to suit borrower's convenience.

H. V. VENKATASUBBIAH
GENERAL MANAGER.

K. R. K. MENON
CHAIRMAN.

Company Meeting

THE DECCAN SUGAR AND ABKHARI COMPANY LTD.

SIXTY-FOURTH ANNUAL GENERAL MEETING

Extracts from Mr. C. R. Srinivasan's Review

Presiding over the Sixty-fourth Annual General Meeting of the Deccan Sugar and Abkhari Company Limited, Mr. C. R. Srinivasan, Chairman said that although the net profit after taxation for the financial year ended 31st May, 1960 was about Rs. 3 lakhs more than that of the previous year the Directors had decided to maintain the dividend on the Ordinary Share Capital at the same level as last year.

Extracts from Mr. C. R. Srinivasan's Review are quoted below:

"The net profit after taxation was about Rs. 3 lakhs more but the Board considered it expedient to take further sums to General Reserve and to place a sizeable sum to Dividend Equalisation Reserve. In this connection I would draw your attention to Note 12 of the Notes on the Accounts headed "Contingent Liability". Unless and until we see the final shape in which the Price Linking Formula emerges from the Tariff Commission's enquiry, the sugar industry cannot tell with exactitude what price it will have to pay for cane delivered from the 1958-59 season onwards. As we have stated in this note, a reasonable provision for this factor has been made in the Accounts, but the possibility of a further Contingent Liability exists and in all prudence we must maintain a margin out of which, if it arises, it can be met. Another major factor which must be borne in mind is that during the current year owing to the All-India increase in production, sugar stocks at our Factories are likely to build up, and we must husband our cash resources to help carry this additional load.

PREFERENCE DIVIDEND

The enactment of the Preference Shares (Regulation of Dividends) Act, 1960 behoves us to declare Dividends totalling 9.1 per cent on the Preference Share Capital of the Company. Unfortunately this was enacted too late to enable us to pay the Final Dividend of 2.1 per cent subject to deduction of Tax for the year ended 31st May, 1960 together with the Interim Dividend for the current year. We have now made arrangements to pay it tomorrow.

PUGALUR FACTORY EXPANSION

In my speech at the last Annual General Meeting I told you that we had applied to the Government of India for permission to expand the capacity of Pugalur factory from 1,000 tons to 1,250 tons cane per day. I am glad to say that permission has been received and orders placed for almost all the necessary equipment. The scheme is expected to cost between Rs. 25 and Rs. 30 lakhs and if the required plant and machinery is delivered in time the new capacity will be effective from the 1962-63 season. Against the background of rising sugar stocks, a doubt may be raised in the minds of some of our shareholders as to the wisdom of going ahead with this expansion. I believe that the law of supply and demand must operate, and the fact that we have more sugar than this country requires will mean that prices will come down, and it is only those factories who can manufacture cheaply who will be able to continue to make a profit.

It is estimated that the expanded factory will produce sugar at approximately Rs. 17 per ton more cheaply than is currently possible. On a production of some 28,000 tons per annum, this Rs. 17 assumes considerable significance. Incidentally, in the last two years we have been able to link the Special and Main Seasons, thus eliminating the idle period between the two. In the current combined season it is hoped to produce 22,400 tons of sugar against 18,429 tons in the previous combined season.

TARIFF COMMISSION'S REPORT

I will now deal with the general problems of the sugar industry as they present themselves to us in the South. The most important events in the interval of time since I addressed you last were, first, the publication in April 1960 of the Tariff Commission's Report on the Cost Structure of Sugar and, second, the reference in October 1960 by the Government of India to the Tariff Commission of the egregious Price Linking Formula for sharing with the cane grower the price realised for sugar.

The outcome of the report on the cost structure of sugar is that the country has been divided into four sugar regions, the Southern region comprising the States of Andhra Pradesh, Madras, Mysore and Kerala, with recommendations as to the basis on which fair ex-factory prices are to be fixed for each region. While we have no serious quarrel with the structure of the ex-factory price suggested for the Southern region, subject to certain obvious lacunae being redressed, the main draw-backs of the recommendations are that (a) the Commission considers that a fair return to the industry is 12 per cent on employed capital within which to meet commitments under bonus and gratuity, interest on borrowed capital, dividend on preference shares, managing agents commission and income-tax and "finally leave a residue to a large majority of the units in all the regions to declare reasonable dividends" and (b) no rehabilitation allowance has been granted in the cost structure, in spite of the fact that the Supreme Court has freely conceded the necessity for it in industry when machinery prices have increased 5 to 6 times in the short space of a decade.

The recommendations of the Commission have been accepted by Government, but I can only hope that before fixing any ex-factory price in the South, where as yet there is only self-imposed control to sell at the same price as the average landed cost of North Indian sugar, Government will give due consideration to the representations made on the utter inadequacy of the "fair" return and the need for a rehabilitation allowance.

PRICE LINKING FORMULA

This brings me to the question of the freight advantage accruing to the Southern factories by reason of the Southern region being still on the whole somewhat deficit in sugar. It is obvious that this advantage can last only so long as the need for importing North Indian sugar continues and our selling price is influenced

ed by the landed cost of North Indian sugar. We in the South have for long voluntarily parted with the lion's share of the freight advantage to the growers in the shape of the SISMA formula or a negotiated settlement, keeping for ourselves only a little over one third of the net ex-factory price realised for sugar. The Price Linking Formula in the form in which it was placed on the Statute Book would upset this fine balance and reduce the factory's share to the point where profits would dwindle and the sugar industry would cease to attract the middle class investor who is still the backbone of the private sector. Perhaps a timely realisation of the ill-effects of the formula prompted the Government to refer it to the Tariff Commission. It is to be hoped that a solution will emerge from the findings of the Commission that will do justice to the industry, the cane grower and the worker in the factory. Proper representations have been made on behalf of the industry.

SUGAR PRODUCTION

The overall sugar situation in the country is that there is a large surplus, part of which must be exported albeit at a huge loss, if internal prices are to be maintained at economic levels. All-India production in the current season is likely to reach an all time record of 27 lakh tons, the South contributing as a whole thirty per cent more than the production in the last season. We in the South are fast attaining not only self-sufficiency but, owing to the unrestricted expansion that seems to be on the anvil, reaching a

state of affairs in which disposal of the substantial surplus after making due allowance for increased per capita consumption will present a problem that cannot be solved by exports which involve heavy loss all round, namely to the industry, the Exchequer and the grower. It behoves Government not to lose sight of the implications of over-expansion and its attendant evils, despite the exhortations of our planners and the pressure of the new vested interests.

Planners should realise that the bulk of next year's sugar crop is already in the ground. This sugarcane must be milled and any intention Government may have of curbing the expansion of sugarcane production can only show any effect on the production of the 1962-63 season.

Our relations with labour during the year under review have been satisfactory and I wish to record my appreciation and that of my fellow-Directors of the loyal work put in by them and the staff."

The Report and Accounts for the year ended 31st May, 1960 were adopted, the retiring Directors, Mr. M. J. Edwards, Mr. G. N. Noel-Tod and Mr. P. Hadfield were re-elected and the retiring Auditors, Messrs. Lovelock and Lewes were re-appointed on the same remuneration as for the previous year.

N.B.: This does not purport to be a report of the Proceedings of the Annual General Meeting.

- * to raise national income
- * to achieve self-sufficiency in food
- * to expand small-scale, village and large-scale industries.

The Third Plan provides for tackling the special problems of the State :—

- high density of population (— acute unemployment)
- growing food deficit (— the agrarian nature of States's economy.

Kerala with her unlimited natural and non-power resources offers wide scope for establishment of industries in all sectors.

Government assure peaceful industrial climate and assistance by provision of land, supply of cheap power and financial participation in appropriate cases.

HELP THE PLAN AND HELP YOURSELF

DOING INDIA THE RIGHT STYLE

Tourists from every continent of the world today, 'do India' in the right style—do it on the swift wings of IAC. Today they may be buying brocades in Banaras while tomorrow, the ivories of Mysore may be their choice. Much of this increase in the internal tourist traffic together with the attendant benefits

to Indian handicraft and small scale industries have been made possible through the air-services offered by IAC. By helping the tourist to visit every part of the country IAC is bringing new trade to the doorsteps of our craftsmen. All this is part of the job of IAC—for IAC is not only an Airline—IT IS A PUBLIC SERVICE.

Only in "MICHIGANS" do you get
Power trains—designed, built and
matched by one manufacturer—Clark

Michigan Tractor Shovels, Dozers, Scrapers, and Logging equipment—18 models and sizes—all use the efficient all-Clark power train.

Of all earthmoving machines now on the market, only Michigan gives you unquestioned efficiencies of a power train engineered and built by one manufacturer.

Designed specifically for earthmoving, Michigan power trains are produced entirely by Clark Equipment Company. This firm needs no introduction in the highly-technical business of designing and manufacturing heavy-duty power-transmissions and axles for heavy "working" vehicles...this has been Clark's specialty for over 50 years. Every Michigan power train represents this half-century of accumulated design and manufacturing experience. **You can't buy better experience anywhere.**

You can't buy a better testimonial of efficiency and durability than the one Michigan gives you. Since the introduction of the Michigan Tractor Shovel, over 12,000 units have been built and sold. Each has the same basic power train. Not a single major design change has been needed...dramatic proof that the power train was *right* from the start...
 ...and that it is *right* today.

MARCH 10, 1961

Govind Ballabh Pant

FOR fourteen days and nights since he was stricken by cerebral thrombosis, Pandit Govind Ballabh Pant lay wavering between life and death while all India held its breath in prayerful suspense. On Tuesday morning, the small flicker of life, which had stubbornly refused to be subdued, quietly ebbed away. And thus there has left the Indian scene a great national figure, a hero of India's Revolution, a tower of strength in almost every recent national crisis. In a sense, his death was like his life, a struggle with invisible enemies, a battle fought with great physical handicaps. Death must always be the ultimate victor, but even in his last struggle Govind Ballabh Pant displayed again all his vigorous qualities. His end came earlier through some of these qualities — an indomitable devotion to duty, and a capacity to wrestle with almost every overwhelming blow until life was forced to an end. And thus, even in dying he struck wonder in those who waited breathlessly in suspense.

Half a million people in Delhi bore witness to the sorrow of the nation at the passing of one of the great giants of India's political life. Perhaps it was also the passing of an age; for those that are alive are less attuned to the demands of this kind of determined devotion to duty in ill-health and adversity. Many of those who have left are also more doctrinaire and committed than was Govind Ballabh Pant. Flexible and pragmatic, profoundly effective as a builder, but nevertheless without single-mindedness, he was a power in the nation while seemingly unconscious of his capacity to command and to compel. During the all-India strike of Government em-

ployees in July last the tremendous stature of the Home Minister shone through the tragedy, as though it were almost created as an ordeal for his proof. It is doubtful if India will find again a man so capable of the highest leadership, but so ready to accept second place in the affairs of this nation.

There is no better way in which we, who have seen this display of courage unto death, can record our admiration of so heroic a figure than by an attempt of imitation. Imitation can be the sincerest form of upliftment, as it is the sincerest form of flattery. India's generation in middle age today does not seem to have that capacity to endure, which made the great heroes of the Revolution. It is time we recognized that this is largely due to a weakness of will, which we are continuing to impart, even in a greater degree, to the generation which is to follow. We now recognize what a deep debt we owe to the Gandhian age, not so much for its capacity to achieve independence, as to build the highest calibre of individual dedication and physical courage. Now, as one by one the great figures of that age depart, we are left poorer not merely in the great talents of administration, in which it was not always superior to any other, but in the great elements of individual character in which it was supreme. This renewed their strength not from their environment but from deep wells built into unconquerable hearts and dedicated minds. If this nation could recognise that in building again these qualities we could relive the best of the Gandhian Age, it need not fear the tremendous ordeals which await it while it builds economic independence for the many out of the courage of the few.

Framework for Import and Export Policy

THE meetings of the Import and Export Advisory Councils on the 6th and 8th March were held under the shadow of, firstly, an impending tragedy and then the tragedy itself. This was particularly apparent in the meeting of Export Advisory Council which, on this occasion, did not appear to make much headway except that it drew from Mr. Lal Bahadur Shastri, Minister for Commerce and Industry, a statement of policy on the demand for new incentives for exports. It is now increasingly clear that the Government means business on exports and proposes, in some manner, to dovetail imports with exports, talking far less of concessions and doing more by pressures. The Minister, in fact, gave no support to the Federation's memorandum on the subject and even indicated to the Associated Chambers that there would be no reduction in the operations of the State Trading Corporation unless the private sector showed quick results in its development of India's export trade. The crisis in India's balance of payments is severe enough for stern action. One would only ask that these measures should be designed

to secure the purpose in view which is to increase our exports. It is not entirely clear that the State Trading Corporation is as successful in increasing exports as diverting to itself exports which would have taken place perhaps on more favourable terms otherwise.

The emphasis, however, was largely on imports. The record of the Government in the year 1960 is one which can generate satisfaction all round. Industrial production in organized industry in 1960 was 12 per cent above 1959, but as the Minister pointed out, if newer industries had been weighted suitably in the index, the figure would have been nearer 14 per cent. Secondly, industrial goods on the basis of the first ten months of 1960 now comprise 65.62 per cent of India's imports or nearly the peak figure in 1957 of 66 per cent, though the absolute quantity is nearly Rs. 100 crores less. All in all, a fine balance has been struck between the need for industrial and capital and consumer goods. The figures for "Consumer goods" (foodgrains) are down from 17 per

cent in 1958 to below 12 per cent during January to October, 1960 and "other items" from 10.75 per cent in 1958 to 9 per cent during January to October, 1960. Capital goods are marginally down from 13.82 per cent in 1959 to 13.55 per cent during January to October, 1960. It is true these figures do not indicate the extent of current production which has been shut off by the absence of raw materials, and the argument was advanced that some substantial bias towards maintenance, as distinguished from development, would still bring benefits to the economy as a whole. While the speech of Mr. Lal Bahadur Shastri indicated that some developments in this direction might still be contemplated, the Minister for Industry, Mr. Manubhai Shah, who concluded the deliberations of the Import Advisory Council in a most able speech, seemed to suggest that in current policy a good balance had already been struck. For several reasons, partly because development imports were tied, partly because some of the new industries were "raw material" producers, partly because certain consumer goods production had been necessitated to be supplied for political reasons, it was impossible to follow a rule of thumb that maintenance needs should always take precedence. The Minister was convincing, but the fact that the Government of India has appointed a Committee with Sir Ramaswami Mudaliar as the Chairman, to advise them on this very point in addition to procedure indicates that there is a recognition that the pragmatic balance now reached is not necessarily one proved to be the best in the circumstances.

On the face of it, with capital goods being produced in the country in increasing quantities, there is room for a further reduction of capital goods, perhaps by Rs. 10 or 15 crores per year and it may be that, until the Ramaswami Mudaliar Committee reports, it would be wise for Government to restraint licences of capital goods for duplication wherever possible. The point was made that productivity in Indian industry was held back by the fact that, when greater utilisation is made of capital goods—and it was admitted that capital goods are not being fully, or even adequately utilised in most cases—the raw materials to go with high production are seldom available. There is obvious need for examining not merely whether raw materials can be substituted in cases of increasing productivity for expansion but also of seeing whether the existing distribution of spares and raw materials as between established importers and actual users is the best possible. Preliminary indications are to the effect that actual users are indenting far more heavily than before, and that there are various categories of stores which are not related to potential capacity so much as

to "notional" capacity set down in the Development Wing's records. One of the proposals made at the Council was to the effect that a new set of norms needed to be introduced by which productivity could be accelerated by bonuses of raw materials or existing machinery rather than by an addition of capital goods. This is no more than the principle that existing capital goods should be fully worked, if necessary, through triple shifts before duplication of plants was sought.

It is sincerely to be hoped that a vigorous effort will be made to examine the whole problem of maintenance and development, not in the abstract on which many generalities have already been produced without assisting policy, but in detail so that the greatest economy can be exercised in the use of foreign exchange in serious shortage.

It is becoming increasingly clear that 1961 cannot be as favourable as 1960. It was stated at the meeting that in 1960 there had been net increase in imports of nearly Rs. 60 crores as against 1959. It is true much of this was raw cotton, but Rs. 26 crores were machinery and there were significant increases of iron and steel from Rs. 79 to Rs. 100 crores, raw jute from 1 to 7 crores, raw and synthetic rubber from Rs. 6 to Rs. 10 crores, copper from Rs. 15 to Rs. 21 crores and zinc from Rs. 5 to Rs. 8 crores. Whilst iron and steel, cotton and raw jute might be somewhat reduced, it is difficult to see where other cuts can be made. Almost the only refuge from the desperate situation which is now being reached with additional units coming into production must come from exports.

The Minister was perfectly justified in complaining that the general attitude towards exports, at the present time, was quite inadequate whether in the Government as a whole or in the business community. The suggestion that additional foreign exchange raw materials, for which no foreign exchange exists, can be provided in any significant quantities is clearly untenable. Consumer goods imports admit of no room to manoeuvre, and even if capital goods imports were reduced by Rs. 10 to Rs. 15 crores, this will not substantially change the raw materials position. In the year 1960, some windfalls in payments enabled the adverse balance of trade to rise from Rs. 319 crores in 1959 to Rs. 342 crores in 1960. There is no reason to suppose that India's current holding in the sterling balances admits of an equally adverse balance. Indeed, all indications point to the fact that the adverse balance on current account should be nearer Rs. 300 crores than the figure for 1959. This would suggest that unless exports rise by Rs. 40 to 50 crores further in 1961, a crisis in raw material imports will be inevitable.

TABLE

Imports of Capital Goods, Industrial Goods and Consumer Goods: 1957-60

Items	1957		1958		1959		Jan.-Oct. 1960.	
	Value	%	Value	%	Value	%	Value	%

Grand Total	1025.82		864.18		914.57		827.85	

(Value in Crores of Rs.)

The Indian business community needs to face squarely the challenges of this situation. Export promotion cannot always take place at a current profit and it is no argument to say that the private sector operates at a profit only. Investment in new markets is a legitimate charge on profits and the fact that the Government will pay by way of reduced taxation its contribution to such exports implies that the public sector is also a partner to

The German Mark and India

THE revaluation of the Deutsche Mark has been announced at long last; it was delayed so long that its coming was doubted. And it came as a welcome surprise. The phenomenal expansion of West Germany's currency reserves and the continued undervaluation of the DM for over two years now had become a source of great concern because of its sharp adverse consequences on world exchange rates. Its unrealistic par value in relation to the American dollar and the pound sterling—the two media for world trade exchange—had added to the strains. Realignment of its rate to a reasonable parity was inescapable and the determination of the US Administration not to devalue the dollar, firmly reiterated by President Kennedy, gave a new sense of urgency to the question of the revaluation of the DM.

Speculation how far the German Government's decision could be related to pressure from America will remain unresolved. But Dr. Erhard has vehemently denied the fact of such pressure and his denial need not be regarded as altogether lacking in substance. It would be wrong to overlook the internal pressures operating within the German economy which certainly had a decisive influence on the decision to revalue. Prolonged undervaluation had served to give an unprecedented boost to Germany's exports, but rising costs were also one of its consequences which fractionally offset its benefit. The artificial parity, however, could not stem inflationary forces in the domestic economy. Wages rose in Germany by something like 20 per cent in 1960 and of course prices also moved up fast. Conservative forecasts for 1961 placed the likely rise in the domestic price level at upwards of 3.5 per cent. With general elections due in September this year, effective action was necessary to reduce the impact of inflation on the standard of living. It may be that revaluation with other related action may hold the price line.

Upvaluation of the DM by 4.75 per cent has been regarded as very moderate and critics have not been slow to emphasise that revision upto 10 per cent could have been made with the IMF's consent. From the German angle, a higher rate of revaluation would have exposed the industry in the Common Market itself to acute competition from France and Italy. In the external context, the objective of revaluation was to assist rectification of the imbalance in world payments and in fairness to Germany it ought to be conceded that she has now made an appreciable contribution to the process of redressal, first, by bringing down her Bank Rate from 5 per cent, to which it was raised a year and a half ago, to 3.5 per cent and, secondly, by revaluation.

America, caught up for a long time in the throes of the worst post-war payments deficit, expects greater cooperation from Germany and the official statement on the German decision says that revaluation has been "useful but a modest step towards redressing the basic imbalance." This divergence of views notwithstanding, no doubts need be entertained that there will be no further action on changing the par value of the

the private sector's loss. There must be organized a far greater drive in the Export Promotion Councils for the earning of the foreign exchange as a sheet-anchor of a policy to keeping India's industry running at high capacity. It is sincerely to be hoped that the Ramaswami Mudaliar Committee will find means for dovetailing imports with exports so that compulsion is, so to speak, exercised from within.

DM. Any speculation on this score seems altogether unwarranted.

Revaluation of the DM will remove some of the current strains on the US dollar (as well as the pound sterling), but its effects will be seen immediately in repatriation of short-term funds and in this process America stands to derive a good share of benefit and relief. But the Kennedy Administration will have no reason to relax its efforts to seek long-term relief to America's serious problem of external deficit. In concrete terms it means that the Administration will need to pursue its negotiations to bring Germany round to the advisability of accepting a greater share of defence contribution and aid to developing countries. External defence expenditure and economic aid abroad undoubtedly constitute the two major causes of America's problem of deficit.

The impact of the revaluation of the DM on India is to be considered first in relation to the credits she has obtained from Germany and on similar aid she expects to receive in the near future on a larger scale. The immediate effect of revaluation would be to raise India's burden, in terms of rupees, of repayment of her outstanding German loans. The German Government's decision to provide a large allocation of \$1,000 million in 1961 by way of economic aid to underdeveloped countries has raised legitimate hope in this country that it will receive a fair share in it. But revaluation would appear to have introduced an element of uncertainty in the quantum of aid for the current year provisionally fixed at \$1,000 million.

This uncertainty arises from the stiff opposition offered by the German Federation of Industries to revaluation. As much as 50 per cent is presumed to be the contribution to these credits for 1961 from private subscription—presumably from industry. So far, firm commitment has not been made by German industry in respect of one-fifth of its assumed share and if the strong views expressed by Herr Fritz Berg, Chairman of the Federation, are a correct indicator, the uncommitted part may not come forth in view of the repercussion of revaluation on Germany's export industries.

The credits provided by Germany for 1961 will be the composite contribution of the Federal Government, the ten State Governments and private sources. America is using her persuasive influence on the German Government to place them on a budgetary and long-term footing as a principle of policy. How far this suggestion will be accepted is difficult to say. Earlier reports in this country that Germany will announce her readiness at next month's Washington meeting of the Aid-India Club to extend additional credits of over Rs. 250 crores for the Third Plan may have to be taken with subdued optimism.

In view of India's substantial dependence on Germany for supply of capital goods and industrial materials, the most immediate adverse effect of revaluation will be to push up the prices of our imports from Germany in terms of our currency.

A DELHI DIARY

GOVIND BALLABH PANT

MY last Diary a fortnight ago was given over to Govind Ballabh Pant. Friends of mine rightly took that as a farewell; in any case there is little more one can say to-day. The great crowds that lined the roads on the evening of the funeral procession showed that Pandit Pant, recluse as he was supposed to be, seemed to have struck deep roots into the popular mind. Tears were freely shed, and I felt amongst people, who had never seen and heard him, a sense of great loss. Almost everyone who is old enough to have a memory of the days of struggle feel that some roots have been torn away. I expect it is largely because these roots were so deep in the nationalist struggle that the passing of the heroes of the revolution moves us greatly. Today we are supposed to know where we are going with socialist pattern of society and plans every five years and exhortations from Ministers every week! Hardly anyone of those in the front ranks of the nationalist struggle had a sense of early arrival; each day brought its own difficulties without hope of ultimate fulfilment in any particular person's life-time. And yet, those were glorious days. In that sense was it better, after all, to have travelled hopefully than to have arrived?

THE COMMON MAN: BABUJI?

During Budget week and for a short while after, we hear a great deal about the common man. This week (before the Budget debate in the Lok Sabha opens) I have been repeatedly asked: What does the common man get out of the Budget? Greatly daring, I evade the answer by asking who is the common man. At this point there is general laughter and no one has yet given me a definition of what the object of their affections really is. Some picture the common man as the kisan, badly clothed and fed, and presumably exploited by the village money-lender, but the picture is wearing thinner and thinner as the volume of agricultural production grows and as there are clear marks of improvement in the rural standard of living. There are others to whom the common man is the notable Babuji, whom I see every day in "The Indian Express". I see Babuji has stopped giving pocket money to his children because of inroads into his cost of living. I am Babuji because I have made a similar decision in respect of mine!

I am trying my hardest to forget about the various impositions which now belong to Mr. Morarji Desai's multisided armoury. I have managed to find escape in two occasions this week which deserve to be inscribed in this Diary as do all occasions which—in spite of the socialist pattern of society and its expression in the Budget—can still raise us from every day worries into a different world. The first of these occasions was the recital at Sapru House last Saturday of the famous German cellist, Ludwig Hoelscher, accompanied on the piano by Otto Soellner. The cello is an amazing instrument; it speaks from the wells of its own space, like an echo coming off a rounded wall and reverberating within. But I had never realized that it could be made to play as though it were a violin on the one hand and a great hollow on the other. Ludwig Hoelscher could

play at both ends of the cello's range with magnificent skill, clearly making himself the foremost cello soloist we have ever had in Delhi. According to tradition in the Delhi Music Society the great classical pieces come at the beginning in a section called Part I. It was right that Beethoven should have received pride of place with the famous Sonata in A Major, the better because so many of us were familiar with its music. Schubert followed with another Sonata in A Minor, but dare I say, in the presence of real connoisseurs, I liked the lively touch of the second part and some relatively unknown composers more than I liked that two great pieces. Perhaps it is nice to be diverted with light and lively things like Frescobaldi's Toccata in D Major, and Dvorak's Rondo with encore after encore till Hoelscher had to give us extra pieces; one an unforgettable piece from Bach without an accompaniment. I still think the piano assists the cello but I was voted by a majority in a quick poll who thought his cello was best by itself!

Another interesting evening followed quickly with the Hungarian Film Festival which was opened by the Defence Minister and ran through three days of full houses. I think most of us have been much impressed by the standard of Hungarian pictures and are happy to find that the Iron Curtain does not, in any way, dominate the scene.

THE DEUTSCHE MARK

On Holi, which was last Friday, there was a great departure from tradition with the Prime Minister making it clear that he was not celebrating Holi and with a very large number of people in the Capital subdued in view of the fact that Pandit Pant was critically ill. I can say proudly that I displayed unusual bravery and drew no fire in some of the main roads of Delhi. But the occasion to remember was not Holi, but the Press Conference of Dr. Wilhelmi at the Ashoka Hotel that evening. The German Minister for Federal Property was in good form describing the plans on German assistance which had already been agreed; he gave a cheerful picture of likely favours to come. But the point that stays in my memory was the answer to a bold pressman who asked him if he could throw any light on the proposals to revalue the Mark. I thought I caught a moment's hesitation, but Dr. Wilhelmi was quick to recover. He said he thought it was very improbable! The Deutsche Mark was revalued at midnight that day. Thus, true to tradition, one goes on denying the course of financial history until it bursts on an astonished world. I see Mr. Selwyn Lloyd has just said that there is no intention of devaluing sterling. I suppose this can be literally true, and yet there might be a devaluation all the same. Only this time, speaking, from deep knowledge of astrology, and the abstruse sciences of economic prediction which abound around me, I say the rupee is staying put. The Finance Minister seemed very anxious to have all the rupees that we have. Let us not buy even an appreciating currency so long as rupees are in such short supply!

—ARGUS

THE GERMAN MARK AND INDIA

(Continued from page 721)

This demand for German imports has gained considerable inelasticity by reason of our tight foreign exchange outlook. Taken along with the increase in the cost of German debt service, this will be an additional strain on India's payments deficit with Germany which has defied, so far, all attempts at its mitigation. Theoretically, it is possible to argue that our exports to Germany will be stimulated by revaluation. But the reality of the prospect is different. Our exports are handicapped by restrictive quotas, as in the case of textiles, or by the purchase tax, as in the case of tea and coffee, which are unlikely to be removed for fiscal

reasons. These handicaps apart, the most noteworthy fact is that revaluation will extend the benefit of stimulation to all the exporting countries. There will be no change, on the score of revaluation, in the relative position of India as an exporter to Germany vis-a-vis her competitors. Now that Germany has launched a disinflationary policy in which import liberalisation will be an ingredient, India's efforts to reduce her baffling deficit must be pursued in the direction of removal of the barriers and a greater intake of her exports by Germany to give content to the enlightened policy of aid with trade.

prestressed concrete for clear space construction

Economy and Speed of Construction at a New Township

At the New Township at Nahorkatiya being built by Oil India Private Limited, the flat roofs of the buildings consist of 2" to 2½" thick x 14" wide precast prestressed concrete planks of span 12 to 20 ft. placed butting against each other. In-situ concrete 1" to 2" thick was laid over the planks to form a composite roof slab

of 3" to 4½" thick. Foam concrete 2" to 4" thick was laid over the roof for additional heat insulation. The roof was finally waterproofed with Stp "Tarfelt". Precasting and absence of shuttering have enabled each bungalow to be completed in all respects within a month.

THE WEEK'S NOTES

Tea Industry

FALLING EXPORTS

THE STATEMENT of Mr. Satish Chandra, Deputy Minister of Commerce and Industry, in the Lok Sabha on March 3 in reply to a question on tea exports in 1960 should suggest that there prevails some confusion in the counsels of the Government as to the real cause of fall in tea exports from this country. Only three days earlier the Union Finance Minister in his taxation proposals had announced a reduction on export duty on tea. This was presumably done to make Indian tea more competitive on the world market. It is indeed intriguing that Mr. Satish Chandra should have attributed the fall in tea exports last year to primarily shortfall in production.

India's tea exports have been going down since 1958. In 1959 India exported only 472.5 million lbs. of tea as against 505.9 million lbs. in 1958. Last year exports fell to about 421.6 million lbs. The fall of nearly 49 million lbs. in tea exports in 1960 cannot surely be attributed only to decline in output which has been of the order of about 20 million lbs. India's tea exports to the United Kingdom, which accounted for nearly 65 per cent of the off-take of her exportable surplus in 1958, fell to 282.2 million lbs. in 1959 and 259.85 million lbs. in 1960. In the meantime, exports by her competitors, especially Ceylon and East African countries, have been going up.

The reduction of 9 nP. per kgm. in export duty on tea is thus welcome. But it is very unlikely that it will help in stepping up exports of the commodity to any large extent. This is because of the fact that simultaneously with the reduction in export duty, excise duty on loose tea has been increased by 7 nP. to 8 nP. per kgm. As pointed out by the Committee of the Tea Association of India, the excise duty on loose tea being non-refundable, the tea industry can derive little comfort from the gesture of the Union Finance Minister. Is it not possible to grant some rebate in excise duty on loose tea exported from the country? That would help substantially in stepping up both production and exports of tea.

The Government of India will also do well to make available to the industry adequate quantities of fertilizers and loans for replanting purposes. This should help in bringing down the cost of production to some extent. The industry on its part should devote greater attention to production of quality teas in order to meet the growing competition from East Africa and some of the South-East Asian countries which export mainly common teas.

Congo

DISPATCH OF INDIAN TROOPS

THE DECISION of the Government of India to send an entire brigade of 3,000 men to the Congo in response to the request of the U.N. Secretary-General, to fight, if need be, the Congolese armed units, Belgian military and para-military personnel, and all foreign mercenaries will be viewed with concern both at home and abroad. The purpose of this dispatch of troops, as clarified by Mr. Nehru, is to expedite the withdrawal of Belgians and other foreign auxiliaries who are in the Congo without the U.N. nomination. While no one disputes the complications that have arisen due to the interference of foreign elements in the Congolese situation, the mere withdrawal of foreign influence would not solve the many deep-rooted and tangled problems that have been created during the past few months. The genesis of the internal strife has gone too deep into the national fibre for outside force, however neutral and well-intentioned, to be effective in bringing about sanity in an explosive situation. The use of force may aggravate the disease rather

than cure it. Moreover, it will create a dangerous precedent of using United Nations' force to disarm the Government of a member nation.

Even those who disagree with India's policy on the Congo will not doubt the sincerity and purpose of Mr. Nehru in sending troops in aid of U.N. operation there. But the question is: Will not this weapon of sending troops to remedy an explosive situation act as a boomerang on India herself, particularly when Kashmir is on the Security Council's agenda? It is not inconceivable that violence and armed conflict may be manoeuvred to give the semblance of pretext for the U.N.'s armed intervention once India has endorsed the policy of such intervention.

It would have been the better part of discretion for India not to have got involved in a dubious course of action and thereby given room for misunderstanding, culminating in hostile attitudes in a highly sensitive area. It is a noble thing to help someone in distress; but if the help that is meant for its good is organised by the third party on its own, it is fraught with embarrassing consequences. The wisdom of rushing to participate in such a scheme of help is open to serious question.

Commonwealth Conference

SOUTH AFRICA'S MEMBERSHIP

A wide range of important topics will be discussed at the Commonwealth Prime Ministers' Conference in London which started on last Wednesday; but the continuance of the membership of South Africa in the "Commonwealth Club" will indirectly overshadow all other discussions. Dr. H. F. Verwoerd, the Prime Minister of South Africa, made it clear that he was not ready to barter away his policy of apartheid with membership of the Commonwealth. He, however, expressed the feeling that he would not walk out of the meeting if South Africa's policy of racial discrimination was discussed. This is a significant departure from the earlier strategy of South Africa to abstain from any meeting which discussed her racial policy.

This change of attitude might have followed the sense of possible isolation that may ensue if South Africa is excluded from the Commonwealth and perhaps because of Britain's private persuasion of Dr. Verwoerd to agree to a discussion of the issue of apartheid and let a considerable part of the feeling steam off. It will be South Africa's political victory if she is allowed to retain her membership of the Commonwealth, as well as her policy of apartheid. And if the aim could not be achieved by threats of anger, the strategy has been changed to that of patience and wait-and-see.

Dr. Verwoerd has, of course, left little choice for the non-white members of the Commonwealth; for he demands a public acceptance of his Government's right to pursue its doctrine of apartheid while still enjoying the Commonwealth membership. And this is impossible for most non-white members of the Commonwealth to accede to. It is known that most of the Prime Ministers are forthright and unhesitant in condemning in public the racial discrimination practised in South Africa. But when it comes to the question of taking action on South Africa's membership of the Commonwealth, they are hesitant. There will be long discussions and private consultations between the Prime Ministers on ways of handling the issue. True to the typical Commonwealth spirit, the Conference would end without arriving at any decision on South Africa's expulsion from the Commonwealth. There will be a challenge to the statesmanship of the Premiers to find a compromise formula to confirm membership of South Africa to save both South Africa's face as well as that of the other members.

ANNOUNCEMENT

THE STATE BANK OF INDIA

have pleasure to announce that,

in pursuance of their objective to promote savings and encourage rural deposits through the large number of branches opened in fulfilment of their Statutory obligation for Branch Expansion,

THE INTEREST RATES

on Savings Bank Accounts and Savings Bank Deposits in all their offices

**HAS BEEN RAISED,
as from the 1st March 1961**

as under :-

Savings Bank Accounts from 1½% to 2½% p.a.

Savings Bank Deposits from 2½% to 2¾% p.a.

THE State Bank's 900 Offices in the Country are at the Nation's Service.

To INDIAN INDUSTRIALISTS

A London Merchant Company, wishing to expand and industrialise its Indian subsidiary established nearly a hundred years ago, invites propositions from Indian Industrialists who have licences or plans for new industrial projects. Assistance with finance, management, administrative services, selling organisation and land in South India could be made available to joint enterprise.

Post Box No. 34,
New Delhi.

UNION CARBIDE INDIA LIMITED

NOTICE

NOTICE is hereby given that the Board of Directors of Union Carbide India Limited, at their meeting held on Monday, the 27th February, 1961, recommended to the shareholders for their approval, at their 26th Annual General Meeting of the Company to be held on 15th May, 1961, the payment of a Final Dividend of Rs. 1.05 Naye Paise per share subject to the deduction of taxes in respect of the Company for the year ended 25th December, 1960.

By Order of the Board
G. BOWLAND,
Secretary.

Registered Office:
1 & 3, Brabourne Road,
Calcutta - 1.

27th February, 1961.

The World Abroad

BUST THAT TRUST!

By ODYSSEUS

AN INFLUENTIAL GROUP is, I understand, to introduce a private member's bill in the New Delhi legislature against monopolies.

This is a subject on which there has been more confusion to the square inch than any other. I propose, therefore, in the succeeding article to try to clear a small path through this jungle.

Most people are against monopolies, price fixing, mergers, and oligopolies, on the ground that they hold consumers up to ransom. So their initial reaction is to call for legislation making monopolies, oligopolies, and the whole gamut of restrictive practices illegal. It is, however, a fact that many monopolies arise not because one firm has used unfair trading practices to eliminate its competitors, but simply because (in the classic example) it makes better mouse traps than anyone else and its administration is better than its competitors. It may have bought out less efficient competitors over the years, and the final result may be that, owing to good management and economies of scale, the public gets better mouse traps, more cheaply, than if a score of smaller firms, with correspondingly bigger overheads, were all competing for a fairly stable demand for mouse traps.

In real life, absolute monopolies are virtually non-existent. The characteristic modern situation is one of oligopoly, in which a few firms compete in the manufacture of, say, motor cars, or a group of similar products, like chemicals. Here again, it is a fact that many oligopolies are the result of mergers, which bring economies of production and administration, and which create firms with sufficient resources to undertake extensive and costly research to develop new techniques and products. The prices of, for example, motor cars in the UK and in the USA would be substantially higher, if the three or four big manufacturers, like General Motors in the USA, or Rootes in the UK, were compelled to dissolve into the innumerable small companies which they amalgamate. Then, again, it seems but common sense to recognise that if a fixed selling price for, say, tooth brushes, is prohibited, the ensuing price war may simply lead to the elimination of weaker producers and end in the monopoly, or oligopoly, of the strong.

THREE KEY QUESTIONS

Faced with these facts, the anti-monopolist replies that it still remains true that an oligopoly can abuse its power, and can overcharge consumers, and that legislation is needed to control it. I concede this at once, but three questions need to be answered before you initiate legislation.

(1) Do you want to prevent excessive concentration of economic power in private hands, regardless of the economic advantages that may accrue from concentration?

(2) Do you want to ensure competition?

(3) Do you want to promote efficiency, rationalisation, and economic growth?

If you answer "Yes" to the first question, you are a democrat, and you believe in individual freedom and in private enterprise. You are not a Socialist, because his "solution" to the problem of excessive concentration of economic power in private hands is to transfer it to the state, i.e., to concentrate all power in the hands of a ruling party and/or civil servants. Whatever this achieves, it is the end of individual freedom and of private enterprise.

If you answer "Yes" to the second question, you again obviously believe in private enterprise, because the Socialist rejects "competition" as the "grab instinct," and wants it replaced by state monopolies. Nevertheless, the moment that you want anti-monopoly legislation to promote competition, you are faced with all the practical difficulties of whether better and cheaper motor cars, anti-biotic drugs, electrical appliances, or mouse traps, will be made by many firms, few firms, or by only one firm, or under what circumstances capital will be available for expensive research and development, and so on.

If you answer "Yes" to the third question, you are opening the door to ever increasing state control, which is likely to end either in a stagnant economy, or in Socialism, because any anti-monopoly legislation must be enforced by a court of judges or a commission of permanent officials of some kind. If it is a permissible defence to a prosecution to say "Yes, we have fixed prices with our competitors, but they are reasonable," or "Yes, we have an agreement with our competitors, but we can't be called a monopoly because we only control 33 (or any other) per cent of the market, or we must behave reasonably because we are always faced with the possibility of competition from substitutes, or we have combined against cut-throat competition, or look at our record, our productivity is outstanding, our wages are high, profits reasonable, so why should we not enforce price restrictions?" — if it is a permissible defence to say that, in the circumstances, your monopoly is doing no harm, and is indeed adding to the growth of the economy, the difficulty is that these are not matters of fact, which can be decided by a court in the light of a statutory definition.

WHAT IS "REASONABLE" PRICE?

They are all questions of economic performance, to which no indisputable economic tests can be applied. What is a "reasonable" return on capital? Consumers, business men, civil servants, and politicians, will reply differently according to personal interests at stake, experience of industry (if any), and their political faith. An arbitrary decision that, say, a 15 per cent return on capital is enough to meet all costs of production, to build up reserves, and to pay for research, is not a general principle. For one product, or industry, it may be ludicrously high; for another ludicrously low. Called upon to decide questions of economic performance, efficiency, and growth, a court can only express an opinion on the circumstances of each particular case. And since there are as many differing circumstances as there are firms, and industries, and national economies competing with other economies, it follows that no firm can know if it is evading the law

simply by examining the court's opinion. Its own circumstances might lead the court to a different judgement.

In other words, where the law requires a court to take into account whether a price, a percentage, or a performance is "reasonable," or good for economic growth, the state must create a Commission to enforce continuing control of prices and practices, with powers for periodical reviews of a firm's situation as new circumstances arise. If you believe in competition, individual enterprise, flexible, resourceful, business management, and in mobility of labour, you will have created a Frankenstein monster which will slowly devour all that you cherish.

There is no perfect solution to the control of monopoly and restrictive business practices, but out of a choice of difficulties, the least inimical to freedom and to economic growth is the US system, described in "The Anti-Trust Laws of the USA" (Cambridge University Press, London, 1960. Price 45 sh.), by Mr A. D. Neale. As the American, Mr Abe Fortas, says in a foreword, "I know of no other single volume which covers the entire field of anti-trust so comprehensively and so well. In about 500 pages, Mr Neale sharply analyses the case law and statutes in each area of anti-trust....."

What is illegal in the USA is to try positively to create a monopolistic or oligopolistic situation, to enter into agreements with others to limit competition, to keep out newcomers, to eliminate competitors by collective boycott, exclusive agreements discriminating against particular buyers or suppliers, dividing up markets etc. etc. Monopoly, oligopoly, mere large size, or price leadership in themselves are not illegal. You cannot be penalised because by making a better mouse trap you beat all competitors, or reduce them to a few large firms, by your competitive efficiency. The basic question before a US court is: "How did this firm attain its

TRUST BUSTING IN THE U. S. A.

THE USA has enforced antitrust laws since the Sherman Act of 1890—longer than any other country in the world. Since a private member's antitrust bill is likely to be introduced in the New Delhi legislature, it is worth asking how far US antitrust has been successful.

Mr. A. D. Neale, an Englishman, has just published "The Antitrust Laws of the USA" (Camb. Univ. Press, London, 1960. Price 45sh), which an American authority describes as the only single volume which covers the entire field, so comprehensively and so well. Mr. Neale points out that the basis of US antitrust (to use a convenient abbreviation) is, first, the conviction that any large concentration of power should be held in check. Antitrust is the projection of this US conviction into the economic sphere: an economy of independent, competing businesses disperses economic decision-making. Secondly, because Americans prefer that power should be controlled by men under the laws rather than by granting powers to administrators or officials, antitrust is carried out by statutes laying down general principles and not by administrative regulation. As all men are equal before the law, this has meant that antitrust is accepted as beyond partisan controversy, whereas it is likely that its administrative regulation by politicians or economic experts would have aroused a sense of bitterness and injustice which would have kept agitation against antitrust continuously alive.

US antitrust has been successful in ending a wide range of restrictive agreements between competitors.

present position?" This is not a question of opinion but of fact. If you attain supremacy by collusion, boycotts, or restrictive practices, prison and enormous fines await you. If you attained it by monopolistic practices, it is no defence to argue that your prices are, in fact, reasonable, that your mergers have led to greater efficiency, or that you are not abusing the position that you have created. These are matters of opinion with which the court is not concerned. The existence of a body of case law, interpreting the statutes, means that any lawyer can advise whether what you propose to do is legal or not.

If you are a Socialist, you should read "The Control of Monopoly in the UK" (Longmans, Green, London, 1960. 25 sh.) by P. H. Guenault and J. M. Jackson, who offer a first class analysis of the British Restrictive Trade Practices Act of 1956. This book, and Mr Neale's, bring out clearly the different American and British approaches. The American, distrusting concentrations of power, whether economic or political, sees the remedy in a general principle — a law. The Englishman has hitherto been less worried by the mere possession of power. To prevent its abuse, he has preferred to set up administrative controls, dealing with each case on its merits. Thus, although some practices are prohibited by law, the UK Restrictive Practices Court is also concerned with whether the way in which a monopoly is exercised is good or bad for the consumer, whether it would benefit the economy for an industry to be made more compact, or whether, having regard to the conditions "obtaining or reasonably foreseen" (sic) at the time of the application (sic), the removal of a restriction would be "likely to have a serious and persistently adverse effect on the general level of employment" (sic). These are all matters of opinion. If the UK court can recruit judges capable of making infallible business decisions and of accurately foreseeing economic trends, the UK can look forward to a prosperity with which no other country will be able to compete (unless, by higher pay, it attracts some of these economic wizards into its own service).

Detection and enforcement are reasonably effective. It must be stressed that whereas most of the cases expounding the law deal with difficult border line issues, these are far outnumbered by straightforward cases dealing with clear violations. The probability that offences will be prosecuted, with the full support of public opinion powerfully influences business conduct.

Agreements between independent firms to fix a common price or to divide the market, or to exclude new entrants in an industry, to grant special terms to a favoured group, or to enforce collective boycotts, are illegal and the courts have developed a keen nose to detect camouflaged agreements. Note that, in many cases, such agreements could be defended on economic grounds as promoting economies of scale or other industrial advantages, but the US courts will not admit such defences because they are questions of economic opinion or assessment, not matters of fact. From the first, the US courts themselves rejected the idea that they should try to assess the balance of economic advantage. They maintain that once an economic argument is admitted (for example, that an agreement is justified as a protection against "excessive" competition), the door is opened to more and more subtle economic arguments between "expert" witnesses. The court is concerned neither to decide between rival economic theories nor with the effect of an agreement, but solely with its restrictive intent.

IMPORTANCE OF "INTENT"

The vital importance of "intent" is that the mere fact that a single firm dominates one market is not

illegal, providing that it has achieved its position by fair competition. Some firms in the USA are giants because of the size of the market which they supply; but mere size is no offence; in many cases their size does not give them control of the market nor free them from competition. In most cases the power of large firms is shared in an oligopolistic market in which competition is by no means excluded. Monopolising is not simply dominating an industry but intending to dominate it. The courts' job in such cases is to find out what the firm was "really up to". Moreover, the bigger the firm, the more sensitive is it to the possibility of antitrust action. Far from crushing a new entrant or an inconvenient small rival, big firms tend to show unnatural solicitude for its survival. Their legal advisers will scrutinise, as potential evidence of intent to monopolise, any proposal to acquire another business (whether horizontally or vertically), to buy the patents of a rival process, to secure raw material supplies by long-term contracts, to undertake to supply, over a period, the full requirements of important customers, and so on.

Mergers, and take-overs, raise difficult problems for antitrust. Mergers go on all the time and many Americans think that they should be stopped. Here, again, the guiding principle is "intent"—what was in the minds of those merging? Mergers often occur simply because many businesses disappear by being sold rather than by being wound up. Some disappear because they are inefficient, some because of changes in demand, some because of the death or retirement of key men. Some mergers make for real economies of scale, e.g., where two firms are below the optimum size, or where it is essential for up-to-date production methods to combine different types of technical knowledge. Others secure tax advantages or spread, and so reduce, investment risks. Even large firms may combine in order to survive. All these are legitimate aims. The courts will only crack down on mergers if they smell out an intent to reduce competition or to monopolise.

Mr. Neale offers many concrete examples to illustrate the principle. Here is one. A large metal smelter may see advantages in branching out into fabrication. If he does this by expanding within the framework of the one company, he may well be able to amass a substantial share of the market in the new field without incurring a charge of monopolising. He must not, however, favour his new enterprise by denying supplies to an already existing regular customer.

If, on the other hand, our smelter were to seek to secure a like share of the market, with similar economic results, by buying up an existing fabricating company, his legal risk would be much greater. Nevertheless, a merger or acquisition is a voluntary action on the part of the company acquired, and the courts would not undo the merger without solid indications that it would significantly impair competition in the industry. But if our smelter seeks to tie up a share of the market by binding independent fabricators, or distributors, contractually, or by collusive agreement, to deal with no other supplier, or by insisting on supplying their full requirements over a substantial period, then antitrust action will follow—even though the share of the market secured is relatively small.

U.S. LAW IS NOT PERFECT

Nobody pretends that the enforcement of antitrust in the USA achieves perfection. This is an imperfect

world. It is only those who hold some vast, world-transforming faith, such as the final triumph of reason or of the proletariat, who believe that there exists a set of doctrines, which are absolutely correct, by means of which all political and economic problems can be solved, in the same way that the laws of engineering, properly applied, enable you to manufacture a motor-car.

Of course, some US industries succeed some of the time in avoiding price-competition. Of course, the degree of oligopoly in some industries is a barrier to new entrants, or at least reinforces the inevitable barrier created by the large minimum capital and technological requirements of so much industry. Of course, enforcement is not perfect: it is, for example, difficult to get clear evidence of collusion in close-knit industries. Moreover, in this type of law—that of "mala prohibita", an act which is illegal as opposed to "mala in se", an act evil by its own nature—in which no serious moral stigma attaches to offences, self-enforcement may be lax, and except where the case-law is very clear, business men are inclined to go ahead as they think best and argue about the law if, and when, the need arises.

Thus, in the borderland between, on the one side, overt agreements between competitors and outright monopolisation, with which the law can deal effectively, and, on the other side, a situation in which there is enough competition to prevent the excessive accumulation of private economic power—the borderland, in short, of oligopoly—US antitrust succeeds only in approximating to its aims.

US antitrust is, in other words, a workable compromise with the facts of real industrial life, acceptable to American public opinion. Americans believe in private enterprise; they believe that competition in industry is good; they want to make concentrations of private economic power difficult. All the evidence suggests that, as far as is humanly possible, they have succeeded.

Has American experience any lesson for India? I wonder. Antitrust works in the USA because all Americans agree on its aims, and its outstanding aim is not to destroy, but to uphold, private enterprise—not to allow it to enfeeble itself, but to make it alert and progressive by maintaining as vigorous competition as may be enforceable in practice.

The danger in India is that antitrust legislation might be used as an instrument to speed Socialism. The chances are that US legislative precedents would not be followed, and that the model of the British Restrictive Trade Practices Act, 1956 (admirably described in Guenault and Jackson's "Control of Monopoly in the UK", Longmans, Green, London, 1960. Price 25sh) would be adopted instead. As I elaborated in the preceding article, although the UK Act does not prohibit certain practices outright, it is also concerned with trying to decide whether, in any given case, the competitive situation is good or bad for the growth of the economy, whether having regard to the conditions "obtaining or reasonably foreseen", the removal of a restriction would be "likely to have a serious and persistently adverse effect on the general level of employment." Slightly amended by Socialists, the UK Act could bring, one after the other, every firm, and every industry, under the Board of Trade's administrative control.

MR. AL FOIL TALKS TO A "POWER PACKED" MAGNATE

*Don't be isolated
by your
insulation problem.
No foiling problem
is difficult enough
to foil Al Foil.*

'Profit', thundered the Magnate insulating himself against sales talk, "Profit's what I am interested in."
"And profit, sir", replied the unabashed Mr. Foil, "profit's what foil insulation ensures in the heavy electrical equipment industry. In transformers, cables or condensers, wherever you need effective insulation, and/or superior dielectric properties aluminium foil is the lightweight answer for a big job. We do a really first class job of 'wrapping up' electrical energy, allowing no leakage come rain or shine. Fact is, aluminium foil foils damp damage for long periods... and no helping hand required... and that's profit for you... low initial outlay, low maintenance and no leakage."

FOOD FROM WEST EUROPE

From Our Special West European Correspondent

PARIS, March 5.

THE large food surpluses that have accompanied North American prosperity since the war have begun to appear in West Europe too. This is no coincidence but is closely connected with the renovation of the West European economies and the vast expansion of European industry. In the 1930's and earlier, one thought of agricultural surpluses as a sign of depression (i.e. farmers' sales declined as industrial activity slowed down) or as the result of excessive protectionism. Thus an excess of food in an industrialised country was either an accident or an error; on either view, production of food could be cut back, either by deliberate policy or by market forces, without damaging industrial expansion. No one thinks that now, except, maybe, for one or two particular crops like sugar beet which are easy to grow and sometimes over-subsidised. In general an expansion of agricultural production (and most agriculture in temperate countries is the production of food) is now seen to be an inevitable accompaniment of industrial expansion, which is why it occurred in the USA and Canada, and then in all the prosperous north-west European countries whose industrial progress now matches North American. Since food consumption in all these countries was already well above the subsistence level, the appearance of surplus food is a consequence of industrial expansion.

This is only in part the outcome of policies that one might condemn as mistaken, e.g., the fixing of support prices that must necessarily encourage over-production because higher than what consumers offer. When one sees a noisy lobby securing such support prices one is inclined to regard the operation as banditry. And yet what else can governments do when urban industry is progressing rapidly? On social and political grounds they cannot allow urban revenues to run too far ahead of rural revenues and if they did, industrial progress would be slowed down: the rural dwellers, after all, constitute a large part of the market for the products of industry, and no one is more in favour of high farm incomes than the automobile manufacturers. More rapid economic expansion is possible if industrial gains are more equally spread, as by the method of financing farm subsidies with urban taxes; fast-growing industry can fairly easily bear the burden of higher food costs. The operation would nevertheless be shortsighted if farmers accepted their subsidies and did nothing about increasing productivity. In practice, they do not; they realise that the only permanent hope of equality with industrial workers is to increase farm productivity in pace with the rise in industrial productivity. And then they find that expanding industry gives them the means to do just that: it provides them (granted subsidies give farmers the means to buy on a scale large enough to permit mass production) with cheap implements, the wherewithal of mechanisation, chemicals for fertilisation, pest destruction, etc, low-cost transport and so on. The upshot is that all the countries that have practised price supports for food have been generously rewarded with astonishing increases in farm productivity—which would mean in many cases that the resultant food surplus would persist even if price supports were now moderated.

To those that have, shall more be given. For we arrive at the paradox that in a world where millions are starving and in rags, and where developing countries face the choice between hastening industrialisation and risking food shortages, the small group of advanced nations secure both industrial progress and a

food surplus. To seek to relieve this paradox by destroying surpluses, or by deliberately restricting food output, if necessary, by paying Western farmers not to produce (as in the USA where Mr. Eisenhower still gets his subsidy for NOT growing beetroot on his Gettysburg farm) will seem to most to be simply criminal. Thus the USA preferred to export its surpluses at immense losses or even to give them away, and we know how useful a contribution that has been to the Indian economy, among many others.

The new fact is that the same situation is now in view for West Europe and this will become more evident in the next four years. The thought of getting cheap food from West Europe is, at first sight, an improbable one but if India acts in time and persuades governments to choose the path of expansion and generosity rather than of restriction, very useful quantities of food could be made available on similar terms to the US wheat loans and grants. West Germany has just decided to increase farm subsidies to around 4,000 million DM this year (because it is election year) although the danger of surpluses is already clear. West German farmers have performed the feat of supplying 55 million compatriots with 80 per cent of their food, which seemed impossible ten years ago in a truncated republic that had lost its traditional farmland; and they have done so while reducing their numbers and reducing their acreages, giving men to industry and land to housebuilding. At the present rate of subsidisation, surpluses are inevitable in the near future. They have already appeared in France, where this year there is a 27 per cent excess of wheat, 35 per cent excess of barley, 50 per cent excess of corn, 14 per cent excess of sugar, 5 per cent of wine (leaving Algerian wine out of account), 10 per cent of milk, etc., etc.

Nor is this glut the accidental result of a good year; it was the 1959 drought that was exceptional, whereas food surplus will remain the normal. In a recent prophetic study called "European Agriculture in 1965", the Economic Commission for Europe says that a ceiling on productivity increases has not been reached yet, and European farms will continue to become more efficient despite the fall in prices that is inevitable in most products other than meat. This fall in prices will not stimulate local consumption proportionately: market research shows that a 10 per cent drop in farm prices causes only a 2 per cent rise in demand for agricultural produce as a whole. Between now and 1965 the ECE forecasts that European farm output will rise faster than internal consumption, and concludes, "By 1965 the problem of surpluses will arise in serious form in the cases of several products, especially in Continental north-west Europe." Specifically, it foresees absolute excesses in cereals, notably those used to make bread, in potatoes, sugar, milk, eggs, poultry and wine. The only products where there is no danger of surpluses are beef, veal and pork. Demand for them will encourage diversion of the surplus of cereals from human to animal consumption, but in the Mediterranean countries where the rise in living standards is not fast enough to create higher demand for meat, the surplus of corn will be considerable.

These calculations are confirmed in a study that relates only to France. Total agricultural output has been increasing at 4 per cent a year, and in the next few years it will do so at 4 to 6 per cent a year. A bigger population and higher living standards will absorb only 2 to 3 per cent a year extra, leaving the remainder—i.e., around 3 per cent of present total production—as an absolute surplus. In the case of

fruit, vegetables and wines, the problem will be dealt with by concentrating on quality; there is a surplus of cider apples but no sign of an excess of table apples, a surplus of cheap wine but no chance of an excess of fine wines. In other foodstuffs, however, absolute excesses are inevitable, and some of them are already with us. Only in one case, that of sugar beet, has the Government chosen the path of restriction, and even then it has been strongly criticized; everywhere else it is obliged to permit, if not to go on encouraging, the expansion of output. The West European economies are doomed, by the nature of their economic and political structure, to go on producing surpluses.

Naturally, these products are too expensive to be sold outside the circle of industrialised countries, except at heavy loss. But the mere fact of being priced at higher than the free international market price does not prove that a line of production is uneconomic, because free market prices are depressed by the large surpluses of North America, themselves produced in just the same way as the new European surpluses. For example, the internal price paid for European wheats (33.81 New Francs per quintal in France, 37.93 NF in the UK) seems high compared with the world price, but in fact is directly comparable with the real cost of growing wheat in North America 32 N.F. in Canada and 32.45 NF in the USA). Wheat prices are low because North America, which had a stock of 496 million quintals on August 1 last) sells at a loss or gives wheat away. The important thing is to persuade European Governments to do the same, as part of their aid pro-

grammes to developing countries, rather than cut back production in a world where so many are hungry.

In other words, they could combine their assistance to their own farmers with their assistance to developing nations. The appearance of surpluses in West Europe as well as in North America might facilitate this by making possible a sort of world bank for agricultural surpluses in which all the advanced nations would participate. It has been suggested that this bank could work in the following way. Each advanced country would set a target quota of food aid, depending on its abilities. To meet that quota it could buy up its own farmers' surpluses at cost price, and not an anna over cost price; what price it paid for the foodstuffs required for internal consumption would be its own affair, but where surpluses appeared it would buy them at cost price and give them to the food bank. If it had no surpluses, it could buy them, again at cost price, from neighbouring countries that did have a surplus, until it had met its quota. This food would be given or lent to developing nations by the bank, and not by one Western government. No Western farmers would be paid not to produce, and their Governments would not go through the present double-loss operation of paying farmers to grow the unsellable and then selling it at a loss while they also give separate grants to developing countries. European farmers are interested in this plan and if governments such as India's are too, they should take it up with European governments before these latter have decided to do with their ever-increasing surpluses.

A VERY PROFITABLE INVESTMENT

Small Monthly Deposits steadily growing into a substantial saving after 46 months.

- ★ SAVING BY MONTHLY INSTALMENTS—Minimum Rs. 10/- and Maximum Rs. 500/-.

historic voyage ended as the steamship "Enterprise" reached Calcutta on 9th December, 1825. The first steam-powered vessel to make the England-India run, the 500-ton "Enterprise" won a cash prize of Rs. 100,000 offered by Calcutta's trading community for this truly pioneering achievement. Her captain on the hazardous voyage round 'the Cape' was James Henry Johnson, Commander, Royal Navy, and a hero of Trafalgar.

Though the "Enterprise" was the first ocean-going, partly steam-propelled ship to arrive at any Indian port, small steam-powered craft were being built in Calcutta as early as 1823.

Among the oldest and best known marine and general engineering firms in the country, a privately-owned concern known as Reid & Company's Hooghly Dock (founded 1819), the forerunner of The Hooghly Docking & Engineering Company Limited, was already flourishing before the introduction of steam to India.

The 'Hooghly Docks' are a part of the vast industrial and engineering organisation of Martin Burn Ltd., an organisation which is playing an important role in India's industrial progress.

Economic Report from the U.S.

CONSTRUCTION INDUSTRY

By GUY SIMS FITCH

WASHINGTON, March 1.

ONE of the industries that normally is counted on to support an economic upturn is showing significant signs of strength. This would be the construction industry, including that highly important segment which is devoted to residential building. Contracts for future construction throughout the United States jumped 13 per cent in January to a new high for the month, according to the F. W. Dodge Corporation, leading private research organization in the industry. This represented the sixth consecutive month in which contracts showed an increase over the previous year. Significantly, all three major construction categories—residential, non-residential and heavy engineering—contributed to the January increase. Particularly heartening was the rise reported in residential building contracts, inasmuch as housing activity has been lagging for some time. From a high of 1.6 million in the spring of 1959, the seasonally adjusted annual rate of new housing started dropped to slightly below the million mark in December, 1960. Thus, any upturn in housing, an important business indicator which often precedes general economic movements, is cause for cheer.

At the moment, there is considerable hope that housing starts for 1961 as a whole can be raised to 1.3 million which would represent a gain of about 50,000 over the 1960 level. Achievement of the 1.3 million total would be no easy task, however, for it would mean a steady rise to an annual rate of 1.5 million by the end of the year. There are some experts who believe that the huge vacuum of housing that existed at the end of World War II has been filled—for the time being, at any rate. They cite as evidence the declining demand over the past year or so for single-family homes. This trend seems to have continued in January, according to the Dodge Corporation's figures, which show that most of the rise in residential construction contracts that month was accounted for by apartment buildings and hotels. All indications point to vigorous moves by the Kennedy Administration to confront these difficulties and stimulate a sound upsurge in home building. It is doing this largely by inducing reductions in interest rates on home mortgages, thereby making purchases of new homes more attractive to prospective buyers. Just this week, the Administration initiated a direct effort to bring down the costs of mortgage money. Secretary of the Treasury Douglas Dillon met with four prominent officials of savings and loan associations—financial institutions which are the source of some 40 per cent of all home-mortgage money. The talks have been described as "exploratory", and the Secretary's approach as one of "persuasion". But their objective is clearly revealed in a formal Treasury statement: "The Administration is desirous of seeing long-term interest rates, including mortgage interest rates, reduced at this time in order to help stimulate the economy." Savings and loan associations usually make "conventional" mortgage loans—that is, loans not backed by government insurance or guarantee. Rates on conventional loans have been easing somewhat, and in most parts of the country have declined from about 6 per cent to 5.75 per cent in recent months. However, the Administration evidently would like to see a further and more general dip. The belief is that if the savings and loan groups were to limit their dividend, or interest,

payments to shareholders (or depositors), they could safely charge less for the loans they make.

Both dividend and loan rates are somewhat higher on the West Coast, where capital is in relatively short supply. Hence, Mr. Dillon has held this first meeting with officials of California savings and loan associations. Indications are, however, that the Treasury also will be discussing the matter with savings and loan officials from other parts of the country as well. The Administration already has moved on other fronts to cut borrowing costs. A month ago, for instance, President Kennedy ordered a reduction to 5.5 per cent from 5.75 per cent in maximum interest rate permitted on mortgages insured by the U.S. Federal Housing Administration (F.H.A.). At that time, savings and loan industry leaders offered to co-operate in making home mortgage costs cheaper. Last week, the U.S. Federal Reserve Board (F.R.B.), the Government's principal monetary and credit manager, embarked on a new operating technique designed to drive down the cost of long-term money in general—a move that could affect interest rates on home mortgages also. Response to this operating shift has been prompt, featured so far by a desired and distinct easing of long-term rates. Meanwhile, by relaxing its stress on short-term bills only, the F.R.B. will help keep short-term interest rates up. And this, in turn, can help halt or reverse last year's flow of short-term funds out of U.S. and into foreign capital markets, and thus contribute to an improvement in the international balance of payments of the United States.

TRADE PROMOTION

... is our business

Australia, New Zealand, and Fiji offer opportunities to exporters and importers and the International Division of the Bank of New South Wales can help those interested.

The Bank's complete banking service includes such specialized facilities as trade and industrial enquiries, economic and trade information, and a complete travel service. The Bank, through more than 1,000 branches and agencies, is closely and constantly in touch with industry, business, and agriculture in the areas it serves.

Enquiries may be made through your own bankers or direct to

WORLDGRAM

India

India's Foreign Trade in Merchandise in January, 1961: The provisional figures of India's foreign trade in merchandise by all routes — sea, air and land — on private and Government accounts during January, 1961, according to information available in the Department of Commercial Intelligence and Statistics, Calcutta, are given below:

Exports	Rs. 53.84 lakhs
Re-exports	Rs. 70 lakhs
Imports	Rs. 83.42 lakhs
Balance of trade	Rs. —28.88 lakhs
The figures exclude trade with Tibet, Sikkim and Bhutan, and the trade arising in the Andaman and Nicobar Islands and the Laccadive, Minicoy and Amindivi Islands. In the case of Nepal, air borne trade alone is included. The figures are exclusive of the value of certain consignments of private merchandise under reference to the customs for verification and of Government stores awaiting adjustment.	

Table I below brings together the provisional figures for January, 1961, along with similar figures for December, 1960, January 1960 and the revised figures for January, 1960:

Foreign trade in merchandise	TABLE I			
	Jan. 1961	Dec. 1960	Jan. 1960	
			Provisional	Revised
		(in lakhs of rupees)		
Exports	53.84	69.21	51.51	50.82
Re-exports	70	75	53	53
Imports	83.42	75.55	62.53	70.71
Balance of trade in merchandise	—28.88	—5.59	—10.49	—19.36

The cumulative totals for the ten months ended January 1961 are shown along with the corresponding figures for 1959-60 in Table II below:

Foreign trade in merchandise	TABLE II			
	Cumulative totals for ten months			
	April to January			
	1960-61	1959-60	Provisional	Revised
			(in lakhs of rupees)	
Exports	527.24	543.88	531.22	
Re-exports	9.18	4.04	6.51	
Imports	839.38	681.90	781.16	
Balance of trade in merchandise	—302.96	—133.98	—243.43	

Fertilizer Factory at Nangal: Initial production of calcium ammonium nitrate started in the Nangal Fertilizer Factory on the 22nd February 1961 thus marking the birth of the second Fertilizer factory in the public sector after Sindri. The main contracts for the Nangal Fertilizer Project were awarded during 1957-58. A turn-key contract (minus civil works) for the group of fertilizer plants proper beginning from air separation cum ammonia plant and ending with the plant for bagging the end-product fertilizer was awarded on the 10th October 1957. Contracts for supply of equipment for electrolysis facilities were awarded between March 1957 and September 1958. This equipment, covering roughly half the total equipment installed in the factory, has been departmentally erected by the fertilizer Corporation of India Ltd.'s own technical personnel.

Testing and commissioning of the fully erected plant commenced when a minimum supply of power from the first Bhakra generator became available, even though to occasional interruptions, from the 6th of December 1960. Nitrogen and oxygen were first produced on 7-1-61 and hydrogen on 10-1-61 in both cases during the commissioning stage. Ammonia was first produced on 11-2-61; nitric acid on 16-2-61 and finally the first production of calcium ammonium nitrate was achieved on the 22nd Feb. 1961. Electric power is the factory's main material and when the factory operates to its full designed capacity and produces 1,200 tons of fertilizers per day, its consumption of electric power would be of the order of 1,60,000 to 1,65,000 kw. On the basis of the current availability of 50,000 kwts. of firm power, the daily average production of the factory will be limited to 300 tons of fertilizer. This will be gradually stepped up first to 400 tons and then to 800 tons per day as and when supplies of 70,000 kw. and 1,15,000 kw. of firm power, respectively, are assured. The heavy water plant for which a contract was awarded, on 26-11-58, is still under erection and is expected to go into production at the end of this year according to schedule.

Central and State Government Loans: Government promissory notes of the following loans enfaced for payment of interest at Delhi and New Delhi, interest on which falls due for payment during March 1961, will now be accepted by the Public Debts Office, Reserve Bank of India, New Delhi, for payment of interest to facilitate delivery of securities and interest warrants on the due dates.

Central Government Loans

- 3% Conversion Loan 1946.
- 2½% Loan, 1976.
- 3% Loan 1967-68.

State Government Loans

- 2½% Loans 1961.
- 3% Loans 1961-66.
- 3½% Loans 1962.
- 4% Loans 1967.
- 4% Loans 1968.
- 4% Loans 1970.
- 4½% Loans 1969.

West German Assistance for India's Third Plan: Dr. Hans Wilhelmi, Minister for Federal Property in the Federal Republic of Germany disclosed in New Delhi recently that his Government was prepared to make available on a long term basis a sum of DM 400 million (Rs. 45.5 crores) towards India's requirements during the first year of the Third Plan. Of this amount DM 100 million will be untied so as to strengthen India's foreign exchange reserves and will be made available early in the financial year 1961-62. To enable India to start immediately with the placing of urgently required orders, the Federal Republic have agreed already last year to guarantee credits in respect of export transactions and had indicated the possibility of a subsequent consolidation of these credits on a long term basis. The amount so consolidated would be considered part of the German contribution towards India's Third Five-Year Plan. The Federal Government have already recognized the importance to the Indian economy of the Rourkela Steel Plant and its extension. They have noted that this expansion would require foreign equipment and services totalling DM 450 million in value and that orders for the entire

expansion will have to be placed early. The Federal Government have, therefore, promised to help India to obtain appropriate credit facilities in the Federal Republic.

LIC Business in 1960: In a written reply to a question by Mr. Anirudh Sinha, the Minister for Finance, Mr. Morarji Desai, disclosed that the total amount of business completed by the Life Insurance Corporation of India during the calendar year 1960 was Rs. 411.42 crores.

Zonewise figures were:

Northern Zone	Rs. 62.40 crores
Central Zone	Rs. 57.27 crores
Eastern Zone	Rs. 86.86 crores
Southern Zone	Rs. 107.41 crores
Western Zone	Rs. 97.48 crores

The total amount of business completed in foreign countries amounted to Rs. 7.96 crores during 1960.

U.K.

More Aid for Overseas Countries: A parliamentary paper published in London recently shows that the United Kingdom Government proposes to spend over £103 million in aid to overseas territories in the financial year 1961-62. This will be an increase of £8 million over total expenditure being incurred on overseas aid in the current financial year.

Silk Makes a Comeback in Britain: With silk regaining its place as the most glamorous fashion fabric in Britain, India's exports to United Kingdom market have more than trebled over the last three years. For the first 11 months of 1960, India's exports to Britain totalled 38,771 sq. yards of silk fabric, compared with 22,589 sq. yards for the whole of 1959 and 13,193 sq. yards in 1958. Britain's output of silk fabrics last year is put at 4,600,000 sq. yards, compared with 3,200,000 sq. yards a year earlier.

Italy

Highest Dam in the World: The Vajont dam built at Longarone, in the province of Belluno, is the highest in the world with its towering height of 265 metres. It was built by the S.A.D.E. company of Venice. Its 3 metre thick surface stretches over an arc 190 metres long. The dam lies on 23 metres thick foundations. The lake which will be formed by the dam has a capacity of 175 million cubic metres of water.

France

New Trade Agreement With Spain: A new trade agreement was recently concluded between France and Spain. It will be valid for the period November 1960 to 31st October, 1961. The new agreement renews the principal modalities of the agreement dated 5th November, 1959. Some modifications have been made especially concerning the importation of Spanish oranges into France. In addition, new accords have been inaugurated for the importation of Spanish vegetables. No modifications were made concerning French exports to Spain.

Bulgaria

Production of Vertical Hydro-Generators: Bulgarian machine-building has for some time now been producing machinery and equipment for hydro-electric stations. Burziya, Stoudena, Batolovo-2 and many other smaller power stations in Bulgaria are equipped with Bulgarian-made machinery and installations. All hydro-generators turned out so far, however, were

horizontal. This year the production of vertical generators for hydraulic power stations with a rating of 2,000 kVA has been launched. Under normal working conditions each of these generates sufficient power in 24 hours to satisfy the requirements of a small town.

Austria

New Sulphuric Acid Plant Project: Donau-Chemie AG (Danube Chemicals Co.) is planning to complete by the end of 1961 the construction of a new sulphuric acid factory to be erected in Lower Austria on the site of the old Moosbierbaum refinery operated by Osterreichische Mineralol-verwaltung (Austrian Mineral Oil Administration — OMV), which will be closed down after the opening of the large refinery under construction for OMV at Schwechat, Lower Austria. Sulphuric Acid production at the company's new plant on the Danube river will be based on the American Monsanto process, for which Donau-Chemie has already been licenced.

I.M.F.

Assistance to Yugoslavia: The International Monetary Fund is making available to the Government of Yugoslavia upto \$75 million in various currencies held by the Fund. These resources are to be used in support of a programme of exchange reform and trade liberalisation which is designed to strengthen the Yugoslav economy and to facilitate its trade and payments relations with the world economy. In addition to the Fund's assistance, the Yugoslav authorities have obtained assurance of substantial credits from the United States and a number of European countries including Austria, France, Italy, the Netherlands, Switzerland, and the United Kingdom. A consortium of German banks is also considering the credit to Yugoslavia. It is expected that the credit from the United States will amount to approximately \$100 million, and that the total of credits from Europe will exceed this figure. Of the \$75 million to be provided by the Fund, the equivalent of \$45 million may be drawn in a single transaction when the Yugoslav Government puts its programme into effect, in French francs, Deutsche marks, Italian lire, Netherland's guilders, pound sterling, and U.S. dollars, while the remaining \$30 million will be available under the terms of a one-year stand-by arrangement.

I.F.C.

Investment in KSB Pumps Private Limited of India: The International Finance Corporation has announced a commitment to invest US\$210,000 in KSB Pumps Private Ltd. of Bombay, to help finance the construction and operation of a plant at Pimpri near Poona, for the manufacture of special-purpose pumps. Principal shareholder is Klein, Schanzlin & Becker AG (KSB) of Frankenthal, Germany. This firm was formed in 1871 and is today a leading manufacturer of a wide range of pumps, compressors, and valves. Other shareholders are: the Industrial and Prudential Investment co., Ltd. of Bombay, the New India Development Corporation (Private) Ltd.; and a private investor. KSB will be responsible for construction of the plant, and for the Indian company's management and technical direction. Production is planned at about 800 pumps annually, and is expected to begin in 1962. Total cost of the project is estimated at \$630,000 in the U.S. dollars and dollar equivalent. The IFC investment of \$210,000 is in unsecured dollar notes bearing 7 per cent payable in dollars, and maturing between 1966 and 1971. IFC will also be entitled to receive additional interest in rupees related to profits. IFC's commitment is subject to completion of the necessary legal formalities.

NEWS IN BRIEF

INDIAN

The Board of Directors of the Blue Mountain Estates Ltd. have allotted 5,25,000 equity shares issued as bonus shares in December, 1960.

A process on "Benzyl chloride" has been developed at Regional Research Laboratory, Hyderabad. Imports of "Benzyl Chloride" during 1959 were 27,338 lbs. valued at Rs. 29,424.

The British and U.S. investments in India have registered a marked rise during the period 1948 to 1958. The British investments in 1958 were Rs. 398.03 crores as compared to Rs. 206.02 crores in 1948; an increase by 93.2 per cent. The U.S. investments in 1958 were Rs. 59.85 crores as compared to Rs. 11.17 crores in 1948, an increase by 435.8 per cent.

The Central Agriculture Ministry is soon likely to launch a project for providing training in fish processing with the assistance of the Japanese Government.

The Government of India has announced their acceptance of the recommendations of the Central Wage Board for Sugar Industry subject to certain conditions.

From an annual output of Rs. 11 crores ten years ago, the production of industrial machinery in India has risen to well over Rs. 100 crores per year. The value of the output of machinery in 1960 is estimated in the neighbourhood of Rs. 120 crores.

The Government of India allocated a sum of Rs. 370 lakhs for inland fisheries schemes of the States during the Second Plan period and made available loans and grants to the extent admissible under the G.M.F. Rules.

It is reported that contracts for the supply of 5,84,750 tons of fertilizers in terms of sulphate of ammonia to be delivered during March-June, 1961, had so far been placed. The supply during 1960-61 was expected to be 10,86,000 tons in terms of sulphate of ammonia or 42% of the level of demand.

About four million Kw. of electric power could be generated from the water resources in the rivers Chenab and the Jhelum in the Indian territory.

Arrears of income-tax as on March 31, 1965, were Rs. 207.8 crores gross; March 31, 1956, Rs. 233.53 crores gross; March 31, 1957, Rs. 267.33 crores gross; March 31, 1958, Rs. 287.32 crores gross; March 31, 1959, Rs. 152.36 crores effective, and as on March 31, 1960, was Rs. 133.61 crores effective.

The Government of India have sponsored 12 agencies to provide financial assistance in the form of loans and grants to industries in the private sector.

There were 1,943,000 metric tons of food grains in the Central Reserve stock at the end of 1960. This consists of wheat 1,239,000 metric tons, rice 676,000 metric tons, and other food grains 28,000 metric tons.

It is reported that nearly 28 lakh employees of some 7,225 factories and industrial establishments are now members of the Employees' Provident Fund.

FOREIGN

One of the largest exhibitions of foreign stamps in the world. "ifa 1961," will be held in Dusseldorf in December, 1961. This will be the third exhibition of its kind to be held in Germany, previous ones being the "Iposta" (1930 in Berlin) and the "Interposta" (1959 in Hamburg).

As the first project to be executed by the International Telecommunication Union on behalf of the United Nations Special Fund, assistance will be provided for the establishment of a training and research centre for telecommunications and electronics in the Republic of China.

Imports of raw wool into the U.K. in January totalled 75m. lb. (actual weight), the highest monthly figure for a year. Nearly half the total—some 38m. lbs.—was from Australia.

It is reported the American Smelting and Refining Company is cutting back zinc production by 11 per cent—roughly 11,000 short tons—at its refinery at corpus christi, Texas.

Legislation is to be submitted at the current session of the Quebec legislature to allow the Province's Caisses Populaires (credit unions) to invest in corporation stock, which may result in the establishment, in the Montreal area of a steel mill, the first in the Province.

It is reported the High Authority of the European Coal and Steel Community will ask the six member countries to establish or communicate to the High authority before December 31, all freight rates charged for the transport of coal and steel by road, rail or ship.

Peru has entered into a standby arrangement with the International Monetary Fund which authorises it to draw equivalent of \$30 m. over the next 12 months in currencies held by the Fund.

Spain will import oil seed products, coffee and cotton from North and South American countries under bilateral trade agreements. Cotton imports will include 7,350 tons worth \$5 m. from Mexico.

Britain's sugar beet crop last season was the highest ever recorded at 7,215,756 tons. According to the British Sugar Corporation, this represents 883,000 tons of granulated sugar.

Sweden's imports from the U.K. in the second half of last year, the period following the first E.F.T.A. tariff cut, were 7 per cent higher than a year earlier.

The British Petroleum Company has arranged to place a third loan of 60m. Swiss Francs (approximately £5m.) on the Swiss market. The offer for sale to the Swiss public is being made by a Syndicate of Swiss banks headed by the Swiss Credit Bank.

The Yugoslav National Assembly has enacted all the bills and draft legal regulations concerning amendments in the Yugoslav economic system. Among other things, the Assembly enacted the law on distribution of the income and amendments to the law on the banking and credit system.

THE UNITED COMMERCIAL BANK, LTD.

REGISTERED OFFICE: 2, INDIA EXCHANGE PLACE,
CALCUTTA-1.

NOTICE

NOTICE IS HEREBY GIVEN that the EIGHT-EENTH ANNUAL GENERAL MEETING of the Members of THE UNITED COMMERCIAL BANK, LIMITED, will be held at the Registered Office of the Bank at 2, India Exchange Place, Calcutta, on Wednesday, the 5th April, 1961, at 4 P.M. to transact the following business:

1. To receive and adopt the Report of the Directors and the Audited Balance Sheet as on 31st December, 1960 and Profit & Loss Account for the year ended 31st December, 1960;
2. To declare a dividend;
3. To appoint four Directors in place of Mr I. P. Goenka, Mr. Y. N. Mafatlal, Mr. R. L. Nopany and Mr. M. L. Tapuriah who retire under Article 92 of the Articles of Association of the Bank and, being eligible, offer themselves for re-appointment;
4. To appoint Auditors for Bank and its branches for the current year and to fix their remuneration;
5. To consider and, if thought fit, to pass, with or without modification, the following resolution as a SPECIAL RESOLUTION:

"That the Articles of Association of the Company be altered in manner following:

- (a) The first paragraph of Article 87 of the existing Articles shall be deleted and the following paragraph inserted in its place:

Each Director shall be paid out of the funds of the Company by way of remuneration for his services a sum not exceeding Rs. 100/- for each Meeting of the Board or any Committee of the Board attended by him.

- (b) At the end of the second paragraph of Article 87 the following sentence shall be added:

The Directors shall further be entitled to be reimbursed and/or paid all expenses that may be incurred or paid by them in connection with any business of the Company."

NOTE: (1) A MEMBER ENTITLED TO ATTEND AND VOTE AT THE MEETING IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND THE PROXY NEED NOT BE A MEMBER.

2. (a) The transfer books of the Bank will be closed from Monday, the 20th March,

1961, to Wednesday, the 5th April, 1961, both days inclusive.

- (b) The dividend, if sanctioned, will be payable on and after the 6th April, 1961, to those members whose names appear on the Company's Register on the 5th April, 1961.

- (c) Dividend Warrants will be posted to the Members at their registered addresses or in accordance with their mandates. Members are requested to advise change in their addresses, if any.

EXPLANATORY STATEMENT REQUIRED BY SECTION 173 OF THE COMPANIES ACT, 1956.

The item of Special Business to be transacted at the Annual General Meeting to be held on the 5th April, 1961, is to consider and pass a Special Resolution seeking to alter Article 87 of the Articles of Association of the Company.

By a special resolution passed on the 9th April, 1958, the remuneration of a Director was changed from a fee not exceeding Rs. 100 for each Meeting of the Directors or any Committee of the Directors attended by him to a fixed remuneration of Rs. 500 per month. By virtue of Section 309(2) of the Companies Act as amended by the Companies (Amendment) Act, 1960, monthly payments to Directors are prohibited. The proposed alteration is to bring the Article in conformity with the provisions of the Companies Act by reinstating the method of remuneration in force prior to the 9th April, 1958.

The second paragraph of Article 87 as it stands at present refers only to expenses incurred in connection with Meetings. It is proper that other expenses, e.g., charges for trunk telephone calls and cost of cables, which may be incurred by the Directors in connection with the business of the Company should be defrayed by the Company. The proposed addition at the end of the second paragraph is intended to enable this to be done.

All the Directors are interested in the proposed amendments to the extent that they relate to the payment of Directors' fees and expenses.

By virtue of Section 35(B) (1) (a) of the Banking Companies Act, 1949, the present amendments regarding the remuneration payable to the Directors require the approval of the Reserve Bank of India, which will be sought after the Company gives its consent to the Special Resolution.

By Order of the Board,
S. T. SADASIVAN
General Manager.

CALCUTTA,
1st March, 1961.

HINDUSTAN MACHINE TOOLS rely on CARBORUNDUM UNIVERSAL ABRASIVES for all grinding operations

"Precision grinding is an all important part of machine tool production, and Carborundum Universal Grinding Wheels, which permit grinding to close limits of accuracy and with fine surface finishes, are helping us to produce better quality precision products."

-HINDUSTAN MACHINE TOOLS LTD.
BANGALORE
(A Government of India undertaking)

In any industry... for any grinding operation...
you can rely on Grinding Wheels made by

CARBORUNDUM UNIVERSAL LTD.
Head Office: 52/53, Jehangir Street, Madras-1 Telephone 2941 (4 lines)
Works: Tiruvottiyur

Distributors: MESSRS. WILLIAM JACKS & CO., LTD.,
Calcutta-1, Bombay-1, Madras-1, New Delhi, Bangalore-1, Kanpur, Hyderabad.
For Specialties only: MESSRS. H. S. COX & CO., PRIVATE LTD., 24, Rampart Row, Bombay.

We now manufacture
CARBOFLEX Reinforced Depressed
Centre Wheels for foundries and for
weld dressing operations

THE BUSINESS WORLD

The Budget: Reactions in Bombay

By

CROESUS

IF the reactions on the Bombay Stock Exchange are any criterion, the first budget of the Third Five-Year Plan is eminently satisfactory, at any rate from the view of the stock markets. But this is not to say that the budget has been universally welcomed. For, perhaps very few budgets, have elicited a wider criticism from the middle classes, especially the upper middle classes, in particular those holding high administrative positions in business or industry. Barring this, and save for the expected criticism that the large increase in indirect taxation would add to the inflationary potential, it is surprising that, even after imposing fresh tax burdens to the tune of Rs. 60.87 crores, there should be more sympathisers for the Union Finance Minister's unenviable plight in the prevailing circumstances than one would normally expect. The explanation, of course, is that, given a Third Five-Year Plan involving a financial outlay of the dimensions envisaged, an outlay during the budget year 1961-62, that is the first year of the Plan, of Rs. 1,166 crores, and a taxation target for the Third Plan of Rs. 1,100 crores to be raised by the Centre alone, no one could have done better. Actually, to those who had roughly worked out the annual average increases in taxation necessary to collect Rs. 1,100 crores over the five-year period, the total additional taxation of Rs. 60.87 crores came as a surprise, as this amount is at least Rs. 15 crores below their estimates. But, as shrewd students of finance, they must have assumed that the Finance Minister's estimate of the total yield from his tax proposals is, as always, an underestimate. Surprise it was, however, to those that thought the Finance Minister dare not impose such a heavy burden on the eve of a general election. But, then, Mr. Desai had to satisfy not only those in this country clamouring for a still more ambitious plan but also those in the foreign countries who have to decide about the size of the aid to this country that the Government of India are determined to do the utmost to raise internal resources.

Very few, however, have pointed to the need for a far greater economy in civil expenditure than the powers-that-be are prepared to accept as a possible alternative to the present burdensome taxation.

Ignoring this last point and granting all the other considerations as above justifying the spreading of the tax net as wide as Mr. Desai has done, one still finds it difficult to explain certain anomalies in the pattern of taxation, such as tax on imports of capital goods and components and reduction in the development rebate in the context of the Government's declared policy of encouraging industrialisation. Take, again, the admittedly unhealthy innovation of subjecting an industry to pay excise duty on both the intermediate raw material and the finished product manufactured by it, as in the case of the cotton textile industry and perhaps also the rayon industry (units producing their own caustic soda). Perhaps Mr. Desai may say, it is only an extension of the same practice as double taxation of shareholders! Consider also the anomaly of the Finance Minister's categorically declaring that

"throughout the next five years, it must be our endeavour to keep the pressure of prices under check" and his selection, at the same time, of commodities constituting basic needs for raising additional revenue, which cannot but lead to higher prices. This is, of course, apart from the apparent contradiction implicit in a promise of higher standard of living, on the one hand, and a determined drive to discourage consumption, on the other, as in the case of kerosene. On a detailed examination, therefore, of all the tax proposals, one school of opinion has observed that Mr. Morarji Desai has attempted the impossible task of pleasing every body by a fine balancing of reliefs and burdens alike. Both in refusing to do away with financially unfruitful imposts like the Wealth and the Expenditure Taxes and in not offering concessions to the hard-pressed middle classes, the Finance Minister has shown that his budget is no less political than economic.

Banking circles are somewhat sceptical of the success of the large borrowing programme proposal. A target of Rs. 235 crores for 1961-62 in the face of an actual fulfilment of less than Rs. 200 crores, including prize bonds, as against a target of Rs. 250 crores for 1960-61 is not at all understandable. But, if this target is fulfilled, it is bound to lead to a severe shrinkage in the capital market for the private sector. According to informed quarters, money in 1961-62 will be tighter than even during this year. What Mr. Desai and his advisers seem to have forgotten is their student-day arithmetical problem of a cistern with two taps, an inflow tap and an outflow tap, the latter having a greater velocity. Our savings pool after all is not bottomless to permit of a simultaneous drain by both the public and the private sectors on the scales proposed.

To turn now to the reactions to few of the individual proposals. Let me begin with the corporate sector. This sector has had a mixed bag of concessions and burdens. While the decision to reduce the tax on bonus issues is a welcome, albeit partial, response to a long-standing demand, Mr. Desai has taken away the grace from his gesture by not going the whole hog, that is do away with this tax altogether, even in respect of bonus issues out of taxed profits. Also, even with the established fact of a higher yield from corporation tax, contrary to official forecasts in the past, the Finance Minister has not cared to say a word about reducing the incidence of this tax. But, instead, this sector is called upon to accept a reduction of 5 per cent in the Development Rebate with effect from the new financial year. Whether to mitigate the effect of this or out of deference to the Tyagi Committee, Mr. Morarji Desai has allowed a successor company, when one company is amalgamated with another, or a firm is converted into a private company, the development already allowed to its predecessor to continue. Again, more psychological than substantial is the relief in respect of the tax on dividend on inter-corporate investment based on the element of foreign participation. The concession in respect of foreign technicians, the

reduction of taxation of royalties payable to foreigners, and the initial depreciation allowance of 20 per cent of the actual cost in respect of buildings erected by the employer for low paid employees have all been welcomed. But one concession that does not seem to have received much notice is the proposal to allow as a deduction an amount not exceeding 10 per cent of the total income of a financial corporation if appropriated to a special reserve account until such account approximates the paid-up capital. It is not clear, however, whether this concession applies to investment corporations also.

Of all the industries, the textile industry and the tobacco industry seem to hold particular fascination for all Finance Ministers. But, in this budget, the textiles have had a worst treatment than even tobacco. Thus, the cotton, woollen, silk, and art silk industries are called upon to pay between Rs. 12.75 crores out of a total of Rs. 60.87 crores, or around 20 per cent! Singling out one industry, especially the cotton textile industry even after it has submitted to all the pressures of the power-that-be, is difficult to understand.

The tea export trade must feel gratified at the reduction in the export duty on tea, but the industry as

a whole cannot be said to benefit much because of the increase in the rates of excise duty that have been effected to make up for the loss on export duty. A curious justification it must seem, at any rate to coffee drinkers, to find the Finance Minister solemnly saying that he raised the duty on coffee "to keep the incidence of duty on this commodity on more or less the same level as on tea for which an average increase of 33 per cent in the rates is proposed by notification". Surely, the circumstances affecting tea and coffee in India are not the same today. No sane person would think of imposing a burden on a commodity like coffee, which has not been faring well either on the export front or on the domestic front, the trouble being strong buyer-resistance. Some purist public financiers have posed the question, whether the new taxation proposals satisfy one of the three main essentials of a sound taxation policy, viz. simplicity. If the complaints of the excise staff about the extra responsibilities suddenly thrust on them as a result of the new excise duties, if the additional number of units brought under excise control number as many as 800 and if the incidental expenses of administration are estimated to cost Rs. 10.55 lakhs per annum, according to the Finance Bill itself, the new proposals can hardly be described as simple. In fact, our whole taxation pattern is tending to become more and more complex and complicated.

Power Planning in Gujarat

THE pattern of power development in the country has effectively established the truism that there can never be too much power in any country. What we have witnessed during the last many years has been that, once power is made available to any area, subsequent expansion has been of such a galloping nature as to confound even the most robust optimists. The power shortages we have been hearing from various parts of the country have only served to confirm the experience of veteran electrical engineers that, although load may initially have to be based on potential demand, eventually, it is the demand that will influence and determine the load.

Although by reason of this peculiar characteristic of the industry, power shortage has become a fairly general phenomenon in almost all the Power Systems in the country, the palm for power shortage must go to Gujarat. And, as far as Gujarat is concerned, it is also true to say that this situation is, to a large extent, man-made, as I shall presently explain.

The main source of power in the industrial region of Gujarat—the City of Ahmedabad and its environs—is the Sabarmati Thermal Power Station operated by the Ahmedabad Electricity Co. Ltd. The record of service of this Company, until very recently, at any rate, has been one of power capacity always being ahead of demand. Unfortunately, this happy record of progressive policy suffered a serious setback, when valuable time was lost over a sterile agitation in determining the type of plant to be installed for the Company's new project. To some extent, the difficulties were also accentuated by the delay in the release of foreign exchange by the Government of India. Nevertheless, with the original conception of the Company to proceed simultaneously with both the stages of its new project, the time lag in the commissioning of two 30 MW sets (incidentally the foreign exchange component of the first set has been taken care of by the DLF Loan) forming part of the project could certainly have been minimized. In the event, however, finalization of the second stage of the project was delayed by certain wiseacres holding the view that power shortage would not afflict the area before 1964-65! The creation of the separate Gujarat State and the consequent accelerated development in that region has certainly proved these quarters to be wrong.

Again, it is the pigheadedness of some in power who were responsible for stalling thermal power development that is putting Gujarat in a power predicament today. This section which, for the sake of convenience, may be described as the "hydro lobby" must take the entire blame for soft-peddling thermal development in the State. If investigated, this episode, I understand, would produce quite interesting results. It is common knowledge that, for the present at any rate, Gujarat has next-to-no hydro development. True the State has some potentialities in this respect if the waters of the Narbada are harnessed. Also to a certain extent, seasonal power would be available from the proposed Ukai Project. But these projects are long-term in character, and I am at a loss to understand how even the most ardent hydro enthusiasts could consider stalling thermal development in the meantime to sustain hydro development which is yet to become a reality.

My researches into power shortage have revealed that at one stage, an ambitious project to run an express transmission line between Bombay and Ahmedabad was mooted, involving the Central Government itself financing some portion of it. The then Bombay authorities, I believe, were very keen and would only have been too glad, to spare some part of the Koyna power to Gujarat, but it would appear that certain superior intellects in Gujarat thought then that such a line, if installed, would come in the way of the State creating its own power facilities! It is not unlikely that at the altar of the concept of owning a power station like the proposed Cambay Thermal Power Station the long-term interest of the State was thus sacrificed. Now, while Gujarat is willing, nay anxious, to have a greater quantum of power, Maharashtra seems loth to consider releasing any power, having regard to its own pattern of load growth.

The proposed Cambay Thermal Power Project would certainly add to the power potentialities of Gujarat sizeably. But much would depend upon the project coming to fruition earlier in 1964. Present indications, however, are that to attempt to achieve this time limit would be to cut it too fine.

Business Notes

State Bank

STEADY PROGRESS

MR. P. C. BHATACHARYA, Chairman of the State Bank of India revealed at the annual general meeting held in Bombay that after making usual provisions, the bank's profit in 1960 showed an increase from Rs. 1.87 crores to Rs. 2.18 crores. Incidentally, this enables the bank to restore the net dividend that was previously available to shareholders. The deposits declined by Rs. 6 crores from Rs. 563.4 crores in December 1959 to Rs. 557.4 crores in December 1960. The entire decline was accounted for by time deposits which fell by Rs. 34.5 crores (9.7 per cent) to Rs. 320.5 crores over the whole year. This obviously, is a matter of concern, even after making allowance for the transfer of PL 480 deposits to the Reserve Bank, in view of the demand for an increasing bank credit. It is to be noted even during the slack season the contraction in the bank credit was much smaller compared to the previous year. Other financial details would be found in the speech of the Chairman published elsewhere in this issue.

So far as the Bank's expansion programme is concerned, it may be recalled that under Section 16(5) of the State Bank of India Act, the Bank was required to open not less than 400 branches within a period of five years from July 1, 1955 or such extended period as the Government may specify. It is a matter of gratification that the Bank has fulfilled that obligation without obtaining extension of the period which was permissible. In this context, it may be mentioned that a sum of Rs. 32,94,654 was debited during the year to the Integration and Development Fund in respect of the year 1959, in order to meet partially the loss incurred at the Bank's new branches. But this is a price of expansion particularly in virgin areas.

The Bank's scheme for the provision of co-ordinated finance to small scale industries recorded good progress during 1960. The number of industrial units assisted and the limits sanctioned increased during the year by 63.8 per cent and 69.2 per cent to 2,451 and 782 lakhs respectively, while the amount outstanding rose still faster, by 106 per cent to Rs. 366 lakhs. A start was made during the year in the use of refinance facilities offered by the Refinance Corporation for Industry Private Ltd. The Bank's procedure relating to the grant of advances against warehouse receipts was further simplified during the year. As on September 30, 1960, the credit limits sanctioned by the bank against warehouse receipts aggregated Rs. 215.7 lakhs as against Rs. 104.4 lakhs as at the end of September 1959.

Engineering Goods

EXPORT PERFORMANCE

INDIAN ENGINEERING goods are beginning to gain a foothold in the export market and this is largely due to their competitive merit. Mr. A. K. Bhattacharya, Chairman, Engineering Export Promotion Council, indicated recently that as against the export target of Rs. 8.50 crores, the engineering goods had earned foreign exchange to the extent of Rs. 10 crores during 1960. Some of the important items are:

	1959	1960
	(Rs. lakhs)	
Electric fans and parts ..	39	89
Sewing machine and parts ..	31	54
M. S. pipes ..	2	21
Screws ..	0.50	12
Cutlery and stainless steelware ..	10	18
C.I. pipes and other castings ..	12	22
Diesel Engines ..	13	22
Oil mill machinery ..	12	13

Engineering goods from India have been well received in industrialized countries like the U.K., West Germany, Holland, Yugoslavia and the United States,

apart from the South-East Asian and West Asian countries. It appears that lower production cost in the manufacture of items like sewing machines, diesel engines, etc. has helped the Indian exporters to compete with the established producers. It must also be said to their credit that the end-products have been of fairly good finish.

Mr. Bhattacharya was of the opinion that Indian engineering goods could certainly be exported to the extent of Rs. 30 crores a year if producers were "provided with facilities and incentives which their competitors from other countries received from their respective Governments." As an instance he pointed out that in Japan the income-tax is levied only on 40 per cent of the profit earned on sales outside the country. This measure provides the exporters a relief to the extent of 3 per cent of the total exports. In view of the foreign exchange shortage which the Indian economy is experiencing, engineering exporters do need facilities to intensify their efforts.

Corporate Sector

COMPANY REGISTRATIONS

ONE EVIDENCE of the impact of planning in India is the increasing number of companies that are coming into existence in the private as well as public sector. During the calendar year 1960, a record number of 1641 new companies with a total authorised capital of Rs. 288 crores was registered as against 1,399 new companies with total authorised capital of Rs. 169 crores registered during 1959. Ever since the enforcement of the Companies Act from April 1956, over 5,600 new companies have been formed with a total authorised capital of Rs. 983 crores. The total paid-up capital of the companies at work increased by about Rs. 625 crores between April 1956 and end 1960. Of this increase in paid-up capital, approximately Rs. 425 crores were in the Government sector. As far as new registrations in 1960 are concerned, 141 were public companies, with authorised capital of Rs. 158 crores. The remaining 1500 companies were private and had a total of authorised capital of Rs. 130 crores.

As between the regions it seems the new registrations helped to bring about a balanced growth in the Indian economy. The new registrations were more and more in the northern and southern regions which were comparatively less-industrialised before 1956. In 1960, the Southern Region comprising Madras, Andhra Pradesh, Mysore and Kerala accounted for 437 companies. The Eastern Region comprising West Bengal, Bihar, Orissa, Assam, Manipur and Tripura accounted for 467 new companies, while in the Western region consisting of the composite State of Bombay and Madhya Pradesh, 425 new companies were registered. In the Northern region, comprising the Punjab, Himachal Pradesh, U.P., Rajasthan and Delhi, also the position has improved from 203 new companies in 1958 to 235 in 1959 and 312 new companies in 1960.

As regards the forms of management, of the new companies registered in 1960, 1038 companies have proposed to be run directly by the Board of Directors, whereas 574 companies have proposed to be managed by Managing Directors. Only 22 companies expressed themselves in favour of appointing Managing Agents. The number of companies that have chosen to be managed by Secretaries and Treasurers, and Managers, was 8 and 4 respectively. Of the 5638 companies registered during the period commencing from the enforcement of the new Act to the end of December 1960, only 66 companies have favoured the managing agency form of management, 13 have gone in for secretaries and treasurers and 10 for the new statutory managerial class of managers. It is seen that no less than 3897 companies out of a total of 5,638 have proposed to be run directly by boards of directors and 1642 by managing directors.

FROM THE CAPITAL'S CORRIDORS

THE BEAS PROJECT

DETAILS are now available of the project planned for harnessing the irrigation and power potential of the river Beas. The project consists of the following two units:

Unit No. 1: The Beas-Sutlej link for diversion of Beas waters into the Sutlej to avail of 1,000 feet fall en route for generation of electric power and extension of irrigation facilities to the arid tracts lying to the South and South-West of Punjab.

Unit No. 2: The Beas Dam at Pong.

A detailed project report of the first unit is under preparation. This unit is expected to cost Rs. 80 crores and will take about eight or nine years for completion. Installation of the power plant included in this unit will, however, be phased for completion earlier according to the development of load demand in the region.

The second unit is estimated to cost Rs. 92.65 crores. In this unit is included construction of a dam on the river near the village Pong, about 24 miles from Mukerian, to impound the seasonal flow of water in a reservoir having a live capacity of 5.5 M.A.F.

The project will ensure extension of perennial irrigation facilities to about 5 million acres of land in Punjab and Rajasthan. Power potential of the project would be nearly 240 MW.

The Pong reservoir will extend to 23 miles upstream the dam site and will submerge about 58,000 acres of land, out of which 28,000 acres are culturable. A number of villages would be submerged. The Pathankot-Jogindernagar metre-gauge railway line would be submerged from mile 28 to 43 and shall have to be realigned above the maximum reservoir level. A fair weather unmetalled road from Talwara to Dera Gopipur, on the left bank of the river, would also be submerged in two reaches for a length of about 11 miles. On the right banks, the road from Nurpur to Dera Gopipur via Jawali and Raniyal would also be submerged in a number of reaches. About 9,400 families (approximately 70,000 persons) are likely to get displaced.

The proposed design of the dam envisages building of an earth and rock fill 325 feet high above the river bed on the right side and construction of a concrete semi-hollow deck slab buttress type dam 250 feet high on the left side. The central 463 feet length of the concrete dam will serve as an over-flow spillway controlled by eight radial gates. The spillway is designed to pass a maximum flood of 650,000 cusecs. It will take about 8 years to finish the construction work.

A project report for this unit was prepared by the Punjab Government. It is now under revision in the light of the latest technological advice and hydrological studies.

Pending finalisation of the project reports for both the units, a provision of Rs. 49 lakhs in the revised estimates for 1960-61 and Rs. 350 lakhs in the Budget estimates for 1961-62 have been made by the Union Finance Minister.

For the execution of the Beas Dam Project (Pong), the United States Government has promised a loan of \$53 million and the World Bank a loan of \$23 million.

HEAVY VESSEL PLATES AND STRUCTURALS PROJECTS

Some last minute hitch appears to have developed in the negotiations that the Government of India has been having with Dary Ashmore for securing technical consultancy services for the Heavy Vessel Plates and Heavy Structural Projects. Enquiries show that the fees demanded by Dary Ashmore are considered to be rather on the high side. The view held in New Delhi appears to be that foreign collaborators should not attempt to make all their profits from one project only; they should widen the base of their operations by

charging fees which are not only reasonable but also competitive.

Some difficulty is also being experienced in arranging foreign financial assistance for these projects. The British credit from which these projects were to be financed is so phased that there will not be adequate funds available for them.

MEKONG RIVER PROJECT

The Government of India has decided to actively participate in the Mekong River Project which will bring prosperity to the areas lying within Laos, Thailand, Cambodia, and Vietnam. This was announced by President Rajendra Prasad in his inaugural address to the 17th session of the UN Economic Commission for Asia and the Far-East. The session is currently being held here.

India will contribute Rs. 12.5 lakhs for carrying out comprehensive examinations to prepare a project report for a barrage to be constructed in the Tonle Sap sector of the Mekong River Valley. The President described this project as an illustration of international co-operation achieved through ECAFE.

EXPANSION OF CALCUTTA

A provision of Rs. 10 crores on Central Government account, it is understood, is being made in the Third Five-Year Plan for expansion, and improvement of Calcutta under a master plan for the city. A similar provision is likely to be made in the Plan for the West Bengal State.

The Hoffman Mission, it may be recalled, had suggested an outlay of Rs. 200 crores for expansion of Calcutta. The West Bengal Government, in co-operation with the World Health Organisation, has made some studies on the problems of the city which will be integrated into a master plan. It has requested the Ford Foundation to arrange for a team of experts to be sent to Calcutta to assist in the preparation of the scheme.

No approach for funds has been made so far to the World Bank or to any other agency to meet part of the expenditure to be incurred on the scheme. Some assistance will, however, be had from abroad when the master plan is ready.

IFC INVESTMENTS IN CAPITAL STOCKS

According to advices received from Washington, Mr. Robert L. Garner, President of the International Finance Corporation, has announced that a resolution to amend the IFC Charter to permit it to make investments in capital stocks is being submitted to the Corporation's Board of Governors for its approval. Hitherto, the Charter has been preventing the IFC from making such investments.

AID-INDIA CLUB MEETING

The World Bank, it is learnt, will be circulating shortly two papers—one dealing with the economic situation of India since the study conducted by the Hoffman Mission and the other dealing with the various Third Plan projects for which external assistance would be required—among the Aid-India Club members for their guidance. These papers will contain an assessment of the World Bank regarding foreign aid requirements of India's Third Plan. They will also suggest how this aid should be provided.

Meanwhile, another World Bank Mission is expected to arrive here on March 12 to study the development programme of railways under the Third Plan. This Mission, which will include six experts from Canada, will study the management and organisation problems and the accounting system of Indian railways and will suggest ways and means to improve their working.

The World Bank teams which visited India during the past few months to study the problem of coal

movement and development of roads and ports are understood to be busy with writing their reports in Washington.

DIESELISATION OF INDIAN RAILWAYS

The Government of India has accepted a tender submitted by the General Motors, USA, for supply of 40 broad-gauge diesel locomotives. Orders for 60 metre-gauge diesel locomotives have also been placed with the US manufacturers. Their purchase will be financed with a loan from the Development Loan Fund.

It is proposed to have diesel traction for goods trains on about 3,800 miles of busy sections during the Third Plan period for movement of coal, raw materials for steel plants and other through traffic.

DIESELISATION OF ROAD TRANSPORT

The greater portion of commercial vehicles operating in India at the end of the Third Five-Year Plan are likely to be diesel-driven. Commercial road transport throughout the world has been rapidly changing over from petrol to diesel-driven vehicles during the last few years. In this country also production of petrol-driven vehicles has been practically stopped, and the four commercial vehicle manufacturers are now concentrating on production of diesel vehicles only. Conversion of old petrol-driven vehicles into diesel driven vehicles is also taking place at a rapid pace.

BADRAVATI STEEL WORKS

The Government of India has approved a Rs. 7 crores expansion programme for the Mysore Iron and Steel Works. The programme envisages setting up at the works an LD plant, an electronic furnace, a billets and light structurals mill and expansion of the foundry and electric supply resources. The expansion programme when completed will raise the production of saleable steel at this works to 85,000 tons per annum.

This expansion scheme was included in the Second Five-Year Plan but could not be undertaken due to some difficulties. Orders have now been placed for the import of plant and machinery required for setting up the LD plant, electric furnace and billets and structurals mills. Work is simultaneously going on for the expansion of the foundry and on the other related programmes.

The Government of India has agreed in principal to Mysore Government's request for financial assistance for this expansion programme. The Central Government will provide assistance in the form of participation in the equity capital of the company and in the shape of a loan to the Mysore Iron and Steel Corporation which is being set up to handle this steel-works. A provision of Rs. 25 lakhs has been made in the next year's Budget estimates for purchase of shares of the proposed Corporation. Besides, a provision of Rs. 1 crore has been made in the Budget estimates for grant of loan to the Corporation.

BHILAI STEEL PLANT

Hindustan Steel Limited proposes to invite a top level expert from the Soviet Union to advise on efficient management and organisation of production at the Bhilai Steel Plant, set up during the Second Plan period with Russian aid. The expert will be called upon to suggest in particular the outlines of a system of periodic departmental returns and reports within the works for the management, general information and control purposes.

DURGAPUR FERTILIZERS

West Bengal Government, it is understood, is now negotiating for technical collaboration for setting up a fertilizers manufacturing factory at Durgapur with a consortium of American firms.

Meanwhile, the Government of India has taken the decision to invite tenders from British firms for

setting up the Nahorkatyia fertilizer factory. The main raw material to be used at this unit will be the refinery gases. Part of the British credit made available for the Third Plan will be utilised to finance this project.

FOREIGN ASSISTANCE FOR COAL MINING

Assistance from abroad, especially from the United States, the United Kingdom, France, West Germany and Poland, is being sought in respect of certain difficult aspects of open-cast and underground mining and erection and maintenance of Central workshops and washeries. Some offers have already been received from the first four countries; these are being considered by the Government of India. A technical team from Poland is at present studying the problems of deep shaft mining of coking coal in Jharia coalfields. It will be some time yet before final decisions are taken as to the scope and mode of assistance to be availed of from each of these countries.

In addition, an open-cast mine, two underground mines and a workshop in the Korba coalfield, and two washeries—one in Kathara and the other in Karanpura—are to be established with the credits offered by the U.S.S.R.

The following projects are likely to receive the highest priority: (i) underground mining of thick and steeply inclined seams in Kathara, Karanpura and Jangdih; (ii) open-cast mining of coking coal near Ramgarh; (iii) deep shaft mining of coking coal in Jharia.

MORE MACHINE TOOL FACTORIES

Mr. Manubhai Shah, the Minister for Industry in the Union Government, stated in the Lok Sabha last week that the German Democratic Republic (East Germany) had offered to collaborate in setting up a machine tool factory in India. A draft agreement, he added, had been drawn up setting out the terms of collaboration. The agreement is proposed to be signed in East Germany after an Indian delegation has visited the Leipzig Fair. The delegation would also select the class of equipment which would be taken up for production at this factory.

Mr. Shah further said that a Calcutta firm, recently licensed for manufacture of machine tools, had put up a proposal to enter into technical collaboration with an East German firm for the manufacture of lathes. The proposal is being examined by the Government.

Mr. Shah also disclosed that the question of setting up two medium type machine tool factories in the public sector during the Third Five-Year Plan was under consideration. The Hindustan Machine Tools Limited have been entrusted with the task of drawing up project reports for setting up these factories. The estimates of costs, selection of sites, etc., are under examination by the Hindustan Machine Tools.

THIRD PLAN POWER PROJECTS

Preliminary work on seven Third Plan power projects, having a total installed capacity of 885,400 kW., has been authorised to be started. Two of these projects, Kundah Stage III Extension Scheme and Mettur Tunnel Power Scheme, with installed capacity of 240,000 kW. and 1,00,000 kW., respectively, are located in Madras State. In Kerala, Pamba-Kakki Hydro-electric Scheme will generate 300,000 kW. of power. The Cambay thermal station, with an installed capacity of 150,000 kW. is in Gujarat, and Khaperkheda thermal station extension, with 30,000 kW. capacity in Maharashtra. In Assam, the Naharkatiya power station will produce 50,400 kW. of power. The Barauni thermal station extension scheme will produce 15,000 kW. of power in Bihar. The power generated at these projects will be largely used for industrial development of the country.

ATOMIC ENERGY

In order to produce the requisite quantity of fuel elements required for the first atomic power station to

be set up at Tarapore, the capacity of the existing Uranium Metal Plant and the Fuel Fabrication Facility Plant at Trombay is envisaged to be increased four-fold. This expansion scheme, estimated to cost Rs. 2.5 crores, is included in the Third Five-Year Plan. The Budget estimates for 1961-62 contain a small provision for meeting the preliminary expenses of this programme.

A By-product Recovery Plan (Project Phoenix) is also being set up for treating irradiated fuel elements and extraction of valuable by-products therefrom. This project will cost about Rs. 2.56 crores—Rs. 1.27 crores on account of equipment and Rs. 1.29 crores on account of civil engineering works, erection charges, etc. The work on the construction of the building to house the plant is in progress. Orders for a substantial part of the equipment have been placed. The plant is scheduled to be commissioned in the financial year 1962-63.

It is also proposed to develop fully during the Third Plan period the Jaduguda Mines (the principal source of uranium ore in India) so as to enable the production of sufficient quantities of uranium ore from which the necessary uranium metal for atomic energy development programme will be produced. A small provision has been made in the Budget estimates for 1961-62 for meeting the preliminary expenses of this scheme. The scheme is estimated to cost Rs. 4.5 crores.

The Plan also envisages setting up of a Uranium Ore Mill, with an ultimate capacity of 1,000 tons per day, for treating the ore mined at Jaduguda Mines. This mill will cost about Rs. 4.5 crores and will take three years for completion.

STEPPING UP COTTON CLOTH OUTPUT

The target of 9,300 million yards of cotton cloth fixed for the Third Five-Year Plan is proposed to be achieved by taking the following steps:

- (1) Adequate expansion of the spinning sector of mill industry to ensure the supply of 2,250 million lbs. of yarn, which will be required to produce 9,300 million yards of cloth.
- (2) Intensive working in the decentralised sector.
- (3) Some expansion of the weaving side of the mill sector.

WOOLLEN INDUSTRY'S REHABILITATION PROGRAMME

The decisions of the Government of India on the Report of the Working Group set up by the National Industrial Development Corporation to draw up a programme for rehabilitation and modernisation of the woollen industry have been published.

Some of the major recommendations made by the Working Group have been broadly agreed to by the Government. In its unanimous Report, the Working Group had emphasized the urgent need for rehabilitation and modernisation of the woollen industry within a period of 5-6 years. The Group has assessed the total cost of the rehabilitation programme at Rs. 11.25 crores, consisting of Rs. 10.25 crores for plant and machinery and Rs. 1 crore for land and buildings. The foreign exchange component has been assessed at Rs. 9.25 crores for import of plant and machinery. The Working Group is of the view that industry from its own resources would be able to meet about 75 per cent of the total cost. The balance will have to come from State lending institutions.

As regards the Working Group's recommendation that the National Industrial Development Corporation should extend loan assistance facilities to the woollen industry for meeting rehabilitation requirements, the Government, after careful consideration, has come to the conclusion that for the present the NIDC would not be in a position to render such assistance to the woollen industry, particularly in view of the heavy demand on its funds from the cotton textile and jute industries.

The Government has accepted in principle the Working Group's recommendation that essential expenditure on spare parts should be adequately provided for. After ascertaining the position about the spare parts manufactured indigenously, priority would be given in future for the import of the necessary spare parts.

The recommendation of the Working Group about fabricating indigenously certain finishing and preparatory machinery during the Third Plan period has also been accepted by the Government in principle. A Committee has been appointed to assess the demand of machinery for different textile industries, including woollen industry, in relation to the indigenous capacity and to suggest suitable steps to bridge the gap between demand and supply. The possibility of manufacture of woollen finishing and preparatory machinery would be fully explored by this Committee.

The Government is examining the recommendation of the Group that the present export incentive scheme might be modified to provide an increase in import entitlement for machinery from 10 to 20 per cent in the value of exports. The recommendation that foreign exchange earned by export of old machinery should be utilised for the import of permissible types of new machinery has been accepted. The Government would consider on a priority basis the question of releasing foreign exchange for import of plant and machinery not covered by the export incentive schemes and rupee payments purchases.

The Government is also examining the recommendation of the Working Group that the excise duty on woollen fabrics should be reviewed with a view to consolidating the position of the industry.

TELEPHONE INDUSTRY

The production of telephones, exchange lines and transmission equipment by the Indian Telephone Industries Ltd., Bangalore, is expected to go up from the current level of 1,20,000 telephones, 88,000 exchange lines and Rs. 75 lakhs worth of transmission equipment to 1,80,000 telephones, 1,36,000 exchange lines and Rs. 260 lakhs worth of transmission equipment per annum under the Third Plan. It is proposed to set up at this factory an additional unit during the Third Plan period for the purpose.

BRIEFS

A new company, known as Messrs. Limac Limited, Madras, has been formed to manufacture earth-moving equipment such as crawler type heavy tractors, shovels, etc. The factory will be set up at Madras. The target of crawler tractors to be manufactured by this company will be fixed by the Government after the firm goes into production.

*

Most of the offers from various Indian parties for acquisition of ships to undertake shipment of foodgrains from the United States to this country under the last year's 17 million tons foodgrains deal have been examined by the Union Government and found to be unacceptable. There are, however, still some proposals under consideration.

*

An application from a private sector firm has been received by the Government of India for the grant of a licence under the Industries Act for setting up an aluminium smelter, with a capacity of 20,000 tons per annum, at Annapur or near Korba, in Madhya Pradesh. A Swiss firm has agreed to provide the technical know-how. The proposal is understood to be under examination by the Government.

Don't throw away parts and money...

It sounds like an impossibility, we know, but it is none the less true. Many hard-to-replace parts costing valuable money are literally thrown away because they have been ruined due to faulty lubrication.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

The service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

PLANNED LUBRICATION—A VITAL FACTOR IN COST CONTROL

We Share Your Disappointment too!

The overwhelming demand for Philips Quality Lamps is pleasing to us, but what a pity we can't meet it. And how disappointing it is for our dealers who, with sad faces, do their best!

All of us know that the lamp industry is more self-sufficient than many others. Yet there is a small but vital content in lamp manufacture which has to be imported. That is where foreign exchange restrictions creep in. So the supply becomes difficult.

Certain positive steps are being taken in the Third Five-Year Plan

to ease the position. Until supplies become plentiful again we request you to bear with us.

Meanwhile, while wishing you happy lighting, here is a list of our retail prices to help you the next time you want to buy Philips Quality Lamps:

	Retail price per piece
25W. Vacuum clear ...	Rs. 1.25
40W. Gasfilled clear ...	Rs. 1.44
60W. Gasfilled clear ...	Rs. 1.56
100W. Gasfilled clear ...	Rs. 2.00
150W. Gasfilled clear ...	Rs. 3.50
200W. Gasfilled clear ...	Rs. 5.12
60W. Argenta (inside white) ...	Rs. 1.75
100W. Argenta ...	Rs. 2.25
150W. Argenta ...	Rs. 3.94
4 ft. 40-Watt Fluorescent ...	Rs. 9.69

These prices are inclusive of excise duty but exclude sales tax and local taxes

COMPANY AFFAIRS

THE NATIONAL INDUSTRIAL DEVELOPMENT CORPORATION

During the year the National Industrial Development Corporation has established a Technological Consultancy Bureau for serving the various projects under study or in the process of implementation. The functions of the Bureau would include preparation of preliminary studies, investigations and selection of sites, preparation of detailed project reports and the designing of structures. The work of the Bureau will be confined for the present to the public sector projects.

The implementation of the bio gas/fertilizer project, for which the Government of India have entered into an agreement with the Hungarian Foreign Trade Company for Chemical Products, has been entrusted to the National Industrial Development Corporation. Action is being taken for the installation of the two pilot plants, one in the Indian Agricultural Research Institute, New Delhi, and the other in the National Sugar Institute, Kanpur. The Technological Consultancy Bureau will take up the execution of the constructional works on receipt of the designs and technical documents from the Hungarians.

The schemes of the National Industrial Development Corporation for financial assistance to jute and cotton textile industries for modernization and rehabilitation are progressing satisfactorily. A sum of Rs. 6.07 crores has been advanced to the Corporation for granting loans to the two industries up to November 30, 1960. The scheme for assistance to jute and cotton textile industries for acquiring machinery on hire-purchase basis for speeding up limited schemes of modernisation and rehabilitation has also been making good progress. A scheme for providing loans to jute and cotton textile industries on short-term basis against guarantees and collateral security for the installation of improved machinery has recently been introduced. In regard to the scheme for financial assistance to the Machine Tool Industry, the Corporation has sanctioned assistance to the extent of Rs. 35 lakhs.

BANK OF INDIA

The Bank of India Limited recorded an increase in its deposits from Rs. 100.69 crores at the end of the year 1959 to Rs. 109.4 crores at the end of 1960. During the same period advances increased from Rs. 67.94 crores to Rs. 83.86 crores, an increase by about six crores. The transactions for the year resulted in a profit of Rs. 1.03 crores as against Rs. 82.68 lakhs during the previous year. This shows a satisfactory functioning of the bank's business. The Bank opened branches during 1960 at Hong Kong and in India at Bhowanipur in Calcutta, at Mount Road in Madras, at Ajmere Gate Extension in Delhi, at Indore and at Walkeshwar in Bombay.

An interim dividend was paid for the half-year ended June 30, 1960 at the rate of 7.50 per cent. subject to deduction of tax at the prescribed rates, on the Paid-up Capital of Rs. 3.00 crores which absorbed Rs. 22.50 lakhs. A sum of Rs. 25 lakhs was provided for Income-tax and Super-tax and another sum of Rs. 18 lakhs was separated for the payment of Bonus to Staff. The Directors have now proposed the payment of a final dividend for the half-year ended December 31, 1960 at the rate of 12.50 per cent. subject to deduction of tax at the prescribed rates, making 20 per cent for the year, on the Paid-up Capital of Rs. 300 crores which will absorb Rs. 37.50 lakhs.

UNION BANK

The Union Bank of India Limited during its working for the year to December 31, 1960 recorded a profit of Rs. 27.16 lakhs against Rs. 24.28 lakhs in the previous year. The Directors have reported that the deposits of the bank which stood around 24.60 crores at the end of 1958, rose to Rs. 32.17 crores at the end of 1959 and were around Rs. 28.50 crores towards the end of 1960. The advances increased from Rs. 15.78 crores at the end of 1958 to Rs. 20.57 crores and Rs. 17.31 crores at the end of 1959 and 1960 respectively. After providing Rs. 8 lakhs towards taxation and Rs. 5.36 lakhs towards provision of bonus to staff the directors have proposed the payment of a dividend of Rs. 57 nP per share or 11.2/5 per cent per annum subject to deduction of tax on 12 lakh shares, absorbing Rs. 6.84 lakhs.

COMMODITY NEWS AND NOTES

MANUFACTURE OF FIRE REFINED COPPER

The Development Council for Non-Ferrous Metals recommended that the Government should give consideration to the scheme of Messrs. Binani concerning with the fire refining of imported scrap and blister copper. The scheme of Messrs G. D. Binani for installation of a refinery for the manufacture of fire refined copper from imported blister copper and scrap is still under consideration. However, the Government of India do not encourage schemes involving a marginal foreign exchange saving only.

The Council approved the requirements of the following non-ferrous metals for the Third Plan period as under:

S. No.	Item	1958 (tons)	1961 (tons)	1966 (tons)
1.	Aluminium	35,000	50,000	100,000
2.	Copper	53,120	85,000	170,000
3.	Lead	19,720	35,000	65,000
4.	Zinc	52,950	85,000	187,000
5.	Tin	—	7,000	10,500
6.	Antimony	—	750/800	900/1,000

With regard to the development of indigenous manufacture of Alumina Hydrate and Sodium Aluminate for Chemical Industries, it was suggested that the demand of these items should be shared by all Aluminium projects in the country.

In this connection a circular letter is being issued to the existing indigenous manufacturers as well as prospective manufacturers, who have since been granted industrial licences for installation of Aluminium Smelter in the country.

TEA EXPORTS

Exports of tea fluctuate from year to year. The quantity exported during 1960 was lower than quantities exported during previous years. There is however no firm trend to show that our exports are declining. The decline in exports in 1960 was mainly due to the shortfall in production on account of drought conditions in North East India during the early months of the 1960-61 season. Progressively, greater quantities of nitrogenous fertilizers are being supplied to the tea estates.

IMPORTS OF ALUMINIUM, COPPER AND NICKEL

The Government of Canada make available some imports of aluminium, copper and nickel under the Colombo Plan Aid Programme. Broadly the arrangement is that consumers in India place orders on firms in India who are normally acting as agents of Canadian manufacturers and suppliers of these metals.

For 1960/61, a sum of Canadian \$11.7 million has been offered to India under the above programme for import of these metals as detailed below:

Aluminium \$5.5 million (11176 metric tons apprx.)
Copper \$5.5 million (4674 metric tons approx.).
Nickel \$7 million (183 metric tons approximately).
Total: \$11.7 million.

TIN-COPPER ALLOY

As a result of investigations conducted at the Indian Institute of Science, Bangalore, tin-copper alloy deposits which are adherent, smooth and fire-grained have been prepared using the pyrophosphate bath. Aside from its non-poisonous character and stability, the electrolytic bath has special advantages compared to the commercial stannate cyanide bath.

It operates at lower bath voltage and higher current density, the range of deposit-composition is wider (10-96 per cent copper), and cathode efficiency is up to 100 per cent which is about twice that of stannate-cyanide bath.

GROUNDNUT CAKE OIL FLOUR

One oil mill has been selected for operating the plant to be put up at Bombay for the commercial production of cheap edible groundnut cake oil flour. The company is making arrangements to receive and install the equipment which UNICEF has offered. In regard to the second plant to be set up in Madras an oil mill to collaborate with the Government of India and UNICEF is expected to be selected shortly.

FUTURES TRADING

The Minister of Commerce, Mr Nityanand Kanungo, recently called upon the trade bodies engaged in futures trading to maintain high standards of self-regulation, discipline and fair trading practices. Mr Kanungo, who was inaugurating a conference of the Presidents and Directors of the Recognised Associations, sponsored by the Forward Markets Commission, warned that there had been undesirable trends in futures trading and, that unless these were promptly controlled, not only would the basic purpose of the futures trading be defeated, but also grave detriment to the national economy would be caused. The Minister said that the conditions in the oil seed and jute market had not been quite conducive to permitting unfettered self-regulation by the Associations. The Forward Markets' Commission had been constrained to intervene on some occasions. Mr Kanungo referred to the substantial increase in the prices of commodities like groundnut, castor seed, rape seed and mustard seed, raw jute and jute goods in the last few weeks and said that this rise did not merely reflect a change in supply and demand position, but was due to a significant extent to speculative activity. It was obvious, he said, that when Government were trying their best to hold the price-line and promote exports through concessions and incentives, they could not allow these efforts to be undermined by uncontrolled speculative activities.

Valuable Protection

for Valuables

Your home is perhaps a vulnerable place for keeping costly jewellery and important documents. Why run the risk of losing your valuables by theft, fire and other hazards?

The local head offices and branches of the State Bank of India afford facilities for the safe custody of your personal effects at moderate charges.

Facilities are also available at local head offices and at a number of important branches for hiring lockers of various sizes.

By depositing your valuables in the State Bank, you will save yourself the worry about their safety.

Please contact the nearest Branch Agent for further particulars.

Company Meeting

THE STATE BANK OF INDIA

Speech of the Chairman, Shri P. C. Bhattacharyya, at the Sixth Annual General Meeting of the Shareholders held in Bombay.

Gentlemen,

I have much pleasure in welcoming you all to this Sixth Annual General Meeting of the State Bank of India. The Report of the Central Board of Directors for the year 1960 together with the Bank's Balance Sheet as on 31st December, 1960 and the Profit and Loss Account for the year ended 31st December, 1960, has already been circulated to you and has been taken as read.

2. I am happy to say that in marked contrast to the position in 1959, the Bank recorded good progress in its traditional business during the year under review. As a result, the Bank's net profit, after the usual and necessary provisions have been made, shows an increase from Rs. 1.87 crores to Rs. 2.18 crores. We have been able thereby not only to strengthen our Reserve Fund and other Funds to a greater extent than last year but also to declare a dividend of Rs. 22.75 per share for the year, thus restoring practically the net dividend that was previously available to the shareholders.

3. There are two reasons for the increase in the Bank's net profit for the year: the increase in the level of the Bank's advances and the rise in the Bank's lending rates after October 1, 1960. The Bank's advances (including bills) which had stood at Rs. 156.5 crores in December 1959 increased sizeably in the course of the busy season and reached a peak of Rs. 215.7 crores in July 1960. They continued to remain at a high level during the slack season and rose further after the commencement of the current busy season. On February 17, 1961, the Bank's advances stood at Rs. 259.2 crores. Secondly, consequent on the Reserve Bank's directive of September 21, 1960, asking all scheduled banks to charge a minimum rate of 5 per cent on advances and to raise their average lending rates by half a per cent, the State Bank of India Advance Rate was raised from 4½ per cent to 5 per cent with effect from October 1, 1960 and other lending rates of the Bank were also increased suitably. This has obviously added to the Bank's earnings during the year.

4. The total deposits of the Bank declined during 1960 by Rs. 6.0 crores. This was solely due to the fact that no deposits of U.S.P.L. 480 funds accrued to the Bank after May 12, 1960 and a sum of Rs. 72.0 crores out of the amounts previously deposited was transferred to the Reserve Bank of India during the year. If the U.S.P.L. 480 deposits are kept out of account, the average deposits of the Bank increased by Rs. 27.9 crores in 1960, as compared to an increase of Rs. 122.0 crores in the total deposits of other scheduled banks. However, the growth of deposits of the State Bank of India as well as other scheduled banks slowed down in the latter half of 1960. This decline in the rate of growth of deposits is a matter of some concern especially in the context of an increasing demand for bank credit. The slack season contraction in bank credit was also much smaller during the last two years. If therefore, the demand for bank credit continues to rise and to remain high throughout the year, all efforts will have to be made by banks to increase deposits.

5. One point deserves to be mentioned in this context. The banking system must continuously play an active role in the overall mobilisation of resources. For this purpose, it is necessary that new techniques be employed from time to time. Hitherto, banks have

depended more on urban areas and industrial and commercial centres for collection of deposits. I feel that the possibilities of securing more deposits from rural and semi-urban areas should now be explored with vigour. Upto the end of 1960, we have opened 429 branches mostly in the rural and semi-urban areas of the country. The total deposits at these branches have increased from Rs. 29.32 crores in 1959 to Rs. 37.03 crores in 1960; and the average deposits per new branch have risen from Rs. 8.17 lakhs to Rs. 8.63 lakhs. I feel, however, that there is still considerable scope for increasing bank deposits in these areas. It has been said that the low rates of interest that we pay on deposits have been an inhibiting factor. In order to reduce the influence of this factor we have raised, as a measure of experiment, the Bank's interest rate on savings bank accounts to 2½ per cent per annum and that on savings bank deposit accounts to 2½ per cent with effect from the 1st of this month. I do hope that this experiment will produce the desired effect and that it will be possible to report better progress next year.

6. I would now refer to the Bank's developmental activities. I am happy to say that with the opening of the Bank's branch at Kairana in Uttar Pradesh on June 1, 1960, the Bank's statutory obligation to open 400 branches in five years was fulfilled before time. This is an achievement which has no parallel in the history of Indian banking. Twenty-nine more branches have been opened between June 1 and December 31, 1960.

7. The Branch Expansion Programme has placed a heavy strain on our staff resources at all levels. The problem of manning new branches was particularly difficult. In addition to taking in many direct recruits, a large number of persons with limited experience had to be promoted; and all these persons had to be appointed to hold charge of branches and other supervisory posts as quickly as possible after giving them the minimum training necessary for the purpose. The Programme has also put a heavy strain on the Local Head Offices as well as the Central Office of the Bank. Your Directors therefore thought that the position should be reviewed comprehensively before deciding on the Bank's future branch expansion policy. A Committee of the Central Board, under the chairmanship of Professor D. G. Karve has been constituted for this purpose. I understand that the work of the Committee has been progressing well and that it will submit its report shortly.

8. In regard to the other two developmental activities, viz. the financing of small scale industries and provision of rural credit, the Bank has made further progress during the year. The credit limits granted by the Bank to small scale industries and to co-operative institutions went up to Rs. 7.8 crores and Rs. 22.4 crores respectively during the year. There has been one development to which I may make a special reference. This is the introduction by the Government of India of a Credit Guarantee Scheme for small scale industries. We have been taking full advantage of this scheme.

9. I now come to the Subsidiary Banks. I am happy to say that the process of integration of the eight State-owned or State-associated banks with the State Bank of India, started on October 1, 1959 has been completed. The complicated and arduous task of

determining the compensation payable to shareholders of the old banks has also been completed. It is gratifying that the shareholders of all the old banks have accepted the compensation determined by the State Bank of India as final, without any demur. The total compensation payable in the case of all the eight Subsidiary Banks amounts to Rs. 8.05 crores out of which Rs. 6.86 crores have been paid upto February 17, 1961. I may also mention here that part of the compensation is payable in the form of shares of the new bank at the option of the shareholders of the old bank and in the case of two Subsidiary Banks as many as about 1,100 shareholders in each case have taken shares of the respective new bank.

10. The annual reports of the Subsidiary Banks have been sent to you and these show that all the eight subsidiaries have shown improved working results in 1960. The State Bank of Hyderabad, The State Bank of Mysore and the State Bank of Travancore have declared dividends for the year at 6 per cent, 9 per cent and 5 per cent respectively. In the case of two subsidiaries, no dividend was declared as no compensation had been paid during the year. Regarding the rest, profits were not sufficiently large to justify declaration of dividends. In two of these cases, profits of the corresponding old banks were not subject to income tax previously whereas provision had to be made for taxation in 1960. This reduced considerably the profits available for distribution. I have every hope that the transitional difficulties in all these cases will soon be overcome and all the Subsidiary Banks will show better operational results in future.

11. The Annual Report refers to a strike from March 4 to March 25, 1960 by the members of the clerical and subordinate staff of the Bank. The essential business of the Bank and Government was carried on during the period, with the assistance of supervising staff and non-striking members of the clerical and sub-

ordinate staff. I must commend the way in which they worked, under very trying conditions and served the Bank during the strike. I extend to them my special thanks and I am sure, the shareholders and the Directors would also like me to convey their thanks to them. As you are aware, the dispute has been referred to and is pending before the Tribunal. The present position in this regard is that the Tribunal has given its Award on the question of interim relief; it has not granted any of the demands put forward by the employees on this account. The hearing on the main demands is continuing.

12. I have pleasure to acknowledge that while the dispute is pending before the Tribunal, our relations with the employees have been generally good. I take this opportunity to record my appreciation of the work put in by all the grades of our staff during the year and convey to them my sincere thanks.

13. I would like to mention here that our staff has recently been active in organising several sports activities and social gatherings etc. We believe that these are very good activities for developing and promoting closer contacts among all the categories of staff. We have therefore been lending our support to these activities and I do hope that the number as well as the variety of these activities will increase at all the branches and offices of the Bank so as to lead to the promotion of congenial staff relations which are so necessary for every organization.

14. Before concluding, I would like to place on record my sincere thanks to Shri Mangaldas Pakvasa who rendered valuable service to the Bank as its Vice-Chairman between February 25, 1959 and April 16, 1960. I would also like to express my sincere thanks to Shri B. P. Patel for the good work that he did as a Managing Director of the Bank for over four crucial years between April 1956 and June 1960.

Report of the Auditors

TO THE PRESIDENT OF INDIA,

We, the undersigned Auditors of the State Bank, of India, appointed under Section 41(I) of the State Bank of India Act, 1955, do hereby report to the Central Government upon the Balance Sheet and Accounts of the Bank as at the 31st December, 1960.

We have examined the above Balance Sheet and the Profit and Loss Account and the Accounts relating thereto of the Central Office and the Local Head Offices at Bombay and Calcutta and the Returns submitted and certified by the Secretaries and Treasurers of the Local Head Offices at Madras and New Delhi, by the Manager, Pakistan Branches and by Branch Agents, which Returns have been incorporated in the above Balance Sheet and Accounts, and report (i) that, in our opinion, the Balance Sheet is a full and fair one, containing all the necessary particulars and properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank; (ii) that where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory; (iii) that the transactions of the Bank which have come to our notice have been within the powers of the Bank; (iv) that the Returns received from the Local Head Offices at Madras and New Delhi and from the Branches of the Bank have been found adequate for the purpose of our audit; (v) that the Profit and Loss Account shows a true balance of profit for the period covered by such account; (vi) that, in our opinion, the Balance Sheet and Profit and Loss Account are drawn up in conformity with the law; and (vii) that, in our opinion, Books of Accounts have been kept by the Bank required by law.

The Audit of the Books and Accounts of the Central Office has been carried out jointly by Messrs. S. B. Billimoria & Co. and Messrs. Ray & Ray. The audit of the Books and Accounts of the Local Head Offices has been carried out at Bombay by Messrs. S.B. Billimoria & Co. and at Calcutta by Messrs. Ray & Ray.

9th February, 1961.

This Age of Sillimanite

WITHOUT REFRACTORIES

the WATER we drink cannot be purified by lime and chlorine, both produced with the aid of Refractories. FOOD is obtained with the aid of potash, phosphates and nitrogenous fertilizers, none of which can be produced in adequate quantities without Refractories. CLOTHING cannot be produced in sufficient quantities if Refractories are not available for the power plant. Power plants using Refractories provide your home with heat for COOKING, LIGHT for comfort, and power for essential domestic appliances. It would be impossible to construct FURNACES to extract metal from ORES or to operate Rail Road LOCOMOTIVES. There will not be high octane AVIATION spirit nor LUBRICANTS as suitable furnaces cannot be constructed. STEEL plates cannot be produced for building SHIPS. It will be impossible to make LORRIES, TANKS, GUNS, SHELLS, Invasion BARGES, BATTLESHIPS even. ALUMINIUM and MAGNESIUM used in the manufacture of AEROPLANES cannot be produced. CHEMICALS used in explosives cannot be manufactured. The large POWERPLANTS supplying power, heat and light cannot operate.

Interest Rates, Bank Money and Prices

THE meeting of India's leading bankers with the Finance Minister last Sunday has been successful in producing an integrated approach on at least one central facet of the monetary system, namely, the rate of interest on bank deposits. With effect from March 15, interest rates have been raised roughly half per cent at all levels of deposits. This in itself cannot be a solution of the major problem of providing funds for India's Third Five-Year Plan; but it is a necessary first step in correction of a situation which has been growing gradually more complex. The problem of bank stringency, created by nothing so much as the growing volume of funds induced by planned projects, does not lie in what is frequently described as monetary control. The banks simply have not the money to create unlimited bank credit. Therefore, very properly, the first step has been an attempt to induce the public to place more of their circulating rupee resources with the banks.

To argue that a small rise in the rate of interest will give the banking system the additional resources that it needs to finance both the public and the private sectors—the former by investments, the latter by advances—is too easily to assume all our difficulties away. But it does involve one substantial difference of approach on the part of the Reserve Bank of India. The creation of bank money is now recognized as a necessary alternative to deficit financing. And so long as our production plans remain what they are, it is physically impossible to restrict money supply. Therefore, the attempts initiated from March 11 onwards by the Reserve Bank to control credit, quantitatively or qualitatively, have been misguided. The price problem remains, perhaps all the greater on this account because money supply cannot be reduced. The answer which is to attempt to induce the public to hold more in deposits and impound its spending power is the right remedy and should have been fostered on a much larger scale from the beginning. If it should happen that a rise in interest rates of half per cent is insufficient, there should be no hesitation in raising the rate by one, or even, two per cent, if it could have the desired results. It is sincerely to be hoped that half measures will not be confused with total remedies.

The problem of prices, which has always been in the background in the Reserve Bank of India's thinking, must now be set in the proper perspective. When the Government of India in its taxation proposals induces a direct price rise of one

per cent, and the cost of living will induce at least another one per cent, it is absurd to expect the banks to finance the same volume of production with a constant money supply. In other words, bank money must rise with the rise in prices for which bank money is not the initiating cause. The case of the rise in prices is the Plan, which, in turn, justifies the additional taxation as well as the consequential rise in prices. It is wholly wrong to create an inflexible instrument of a price rise and to act thereafter as though it did not exist. In other words, if the Government of India is unable to impound the necessary rupee resources for the Plan at the higher prices which its successive actions will induce, it must take the responsibility for some degree of compulsion in savings which alone will guarantee that consumer spending will not deny both the public and the private sectors the resources needed for investment.

This vital issue, namely, that stable prices for the period of the Plan are just not feasible, has not been recognized either in the Planning Commission documents or in those of the Reserve Bank of India. The Finance Minister himself admitted that in a developing economy prices must rise. The consequences of this philosophy are now to be built into practical measures. These measures are, firstly, that in addition to deposit insurance, rates of interest and material incentives must make the banking habit grow in areas where it has hitherto lagged behind. Secondly, should voluntary measures not succeed in producing the requisite results, the remedy must be some measures of compulsion. In particular, the Government of India should insist on payment by cheque at all levels of its own vast spending apparatus. Thirdly, Government rates of interest must now be realistic and in line with the fact that it must pay for money the rate at which it is forthcoming. Pressure on the banks to take up securities at an unreal rate of interest, while they are paying substantially higher rates on their deposits, will not succeed. This presages a total movement upwards of interest rates and, unhappily, a depressing effect on Government securities and on the stock exchanges. This is necessarily involved in a realistic policy on the prices and in the long run will probably arrest an even steeper price rise than would otherwise occur. Once and for all, bank money must be allowed to be created for the purpose of financing true production, and interest rates must be flexible enough to draw into both public and private financing agencies the resources needed for development.

Private Foreign Investment : An Open Door

THE inauguration of Union Carbide's splendid new synthetic chemicals plant at Trombay, Bombay, last Saturday, provided a happy opportunity for a clarification of the philosophy which now attends on international collaboration in the industrial field. Mr. Manubhai Shah, Minister for Industry, who inaugurated the plant made a remarkably helpful speech which sought to set in perspective the thinking of the Government of India in his Ministry on the character of foreign participation. He made it clear that the policy, notwithstanding hesitations here and there, was one of an open door; India was proceeding to adopt technologies and develop skills for the long haul. Private foreign investment was welcome in the Indian Union in this adventure, though naturally it would be more welcome in certain areas which helped the balance of payments and raw material industries rather than in fields where less urgency was being experienced. There had, in recent years, been a movement away from limits of participation and, while association with Indians was naturally to be expected and in the long run would be helpful to the enterprise itself, the Government had been flexible and this has been appreciated by foreign companies. In particular, Union Carbide had stated publicly in New York that it was well satisfied with the conditions prevailing in the Indian Union and the plant now opened in Trombay was a positive indication of its intention to enhance greatly its range of products in India. Already the expansion of the plant has been decided upon and it would appear that further developments in fields outside those envisaged in the first proposals are being contemplated.

The predominant impression of those who attended the inauguration at Trombay was one of a remarkable meeting of minds, in which mutual trust has dissipated the differences which arise from approaching a project from the 'free enterprise' and the 'socialist pattern' ends. The major purpose, which was production with the best know-how and the willingness to subordinate ideology to the need of quick production, has provided a solvent of all ideological differences. There may be little difference on the specific role of the public sector and the private sector in getting a major scheme of this size through all phases of sanction and implementation. But where mutual trust exists, the particular form of participation is always capable of solution. Also, it is relatively

easy once agreement has been reached to obtain a relaxing of any particular clause which tends to cause disharmony. This has already happened in one or two cases and the Minister at least made it clear that so far as the Government of India was concerned there was a flexibility in outlook on every matter. Meanwhile, the Budget for 1961, with its reduction of tax on royalties and its reduction of tax on minority shareholdings, has paved the way for even more active participation by foreign private investors.

The question naturally arose whether or not the Minister for Industry was reflecting the views of the Government of India in regard to matters not pertaining to his Ministry. The somewhat unpleasant experience of the oil companies in recent years might indicate that the trust of which Mr. Manubhai Shah spoke is noticeably absent, in another Ministry. This week a quite unnecessary statement by Mr. K. D. Malaviya in regard to the refining of Ankleshwar crude oil has led to a statement by the Chairman of the Bombay Refineries, who has pointed that they had at no time refused to refine Cambay or Ankleshwar oil; only they required adequate information and the settlement of all the necessary details which must arise when the oil of one consistency is mixed with oils for which the refinery has been specially designed. The Ministry of Fuel and Power has much, it seems, to learn from the Ministry of Commerce and Industry. It should be impressed on all Ministers of the Government of India the recognition of the fact that, if production is delayed (as it was in the public sector refineries as a result of the acrimonious negotiations in the starting of Oil India) the country's loss is generally far greater than anything the Ministry gains by a narrow spirit of immediate gain. What is lost by more liberal approach to the foreign investment is almost always gained by the earlier coming into being of foreign exchange earners or savers, and thus the policy of the Ministry of Commerce and Industry has naturally been far more successful than that of the Ministry of Fuel in augmenting India's foreign exchange resources. It is sincerely to be hoped that the spirit of Mr. Manubhai Shah's inauguration speech at Trombay will be reflected in negotiations which the Government of India and State Governments are now conducting in order to implement India's Third Five-Year Plan.

ECAFE: Promise and Performance

ALTHOUGH ECAFE was the second among the four regional economic commissions to be set up by the United Nations—and the first among the three for economically backward regions—it can hardly lay claim to success in maintaining the title to priority in rank which ought to belong to it by virtue of time. It is now in its teens, but over thirteen years of experience have not been turned to fruitful exploitation in narrowing the vast gap between its functional value and the value of the Economic Commission for Europe. Observers of progress in operation may be pardoned if they entertain genuine misgivings whether the Economic Commission for Latin America—its junior in the fraternity of four—has not already begun to steal a march over it.

Vigorous and objective consultation among member countries for closer economic co-operation is the minimum base from which ECAFE, like its counterparts in Europe, Latin America and Africa, is expected to operate. The aim of this co-operation is to secure a growing degree of co-ordination in policy matters of common regional interests. The limits on the potential capacity of the commissions to function as effective instruments to achieve this purpose, which arise from the sovereign rights of member-governments and from the diversity of their national outlook, are recognized handicaps; but they apply to each of the regional commissions. Their magnitude ought not to be exaggerated. Integration, without surrender of national sovereignty, is a dominant emerging trend

in intra-regional economic relationships and the regional economic commissions can make their distinct contribution as agencies for forging a growing degree of cohesion among the countries within their jurisdiction. The regrettable fact is that it is hard to deny the existence, even after thirteen long years, of an element of unreality about the activities of ECAFE. Could it be that it is due to a lack of will and determination to perform its functions with a full sense of faith in its purpose?

This is not to imply that there is absence of any worthy achievements on the credit side of the balance sheet. The Mekong River Project is making satisfactory progress in the fulfilment of the first spectacular phase of building four multipurpose dams on its main streams and four similar projects on its main tributaries. ECAFE has been successful in enlisting the participation of eleven countries and ten UN agencies, besides the four riparian countries which stand to benefit from it directly. India has now declared her decision to contribute her modest share in terms of finance and technical know-how. The Asian Highway network, based essentially on the existing national roads, which aims at providing a well-knit regional system of communications extending over 30,000 miles of all-weather roads, linking the capital cities and main trade centres, is another project which bears special mention. But the anticipation to set up this network in a span of five years "under favourable conditions" is patently wishful and it overlooks the manifold practical difficulties.

There is something more of significance. ECAFE broke, albeit after a full decade, its stagnating tradition of functioning practically as a mere clearing house of information and making it available to member countries after it lost much of its value in point of time. It has opened a modest new chapter in its functions to serve as a clearing house of ideas. It will be four years now that it has laid down for itself the discipline of selecting a specified aspect of the economies of member countries to discuss and examine its long-term aspects and their implications for national policies. This healthy departure has yet to esta-

blish its practical utility as an aid to the solution of the problems of individual countries.

U Nyun, the Commission's Executive Secretary, propounded the thesis, in his speech on the inaugural day of ECAFE's current session in New Delhi, about its role to provide the "philosophic infra-structure" for the development of the region. He has given an elaborate account of special committee meetings, seminars and a "large body of literature" on the subjects taken up for discussion or technical investigation. It could have been richly supplemented by a similar account of results achieved in concrete terms. ECAFE's rounds of intra-regional trade promotion talks is a case in point. Its latest annual survey records the fact that the industrial countries increased their imports from each other by 24 per cent in the first half of 1960 over the same period of 1959, but their imports from primary exporting countries did not rise at all. This is a warning of an incipient trend, fraught with serious consequences to the region which is already under a compulsion to incur a heavy import surplus from the industrial countries. The utility of these exchanges need not be underrated. But the error lies in the almost complete preoccupation with the "philosophic infra-structure". The Executive Secretary has made a mere passing reference to the UN General Assembly's resolution laying great stress on the "operational work" which the regional commissions ought to perform. There, perhaps, is the rub.

An important item on the agenda of ECAFE's present session is the reference made by Mr. Hammarskjöld on a resolution adopted unanimously by the General Assembly for progressive decentralization of the UN's economic and social activities. Unanimous adoption of this resolution means concurrence of the member countries of ECAFE. In this context a significant and pertinent fact which ought to be repeated is the amendment of ECAFE's terms of reference (or charter) charging it with social functions interrelated with economic development. The agreement on decentralisation is in the form of commitment in principle. In view of ECAFE's manifest lapses in its present functions, it would be too hasty to add to its responsibilities which decentralisation implies.

The Coal Comedy

THE coal crisis continues to deepen; it has only changed its complexion. A few months ago when coal shortages were felt in various parts of the country, they were attributed to low output. Now that production has started picking up, thanks to some energetic action taken by the Fuel Ministry, there has emerged a terrible bottleneck in the movement of coal, with the result that in areas situated at a distance from the coal belt one is finding it extremely difficult to carry on with the tight coal supplies. Industrial growth has been arrested to not an inconsiderable extent due to non-availability of adequate quantities of this vital energy producing material.

The comical manner in which the Union Ministries of Fuel and Railways are accusing each other for the tragedy on the coal front is a classical example of lack of co-ordination between the various Ministries at the Centre. The Railway Board takes pride in the fact that it has achieved the target of coal movement fixed for it under the Second Five-Year Plan. Railways, it is said, are moving coal, outside the steel sector, at the rate

of 42 million tons per annum, as against the prescribed target of 41 million tons. This, it is asserted, has been achieved despite an appreciable loss of movement capacity last year due to Central Government employees' strike and unprecedented floods in some States. The Fuel Ministry, on the other hand, is vehement on the point that the movement of coal is not commensurate with the output which is now nearing the Second Plan target rate of production. During the past one month, nearly 3.5 million tons of coal stocks are reported to have got accumulated at the pitheads. The worst affected collieries are said to be in the public sector. Sardar Swaran Singh, Union Minister for Steel, Mines and Fuel, has stated that if coal is not moved from the collieries expeditiously, output will have to be staggered to avoid outbreak of fires at the pitheads.

Obviously, there has been tremendous lack of planning for production of coal as well as its movement. It appears that no correlation between

(Continued on Page 772)

A DELHI DIARY

TROMBAY REVISITED

I SHALL do nothing to hide the naked truth, which is that this Delhi Diary is written from Bombay; with even more pride, let me say that it is written on the Sabbath. I shall, therefore, omit events in Delhi which, I see, include an Adjournment Motion on Mr. K. D. Malaviya's latest well in Assam, of which more will undoubtedly be heard, as well as Mr. Jagjivan Ram's discomfiture over the unhappy manner in which his Railways dropped a journalist member of the Rajya Sabha out of a moving train. In Trombay one lives in a state of animated suspense, with nuclear energy on the one hand and refinery gases breathing fire on the other. For the moment, however, I am too deeply steeped in the stratosphere of advanced chemical research and Greek tragedy, to notice anything else. The chemical research centres round Union Carbide's magnificent new plant for what are called synthetic organic chemicals. The Greek tragedy is the splendid performance of Medea by the Bombay Theatre Unit—I believe the first large-scale attempt to bring Euripides into India. I feel very virtuous thus dwelling in the higher reaches of both science and the humanities which, they keep on telling me, round off a perfect education. Being denied a perfect education by the accidents of youth, and the inevitably enervating diversions of life in journalism, I am glad to say that almost everything that has happened since I arrived in Bombay on Friday was new. Certainly the chemical reactions which go on behind the mysterious tubes and pipes and great pressure vessels in Trombay were a continuous mystery to me. Of alcohol I had heard in another connection, and indeed, I might claim to have had a little experience of its more potent properties but of acetic acid, n-butanol, butyl acetate and ethyl acetate, all of which are now being produced at Trombay, I knew, until Saturday, not a thing!

INNOCENT ALCOHOL

Who would have thought that from very innocent alcohol, obtained from even-more-innocent sugarcane, there could be built up some of the most remarkable raw materials and intermediaries required in industries ranging from textiles, through drugs and dyestuffs, plastics and insecticides to artificial pearls and celluloid bangles? I have collected a goodly set of samples, and I am prepared to display to any fan, a pencil which contains at its top some special resin which, authoritative sources tell me, have been produced by this happy process. I have not yet checked details; I accept all I am told in faith, because more things are wrought by faith than this world dreams of. Anyhow, as I have been saying, from alcohol, after much compressing and piping, there is produced a substance called acetaldehyde. As is usual in all extraordinary chemical processes, and that most extraordinary thing called atomic fission or fusion, hydrogen has something to do with the reaction. In this case hydrogen has to go meekly through a catalytic convertor, but, as is not unusual, it keeps on eluding its chaser; it is eventually to be caught by what are called condensers. Then, of course, there must be a 'recycling'; out of recycling, best shown by a series of polygons, somehow or other, butyl acetate and ethyl acetate appear as by magic and, of course, are conveniently located at the right places so that they can be easily extracted and contribute to India's Welfare State. The whole plant which brings about this happy result has cost Rs. 4.5 crores and, if my arithmetic is right, will produce 15 million lbs. of polythelene and chemicals worth Rs. 2.5 crores. More important, though it does not follow from the chemical reaction, the country will save annually in foreign exchange about Rs. 2 crores!

The result of this beneficent transformation is to lay the flattering unction to the Government of Maharashtra's distressed soul that its Chitali distillery, situated 200 miles from Bombay, is no longer corrupting the country, but is contributing powerfully to economic progress, notwithstanding the fact that it is synthesizing and, therefore, presumably incorporating artificial, as distinguished from more Gandhian, techniques of transformation. Actually the Government of Maharashtra—tell it not in Gath!—is selling three million gallons of alcohol and making a substantial profit on the transaction. Thus does good come out of evil; alcohol which, until our industrial age really dawned, was actually thrown foolishly down the wrong channels, has, become a great raw material, a saver of foreign exchange and a giant contributor to Maharashtra's budget. No doubt it has other virtues, too, which I have not yet discovered.

PARTNERSHIP PLUS

The inauguration by Mr. Manubhai Shah, Union Minister for Industry, was attractive and satisfying on its own account. This is because there was revealed in the speeches of Mr. J. R. Galloway, Managing Director of the Union Carbide in India and Mr. Kenneth Rush, Vice-President of Union Carbide of the USA, on the one hand, and Mr. Manubhai Shah, on the other, a spirit of happy partnership, which was the more welcome in view of some of the dubious statements which are sometimes made in regard to what is mysteriously described "as the economic climate" for private foreign investment. Mr. Galloway spoke warmly of the experience of Union Carbide (India), formerly the National Carbon Company in India, and Mr. Manubhai Shah mentioned the extraordinary help that a President of the Union Carbide had given the Finance Minister and himself when they were facing some considerable embarrassment at a meeting of critical businessmen in New York. Apparently, a statement was then made that of all the countries where the Union Carbide had operations—I believe there were 37—India was on the top of their list for happy experiences. I wonder whether oil companies, wrestling with Mr. K. D. Malaviya, will echo this sentiment in equal measure!

EURIPIDES IN BOMBAY

I have had the experience (twice) of sitting in the famous theatre near the Acropolis in Athens as an Athenian would do in the time of the great giants of Athenian literature. Only on both occasions there were no plays being enacted. Nevertheless, one had a sensation of living in a great age. In Bombay on Sunday the position was somewhat reversed. The Theatre, an improvised open-air one, if I might say so with some respect, was on an unduly high level from the ground, had no marble sets and no grand history in the background. But, on the other hand, there was a real play bringing Euripides back to life with something like the grandeur of its original setting. And thus it is that one had a sense of completion putting together the empty theatre on the Acropolis with the full presentation of Euripides' masterpiece Medea. Like all Greek tragedies, it works itself out bloodily; Medea, after murdering her own brother, actually strews the pieces of his body over the water so that her father's fleet, while collecting the fragments, lost time in pursuing Jason. Usha Amin as Medea gave a superb performance and the whole setting with the production by E. Alkazi, made one proud of the capacity of Bombay's Theatre Unit to rise to great heights. I pay them tribute here, and greatly daring, promise to assist them in an effort to establish a repertory company with a regular performance of three "new" plays per season!

THE WEEK'S NOTES

Agriculture

LARGE-SCALE MECHANIZED FARMING

THE FIRST report of the Damle Committee on large-sized farms has just been submitted to the Government of India. The Committee was appointed in February 1959 to examine in detail the economics of large state-owned farms in the light of the experience gained at the Central Mechanized Farm, Suratgarh, with a view to setting up more such farms elsewhere in the country. The Committee has come to the conclusion that a farm like Suratgarh Farm can earn an annual return of 6 per cent over the initial capital invested after fully recovering the expenditure including interest on capital and depreciation on capital assets, provided the necessary facilities, particularly perennial irrigation, are available. Thus, the Committee feels that the entire investment over a large sized mechanized farm could be recovered in a period of 16 to 20 years, making allowance for one bad year in every slab of four years. It is obvious that the element of uncertainty arising out of vagaries of nature has been taken into account. But, one is not sure if the element of risk arising out of price and cost fluctuations has been adequately appreciated while making these flat estimates. It is apparent that the Committee's conclusions are subject to correction on account of risks of changes in prices of agricultural commodities and in their cost of production.

In the light of detailed calculations made on the basis of proposals received from the State Governments, the Committee has recommended setting up of a farm at Jetsar, near Suratgarh in Rajasthan. The Committee, however, regrets to mention that the response from the States to the enquiries regarding availability of land was poor. The Committee felt that the States had not fully appreciated the advantages of having large sized mechanized farms and due attention and thought had not been devoted to this important possibility. Due to the paucity of many blocks that have the necessary facilities for large-scale mechanised farming, it was not possible for the Committee to suggest many sites.

In this connection, the proposed Land Ceilings Bill of the Government of Maharashtra may be recalled. If the object of the Government is to attempt to secure higher production at lower costs, then the move to apply land ceilings on agriculture land cultivated by industrial and commercial undertakings on modern farming techniques is nothing but a grievous retrograde step. This particular exception made in favour of the Maharashtra Ministry is a serious error of judgment. There was no justification for a departure from the principle of policy not to apply ceilings to such lands.

A word of caution is, however, necessary. The Committee has based its recommendations on certain tentative crop pattern for the first two years on the new farm; but the crop pattern may have to be modified after results of detailed soil analysis are known. Such modifications may materially alter the conclusions on which the recommendations are based and this aspect of farm planning and the consequent effect on profits should be fully appreciated while finalising decisions; for many grandiose schemes of the Government have come to grief for lack of adequate safeguards at the initial stages of planning and execution.

Press

TRAGIC END OF K. RAMA RAO

THE CIRCUMSTANCES under which Mr. K. Rama Rao met with his death are poignant indeed. He is reported

to have fallen from a running train while travelling from Patna to Lucknow. The train could not be stopped though some fellow-passengers repeatedly pulled the alarm chain; the alarm cord in that section of the train had been blanked off. Mr. Rama Rao was picked up an hour and a half later by the Janta Express and by the time medical aid could be provided life in him was extinct.

Whatever justification there may be for blanking off alarm chains on some sections of the railways in the interest of checking unnecessary stoppage of trains, it is highly deplorable that the safety of passengers should be jeopardised in the process. The statement of the Railway Minister, Mr. Jagjivan Ram, in the Rajya Sabha after this tragedy took place—orders to blank off alarm chains on the Dinapur section of the Eastern Railway, where the tragedy occurred, would stand, he said—amply speaks of his utter callousness towards safety of railway passengers which should be his first responsibility as Railways Minister. If the alarm cords are to be disconnected without any alternative arrangements being made for ensuring the safety of passengers, especially at times when armed robberies on trains are not infrequent, the railway using public runs a great risk.

Mr. Rama Rao was a veteran journalist who had a chequered career in the Indian newspaper world. He was perhaps the only journalist who had the distinction of having served on the editorial staff of over a score of newspapers in one capacity or the other. He will be long remembered for his association with the "National Herald" where as Editor he crossed swords with the then British authorities. He gave ample indication of the fiery writing that was to come from his pen at the very dawn of his journalistic career. Handling a news story dealing with a labour strike during his apprenticeship period with "The Leader", he headlined it "Bayonets Lose Terror".

Mr. Rama Rao rose to great heights in the intense phase of the freedom struggle. The information he collected from inside the jail where detenus of the 1940 Individual Satyagraha were huddled together and the editorial—"Jail or Jungle?"—he wrote based on this information earned him the wrath of the authorities. The way he outmanoeuvred the Government of the day during the Quit India Movement of 1942 on the question of closure of the "National Herald" is an epic story in Indian journalism; not even his staff knew when the paper was to suspend publication. And the fiery editorial "Vandemataram"—a call to the nation to rise against the British Raj—which he smuggled into the journal on August 15, 1942, under the very nose of the censorship authorities, landed him in jail for six months. What utter disregard he had for his personal welfare while serving the national cause is apparent from his retort to the Editor of "The Pioneer" who telephoned to him the following day to inquire about his likely means of livelihood after the closure of the "National Herald"; "It is a soldier's life. God is great. You need not worry," quipped Mr. Rama Rao. The popularity he enjoyed as the Editor of the "National Herald" can be gauged from the fact that when in 1941 he was asked to furnish security of Rs. 6,000, public came forth to raise a fund of Rs. 48,000.

Mr. Rama Rao belonged to an age when one served journalism with missionary zeal. And he lived through his journalistic career with that ideal in view. In the post-Independence period; he found himself out of tune with the changed circumstances; though he edited a

number of newspapers after 1947, he could hardly rise to the heights he attained during the War years. Mr. Rama Rao's knowledge of the technical details of newspaper production was perhaps unsurpassed. His standards were exacting. He himself set the example of hard work, that is the lot of a conscientious journalist, by working 16 hours a day and even from the sick-bed. The service he did to Indian journalism by training scores of young journalists speaks of how dear to the heart he held his profession.

Public Accounts Committee Report

STRICTURE ON ISCO AND ON ROURKELA PRODUCTION

THE PUBLIC ACCOUNTS COMMITTEE has suggested a thorough investigation into the working of the Iron and Steel Control Organisation in its 34th report, presented to the Lok Sabha this week. This suggestion has been caused due to the placement of contracts with a black-listed firm "in clear disregard of Government's orders" by the Iron and Steel Control Organisation. Here is another case of mismanagement of public funds and of public trust which has been shaken by a public undertaking.

The Ministry of Works, Housing and Supply black-listed a firm with all its branches and associate firms in August-September 1954 under intimation to all the Ministries of the Central Government. The persons connected with the black-listed firm floated another

limited company and the Iron and Steel Control Organisation placed about 52 contracts, valued at about Rs. 23 crores during the period June 1955 to October 1956 for import of steel. The Ministry of Steel, Mines and Fuel issued separate orders in October 1956 banning all business dealings with this firm, both in the old name as well as in the new garb. What is surprising, even after the issue of this second order, 10 more contracts were placed on the same firm during the period November 1956 to January 1957, valued at Rs. 4.12 crores. The Accounts Committee has very rightly insisted upon a thorough investigation into the very working of the Iron and Steel Control Organisation.

The Public Accounts Committee has also drawn attention to lack of co-ordination between production of iron and steel on the one hand, and transport of coal for the steel plants on the other. The Committee has very rightly emphasized the need for a high degree of co-ordinated effort on the part of the Ministries of Steel, Mines and Fuel and of Railways, so as to avoid any possible bottlenecks. As a matter of fact, only 30,000 tons of pig iron was produced per month during April to August 1960 against the rated capacity of the two blast furnaces at Rourkela of 60,000 tons of pig iron per month. Lately, the Railways have been strongly criticised, both in the Press and Parliament for not coming up to the expectation of planned development of the country, and here is another example of lapse of the Railway Ministry where it should pull itself up. It is high time the Railway Ministry wakes up to its responsibilities which it owes to the nation.

THE COAL COMEDY

(Contd. from Page 769)

production and movement of coal was established by the Planning Commission while drawing up the Second Plan targets. It was probably due to the fact that targets were fixed not on requirement considerations but on financial ones. The tight financial allocation made for the Railway Ministry, it is understood, compelled it to readjust its coal movement plan in 1958 when the Ministry of Fuel started talking in terms of 56 million tons target of coal production instead of 60 million tons target provided in the Plan. Even when at a later stage it was decided to stick to the 60 million tons coal production target, no corresponding stepping up of the railways' developmental programme was insisted upon.

The second factor that has led to the current coal crisis appears to be the anxiety of the National Coal Development Council, though well-intentioned, to achieve the target fixed for it by concentrating on development of mines from where movement of coal had to be effected through one of the biggest bottlenecks of the Indian railway system — Moghulsarai. There was little justification for the NCDC to have gone on concentrating on production in the Karanpura coalfields despite repeated warnings from the Railway Board, and the advice tendered to it by the Planning Commission to alter its fieldwise programme of production in favour of Central India coalfields which could serve some of the West and South Indian industrial centres.

The coal movement crisis has got two components: one arising out of the bottlenecks created by the railway track capacity and the other shortage of wagons. In the immediate future not much can be done to increase the track capacity; laying of new railway lines is a time consuming process. So to alleviate the distress caused by shortages

of coal it is essential that wagon production programme should be stepped up immediately. The measures such as creation of coal dumps in various States, haulage of coal by road transport over short distances and coal shipment by sea to South Indian centres can only be useful in the short run because they envisage increased cost to the industry and the general consumer which may not be resented for a short while. From the long-term point of view, it is essential that the development of railways should be thought of in terms of meeting the growing demands for coal movement. No lesson appears to have been learnt by the Planning Commission from the Second Plan operation. The allocation for railways' development in the Third Plan is as tight as it was in the Second Plan. It is not too late as yet to correlate railways' capacity to carry traffic with the production envisaged under the next Plan. For the foreign exchange component of the railways' development programme enough funds can be secured from the World Bank and other international lending institutions. It is hoped that rupee resources will be made available to the railways to increase their movement capacity to an extent which should not only be enough to carry the anticipated load of traffic but would also provide for some surplus capacity to be made use of under unforeseen contingencies.

The railways in the short-run will do well to improve their operations which, according to some authorities, have shown some deterioration during the recent past. Turn-round of railway wagons is alleged to have slowed down; it can be speeded up to not an inconsiderable extent. Creation of coal dumps at some of the railway bottleneck heads can also be useful though it will entail some additional labour costs to reload coal in railway wagons. This should go some way in alleviating the distress of the public sector coal mines in Karanpura area.

STEEL PRODUCTION SOARS BY 173% AT MUKAND

In 1940, Mukand employed 694 men; in June 1960—2,187. Over the past seven years, production figures have soared—18,234 tons in 1952/53; 49,787 tons in 1959/60. This increase is a reflection of a good management of finances:—

	1957/58	1958/59	1959/60	
	(Rs. in lacs)			
Capital	51	51	71	Mukand manufacture high-grade steel products—bars, rods and castings. Presently an expansion programme is under way. It will cope with the growing influx of big orders—like the one placed by the Railways with Mukand on 16th July 1960 for 4,035 sets of Centre Buffer Couplers valued at 84 lacs.
Depreciation provided up to date	32	36	41	
Profits retained in business to date	25	35	45	
Profit for the year	19	30	32	
Dividend for the year	5	5	8	

Mukand provides India's new and growing industries with the quality steel components they must have.

AFTER NEHRU—WHO ?

By

ODYSSEUS

AFTER NEHRU, WHO ? This is the question which every visitor from India is asked in the UK. The names most mentioned are those of certain admirable but perhaps somewhat elderly politicians. I do not know if the Congress party and the Praja Socialists have any organisation like the British Young Conservatives Organisation. Even if they have I would still have liked some of the patriarchs of the Congress to have attended the National Conference of the Young Conservative Organisation recently held in London. Membership of the Y.C.O. is open to boys and girls between the ages of 16 and 35. With over 200,000 members, the Y.C.O. is the largest voluntary political youth organisation in the free world. It has branches in every division of every constituency. These branches organise social meetings for dances, tennis, etc., study groups in which every kind of political, economic, and social problem is tackled, and, of course, debates, in which boys and girls acquire confidence in public speaking.

The average British Conservative M.P. is 48, the average Socialist 55 years of age. Of the M.P.'s below 39 years of age, there are 75 Conservatives and only 18 Socialists. The largest single Conservative age group is 45/49, which numbers 75. With the Socialists, the largest is the 50/54 age group, numbering 52.

The comparative youthfulness of Conservative M.P.'s has two causes. First, the Labour party is, as its failure in three elections running suggests, fighting old battles with obsolete ideas and therefore finds more supporters among older than young people. Secondly, in the Y.C.O., the Conservatives have an excellent nursery, both of candidates and of party workers. 300 Y.C.O.'s are candidates in the forthcoming municipal elections, and such confidence have the elders of the party in them that Young Conservatives will be entrusted with the responsible task of being in complete charge of many branch campaigns.

The 1,100 young people, about evenly divided between men and women, who attended the National Conference, all had a sound command of debating procedure, and it was obvious that most of the speakers had made real studies of their subjects. My recollection of debates among Indian students is that most have self-confidence but that few have made any serious study of the problems about which they are so fluent.

FIVE CABINET MINISTERS

The presence of five cabinet ministers (for Colonies, Commonwealth Relations, Home Affairs, Defence, and the Prime Minister himself) at the Y.C.O. conference suggests the importance that the Conservative Party attaches to cultivating its younger supporters. Moreover, the speeches of Mr Heath on the UK's relations with Europe and Mr Macmillan's references to Africa, were head-lined by the press the next day as major declarations of policy.

The Young Conservatives did not indulge in flattery of the Conservative "establishment." One resolution, for example, said: "The young Conservatives deplore the unctuous terms of so many of the resolutions submitted to the party's annual conference," which evoked from Mr Ian Macleod (Minister for Colonies) the smiling comment: "Automatic and indiscriminate praise is

one of the dreariest features of our conferences. We must put this right. The matter is in your hands. Apathy is our besetting sin. The government welcome the spur of your comments and even the lash of your criticisms."

Again, while upholding the UK's possession of nuclear weapons, the Young Conservatives voted unanimously to omit a sentence in the resolution endorsing the government's defence policy, which speaker after speaker condemned as muddled and uncertain. Mr Watkinson, Defence Minister, took his medicine gracefully, saying "I'm not sure that I endorse my own policy myself!"

Another motion, "That this conference, while recognising the government's efforts to reduce taxation, believes that the present rate of taxation deters increased productivity," was widely criticised on the ground that money for social services must be found, and was defeated by a large majority. In company with many other economists, I consider that the burden of UK taxation seriously impedes economic growth. I agree, for example, with the several recommendations made in Political and Economic Planning's new report "Growth in the British Economy" (Allen & Unwin 1960). But when you reflect that Conservatives are always popularly supposed to be clamouring, contradictorily, for lower taxes and more welfare, the Y.C.O. resolution shows that these young people refuse to acquiesce in superficial generalities and have a grasp of current political realities.

BRITAIN IN EUROPE

A resolution of outstanding interest, which evoked a high level of informed discussion, said "This conference urges the government to ensure the UK's full and active support for the formation of an economically and politically integrated Europe." Proposing this William Shearman, aged 23, of 806 Romford Road, LONDON, E.12, who is Chairman of the East Ham North Y.C.O. branch said: "Since the end of the war, Europe has waited in vain for the UK to take the lead for unity. At last, despairing of the UK, the Six formed the Common Market. In order to keep pace with Europe, the UK formed the Free Trade Association of the Seven. Europe is therefore divided into two blocs, which in the long run can only be harmful, economically and politically, to Europe and to Western civilisation... It is time that the UK took the initiative for European unity. The European Economic Community has proved itself. Trade between the Six has increased far beyond expectations... EEC exports to the rest of the world have risen 22 per cent, imports 24 per cent, internal trade by 30 per cent... We must bring about a customs union embracing the Six and the Seven..." After pointing out that the loss of Imperial Preference would be unimportant to UK trade, Mr Shearman went on: "Obviously economic unity will bring political integration... whether federal or confederal this could only be advantageous..." Space limits as to these snippets from Mr Shearman's speech, but enough perhaps remains to suggest that it contained some tough thinking for a young man of 23. This resolution was carried by 585 to 510. My guess is that a nation-wide Gallup poll on this resolution would reveal a narrow majority against it, because a large section of British opinion clings to the concept of national sovereignty, and also

fears that since the Commonwealth is an association of sovereign nations, the loss of UK sovereignty would disrupt Commonwealth relations. That this resolution was carried by a small majority of young Conservatives suggests that they are a progressively minded group. This resolution was, incidentally, carried before the UK government's offer to join in a customs union with the Six was known.

When the Prime Minister addressed the conference at the end of the day, he was obviously delighted that the young Conservatives had been kicking over the traces. "There has been much healthy criticism," he smiled, "and a healthy disrespect for your elders." The conference closed with a speech of thanks to the Prime Minister by Miss Patricia O'Gara, Vice-chairman of the Y.C.O., whose intelligence, youthful vivacity, good looks and charm, rejoiced my elderly heart. She referred to a passage in Mr Macmillan's speech in which he had recalled that as a young man after World War I, he, in common with many friends of his generation, were anxious to play their part in the work of reconstruction, and to make their contribution to the public life of their country. But, commented Miss O'Gara, Mr Macmillan's elders did not give much heed to the views of youth. On the other hand, the presence of Mr Macmillan and four leading members of his cabinet showed, Miss O'Gara said, that the Prime Minister was creating a sound new precedent. "Today, you are ready to listen to youth," she said. I happened to be sitting a few feet away from Mr Macmillan and I could

see that he was touched by Miss O'Gara's words. The tears welled in his eyes.

I must mention the conference chairman, Mr Andrew Bowden, who looked to me about 28. He controlled the debates of the thousand lively young people with the ease and skill of a man twice his years. On several occasions he had to give rulings on points of order and to deal with two or three noisy demonstrations. He did so with a good humour and a courteous firmness which together revealed that he possessed the two essential qualifications for a successful chairman: a conciliatory sensitiveness to the shades of feeling in the house that disarmed opposition, and a complete mastery of the rules of debate which inspired confidence in his impartiality and ensured quick acceptance of his rulings.

Is there a moral for India in all this? None at all if the political leaders in the states are already organising groups among the young to train them for political service to their country. But if they are, there must have been a big and fairly recent change. It is not so long ago since contacts between political leaders and youth were limited to organising students to march about shouting slogans. Whatever that is, it is not training for a serious political career. If any Indian politician is interested in securing details of the Young Conservative Organisation's constitution and methods, he can write to the Chairman, 32 Smith Square, London. S.W. 1., where, incidentally overseas visitors are always welcome.

dynamic the industrialist takes a step forward

Every step towards Hannover Fair is a step forward in industrial progress. At Hannover you will learn the latest production methods and techniques... exchange ideas with leading international industrialists... see over 5000 exhibits from all over the world... feel the driving force of modern industry!

Groups exhibited include:

Mechanical & Electrical Engineering, Iron & Steel, Non-Ferrous Metals, Chemicals and Plastics, Rubber, Building Materials, Precision Mechanics and Tools, Optics, Office Equipment, China, Ceramics, Glassware, Clocks and Watches, Jewellery, Hardware and Cutlery, Handicrafts, Gift Articles — and many others.

THE ONLY WORLD AIRLINE THAT HAS FLOWN MORE THAN 2,000,000 JET PASSENGERS

*The European Scene***WHEN COLONIAL CAPITAL COMES HOME**

From Our Special West European Correspondent

PARIS, March 13.

COLONIAL capital is never just money, but the investments of enterprises of a particular sort. This banal statement needs to be borne in mind in order to understand many of the economic aspects of imperialism, decolonisation and their aftermath. Money seldom crosses the seas without taking with it abilities, interests and "know-how" of quite specific kinds, and in the case of typically colonial capital these relate to trading and its finance, plantations and certain administrative functions (e.g. zamindari companies or the Suez Canal Company when it was simply collecting transit charges). This explains why even the most profitable colonial investments cannot be assumed to be in the interest of the imperialist country as a whole, since they inevitably imply a diversion of home savings away from progressive productive industry to commercial and agricultural operations. Witness the technological advance taken by non-imperialist countries like the USA and Germany over the colonial powers, Britain, France, Belgium and Holland in the first half of this century. Imperialist interests in those latter nations protested that they were working in the cause of all their compatriots, and pointed to the share-out of colonial profits that certainly took place. Nevertheless, they were working at the expense of progressive forces in their own country: a half-century of colonial profits in the Congo has left Belgium technologically backward.

Similarly, it explains why newly independent colonies at once begin wooing the ex-imperialist for more and more capital, and only turn to non-imperialist lenders like the USA and West Germany because the technological backwardness of the former imperialist (due to its colonial investments) means that it cannot provide the sort of capital that the developing nation needs more of. If possible (and in some cases it has been possible) the ex-colony would like to get more capital from the ex-imperialist than ever it received in colonial days—only, it now wants capital of a different sort, bringing with it abilities and know-how unknown to colonial investors. Umbrageous nationalists, who imagine that all British capital is just plain money, regard this as "neo-colonialism" and talk of "new East India Companies"; perhaps they are encouraged in this by the practice of stating foreign capital needs, in the national plans, in money terms, which is meaningless because capital can be of so many different sorts that it can scarcely be added up. Capital invested in India by ICI, Metal Box, Pfizer or Krupps-Demag means something totally different from capital invested by tea companies or exchange banks, because those firms send abroad different abilities and represent totally different political forces in their country of origin.

This can be proven when we see what colonial capital does when it goes back home after decolonisation. As has been said, the net export of capital, measured in money, from the ex-imperialist to the ex-colony may actually increase after independence, but the bulk of it is now being put up by progressive productive industry which was handicapped, both at home and abroad, during the imperialist age. On the other hand, colonial capital that was invested in trading, plantations, and para-administrative work (e.g. the US capital that Fidel Castro has just nationalised in Cuba: sugar plantations, import trading and public utility monopolies) goes home for good and all. Now if it were just money, this repatriated capital would disappear into

the anonymous pool of the country's financial resources. In reality, it very often reappears on the metropolitan scene, just as it first appeared on the colonial scene, as the purveyor of specific abilities, seeking not just any profitable investment but the sort of work it has been accustomed to.

The interesting thing is that when colonial capital comes back home it can often claim, just as industrial capital does when it goes to a developing country, to bring know-how of a sort both unfamiliar and valuable in the metropolitan country's economy. This is because, during its expatriation in the colony, it has learned skills not common in Europe; in particular it acquires a taste for bigness—e.g., mass trading in commodities, or extensive agriculture—for which it found scope in the vast colony while the home country remained under the influence of small shopkeepers and peasants. Thus the impact of homecoming colonial capital can be considerable. Whereas the impact of foreign capital on a colony has been extensively studied, no one, that I know, has systematically examined the reverse process that I am talking about here. It may be seen, already, in the first act of decolonisation in modern times: the eviction of the Spaniards from their last imperial possessions, in Cuba and the Philippines, in the Spanish-American War of 1898. A large amount of Spanish capital was obliged to abandon the colonial positions it held in those countries; the Americans, by and large, took over the same positions in Cuba and held them until Fidel Castro, and they still hold them in the Philippines. On its return to Spain, and more precisely to Catalonia and the Basque country, this capital touched off a minor economic revolution in that decadent country, restored Spanish fortunes for a time at the beginning of this century, and caused the economic unbalance between the centre and the northern provinces that has not yet been corrected.

Naturally, the process may be seen on a much larger scale in contemporary decolonisation and it will repay some student's effort one day to follow through the movements of repatriated colonial capital to Britain, France, Holland and Belgium. It is already clear that the re-activation of the vast resources of the Suez Canal Company since 1956, in the Suez Finance Company and others, will prove to be one of the most important stimuli to economic progress in West Europe in recent years. There is scarcely an industry in France that has not by now felt the financial support of the Suez Company in its most active members, and if the tunnel and/or bridge is ever built under/across the English Channel, it will be thanks to Suez capital—a choice of investment that is not accidental.

More immediately significant is a commercial revolution that is just beginning in this country and which will change everyday life here radically by 1965. It is the work of a loose consortium of colonial capital: the Indo-China banks, the giant trading corporations of tropical Africa and the ubiquitous Suez Company. When the prospects for commodities trading in Africa darkened last year, the West Africa Commercial Company (annual turnover Rs. 95 crores), the French West Africa Company (turnover Rs. 101 crores) decided, along with somewhat smaller traders like the Optorg Co. and Peyrissac, to bring funds back to work in France. Looking for something to do, they not surprisingly thought of commerce, a field that is still dominated here by 360,000 small shops and a few food chain-stores dating from the last century. Joining hands with Indo-China and Suez

**Having fun—wish you were here**

Puri. Sea's warm, wonderfully refreshing. Lazy hours on superb beach, perfectly peaceful. Acquiring antiques—also smattering of temple architecture. Prolonging week-end by week. (No trouble getting Wills' Gold Flake—really fresh—wherever you go they're good.)

Issued by The Imperial Tobacco Company of India Limited

capital and with Belgian funds whose availability probably had something to do with the Congo, they set out to revolutionise French retailing. In the last few months they have formed no fewer than 23 supermarket companies with a total initial capital running into tens of crores and which plan to open by 1965 as many as 3,000 supermarkets. Accustomed to the wide horizons of the colonies, these super-merchants find France much too small for their ambitions, and they are organising their activities on an international scale. They are forming supermarket supply companies to buy and distribute throughout all West Europe, holding companies to run international chains of self-service, discount department stores, and investment trusts specialising in buying premises for supermarkets anywhere in Europe, renting them out for a percentage of turnover.

This invasion of colonial commercial capital will no doubt be described as Americanisation, but then homecoming colonial capital is usually so described in Europe. For example, when North African agricultural capital began coming home several years ago it was said to be treating the south of France as though it were the US mid-West: It bought up huge blocks of land in depopulated areas, deserted by the peasantry, ran them together, wiped out hedges and walls and introduced the extensive-farming methods it had long practised in North Africa. Most of the people responsible for this operation had never seen the USA; they were simply repeating in reverse the methods of colonists in North Africa a century ago, and of plantation mana-

gers around the world since colonisation began. (To complete the analogy, they even set French peasants to work as day-labourers and treated them rudely.) In general, what Europeans call Americanisation often has nothing in particular to do with the USA but is just the application in conservative Europe of large-scale trading and farming methods that have been learned in the wide open spaces and the freedom from traditional restraint that characterise both the colonies and the New World.

The reappearance of the colonial traders on the European scene will have far-reaching effects. They will split open the closed circuit of European retailing, which was marked by vertical concentration between manufacturers and distributors, and put the business of retail commerce into the hands of professional merchants dedicated to selling anybody's goods as quickly and as cheaply as possible—while providing as little personal service to the customer as the Negro gets when he swaps his cocoa beans for coloured cloth in a jungle trading post. They will incidentally ensure that the foreign goods made available by the Common Market and the end of dollar import-bans get right through to the European consumer. There was no guarantee that this would happen with the old retail system, where small and inefficient shops sold what their suppliers gave them—at prices fixed by the manufacturer. The repatriation of colonial trading capital will make a reality of freer European trade for the ordinary consumer.

India today is caught up in the feverish activity of industrial advancement. Projects are planned...dams are being built...all through the night we hear the ceaseless hum of men and machines at work. In the world of today, the economic development of a nation is gauged by her machines...and the STEEL consumed by them. In dams and bridges, in the railway and automobile industry, in the manufacture of the thousands of consumer goods, STEEL is necessary—absolutely necessary! And so steel has come to be indicative of the economic development of a country...indicative of what a country is worth in cold hard cash.

DIRECTORY OF

INDIAN ENGINEERING EXPORTERS FOURTH REVISED EDITION

We are glad to inform that material for publication of the fourth revised edition of the Directory is now being collected by the Council. The Directory will contain names and addresses of Indian manufacturers and exporters, who are members of the Council, along with the details of exportable engineering goods, an illustrated chapter on important brands and trade marks in Indian engineering goods and other useful news and information such as addresses of Indian trade representations in foreign countries and foreign trade representations in India, list of Showrooms, Showcases maintained by the Government of India in foreign countries etc.

The book will be printed on imitation art paper and will contain hundreds of illustrations of exportable products in the engineering line.

This Publication provides very good media for the manufacturers/exporters of engineering goods for carrying their advertisement. Advertisement rates are as follows:—

Full Page	..	Rs. 500/-
Half Page	..	Rs. 300/-
Quarter Page	..	Rs. 160/-

Economic Report from the U.S.**C.E.A. REPORT**

By GUY SIMS FITCH

WASHINGTON, March 8.

NO other country is so constantly, so fully and so carefully analyzed as is that of the U.S. From government officials, from scholars, from businessmen, and from various quarters both friendly and hostile, comes a seemingly endless flow of comment on U.S. economic conditions, trends and prospects. All this may be accepted as an inevitable consequence of traits which seem almost ingrained in the American character. One is the penchant for self-examination, and the self-improvement that flows from it. Another is the common and usually uncritical acceptance of the "open society" concept, and its application to economics. It sometimes appears that American economists and government officials can neither boast about a favourable trend nor hide an unfavourable one, so evident are these developments from the voluminous and uncensored U.S. statistical records and public discussion.

Much of this discussion, of course, can and should be relegated to this proper place: personal opinion. And from that vantage point it should be evaluated for accuracy and reliability. But amid the welter of comment and proposals there also emerges a coherent government viewpoint that merits the designation of "official." Such a viewpoint is now available in the form of a 56 page report presented to the joint economic committee of Congress by President Kennedy's Council of Economic Advisers (CEA). Coupled with the testimony before the committee by CEA Chairman Walter Heller, the report amounts to the most comprehensive review of US economic conditions and requirements yet offered by the Kennedy administration. Planned by his two fellow Council members — James Tobin and Kermit Gordon — Dr. Heller laid bare to the Committee the administration's hopes and fears for the American economy. In substance, CEA expects a "noticeable" pick-up in economic activity within the next few months, but cautions that such an upturn "would be only the beginning, not the end of the solution to our economic problems." The key problems, as described by Dr. Heller, concerns "taking up the slack" between "that we are producing" and "what we can produce."

To document this point, the CEA report details what it terms the difference between actual and potential output last year. It puts this difference at \$30,000 million to \$35,000 million, or 5 to 7 per cent of the record 1960 gross national product (total output of goods and services) of \$503,200 million. What is more, according to Dr. Heller, this gap between the potential and the actual "has shown a distressing upward trend" for the past half-dozen years or so. At present, given — as he put it — the weak recovery from the 1958 recession followed by the business dip of the past 10 months, the gap can be measured at about \$50,000 million. According to this reasoning, it is Dr. Heller's contention that even if the gross national product by the last quarter of 1961 achieves a level 3.5 per cent higher than the last quarter of 1960 — a substantial year-to-year gain of about \$18,000 million in constant prices — the situation still would not be wholly satisfactory in terms of production, incomes and employment.

In this context, the Kennedy administration seems to draw small comfort from the fact that the current recession has been even shallower than the other brief and modest postwar dips, and bids fair to give way soon to a rise that will carry the economy to new peaks. Involved in this dissatisfaction with current trends is a vision of an increasingly prosperous U.S. with more production, more jobs, more incomes, more personal well-being and more goods and services of all kinds. And it is clear from the tenor of the CEA report and the related Heller testimony, that the President and his young family of vigorous intellectuals are confident that the U.S. has the resources and the dedication to fulfill its glowing economic promise. What this amounts to, then, is a clarion call for an acceleration of the nation's long-term economic growth, for a frank recognition that what may have been good enough yesterday should not be accepted as good enough today. With the economy below its potential, say President Kennedy's advisers, "the expansionary effects of government programmes will be welcome even if they occur well after the recession has been reversed."

Fig Latex as Clotting Agent in Cheese Production: Scientists of the Central Food Technological Research Institute at Mysore have successfully isolated a milk clotting agent from the latex of semi-ripe fruits of the fig variety. The clotting agent can be used in the production of cheddar and processed cheese. Large scale trials have been carried out with the processed fig latex at the Kaira Co-operative Milk Producers' Union, Anand, and at the Regional Station of the National Dairy Research Institute, Bangalore. It has been found that fig latex is a good substitute for the commonly used animal rennet. In India, processed cheese and animal rennet are largely imported. The total cost of cheese manufacture with the vegetable rennet (fig latex) works out to about Rs. 7.70 per Kg. as against Rs. 12.22 per Kg. for imported cheese. Results of these investigations have been presented in a recent issue of 'Research & Industry,' a monthly periodical published by the Council of Scientific & Industrial Research, New Delhi. Another article in this issue gives the process details and cost estimates of producing a pigment, cadmium orange, used in ceramic, rubber, paper and paint industries. The process has been developed at the Regional Research Laboratory, Hyderabad, where the pigment has been produced on a laboratory scale. Cadmium is likely to become available as a by-product from the zinc smelter to be set up in Rajasthan.

Decasualisation Scheme for Colliery Workers:

A scheme for decasualisation for colliery workers has been drawn out by the Ministry of Labour with a view to avoiding wastage of manpower, increasing the efficiency of workers and eliminating malpractices and favouritism in the recruitment of colliery workers. The scheme also seeks to ensure speedy re-employment of experienced surplus labour in collieries before new hands are engaged and to reduce the period of waiting before a worker gets a job. It is proposed to administer the scheme through employment exchanges that may be set up for this purpose or through sub-offices of employment exchanges, wherever necessary. Under the scheme, colliery workers already employed and those seeking employment are to be registered at these employment exchanges, and divided into through categories: those working in colliery for one year or more; those who had worked for less than a year and those seeking employment for the first time. After the scheme comes into force, no participating colliery shall obtain workers except through the appropriate employment exchange. The exchange will submit applicants against vacancies in the order of seniority, in the Live Register, occupation-wise. Workers who have been previously employed by a colliery owner in a particular coal-mine area shall be given preference in the matter of submission against vacancies occurring under the same employer and in the same coal mine. Under the scheme, it is proposed to submit workers against vacancies by rotation so as to ensure equal opportunities of employment for all the registrants.

United States

American Participation in Indian Industries Fair: Arrangements for the American participation in the

Indian industries fair 1961 have begun with the arrival in New Delhi of Mr. Howard C. Messmore, of the office of the International Trade Fairs, U.S. Department of Commerce. Mr. Messmore who arrived recently will be manager of the U.S. exhibition at the Industries Fair. The American exhibits, to be laid out over a 5½ acre plot in the former Amriki Mela Buildings, will have as its theme "industry in the service of man" and will cost over a million dollars. Though final blue prints are yet being worked out, the U.S. exhibit will include a tool and dye shop and a weather station to depict the importance of weather to industry. The fair, scheduled to open on November 15, and last until January 1, 1962, is being sponsored by the Federation of Indian Chambers of Commerce and Industry. The U.S. exhibit at the Fair will be manned by 30 to 40 Americans and nearly 200 Indian employees.

Great Scope for Development of Protein Foods from Plants: Dr. N. W. Pirie, a distinguished British biochemist said in New Delhi recently that there was great scope for the development of protein foods from Indian plants. Research was needed to find out the type of leaves most suitable for the purpose. Dr. Pirie was invited to India under the Colombo Plan to advise the Government on aspects of applied nutrition and supplementary food.

Yugoslavia

Exports to Exceed Plan Targets: The Director General of Yugoslav Trade Bank stated to Journalists at a Press Conference that there were prospects not only to fulfil but also to exceed this year Yugoslav Export Plan. Exports for this year are fixed at 11,000 million dinars more than last year. The Director-General said that Yugoslav exports of industrial commodities would be 11 per cent greater than last, while farm produce exports would remain at the same level as last year. Among industrial commodities, timber non-ferrous products, ships, machinery and complete capital equipment would be exported this year.

Extension of Trade Between India and Yugoslavia: A delegation of the Council for expansion of Indian export of Calcutta, which had talks on possibilities for extension of exports from India to Yugoslavia with representatives of Yugoslav authorities, chambers and enterprises revealed recently that it was found that the Yugoslav economy is interested in extension of the variety of goods imported from India. It was also stressed that favourable possibilities exist for joint appearance of Yugoslav and Indian industries on the markets of other countries. Yugoslav economic circles consider that increase in imports from India will also contribute to the increase in exports of Yugoslav goods to this Asian country.

Israel

Maritime Trade: In October 1960, Israel's fleet consisted of 53 ships, having a gross tonnage of 340,000 tons and a deadweight capacity of 461,000 tons. When

Israel started 13 years ago to build up its merchant marine, it owned only 5 small and old ships which carried a negligible section of Israel's maritime trade. Now Israel has reached a stage where her fleet carries more than 50 per cent of Israel's sea-borne trade. For years it was the goal of the leaders of Israel's maritime industry to reach this proportion. Though the overall picture shows that Israel, or Israel controlled ships, carry over 50 per cent of the country's maritime trade, this does not mean that in all the different branches of traffic Israel reached this proportion. There are some branches in which a bigger share has been attained as for instance in the transport of oil and in the carriage of passengers. In oil, Israel ships now carry nearly 100 per cent of Israel's needs, whereas in the passenger trade they carry over 75 per cent of the sea-borne passenger movement. In the carriage of grains, it is 50 per cent. Only in general cargo, import and export alike, is Israel's share still below 50 per cent, and approximates 30 per cent only. Regarding citrus fruit, it seems that Israel ships will always carry less than 50 per cent, perhaps between 20 and 30 per cent only. The reason for this is the short citrus export season. In order to pay reasonable freight rates for citrus exports, Israel has always to make extensive use of foreign bottoms for the transport of these commodities. With additional new ships ordered, some improvement in the general cargo import trade can be expected.

Austria

Transistor Production: Wiener Radiowerke AG, a member of the Philips group, will next year start production of transistors, the major part of which will be for exports. The company has at present a total labour force of 1,800. Approximately 80 per cent of its output is sold abroad for roughly Sch. 250 million per annum. The greatest share of exports is found in Philips tape recorders, which were developed at the group's laboratory in Vienna.

Unemployment in Austria: This year the increase in seasonal unemployment was a very moderate one. Though the number of jobless rose by 13,880 to 84,584 persons during the first two weeks of December, this figure was still 27,956 or 24.8 per cent below that of the same time last year. This improvement was partly due to the favourable weather during the period in question, which accounted for a very slow decline in building activities. Unemployment in the building trade was by 9,777 persons lower in mid-December, 1960 than on December 15, 1959.

Norway

Fisheries Agreement Documents Exchanged: The ratification documents containing the agreement between Britain and Norway on the fisheries limits off the Norwegian coast were exchanged at the Foreign Office in London recently. The main provision of the agreement is that British trawlers should be allowed to fish in the outer six-mile zone for a period of 10 years, when Norway extends her fisheries limits from 4 to 12 miles. The agreement comes into force automatically with the exchange of documents. The extension of the fisheries limits will be undertaken in two stages — from 4 to 6 miles on April 1 and from 6 to 12 miles on September 1. The ten-year period is reckoned from

October last year, when the provision was agreed upon and consequently expires in October 1970.

New British-Norwegian Nylon Production Firm: The Klinger Manufacturing Company Limited, London, has concluded an agreement with the Norwegian textile manufacturer Haakon Wenger, under which the British Companies will invest £250,000 in a new establishment for the manufacture of nylon thread in Norway. The name of the firm is Scandinavian Klinger A/s. The factory, which will be the only one of its kind in Scandinavia, will concentrate initially on the production of fully finished textile articles for domestic and export markets.

Japan

Industrial Production in 1960: The Ministry of International Trade and Industry announced on January 30 that Japan's industrial trend in 1960 was favourable following the previous year as noted below: mining and manufacturing production index set the highest record in the past 10 years, representing a 25 per cent rise compared with the previous year. Moreover, supply-demand relations were in balance throughout the year, together with stable inventory accumulation and wholesale price and other trends. Plant and equipment investment played a major part in propping mining and manufacturing production. The Ministry officials forecast that, a further increase in plant and equipment investment will not be expected, the nation's industrial trend will largely depend upon steady rising of consumption expenditures and government outlays hereafter.

Technical Assistance in the Field of Tele-communications: Japan is extending economic as well as technical assistance in various forms to countries of South-East Asia, the Middle and Far East and Central and South Africa. In the field of tele-communications, technical assistance is provided by two major organizations, namely, the Kokusai Denshin Denwa Company and the Japan Telegraph and Telephone Corporation. One of the basic problems in international co-operation is the establishment of tele-communications systems in the newly developing countries. It is interesting to know in this connection that the International Tele-communication Union, which has a long history and tradition, and is specialized agency of the United Nations decided recently to expand its activities to provide assistance in developing tele-communications facilities in the new nations of the world.

Germany

Hanover Fair: The fifteenth German Industries Fair will be held in Hanover from 30th April until 9th May, 1961. About 5,000 manufacturers on 506,000 sq. miles of exhibition space will show their finest products to visitors from over 100 countries. This great show, to which more than 100,000 people must be transported daily entails enormous traffic such as to be seen in only a few places in the world. Since 1950, when foreign exhibitors came to Hanover for the first time and participation grew from year to year, visitors from abroad, in addition to rising home attendance, have steadily increased. In 1960 approximately 25,000 visitors came to the fair by air alone.

NEWS IN BRIEF

INDIAN

As a result of negotiations which recently took place between a three-member Finish delegation and officials of the Central Board of Revenue, a draft agreement for the avoidance of double taxation of income between Finland and India has been initiated at technical level.

Labour employed in iron ore mines have the same statutory welfare amenities like drinking water, canteens, creches, first aid etc. as are enjoyed by other miners. They do not, however, have the special amenities provided to coal and mica mines under the Coal and Mica Mines Labour Welfare Funds Act.

It is reported during the period 1-7-1959 to 31-10-1960, 33,190 societies have been reorganized as service co-operatives. Service co-operatives are being given a management subsidy upto Rs. 900 per society spread over a period of 3 to 5 years.

Andhra Pradesh, which is the first State to send its census result, has a population of 35,977,999 and shows an increase of 15.63 per cent over the 1951 count.

It was disclosed recently by Mr. D. P. Karmarkar that water supply schemes have been introduced in 61 villages in Delhi since the beginning of the Second Plan. Against the total provision in the Second Plan of Rs. 19 lakhs, the amount spent so far was Rs. 9.38 lakhs.

It has recently been decided to set up an organization in the Power Wing of the Central Water and Power Commission for taking up the specialised work of engineering, design, procurement and installation of large thermal and hydro power stations in the country.

It is reported the average annual milk yield of cow had gone up from 366 lbs. in 1951 to 382 lbs. in 1956, buffalo from 963 lbs. to 1,117 lbs, and goat from 122 lbs to 127 lbs during that period.

Mr. Jaisukhlal Hathi, Union Deputy Minister of Irrigation and Power, stated in the Lok Sabha that the demand on the Damodar Valley Corporation power system had exceeded the generating capacity with the result that the Corporation had to resort to stretching of generation to more than the normal capacity of the existing units at the Bokaro Thermal Power Station.

The Damle Committee on large sized farms has favoured the setting up and running of big mechanized farms which, in its opinion, should be a profitable proposition.

An increase in tax on petrol from 7 nP to 8 nP per litre and on diesel oil from 5 nP to 7 nP per litre estimated to yield Rs. 14.5 lakhs has been proposed by the Assam Finance Minister to meet the estimated revenue deficit of a little over Rs. 14 lakhs for 1961-62.

India is assisting Nepal in establishing national archives including a library of old sanskrit manuscript. A National Archive Board, set up by the Nepal Government had invited three leading indological scholars from India as advisers to its academic committee.

FOREIGN

East Germany believes its future Western trade will develop more closely with E.F.T.A. countries than with those of the Common Market. Trade with Western countries in general had increased by 24 per cent in 1960, compared with 1959, the biggest increase being with E.F.T.A.

The Argentine Government has authorised the French group Pechiney, uging and Cegedur, to invest \$1.3 million for the purchase of equipment and machinery to expand the aluminium fabricating plant of Camca, the group's Argentine subsidiary.

South Africa's wool clip for the seven months to the end of January was 8,733,000 lbs lower than in the previous season and the value was £28.4 million against £34.2 million. The weight was 183 million lbs. against 192 million lbs.

A U.K. trade delegation is to visit seven South-East Asian countries next month, the Federation of British Industries announced recently.

The High Authority of the European Coal and Steel Community will ask the six member countries to publish or communicate to the High Authority before March 31st all freight rates charged for the transport of coal and steel by road, rail or ship.

Western Leaseholds has been given approval in principle, to plan the construction of a \$6 million gas processing plant in the wildcat Hills Gasfield, Alberta, approximately 35 miles north-west of Calgary.

U.K. consumption of all forms of copper rose 5 per cent in January to 59,155 tons, according to advance figures issued by the British Bureau of Non-Ferrous Metals Statistics.

Saudi-Arabia is to build a 900-mile road to link the Western and Eastern Coasts. The Government would also build a new road network linking six cities. The projects will cost about £4 million.

It is reported the Government of India has granted a licence to International Minerals and Chemicals, of New York, Standard Oil of California and the Indian I.E.D. Pary Group, of Madras, to build a \$51 million fertiliser plant near Vizagapatnam.

Negotiations are taking place for the setting up of a factory by Rover Company in the Federation of Rhodesia and Nyasaland. This development follows discussions with the Federal Government.

Shell has announced plans to establish a £A 6 million plant at its Gee-long refinery for the production of lubricating oils. The new plant is expected to be operating by 1964, with an initial capacity of 80,000 tons of lubricating oil components, which are used in the manufacture of automotive and industrial oils.

Special Article

PUBLIC SECTOR RETURNS ON CAPITAL EMPLOYED

THE latest explanatory memorandum on the budget of the Central Government for 1961-62 gives financial details in regard to the working of 72 public sector undertakings. It is the object of this article to examine the profitability of these enterprises in the light of the tests applied to the private sector companies by the Tariff Commission in some of its recent reports. One of the chief complaints of the private sector against the Tariff Commission has been that the formula of uniform 12 per cent return on capital employed does injustice to particular industries such as sugar and paper and it needs to be revised at an early date.

Another consideration of great significance is the high hopes placed by the Planning Commission on the performance of these enterprises for yielding a sum of Rs. 449 crores (according to estimates given in the National Development Council papers) for financing the Third Five-Year Plan. The enterprises controlled by the Central Government such as the iron and steel factories, fertilizer factories, oil refineries, etc. are estimated to yield about Rs. 300 crores. The enterprises under the control of the States are likely to yield a sum of Rs. 149 crores.

The working results of the Union Government enterprises for the years 1959-60 to 1961-62 are, however, far from encouraging. By the end of the fiscal year 1959-60, the Union Government had made a total investment of

Rs. 506 crores in these enterprises. The total profits earned were not more than a crore of rupees, indicating a very discouraging rate of return of 0.2 per cent. If the Tariff Commission Formula of capital employed were to be used, the rate of return would be much smaller because the capital employed in any enterprise is computed by the Tariff Commission by taking into account not only the net assets but also the circulating capital. This places the total capital employed for any enterprise at almost 50 to 75 per cent above the subscribed or paid-up capital, which is taken as investment in the results set out by the Union Government in its explanatory memorandum.

The financial results of the 72 major undertakings of the Union Government are of a non-uniform character. Only six of these enterprises had shown a profit in the year 1959-60, while it is anticipated that by 1961-62 the number of profit-earning enterprises would rise to eight. According to the estimates set out in the Explanatory Memorandum, the total profits for the year 1961-62 would be around Rs. 3.6 crores as against only a crore of rupees in 1959-60. Even this increase in profits does not indicate that the yield on capital employed in these enterprises is comparable with the performance of the private sector companies.

The table below summarises the performance of these public sector industrial enterprises which are

PROFIT-EARNING PUBLIC SECTOR INDUSTRIAL UNDERTAKINGS

(Rs. lakhs)

* Investments like those in Reserve Bank of India, Life Insurance Corporation, National Co-operative Development and Warehousing Board, Overseas Communications Service, Delhi Milk Scheme and Tripura State Bank etc. have not been included.

likely to show profits in the year 1961-62. In the budget year 1961-62, according to this statistical statement, the total capital invested at more than Rs. 700 crores is likely to yield not more than 3.6 crores of rupees. Nearly 64 of these undertakings with their total capital investment at more than Rs. 600 crores are not likely to yield any profit at all.

It is to be noted that the only two industrial undertakings which promise to yield sizeable profits are the National Coal Development Corporation and the State Trading Corporation. In the case of the State Trading Corporation, profits as a percentage of investment (which here stands for the subscribed capital alone) at 9 per cent in 1961-62 is expected to be the highest for all public sector undertakings. The National Coal Development Corporation promises to yield something like 6 per cent on the subscribed capital; in absolute figures, it would be nearly Rs. 2.35 crores on a total investment of Rs. 36 crores. In percentage terms, the yield from Orissa Mining Corporation would also be encouraging. Out of a total investment of Rs. 14 lakhs the profit in 1961-62 is expected to be about Rs. 100,000, thus indicating a more than 7 per cent return on investment.

The Finance Minister in his reply to the budget debate drew pointed attention to the criticism levelled

in the House in regard to the dismal performance of these undertakings. He cited these very figures in order to support his contention that the performance of the public sector undertakings was slowly looking up and that in the subsequent years they are likely to do much better. The Finance Minister, however, failed to make the distinction between subscribed capital and the capital employed which reduces the percentages cited by him to less than half.

The analysis of the public sector undertakings' working results clearly shows that the high hope placed by the Planning Commission on the yield of surpluses from these enterprises is not likely to fructify. The basic element involved is the non-business-like manner of running these enterprises. Unless some drastic changes are made in the day to day management of these enterprises, the targets laid down in the Third Plan in regard to the yield of resources are not going to materialise. The Estimates Committee of Parliament has also drawn attention to this aspect in some of its recent reports. There needs to be greater delegation of powers to the administrative staff of these undertakings. Unless this is done, the large amount of capital investment which is taking place in these undertakings is likely to result in wasteful utilisation of valuable resources needed urgently to take the economy further on the road of progress.

Better Than Gold

By WILLIAM REES-MOGG

THE revaluation of the D. Mark is one of those major financial events whose full impact must take a considerable time to be disclosed. The first reaction was merely an opening splash, with sterling, which stands to benefit substantially from the revaluation, marked down in price as the currency speculators moved into the currencies which might conceivably be expected to move into line with Germany.

The American reaction seemed to be surprisingly grudging. Dr. Adenauer only agreed to revalue in an election year because of very intense American pressure; admittedly the United States would have preferred a larger revaluation, perhaps even as much as 10 per cent., but any voluntary revaluation is such an unusual event that it seems churlish to criticise this one. On the other hand the fact that both the pound and the dollar opened below the new parity does suggest that this revaluation may have been too small to obliterate the difference in value that has existed for some years.

The exciting thing about the revaluation is, however, that it happened at all. Revaluations are very rare events in monetary history; adjustments have normally been forced upon weak currencies by way of devaluations. This move sets a precedent for correcting false currency alignments by moving the strong currencies rather than the weak ones.

There are a number of notable advantages in this. One is purely psychological. There is no doubt that a devaluation is in itself bad for national morale; it tends also to throw lasting discredit on the currency to which it happens. It is also by its nature inflationary, and there is a danger of a vicious spiral being established in which inflation causes devaluation and devaluation leads to further inflation.

In a period of general inflation, such as the present, it is much better that currencies should be raised in value, which puts at least some disinflationary effect on the home market. There is also the advantage of discouraging speculation in gold and gold hoarding. One of the most notable aspects of the German decision is that Germany has devalued gold.

This again has much wider implications. If it becomes normal for currency realignments to be made by raising rather than reducing exchange values, then gold ceases to be any safeguard; there could be a whole round of such revaluations, and in particular there could be a revaluation of the dollar.

The basis of gold hoarding is the assumption that inflation is likely to lead to currency devaluation; once it has been appreciated that natural consequence of world-wide inflation is for the strong currencies to enjoy the disinflationary benefits of revaluing upwards, then gold hoarding becomes nonsense. Far from being onto something for nothing, the hoarder is onto a nothing for something, lose-either-way proposition.

If this is understood, and it could well take a considerable time to be accepted, one would expect a considerable flow of hoarded gold onto the world market. Most of the Eastern gold hoards are held as security against currencies which could not conceivably themselves be revalued, unless the dollar were revalued first. They are likely, therefore, to be little affected. On the other hand the French private gold holdings would quite conceivably come onto the market if a revaluation of the Franc comes to be expected. And a revaluation of the Franc is now entirely conceivable.

This is important in itself; any reduction in gold speculation — and German speculators in gold have been taught a sharp lesson — or any reduction of the gold held privately increases the liquidity of the Central Banking system. It is also important as a psychological prelude to the possible reconstruction of the whole of the world exchange system.

Any major reorganisation would involve giving the International Monetary Fund the functions of an International central bank, the plan that Lord Keynes originally intended. For this to be achieved, it is necessary for gold to vanquish paper. People must accept throughout the world that any currency, gold, silver, paper or cowrie shells, does not depend on intrinsic value but on the value attributed to it by people in control of real assets. For this purpose gold is no more and no less real than paper; what it does have is the twin advantages of permanence and a habitual psychological association with real wealth.

If the liquidity of the world exchange system is to be taken out of the realm of accident (and Russian and South African new gold production) gold itself must be made an ancillary to an international monetary standard based on credit creation by the I.M.F. To achieve this it is necessary to show that a paper currency cannot be merely as good as old, but better. This revolutionary achievement may be the most important outcome of the German Government's decision to revalue.

in which inefficiency and waste have been allowed to creep into the working of the Khadi Commission. The Public Accounts Committee has evinced forthrightness and courage in expressing its views on this delicate issue.

Business Notes

Khadi Commission

IN THE DOCK

AVAILABLE PRESS summary of the Public Accounts Committee's report presented to the Lok Sabha on Monday this week throws revealing light on the manner

It has done a good deal of blunt speaking and on the basis of facts which have come to its knowledge it has placed the Khadi Commission, as it were, in the dock.

The Khadi Commission has been found defaulting gravely in the matter of elementary regularities in financial management. It placed a bulk order with a co-operative society for the manufacture of Ambar Charkhas—2,500 sets. Only a negligible fraction of the Ambar Charkhas was delivered. The Co-operative Society in question was wound up in January 1958 and one of the major grounds of winding up was misuse of controlled materials. This society is now under liquidation. As large a sum as Rs. 43,680 was outstanding against the society at the time of its winding up and, although the official liquidator may try his level best to recover the society's assets, the chances of the Khadi Commission realizing its outstandings are considered to be dim. Similarly, the Public Accounts Committee has put its finger on some more (and inexcusable) irregularities in extending financial assistance to weavers for spinning yarn for their own use, in running a Vidalaya and in the accounts of the two Karyalayas under the control and the supervision of the Commission.

In absolute size the financial loss which the Exchequer has to sustain may not appear to be of a tall order. But in relation to the purposes of expenditure it can hardly be treated as such. The pertinent point is that the tax-payer is made to bear a definite burden in the name of bolstering the handloom industry and, furthermore, the economy is placed under artificial handicaps, such as those of reservations of spheres of production for the handloom industry and imposition of levies on the mill industry. While this approach to invigorate the handloom industry, based on patronage, is wrong in the long run and detrimental to the modernization of small-scale industry on which its future eventually depends, the Khadi Commission has revealed by its deplorable lapses the reality of waste.

Tea

IMPLICATIONS OF THIRD PLAN TARGET

AT A time when attention is focused on the prospect of launching the Third Plan in the most propitious circumstances practicable, the major point which attracts notice, among others, in the presidential speech of Mr. N. S. Coldwell, at the annual session of the Indian Tea Association held on March 10, is the production target fixed for tea in the next plan and the implications behind it. All aids in resources, which are a pre-condition of the target, ought to be made accessible to the industry. In procuring them the industry may be responsible in part, but it would appear that much the larger share in this procurement rests with the Government. This point ought not to be overlooked.

Mr. Coldwell has clarified the implication of the target of 900 million lbs. which is provisionally fixed for tea at the end of the Third Five-Year Plan. This target means an additional output of 150 million lbs. above the current production of 750 million lbs. An increase of 20 per cent is thus assumed in the target. The time-limit of five years within which this increase is to be achieved is a most material consideration. The Association's Chairman has emphasized the fact that a tea bush takes not less than 5 years to come into full bearing. Its meaning is that the increase of 150 million lbs. of tea cannot be achieved by new plantings, that is to say, by extensive cultivation. The entire increase must be obtained from the bushes which are already in the estates.

This, therefore, is a function of intensive methods of production. For intensive increases in output timely and adequate supply of fertilizers, is a sine qua non. Mr. Coldwell has pointed out that scientific observations have proved how failure to apply fertilizer to the bushes even for a single year immediately recoils in the form of a loss of 30 per cent of the output and this damage keeps growing until corrective action is taken. This explains the basic dependence of higher tea output on fertilizers. Even to maintain the output achieved, no relaxation in the matter of fertilizers can be tolerated.

The Chairman's stress on advance action to ensure adequate supplies of fertilizers to produce a higher output of 20 per cent ought, therefore, to be taken as a forewarning. The supply position as regards fertilizers is below minimum requirements. In 1960 the tea industry received an allocation of 50,000 tons of sulphate of ammonia which was one-third below the requirements. Foreign exchange for imports could not be spared and Sindri's allocations could not be raised. Failures in the matter of fertilizer supply will react immediately and sharply on tea output. Mr. Coldwell has asked for due attention to be given to this important factor. When the new fertilizer plant to be set up in Assam attains optimum output, the position will change considerably to the advantage of the tea industry in North India. Meantime, import licensing policy as well as allocations from current indigenous output ought to treat the case of the tea industry on a basis of priority.

Rajasthan Budget

SYSTEMATIC PROGRESS

THE BUDGET SPEECH of Mr. Hari Bhau Upadhyaya, Rajasthan's Finance Minister, has a realistic approach to many of the problems facing this under-developed State. The deficit in revenue account of Rs. 250 lakhs and Rs. 77 lakhs on capital account in 1961-62 is proposed to be met by new taxation proposals, small savings. State loans, better realization of arrears of Government dues, further measures of austerity and economy and tightening of the machinery for preventing tax evasion etc. The new taxation proposals include increases in motor vehicle taxes, passenger and goods taxes and in rates of State excise duties and court fees. Entertainment tax is being made good use of, the possibilities for which have not yet been fully exhausted. The total revenue from taxation proposals is expected to be Rs. 135 lakhs. There is no doubt that the taxation proposals are likely to place some burden on the people of the State, but it is a burden for the development of the State, to which all must contribute. Although the economy measures are likely to net in only Rs. 28 lakhs, some of the suggestions made are really sensible and go a long way to prove that administrative efficiency is not synonymous with endless expansion of administrative departments. There is no mention of approaching the Centre for increased assistance in the speech which shows the keenness on the part of the State to rest on its own oars.

The State of Rajasthan has made good progress in the first two Plans. The target of additional food production has already been achieved and primary education has made rapid strides. Rajasthan can claim that progress is being made in that State. With the completion of the Rajasthan Canal, Kotah Barrage and other development projects, altogether new resources will be available for lifting this State from its low economic level.

Finance**MADRAS INDUSTRIAL INVESTMENT CORPORATION**

MR. R. VENKATASWAMY NAIDU, Chairman, the Madras Industrial Investment Corporation Ltd. indicated at the annual general meeting held recently that not long back the Corporation did not receive sufficient number of applications for funds. It is apparently the effect of growing industrialisation witnessed in the country that the Corporation seems to have a heavy demand for funds from industries in various fields. The Corporation has underwritten and subscribed to the preference and equity capital of new ventures. Highlighting the significance of the Corporation, the Chairman added that even an industrial venture promoted by a well-known business house may not get necessary capital from the public, unless there was the backing of the venture by underwriting or subscription by well-known financial houses like this Corporation, the Industrial Finance Corporation, the Industrial Credit & Investment Corporation of India, etc.

The Corporation has so far underwritten shares of new issues to the extent of Rs. 3.40 crores, subscribed to ordinary shares worth Rs. 2.36 crores and preference shares worth Rs. 77.5 lakhs. The Chairman has pointed out that in view of the limited funds at the disposal of the Corporation, the primary objective is to see that the public invest in the shares of new ventures. The Corporation has, therefore, decided to restrict its offers to pure underwriting. Following the new practice of the Industrial Finance Corporation of India in the matter of underwriting of issues, this Corporation would do well to enter into underwriting contracts in collaboration with professional underwriters to minimise its own risks.

The Corporation has provided financial relief to several important industries listed below. Their capital issues and the extent to which the Corporation has underwritten is also indicated:

Industry	Total Capacity	Amount
	Issued	Underwritten
Paper ..	350	100
Aluminium ..	660	150
Sugar ..	170	30
Cement ..	70	35
Cable ..	120	25
..	1,310	340

Union Carbide**THE NEW PLANT AT TROMBAY**

THE INAUGURATION of the Rs. 4.5-crore chemicals and polyethylene plant at Trombay by Mr. Manubhai Shah last week marks the entry of Union Carbide (India) Ltd. into the chemicals and plastic fields. An Indo-U.S. enterprise, the plant will produce Rs. 2.5 crores worth of chemicals and polyethylene for the plastic industry annually and will help save Rs. 2 crores in foreign exchange every year. Steps have already been undertaken by the Company to expand production of various chemicals and research and technical know-how in which the company has displayed great access will be utilized for new products and improved processes in this country. With a view to widening the polyethylene usage, a polyethylene service laboratory will be attached to the Trombay plant. Not only will the service laboratory provide advice on customers' problems but it will also help to train the technical personnel. Since the laboratory will be equipped with all the modern equipment and

accessories not so far employed in India, customers and trainees will have the advantage of observing and learning how to use new processes and to make new products.

An important feature of the Trombay plant which has a production capacity of 15 million pounds of polyethylene resins and organic chemicals is that the products manufactured are based almost exclusively on industrial alcohol as the primary raw material which will be supplied mainly from the Maharashtra Government's Chitali Distillery. This incidentally is the second plant that has been set up to manufacture plastic chemicals, the first one being at Calcutta. A third plant will be set up in Assam and the fourth one in South India.

Rural Investment**RESERVE BANK'S SURVEY**

THE RURAL sector of the Indian economy will again be surveyed, this time for information concerning not only rural debt but also rural investment, and the survey is to be undertaken by the Reserve Bank of India. Exactly a decade ago, it will be recalled, an All-India Rural Credit Survey was conducted for the first time. That survey, however, was exclusively devoted to a study of the pattern of borrowings and lendings for agricultural purposes in different States of India and the working of the various agencies and institutions supplying credit in rural areas, in order to help reorganise the rural credit structure.

According to the Reserve Bank, the proposed new survey will yield estimates, among others, with fair precision, of the level of debt, capital formation, etc., of the rural household sector throughout the country. Giving details about the survey, Mr. B. Venkatappaiah, Deputy Governor of the Reserve Bank, disclosed that the enquiry would cover about 1,800 villages selected from all over the country, after dividing the country into a number of strata, homogenous in regard to general agricultural conditions. The field investigation of the survey, it is expected, would be spread over a period of about 15 months from July 1961.

Prof. D. R. Gadgil, who also spoke, outlined the method of approach or the methodology of the proposed survey. Among others, he indicated that information on the assets and liabilities of the rural households, both at the beginning and at the end of a given year, as well as all transactions of a capital nature during that year would be collected. He also raised a few conceptual problems that might confront the investigators whilst estimating capital formation, investment etc. and exhorted the authorities concerned to view these problems dispassionately. Presumably the data are intended to help the authorities follow up the grant of credit so as to make sure that the credit extended is used by the agriculturist for the specific purpose for which it is given and not squandered away. Perhaps the Survey is also intended to find out the particular investment propensity of the agriculturist so as to devise and offer him suitable investment opportunities as a part of the Government's savings drive.

A CORRECTION**Blue Supplement on Plantation Industry**

Page No. 1, paragraph 4, line 2, the word "production" has crept in by oversight. The correct word is "consumption". The first sentence, therefore, would read as follows: "During the period of planning, between 1951 and 1960, the consumption of natural rubber in India increased from 24,206 tons to 50,694 tons". The error is regretted. — Ed.

THIRD PLAN

THE National Development Council will be meeting here next month to consider the final draft of the Third Five-Year Plan currently being prepared by the Planning Commission in the light of the NDC discussions of January last. In this context, a report on the Third Plan developmental programmes prepared by Sir Theodore Gregory for the Associated Chambers of Commerce, at whose invitation he visited India last autumn, will be read with great interest.

Dr. Gregory has expressed the opinion that India should be given as free a hand as possible in the disposal of foreign aid granted to her by international lending institutions and other friendly countries. "It is natural enough", says Dr. Gregory, "that foreign countries should seek to know what it is intended to do with the aid extended by them, and should attempt to obtain orders for manufacturers in their own countries in return for aid given. But such restrictions may add to imbalance within the Indian economy, nevertheless, and imbalance, on this as well as on other grounds, should be prevented to the greatest extent possible."

On the size of the Plan though the report is not categorical, it implies that taking into consideration the past experience, it should be quite possible that somewhat less ambitious Plan would give no less favourable results without the risk of further inflation and of further pressure on the tax-payer, with all the difficulties that high taxation inevitably brings with it. If foreign aid does not come to the extent postulated, it will be impossible to fulfil the targets laid down. There is every likelihood, says Dr. Gregory, that there will be a lag between intent and performance even if the necessary volume of foreign assistance is forthcoming.

Looking at the resources picture, Dr. Gregory opines, "It is difficult to state whether the additional contribution to be made by the tax system is over-optimistic or not. A rise of Rs. 650 crores* in the tax contribution i.e. on the average Rs. 130 crores per annum at a time when, if everything goes right, national income will expand by 5 per cent per annum, is not perhaps an excessive figure in itself." But it must be borne in mind, he adds, that Plan expenditure cannot be considered in isolation and there are other claims on tax revenue; non-Plan development expenditure, defence expenditure and the general overall expenditure on administration. If it were to be the case that the increase of Rs. 650 crores additional were to constitute the sole object of additional taxation, the position would be easier than if that figure were only to be part of the much larger sum required for overall increase in expenditure, the magnitudes of which obviously cannot be known in advance.

SURPLUSES FROM PUBLIC ENTERPRISES

About the utilisation of surpluses from public enterprises for financing the Third Plan, Dr. Gregory says, "It must at this stage be altogether a matter of conjecture whether surpluses from public enterprises and the yield from provident funds etc. will attain the figure hoped for." In the absence of detailed breakdown, he makes the following general observations:

(a) Insofar as these figures include sums allocated to reserves for depreciation, renewals etc. they are not net additions available for general expenditure. Sums accruing may, indeed, be temporarily invested in Government of India securities etc., but when the time

*This figure has already been revised upwards by the Planning Commission.

comes for the renewals and replacements to be made, such investments will have to be repaid, otherwise the corpus of invested capital will decline and future productivity will be affected.

(b) Whilst profit-making by public enterprises is to be welcomed, the pricing policies necessary to enable such profits to be earned may have adverse repercussions on the economy, so that net overall benefit may be smaller. This is particularly the case when profits are earned by enterprises producing goods and services consumed by other industries whose profits are also subject to tax.

DEFICIT FINANCING

About recourse to deficit financing, Dr. Gregory observes, "It is all for the good that the Planning authorities have drastically revised their concept of the extent to which resort should be had to deficit financing; indeed, the current exchange crisis (September 1960) through which the country is passing is an emphatic warning that should resort be again had on an increasing scale to deficit financing, the 'offsetting factor' in the shape of loss of foreign exchange is not available, as it previously was, so that the effect on the price level (and, therefore, on export possibilities, the cost of living and the state of confidence) will be ipso facto that much more serious." But the possibility of doing deficit financing on the old scale, he adds, turns upon the degree to which the other estimates of future receipts are capable of realisation. If they are not, then the alternatives are simple but depressing: either a renewed resort on a larger scale to inflationary procedures or an adaptation of the Third Plan to the harsh reality of non-availability of the necessary resources. And, once having announced this intention of not resorting to deficit financing on the old scale, the psychological, political and economic repercussions are likely (especially in the absence of countervailing influences in the shape of loss of exchange resources) to be the more serious, if the words of the Government are belied by deeds.

It would be possible, though at a very considerable risk, to compensate shortfalls in internal receipts from revenue, savings and so on, by a further recourse to deficit financing, but no such expedient is available as regards the foreign exchange needs. Some curtailment of the Plan, therefore, may have to be effected.

PHASING OF INDUSTRIAL PROJECTS

On the point of phasing of industrial projects included in the Third Plan in case the Plan has to be cut, Dr. Gregory says that the Plan aims at industrial expansion with a view to save foreign exchange in the long run. From the point of view of immediate foreign exchange requirements, a different order of priorities may have to be accorded to the various industrial projects. He gives the following statistics of foreign exchange requirements of setting up new industrial units:

Percentage of Foreign Exchange Element

Metallurgical Industries	50
Machinery and other Engineering Industries	53
Chemicals Industries	43
Minerals	52
Textiles	50
Food Industries	15

Obviously from the employment point of view, says Dr. Gregory, the situation is likely to be very different. But, since the emphasis is on long-term economies in the use of foreign exchange, the question at issue is really this: Which of these various (and competing)

alternatives will save most foreign exchange, and which, therefore, if there are going to be difficulties in obtaining sufficient foreign assistance, to carry out all the projects, should be given preference?

In the opinion of Dr. Gregory, it would, of course, be desirable to carry out the entire programme, but if the choice has to be made, then it would appear that as the foreign exchange saving effected by machinery and other finished products manufacturing industries generally is greater than by the iron and steel industry, preference should be given to engineering rather than metallurgical projects. It is also warranted by the fact that metallurgical projects assume that adequate supplies of coking coal will be available. This expectation in reality may not materialise.

BANKERS MEET

Measures to attract more bank deposits, to strengthen banking industry in general and to meet the increased demand for credit are understood to have been discussed at a three-hour conference held here on Sunday last in which about 20 representatives of the banking industry participated along with the Governor of the Reserve Bank and officials of the Union Ministry of Finance. It was decided at the conference that interest rates on all deposits should be stepped up with a view to attracting more deposits. The Indian Banks' Association, it is understood, has sent circular to its member banks to put up interest rates on various types of deposits, except savings bank accounts, with effect from March 15. The proposed increase in interest rates on savings bank account will take effect from April 1. The revised rates of interest, reports suggest, will be as follows: 3 per cent on deposits for three days to 30 days; $3\frac{1}{4}$ per cent on deposits for 31 days to 60 days; $3\frac{1}{2}$ per cent on deposits for 61 days to 90 days; $3\frac{3}{4}$ per cent on deposits for 91 days to 12 months; 4 per cent on deposits for 12 to 24 months; $4\frac{1}{4}$ per cent on deposits for 24 to 48 months; $4\frac{1}{2}$ per cent on deposits for 48 to 60 months and 5 per cent on deposits for 61 months and over. The ceiling on interest payable on savings bank account will be 3 per cent.

To mop up savings in rural areas, it was suggested that small banks should open more and more branches in the country-side; their operational expenses being much less than those of the bigger banks, they would be in a position to allow higher interest rates on deposits.

To meet the increased demand for credit, bankers suggested that the Reserve Bank should administer the bill market scheme more liberally. This is understood to have been agreed to by the Reserve Bank and the officials of the Union Finance Ministry.

The bankers are understood to have agreed in principle to the introduction of a deposit insurance scheme which will safeguard the interests of smaller depositors in the event of bank failures. They suggested that deposits up to Rs. 1,500 should be covered by this scheme as against Rs. 1,000 proposed by the Reserve Bank. The details of the scheme will be worked out by the Union Finance Ministry in consultation with the Reserve Bank. The State Bank of India, it is understood, will also participate in the scheme. A separate organisation is likely to be set up to administer the scheme. What will be the status of this organisation and how the Reserve Bank would come into the picture is understood to be under consideration of the Finance Ministry.

The conference, it is learnt, also considered the question of merger and integration of small banks with bigger units. The Governor of the Reserve Bank, it is understood, urged the need for going ahead with banks amalgamation programme to inspire confidence among

depositors. Some bankers are said to have expressed the view that amalgamation should be brought about without declaring a moratorium to avoid hardship to depositors. They are understood to have suggested that such banks could be made subsidiaries to the bigger banks and that the Banking Companies Act should be amended to allow a bank to be made the subsidiary of another.

The new scheme devised by the Reserve Bank for amalgamation of banks desires that the bank taking over a weaker unit should make an initial payment of 60 per cent of the realisable assets to the depositors, while the rest should be paid on a pro rata basis over a period of 12 years. Under the present provision in the Banking Companies Act, the initial amount to be paid to a depositor in the event of a bank's amalgamation with another is only Rs. 250, the balance being disbursed to the depositors on pro rata basis as assets are progressively realized.

LARGE-SIZED MECHANIZED FARMING

The Damle Committee on large-sized farms has favoured setting up of big mechanized farms which, in its opinion, should be a profitable proposition. The Committee feels that given necessary facilities, particularly perennial irrigation, it should be possible for a farm like the Suratgarh Farm to get a return of 6 per cent on capital employed after recovering in full the expenditure including the invisible charges like interest on capital and depreciation on fixed assets. The entire investment on a large-sized mechanized farm, in the opinion of the Committee, can be recovered in a period of 16 to 20 years, even if one year in every four turns out to be a year of below-normal production due to natural calamities and other unforeseen circumstances peculiar to agriculture.

The Committee examined 15 proposals from various State Governments—Rajasthan, Bombay, Andhra Pradesh, Punjab, Mysore, Orissa, Bihar and Madhya Pradesh—for setting up such farms, but has recommended establishment of only one more large-sized farm for the present. The other 14 proposals were found to be unacceptable because of two reasons. Firstly, some of the blocks suggested by the States for setting up mechanized farms involved heavy initial expenditure on reclamation work. Secondly, perennial water supplies were not available at some of the proposed sites.

The large-sized mechanized farm recommended by the Committee to be set up is to be located at Jetsar near Suratgarh in Rajasthan. On the basis of perennial and non-perennial supplies of water that may be made available immediately to this farm, the Committee thinks it should be possible to tackle an area of 10,000 acres in the first year of operation and about 12,500 acres in the second year. The Committee has suggested a tentative cropping programme for the first two years' operations at this farm; this programme may, however, be modified later on after the results of detailed soil analysis are known. A small percentage of area has been suggested to be sown with cash crops like cotton and sugarcane right from the second year to allow full utilisation of perennial water supplies during the months of March, April and May. The Committee thinks that cultivation on this farm can be started in June next year.

About the machinery required for this farm, the Committee has expressed the opinion that because of its proximity to the Suratgarh Farm, it would be advisable to have machinery at this farm similar to that used at the Suratgarh Farm; this, it says, "would mean an overall economy in spares and flexibility in exchange of equipment available at the existing farm and that proposed to be purchased for the new farm." Also the workshop being completed at Suratgarh would be able

Brown Recording-Integrating Flow Receiver

What is the cost of process flows for the various production departments of your plant? You must have accurate records of the quantities of steam, water, air, chemicals, fuel oil and other fluids supplied to each department to know where your money goes and why. Honeywell Flow Meters aid cost accounting by providing the information you need.

Honeywell is the recognized world's leader in the design and manufacture of automatic control equipment. An organization of more than 30,000 persons, with factories in the United States, Canada, France, Germany, Holland, Japan and the United Kingdom, Honeywell products are used in scores of widely diversified fields.

Honeywell products—more than 13,000 of them—fall into these three principal categories:

Heating and air conditioning controls and control systems for residences and industrial, commercial, public and educational buildings.
Instruments and instrumentation systems, process controls and control systems, valves, precision switches and data processing systems for business and industry.
Precision electronic instruments and control systems for aircraft and missiles.

to undertake major overhauls and repairs of this type of equipment. The cost of machinery and equipment required to be purchased for the Jetsar farm is estimated at Rs. 61 lakhs. The Committee believes that the proposed farm would show profit right from the first year of its working. Margin of profit would go up appreciably when perennial water supply becomes available.

The Committee has expressed concern at the response from the States in selection of areas to be brought under large-scale mechanised farming. The response, it says, has been poor; the States took unduly long time to send their replies. The situation did not improve even when the Committee decided to obtain data for small blocks of 10,000 acres. The Committee, however, has suggested that further exploration work should be undertaken in this regard. The Committee would continue to examine new proposals that are received from the States from time to time.

EXCESS PROFITS TAX

Replying to the debate on the General Budget in the Rajya Sabha on Monday, Mr. Morarji Desai, the Union Finance Minister, categorically ruled out the revival of excess profits tax. This impost, he said, could only be justified as a war-time measure; it could not be levied at all times. Mr. Desai opined that there were not large profits being made in India at present. It was possible, he said, that some units made greater profits. But to tax them would amount to penalising efficiency. Tax on excess profits, he stated, was also unnecessary at present when the wealth tax mopped up some of the incomes in the higher-income groups.

SOLVING COAL CRISIS

The second inquiry into the coal crisis by the Cabinet Secretary, Mr. Vishnu Sahay, is understood to be nearing completion. This time Mr. Vishnu Sahay is being assisted by secretaries of nearly half a dozen ministries. The Committee, it is understood, is inclined to the view that greater use of coastal shipping and changes in the existing prices for the different grades of coal and equalization of shipping and rail freights for the transport of coal would be helpful in solving coal crisis in the short run.

CAMBAY THERMAL STATION

The Government of India has approved the Cambay Thermal Station Project, which envisages the construction of a power house, with an installed capacity of 200,000 kW., at Dhurwaran near the Gulf of Cambay in Gujarat. Initially, this thermal station will have three turbo-alternator sets. Each unit will be connected to two boilers, while there will be a third standby boiler. These boilers will be designed to use coal, oil or gas.

Demand for power in the Gujarat-Saurashtra region has been rising steadily. It is estimated to increase to 456,000 kW. that by 1965-66. The present firm capacity of the power system in the area, however, is only about 240,000 kW. It is expected that the new thermal station will meet the shortage for power in the area.

Under the present scheme, the power generated at the Cambay thermal station will be transmitted over 132 kV. lines to Gondal (Saurashtra) and Barejadi (Gujarat) areas.

The project is estimated to cost Rs. 25 crores.

POWER DEVELOPMENT IN U.P.

Seven new schemes for power development in Uttar Pradesh are likely to be included in the Third

Plan. Of these, three relate to installation of Singrauli Thermal Power Station, Obra Hydel Station and extension of the Harduaganj Power Station. The total installed capacity of these projects will be 328,000 kW. The remaining four schemes are for extension of transmission and distribution lines, rural electrification, establishment of small hydel stations, and conducting of investigations for future power projects in the State.

In addition, there are eight power development schemes which will be continued from the Second Plan. These are the Rihand Dam Project, Kanpur Electric Supply Adm. Extension Project, Yamuna Hydel Project (Stage I and Stage II), Matatila Hydro-Electric Project, Harduaganj Extension (Stage I), Ganga Grid Transmission (Stage IV), Ram Ganga Hydel Project, and Diesel Station at Ghaziabad. The total installed capacity of these schemes is over 800,000 kW.

The aggregate installed capacity in Uttar Pradesh at the beginning of the Second Five-Year Plan was 324,000 kW. It is expected to increase to 394,000 kW. by the end of the current month.

AVOIDANCE OF DOUBLE TAXATION

As a result of negotiations which have taken place here during the past few days between a three-member Finnish delegation and officials of the Central Board of Revenue, Government of India, a draft agreement on avoidance of double taxation of income between India and Finland has been initialled at the technical level. The agreement will now be considered by the two Governments with a view to ratifying it.

HELPING MACHINERY MANUFACTURE IN INDIA

The Government of India has decided that manufacturing units to whom foreign exchange allotment has been made for expansion programmes may increase their production beyond the licensed capacity if they can do so without further importing machinery and raw materials and by procuring a greater proportion of their requirements indigenously. After these units have increased their output beyond the licensed capacity, the increase in their licensed capacity will be regularised if necessary. The step has been taken with a view to giving incentive to machinery manufacture in the country.

DLF LOAN TO PREMIER AUTOMOBILES

The U.S. Development Loan Fund has sanctioned a loan of \$7.2 million to the Premier Automobiles Limited, Bombay. The loan will be utilised to meet the cost of imports from the United States of the machinery required for producing sheet metal equipment of Fiat cars and Dodge trucks which are on the present manufacturing programme of the firm. The loan carries an interest of 5½ per cent per annum and is to be repaid in Indian rupees within 15 years of the first drawal of the loan.

The Government of India, it is understood, is not a party to this agreement; the agreement has been negotiated directly between Premier Automobiles and the Development Loan Fund.

Premier Automobiles, it is learnt, have also asked for Rs. 1.6 crores worth of foreign exchange for import of machinery and plant from Italy. This is in addition to Rs. 5 crores worth of foreign exchange the firm requires for doubling its production 15,000 cars per year.

PAPER MILL AT PANIPAT

Messrs. Bedi and Company, of Bangalore, have been granted a licence under the Industries Act to set up a

March 17, 1961.

paper and pulp manufacturing unit at Panipat (Punjab), with a capacity of 30,000 tons per annum. The raw material to be used by this factory will be bagasse.

Foreign collaboration for this project is being sought from a U.S. firm.

NEPA MILLS

The National Newsprint Factory (Madhya Pradesh) has been granted a licence for setting up a plant to manufacture caustic soda and chlorine. The total cost of the project is estimated to be around Rs. 50 lakhs. When in full production, the plant will turn out 4,068 tons of caustic soda and 3,600 tons of chlorine per annum.

INDIAN MINORITIES ABROAD

Mr Manubhai Shah, Minister for Industry in the Union Government, disclosed in Parliament last week that the ball and roller bearings plant proposed to be set up in the public sector under the Third Five-Year Plan had to be taken out of the recent Indo-U.S. credit agreement because the Soviet organizations with whom

collaboration was sought were busy in modernising their own industry. The U.S.S.R. representatives had suggested that they could offer help to set up a ball and roller bearings manufacturing unit in India only when they were free from their commitments at home.

SUGAR EXPORTS

The total quantity of sugar shipped up to February 26, out of the one lakh tons quota released so far, was 37,906 metric tons. The loss on these exports is estimated to be in the neighbourhood of Rs. 1.30 crores. This sugar has been sold to foreign countries at a price ranging from £28.5s. to £37 10s. C & F per metric ton, depending upon the fluctuations in the international market.

BRIEFS

The Government of India, it is learnt, has approved in principle the grant of a licence to Traco Enterprises Private Limited for obtaining capital equipment from Japan for setting up a cable factory at Thripunithura.

Messrs. Ideal Motors have been granted a licence to set up a factory at Mysore for manufacturing Java motor cycles in collaboration with a Czechoslovak firm.

BOOK REVIEW

INDIAN MINORITIES ABROAD

The Role of Indian Minorities in Burma and Malaya:
By Dr. Usha Mahajani: Vora & Company, Publishers Private Ltd., Bombay: Price Rs. 20.

DR. Usha Mahajani has done a service to Indian scholars and also for the Historical Records Division of the Ministry of External Affairs by her very able study of the Indian minorities in Burma and Malaya. The study is historical, going back over 50 years, but its vital contribution arises from the author's individual assessment of the pattern of the influence which Indians have exercised even when they were a small minority in both countries. Some of the facts presented are new and the pattern of employment of Indians in both countries is one which has been documented over the long period for the first time.

Indian immigrants in both Burma and Malaya have naturally raised, by their adherence to their own culture, predominantly South Indian, and in a sense insular, some suspicions in the minds of the majorities in both countries. In the post-Independence age in Burma and in the recent Independence of Malaya there have naturally been processes of adjustment, where economic ties have been rearranged to suit political groupings which had been functioning, so long as political power was exercised under British domination, in a state of suspense. The story is not the same in both areas, and as Dr.

Mahajani points out that Indian minority is dwindling in Burma both in numbers and influence while in Malaya it is flourishing. In both cases, however, the presence of Indians has been of positive assistance to the creation of both Burmese and Malayan nationalism. There have been, it is true, less happy results in terms of conflicts between the majorities and the minorities. These are dealt with by Dr. Mahajani with great objectivity. Her description of the changes in legal status of the Indian communities particularly after 1937 on pages 148 and 149 are of special interest. So, indeed, are her studies of Burma's nationalism during the War and Indians' problems in post-war Malaya. One of the most interesting portions of the book is this flow of nationalism back and forth, partly fostered by the nationalist current which has been the dominating note of Indian history in the last 50 years.

Prepared as a doctorate thesis for John Hopkins University and issued under the auspices of the Institute of Pacific Relations, the book has been designed not only to evaluate but also to document an area in which hitherto documentation has been very incomplete. With its great wealth of detail and its fine scholarship, the book has a claim to be the standard work in this field. Pandit H. N. Kunzru has paid the author a tribute in the Foreword for her "objective" approach. He points out that "she has not hesitated to criticise her own countrymen where she thought this necessary." The tribute is well deserved.

*fair chance
for young
talent*

Some 48,000 children are at school in Jamshedpur, where Tata Steel runs 34 schools—17 of them on two shifts—and assists 122 other schools with recurring or capital grants. Instruction up to matriculation is given in four languages to meet the needs of the cosmopolitan industrial community.

Employees' children are taught free or pay a concessional fee depending on the parents' income. Here, we see Shri Etwari of Monghyr, an operative in the steel works, and his son, Kameshwar Prasad. Kameshwar passed matriculation in the first division in 1959,

qualifying for a university stipend and for a Tata Steel Jubilee scholarship of Rs. 75 per month which will see him through college without any strain on his father's modest resources.

Jubilee scholarships apart, Tata Steel provides assistance in several ways to enable deserving children to take up higher studies. Young talent is thus encouraged and nurtured at Jamshedpur, where industry is not merely a source of livelihood but a way of life.

COMPANY AFFAIRS

UNITED COMMERCIAL BANK: HIGHER PROFITS

The profit of the United Commercial Bank Ltd.; during the year to December 31, 1960, were recorded at Rs. 67.43 lakhs as against Rs. 60.42 lakhs during the previous year. Income from interest and discount as well as commission, exchange and brokerage was higher at Rs. 3.79 crores and Rs. 1.42 crores as against Rs. 3.62 crores and Rs. 1.21 crores respectively earned in the previous year. The deposits of the Bank at the end of the year 1960 stood around Rs. 88.94 crores and at the same time advances in the form of loans and bills discounted and purchased were around Rs. 61.39 crores. The Bank has, therefore, shown its capacity to operate efficiently even during the year which was considered comparatively less favourable for the banking institutions. During the year branches of the Bank were opened at Bhopal, Durgapur, Kota, Maligaon (Gauhati), Mandvi (Bombay), Nagapattinam, Pipri and Ranchi. The Directors have reported that stringent conditions prevailed in the money market almost throughout the year.

The Directors have transferred Rs. 30 lakhs to Reserve Fund and provided Rs. 13 lakhs for bonus to staff from the profit during the year under review. They have recommended the payment of a dividend at the rate of Rs. 6 per share subject to deduction of tax which will absorb Rs. 24 lakhs.

ALKALI AND CHEMICAL CORPORATION

The sale proceeds of the Alkali and Chemical Corporation of India Ltd. during the year to September 30, 1960, were considerably higher at Rs. 540 lakhs than the previous year's figure of Rs. 344 lakhs. Overall operation of all the sections of the Corporation was satisfactory. The polythene plant achieved a higher rate of production, as the Directors have reported, with remarkable facility received from the technical consultants of the Company — Imperial Chemical Industries Ltd., London. The paints plant ran well and a high level of production was achieved despite inadequate supplies of imported raw materials. Extensions to the plant were taken in hand during the year and are nearing completion. The chlorine and caustic soda unit worked at full capacity. The profit margin was, however, restricted by the price ceiling fixed by the Government and the increasing cost of salt—the major raw material used in this process.

Proposals are being considered for extending the capacity of most units to meet the increasing demand and maintain the Company's competitive position. The growing demand for Polythene required early action, and plans are now well advanced to extend the capacity threefold. The Company's proposals have been accepted in principle by the Government of India and an application for a licence has been made. The cost of these extensions is estimated at about Rs. 3 crores.

The net profit (before tax) for the year was Rs. 129.32 lakhs as compared with Rs. 37.78 lakhs for the previous year. The Preference Shares (Regulation of Dividends) Bill 1960, was enacted after the close of the financial year and payment of Preference Dividend at the rate of 6.5 per cent per annum, subject to deduction of tax at source, has been made to these shareholders in accordance with the Act. The Board recommends a dividend of 12 per cent subject to deduction of tax at source on both classes of Ordinary Shares; this will absorb Rs. 37.20 lakhs.

TUNGABHADRA INDUSTRIES

Tungabhadra Industries Ltd. during the year to September, 1960, recorded a profit of Rs. 88,201 after

providing for depreciation, development rebate and wealth tax and taking into consideration the credit balance brought forward from the previous year. The amount is proposed to be carried forward.

The aggregate production of vanaspati, refined oil and hard oils during the year was about 15,000 tons as against about 15,300 tons in the previous year. While the production has been maintained at almost the same level as that of previous year, there has been an increase in the turnover due to higher prices of raw materials and finished goods. The margin of profit, however, was comparatively less as the selling prices of finished goods did not register an increase to the extent of higher cost of raw materials due to keen competition in the market. As the factory is not situated on port, for effecting bulk shipments and as the prices of hydrogenated groundnut oil and other edible oils in the international market remained unremunerative, the Company could not export its finished products in spite of export promotion scheme of the Government. There was, however, good internal demand for the products of the Company.

A PASSENGER FROM DELHI WRITES.....

..... the staff there is always very helpful and very obliging. It is a real pleasure to deal with them I congratulate you on the excellence of your office organisation and the smoothness of the KLM flights

COMMODITY NEWS AND NOTES

JUTE LICENSING AND CONTROL ORDER

The Government of India have promulgated the Jute Licensing and Control Order under the Essential Commodities Act. The Order provides for the licensing of dealers in raw jute and jute textiles, fixation of maximum and minimum prices, both for raw jute and jute textiles, regulation of stocks of raw jute held by manufacturers of jute textiles and requisition of raw jute and jute textiles. Under the Order, the Jute Commission is authorised to issue licences to dealers in raw jute and jute goods from year to year. In granting the licence, the stock of raw jute or jute textiles available in the locality, the business ordinarily carried on by the applicant and other relevant factors would be taken into consideration. The Order also empowers the licensing authority to suspend or cancel licences under certain circumstances. The Jute Commissioner is further authorised to fix the maximum and minimum prices at which raw jute and jute textiles may be purchased or sold. The maximum quantity of raw jute, which the manufacturers of jute textiles may buy or have in their possession will also be prescribed by the Jute Commissioner.

The Jute Commissioner has been authorised to requisition stocks to ensure the equitable distribution of raw jute and jute textiles. He will also have the power to entry and inspection to ensure compliance with the Control Order. Persons contravening the provisions of this Order or failing to carry out directions or requi-

sitions made under this Order shall be liable to punishment, as prescribed under section seven of the Essential Commodities Act.

COTTON FROM U.S.A.

The Union Finance Minister, Mr. Morarji Desai, presided recently over a ceremony when an agreement under U.S. Public Law 480 was signed under which India will get 300,000 bales of American cotton. This cotton will help fill the gap created by an unusually low Indian cotton crop last year and assist in the stabilisation of cotton prices. Furthermore, there is an understanding that imports under this agreement will be over and above the usual commercial imports during the U.S. fiscal year 1962 of not less than 420,000 Indian bales.

Under the agreement, India will import American upland cotton with a staple length of less than one and one-sixteenth inches. The value of the cotton is \$33.6 million. An additional sum of \$1.5 million will be made available for ocean transportation cost. Payment for imports will be in rupees. Of the total, a sum of \$14.18 million (Rs. 7 crores) will be given back to India as a grant for economic development projects. An equal amount will be made available as long-term loans at 4 per cent interest. The equivalent of \$1.8 million (Rs. 85 lakhs) will be reserved under the Cooley Amendment for loans to private enterprise in India associated with U.S. firms and \$3.7 million (\$1.75 crores) retained for U.S. uses in India.

New avenues of progress

The rapid development of India's road transport has opened up new avenues of progress. Diesel trucks, lorries and buses now link every part of the country...carry goods and people to once-remote areas. With the growth of road transport has grown demand for High Speed Diesel Oil. Today over 1 million tons are consumed. By the end of the

Third Plan the country's needs will be 3 million tons—three times as much as they are today. There can be no question that the first priority should be the exploration and production of indigenous crude oil; the second priority must be to expand refining capacity in India. Oil is essential to economic growth, and Burmah-Shell believes that

for tomorrow's needs we must act today

a
hundred
years
in India

An East Indiaman in the last century brought young Robert Stanes to Madras in 1857. His name was to become famous over a century in South India long after he began business in 1861 in Coimbatore. Few could have imagined that the independence and resolution of youth were to bear such fine fruit in the years to come.

Pioneering in Coffee and Tea in the Nilgiris, Robert Stanes started the first Coffee Curing Works in Coimbatore in 1861, the first Cotton Mill in 1888, and in 1862—as a young man of 21—laid the first foundations of Stanes High School.

Tea and Coffee Estates and their requirements have always formed a large part of the business, besides Fertiliser Factories, Coffee Roasting and Sales through The United Coffee Supply Company Limited, and now the manufacture of Instant Coffee.

With the arrival in India of the Motor Car—Robert Stanes held the registration number C.O.1—also developed Stanes Motors (South India) Limited, with its many activities and branches throughout the South,—including “Tyresoles” and “Vaculug” for reconditioning of all sizes of Tyres—and a model bus service in Coimbatore.

Robert Stanes, knighted in 1920, was the first Chairman of the Coimbatore Municipal Council, and until his death in Coonoor in 1936, took a keen interest in the social welfare problems of all communities, and in particular in Stanes High Schools, both in Coimbatore and Coonoor.

The present Estate business includes The United Nilgiri Tea Estates Company Limited and Stanes Amalgamated Estates Limited, manufacturing 2½ million pounds of Tea per year.

Celebrating the Centenary of the start in Coimbatore in 1861 and Golden Jubilee of the Limited Company, the Stanes Group look forward with a sense of achievement to continued service to the community and to the nation.

Guest Editorial

The Commonwealth: From Strength to Strength

By

ANDREW BOYD

"THE character of the Commonwealth has apparently changed completely during the last year". Dr. Verwoerd used these words in the brief speech in which he told the other heads of government, assembled in Lancaster House, that he was no longer asking for continued Commonwealth membership for South Africa. It was a bitter little speech, the expression of his inability to understand what had been happening in the outside world from which he had been withdrawn for so many years. But in that one phrase the South African Prime Minister stumbled upon something close to a revelation — a revelation that had just burst not only upon him but on an astonishing number of other people.

Lancaster House being just round the corner from my office, it had been temptingly easy to wander past St. James's Palace from time to time and see if there was any outward evidence of the tension that had built up inside the conference room during the three long days of debate about South Africa. There was none. London was almost sweltering in a minor heatwave that brought people out into St. James's quiet precincts and the nearby parks to sun themselves in a quite un-March-like way. The police cordon that had been established round the conference building, prudently, no doubt, but quite unnecessarily, had nothing to do except apologetically explain to a few frustrated strollers that they could not, for the time being, use their favourite short cuts into the park. There was least hint of a rowdy demonstration. Even the silent, dignified black-sash "mourners" who had taken turns in maintaining a day and night vigil for the first three days of the conference had gone. And, less than an hour before Dr. Verwoerd's dramatic ann-

ouncement from inside Lancaster House, there had come news of seemingly utter anticlimax: the heads of government had broken off for tea (Commonwealth solidarity, with the possible exception of Canada, could be taken for granted on this if on no other point).

Upheaval of an almost revolutionary kind was, nevertheless, going on — not in a noisy street, but in the quiet conference room itself, where hardly a voice was raised above the normal level. Writing just after the event, when even the participants in the conference find it hard to put what happened in true perspective, I may be misled by their initial reactions: but I would venture to say that the breach with South Africa was really no more than a by-product of something fundamentally more important that first took full shape this past week in the sunny stillness of St. James's.

Did the Commonwealth undergo a subtle but crucial change "during the past year" (the year since Sharpeville), as Dr. Verwoerd thinks, or just during this past week, or over what period? I don't think one can define the precise period during which the underlying change took place. The Commonwealth has newly — thank goodness — shown itself to be an organic kind of association; and in organic growth it is difficult to measure at precisely what point in time a fresh phase begins or ends. What one can pin-point is the moment of recognition of the change. That moment was here, now, in the Lancaster House conference room.

The Commonwealth, I believe, surprised itself. One might almost say that until this moment it had not taken itself seriously. For so long the air had been full of intangibles, of reverent ex-

pressions of respect for an ill-defined mystique, of such claims as "the Commonwealth is not breaking up, it is growing up." Who could tell whether words like these meant what they said, whether, indeed, they meant anything? Was there never to be a plain straightforward answer to the blunt question: What is the Commonwealth for? Was there to be answer to the lurking suspicion that the whole thing was a typical product of the crafty British unconscious mind, which had instinctively groped its way to a means of influencing nations which Britain could no longer control?

With the South African issue as catalyst, the Lancaster House conference forced its way, painfully, to the long awaited answer to these questions. It did so in spite of dogged British attempts to wave the questions away. Politely, indeed respectfully, but with quiet resolve, the sovereign sisterhood of nations made it clear that the "Mother Country" must at last face the fact that it was now no more than an elder sister in a group of true equals. With equal firmness, it brushed aside the whole corpus of over-sentimentalised argument that was brought in to buttress the South African position: the argument that the Commonwealth, arising as it does merely from the accidents of history, is an amiable freak that can go on fumbling its way happily through a changing world without any real sense of purpose. Instead, a clear purpose was perceived — and essentially only one. This was not a matter of thinking up a role for the Commonwealth to play in world affairs in order to give it something to do that would help it to hold together. The surge of world events has on the contrary, thrust a role upon the Commonwealth. Across the yawning, widening gap between the nations of Asia and Africa and those of the West, it can serve as a bridge of understanding and candid friendship — a bridge that has no match.

Such a bridge can be firmly founded only on the basis of mutual respect and equal dealing

The Budget Debate

THE general debate on the Budget, both in the Rajya Sabha and in the Lok Sabha, failed to reveal any constructive approach to the problem of financing India's Third Five-Year Plan, or any path different from the constructive one which the Finance Minister had chosen. Not unexpectedly, the usual complaints about the excessive burdens which the Finance Minister had placed on the common man, received repeated, if not very eloquent, reiteration. In the end, however, the House, which had rightly recognized that the Finance Minister's choice was not dictated by any of his own preferences, but by the imperatives of the Plan, was fully placated and the small concessions made in respect of kerosene duty and the provision in regard to powerlooms was even accepted as a mark of generosity, which, in fact it hardly was. Sooner or later, we will need to recognize that the habit of securing minor, and almost irrelevant, concessions in a Budget is not the purpose of a Budget debate.

The major issues of the country which are the mobilisation of resources and the obtaining of the necessary foreign exchange, unfortunately, failed to receive attention. The problem of prices was, indeed, dealt with at length, but not with any new proposal in regard to the operation of

between peoples, without distinction of race or pigmentation or any other ill-mannered nonsense. South Africa's blunt negation of these principles was in diametrical conflict with the whole concept of Commonwealth that emerged from this new sense of real purpose. It was hardly surprising that a bruised and rather bewildered Dr. Verwoerd lashed out at other members with wild charges of "oppression" and undemocratic conduct; but his charges, quite apart from the odd way they fell from those particular lips, were utterly irrelevant to the point at issue. Equally irrelevant was his prophetic gloom about the coming "disintegration of the Commonwealth". That phrase, which recalled to my mind Mr. Khrushchev's remarkably similar claim about "the beginning of the disintegration of the United Nations" during his visit to New York last year, was like all such angry warnings, no more than an expression of frustrated futility. Disintegration is precisely what the departure of South Africa can spare the Commonwealth.

In your columns last December 16, I was permitted to dwell on "the plain fact that, unless South Africa changes, the Commonwealth will have to eject it if the purpose of the Commonwealth is to be fulfilled". Exactly three months later, on the morning after Dr. Verwoerd's announcement, it seemed a slightly traumatic experience to find a leading article in *The Times* acknowledging that "the more the circumstances of this solemn issue are considered, the more clear it becomes that had South Africa not withdrawn, the unit of the Commonwealth would have been gravely threatened". As the Americans put it, hindsight is twenty-twenty. Being somewhat allergic to the past conditional tense, perhaps I may be allowed to prefer the simultaneously published verdict of the Prime Minister of Nigeria: that, far from "disintegrating" after South Africa's withdrawal, the Commonwealth "will continue to grow from strength to strength".

monetary control. Much the most important element in the debate turned out to be an acrimonious dispute between Acharya J. B. Kripalani and the Finance Minister in regard to the role of criticism which Parliament can legitimately entertain on the conduct of military affairs. Both Pandit Kunzru and Acharya Kripalani held that it was the Defence Minister who was primarily responsible for injuring morale in the army by investing promotions with a strong personal equation. The Finance Minister's argument was that it was the Members of the House who, by parading differences and complaining about the morale of the army, were doing disservice to the country; this naturally recorded with supporters of the Defence Minister. But it is doubtful, if the country as a whole, will accept the Finance Minister's view that all the responsibility for army affairs should be vested entirely in the Executive.

The Finance Minister's rather abrupt treatment of Acharya Kripalani and his somewhat curt treatment of criticisms of other members of the Opposition, notably, that of Mr. M. R. Masani of the Swatantra Party, belongs to his directness which may or may not be in the best interests of his Party. On the whole, the feeling is that the direct approach is much more appreciated by the Members of his Party than by the Opposition.

Members of the Opposition are accustomed to be treated with rather more gentleness than normally comes from the Finance Minister. It may be that here his manner could be improved upon. In substance, however, the Finance Minister can claim that, so far as the content of the Budget is concerned, his critics made a poor showing. *The Eastern Economist* takes the view that this Budget is a necessary and a commendable step in the fulfilment of India's Third Five-Year Plan. The negative approach that Mr. Masani presented ably of a small Plan or a planless effort in deve-

lopment runs counter to popular (and much informed) opinion both inside and outside Parliament. It is doubtful if this approach embodies a wise political course.

All in all, one should look upon the relative inertness of the criticism as a tribute to the constructive character of the Finance Minister's Budget. The success of the Treasury Benches is due largely to the content of the Budget rather than to the manner in which it was defended from a fairly dispersed and unprepared attack.

Movement of Sugar: Decontrol Needed

THE sugar mill industry is facing a serious problem today; with output steadily mounting, it is finding it difficult to service, in a tight money market, the unsold stocks. The industry is anxiously looking forward to export of sugar to the United States where introduction of a Bill in the Congress by Mr. Harold D. Cooley, Chairman of the Agricultural Committee in the House of Representatives, has brightened the prospects of Indian sugar exports. The Bill seeks to amend the U.S. Sugar Act of 1948 and envisages redistribution of the Cuban quota amongst countries of the Western hemisphere and those purchasing U.S. agricultural commodities. Advices from Washington indicate that though final decision on granting a regular quota to India for export of sugar to the United States will be taken sometime in August, an interim quota may be granted to this country to export to the U.S.A. about 1½ lakh short tons of sugar.

This quota coupled with exports of sugar to the Middle East and South-East Asia under the one million metric tons release for sugar exports, announced by the Government of India sometime ago, will help to some extent in lightening the burden of unsold stocks on the industry. It is understood that up to March 16, the Indian Sugar Mills Association had entered into contracts with the South-East Asian and Middle East countries for export of sugar to the tune of about 72,000 metric tons. Contracts for another 7,000 metric tons are expected to be finalised soon. Actual shipments up to March 16, amounted to nearly 52,250 metric tons. Another 5,000 metric tons are expected to be moved shortly.

The export of these 2.5 lakh tons of sugar will, however, not totally solve the industry's problem. The industry has been banking upon an export quota of about 5 lakh tons to the United States. Even after these shipments, the industry, it is expected, will have to carry over stocks at the end of the current crushing season to the tune of about 8 lakh tons which it will undoubtedly find it difficult to service in a stringent money market.

Is it not time that some re-thinking is done about the movement of sugar within the country? Though releases of sugar for the domestic market in the past few months have been substantial — nearly two lakh tons per month — the quantity lifted has been gradually going down. In November last, only 84.88 per cent of the quantity released was lifted by the States or their nominees who, under the present system of sugar movement, are the only persons to whom mills can sell the commodity. In December and Janu-

ary, the quantity lifted came down to 78.58 per cent and 77.20 per cent of the total releases.

Much of the industry's distress can be alleviated if the Government does away with the control on movement of sugar within the country. Some stocks in that event will be passed on to the trade, thus relieving the industry of some of the liability of servicing these stocks. With the supply position comfortable, there is absolutely no danger of prices of the commodity going up. On the other hand, they may even come down slightly in areas where at present they are ruling at a slightly higher plateau than warranted by the supply position.

Supply of sugar to the confectionery and food processing industries at concessional rates under the Export Promotion Scheme will also be helpful to some extent. The Union Government, it is said, has been contemplating for some time to introduce a Sugar Export Promotion Bill in Parliament by virtue of which sugar will be supplied to these industries at international prices, the loss to sugar producers being made good from the Trade Development Fund, created by the State Trading Corporation for such purposes. It passes one's comprehension why the introduction of this Bill is being inordinately delayed though President Rajendra Prasad in his inaugural address to the Parliament indicated that this Bill would be introduced at an early date. The Indian confectionery products can find a good market in the neighbouring countries provided their prices are competitive. And one way to make them competitive is to reduce the cost of this essential raw material for the confectionery industry.

Efforts, however, have to be continued to secure an export quota of about 5 lakh tons from the United States because if India has to emerge as a big exporter of sugar, it can do so only with a quota of this magnitude from that country which imports sugar at prices about 60 per cent higher than those obtaining in the international market. Indian sugar, at present, is being exported even after full drawback of excise duty and other Governmental imposts, at a loss of about Rs. 14 per maund. Exports to the United States would cut this loss to about Rs. 6 per maund. Misgivings expressed in some circles in the United States that India may not be able to supply regularly 5 lakh tons of sugar a year to that country are unwarranted. The sugar mill industry in this country is expanding fast and it can be safely assumed that India's sugar output in future will be of the order which can yield a surplus of over 5 lakh tons over the domestic consumption.

A DELHI DIARY

THE SHIFTING SPOTLIGHT

THE spotlight has shifted frantically this week; firstly, to Parliament with the Budget debate and then, as interest ebbed because of its repetitive character, to Laos which entered a strong candidate for attention with the arrival of Prince Souvanna Phouma on Saturday. Mr. Averell Harriman, Special Representative of President Kennedy, sprung a surprise on Delhi by suddenly deciding to say a piece to ECAFE delegates and then to an expectant Press. In the end, it is difficult to say how much of the spotlight he actually captured. In my (bold) opinion, not very much. His replies, while initially gratifying, tended to recede on reflection. Does self-determination for Goa imply that the United States accepts the Indian views on the retirement of Portugal? Supposing a vote can be arranged so as to give the Portuguese Government a bare majority, are we any better off? I fear that much of the genuine goodwill which Mr. Harriman dispersed was not necessarily a pointer to an immediate change of history. However, one change of history in a week should be satisfying even to an incorrigible grumbler like myself. The departure of South Africa from the Commonwealth and the recognition that the coloured nations of the Commonwealth would rise superior to what might be called (disrespectfully) the traditional ruling group is historic enough. Sufficient for the week is the change thereof.

REFLECTIONS ON AMBASSADORS

I am quite happy to leave this great turning point of history and infructuous contemplation for some reflections on the role of ambassadors. In fact, all this week, for a very large number of people, the spotlight has rested firmly not on history but on two much loved personalities—Ellsworth and Harriet Bunker. It is not, indeed, irrelevant that Mr. Bunker was American Ambassador in India for over four years, and that some of the affection that they both aroused is due to the fact that they have a lively sense of participation in Indo-American relations and Indo-American assistance in the grand manner. During his stewardship the greatest commodity loan of all times—17 million metric tons of foodgrains—went through almost unobtrusively. The range of American assistance and of partnership have also eclipsed all previous records. It is not a small thing that this should have been accomplished quietly without any attempt to draw gratitude or attention to those who spearheaded the task. I know that comparisons are odious, but being an odious person, I must indulge in personal comparison. I cannot think that the United States has had, since independence, any more effective representative and, greatly daring, I predict that it will not have Mr. Bunker's equal again. In a sense this is because his view of diplomacy was as catholic as his outlook. As distinguished from most diplomats who have conceived of their purpose as striking the pockets of influence in particular areas, the Bunkers broadcast their seed with an almost complete indifference as to whether it bore immediate fruit. The picture of the American Ambassador also was curiously many-sided; to the businessmen he appeared as a leading business executive with deep knowledge of the sugar industry as well as of banking with which he would be intimately associated in Wall Street. To the diplomatic world he appeared much more as the practised diplomat who had survived the Peron administration in Argentina, great difficulties in Italy, and not the least of all, a fairly difficult initial period in the Indian Union. To the social worker and the Press he appeared as a fine observer of events capable of detaching himself with amazing ease from the material interests of his country as distinguished from the larger moral purposes of

democratic living in which India and the United States are necessarily involved. There was combined in the Ambassador a great multitude of talents none of which was so obtruded as to leave those who conversed with him with the feeling that they were dealing with specialists in particular fields. Thus, they created, with a multitude of persons, relations which were spontaneous and free, in which many hundreds of people, without what might be described as "influence" in particular circles, claimed a friendship with both Mr. and Mrs. Bunker, which will be literally permanent. Thus they disengaged themselves from their ambassadorial responsibilities and established a direct bond with the Indian people in which lasting personal friendships arose above both influence and immediate objectives of Indo-American relations. I doubt if any ambassador in New Delhi has accomplished the broad and lasting sweep of goodwill that the Bunkers together have achieved.

THE STAND-UP BROOM

I say together because one of the great achievements of the Bunkers was that they worked as a team apparently unplanned but concerted and operated with a common imagination. Harriet Bunker's notable achievement—amongst those who have not known her—is her introduction of what has been called the stand-up broom. This captured the Prime Minister's attention and one fine week, every Chief Minister of India got a circular letter on the importance to human dignity of standing up while sweeping. Incidentally, the picture of Harriet Bunker, as someone who is concerned above all about the stand-up broom, was hopelessly wrong. She was concerned not with brooms but everything which added to the dignity of human personality. The amazing capacity that she had even in ill health to pursue the larger objectives of what has been called social service had to be seen to be believed. Thus there leaves the Indian scene a notable partnership of which, I am hoping, we will see at least an equal in the years to come. It was not an accident that a very large number of people came to Safdarjung airport on Saturday morning to see them take-off for Bombay en route to the United States. On that occasion I noticed everyone was remembered by his or her Christian name.

PROF. KENNETH GALBRAITH

People keep on asking me how Prof. Galbraith, who was appointed as American Ambassador to India this week, will fair in the succession. I know of Prof. Galbraith's writings, particularly, the dramatic ones—'The Great Crash' and 'The Affluent Society'—and naturally anyone who writes so well and so provocatively will be received with interest and perhaps with some respect. But it would be an error to suppose that cleverness and scholarship are easy passports to the affections of the Indian people. It is still said, somewhat disrespectfully, of Rajaji that he was too clever for Indian popular consumption, and I expect that his fine mind is as much a liability as an asset to the Swatantra Party. Prof. Galbraith begins with a great flow of goodwill to the United States and with a pattern of broadcasting goodwill which might, in fact, be an even greater asset than his undoubted intellectual ability. But now that Washington has become a great ferment of intellectual activity with the intellectuals of what is disrespectfully called the Harvard set in the ascendant, it may be tempting to assume that the Indian intellectual is equally important in the Indian scheme. Mr. and Mrs. Bunker did not make that mistake. There endeth the first sermon!

ARGUS

THE WEEK'S NOTES

Averell Harriman

DASH TO NEW DELHI

THE SUDDEN news that Mr Averell Harriman, Special Representative of President Kennedy, would come to Delhi for the ECAFE Session naturally led to expectations that a major policy statement was about to be made. Indeed, the Press was informed that such a policy statement was to be made after a "banquet" on Friday, March 17, and on Saturday Mr Harriman held a well-advertised Press Conference. Views differ in regard to the wisdom of having raised expectations so high because it did not, at least at first sight, appear that the statement made carried any significant new development. However, there was in Mr Harriman's statements a ring of change, the full significance of which has not been lost on those who heard him speak. The written word has not been equally satisfying.

Not the least of the points made by Mr Harriman was the fact that the Kennedy administration has electrified Washington, and there is a passion for change and action which recalls the ferment of the early days of newly formed Roosevelt administration. This ferment is already overflowing into other fields. Obviously, the President cannot change everything overnight and the view that he is creating an atmosphere for change, rather than change itself, is justified. The President has to hasten slowly with the American public opinion, still uncommitted to a dramatic change in aid policy, particularly with the dollar by no means completely underwritten. All things considered, Mr Harriman spoke with assurance which has conveyed the impression, rightly or wrongly, that India's requirements on the Third Plan would not merely receive earnest consideration—for this alone his presence could hardly have been necessary—but that the amount desired would, in fact, arrive. Perhaps this is an overstatement from the assurance with which Mr Harriman spoke. If, in fact, this impression is justified, it would be better than another policy statement.

Laos and India

PRINCE SOUVANNA PHOUMA'S VISIT

COMPETING WITH Mr Averell Harriman for interest has been the visit of Prince Souvanna Phouma of Laos. He was awaiting return of the Prime Minister on Wednesday. It is believed that a major solution to the problem of Laos is in the offing with a large new International Commission, possibly with representatives of fourteen nations, devising a suitable formula. Meanwhile, the point that the United States is digging in its position in South-East Asia has been made clear by the warning that it will not sit by idly, should Laos come under Communist control. In other words, the situation is ripe for intervention of the Geneva type with a stabilisation of frontier, and presumably the neutralist administration, which will replace the pro-American administration of recent months. This solution might well suit both sides since Laos does not seem to be strategically so vital to either that it would be worth overstepping the limits of moderation. Here, at least, one can say that expectations in Delhi are running high, and with justification. It is unlikely that Prince Souvanna Phouma will return totally disappointed from New Delhi. Busy as the Prime Minister is, Laos will obtain attention.

Central Budgets

A DECADE'S BUDGET ESTIMATES IN RETROSPECT

AFTER A well-balanced and objective assessment of all the relevant Central budget papers, the Committee of the Indian Merchants' Chamber, Bombay, has made a few pertinent observations which merit serious consideration.

Perhaps the most notable point about the Government's budgeting in respect of revenues and expenditure that the I.M.C. Committee has made is the one that relates to the trends in revenue and expenditure. Even a cursory comparison of the figures budgeted for and those actually realised over the past ten years, i.e. 1950-51 to 1959-60, as the I.M.C. has proved, shows a persistent policy of over-estimating the expenditure and under-estimating the revenues, so common to all Finance Ministers. For instance, according to the budget estimates of each year between 1950-51 and 1959-60, there ought to have been a total deficit of about Rs. 49.87 crores, but, when compared with the actual realisation of revenues, the accounts show no such deficit but a surplus, on the contrary, of Rs. 477.44 crores. In the result, revenue has gone up by Rs. 527.31 crores, bringing an average surplus income of over Rs. 50 crores per year during the whole period. It is only right to insist then, as the I.M.C. has done, that not only this wide variation between estimates of revenue and expenditure be carefully examined, but the Union Finance Minister should make it a point to mention, in his budget speech, the final results in regard to the previous budget estimates of surpluses or deficits. To further substantiate the point it has made in this connection, the I.M.C. Committee has also pointed out that, whereas, in the budget year 1959-60, the deficit was shown as Rs. 58.32 crores, in the revised estimates for that year, the deficit was reduced to Rs. 15.39 crores, while the actual accounts, as given in the Explanatory Memorandum of the Budget 1961-62, show that even this deficit has been wiped out, and there is, instead, a surplus of Rs. 42.55 crores! If the final results in regard to the previous budget estimates of surpluses or deficits are made available in the course of the budget speech every year, as the Committee suggests, it would enable both the Government and the public to have a clear view of the resilience of the economy in terms of resources.

While welcoming some of the latest budget proposals in the field of direct taxation, the I.M.C. suggests a few positive measures for increasing private savings and capital formation in the country. For instance, it advocates the placing of a ceiling for taxation on individual incomes and the raising of the minimum taxable limit to Rs. 5,000 for individuals and to Rs. 15,000 for Hindu undivided families.

The I.M.C. has also gone into the question of indirect taxation and points out that the enhanced customs duty both on the basic raw materials or intermediates and components and on the end-products for various industries would affect the competitive capacity of our export products adversely. According to the Committee, there is scope for revision and suitable modification of the budget proposals for the year 1961-62, inasmuch as, apart from the fresh levies, a very much larger revenue may be expected to accrue from the

existing levies themselves in the future than in the past.

Dandakaranya

MOVEMENT OF DISPLACED PERSONS

LAST WEEK, Mr Mehar Chand Khanna, the Union Minister for Rehabilitation, made a statement in the Lok Sabha on the unsatisfactory position regarding movement of displaced persons to Dandakaranya for settlement. Everyone agrees with Mr Khanna that the progress made so far is very unsatisfactory and also that there is much wastage of Government revenue on a scheme which has proved almost abortive. Mr Khanna is now thinking of using compulsion instead of persuasion for the movement of camp families in West Bengal to Dandakaranya. Use of compulsion or putting pressure by issuing notices to displaced families to move to Dandakaranya has not proved successful in the past; for example, the State Government had issued notices to about 1700 families up to the end of January, but only 252 families moved to Dandakaranya during January and February this year. Use of compulsion or pressure may only aggravate the unsatisfactory position that has been pursuing the whole scheme since its inception; it may, in addition, encourage interested political parties to make capital of this issue, specially in view of the coming general election next year. As a matter of fact, it is political propaganda coupled with

individual and party interests which has played havoc with the life and happiness of the displaced persons from East Pakistan. On the other hand, the unimaginative conformity to stale rules and regulations of a Government department coupled with red tape and stereotype routine approach to a human problem has failed to elicit the necessary response for the rehabilitation of refugees of a particular part of the country in another totally different climate and environment. It is only trust, confidence, sympathy and tact on the part of uninterested individuals and organisations, that can win the natural reluctance of refugees to settle in an area which was hitherto nothing but jungles. The most suitable agency that can make a success of the rehabilitation of displaced persons from East Pakistan in Dandakaranya is the sincere and wholehearted work of a few voluntary social organisations which have worked for the refugees in the past and who enjoy the confidence of the displaced persons. It is strongly felt that unless the Government executes its policy through such voluntary social organisations, it can never meet with success. Such a course on the part of the ruling party would also prevent the opposition political parties from playing havoc with the life and happiness of displaced persons for their private ends. It implies that the Ministry of Rehabilitation would have to delegate power and authority to a large extent to a voluntary social organisation for making refugees agree to shift from the camps in West Bengal to Dandakaranya. It does not, of course, absolve the Ministry from the duty of providing all the promised basic amenities in Dandakaranya.

The World Abroad

ANTITRUST AT WORK IN BRITAIN

By

ODYSSEUS

A READER has suggested that in my two recent articles outlining anti-monopoly legislation in the USA and in the UK, I have been too sweeping in condemning the UK Restrictive Trade Practices Act of 1956.

Let us, therefore, take a look at the Act. It provides for a Registrar of Restrictive Trade Agreements, and a Restrictive Practices Court. The Registrar is concerned with agreement between persons carrying on business as producers, processors, or suppliers of goods, or associations composed of such persons, under which mutual restrictions are accepted in the matters of prices, terms and conditions of trading, quantities, or descriptions of goods, processes of manufacture, areas or places of trading and persons with whom business is done. The law enables the Registrar to secure all the information that he wants.

So far the UK Act is roughly in step with the prohibitions enforced by US antitrust, the broad aims of which (you will recall) are to disperse excessive concentration of private economic power and to uphold the principle of competition. US antitrust is not concerned with any economic benefits claimed to accrue from restrictive practices or any evils alleged to follow from ending them. These are matters of opinion, on which consumers, businessmen, economists, and other "expert" witnesses, will often differ.

The UK Act, however, allows a firm to defend a restrictive agreement by showing that it confers benefits in one or more of the following ways: (a) by protecting the public against injury in connection with the installation, use or consumption of goods; (b) by making available other 'specific substantial' benefits to the public; (c) by counteracting restrictive measures taken by 'any one person' who is not a party to the agreement; (d) by permitting the negotiation of 'fair terms' for the purchase or sale of goods with buyers or sellers who represent a preponderant part of the trade; (e) by preventing the occurrence of 'serious and persistent' unemployment in an area heavily dependent upon the particular trade; (f) in maintaining the volume or earnings of the export trade in the commodity where this is substantial in relation to the export trade of the United Kingdom as a whole or in relation to the whole business of the particular trade; (g) in maintaining some other restriction which the Court holds to be justified on its own merits.

A NEAT BALANCING ACT

Faced with defence arguments on any of these points, the UK court enters what is called the 'balancing phase' of the hearing in which defendants have to satisfy the court (the onus is, rightly, on the defendants) that the restriction is not unreasonable having regard to the balance between the benefits resulting, or likely (sic) to result and any detriment to the public or to persons not a party to the agreement. Messrs. Guenault and Jackson, in their useful "Control of Monopoly in the UK" (Longmans Green. 1960. 25sh.) point out that the Court does not have to be satisfied

that the benefits and detriments are evenly balanced, but merely that in the light of the net balance, which may be adverse, the restrictions are not unreasonable. Thus, the court must balance (a) the specific justification for the restriction against, (b) the actual or possible (sic!) injury to the public and then decide whether the restriction is not unreasonable.

The Act thus gives economists for the first time in history an important role in British court procedure. The best comment on this came from Professor A. Beacham who said that, in the main, the issues were not of a kind to which an economist can give clear-cut answers on an objective basis, and if economists habitually expressed definite opinions on questions to which economics has no answer in any practical context, great harm might be done to the standing of the profession. The economist, he said, should rather be useful in marshalling and occasionally interpreting the facts. A second objection is that the given facts of any economic situation are always evolving, so that the UK could easily be led to set up machinery for the continuous supervision of a firm or an industry to allow for new circumstances, and so bring all the inflexibilities of government control in by the back door. A third objection is that as the circumstances of each firm and industry differ, a decision in one case provides no precedent, and therefore no guidance, for other industries.

The Act also sets up a Monopolies Commission to deal with agreements solely concerned with export trade and what are called "single firm monopolies", which are defined as any firm responsible for one-third of the supply. This seems nonsense, because a monopoly situation is not a question of a percentage but of fact. In the USA, Judge Leahy found that although du Ponts supplied 75 per cent of the output of cellophane, the market which buys it is acutely sensitive to price-changes and to substitutes and that du Ponts in fact possessed no significant power in the packaging market as a whole.

Finally, note that the UK Act allows individual "vertical" resale price maintenance but forbids collective boycotts, exclusive dealing, the imposition of trade penalties, and the use of secret trade courts to enforce it. Resale price maintenance, which is also legal in the USA, differs from "horizontal" price-fixing, especially in that it normally applies only to branded goods, and there are usually competing branded lines which are price-maintained. One brand of tooth paste may be sold at the same price at all shops, but they will also be selling other brands at other prices. The arguments for and against resale price maintenance are outlined by A. D. Neale in his "Antitrust Laws of the USA" (Camb. Univ. Press. London. 1960). Its main support comes from small shopkeepers who regard it as an essential defence against absorption by chain stores.

As long as a Conservative government is in office in the UK, I don't foresee that the law will be used to

inaugurate administrative control of business by the back door.

U.K. ACT WORKS WELL

The Act has, in fact, worked well. Fears that the court would interpret the Act leniently have proved groundless. However faulty (in my view) the Act is, its mere existence is a convincing refutation of the widespread belief that all Tory governments are controlled by big business. The Federation of British Industries took the dimmest view of the bill. Their representations were heard courteously but proved unavailing.

The court seems also to have sensed the risks of getting involved too deeply in questions of economic theory, and has intimated that the evidence of economists and accountants should be confined to the specific peculiarities of the cases under investigation. Some 2,200 agreements have been registered, of which 600 have been abandoned by the parties concerned. Of the 2,200, many are of small importance and some duplicate each other. An unknown but substantial number have been dissolved rather than face the publicity of registration and possible court action.

One significant fact of interest to students of economics which has emerged is that, in general, the agreements which have been condemned by the court had not enabled large or easy profits to be made by the industries concerned. What most often happens are undesirable rigidities in the structure of the industries and their channels of distribution, and a weakening of incentives to reduce costs and to improve methods of production.

Although individual resale price maintenance is legal, it is not so easy for manufacturers to detect when retailers sell below the agreed price. Litigation is troublesome, expensive, and is often bad publicity for

the product. A manufacturer who insists on maintaining his resale price is taking the risk that his competitors will undersell him. Where therefore there are many producers of similar products, prices are not likely to be enforced. The result is that the facade of UK resale price maintenance is developing ever more numerous cracks. Most electrical goods (all the way from TV sets to electric toasters) can be brought at substantial discounts off list price. Cheap petrol is on sale. "Shop-soiled" cars are available at cut prices. The Co-operative Wholesale Stores have developed an "instant dividend" scheme. Price cutting grocers and food stores are innumerable.

One effect of all this has been to give fresh impetus to the supersession of the small shop, with its comparatively heavy overheads, by the self-service supermarkets, which assemble under one vast roof almost every conceivable commodity that a housewife wants. In 1950, there were only 500 self-service shops in the UK; in 1957 there were 3,500; today there are 6,000. A conventional shop with a turnover of Rs. 7,800 a week has wage costs of about 7.5 per cent of sales. A self-service store which mechanises the price process, lets the customer do his own choosing and carrying, and channels him out via a four-laned exit, cuts labour costs to under 5 per cent of sales.

All this competition is splendid. But the proof of the Conservative Monopoly pudding will come in the eating under a Labour government. The Labour party is not seriously interested in the mere control of monopoly. Its goal is a Socialist (or at least a Socialist pattern!) society, which means the extension of public ownership where feasible, and, where not, the inauguration of controls and regulations over industry. With but slight amendment to the Act, the UK Monopolies Commission could be a powerful weapon in their hands. That is why I prefer the cast-iron principles of US antitrust to the empiricism and individual case study of the UK law.

dynamic the industrialist takes a step forward

Every step towards Hannover Fair is a step forward in industrial progress. At Hannover you will learn the latest production methods and techniques... exchange ideas with leading international industrialists... see over 5000 exhibits from all over the world... feel the driving force of modern industry!

Groups exhibited include:

Mechanical & Electrical Engineering, Iron & Steel, Non-Ferrous Metals, Chemicals and Plastics, Rubber, Building Materials, Precision Mechanics and Tools, Optics, Office Equipment, China, Ceramics, Glassware, Clocks and Watches, Jewellery, Hardware and Cutlery, Handicrafts, Gift Articles - and many others.

ENGLISH ELECTRIC

HIGH RUPTURING CAPACITY HEAVY DUTY FUSEGEAR

H. R. C. CARTRIDGE FUSE-LINKS

Hermetically sealed construction—
Non-deteriorating—
ASTA certified for 35 MVA rupturing capacity—
Visible indication of operation—
Ratings up to 300 amps.

COMBINATION FUSE-SWITCHES

Ratings from 30 to 750 amps—
Rugged construction, fully shrouded and interlocked—
Type tested for 35 MVA rupturing capacity.

COMBINATION FUSE-SWITCHBOARDS

Incorporating Combination Fuse-Switches upto 750 amps—
Robust and compact construction—
Readily modified and extended—
Type tested for 35 MVA rupturing capacity.

DISTRIBUTION FUSE-BOARDS

Robust, dust and moisture proof construction—
Type tested for 35 MVA rupturing capacity—
Ratings from 15 to 100 amps.

Flexibility of power distribution—
Can be installed without disturbing existing layout or production—
Avoids chasing of floors for ducting—
Approved by Fire Insurance Authorities.

OVERHEAD BUSBAR EQUIPMENT

A complete range of distribution equipment manufactured at the Madras Works of The English Electric Company of India (Private) Ltd.

WESTERN DEVELOPMENT ASSISTANCE

From Our Special West European Correspondent

PARIS, March 19.

FOR once, a study of Western aid to developing countries has been made for purposes other than propaganda and polemic. Numerous comparative statements of foreign aid transactions have been compiled in recent years, usually with the aim of showing that one industrialised country is doing more than another, or that Western countries are doing much more than the Communist bloc. The report published here this month by the Organisation for European Economic Co-operation has another purpose, and can thus afford to be honest about the difficulties of comparing and adding up the dozens of different sorts of assistance received by developing nations. The report is a joint effort of the members of the OEEC and their associates, and so there is no attempt to prove that one is more generous than another; Russian efforts are nowhere mentioned. The desire to avoid invidious comparisons has even led the authors to make no general synthesis of their findings, though there is a table of aid transactions by countries, produced below.

The object of the OEEC report is to prepare discussion of ways to increase and co-ordinate foreign assistance when the OEEC is succeeded by the OECD: Organisation for Economic Co-operation and Development, which will include all the European members of the OEEC plus Canada and the USA. Unlike the OEEC, which is now winding up its affairs, the new OECD has aid to developing countries as one of its prime objectives, but it has no funds of its own for that purpose. Before useful discussion could begin, it was necessary that all the member-countries should make known what they were doing in the field already and what sort of activities they regarded as "assistance to developing countries". So the 20 capitals involved received a questionnaire, which they have answered with a commendable promptness. Even though it was agreed that purely military grants and short-term commercial credits (of less than one year) should be omitted, the replies are still of a bewildering complexity, because there is no one definition of "assistance"—and nor is it desirable that there should be, for developing nations require aid of many different kinds, not all of which can be expressed in money terms.

As for comparisons of gross money totals, we learn nothing from the OEEC report that was not already known: that the USA does most in absolute terms, and that by a long chalk; that France contributes the next largest total, which means that in relation either to her population or to her national revenue, her effort is the most burdensome; and that, in relation to the same factors, West Germany does comparatively little.

Hence the following table of "participation in assistance to development abroad" for the four years 1956-59:

(In millions of US dollars)

USA	14,062
France	4,921
UK	3,149
West Germany	2,328
Holland	850
Japan	588
Italy	552
Canada	464
Belgium	394
Switzerland	393
Portugal	133
Sweden	111
Denmark	48
Luxemburg	8
Norway	6
Ireland	2
Austria	—49

To be really informative, this table of bare money totals would require a series of footnotes many pages long. The OEEC's aim in preparing it was less to issue a prize-list in competitive generosity than to open the debate on the nature of "assistance" which the successor OECD will have to conduct before it can begin co-ordinating dispersed activities. Mr. Thorkil Kristensen, of Denmark, whose secretaryship will span the end of the OEEC and the birth of the OECD said this last week: "What we envisage doing at the OECD in the matter of development aid is first of all to arrange consultation and exchange of information between the nations interested. Very substantial quantities of capital are flowing on a bilateral basis from Western countries to under-developed countries. Therefore it is most important that the former should discuss between themselves how this flow of capital and technical knowledge could be best increased and improved without endangering the payments-balance of capital-exporters. I am convinced that we must re-think this problem, and discuss it in order to put these multifarious activities to more rational use. It is absolutely indispensable that we make sure that the financial and human resources sacrificed by certain countries in favour of others are not wasted or used inefficiently. In other words, I am sure that we can discharge our responsibilities to the under-developed countries much more efficaciously than we have done so far".

The following table drawn, from the report, shows the magnitude of the sums involved in recent assistance efforts by the OEEC group as a whole (in thousands of millions of dollars):

BILATERAL CONTRIBUTIONS

	Public Sector		Private Sector				Total
	Gifts	Net Loans	Export Credit Guarantee	New Loans and Investments	Re-invested Profits	Contributions to International Organisations	
Average 1950-1955	1.2	0.6	0.2	0.7	0.6	0.2	3.5
1956	2.0	0.9	0.4	1.5	1.0	0.2	6.1
1957	2.2	1.1	0.5	2.1	1.0	0.5	7.4
1958	2.4	1.4	0.2	1.4	0.9	0.7	7.1
1959	2.6	1.6	0.3	1.1	0.8	0.5	6.8
Average 1956-1959	2.3	1.3	0.3	1.5	0.9	0.5	6.9

It emerges that the OEEC group gave an annual 6.9 milliard dollars to development aid in the period 1956-59, which was just about twice what they gave in 1950-55 (3.5 milliard dollars). Yet a peak was reached in 1957, since when aid has been diminishing. It is clear that aid has not been increasing as it should. My own guess is that this decrease is due to the oil industry: it will be seen in the table that new private loans and investments plus re-invested private profits reached a peak of 3.1 milliard dollars in 1957, i.e., within months of the nationalisation of the Suez Canal and the apparent threat to the West's oil supplies. This fell to 1.9 milliard dollars in 1959, when it was clear that there was an energy surplus, and in particular a glut of crude oil. European industry's shares of these totals is more than half and has been relatively stable (it comes almost wholly from British, French and West German firms); the rest is the investment of U.S. industry and this has fallen, no doubt, because of the more cautious investment policies of the oil companies. Since oil investments interest only a minority of developing countries, we may conclude that no tendency toward less financial assistance in general is shown by the table.

Another element in these figures that concerns only certain developing nations, and not India, is a substantial part of government grants (column 1). Of the total of 9.2 milliard dollars of public gifts made in the four years 1956-59, about 5.3 milliard came from the USA and much of that was "defence support aid," which is not strictly military aid but civil aid given with military considerations in mind. Also, part of these public grants are sums allocated by Britain, France, Belgium and Holland to balance the budgets of colonies and former colonies.

The sums shown as having been contributed to international organisations (the World Bank is the most

important, but there are 15 others) exceeded the sums drawn from those organisations by the developing countries. The Western nations themselves often draw on the aid of those institutions—not only Austria, which has received much more help than she has given, but the big Powers too. Moreover, the world bodies put large sums to reserve, while a part of the loans and grants they have made remain unused. So one cannot add up the second last column and conclude that all this has gone to assisting developing countries.

Now, it will be seen that, without trying to criticise the figures presented by the OEEC but just in order to explain them, it has already been shown that a very large part of developing assistance is related to power-bloc defence plans, or concerns the oil industry, or goes to struggling ex-colonies and colonies for their current budgets, or goes to world bodies without reaching borrowers from the developing regions. None of those countries is what India has in mind when she looks for increased development aid. It would be a good thing if, when the OECD is born and gets around to discussing the co-ordination of assistance programmes, some of the recipient countries like India were associated with the work. They could point out, more quickly than donor-nations are likely to do, that much of what is presented as development aid has a very restricted scope. More important, rational co-ordination of real development assistance cannot be decided by the donors alone; they will have to consult the recipients, either singly in the case of big countries like India, or in regional groups when the balkanised African territories are involved. I am not suggesting that the OEEC report is dishonest or hypocritical but it does illustrate how, when donor-nations get to discussing aid among themselves, they add up their sacrifices instead of calculating their real net contribution to development in regions where development is actually going on.

WORLDGRAM

India

Regional Research Laboratory at Jorhat: A Regional Research Laboratory is being set up at Jorhat in Assam, by the Council of Scientific and Industrial Research. The Jorhat Laboratory will aim at investigating problems relating to the important raw materials available in Assam and in the surrounding areas of North-East Frontier Agency, Manipur, Tripura, and the Dooars. The Laboratory will also provide help to the existing industries of the region and foster new ones. To start with the laboratory will have two divisions, one for applied chemistry and the other for engineering. The technological and engineering section will have facilities for carrying out pilot plant trials. The Laboratory will have a museum, a library, a documentation centre and an extension department for disseminating the results of research and for maintaining liaison with the Government, industry and the general public. When fully developed, the work of the Laboratory will be distributed among several divisions: mines and fuel, medicinal plants, leather, food, plant products, roads and buildings, earthquake engineering and public health engineering. The Regional Research Laboratory will function in collaboration with the various national laboratories, research organisations and the Gauhati University.

U.K.

New Plant to Manufacture Melinex: A new plant for the manufacture of Melinex, a polyester film with hundreds of uses in industry and the home, has been opened by Imperial Chemical Industrial in Dumfries, Scotland. The outstanding quality of Melinex, which is manufactured in Britain only by ICI, is its versatility. It has great mechanical and dielectric strength as well as chemical and heat resistance. In the electrical industry, it can be used for condensers, capacitors, cables, and electric motor slot insulators. Other industrial uses include the lining of chemical and gas pipes. Melinex derived from the polymer from which terylene is made, was discovered in 1939 by two British scientists in the laboratories of the Calico Printers Association. Extensive research was carried out by ICI at a pilot plant to prepare the way for the manufacture of the film commercially, and now the Plastics Division claims that it will be able to supply the whole of the home market.

India Orders Machine Tools From U.K. Firm: Craven Bros. (Manchester) Ltd., the Stockport (England) firm of machine tool makers have been awarded orders from India valued at more than £6 lakh. Craven Bros. specialise in large heavy machine tools for general purposes. This latest order brings the intake of new work since the beginning of this year to well above £1 m. and further substantial contracts are at present being negotiated. Craven brothers have already fulfilled a number of orders in India.

Upward Trend in Exports: United Kingdom exports were valued at £297,100,000, imports at £353,300,000 and re-exports at £11,200,000, according to provincial figures issued by the Board of Trade in London. The February figures, it is pointed out in London strengthen the impression given by the

January and December results that an encouraging upward trend in British exports has established itself. The Board of trade now provides figures for both exports and imports which allow for the normal seasonal variation, and the February export total on this basis is shown as £307 million, which is not far short of the exceptional January figure. Looking back over recent months, which enables the upward trend to be more clearly seen, British exports (seasonally adjusted) in December, January and February were 5½ per cent more than in the three months September-November and were 4½ per cent above the average for 1960. On the same basis, imports were 1 per cent less in December-February than in September-November, while remaining two per cent more than the average for 1960. In addition to confirming the upward trend in exports, the February figures support an expression gained in recent months that the imports have now definitely past their peak.

U.K. Firm to Build Dam in Sierra Leone: A contract for an earth dam costing £2m. in the Guma valley of Sierra Leone has been placed with Taylor Woodrow Limited by the Crown Agents for Oversea Governments. The 900 ft.-long dam will augment the water supply of Freetown, capital of Sierra Leone. This West African territory attains independence next month. Of the money needed, £1m. will be provided by the Colonial Development Corporation. There is a possibility that at some time in the future the dam will supply water for a hydro-electric station.

Australia

Rural Industry: Rural industry in Australia continues to develop, and the aggregate volume of production last financial year was officially estimated at about 45 per cent above pre-war levels, and this year should be higher by 52 per cent, according to the National Bank of Australia Ltd. In a recent summary of Australian business conditions, the Bank states that the aggregate gross value of rural production, for the current financial year (to June 30) might be close to £1,300,000,000 are only about £15m. less than the actual value for 1959-60. In the current season, the Australian wool return would probably be some £65 m. to £70m. below the £400m. recorded last season, but every indication was that the volume of agricultural production would be at a particularly high level. Gross value might rise by as much as £75m. The bank points out that on a gross production value basis, the greater agricultural production should largely upset the decline in wool.

Production of Fertilizers: Production of fertilizers in Australia is now worth £25m. a year, with Australian farmers spending about £20m. a year on superphosphate alone. A recent survey of the industry by the Australian Department of Trade shows that production and use of superphosphate have nearly doubled in the last fifteen years. This usage has been reflected in considerable crop yield increases and in pasture improvement over the period. It is estimated that only about 1 acre in every six suitable for treatment with fertilizers has been fertilized so far. Capacity to pro-

duce superphosphate is now estimated to be 2,650,000 tons a year.

France

Record River Traffic in 1960: In 1960 river traffic totalled a figure which had never before been attained. The record of 1957, the best year since the war, was beaten with tonnage increasing from 65,684,000 tons in 1957 to 68,125,867 tons in 1960. Compared with 1959, the comparison is as follows: Tonnage loaded: 68,125,867 tons in 1960 compared with 63,338,102 tons in 1959, which was an increase of 9.2%. Kilometric tonnage: the increase is still greater since it increased by 14.9%, or 10,706,400,053 kilometric tons in 1960 compared with 9,316,972,513 kilometric tons in 1959. Except for ore and building material, which remained stationary, every group showed both an increase in tons transported and an increase in kilometric tons compared with 1959, which reached respectively 11.5% and 10.6% for industrial products; 17.5% and 20.7% for hydrocarbons; 20.5% and 33.4% for metallurgical products; and 39.5% and 36% for raw materials used by the metallurgical industry.

U.S.S.R.

Rise in Foreign Trade: The Soviet Union Foreign Trade increased by 27 per cent in the first two years of 7-year plan (1959-1960) the newspaper Soviet Trade reported recently. It points out that Soviet foreign trade will further increase in the near future, as indicated by agreements concluded with many States at the end of last year and the beginning of the current year. The paper points out that though the final figures about Soviet foreign trade in 1960 are not yet available it is already clear that our economic relations with many capitalist countries have been developing in the right direction.

*

Programme of Railways and Highways: This year the Soviet builders will lay thousands of kilometres of railways and highways, commission new sections of the underground in Moscow and Leningrad, and build many other installations. It is reported that the total length of Soviet railways is to increase by over 1,200 kilometres in 1961, and that of hard surface highways by over 1,000 kilometres. Large-scale work is to be carried out this year to increase the through-put capacity and to electrify the railways already in operation. Electric traction is to be introduced on more than 1,000 km. of railroads in 1961. In the course of the 7-year plan period, ending 1965, a total of over 17,000 km. of railway lines are to be electrified.

Sweden

Industrial Production: According to the index of the Federation of Swedish industries, the output of the whole industry amounted in October 1960 to 288 units and in October 1959 to 280 units. The seasonal adjustments having been made in the index series, the figure for October is shown to be 272, and that for the preceding month 271. This means that the output was 3 per cent higher than in October 1959. The increase took place at a lower rate both in September and in October, than earlier this year, which is partly due to the fact that the production figure had increased considerably in the autumn of 1959. The output of the capital goods

industry showed in October an increase of 7 per cent whereas that of the consumption goods industry decreased by a couple of per cent. This decrease took place mainly in the food industry, the output of which had sunk by more than 10 per cent. The output of leather and shoe industry decreased in October too viz. by 13 per cent. Iron ore mining showed an increase of 12 per cent. The output of the iron and metal works rose 11 per cent, that of the wood-working industry 7 per cent and that of the wood pulp and paper industry is calculated to have risen nearly 10 per cent. The number of persons employed in the engineering industry increased by 4 per cent.

Holland

Cattle Population: According to data furnished by the Netherlands Central Bureau of Statistics, in December 1960, the Dutch cattle population totalled 3.2 million compared to 3.1 million in December 1959. The number of young cattle increased by 22,000 to 1.4 millions and that of milch cows by nearly 45,000 to 1.59 millions. The number of pigs and fattened pigs increased by 62,000 but was offset by a 60,000 drop in the number of breeding sows; this resulted in a drop by about 4,000 in the number of pigs, which was 2.93 millions by the end of 1960. The number of farm horses fell by 13,500 to 1,77,000, that of sheep by 31,000 to 163,000.

Germany

Foreign Trade: More than 20 per cent of the German foreign trade in 1960 went via Hamburg harbour. 2,400 million US dollars worth of goods or 19.4 per cent of West Germany's total exports were exported via Germany's biggest harbour last year, compared to 2,050 US million dollar in 1959.

OEEC

European Chemical Industry Makes Further Progress: The chemical industry in Western Europe is increasing its share of the product of the manufacturing industries which now exceeds 10 per cent. With a turnover in the chemical industry in 1959 of \$16,900 million, the increase over 1958 was 11.5 per cent, the highest since 1954. Investments during 1959 remained at about the same level as 1958 between \$1,200 million and \$1,300 million. The expansion of trade in chemicals which had slowed somewhat during 1958 compared with earlier years, gathered momentum in 1959. Thus total exports by OEEC countries increased 15 per cent to about \$3,750 million and imports 16 per cent to about \$2,500 million. Prices of chemicals in 1959 tended to fall.

*

Production and Consumption of Pulp, Paper and Paper Board: Remarkable increases in production and consumption of pulp, paper and paper board were recorded in the first six months of 1960 by the OEEC countries and Finland combined. This is the conclusion of the study of the European pulp and paper market trend recently carried out by the Pulp and Paper Committee. The committee found that expansion in this sector, which had already been substantial in 1959, continued even more rapidly in the first six months of 1960, and that new records had been established in Europe.

ASP/LIC-SP-11

Up and up soars the edifice of Life Insurance. In the second year of its Five-Year Plan, the Life Insurance Corporation is at the half-way mark to its target of Rs. 1,000 crores in 1963, with yet another new business record of

Rs. 496,00,00,000

Year after year, the L.I.C. has improved upon past records. In 1960, it advanced by Rs. 68 crores upon its 1959 high of Rs. 428 crores.

Thus, since 1956, the L.I.C. has multiplied its new business intake nearly two and a half times. From Rs. 200 crores to close on Rs. 500 crores.....in five years.

Figures speak volumes—they point to the increasing trust and confidence placed in the L.I.C. as an institution. They speak of the growing belief by the average breadwinner that Life Insurance—and Life Insurance alone—can provide his family with the complete security he wishes for them—a security in which funds are guaranteed for a man's old age, for his son's education, his daughter's marriage, or for his family in case they should lose him.

Promoting Indo-German Relations

NEWS IN BRIEF

INDIAN

A scheme for insuring bank deposits will be instituted in India. This was agreed at a meeting between leading bankers, the Finance Minister, and the Governor and officials of the Reserve Bank. The scheme is intended to strengthen confidence in the banking structure shaken somewhat by recent bank failures.

The Employees State Insurance Corporation, at its meeting in New Delhi recently appointed a sub-committee to consider various proposals to amend the Employees' State Insurance Act and submit its recommendations within 6 months.

Seven new schemes for power development in Uttar Pradesh are likely to be included in the Third Plan. Of these, three relate to installation of Singrauli Thermal Power Station and Ohera Hydel Station and extension of the Harduaganj Power Station in the State. The total installed capacity of these projects will be 328,000 Kw.

The total electricity produced by the public utility power stations in India in November, 1960, was 1,367.5 million Kwh. of which 1,140.5 million Kwh. were sold to ultimate consumers.

The Government of India have provided Rs. 5 crores in the Second Five-Year Plan for horticultural development, and a sum of Rs. 12 crores in the Third Plan.

The Union Labour Minister, Mr. G. L. Nanda, revealed recently that it was proposed to introduce legislation soon to give effect to the recommendations of wage boards. A draft bill had already been prepared and the Commerce and Industry Ministry was being consulted.

The question of speeding up the progress of the scheme for giving workers a voice in the management of public sector undertakings through Joint Management Councils was discussed at a high level inter-ministerial meeting on February 22, 1961. Details of the scheme, on the basis of the conclusions reached at the meeting, are being worked out.

In order to curb speculation in land, the measures already recommended to State Governments inter alia were taxation of vacant plots; and transfer of land acquired for public housing schemes, to beneficiaries, on lease-hold rather than free-hold basis, so that a portion at least of the unearned increment in terms of the lease reverted to the community.

The Punjab Government has issued an order regulating the sale of cottonseed in the State. The order says that no person shall sell or offer or store for sale cottonseed except under a license to be issued by the District Magistrate or any officer authorized by him in that behalf.

The West Bengal Government has asked the Union Government to appoint a wage board for the iron and steel industry on the pattern of similar boards set up for the sugar, textile and other industries.

The last date for submitting applications for regulation of unauthorized powerlooms has been extended upto May 15, 1961, in order to enable the owners of unauthorised powerlooms to submit their applications along with the necessary certificates or licenses from the excise authorities.

FOREIGN

After adjusting for normal seasonal corrections, the UK trade gap fell to £65 million last month from its level of £68 million in January. Both imports and exports were below the January figures but imports fell considerably more than exports.

The Soviet Union holds the leading place in Europe with regard to the scale of application of mechanized welding techniques and the output of welded constructions, Boris Paton, Director of the Electric Welding Research Institute in Kiev, told a Scientific Technical Conference on Welding in Central Asia recently.

US Government officials are considering a plan to ship older US manufacturing plants to foreign countries with the double purpose of modernising US industry and aiding less industrialized nations.

The Bundesbank return, published recently, shows that during revaluation week, West Germany added about £43 million to its stock of gold and foreign exchange.

The increase in world meat production, which amounted to 4 per cent in 1959 was probably maintained in 1960. Meat exports in 1960, however, appear to have shown little change, whereas in the previous year increased international trade accompanied the rise in output.

It has been announced by the Board of Trade that the 1961 census of production in UK to take place next year, will be on similar lines to that now being taken for 1960, and will include concerns engaged in mining and quarrying, manufacturing, construction and water supply.

Plans for £A1 million razor blade factory in Melbourne were announced by the Managing Director of Gillette (Australia) Pty. The new factory will make use of imported Sheffield strip steel.

The Foreign Agricultural Service of the US Department of Agriculture announced a revised estimate of world cotton production for 1960-61 placing this at 46.8 million bales.

British Guiana will benefit by £1,269,532 from four UK Government grants made under the Colonial Development and Welfare Act in January.

Negotiations on the agreements between Switzerland and Italy relating to social insurance—particularly for Italian migrant workers are to begin in Berne later this month.

According to the Japanese Motor Industry, overall production for fiscal year 1960-61, will be about 441,000 units (excluding three-wheeled vehicles and light four-wheeled vehicles. This represents an increase of about 50 per cent over production in the previous year.

It is reported cotton will be one of the principal crops cultivated by large-scale co-operative farms which will shortly be started in Ghana.

A 9 per cent rise in private capital investment is forecast for this year in a survey published by the Swedish Board of Trade. Last year's increase is estimated to have been nearly 11 per cent.

Special Article**THE PUBLIC SECTOR IN THE ECAFE COUNTRIES**

THE latest annual of the Economic Commission for Asia and the Far East has focussed attention on the steady growth of the public sector in the South-East Asian countries during the last decade. The pattern of change which has occurred due to the zeal of the Governments of these countries to accelerate the pace of economic development has resulted in enhancing the share of the public sector in most of these countries, though at varying rates. The Secretariat of the Commission has done a splendid job in analysing the available statistics so as to measure the changing trends, though it has not been possible to make inter-country comparisons of a very high validity due to the absence of uniformity either in the definitions or in the methods of computation of the national accounts and due to varying degree of reliability of the basic data from which these accounts are prepared.

There are a number of ways of computing the relative shares of the two sectors in the economy of a particularly country, but for any analysis which attempts to measure the growth of the two sectors over the whole region, it is necessary to evolve a common method which will yield meaningful results in the case of most of the countries. The national income approach

failed to yield any results as most of the countries did not possess up-to-date statistical information. Similar was the case with the national wealth approach. The Commission evolved a more workable technique of computing the gross national expenditure for each country — an indicator for which necessary statistical details were available from most of the countries.

The findings of the Commission are summarised in the table below. It will be seen that almost all the countries of the region have shown a rise in the share of the public sector in percentage terms. Highest in the list stands China (mainland), wherein the net claim of the public sector has, within the span of eight years, risen from 16.2 per cent in 1950 to 32.7 per cent in 1958. Lowest in the ladder is the Philippines, in which case the percentage of public sector share has risen marginally from 10.0 per cent to 10.5 per cent. The other fast movers are Burma and South Korea. The pace of the growth of the public sector in the case of other countries, such as Ceylon, India, Indonesia, Japan, Pakistan and Thailand has been not very fast. In the case of the Indian Union, the public sector is supposed to have swelled from 8.3 per cent in 1950 to 14.0 per cent in 1958. This approach, however, tends to distort the Indian case as the national income approach puts the

* Including inventory changes; + 1.2 per cent of gross national expenditure in 1951 and + 0.4 per cent in 1958.

share of the public sector at less than 11 per cent of the total.

It seems that the percentage approach in comparing the two sectors gives an erroneous impression. The steady rise of the public sector, according to the figures compiled by the ECAFE, tends to indicate as if the private sector has been kept low during the fifties. This is far from the truth. With the exception of China (mainland), the size of the private sector has been increasing in almost all the countries in absolute terms, though not in percentage terms. This fact may be illustrated with special reference to the Indian Union. While the total volume of the gross national expenditure has been rising at the rate of 4 to 5 per cent per annum, the increase that has been registered in the case of the public sector does not tend to reduce the size of the private sector. In fact, the private sector has also continued to grow. It will, therefore, be very unfortunate if the readers of the "Economic Survey" are carried away by these percentages to assume that the private sector in these countries does not offer ample opportunities. In fact, the conclusion to be derived from this analysis is that despite the efforts of the Governments in this region to play a leading role in the process of economic growth, more than 80 per cent of national resources have been left in the hands of the private sector, both for consumption and investment.

In fact, there are certain basic difficulties which hamper the growth of the public sector in these countries. One such factor, namely, the low profitability of the public sector undertakings was discussed last week in a special article in "The Eastern Economist". Low yield on investment is in itself a major factor in limiting the growth of the Government sector. How can steady growth in these undertakings be maintained without schemes of expansion through the "ploughed-in" profits?

To**INDIAN INDUSTRIALISTS**

A London Merchant Company, wishing to expand and industrialise its Indian subsidiary established nearly a hundred years ago, invites propositions from Indian Industrialists who have licences or plans for new industrial projects. Assistance with finance, management, administrative services, selling organisation and land in South India could be made available to joint enterprise.

THE BUSINESS WORLD

Germany Rocks the Currency Boat

By PAUL BAREAU

THERE is much more than a marginal 5 per cent significance in Germany's and the Netherlands' upvaluation of their currencies by that very modest figure. As far as Germany, the Prime mover, is concerned the upvaluation of the mark is by no means a bad thing in itself. It has for many years been impressed on Germany that her currency was undervalued. This is one of the reasons why Germany held its chronic creditor position for so long and has tended to be a persistent absorber of world liquidity.

To correct this situation Germany had two alternatives. The first was to allow inflationary developments within its own territory and to correct the external undervaluation of its currency by conducting to some degree of domestic devaluation. The second alternative was to take the domestic value as given and to adjust the exchange rates to it by upvaluing the currency.

There was always a third possibility of correcting this disparity and one which the German authorities had been fond of suggesting whenever they were exhorted by other countries to take steps to cure their imbalance. This was that all other countries should get into step with Germany, either by deflating or by devaluing their currencies. There was never much hope of this possible cure for the disease being applied. The corrective action had to be taken by Germany herself.

It is not surprising that Germany should have resisted conscious domestic inflation. A country which has seen its currency annihilated by inflation twice in the course of one generation, is not predisposed to run the risk a third time. There had, however, been some preliminary signs of inflationary symptoms in Germany. Within the last few weeks the state of overfull employment had led to a widespread and considerable increase in wages. This emergence of inflationary symptoms no doubt hurried the decision of the German authorities to take some action on the external front. By upvaluing the mark they will lower the prices of imported goods and help to stem any further inflationary developments.

So far all that has been done seems reasonable enough. There can, in fact, be very little questioning of the move by which Germany proposes to correct a state of imbalance which has done a certain amount of damage to other countries of the free world.

There must, however, be serious question of the manner in which this initiative was taken. It was done without any discussion with other interested countries. All countries are perforce interested in a move of this kind because an exchange rate is by definition a measurement of one currency in terms of others. Admittedly such matters cannot be discussed in public. To do so would be to let loose a wave of speculation. But as between central banks and monetary authorities there can be discreet exchange of information and effective collaboration. Concerted action can be organized in private and without any leakages.

The move of twelve European currencies into convertibility in December 1958 and the concurrent devaluation of the French franc was a good example of such co-operation and discretion. Another was the more recent move by ten countries into full convertibility under the Articles of Agreement of the International Monetary Fund. On the occasion of the Mark upvaluation there was no such collaboration. On the contrary the President of the German Bundesbank was assuring his central banking colleagues less than a fortnight before these events occurred that any upvaluation of the Mark would only be effected over his dead body. He is still alive and kicking.

The result of the upvaluation of the Mark was to create complete uncertainty about the whole pattern of exchange rates. The Dutch guilder followed the mark almost immediately but the Dutch authorities were clearly caught by surprise and their own upvaluation had a decidedly improvised look. When the markets opened after the week-end during which these moves were made, the question on every dealer's lips was, "which other currencies would follow?" There was in consequence a massive flight of capital into Swiss francs, Italian lire and French francs.

These speculative operations were supplemented later by bear attacks on sterling caused by rumours of a possible devaluation. Although these were officially denied in the House of Commons the fate of the denials of a German upvaluation was still fresh in the minds of the foreign exchange market, and therefore the Chancellor of the Exchequer's statement did not prevent what the market has defined as the biggest speculative flurry since the 1920s.

In the defence of sterling the Bank of England, acting for the Exchange Equalisation Account, had to sustain considerable losses of gold and dollars. The British authorities, however, acted with coolness and courage. Having taken all the sterling that the speculators flung at them, the Bank of England then counter-attacked and by sales of dollars moved the rate back from \$2.79½ to which it had fallen to close on \$2.80. The speculators have been beaten and many of them must be nursing considerable and painful losses.

This episode, however, underlines the need for more effective collaboration between the monetary authorities of the free world. It also stresses the danger of using minor changes in exchange parities as an instrument of general economic policy. There is an inherent virtue in exchange stability which should not be sacrificed for such modest adjustments as have just been perpetrated by the German and Dutch monetary authorities.

There has been much talk lately of the need to reinforce the institutions responsible for conduct of monetary affairs and, in particular, to make the Inter-

national Monetary Fund more flexible and more conducive to the objectives of economic expansion in the free world. However much the Fund may be strengthened and made more flexible, however good may be the new techniques with which it is endowed, the work for which it stands cannot be performed effectively with-

Perspective on Powerlooms

By
CROESUS

"MAN is born free, but is found in chains everywhere," said the famous political philosopher Rousseau during those momentous days of the French Revolution. Several decades have passed since the French Revolution, and yet this trite saying seems to hold good. Not even the achievement of Independence, in so far as India is concerned, has appreciably affected its relevance to the prevailing conditions. Nowhere does this saying apply so aptly as in the case of the organised sector of the Indian Textile Industry. The Indian cotton mill industry is asked to produce a given quantity of the country's total requirements of cloth, and, despite all sorts of handicaps, it does so, but there is no patting it on the back for the achievement, not even for exceeding its target. On the contrary, it has to take all the blame for a situation which is the result of the other sectors, especially the handloom sector, and now also the 'Ambar Charkha' sector, not fulfilling their respective targets. By their failure, the latter account for the total supplies of cloth falling below the total demand as computed by the authorities responsible for making the allotments of production quotas to the different sectors of the Indian textile industry. When supplies fall short of demand, the normal and inexorable laws of supply and demand come into operation and prices rise, tending to accentuate or exaggerate scarcity conditions and leading to a hue and cry all over the country. This has gone on for long and, every time, the organised sector of the industry has been blamed for it. Maybe a unit here and a unit there of even this sector has not played the game, succumbing to the temptation of the way of all flesh. But is the solution to these repeated cloth crises always to be the same palliative and negative approach? Are regulatory measures, whether to discourage cloth consumption (rationing) or to prevent a rise in prices (price control) the only answers? Can we not at least begin to think in terms of a reorientation of this negative and inhibitory approach in favour of a more positive and purposeful attitude? These are the questions that the Indian Cotton Mills' Federation set out to answer in a memorandum entitled 'Third Plan Targets for Handlooms, Powerlooms and Mills' issued by it last month. At a press conference, convened to release that publication, Mr. Krishnaraj M. D. Thackersay, Chairman of the Federation, would not make a categorical statement of the stand of the mill interests on whether they were opposed to the powerloom sector, but he left no room for any doubt that the millowners were determined to end a state of affairs in the industry arising from a measure of lawlessness prevailing in the powerloom sector. This was also the main theme of the valedictory presidential address of Mr. Ramnath Podar at the last annual meeting of the Millowners' Association. Mr. Podar also referred to the future burdens on the cotton mill industry imposed in the latest budget and the complications the new levies would lead to. Evidently he felt there was no prospect of the Finance Minister reducing the duties, so that he was content to express the hope that the duties would be levied in such a manner as not to hamper the smooth working of the industry.

It is perhaps necessary to mention here that the organised industry is not out to oppose the decentralised sector as such, certainly not that part of the

out a real spirit of understanding and co-operation between the monetary authorities of its member countries. The action taken by Germany, however justified it may have been, has done considerable damage to that climate of collaboration which had been gradually created over the years of post-war monetary reconstruction.

powerlooms sector which is properly registered and openly functioning, but it finds it cannot but oppose the thousands of unauthorised power looms. In opposing the latter and asking the powers-that-be to put an end to this state of affairs, the millowners may not be wholly altruistic; the hearts of not all of them may be said to go all out to the poor handloom weavers. But, then, the facts pointed out by them need not on that score be twisted to twist them. There is imperative need, in my opinion, to take note of such facts, as, for example the avoidable loss to the National Exchequer. Surely a loss in revenue of Rs. 20 crores every year caused by the small powerloom sector is not negligible, particularly at the present juncture when the country needs every 'naya paisa' to meet its urgent and large development programmes. Then, again, there is a moral angle to this question. Is it right that the authorities—and, for that matter, the country at large—should be privy to a state of affairs in which a weak sector, for which they have deliberately earmarked a place and allowed all facilities, finds itself unable to rise to the occasion and another sector—albeit decentralised—manages surreptitiously to appropriate the bulk of these advantages and, at the same time, fails in its legitimate duty of paying to the Exchequer what it is required to pay, by way of duty or taxes, under the law? Only when looked at from these angles, I believe, can one get the proper perspective on these powerlooms.

There are certain 'faits accomplis' which must be recognised by all, by the millowners as much as by others. In the first place, the present Government is irrevocably committed to protecting the handloom industry, partly because of ideological considerations and partly because of a probably persisting belief that the new progeny of the old handloom weaving community is still content to step into the shoe of paternal profession, but primarily because of the hope that it would provide employment. That there is considerable confusion of thinking in these, even in the highest circles, is obvious from the fact that there are two schools among them, one unflinchingly favouring the continuance of the handloom industry as it was of old — ante-diluvian — and another fervently feeling that, to survive, the handloom must needs evolve into the powerloom. The Kanungo Committee has been severely criticised for this "heresy." But so long as this controversy lasts, the country must continue to experience the costly luxury of the worst features of both. The advent of 'Ambar Charkha' and 'Ambar cloth' both has only come in as an unstable prop to an already outmoded industry. Secondly, powerlooms have become a fairly well-entrenched "vested interest." They have successfully defied being fathomed by the Fact-Finding Committee in 1942 and, thereafter, by the Kanungo Committee in 1954. Even the serious limitations of the powerloom industry from humanitarian and socio-economic angles, to which the Karve Committee drew attention not long ago, have not succeeded in dethroning them from the high pedestal they have managed to usurp. Instead, the present cry of decentralisation of industry has endowed them with a fashionable respectability which is a sure guarantee of political support, at least for continuance, if not for further expansion. It is a futile pastime, therefore, to think in terms of doing away with the powerlooms, whether authorised or unauthorised. It is a moot point whether, even after

the present really earnest campaign of licensing and regularising all unauthorised looms, there will not be left quite a few thousands of unauthorised powerlooms. As a wag facetiously put it, with the present policy, they will co-exist even as illicit distillation has been co-existing with prohibition.

What, then, is the remedy not only from the point of view of the millowners, but from a broader national angle? In my opinion, the only remedy is to become pragmatic by first deciding as to what we require and how we should go about to get it. If we require more cloth, as the Third Plan has postulated, we must decide as to how we should ensure it. True the overall target and even the targets for the respective sectors of the textile industry have already been fixed. But in the context of performance so far, and as the situation prevails today, we must ask the question: "Are these different targets possible of fulfilment by the respective sectors?" According to figures included in the Federation's Memorandum verified from official sources, it is clear that the handlooms cannot deliver the goods, while the powerlooms have demonstrated their ability to do so—if left unchecked—and the mills have actually exceeded their targets. On this basis, it would seem prudent to reallocate the share of each sector, but a prerequisite to that is to stabilise the respective numbers of handlooms, powerlooms, and mill-looms as they stand today, for purposes of determining, their respective quotas. Once these quotas are fixed, it must

be made obligatory for the sector concerned to account for its quota or to be prepared for a revision, either way, depending on whether it has attained or exceeded its quota or not. It would be a good idea even to reward a sector if it should exceed its quota.

I would append to any such arrangement yet another feature. It is that, if any sector fulfils the target assigned to it, it must not be subjected to all manner of unwarranted controls as to the lines it should produce, the prices it has to charge and so on; on the other hand, so long as the quality and price are acknowledged to be reasonable—and the Government has now any number of agencies to determine this—and no case can be made against it of exploitation, it should be allowed to operate freely within manoeuvrable limits. This is precisely what the organised sector of the Indian cotton textile industry has been urging. "The mill industry would like to be assured," says the ICMF Chairman, in his foreword to the publication issued in February, "that, so long as its production is in line with its targets, it will be allowed to work in peace and not subjected to irksome controls." In another foreword to the latest publication of the Federation—"Facts Relating to Cloth Prices"—Mr. Krishnaraj has said: "The most vital need is to achieve higher production, when alone prices can be kept at reasonable levels. This would call for a judicious allocation of production targets, among the three sectors of the industry, namely, the mills, the handlooms and the powerlooms."

Business Notes

Rayon

THE BUDGET AND RAYON YARN PRICES

A NEWSPAPER report, which appears to be entirely without foundation, is to the effect that the authorities would like rayon yarn manufacturers to take a substantial burden of the new excise taxes levied on rayon yarn. There has been some misunderstanding, both in official circles and elsewhere, of the manner in which the rayon industry is currently constituted and the consequent implication of price rise. The industry composes of very few large spinning units with a multitude of weaving units. If the major incidence of new taxes fell on the large spinning units, corporate profits in these units would fall very substantially and the Government revenue would be greatly affected. If the whole of the additional duties were so absorbed, the loss is computed at 60 per cent of the estimated receipts from the new rayon excises. On the other hand, rayon cloth prices have already been raised and there is no likelihood of a fall under operation of the laws of supply and demand. The net effect would be, if prices of yarn were not to rise, that middle units, which are weaving units and which do not contribute significantly to Government revenue would be greatly and improperly benefited, with Government and spinning units injured. It is thus both in the interest of Government that the normal operation of the market should decide where incidence should lie. This implies that at any rate for some time until market forces settle down, there should be no attempt at directing the level of either yarn or cloth prices. This is incidentally likely to be as much in the national interest as it is in the interest of the units concerned. An unstable position with partial control will merely involve a subsidy to weaving units at the expense of production as well as Central revenues.

Banking

STEADY PROGRESS OF NATIONAL AND GRINDLAYS BANK

FROM THE statement of the Chairman, Mr J. K. Michie of the National and Grindlays Bank Limited, it is

apparent that the Bank had a mutually agreeable arrangement with the Lloyds Bank Limited in 1960. This has added 19 branches to its list, which means an increase of £50 millions in the total of the next balance sheet. The total of the bank's consolidated balance sheet at 31st December, 1961, was £181,551,921—an increase of £18,516,333 over the previous year. The net profit was higher by £74,568 and stood at £479,276 reflecting thereby the overall favourable banking conditions in 1960 in the territories where the bank operates. On account of this encouraging outlook, the bank has increased second interim dividend for 1960 from 6½ per cent to 7 per cent taking the total distribution for 1960 to 13½ per cent. This rate of dividend is not only expected to be consolidated, but rather a rate of 14% is forecast on the increased capital for the current year. The increase in the number of branches and sub-branches from 94 to the present total of 141, and the appreciation, in dividend goes to show that the Board of Management does not hold a pessimistic view of the future. Dealing with conditions in various territories where the bank operates, Mr Michie pointed out that in India, it is all well so far as the step taken by the Reserve Bank to strengthen confidence in the banking structure is concerned, but if the Third Five-Year Plan is to be a success, India's hidden cash balances will have to be drawn into the banking system. In other words, it implies that efforts will have to be intensified to attract deposits. The theme no doubt has been oft repeated, but certainly it underlines the importance of devising measures. It is yet to be seen if the recent rise in interest rates will stimulate the flow of funds to the banks.

Tea

UPASI ON THE BUDGET PROPOSALS

THE EASTERN ECONOMIST analysed the implications of the budget proposals in regard to tea, in a Week's Note in the issue dated March 10, 1961, UPASI has now come out with a detailed analysis of these proposals in an effort to drive home the fact that tea industry would

not get substantial concession of 17 per cent on export duty as announced by the Finance Minister but only 4 per cent. Their thesis is based on the fact that there is no drawback of excise duty on exports and that all loose teas, whether exported or sold internally have to pay excise duty. The result is that teas that are exported will get a reduction of 9 nP. by way of export duty, but they will have to pay also an additional excise duty of between 5.5 nP. and 7.0 nP., according to the Zone in which they are produced. In the case of teas produced in Zone III-A i.e. high grown Nilgeris teas, the benefit only comes to 2 nP. per kilogram, as the reduction of 9 nP. in export duty is offset by the increase of 7 nP. in excise duty. In the same way the relief in the case of teas in Zone I and Zone II comes to only 5.7 per cent and 6.6 per cent.

The position in regard to 'package teas' is no way better. In the first instance, it may be noted that the Finance Minister has announced a reduction of 6 nP. per kilogram in the excise duty on such teas, bringing thereby the duty to 40 nP. But package tea released from estates also paid the appropriate duty for loose tea on the zonal basis, which meant that the duty paid by package tea in Zone I was 50.5 nP., in Zone II, 55 nP. and Zone III-A of 64 nP. The corresponding figures now are 50 nP., 55 nP. and 65 nP. respectively. Thus, it is obvious that there is no relief in Zone II, only a slight relief of 0.5 nP. in Zone I and actually an increase of 1 nP. in Zone III-A. This leaves no doubt that the relief is illusory.

Finance

STRINGENT MONEY HAS COME TO STAY!

MANY EXPLANATIONS have been given for the stringent money conditions that we have been witnessing for some months past. These conditions have belied all the erstwhile theories of the conventional slack and busy seasons, so much so that one tends to speak these days of only a busy season and a busier season, as they talk of only a hot season and a hotter season in the South. In view of this, the observation of Mr. H. V. R. Iengar, Governor of the Reserve Bank of India, when he addressed the last annual general meeting of the Refinance Corporation was taken particular note of, although there was nothing particularly new in what he said. "The stagnation in deposits, together with a heavy demand from a rapidly developing industrial sector", he said, "has resulted in severe monetary stringency". As everyone knows, bank deposits have not shown any substantial increase, especially since September last, with the result that the ratio of advances to deposit has gone up steadily. The rise in ratio in the case of certain commercial banks has been well over 80 per cent! Notwithstanding this, the demand for bank credit, whether for medium or long-term finance to industries, does not appear to have been fully met. Meanwhile, the demand too has been steadily rising.

The present demand for bank credit, according to Mr. Iengar, is higher by 20 per cent over last year and by 66 per cent over the 1955-56 level. Considering the snail's pace in the growth of the banks' deposits, on the one hand, and the increasing demand for bank credit, on the other, it would be a hard task for the banks, as he rightly pointed out, to finance, even out of their own resources, fixed assets formation in the industrial sector any longer. What is more significant is Mr. Iengar's considered view that the present monetary stringency in the economy would continue to remain for quite a few years, although its severity might vary from time to time. In saying this, the Reserve Bank Governor was only sounding a note

of warning that if necessary steps are not taken to augment the inflow of deposits, it would be difficult for the banks to meet even the legitimate demands of short-term working capital.

Although those in charge of the working of the Refinance Corporation cannot be blamed for bringing about these conditions, the emergence of these conditions has certainly brightened the scope for the activities of that body. The role of the Refinance Corporation, particularly in supplying the necessary funds for the banking system, assumes all the more importance in this context. One already notices visible signs of this in the latest annual report of the Refinance Corporation. Thus, during the year 1960, the Corporation received a greater number of applications and also disbursed a much larger amount, namely Rs. 1.41 crores than in the previous two years (Rs. 85 lakhs). The pace has gathered momentum, more significantly during the last four months, when 25 applications for a total amount of Rs. 4.58 crores were received, while disbursements during the months of January and February 1961 alone aggregated Rs. 88.45 lakhs. That the Corporation is really proving to be quite useful to the banks is further evidenced by the fact that the membership of the Refinance Corporation has since been thrown open to as many as 43 banks, 14 State financial corporations and three State co-operative banks. Hitherto, its service could be availed of only by its shareholder institutions. The question naturally arises, therefore, that, when so many institutions begin to draw on the services and funds of the Corporation, as they are bound to do in the coming months, will the corporation be able to rise to the occasion?

TAX CONCESSIONS

Replying to the Budget debate in the Lok Sabha, the Union Finance Minister, Mr. Morarji Desai, announced three important modifications of his taxation proposals. The effective incidence of the increase in excise duty on kerosene, he said, was proposed to be reduced by 50 per cent. Steps were also being taken, he added, to see that all kerosene which falls in the category of inferior quality is quickly released from bond so that it could be made available in different parts of the country in adequate quantities. Steps were also being taken, Mr. Desai said, to increase the import of inferior kerosene to supplement indigenous supplies. Import of inferior kerosene in place of superior varieties would reduce the expenditure in foreign exchange.

The second important concession in taxation proposals announced by Mr. Desai refers to the compounded levy on units of three or four powerlooms which in the next financial year would be paying an excise duty on cotton cloth. The Finance Minister announced a reduction of 50 per cent in the incidence of this duty also. To avoid sharp increase in the burden of duty at the stage of transition, the Finance Minister disclosed that steps were being taken to introduce the tax on slab basis for small units of powerlooms.

The third concession announced by the Finance Minister is the exemption from the new levy of the yarn of count 1 to 10. This exemption is meant to facilitate production of coarse cloth and cotton carpets woven on handlooms. Mr. Desai said it would not be possible to extend similar treatment to wool purchased by manufacturers for making carpets on handlooms since a very large part of such carpets was exported. Steps, he said, however, would be taken to see that full drawback of the duty on wool was given to the exporters of these carpets.

Mr. Morarji Desai also disclosed that the policy of exempting production of units where a small family worked on its own, without any use of power or assistance of hired labour, would be continued. In order to avoid administrative inconvenience to small manufacturers, measures would be devised to recover excise duty from them on the basis of their own accounts open to periodical inspection instead of posting excise officers at their places of manufacture.

The case of producers of inferior coffee, the Finance Minister said, had been re-examined by him. If suitable means could be devised to distinguish such coffee and to avoid tax evasion, partial exemption of such coffee from the present increase in excise duty could be considered. About the increase in import duty on betelnuts, Mr. Morarji Desai stated that the stepping up of this duty was meant to mop up large profits which the trade made today. As such, there was no case for grant of relief in this duty. The Finance Minister held out a threat that if the importers failed to take immediate steps to bring down betelnut prices, the Government would have to consider whether the issue of import licences for betelnuts should be restricted only to those who could take effective steps to keep prices down.

The excise duty on plastics and glass and glassware, Mr. Morarji Desai clarified, would be at one stage only—at the stage of powder, granule or flake in the case of plastics and at the stage of sheets and tubes in the case of glass. The items made out of duty-paid

plastic powder or glass sheets or glass tubes would not be liable to this duty. It was necessary to retain "other categories" in the tax schedule to ensure that imported goods falling in these categories bear the countervailing duty.

The total effect of the concessions announced by the Finance Minister is likely to be a reduction in revenue by about Rs. 4.5 crores. This takes into account the concessions in the countervailing customs duties in the case of kerosene.

SOLVING COAL CRISIS

As a measure to relieve coal shortages in West India, the Union Government, it is learnt, has decided to move one million tons of coal by sea. This will be in addition to the one million tons of coal already being shipped from Calcutta to South India for consumption by railways.

As movement of coal by sea costs about Rs. 35 per ton more than its movement by rail, the Government, it is understood, is considering ways and means of subsidising movement by sea so that coal in the western regions is available at current prices. Some increase in coal prices in West India, however, is not ruled out.

A second measure that is contemplated to relieve coal shortages is development of Central India mines from where movement will not have to be effected through Moghulsarai which is one of the biggest bottlenecks of the Indian railway system.

The Union Ministry of Steel, Mines and Fuel has also decided that henceforward precise schedules of annual production in each mine, both in the private and the public sectors, should be worked out in advance so that production and movement of coal can be matched.

Coal requirements of priority users, namely, railways, steel plants, thermal stations and major industrial units, official circles claim, are now being fully met. There is no coal shortage being experienced in West Bengal, Bihar and Orissa. The situation in the South also is more or less satisfactory. In Madhya Pradesh and "above" Moghulsarai areas of North and West India some difficulties are being experienced due to bottleneck at Moghulsarai. The impact of shortages, however, is mainly restricted on low priority users of coal.

The situation, official circles opine, is likely to ease somewhat by July next when the railways would be able to move daily 21,000 wagons of coal above Moghulsarai as against approximately 19,000 wagons being moved at present. By that time some of the track works on this section now under construction would have been completed.

Availability of wagons in the near future is likely to be increased to some extent as supplies by the indigenous manufactures of the 1,750 new design 8-wheeler bogey wagons, ordered by the railways last year, are being accelerated.

The railways, it is understood, are stepping up their wagon production programme to 2,000 wagons a

Here's Another Way to MAKE YOUR TRUCK TYRES LAST LONGER!

At its present maximum output the Tyre Industry in India cannot manufacture sufficient truck and bus tyres to accommodate the needs of every vehicle owner.

It is not a matter of distribution. Throughout the country, authorized Tyre Dealers have taken the proper action to ensure that tyres are allocated at the published retail prices on a strict priority basis to those whose need is greatest.

Some time will still elapse before new tyre factories start production and before the expansion schemes of the present manufacturers bear fruit.

In the meantime, what?

WE BELIEVE that this scarcity condition can be eased if every truck tyre user takes greater care of his tyres—so that they can be **RETREADED** for further mileage and longer life. Remove tyres from service for retreading before it is too late!

THE PICTURES TELL THE STORY

Firestone

month in terms of 4-wheelers. At present the rate of production is stated to be 20,000 units a year. The limiting factor of the production programme is said to be shortage of steel. As soon as steel is made available, either from indigenous sources or from imports, production will be stepped up.

All of the additional wagons to be built in 1961-62 will be open wagons, specially suited for movement of coal. Fifty per cent of them would be built according to new design which will give a capacity more than double that of the existing wagons.

ASSAM OIL PIPELINE

The Union Ministry of Railways, it is learnt, has given permission to Oil India Private Ltd. to take its oil pipeline across the Brahmaputra railway bridge. This decision will entail a saving of nearly Rs. 1 crore in the total cost of laying the pipeline; a substantial portion of the saving will be in foreign exchange. Apart from resulting in saving in cost, the decision of the Railway Ministry will mean much greater security to be obtained, as otherwise the pipeline would have been vulnerable to extreme weather conditions.

The pipeline is being laid for Oil India by the Burmah Oil Company (Pipelines) Private Ltd. on non-profit basis. It will bring crude oil from Nahorkatiya and Moran oilfields to the two public sector refineries being set up at Nunmati and Barauni. The total length of the pipeline will be 720 miles—260 miles from Nahorkatiya to Nunmati and 460 miles from Nunmati to Barauni. It will pass over three States—Assam, West Bengal and Bihar.

This pipeline will be one of the world's largest remotely controlled pipelines working in difficult terrain and with a very highly viscous crude oil. It will have the most modern tele-communication, tele-metering and tele-control equipment.

Oil India Private Ltd. was incorporated as a rupee company on February 18, 1959, with an authorised capital of Rs. 50 crores. Issued capital of the company was Rs. 28.25 crores, of which 66-2/3 per cent was allocated to the Burmah Oil Company and 33-1/3 per cent to the Government of India.

AID-INDIA CLUB

The Aid-India Club, it is learnt, will now be meeting in Washington on or about April 25. The two-week postponement of the meeting, it is understood, has been effected to enable the Kennedy Administration to finalise its assistance programme.

As already reported, in addition to the old members—the U.S.A., U.K., West Germany, Canada and Japan—Netherlands, Italy and Switzerland, who have expressed their willingness to join the Club, will be attending the meeting. France is said to be planning to send an observer.

As compared to the United States or the Communist bloc, the credit offered by the United Kingdom, prima facie, is a small one. Great Britain's major contribution towards India's development, however, continues to be through private sector.

REPAYMENT OF ROURKELA PLANT CREDIT

The West German Government, it is learnt, has agreed to deferment of a portion of the loan, made

available by West Germany for setting up of the Rourkela Steel Plant, falling due for repayment during the years 1960-61 and 1961-62. Out of a sum of DM 147.55 million falling due for repayment in 1960-61, a sum of DM 49.19 million is being repaid on the due dates. The period of repayment of the balance of DM 98.36 million has been extended initially by four years. According to an understanding reached between the West German Government and the Government of India, repayment of one half of this amount can be further deferred by four years and of the other half by eight years.

Of the DM 256.46 million repayable in 1961-62, only 10 per cent, i.e., DM 25.64 million, would be repaid on the due dates; the period of payment of the balance would be extended initially for a period of four years with an option for a further extension by four years in respect of half of this amount and by eight years in respect of the other half.

A sum of DF 253.99 million would be due for repayment between 1962 and 1965. No understanding it is understood, has been reached in respect of deferment of repayment of this sum.

In respect of the postponement of repayment of DM 98.36 million falling due for repayment in 1960-61 an additional amount of DM 22.62 million, representing interest at 5½ per cent for the period February 1, 1961, to January 31, 1965, will have to be paid. Details of the terms and conditions of the other postponements of repayments are yet to be negotiated.

GIVING EFFECT TO WAGE BOARDS' RECOMMENDATIONS

Addressing the Parliament's Informal Consultative Committee for Labour, the Union Labour Minister, Mr G. L. Nanda, stated that the Government proposed to introduce legislation soon to give effect to the recommendations of wage boards. A draft bill has already been prepared and the Commerce and Industry Ministry is being consulted on its various provisions.

Mr Nanda added that the Government was anxious to avoid recourse to compulsion, but there were two considerations which required that statutory force be given to the recommendations of wage boards. Firstly, even if one unit in an industry failed to implement the recommendations, it created problems for the future. Secondly, there had to be a time limit for implementation of wage board's decisions, for the longer the delay in implementing the recommendations, the greater is the accumulation of arrears that have to be paid to the workers. Mr Nanda explained that the proposed measure would not be in the nature of a "general legislation", but a "piecemeal measure" in respect of each wage board.

He disclosed that out of the 445 textile mills in the country, 427 were covered by the recommendations of the Textiles Wage Board. Of these, only 375 had so far implemented the recommendations of the Board fully or partially. Out of the 32 cement factories in the country, 11 had so far fully implemented the Cement Wage Board's recommendations and six had done so partially. Mr Nanda also stated that the Indian Jute Mills Association had asked all its constituents to implement the interim recommendations of the Jute Wage Board. Some members complained that the jute mills in U.P. and Andhra had not so far implemented these recommendations. The Labour Minister said that the matter had been taken up with the State Governments concerned and their replies were awaited.

Mr Nanda also announced that wage boards for coffee and rubber would be set up soon.

BONUS COMMISSION AND THE PUBLIC SECTOR

In anticipation of a demand from private sector employers that public sector undertakings should also be brought within the purview of the proposed Bonus Commission, the Union Labour Ministry, it is understood, is sounding other Central Ministries about the categories of Central undertakings which might be "covered" by the Commission.

Under the present dispensation, public sector enterprises do not distribute any share of their profits as bonus to the workers. But many undertakings have in operation a scheme of incentive bonus as a reward for a higher productivity.

While official thinking continues to be opposed to the payment of bonus by public sector undertakings from their profits on the ground that these profits go to help finance the Plan—about Rs. 450 crores are expected to be contributed by them for the Third Plan—a view has been expressed that there need not be wholesale exclusion of public sector undertakings from the purview of the Bonus Commission. Barring those State enterprises which are not run as a commercial proposition and where the competitive element does not enter, a scrutiny of the remaining industries by the Commission, it is felt, may be well worth it.

In spite of the probe by the Labour Minister into the minds of the other Ministries, a positive announcement by the Government on this matter is unlikely. In all probability, it will be left to the Bonus Commission to take up or not the case of a particular public sector enterprise unless, of course, the terms of reference specifically forbid it to do so.

The Government has called a meeting of the employers and workers towards the close of April to finalise the terms of reference of the Commission.

GOVERNMENT SERVANTS AND DERECOGNIZED UNIONS

The invalidation by the Bombay High Court of Section 4B of the Government Servants' Conduct Rules has put the Central Government in a quandary. Section 4B prohibits a Government servant to remain a member of a derecognized union.

Following the general strike of July, 1960, the Central Government derecognized 129 out of 405 unions of Government employees. But the unions derecognized have a large membership—about 55 per cent of the total membership.

Government's discomfiture arises out of the fact that derecognition of unions has been rendered an ineffective penalty by the Bombay High Court's judgment; a Government employee can continue to be a member of a derecognized union with impunity.

The implications of the judgment are being studied and a reference of the case to the Supreme Court is not ruled out.

INDUSTRIAL DESIGNS INSTITUTE

It has been decided to establish an Industrial Designs Institute at Ahmedabad with the object of training students for top level responsibilities of Industrial Designers for the private and public sector enterprises as well as for handicrafts. The Institute will also provide advanced training facilities for architectural designers who are expected primarily to function as independent practising architects. Besides, it will provide service to industries and agencies

interested in introducing new design methods in their production, building and sales schemes. In due course, it is proposed to have a research wing at the Institute closely connected with the training and servicing programmes. About 50 students are expected to be trained in the Institute every year.

The Institute is expected to earn some revenue as fees from the trainees, charges for services rendered to industries and sales of prototypes. The annual recurring expenditure of the scheme is estimated around Rs 2.50 lakhs. The expenditure to be incurred on purchase of machinery and equipment required for the Institute as well as on securing the services of some foreign experts is expected to be met by the Ford Foundation.

The Institute is likely to start functioning during the next financial year.

BRIQUETTING AND CARBONISATION PLANT

The Government of India, it is learnt, has accepted the tender of a consortium of firms comprising Maschinenfabrick Buckau R. Wolf, A.G. West Germany, Lurgi Gessellschaft Fuer Schukert Werke, A.G., West Germany, Protos Engineering Company (P) Limited, Bombay, and the State Electricity Commission of Victoria, Australia, for the supply and erection of the proposed briquetting and carbonisation plant. The project is expected to cost Rs. 20 crores. The contract is likely to be signed by the end of this month.

INCREASING CEMENT OUTPUT

The Associated Cement Companies Ltd., Bombay, have drawn up a scheme for putting up a cement factory at Durg (Madhya Pradesh) to produce 1,65,000 tons of portland cement and 85,000 tons of slag cement per annum. The factory is expected to go into production in 1963.

Assam Cements Ltd., who hold an industrial licence for setting up a cement factory at Cherrapunji (Assam), have entered into an arrangement with a Yugoslav firm for the supply and erection of a complete cement manufacturing plant, having a production capacity of 250 tons per day. The plant will cost Rs. 62.98 lakhs. A licence to import the plant is expected to be issued in the near future.

PRODUCTION OF ZINC

A licence under the Industries Act has been granted for setting up a 15,000 tons annual capacity zinc smelter near Udaipur (Rajasthan) to be worked from Zawar deposits. According to the terms of the licence, the smelter is to be established by the middle of 1962. Its capacity might be expanded at a later stage to 40,000-45,000 tons per annum if sufficient quantities of ore are proved in the Zawar area.

It is also proposed to issue a licence to a private party for the manufacture of 12,000 tons zinc per annum from imported concentrates. The party is understood to be working out the details of the scheme which is expected to result in a substantial saving of foreign exchange.

MANUFACTURE OF REFRACTORY BRICKS

In the Yorkshire factory of William Johnson & Sons (Leeds) Ltd., a complete plant for the manufacture of refractory bricks and blocks is nearing completion. This plant is meant for New Bharat Refrac-

tories Ltd., Calcutta. It will be set up at a site near Durgapur Steelworks and will cost nearly £60,000.

This is the second contract to be fulfilled in the recent past by William Johnsons for the Indian company. Towards the close of last year they supplied similar equipment to the Bharat Mining Corporation, an associated company of the New Bharat Refractories.

BHAKRA NANGAL PROJECT

The work on Bhakra Dam is proceeding apace; by the end of January, the dam had been raised to a height of 580 feet above the deepest foundation, out of the ultimate height of 740ft. to be reached. Concreting to the extent of 46.64 lakh c. yds, which constitutes 86.64 per cent of the total, had been done by then. The concreting of the dam is expected to be completed by the end of the current year. The remaining works connected with parapets, approaches, spillway walls, steel radial gates and stairs in the galleries will continue up to the end of 1962.

Civil works on the Left Bank Power House, which will consist of five units of 90,000 kW. each, have been completed. The first unit was commissioned on November 14, 1960, and the second unit on February 1, 1961. The remaining three units are likely to be commissioned at intervals of three months each. With the commissioning of these units, the present power requirements of the Nangal Fertilizer Factory would be fully met.

The preliminary work in connection with the Right Bank Power House, which will consist of four generating units with an installed capacity of 1,20,000 kW. each, is also in hand.

The work of erection of one additional generating unit of 29,000 kW. at each of the power houses at Kotla and Ganguwal is said to be progressing satisfactorily. These units are expected to be ready for commissioning in April and July respectively. A huge network of transmission lines and sub-stations has been erected for carrying Bhakra power to the remotest corners of Punjab, Rajasthan and Delhi.

FOODGRAINS STORAGE PROGRAMME

Total foodgrains storage capacity with the Department of Food increased in 1960 from 15.5 lakh tons to 21.3 lakh tons. Construction is in progress for raising the capacity by another 4.43 lakh tons. Some more projects are also understood to have been finalised; they will be sanctioned soon. The second Silo-cum-Elevator, currently being put up in Calcutta, is expected to be completed by the end of next month.

BRIEFS

The Hindustan Steel, it is learnt, has appointed the Canadian firm ATLAS as its technical consultant for the Alloy Steel Plant to be set up at Durgapur. The Canadian firm will be paid a fee of Rs. 1.5 crores for its services.

The Government of India has secured under the United Nations Technical Assistance Programme the services of Mr. Cook, a re-insurance expert, to advise her on the establishment of a re-insurance company in this country. Mr. Cook will tender advice on organisational, legal and commercial aspects of the project.

A new private sector company, to be set up in Maharashtra, has been licensed to produce 96,000 tons pig iron a year. An Orissa unit has been permitted to expand its capacity from 15,000 tons to 1,00,000 tons per annum.

The total amount of foreign exchange approved for private sector industries during the Second Five-Year Plan, up to February, 1961, was Rs. 587 crores. During the first 11 months of the current financial year, the amount approved was Rs. 146 crores.

During the year 1960, 110 licences were issued to the private sector for undertaking manufacture of various kinds of industrial machinery and equipment, including spare parts of heavy machinery. The corresponding number of licences granted in 1959 was 69.

COMPANY AFFAIRS

JAY SHREE TEXTILES

Several new varieties of fabric and yarns were introduced by the Jay Shree Textiles Limited, during the year to December 31, 1960. Of the items which were well-received in the market, special mention may be made of 'Flaxocot' canvas, heavy industrial fabrics, jacquard twines and linen threads for spindle tape stitching etc. The manufacture of reinforced rubberlined hose in collaboration with Messrs. George Angus & Co. Ltd., England, commenced during the current year. This is the only company in the East which manufactures yarn and fabrics made from flax, staple fibre, cotton and wool in the same factory.

The Company has obtained permission under the Industrial Development and Regulation Act to install a cotton spinning plant of 15,200 spindles. The Directors have decided to implement this scheme immediately. Most of the orders for machinery and equipment have already been placed and building work has been started. This plant is estimated to cost about Rs. 70 lakhs and is expected to go into production about the middle of 1962.

The Company has been granted licences under the Industrial Development and Regulation Act to manufacture synthetic rubber oil seals and malleable castings, steel forgings and steel structurals. The Directors are considering technical and financial implications of these projects.

To implement the new projects of the Company, the Directors are examining the question of raising additional finances by increasing the capital of the Company. Necessary permission from the Examiner of Capital Issues has already been received to issue fresh equity capital to the extent of Rs. 24.59 lakhs (by issuing one new share at par for every two existing shares). The whole matter is under consideration and decision is expected to be taken sometime during the current year depending on the financial requirement of the Company.

The net sales during the year increased from Rs. 102.6 lakhs during the previous year to Rs. 127.7 lakhs. This improvement is reflected in various appropriations. Net profit during the year under review after making necessary provisions for depreciation and taxation comes to Rs. 10.98 lakhs. The Directors have recommended the transfer of Rs. 1.19 lakhs to develop-

ment rebate reserve and Rs. 5 lakhs to dividend equalisation reserve. They have proposed the payment of dividend on equity shares at the rate of Re. 1 per share subject to deduction of tax (17n.P. per share net) which will absorb Rs. 4.91 lakhs.

UNITED BANK OF INDIA

During 1960 the growth of bank-deposits was rather slow, but United Bank of India Limited maintained its steady growth and its deposits rose by Rs. 4.06 crores, from Rs. 47.68 crores as at the end of 1959 to Rs. 51.74 crores as at the end of 1960; of this, the rise in Savings Bank deposits was Rs. 1.68 crores, from Rs. 16.20 crores to Rs. 17.94 crores. Owing to pressure of demand for funds resulting from the increased tempo in the economic activities of the country, the rise in advances has been proportionately more being Rs. 4.10 crores, from Rs. 27.52 crores as at the end of 1959 to Rs. 31.62 crores as at the end of 1960. Advances-Deposits ratio stood at 61.1%.

The Bank has shown its holdings in Government and other Trustee securities at or below market value; its investment under this head has declined from Rs. 14.85 crores as at the end of 1959 to Rs. 13.59 crores as at the end of 1960. However, the overall ratio of its Cash and Bank balances, investments in securities, and money at call and short notice, bore a ratio of 44.6% to its deposits as at the end of 1960.

Total earnings rose from Rs. 2.47 crores (for the year 1959) to Rs. 2.70 crores (for the year 1960). There was a slight increase in the balance of profit by Rs. 34,000 from Rs. 14.29 lakhs (for the year 1959) to Rs. 14.63 lakhs (for the year 1960). On the expenditure side the major increase has been in, (a) interest on deposits and borrowings by Rs. 6.67 lakhs, and (b) establishment expenses by Rs. 10.74 lakhs.

In 1960 United Bank of India Limited completed its ten years of working since it was formed by an amalgamation by four banks in 1950. During this decade the deposits of the Bank has been almost doubled, from Rs. 26.90 crores as at the end of 1950 to Rs. 51.74 crores as at the end of 1960; the advances have increased from Rs. 13.95 crores to Rs. 31.62 crores. The Bank has, during this period, opened 24 new branches and many of these have been at places where modern banking facility was either absent or inadequate.

Jet your goods to LONDON

Take advantage of our 5 Boeing flights every week to the Middle-East, Continent and the U.K. Jet your goods in the modern manner to the great markets of the West in a matter of hours!

Air transportation ensures streamlined distribution of goods—an important factor in business today...it eliminates incidental charges including heavy warehousing costs. That's why flying your goods on Air-India means less tied-up capital, quicker turnover and larger profits.

Plan your exports now...jet-speed them in the holds of Air-India's Boeing 707s, which have a 5 ton capacity for cargo.

Special reduced rates applicable to a number of commodities. Contact our local Booking Office/Cargo Agent.

THE SWATANTRA BHARAT MILLS AT DELHI

LIGHTING BY PHILIPS

The Swatantra Bharat Mills, one of the well-known D.C.M. Group of Textile Mills, have used Philips lighting. The Management of this mill has been so impressed with the performance of Philips lighting that they have, as before, relied exclusively on Philips to refit the entire unit, covering the large area of over 3½ lakh square feet and maintaining the high efficiency of nearly 5,000 workers.

Philips' exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy by providing the maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips'

scientifically designed equipment is the result of experience as well as research and development aimed to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible *plus* of Philips' international experience and know-how.

FREE: For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.

LARGER NET PROFIT REFLECTS MORE FAVOURABLE CONDITIONS

DIVIDEND INCREASE BASED ON HOPEFUL OUTLOOK.

SUCCESS OF MUTUAL ARRANGEMENT WITH LLOYDS BANK

Mr. J. K. Michie on Importance of Stable Banking

The Annual General Meeting of National and Grindlays Bank Limited will be held on April 11 at 26, Bishops-gate, London, E.C.

The following are extracts from the statement by the Chairman, Mr. J. K. Michie, which has been circulated with the report and accounts:-

The principal event in our record of 1960 is not reflected in the balance sheet — the acquisition by us of the Eastern business and branches of Lloyds Bank Ltd. and as a part of that bargain the acquisition by Lloyds Bank Ltd. of just under 25 per cent of our capital. This mutually agreeable arrangement was ratified by you at an Extraordinary General Meeting held on 15th November, 1960. As you will see it has added 19 to our list of branches and as will emerge it means an increase of around £50 millions in the total of our next balance sheet.

Another concomitant effect was the strengthening of our Board by the addition on 1st January of Sir Jeremy Raisman and Lord Lloyd, appointments which fall to be confirmed at the Annual General Meeting. Sir Jeremy is Deputy Chairman of Lloyds Bank and both are distinguished names in the realm of Commonwealth affairs. At the same time Mr. C. Gardner, Chief Manager of Lloyds Bank Eastern Department joined our executive staff as an Assistant General Manager and Mr. R. J. S. Marsh as Assistant Manager.

A great deal of time and thought was given to preparation for this merger of interests and your General Manager, Mr. Gillespie, and I have just returned from tours much of which we did in concert though his was the more comprehensive and strenuous. Our visits covered the principal branches of the combined Bank in India, Pakistan and Aden. In addition Mr. Gillespie visited Ceylon.

Our journeys although covering a wider field were undertaken with the particular object of seeing that in every possible respect the merger should get off to a good start and that there should be no misunderstandings about our future policy in the minds of either our constituents or our staff.

ADDED STRENGTH ASSURED

I am glad to report that our impressions were without exception favourable. Our combined staffs have from the outset shown a most admirable team spirit while our constituents appreciate that the merger means additional strength to the Bank. There is too a realisation in India and Pakistan that banking should be inherently as strong as possible and this was reflected in expressions of approval of the merger made to us by many individuals including members of the banking fraternity.

GROWTH OF ADVANCES

The total of our consolidated balance sheet at 31st December, 1960 was £181,551,921 — an increase of £18,516,333 over the previous year. The growing demand for finance in the territories in which we operate, has resulted in an increase in advances of just under £19 million. Current, Deposit and other accounts are over £18 million higher, but this pressure of demand for seasonal finance has had the effect of reducing our liquidity ratio.

At £479,276 our net profit was £74,568 higher reflecting the overall more favourable conditions for

banking which obtained in our territories in 1960 in comparison with the previous year — which in turn showed an improvement over 1958.

Subject to necessary reservations in respect of East and Central Africa and Burma this better climate for banking generally seems likely to continue and as a consequence of this view we have increased our second interim dividend for 1960 from 6½ per cent to 7 per cent, making the total distribution for the year 13½ per cent. Further this action would not have been taken unless we had felt justified in promising to consolidate this rate of dividend — you can therefore expect subject to no unpredictable contingency to receive 14 per cent on the increased capital for the current year.

National and Grindlays Finance and Development Corporation. The net profit for the year was £10,152 the reduction being accounted for by the higher rates of interest paid on its borrowings from the Bank.

INDIA

What particularly struck Mr. Gillespie and myself in our journeyings through India is the surge of industrialisation which is going on, with, it seemed, increasing momentum. The reasons behind this expansion are all excellent and legitimate and in most cases the capital in so far as cover for land, buildings and plant are concerned seems to be available. But it is the provision of "working" capital to carry stocks and outstandings which to our minds poses a real difficulty, and unless more money can be found by or for the banking system it seems to me it will be put under considerable strain within the next twelve months.

I know this aspect of the third five-year plan is appreciated by the Reserve Bank, which has already taken certain measures to increase the resources of the banks by the release of the special deposits which had been called for in March and May 1960 and by the extension of their Bill Market Scheme for the rediscounting of bills on behalf of banks, although on an escalator scale of interest. The Reserve Bank has also taken steps to strengthen and thereby to increase confidence in banking in India generally — it having unfortunately suffered a setback last autumn. These steps include the merging of some of the smaller banks with stronger units.

But somehow the hidden cash balances of India must be drawn into the banking system and through it put to work if the latest five-year plan is to be — as it must be — a success.

When it is realised that the total of bank deposits in all India at 30th June, 1960 was only Rs. 1,946 crores or £1,459,000,000 — or an average sum per capita estimated at Rs. 55 — it will be realised what the scope and the necessities are, and progress is painfully slow. The portents therefore are of a continuance of tight money conditions in the foreseeable future.

Naturally we are doing all we can to attract further deposits but our branch system sets limits to our potential progress.

During 1960 India's external reserves fell by Rs. 68 crores to Rs. 319 crores.

The Reserve Bank rate remained at 4 per cent throughout the year.

Tea has had a favourable experience somewhat marred by drought in Assam though this was largely compensated by good crops in South India areas. Internal consumption continues to rise and the reduction of the export duty by 17 per cent announced in the 1961 Budget should benefit exports by making Indian tea prices more competitive in world markets.

Jute manufacturers and shippers have had an exciting and a difficult year caused by the tremendous rise in prices in India and Pakistan in October last consequent on the then disclosed shortage of raw jute. These conditions may well react to the detriment of the trade as a whole for consumer countries will be apt to look for substitute materials rather than be at the mercy of such vagaries in cost.

PAKISTAN

The impetus of President Ayub's administration continues to be felt and is reflected in a general feeling of confidence individually and nationally.

The major and much the most important work now in progress is the five rivers water scheme known as the Indus Basin Projects with its tremendous potentials in extending agriculture and, by disalinisation of land, improving it. What I have already said about jute applies even more so to Pakistan where the crop is comparatively a much bigger factor in her economy. The percentage of the crop consumed internally continues to grow.

For identical reasons the need for an expansion of bank deposits is at least as urgent as in India; indeed the ratio of deposits to population is somewhat lower but that may be in some degree a consequence of the traditional Muslim objection to accepting interest.

The State Bank rate has remained at 4 per cent and, as I have indicated, money is scarce and, relative to current bank lending rates, expensive.

External assets of the State Bank of Pakistan rose by Rs. 6 crores during the year.

CEYLON

Both politically and financially Ceylon has had a disturbed year.

Two general elections have been held, the eventual result being a victory for Mrs. Bandaranaike's Sri Lanka Party.

Despite reasonably good prices for tea and rubber, although other exports were not so fortunate, Ceylon's external resources again fell during 1960 — by Rs. 207.6 million — to a figure of Rs. 481.2 million and drastic measures are now being taken to reverse this continued loss by restriction of imports and by raising the Central Bank rate to 4 per cent from the previous inadequate basis of 2½ per cent.

As I have said before, Ceylon's natural wealth is such that a commonsense economic policy followed consistently would soon put matters right and it is hoped that neither panic nor discriminatory measures will be adopted and that the present penal rates of taxation will be moderated. For these are not the ways to attract foreign investors to the country or indeed to retain existing non-indigenous investment.

Mercantile Credit Ltd., the Colombo hire-purchase company in which this Bank has an interest, did an expanding business in 1960 and good results are expected. This year import and credit restrictions are almost certain to reduce the volume of trade covered by hire purchase.

BURMA

The pattern of events described last year has continued under U Nu's A.F.P.F.L. Party.

Burma's foreign exchange reserves rose during the first half of 1960 but were lower by £5½ million by the

end of the year as a result of certain capital disbursements including a repayment to the International Monetary Fund. There was an increase of rice exports to 2,000,000 tons — which nevertheless is still only about 60 per cent of pre-war figures. Increased internal consumption doubtless partly accounts for this disparity.

During 1960 the Government of Burma exercised its option to acquire an increased share of the capital of the internal oil industry now run as the Burma Oil Co. (1954) Ltd. and its holding is now 51 per cent.

The attitude to foreign companies operating in Burma continues fundamentally unchanged although a recent Ministerial Mission to Europe has expressed the wish to encourage new capital to set up industries in the country. The two policies can hardly be said to run parallel.

ADEN

Lack of rain adversely affected the 1960 cotton crop which fell below expectations. However the prosperity of Aden very largely depends on the activity of the port as a bunkering centre and on the operation of the refinery. In the absence of labour troubles for most of the year both were fully employed — in fact the prompt handling of ships is now a pressing problem which is to be met by new installations in the coming year.

Recently we opened another sub-branch in the Maalla area bringing the total of our offices to five. We have also been given a licence to operate at Al-Ittihad, the capital of the Federation of Arab Amirates of South Arabia, when this comes into being.

CONFIDENCE IN THE FUTURE

While it is apparent from what I have written that all is by no means plain sailing it is also true to say that your Board and Management do not take a pessimistic view of our future, otherwise we should neither have increased our dividend nor have increased the number of our branches and sub-branches from 94 to the present total of 141 in a period of just over a year. We continue to believe that whatever the political future, sound banking is a necessity to economic life, and it is that which we aim to provide. Indeed I agree with those who argue that sound economics backed by a stable banking system is a necessary background to any country and any Government and should have a high priority.

What continues to puzzle me in regard to this country and I am sure causes concern in many minds, is our apparent inability to achieve a worthwhile favourable balance of trade in spite of what is to all intents and purposes full employment. It is all very well to argue that the British people prefer "the good life" to a higher level of savings but in the world of today the problem by no means ends there. We must either have more money to invest abroad, to lend to our Commonwealth friends and particularly to emerging nations, or see our influence and our trade with them steadily wane.

We incline to claim that we are a special repository of wisdom on international affairs and that others have always been glad to have our counsel but I feel that would be a more valid argument were we to prove ourselves more successful and more able to help them financially. There is much in the Russian claim that the cold war is now becoming an economic one.

TRIBUTES TO STAFF

Finally, our Staff — and that includes those we have recently absorbed — have given and are giving us enthusiastic and loyal service and that applies from our General Manager right down the line.

When Mr. Gillespie and I were recently on tour we took occasion to meet as many of the staff as was possible and I hope that the friendly exchanges we had — "inter alia" with our Union officials — will bear good fruit.

Fabrications to specifications

Under licences
from Messrs Fives-Lille-Cail,
France, who built the largest sugar and cement
plants in the world and have supplied Soviet Russia
in 1959 a five thousand ton daily capacity cement plant, we
manufacture machinery and equip complete sugar and cement plants.

We also manufacture and supply complete sulphuric acid and super
phosphate plants. We have secured orders for five complete sugar
plants, of one thousand tons daily sugar cane crushing capacity.

COMMODITY NEWS AND NOTES

Contracts have been signed to export 13.395 lakh tons of iron ore during 1961, while negotiations for the export of 27.50 lakh tons are in progress. The following are the details:

Country	Quantity sold for delivery during 1961
Rumania	2.00 lakh tons
Czechoslovakia	9.03 lakh tons
Yugoslavia	1.35 lakh tons
West Germany	1.015 lakh tons
Country	Quantity for delivery in 1961 in respect of which negotiations are in progress
Hungary	1.00 lakh tons
Italy	1.00 lakh tons
Poland	1.00 lakh tons
East Germany	1.00 lakh tons
Austria	0.50 lakh tons
Japan	20.00 lakh tons
Egypt	3.00 lakh tons

INTERNAL RELEASES OF COFFEE AND EXPORT SALES

Up to end of January 1961 the receipts of coffee into the 1960-61 pool amounted to 21,072 (12,909) tonnes, comprising 18,744 (12,043) Plantation, 1,485 (682) Arabica Cherry and 843 (184) Robusta, the figures within brackets indicating pool receipts on the same date last year. The releases of coffee in the in-

ternal market during January 1961 amounted to 2,851 (2,462) tonnes, made up of 1,018 (799) Plantation, 305 (567) Arabica Cherry and 1,528 (1,096) Robusta, the figures within brackets indicating internal releases during January 1960. The Marketing Committee at its meeting on 2nd February 1961 decided to allocate a quantity of 21,500 tonnes of coffee for export out of 1960-61 crop, comprising 11,000 Plantation, 3,500 Arabica Cherry and 7,000 Robusta. A quantity of 527 tonnes Plantation Coffee was sold for export out of 1960-61 crop at the export sale held on 25-1-1961. Tenders have been invited for a quantity of 1,355 tonnes Plantation and are due on 9th January 1961.

PACKET PRICE OF TEA REDUCED

The wholesale packet price of tea has been reduced by 3 nP per lb. from March 12, in view of the reduction of excise duty on package tea by 6 nP per kgm. as provided in the Central Budget proposals for 1961-62, according to a press note issued on behalf of the major tea packing companies.

IMPORT OF U.S. COTTON

The additional amount authorised by bartering firms in the U.S. in respect of import of raw cotton against the export of manganese ore under the barter agreement between the State Trading Corporation and the four U.S. bartering firms is now increased from \$ 2m. to \$ 3m. according to a press note issued by the Joint Chief Controller of Imports and Exports. It was announced on March 1 that the additional amount authorised by the bartering firms in the U.S. then amounted to about \$ 2m.

The Federation and the Country

THE annual meeting of the Federation of Indian Chambers of Commerce and Industry held in New Delhi this week has run true to form and, indeed, almost to formality. It was inaugurated sedately at Vigyan Bhavan by the Prime Minister, whose address this year was, unfortunately, less attuned to the needs of the moment and to the present temper of businessmen than ever before. It is true enough that trade and industry have to be integrated with the larger economic and social objectives of the country, which are towards greater equality and greater participation, whether or not these are contained in the slogan of the socialist pattern of society. But the Prime Minister did less than justice to his business audience when he suggested that they have not made a substantial change in that direction already. The Federation is already including amongst its members a number of small businesses, and many of the larger businesses are thinking in terms of subcontracting or otherwise assisting ancillary industries. At the same time, by and large, the Federation has accepted gracefully the pattern of taxation of the Indian Union with small footnotes of dissent at points where the pressures of taxation have been intense. It is quite surprising how readily a massive armoury of taxes, including Wealth tax, Expenditure tax and the Gift tax as well as nearly the highest level of personal taxation in the world, have been accepted by the main current of business opinion in India.

A word of approval of the private sector's adaptability and performance would have been more appropriate than the reiteration of the querulous point of private wealth and public squalor which the Prime Minister chose to make. This is the time not merely for a meeting of minds in the public and the private sectors, but for generous recognition that a condition for common implementation is that minor differences in outlook need not be publicly displayed on these occasions. Indeed, nothing could have been more conciliatory than the address of the President of the Federation, Mr. A. M. M. Murugappa Chettiar, who spoke wisely of the

necessity of directing business policy to the imperative needs of the masses. There are some differences in the Federation itself as to whether this should be done currently by restricting or fostering consumption. This is not, however, the difference between the "privilege" of the classes and the neglect of masses, but merely a judgment as to the time it is to take for the mass consumption society to be developed in this country. The Prime Minister's view, shared by several members of the Federation, was that it is better to restrict consumption and build up producer goods and exports so that the pace of self-sufficient economic development might be eventually faster. Mr. B. M. Birla held the contrary view which might be justified in a society in which only large markets provide incentives. Consumer goods cannot develop in a vacuum; they must be developed against existing markets. But the contradiction is less intense than it appeared, because expenditure incurred on producer goods at second round provides the demand for consumer goods. Thus, in point of fact, the market for consumer goods is implicit in expenditure on investment in producer goods. The only question is whether balance can be struck in phasing. On the whole, the Third Plan, which was supported by the Federation, strikes the balance in the right place.

It was clear, however, that while the general framework of the Third Plan was as acceptable as the Second, the Federation was extremely critical of public sector implementation, particularly on transport and on power. The public sector which occupies the strategic heights of the economic scene in these areas, must be made aware of its own responsibilities, particularly if the shortfall in either or both should impinge heavily on other production. It is sincerely to be hoped that the Federation, in its anxiety to placate the public sector, will not abstain from saying its piece boldly in regard to the failures of administration, of which there are many examples even outside transport and coal. The delays in

sanctioning schemes or even in rejecting them are unnecessarily long, and the apparatus of Government needs to be overhauled if the tempo of economic development is to be increased. Indeed, there could have been much more documentation on this point. Few people realise adequately the losses that are incurred by delay in attaining full production. Certainly, if Hindustan Steel could have produced its current output even three months earlier, its balance-sheet would have been very different. Businessmen would render a service to the country if they could get the public sector to emulate them in speed, just as the public sector should get the private sector to take a larger view in regard to exports (even at a temporary loss) and social responsibilities in terms of fair dealing all round. The Federation might

claim to have judged rightly in its tone, which was one of full co-operation in a national effort, but with a clear expression of the private sector's personality where the expression of that different personality serves the national interest. Nevertheless, one cannot help feeling that, with the restraints written into the political atmosphere, dominated now by the outlook of the Government, the Federation's meetings are losing interest and fail to impinge constructively on the making of public policy. The Federation needs to give some thought to the declining value of its currency in the public mind. Perhaps, the quality of thinking which goes into its resolutions and the quality of its memoranda need to be improved to make a greater impact both on sectors of influence in New Delhi and on the public at large.

Exports, Advertising and Marketing Research

THE accent this week has, in several places, been on exports. An important resolution of the Federation of Indian Chambers of Commerce and Industry deals with this subject and even more important than the resolution was an outspoken address by Mr. S. K. Patil, Food Minister, at one of the Federation lunches in which he expressed grave fears about the elimination of Indian products, particularly sugar and fertilisers, from the export field as a result of their absurdly high cost structure. More direct reference to exports, with several constructive proposals, was made in the Advertising Conference on Marketing and Export Promotion inaugurated by the Prime Minister on Monday. This Conference was sponsored by the Indian Society of Advertisers, but its emphasis went far beyond advertising. Mr. Chinubhai Kilachand, Chairman of the Indian Society of Advertisers, suggested a Central Export Institute to co-ordinate the activities of the various export promotion councils. But his emphasis was much more on an aggressive and sustained advertising and market research programme to diversify markets and goods. One of his proposals that advertising should take advantage of the effectiveness of commercial radio stations was dismissed by the Prime Minister almost without consideration, but the other points that he made, such as that the market research must be continuous in order that we have up-to-date information on consumer preferences abroad and the trade marks and brands should build up a personality for our products, won more acceptance at least in theory. We are no further with a practical export promotion effort at the present time and, therefore, there is need for hard thinking as to what are the obstacles in the way.

So far as the Indian Society of Advertisers are concerned they can complain legitimately that the Government of India demands an extraordinary effort to sell abroad, but in point of fact, pettily denies foreign exchange for widespread sales promotion. The net result is that sales promotion activities abroad, whether in respect of advertising or marketing research, cannot be undertaken. Mr. Kilachand's point that, unless this is done continuously Indian producers cannot be expected to produce to the standards of consumers in different countries, is inescapable. If the Government of India believes — as the Prime Minister made clear — that advertising should be done with the idea of export promotion, the first logical step, to which the Finance Ministry and the Reserve Bank of India should agree, is that for products which have clear possibilities abroad

to be established by marketing research studies, the necessary foreign exchange for a sales programme and further marketing research should be made available without undue delay. At the present time, it looks as though every one is earnest about exports, but no one is prepared to pay the necessary price to bring them about.

The other problem on which too little was said was quality. There was some feeling that Mr. S. K. Patil was exaggerating defects in quality in regard to Indian sugar. But the fact remains that the display of our products is often defective. Sometimes, little elements, like good packaging, are forgotten. It is not impossible that, unless we rectify these mistakes, Mr. Kilachand's fear that European nations will decline in our export trade will materialise. He considered that the answer was not necessarily old markets, but aggressive salesmanship in new ones. He thought that the performance of the engineering industries, which have done well in 1960, was a model of what could be achieved, but surely this success, while welcome, is too inadequate to serve as a guide for the future. We need ten times this effort in engineering alone.

There is also the obverse need of buying in the cheapest market. It is not often realised how much India has lost by the fact that her orders for capital goods and raw materials have often been placed not in the cheapest market, but elsewhere because of particular connections, such, for example, as those which obtain between the S.T.C. and the East European markets. It is time that marketing research provided not merely information on exports, but details of price lists in competing countries for the capital goods which India needs. It has been estimated that for the period of the Third Plan the Director-General of Supplies and Disposals alone will be placing orders to the extent of Rs. 250 crores. Surely, one of the most important matters of policy connected with the Plan should be a permanent organisation which should advise the Director-General of Supplies on changes in foreign prices and how advantages could be obtained from changing areas of purchase or, alternatively, in negotiating for a reduction of prices clearly unfavourable to this country. If even a small fraction of the suggestions made by the Indian Society of Advertisers were fully implemented, a very useful beginning would have been made in an export promotion campaign. It is sincerely to be hoped that no time will be lost in making India's export promotion policy dynamic in these or similar terms.

Guest Editorial

The Economic Consequences of Dr. Verwoerd

By PAUL BAREAU

SUFFICIENT time has now passed since the self-exclusion of South Africa from the Commonwealth to assess its consequences in a mood washed of the emotions which this particular outcome of the recent Commonwealth Conference inevitably aroused. They were deep emotions for, as the Prime Minister, Mr. Harold Macmillan, said in the debate on this matter in the House of Commons "our Commonwealth is not a league of governments, it is an association of peoples", — and many of the people who are now leaving the Commonwealth loathe *apartheid* with an abhorrence that derives from the fact that they suffer from it. This need not have happened had it not been for the doctrinal rigidity with which the Prime Minister of South Africa raised to the level of philosophy practices which might have been condoned or at least tolerated within the Commonwealth, had they been merely part of a gradualness in the approach towards racial equality.

All these, however, are might-have-beens. The die has been cast though the hope must remain that one day South Africa, purged of this evil doctrine, will voluntarily return to this multi-racial community of peoples. The urge to return may become greater as the economic consequences of Dr. Verwoerd's decision become more apparent.

For the immediate future those economic consequences are likely to be small. In the first place, South Africa will remain a member of the sterling area. It was almost a foregone conclusion that it should do so. The decision is justified by the mutual interests of the parties primarily involved. The bulk of South Africa's trade is with the United Kingdom and other sterling countries. The major part of its external debt is expressed in terms of sterling. Its big finance houses derive their resources from Britain as well as from South Africa. A substantial part of South Africa's external reserves is held in sterling balances. Its banking system is closely linked with the London market. For all these reasons any decision other than that which has been taken would have been an attempt on South Africa's part to cut off its nose to spite its face.

South Africa will also presumably continue to sell the bulk of its gold through the London market. Since April 1959, attempts have been made by South Africa to make direct sales of gold from Johannesburg. These have been so successful that it is authoritatively estimated that last year two-fifths of the gold sold by the South African Reserve Bank was disposed of by direct sales and without going through the Bank of England. These direct sales have, however, been dwindling particularly since the gold flurry of last October which showed how supremely well the London market performed in a period of extraordinary difficulty and gave both sellers and buyers a service and flexibility which no other gold market began to approach.

There have, however, been some doubts whether South African gold will continue to be sold in London and these have caused some pressure on sterling. There is a serious flaw in the logic of this argument, quite apart from its false premise. Even if South Africa sold all its gold direct to the United States and kept part of its reserves

in dollars rather than in sterling, it would (other things being equal) have to convert these dollars into sterling. These "other things" are the distribution of South African external trade and the harsh realities of its balance of payments.

The pattern of South African external trade is unlikely to be seriously disturbed by changes in the political status of the country. The Commonwealth preferences will continue to apply. The Ottawa Agreements, under which they are conceded, were a series of bilateral agreements. Whatever may happen to the agreements between South Africa and other members of the Commonwealth, that between South Africa and the United Kingdom will remain undisturbed. This will be wholly consistent with the General Agreement on Tariffs and Trade. When GATT was signed after the war it recognised existing preferential arrangements, though it banned new preferences. The recognition of agreements then in force was made independently of their Commonwealth context.

As regards the question of citizenship and the mobility of people between South Africa and the United Kingdom, there is likely to be a short-term agreement to continue the *status quo*, and give South African citizens the full rights of British citizenship. A precedent for this was set by the treatment meted out to the Republic of Ireland when it decided many years ago to leave the Commonwealth. The Irish, by definition, should not set precedents for anyone or anything else. They are the proverbial exception that proves every rule. They have left the Commonwealth but have retained every privilege of membership — a paradoxical situation which is unlikely in the long run to apply to South Africa.

This retention of privileges will certainly not apply to access to the British capital market. This will not be due to any conscious restrictive move on the part of the British authorities but to a natural revulsion and lack of confidence on the part of thousands of investors, individual and institutional, in Britain. The recent slump in South African shares measures this revulsion. It heralds the possibility of considerable withdrawals of British capital, estimated at some £900 million, from South Africa. Since the South African gold and foreign currency reserves amount to about one-tenth of this figure, any massive repatriation would rapidly bring into being a rigid restriction of payments not only on current but on capital account.

South Africa may yet discover that the economic consequences of Dr. Verwoerd's decision are graver than most appear to assume. This is not the first time that South African Boers have taken to the ox-wagon and trekked away from other communities. But it is one thing to do so in the context of a simple, pastoral, self-sufficing society as was done by the Voortrekkers 125 years ago. It is another to attempt it, however metaphorically, in this second half of the twentieth century and in a country which is rapidly becoming industrialised and which still largely depends on external capital. The day of reckoning may not be long in dawning.

A DELHI DIARY

THE CROSS-ROADS OF ASIA?

A NICE question has been asked in Delhi this week.

Have we become the cross-roads of Asia or are there many cross-roads and Delhi only also a ran? The occasion for the remark has been the vast number of VIPs who were in town this week or have just recently departed. After Mr. Averell Harriman and Prince Souvanna Phouma, who are now carrying their good work at Washington and Paris respectively, New Delhi has seen Mr. Dean Rusk (for the first time as U.S. Secretary of State) and Lord Home, who has become an interesting character after the confession of his failures on tiger shooting in Nepal. The tiger to be shot at the present time, for which appropriate arrangements seem to have been made, is Laos. Perhaps, like Lord Home's tiger in Nepal, it will keep bobbing up and down. Only one hopes that eventually somebody will entrap it in a suitable receptacle. At the present time, while the appropriate noises are being made in the British and Russian Presses, everyone has been kept guessing as to whether or not Laos is on the way to a political solution. Meanwhile, the rise in appropriations asked for Defence by President Kennedy has not been a very encouraging sign. Nor indeed has been the Peace Council's session in Delhi, which has shown, all over again, the aggressive spirit of the People's Republic of China masked cleverly for a period of 'X' years. Readers are asked to solve the equation for 'X'!

But as I was saying, Delhi seems to have become, in the year 1961, an even more sought-after place by VIPs from abroad. It has also this week become a meeting place for all and sundry from all parts of India. The Federation of Indian Chambers of Commerce and Industry, which held its annual meeting, occupied the stage for three days, after which it was hastily occupied by the Indian Society of Advertisers. The common link in the two conferences was an inaugural address by the Prime Minister and a hotly debated subject—export promotion. I cannot say that after the deliberations, most of which, they tell me, have been 'constructive'—happy word!—anything will happen on our exports. But Sir Donald MacDougall, who delivered a splendid challenge at the Indian Society of Advertisers, came to the view that, unless our exports trebled in the next decade, we were in for a pretty difficult time. On the other hand, Mr. S. N. Chib emphasised the point that tourism—has this or has not this to do with Delhi's cross-roads?—would do a magnificent job. In fact, it is now the lustiest infant foreign exchange earner that we already have.

THE MAN WHO CAME TO DINNER

I must leave the problem of the cross-roads without an answer in order to say my piece about the man who came to dinner. In fact, it was a luncheon and not a dinner, and the man concerned is by no means unknown—Mr. S. K. Patil. He certainly stole the show so far as the Federation meeting was concerned. He defused with humour the bomb that he was exploding, but it was a bomb alright. He warned the business community (in one of the most cheerful speeches it has ever heard) about the explosive dangers of abundance, and not of population only. The Food Minister

was glad—and sad!—that now food figured so little in Parliament that scarcely 10 per cent of the questions referred to the misdeeds of his Ministry. It was implied that the misdeeds were not many. There was almost no need for a food debate and yet from all he said it looked as though there was an excellent ground for a debate on sugar in which India's surplus held in the current year might be, he said, one million tons. Talking about support prices on which there has been quite a little confusion in recent months, the support price of sugar now raises Indian price nearly to Rs. 300 per ton above international price. Even if the United States, with seeming generosity, bought our sugar at Rs. 550 per ton, Indian sugar had to be subsidised to the extent of Rs 150 per ton in order to enter the United States. This was the current position. But if we went on at this rate, what would happen ten or 15 years from now? Our fertilisers were 30 per cent above world prices; sugar was 75 per cent and textiles were beginning to show that they were uncompetitive. In what was India competitive, and if we were uncompetitive abroad and internal consumption was incapable of absorbing the miracles of production that had been accomplished in sugar and presumably will be accomplished in other (Patilian) fields, how was the demon of surplus to be laid? The Minister himself had been frightened to the point of not taking sugar with his coffee and now he feared he would have to take a trip abroad to sell sugar to the United States. This was very different from buying 17 million metric tons of foodgrains on which he happened to be on the right side of the fence. It was all a very disagreeable pill for the business men present, but at least it was sugar-coated with an abundance of humour.

THE TRIALS OF TRADE

The second speaker at the Federation lunch, Sir Paul Gore-Booth, had a grimmer subject, but happily a more cheerful conclusion. The subject was the European Common Market and United Kingdom and Commonwealth interests. It was an intricate subject on which, as Sir Paul Gore-Booth said, we need, like Sam Weller, "Double million gas microscopes of hextra power....." There was, however, good cheer to be found, firstly, from the fact that an agreement between Six and Seven would not necessarily be detrimental to Commonwealth interests. Much of the fear that under-developed countries would suffer in the process could be dispelled if it was recognised that now Europe divided investment resources between the Six and the Seven with much duplication; but if an agreement could be found, these resources might conceivably be available for the under-developed (developing?) countries. Secondly, the current would not be changed in the short period very much by an agreement and there would be plenty of time to make the necessary adjustments which were essentially long-term arrangements. I wondered how many business men really followed the strain of the argument which the High Commissioner presented so ably. But I think everyone was happy with the conclusion that the United Kingdom Government would continue to explore the possibility of an association in Europe and that the search was worth while and hopeful for the Commonwealth, no less than for the United Kingdom. Thus, we return at last to the best of all possible worlds!

—ARGUS

THE WEEK'S NOTES

Laos

TIME FOR ACTION

THE CONCERN expressed by Prime Minister Nehru in Rajya Sabha on Monday on the deteriorating Laos situation will be widely shared. With the Pathet Lao forces heading fast towards the Mekong plains, the situation is indeed explosive and requires urgent attention. As Mr Nehru has stated, the issue of war and peace in a big way depends on what happens in Laos in the next few days. If the Pathet Lao forces continue their onward march in the Mekong plains, the SEATO nations will undoubtedly step in, thereby making the situation worse.

In this gloomy picture, however, there is a silver lining; it is the latest proposals of the British Government for early negotiations between the co-chairmen of the 1954 Geneva Conference—Great Britain and Russia. The British plan envisages, firstly, that the Soviet Union should join the U.K. in making an appeal for a cease-fire in Laos, secondly, that the 1954 International Commission for Laos should be revived and, finally, an International Conference on the substance of the Laos problem should be held. This three-stage plan is very near to the proposals put forth by the Soviet Union some time ago. The latest reports from Moscow suggest that negotiations on the basis of this plan can be started soon. The Western Powers—the British proposals are said to have the blessings of the U.S. Government—apparently have come to agree to the summoning of a 14-nation Conference as suggested by Prince Souvanna Phouma and the Soviet Union to resolve the Laos tangle. This Conference, according to the British Plan, would be held when the first two stages of the scheme have been satisfactorily implemented, i.e., the International Commission for Laos has been revived and a cease-fire ordered.

There, however, remains, one big hurdle to be surmounted and that is the insistence of the Soviet Union that before any negotiations are started for reconvening the International Commission, the West must recognise that Prince Souvanna Phouma, though in exile, still remains the de jure Prime Minister of Laos. There are no indications as yet as to whether the Western Powers would agree to this. But since both Prince Souvanna Phouma and the present Prime Minister of Laos, Mr. Boun Oum, are agreeable to reconvening of the International Commission, there should be no hesitation in reviving it.

It is indeed encouraging that both the Western Powers and the Soviet Union have come to realise that Laos should be a neutral country on the periphery of the Communist world in South-East Asia. That was the basis on which the 1954 Geneva Conference proceeded and reiteration of this by both the Western Powers and Russia should help in resolving the issue and bringing peace to the strife-torn Laos. The United States and the Soviet Union will do well in forthwith stopping military aid to the two warring groups in Laos. Any further delay in dealing with the Laotian problem will undoubtedly mean it's becoming more and more complicated and difficult to solve.

World Peace Conference

AFFRONT AND ABUSE

THE PRIME MINISTER categorically denied this week in the Lok Sabha that there was any understanding between him and Mr Sunder Lal, Chairman of the All-India Peace Council, which played host to the World Peace Conference in New Delhi, that there should be no discussion of the Sino-Indian border dispute at the World Peace Council's session. This was in reply to a question put to him in the House with reference to Mr. Sunder Lal's statement at a Press briefing that there was such an understanding. Mr. Nehru gave clarification on this point in the most emphatic terms to the effect that he impressed upon Mr. Sunder Lal that the border issue was "a test of the views of the Peace Council." It is amazing that those who speak with authority for the All-India Peace Council should indulge in lies of this type.

Even assuming that there was an understanding as stated by Mr Sunder Lal, that understanding would not be conceivable unless the Chinese delegation to the World Peace Council was also a party to it. An understanding which would bind the Indian delegation not to touch the border issue and would leave the Chinese delegation free to mention or discuss it would be totally devoid of any sense whatsoever. In the course of the Council's deliberations, the leader of the Chinese delegation made the unabashed and untrue statement that the overwhelming majority of the people in India favoured the Chinese stand on the Sino-Indian border issue. It needs no arguing that Chinese aggression and occupation by military force of India's territory has been opposed by the entire Indian nation except a tiny number of China's camp followers in this country. It was up to Mr. Sunder Lal and his co-delegates from India to stand up against this statement and demand its withdrawal. Instead, they meekly swallowed it and allowed it to go on record.

It was left to the French delegate to give a retort. He asserted bluntly that "even in this part of the world (Asia) there is a great threat to peaceful co-existence. This is because one neighbouring country has committed aggression on one of the largest democracies in the world." The aggressor referred to was unquestionably China and the Chinese delegation threatened to stage a walk-out unless the French delegate withdrew his statement. Ultimately, at the intervention of the Chairman of the Disarmament and Peaceful Co-existence Commission of the Council the statement was withdrawn. Here was a clear opportunity for the Indian delegation to demand as a condition precedent the withdrawal of the false and propagandist statement of the Chinese delegation. But the Indian delegation did not have the courage to take this course.

The Chinese delegation has abused India's hospitality in carrying malicious propaganda against the host country purposefully and deliberately. It indulged in this brazen-faced activity by making a direct attack on the Government of India as inheritors of the seeds of British imperialism at the cultural meeting of the Council convened in connection with Tagore's birth centenary and exposed itself to the penalty

of indirect expulsion from the country. In doing so, has it strengthened its country's "cause" or enhanced its reputation?

The deplorable fact which emerges from this incident is that a naked affront to India was swallowed by the All-India Peace Council even without a word of protest. Can this conduct be explained on any other hypothesis than that of extra-territorial loyalty?

Gujarat's Finances

MEMORANDUM TO THE FINANCE COMMISSION

IN RESPONSE to the Third Finance Commission's invitation to make observations and suggestions on the basis of allocation of the proceeds of certain taxes and duties between the Centre and the States, the Gujarat Chamber of Commerce has made a well balanced and objective assessment of all the relevant factors which merit serious consideration. Against the total outlay of Rs. 235 crores for the Third Five-Year Plan for Gujarat, the Centre's contribution is estimated to be Rs. 113 crores while the remaining amount of Rs. 122 crores has to be made available by the State through mobilisation of internal resources. Analysing the resource position of Gujarat, Mr. Maldevji Odedra, Deputy Finance Minister, Government of Gujarat, pointed out that the State Government will not be able to raise more than 100 to 105 crores of rupees even after putting the best efforts. It is claimed that the per capita tax revenue, calculated on the basis of actuals for the year 1958-59, for Gujarat State comes to Rs. 15.5—one

of the highest among many States in India and higher than the all-India average of Rs. 12.9. Further, it is pointed out that the State Government have exploited 15 sources out of the 17 sources of taxes and cesses—that is, all sources of taxes have been tapped except tax on agricultural income and tax on trade, professions and callings, which do not offer much prospect by way of bringing in substantial revenue.

Thus it is felt that in view of limited scope for widening the tax base and the high level of taxation that is already obtaining in Gujarat, greater allocation of revenue by the Centre to the State is called for. In this connection the Chamber of Commerce suggests that the percentage share allotted to the States out of the proceeds from income should be raised from 60 per cent to about 75 to 80 per cent. It also suggests that the share of excise duties of each State should be determined on the basis of extent of consumption of commodities and should be 50 per cent of the proceeds thereof. The Chamber also holds the opinion that the proceeds of the estate duty should be distributed among the States on the basis of collections. In view of the heavy budgetary deficit, high incidence of per capita taxation, backlog of development in regard to irrigation facilities, power, transport, roads, etc., numerous transitional problems arising from the creation of the new State and additional financial burdens that will have to be borne by the State Government on that account, justice will be done to the State of Gujarat only if a sizable sum is allotted by the Centre by way of grants-in-aid.

ODYSSEUS

MR RICHARD C. SMYTH, President of Smyth & Murphy Associates, a US firm of business consultants, has just published a stimulating book entitled "Financial Incentives for Management" (McGraw Hill, London, 66sh). Mr Smyth sets out to explain, with a wealth of practical examples, statistical tables, and graphs, right and wrong ways in which to use financial incentives to extract harder and better work from employees—from foremen to chief executives. In other words, his subject is: what are the best ways of offering more pay for better work, by bigger salaries, bonuses, profit-sharing schemes etc.?

Perhaps, at the outset, we ought to consider two objections against the profit motive itself—although they are not heard so frequently today as they were some years ago. The first is that the acquisitive instinct is at the root of all evil: the source of inequality. In Germany, and other countries of the West, where the acquisitive instinct is allowed full play, the individual is, it is alleged, made selfish and, dazzled by his material prosperity, forgets his obligations to the aged and the poor, the sick and the young. In place of all this, the Socialist ideal is a society in which one stands for all and all for one. In real life, however, where this selfless ideal is enforced you find primitive societies, like the South African Bantus, the yield of whose agricultural system of joint production has remained constant for centuries. The Bantus achieve the Socialist egalitarian ideal: their society is not stratified according to differing incomes. The result is the absence of incentive to advancement and the presence of an equally important incentive to a static economy. The Soviets quickly grasped this point and long ago introduced bonus schemes for workers and high salaries for executives, so much so that the sons of Moscow's top level executives constitute a new "gilded youth"—a term which taxes caused to disappear from current usage in the rest of Europe several decades ago.

But it is not only the Left which minimises the importance for economic advance of the acquisitive instinct. In its interesting and authoritative report, "Growth in the British Economy" (Allen & Unwin, London, 1960), Political and Economic Planning disputes (with certain qualifications) the view that high taxation damps individual initiative. One of Mr Smyth's most useful contributions to this debate is to provide facts and figures which establish that where there is a direct unblurred connection between effort and reward, efforts are greater. He tells us that over the past forty years industrialists have ascertained by experience in applying wage incentive plans in workshops that a chance to earn a bonus of at least 20 percent is needed to achieve sustained high level performance. If the bonus is much below 20 percent, the average employee sees no point in exerting himself. American experience has been that to obtain the best results, top level executives need opportunities to earn bonuses of 40 to 60 percent of their basic salaries; middle position managers need 30 to 40 percent; and supervisory and administrative staff need 20 to 30 percent. As profits increase, a share of the increase goes to the executives. Thus, both shareholders and executives secure increased earnings. A study of fortyone leading companies between the years 1939/50 revealed that those which increased senior executives' compensation by over 80 percent had an average increase in net profit of 360 percent. Where compensation was 50 and 80 percent, the average net profit gain was 230 percent; and where executive com-

pensation was either not increased at all or only up to 20 percent, profits increased only by 118 percent.

BIG SALARIES MEAN BIG PROFITS

A more recent study of executive salaries and bonuses involving seventy-one representative large companies each with 20,000 or more employees showed that the top-paying companies in 15 major industries had a substantially higher return on invested capital than did their lower-paying competitors. The company in each industry that paid its executive group the highest percentage of total payroll earned an average of 17.2 percent in 1956 on invested capital. This return is 40 percent above the 12.3 percent return reported by the average of all companies taking part in the survey. Top-paying companies earned twice as much on invested capital as did the companies with the lowest executive pay in each industry which reported a 7.6 percent return on investment. Further evidence is found in an analysis of the profit increases of these 71 large companies during the ten years ending in 1956. The top paying companies in each industry reported profit gains that were twice the average, and more than ten times the ten year profit increase of the low-paying companies in each industry.

After reviewing all the evidence, it seems reasonable to conclude that a properly designed and administered executive incentive bonus plan tends to increase corporate net income and to benefit shareholders.

In this age of social security, unemployment pay, sickness relief, fringe benefits of all kinds, and pensions, coupled with higher and higher taxation, it is becoming increasingly difficult to induce many men, well settled in comfortable junior positions, to undertake responsibilities, anxieties, and often the public criticism, that go with top level positions. For example, Mr Smyth cites Mr Reese Taylor, Chairman of the Union Oil Company of California, as reporting that his company has actually "had fellows decline promotions," because of high taxes plus heavy responsibilities that seem disproportionate to the financial rewards. "We don't find enough people who want to be president of the company any more." Again Mr Harlee Branch, Jr., president of the giant Southern Company, says: "We have found it difficult, at times impossible, to attract men of superior talent inasmuch as their only hope of reward in our business is salary payments which are so heavily taxed."

It is, of course, true that financial rewards are not the only considerations which inspire men. Others include a sense of responsibility, loyalty to the organisation, the challenge of the job to be done, pride in accomplishment, a chance to participate in forming company policies, easy access to managers above them, good physical working conditions and pleasant surroundings, a sense of mission, and interest in the work itself. These are all honourable motives, and they may, on occasion, induce a man to stay where he is rather than accept a better paid job elsewhere. Nevertheless, these motives must have a solid foundation on which to develop, and that is provided by an adequate financial reward, with reasonable prospects of improvement in recognition of good work.

Mr Smyth's evidence that the various levels of management in the USA are relatively less well off today than before the war is even more true of the UK

ANNOUNCEMENT THE STATE BANK OF INDIA

announced
an INCREASE as from the
1st March 1961
in their

INTEREST RATES

on

Savings Bank Accounts from $1\frac{1}{2}\%$ to $2\frac{1}{2}\%$ p.a.
Savings Bank Deposits from $2\frac{1}{2}\%$ to $2\frac{3}{4}\%$ p.a.

They now have pleasure to announce
the following

FURTHER INCREASES as from 1st April 1961

in their

FIXED DEPOSIT RATES

for six months from $2\frac{3}{4}\%$ to $3\frac{1}{4}\%$ p.a.
for twelve months from 3% to $3\frac{1}{2}\%$ p.a.

and other SHORT TERM DEPOSITS at
competitive rates, which may be ascertained
on application.

The State Bank's 903 offices in the country
are at the nation's service.

where both taxation and inflation have been steeper. The previously cited survey of fortyone US companies over a wide range of major US industries showed that between 1939/50 the percentage increase in gross pay for managerial staff was far less than the increases for white collar and hourly paid workers:

**Percentage Increase in Average Gross Compensation
(Excluding Overtime Pay)**

Top management	35
Middle management	45
Supervisory management	83
White-collar & hourly paid employees	106

Allowing for taxation and the fall in the purchasing power of the £, a man who was earning £1,750 (approx. \$5,000) gross in 1938 in the UK needs to earn £7,740 (approx. \$221,000) today to recapture his 1938 purchasing power. An American who earned \$5,000 in 1938 would need \$11,744 (approx. £4,187) today to equal his prewar standard of living. In both countries, the increase in taxes has hit the higher-income levels disproportionately harder. As a result, in the USA when tax increases and inflation are allowed for, managerial staff has lost ground in comparison with prewar US white collar and hourly paid workers as follows:

**Percentage Change in Average Gross Compensation
Adjusted for Increased Taxes and Living Costs**

Top management	-59
Middle management	-40
Supervisory	-13
White-collar and hourly paid employees	+3

It is interesting to note that despite their substantial monetary rises, US wage-earners are only 3 per cent better off in real values than prewar.

Whether you regard this trend as good or bad depends on your social philosophy, but from the point of view of paying salaries and finding incentives to best performances, it does create problems.

The basic fact is that in a modern dynamic industrial economy, as opposed to a primitive, static agricultural economy, unless you pay rewards that offer real incentives, you will not get men to take real responsibilities. This poses a particularly difficult problem in the higher executive levels. Where, as in so many countries, taxation is precipitously steep at the higher levels, such big increments often become necessary to secure any appreciable addition to the net cash in an executive's pocket after taxation that adequate salaries can become a burden on any but the biggest companies.

In the USA, for example, a ten percent rise of \$500 on a salary of \$5,000 a year, leads to a tax of 19.8 percent on the \$500. A rise of \$20,000 on a salary of \$200,000 leads to a tax of 78.3 percent on the \$20,000. In the UK today, tax is at the rate of 88.7 percent in the top bracket. Such steep taxes hit especially hard companies which have to send executives to manage overseas enterprises. Not only are these outsize salaries apt to be a burden, but they often attract strong criticism from uninformed people who argue that "no man is worth Rs 150,000 a year." Next week, I will comment on some of the solutions of these problems offered by Mr Richard Smyth.

The European Scene

GATT'S CRISIS

From Our Special West European Correspondent

PARIS, March 25.

SEVERAL European newspapers lately have spoken of a "crisis in GATT" and there have even been polemical articles, possibly inspired officially, blaming one country or another for the present near-breakdown in tariff negotiations in Geneva. These reports are considerably exaggerated but it is true that GATT has run into problems of an immense complexity and is making precious little progress toward resolving them. Negotiations that were scheduled to be completed months ago have dragged on interminably, meetings are being adjourned sine die, and more important matters that were due to be taken up this spring have had to be put off indefinitely. Although the questions involved are of vital interest to traders everywhere, their intricacy discourages public curiosity and it is probable that events are being followed closely only by a small number of experts—and even they have lately had to get an electronic computer brought across from the USA to help them unravel the mass of calculations in which they have got lost.

Yet the issues can be described fairly simply, in their bare outlines. GATT (the General Agreement on Tariffs and Trade) is the international trade body that survives from the Havana Charter of 1948, which was never ratified. It is concerned with reducing obstacles to international commerce, mainly by providing a sort of market-place where nations agree to reciprocal reductions in customs duties. GATT, unlike the World Bank or the United Nations, has virtually no permanent executive or secretariat of its own, and thus only enjoys full existence when member-nations meet in Geneva to bargain about duties. The usual procedure is that the two or three countries most interested in trade in a certain article (e.g. the biggest exporter of shoes and the main importers) negotiate a reduction of duties or agree that duties will not be changed for three years (this is called "consolidating" a tariff), and this is then automatically extended to the other members of GATT by means of the most-favoured-nation clause which ensures that a concession made to one member is applied to all the others.

Though little known, this procedure has produced some quite spectacular results. At the first three tariff conferences (Geneva 1947, Annecy 1949 and Torquay 1950-51) about 58,000 customs duties were reduced or consolidated and this was no mean contribution to the expansion of world trade. Another conference in Geneva in 1956, aimed at a universal reduction of world tariffs, failed, but these problems were to be taken up at the Fifth International Tariff Conference that began last September. Meantime new developments emerged which altered the whole context of the GATT negotiations: one held out a great hope, and the others complicated matters considerably. The hope lies in the Dillon Proposal, put forward by the man who has since become the American treasurer. The U.S. Congress has authorised the President to grant by decree reductions in American tariffs going as far as 20 per cent, on condition naturally of reciprocity. This required a multinational conference, at which the USA would trade its tariff-cuts for concessions made by others, and Mr Dillon suggested

such a conference as long ago as 1958. It has not yet begun, but the powers granted by Congress expire on June 30, 1962; since the horse-trading will take very many months, it is urgent that the "Dillon Round" should begin in Geneva by September this year. If the opportunity is missed, the power to grant U.S. duty reductions will revert to Congress and, seeing that the USA's trading position has changed since Congress wrote its blank cheque to the White House, duty reductions would then be much harder to obtain.

The complications that have appeared are, of course, the constitution of regional groups such as the Common Market, the Free Trade Zone and the Latin American ventures in the same direction. These entail discriminatory duty reductions among their participants, which are not extended to the other members of GATT. The rules of the association foresaw the possibility of customs unions and free-trade areas (the distinction between the two being that the former has a uniform external tariff and the latter has not) but stipulated that, to accord with GATT, they had to be real customs unions covering all the products traded between their members. Now the British-led EFTA excludes agricultural produce, so it is not a legal free-trade area as defined in the charter. The Common Market includes agricultural produce but does not simply abolish duties and quotas; it proposes a "joint agricultural policy" for its six members. So its case is doubtful and some members of GATT argue that it is illegal. GATT has been unable to settle this juridical debate and has just postponed a decision. The Common Market, however, appears to have been accepted de facto, but a battle is yet to be fought about EFTA.

The really serious problem concerns the Common Market's external tariff. Since this is to be the arithmetical average of the five national tariffs (five only, because the Belgium-Luxembourg union has one tariff), it means that some tariffs must go up while others come down. There is no trouble about those that come down; GATT is there to encourage that. But many of those that are due to go up, mainly West German and Dutch duties, have been "consolidated" i.e. those nations have agreed in GATT not to raise them, or at least to give adequate compensation if they do so. Now of course the Common Market countries (who have taken a common line and sent a joint committee of experts to negotiate in Geneva) argue that what outsiders lose when a German duty goes up is already adequately compensated for when a French or Italian duty comes down. This, the outsiders flatly refuse to believe. One country, say India, might lose a great deal when a German tariff increases whereas it gains nothing when a French tariff on the same article falls because France does not import that article, or not so much of it, or imports it from elsewhere; thus India could demand some compensation.

That was where the electronic computer came in—it was asked whether a 5.4% fall in the Italian tariff on Burmese fishing rods compensated for a 2.8% rise in the German tariff on Bolivian straw hats. Not surprisingly very little progress has been made, because this sort of problem is insoluble. The Common Market countries are sticking rigidly to the doctrine that the arith-

metic average offers as many concessions as it entails losses, whereas other delegations, notably the British, are insisting on a point-by-point proof of this, over a range of thousands of articles. As usual when international conferences get deadlocked, allegations of ill will begin to be made. The Swiss roundly blame the French for the whole trouble, though France is not negotiating at Geneva: it is the Common Market as a unity that is dealing with the other members. In turn the French accuse the British of a diabolical scheme: they are deliberately drawing out the interminable squabble about the Common Market's external tariff so that the Dillon negotiations cannot be completed in time, because London fears the results for British industry of a universal 20% duty cut. No evidence is available for this improbable suggestion.

It is curious that GATT has got bogged down in the minor question of infinitesimal disadvantages caused by the Common Market's external tariff when Mr Dillon is waiting patiently with that 20% cut in U.S. tariffs. The Common Market countries have already offered to cut their external tariff by 20% if the Dillon plan succeeds, so anything that might be lost by an overseas country because of the introduction of that external tariff would soon be made up by a fall of one-fifth in its level. The discussions that have been dragging on inconclusively for months in Geneva no doubt have their importance but the uninitiated will find it hard to believe that it exceeds that of a substantial and universal reduction in duties.

It would be too strong to say that GATT had broken down, but it has certainly shown itself incapable of dealing, so far, with the problems before it. This is regrettable because GATT was on the verge of becoming a much more important and influential organisation than it has been to date. In the long period of payments-balance difficulties in Europe, GATT's rules could not be applied literally since every country was allowed to practise protectionism to safeguard its currency. Now, all the major European countries have foresworn that escape-clause; their currencies are restored and they have promised the IMF to impose no new restrictions on convertibility, so GATT could hope to see its rules followed to the letter. Moreover the OEEC, which was always a technical infringement of GATT rules, is being wound up and the successor OECD has indicated that it will no longer deal with tariff matters but will hand them over to GATT. Since the USA and Canada are full members of the OECD, this means that GATT would receive total jurisdiction over 70% of the world's trade, that being the share of the European members of the OEEC plus North America. It also means that the famous problem of the trade-war between the Six and the Seven would be settled in GATT and not inside the OECD.

It will be no advantage to hand these questions over to an organisation that is deadlocked over smaller matters. GATT certainly needs some structural reforms, for it is altogether too "democratic": it has no "security council" and no permanent executive, so it can be held up over relative trivialities and tends to lose the thread in between sessions. Confidence in the organisation has been shaken and will not be restored until it begins, in good time, the negotiations suggested by the Americans and which could result in a one-fifth reduction in duties all around the world.

design your next wiring job in
covered aluminium conductors!

ALIND ALL-WEATHER
Weatherproof wire.
Polythene-insulated, braided and weatherproof - compounded aluminium conductor for outdoor weather-proof applications.

ALIND KER-AL-LITE
Building wire.
Polythene insulated and polyvinyl chloride (PVC) sheathed aluminium conductor for indoor power and light wiring. (in place of conventional CTS and TRS wire)

Our West German Letter

DR. ERHARD ON INDIA

[Dr. Gabriele Wulker, our Special Correspondent in Bonn, interviewed Dr. Erhard recently. An edited version of the interview is published below. —Ed.]

QUESTION: Public concern is frequently being expressed in India that the Federal Republic would be more interested in Africa than in Asia. However, in view of the Third Five-Year Plan, India hopes for decisive support from the Federal Republic. It would be of interest to us if you could give us some details of the supporting measures you intend for Africa and Asia.

Answer: In awareness of the special difficulties of the developing countries, the Federal Republic endeavours at present to considerably increase its contribution for the development of a productive and sound economy in these countries. On account of its size and population, and its importance for several other reasons, India has so far received greater support. This aid will be increased in the future. May I remark in this connection, that the Federal Republic has contributed to the Second Five-Year Plan an amount of \$100 million and that it intends to make available further amounts for expansion of Rourkela Steelworks and for the realisation of the Indus-Water-Project, and also the technical assistance.

The Federal Government will contribute to India's Third Plan as far as its financial resources permit. The special interest of the Federal Government in India's problems was clearly demonstrated by the Federal Minister Wilhelmi, who recently visited India on behalf of the Federal Government. He announced a German contribution of DM 400 million for the first year of the Third Plan. The Federal Government furthermore endeavours to promote private German investments in India. I am fully convinced that the Indian economy will particularly profit from the assistance provided by the private enterprises. Under these circumstances the preference of Africa is out of question. It is true that in the past few years specific problems were posed by the newly independent States. They urgently need technical assistance and capital aid. This, however, does not mean that aid to India will not be intensified.

Question: Is the Federal Republic particularly interested in giving support to the developing countries through the World Bank or directly through bilateral or multilateral channels?

Answer: The Federal Republic has in the past given multilateral as well as bilateral aid. The demand for capital in the developing countries is nowadays so great that both the means are necessary on a parallel line, supplementing each other.

The multilateral aid has proved to be an important instrument for the accumulation of capital from many sources to finance greater projects, which would exceed the possibilities of one single country. Whereas, in favour of bilateral aid it is frequently held that thereby closer economic and cultural relations between donor and receiver country may be created, particularly if they lead to co-operation on the basis of true partnership and mutual understanding. This is the goal of the German aid.

I believe that under the leadership of the World Bank the difference between bilateral and multilateral aid will be eliminated. Just to give some instances I may say: The Indus Water-Project and India's Third Five-Year Plan. In both the cases the special needs were confirmed multilaterally. The execution will, however, be reserved to bilateral agreements. This does not exclude that in future, for certain spheres of projects bilateral and for other spheres, multilateral aid will be appropriate. This depends on the specific needs of the receiver-country.

Question: India needs qualified labour in indus-

plans of the West-German Government, to send for some years highly qualified labour to India?

Answer: Qualified experts are sent to India whenever the Indian Government sends its requirements. The period of their stay depends on the job to be executed, which may be expert opinions or an extended activity as a teacher or as an adviser. The German training experts for the prototype and training workshop at Okhla and for the technical school at Madras are important instances. The advisory group for the Indian coal-mining as well as a team of about 175 experts for Rourkela Steelworks are further examples. This German team will pass on their experience with modern techniques to the Indian technicians of the Hindustan Steel Ltd. In the future too the Federal Government will do its best to meet the Indian demands for German experts.

Question: Quite a number of Indian students and trainees have come to Germany. They acquire knowledge in the restricted fields of their studies or technical training. Cannot the firms and universities arrange that they not only gain special knowledge but also come into close contact with the German culture?

Answer: This question is easier to solve for the Indian students themselves. Training at the universities itself entails sufficient contact with the German cultural life. Moreover the students have the opportunity of participating in the cultural events conducted at the universities. In his respect the "German Academic Exchange Service" always provides assistance. The trainees who spend most of the day in workshops and factories find it difficult to come in contact with the German life. For them various facilities are available. The "Carl Duisberg Gesellschaft" may be named first, which takes care of the foreign trainees in the Federal Republic and tries to make various arrangements for them. The "German-Indian Society" in Stuttgart and the Indian Institute in Munich follow the same line. The "Carl Duisberg Gesellschaft" maintains the so called foreign circles or contact centres in cities and towns. They introduce the foreign trainees to the German cultural life by means of cultural events, e.g. musical evenings, theatre, excursions or discussion groups. Furthermore a seminar is held once a year for the trainees invited by the Government and are offered visits to theatres, film shows, etc.

Larger firms are on their part trying to foster their foreign trainees in such a way that they can establish contacts with the cultural life. In general, it depends more or less upon the person himself to endeavour to know the German culture. Nevertheless wide range of possibilities is offered to all foreign students on a voluntary basis.

Question: What facilities have been created for the Germans who go to India to introduce them to the social and cultural structure of the country. Can the experts in one way or the other be induced to make use of these facilities?

Answer: Facilities have been provided to introduce the German experts going abroad to the social, economic and cultural structure of the particular country. Various institutions have taken up this task: The "Deutsche Stiftung für Entwicklungsländer" in Berlin Tegel, the "Haus Rissen" in Hamburg and the Industrial School for Teachers in Solingen. The last one trains German teachers at industrial or technical schools for their future tasks at technical schools in developing countries.

Learning from the experience which the German experts could hitherto gather in developing countries,

(Continued)

Economic Report from the U.S.**FOREIGN AID MESSAGE**

WASHINGTON, March 22.

THE special foreign aid message President Kennedy has sent to the U.S. Congress is proof of the fact that new challenges bring forth new responses. For what the President has proposed is an all but complete revamping of the U.S. programme of aid to developing lands—not so much in the monetary totals involved as in the direction and administration. Implicit is a vast co-operative effort by all free nations to raise living standards and promote economic and social progress throughout the developing areas of the world. This would require programmes of self-help by the developing nations, as well as programmes of enlarged and co-ordinated assistance by the developed nations. It would involve the establishment of long-range goals and a common undertaking to meet those goals, with each nation's contribution related to the contributions of other to the precise needs of each developing land.

Out of this, the 1960's could emerge, in Mr. Kennedy's ringing words, as a "decade of development", in which many developing nations could make the transition to self-sustained growth. Achieving this, in his view, will require a "new partnership" in which each free nation will assume a responsibility proportional to its means. To help bring about these ends, the President is proposing a comprehensive reorganisation of the U.S. aid effort, under one administration, which would report to the Secretary of State, and would embrace such now independent operations as the International Co-operation Administration (ICA), including its technical assistance functions; the Development Loan Fund; the Food for Peace Programme; certain lending activities of the Export-Import Bank; the New Peace Corps; and other related services. This newly proposed over-all aid agency still has no name. But that detail is far less important than the improvements it could work in the aid effort. For it would enable one administrative body to draw upon funds from different sources to achieve the kind of development progress that is best suited to the needs of individual recipient countries. In making it possible to co-ordinate the various types of aid needed in each developing land, the new agency would enhance the effectiveness of the entire foreign aid effort. There has been up to now no such U.S. instrumentality for laying out and administering co-ordinated national and regional aid programmes in this manner.

The nature of the individual country programmes would depend in large measure, of course, on the needs of those countries and the steps they take to accelerate their own economic and social progress. Development of standards will be important in this regard, as the developing lands will have to institute their own reforms and so provide a basis for effective use of the assistance provided. But organisational machinery is only one step. There also must be something to administer. And in this regard, President Kennedy is proposing a significant shift in the kind of assistance the United States will be offering. This shift does not involve in the first instance any changes in the total amounts of U.S. money to be made available. The \$4,000 million President Eisenhower requested for foreign aid in his last proposed budget—that for the 1962 fiscal year beginning next July 1—is the same amount President Kennedy is asking for now. There would, however, be important changes within that amount—changes that reflect a growing emphasis on economic assistance, particularly of a long-range nature. Where Mr. Eisenhower had asked for \$1,800 million for military and \$2,200 million for economic aid, Mr. Kennedy is proposing \$1,600 million for military and \$2,400 million for economic assistance. Moreover, Mr. Kennedy is further proposing that the military

assistance figure be incorporated within the budget of the Defence Department, rather than that of the new aid agency, thus emphasizing the economic side of the U.S. assistance effort.

Within the economic aid effort, there is another highly significant change. This is the proposal that development assistance take the form of long-term loans up to 50 years in maturity, and carrying low interest or no interest charges, depending on circumstances. These would be financed not through regular annual appropriations by the U.S. Congress, but through authority to borrow from the U.S. Treasury. As currently contemplated, that borrowing authority would range up to \$1,600 million for each of four years subsequent to the 1962 fiscal year. With \$900 million being asked for long-term development assistance in fiscal 1962 this would make for a long-term development assistance total of up to \$7,300 million over a five-year period. This long-term borrowing authority is considered in many ways the key to the development assistance effort. For it would enable the United States to schedule development aid on a realistic basis, one that is related to the long-term self-help programmes of the developing nations themselves. It thus would get away from the short-term "crisis" approach to development assistance, and would make for a more efficient aid programme both here and abroad. It should be noted that emphasis will be on dollar rather than soft-currency loans. But the length of the loans and the ease of the repayment terms are considered the really important factors. The expectation is that as developing lands make the kind of progress that is envisaged, the repayment of easy-term dollars loans will work little hardship on them, and indeed will help give them a greater sense of contributing to their own progress. Other parts of the aid programme, however, would continue to be subject to annual Congressional appropriations. These, such as technical assistance and other forms of grant aid, do not usually require lengthy planning, and often are given in response to current and immediate needs which may change from year to year.

DR. ERHARD ON INDIA—Contd. from page 865

the German experts who now go to these countries are increasingly recognizing the advantages of participating in preparatory courses at the institutes mentioned above. It can be expected that the preparatory training will increase in the Federal Republic within the next years thus deepening the knowledge of your great and ancient country—India.

Question: The Federal Republic has become known in India especially by the steel mill at Rourkela which was constructed in co-operation with the Hindustan Steel Ltd. Do you think that the co-operation between the Federal Republic and India can also be intensified in the fields of small and medium sized industrial enterprises?

Answer: The appropriate distribution of factories and workshops of all sizes within a country is to my opinion an inevitable prerequisite of a sound economic social and political system. Nearly each great enterprise needs a number of small-scale industrial units which play an important role as ancillaries.

We will try to find ways and means for a closer co-operation in this field. The Federal Government at present is investigating whether the national developing banks should be supported to intensify the small and medium-sized industries. Moreover the means of information and credit facilities for those German enterprises who want to take part in the respective projects in developing countries will be improved.

POPULATION GROWTH AND ECONOMIC DEVELOPMENT

IT is a matter of gratification that the preliminary data in respect of the 1961 census have been released in remarkably short time. The provisional summary contains changes in population, literacy and sex ratio in the Indian Union during the last decade. The most significant, though not quite unexpected, revelation is that the population of the Indian Union at present is 438 million against 361 million in 1951, the annual rate of increase being around 2.15 per cent. India's population has overshot all the previous projections for 1961. On the basis of the census results of 1951 when the annual rate of increase was placed at 1.33 per cent, probable population by 1961 was envisaged at 407 million. Messrs. Coale and Hoover of the Princeton University, whose estimates were considered fairly on the higher side, placed the population by 1961 at 424 million. Towards the end of 1959, the Expert Committee of the Planning Commission estimated it at 431 million. The count at 438 million now, therefore, exceeds all these estimates.

To explain this rate of increase, an analysis of the existing death and birth rates is, of course, necessary. During the decade 1941-51, the death rate was roughly 27 per cent, while the birth rate was 40 per cent, so that the net annual increase worked out to 1.3 per cent. In the absence of any precise data for birth and death rates at present, we can assume that the birth rate might have remained stationary or increased only marginally. The major change, it appears, has come about in respect of the death rate which, evidently, is the result of improved levels of nutrition and medical care in the urban as well as rural areas under the impact of India's two plans. At the time of the finalisation of the first as well as the second Plans, concern was expressed in respect of population increase. But the steps taken to control it hardly touched the fringe of the problem. In the result, an annual rate of increase of the order of 2.2 per cent by 1961 has emerged.

How is this higher rate of increase in population likely to affect the country's economy? In the first instance, it has meant a lower rate of growth in the per capita income than was originally assumed. This assumption needs downward revision by reason of the

fact that the assumed rate of increase in national income is not going to materialise and will decline by 5 per cent to 20 per cent. It was believed that the national income during the Second Plan period increased by about 20 per cent. Taking into account the fact that the rate of growth in population has been around 2.2 per cent annually, the per capita income increased during the Second Plan period just by about 9 per cent. The revised estimate of the rate of increase in per capita income was placed at 12 per cent.

Moreover, the Planning Commission will have to revise certain targets to be achieved during the Third Five-Year Plan. This will apply especially to foodgrains output and employment—both of which are directly connected with the country's population. In the table below have been examined the possible changes in the target for the output of foodgrains by 1965-66 which actually was based on the assumption that by the end of the Third Plan the country's population may be around 480 million. In the light of the latest census data the population may rise to 490 million by 1965-66. The consumption requirements on the basis of 18 ounces of foodgrains per capita (15 oz. of cereals and 3 oz. of pulses per capita) now work out to 86.7 million tons instead of 84.9 million tons. Similarly a provision of 13.9 million tons will have to be made for seed, feed and wastage. A minimum stock of 1.5 million tons, as assumed earlier, will require the total output to be nearly 102.1 million tons against a target of 100 million tons. Thus the Planning Commission has to make provisions for an additional food grains output to the extent of 2 million tons to adhere to the accepted level of nutrition.

FOOD REQUIREMENTS—1965-66

	Original estimate	Revised estimate
Population (in millions)	480	490
Food requirements		
(i) For consumption (in millions)	84.9	86.7
(ii) For seed, feed and wastage (million tons)	13.6	13.9
(iii) For stocks (million tons)	1.5	1.5
(iv) Total (million tons)	100.0	102.1

The Draft Outline of the Third Plan, makes the disconcerting disclosure that the backlog of unemployment at the end of the Second Plan is likely to rise to 7.5—8 million as against a backlog of 5.3 million at the end of First Plan. It has been estimated that the new entrants to the labour force during 1961-66 may be around 15 million. Now, with a higher estimate of total population, the new entrants are likely to be more than assumed earlier. In this connection it may be added that the average expectation of life in India too has now increased to 45 years as against 32 years overall at the time of the previous census. Thus the new entrants are likely to be 15.5 million in the light of the latest census data as against the Planning Commission's estimate of 15 million, raising the total number of the unemployed to 23.0 million or 23.5 million. This gives an increase of 0.5 million as a result of the higher rate of population growth. The draft outline of the Third Five-Year Plan provides that employment outside agriculture might be about 10.5 million and the absorption in agriculture itself might be around 3.5 million. Thus the Plan promises employment only to the new entrants and that too not to a full extent. The backlog of unemployment at the end of the Third Plan may be around 9 to 9.5 million. The Planning Commission may have to make certain alterations in the pattern of investment in favour of labour-intensive projects which implies postponement of some heavy capital intensive projects.

The density of population, as shown in the table on page 869, for the country as a whole has increased from 316 in 1951 to 384 at present. Areas of actual increase are fairly well distributed all over the country, though there are appreciable variations in the rate of growth from State to State. For instance, in Kerala where the level of literacy is the highest in the country, population increased at the rate of 24.6 per cent, while in Madras the increase was 11.7 per cent. This wide difference can only be explained when complete data in respect of other items are received. The variations are not necessarily due to natural increase in population. For instance, two States where the rate of increase was more marked are Assam with 34.3 per cent and West Bengal with 32.9 per cent during the decade. In Assam the increase beyond the average for India may be reasonably explained by immigration of labour

particularly in plantations, mines, railway and road projects. Similarly, the increase in West Bengal can be explained by the influx of displaced persons from East Bengal and Tibet and a perennial immigration into the city of Calcutta and the adjoining industrial regions. A spectacular increase of over 50 per cent was recorded in Delhi which again was due to many-sided expansion of the nation's capital city. At present 17.84 per cent of the population is living in the urban areas which shows a fractional rise over the figure of 17.38 per cent in 1951. The trend towards urbanization is most likely to be accelerated during the period of the Third and subsequent Five-Year Plans which will place an increasing accent on industrial expansion.

There is an unmistakable warning in the rate of net population growth as disclosed by these preliminary census data for 1961. This rate has surpassed all the other estimates made in this behalf. While India is struggling with the hard problem of rupee as well as foreign exchange resources for development, the higher rate of population increase will detract from the fruits of investment flowing from the development programmes because the growing population is bound to make its adverse impact on each sector of development. There is no way out except through a firm and effective policy of birth control. In the years to come the declining death rate will add to the compulsion of birth control. A clear policy for family planning must be enunciated now and implemented with determination particularly in the rural areas which account for as high a proportion as 82.16 per cent.

DECENNIAL GROWTH OF POPULATION

THE BUSINESS WORLD

Banks' Problems in 1960

By CROESUS

THE valedictory address of Mr. C. H. Bhabha, who laid down his office as Chairman of the Indian Banks' Association after six years, was a comprehensive survey of the problems and progress of Indian Banks during the year 1960, generally, and a critical appreciation of the policies of the Reserve Bank and the State Bank of India, in particular. The criticisms of Mr. Bhabha are such that they require to be looked into immediately by those concerned. It is possible to misunderstand some of them, but, as Mr. Bhabha made it very clear at the outset of his speech, "The Indian Banks' Association has not failed to be critical of official or semi-official policies or actions which it genuinely believes could not but lead to unnecessary hardship to banks in fulfilling their mission for the community as a whole." It is necessary to do this, by reason of the fact that "Banking is a highly sensitive industry which has to deal with depositors' monies and which is based essentially on public goodwill, confidence, and credit." As the Association has rightly opened, "what is essential for a faster growth of banking in the country is a cool consideration of its importance as well as of its contribution to the economic prosperity and progress of the nation." Also, to quote Mr Bhabha, again, "a good deal of liberal foresight and practical approach" is the prime need of the hour to foster the healthy growth of Indian Banking.

It is against this background and the banking trends witnessed during 1960 that one should examine the criticisms of the out-going I.B.A. Chairman.

To take banking trends first. These may be briefly recalled here. First the year 1960 witnessed a reversal of the trends in recent years in regard to both the growth in deposits and the composition thereof. As Mr. Bhabha stated, "the total deposits of the scheduled banks fell from Rs. 1,828 crores on 25th December, 1959 to Rs. 1,760 crores on 30th December, 1960, showing a fall of Rs. 68 crores." It is necessary to digress here a little to point to the discrepancy between these figures, which are more or less corroborated by those published in the Weekly Statistical Supplement to the Reserve Bank of India Bulletin, and the figures contained in para 7 of the Report of the Central Board of Directors of the State Bank of India for 1960. According to the latter, "the total deposit liabilities of scheduled banks continued to expand, though at a slower pace, till about August, when they aggregated Rs. 1,966.0 crores. Thereafter, they declined and stood at Rs. 1,891.9 crores in December, 1960. Over the year, total deposits of scheduled banks increased only by Rs. 64.8 crores, as compared to the expansion of Rs. 253.6 crores in the previous year. A third source—the latest issue of Tata Quarterly—gives still different figures. According to it, the total deposits, which were Rs. 1,887 crores in January, 1960 rose by Rs. 124 crores to Rs. 2,011 crores in August and declined to Rs. 1,921 crores in December, thereby registering a net decline of Rs. 90 crores. The position, therefore, according to this source, is a net improvement of only Rs. 34 crores in the total deposits of scheduled banks over the year 1960. A layman may

be excused if he says he is unable to decide as to which of these three figures he should accept as correct. A clarification of the position and the reasons for the discrepancy, either by the I.B.A. or by the State Bank of India, would be appreciated.

As regards the composition of deposits, time deposits, which were increasing faster than demand deposits in the last two years ceased to do so and the position was actually reversed. The decline in time deposits was also faster than that in demand deposits. One would have liked to know the reasons for this from the IBA Chief, but he dismissed the subject by saying that the matter must be receiving the attention of the central banking authorities.

If the upward trend in deposits slackened, or was actually reversed, scheduled banks' advances continued their upward trend to cross the Rs. 1,000-crore mark and register an increase of Rs. 166 crores over the year. This was only to be expected with the increase in the general tempo of economic growth. But this has given rise to problems consequent to the undue strain created thereby on the total resources of the banking system. It is a moot point whether the remedy for such a situation is to curb credit or to increase deposits. Of course, it is easier to curb credit as the Reserve Bank attempted to do in a number of ways, such as placing restrictions on the growth of bills discounted and impounding new deposits. It is for the economic historian of the future dispassionately to examine the justification or otherwise, as also the effectiveness or otherwise, of the policies of the Central Banking Institution. But one thing that must be said to the credit of the Reserve Bank is that, from the beginning, it has viewed these restrictions as flexible and, in fact, when the position in the money market deteriorated it was not slow to withdraw most of the restrictions. There are, however, still some, like the measures relating to the rediscounting of bills and advances against securities, the effects of which do not appear to have been watched with sufficient care. Accordingly, Mr. Bhabha's warning in this connection, especially about the long-term impacts of these measures in particular on the Government securities needs to be taken note of by the authorities. Surely, with its large borrowing programme during the Third Five-Year Plan period, they cannot afford to be complacent about what happens to the gilt-edged market.

A very pertinent point was made by Mr. Bhabha when he referred to the applicability of certain amendments to the Companies Act to banking companies. It is not clear why, when there is a separate Banking Companies Act, some sections of the Indian Companies' Act should be made applicable to the banking companies, thereby creating an anomalous situation. When a separate legislation exists for any sphere of economic activity, it pre-supposes that there are certain problems peculiar to them. The instances quoted by Mr. Bhabha only serve to confirm the need for keeping the two legislations distinct.

Equally anomalous is the differentiation in the application of the banking legislation as between the State Bank of India, which is a semi-autonomous corporation, and the other banking companies in the country. If, as in the other spheres, it is being increasingly recognised that the same code should apply to enterprises in both the private and the public sectors, there is no reason why this dichotomy should prevail in the field of banking. What is sauce for the goose could be just as good sauce for the gander.

Perhaps the most serious charge levelled by Mr. Bhabha against the State Bank is the unfair method alleged to be employed by the State Bank to divert business. What is intriguing is that, even when its attention was drawn to these unfair methods, the Reserve Bank should have remained passive, which can only lead to either of two conclusions, namely either that the allegation is not justified or that the Reserve Bank is too much interested in the State Bank to take a dispassionate view and mete justice. In any case, it is high time that the whole question of the relations between the State Bank and the other commercial banks in the country was thoroughly gone into. Some might have thought that after PL 430 deposits with the State Bank were transferred to the Reserve Bank, there was hardly any cause for the other commercial banks to complain against the State Bank, but it would appear from the address of Mr. Bhabha that, by virtue of its being the agent of the Reserve Bank, the State Bank enjoys certain facilities which place it at a relatively more advantageous position than the rest of the commercial banks, and this naturally vitiates healthy competition. The sooner the feeling that the State Bank has been adopting a deliberately unhealthy attitude towards other banks is removed, the better it would be for the sound growth of Indian banking.

With the narrowing of the profitability of the banking industry as it is situated today, it is but natural that the attention of Indian bankers should turn to productivity. A good deal of Mr. Bhabha's address was devoted to making out that, whereas the average earnings of the subordinate staff in the banks had increased perceptibly, there was no commensurate increase in their outturn. The relatively lower amount of work put in by the bank employees of India, he said, was partly due to the larger number of public holidays in India compared to other countries, as also the smaller number of hours of work for bank employees in this country compared to that of their colleagues in some advanced countries and the

resulting shorter output of work. While entirely endorsing Mr. Bhabha's complaint about the relatively inadequate quantum of work put in by our bank employees these days, I do not think it is right to grudge them the increase of even 24 per cent in their overall earnings over the past few years in the context of the prevailing inflationary conditions.

Next, Mr. Bhabha welcomed the move on the part of the Reserve Bank to introduce the deposit insurance scheme despite the heavy burden imposed by it on well-managed units, if only because it may be expected to go a long way towards inspiring public confidence in Indian banking. But he was critical of the Central Banking Institution and felt that with the wide power enjoyed by the Central Banking Institution, it should not have been difficult to give good guidance and keep strict vigilance to prevent misdeemeanours on the part of the erring banks.

I was happy to note that Mr. Bhabha shares the view that it is a sound thing for banking companies suitably to strengthen their capital structure so as to bring their capital and reserves in line with their growing deposits. Of course, as he said, this would be possible if the banking industry also prospered in line with the others. If, as the I.B.A. Chairman averred "despite the faster planned economic development of India, the benefits reaped by Indian banks have not at all been commensurate with their untiring efforts to prove their worth under all conditions of stress and strain and to support official programmes and policies" it is certainly worthwhile examining the reasons for it, and this is as much the responsibility of the I.B.A. as of the Reserve Bank.

Finally, in regard to the regulation of interest rates on deposits, while Mr. Bhabha claimed that the gentlemen's agreement has worked well and strengthened the banking structure, he was not categorical in claiming the superiority of this system to the system of official regulation as in the U.S.A. His remark that "by and large, both these methods have proved wholesome and have in no way affected adversely the growth of deposits" is like the famous pronouncement of Sir Roger De Coverly that "much might be said to both sides," unless, of course, one has to infer that, in making the suggestion that "the present system in India should be suitably improved so as to be helpful to the banking industry to fulfil its mission," he has definitely voted in favour of the system of gentlemen's agreement among banks in India.

Business Notes

Industrial Policy

DOCTRINAIRE PREFERENCE OR PRAGMATISM?

THE PRESENT industrial policy of the Government establishes beyond doubt that the powers-that-be are "blinded still, whether for the country's good or bad, with doctrinaire preference with regard to the means to be selected in exploiting the country's national wealth," to quote Mr C. H. Campbell, President of the Bombay Chamber of Commerce and Industry. As he told the Chamber's annual general meeting, last week, in his valedictory address, there are many instances that one can quote to substantiate this charge which one hears so often from all quarters of the country.

In order to illustrate his point, Mr Campbell chose a rather controversial subject of the day—refining of oil in India. The existing refining capacity in India, he said, is six million tons per annum. As against this, in 1966, perhaps nearly 14 million tons would be required, leaving a gap of eight million tons per annum. One would have thought that, in view of this, the authorities would do everything to step up the refining capacity. But what the retiring President of the Bombay Chamber of Commerce stated at the meeting does not seem to bear this out. Thus, Mr. Camp-

bell said that a major oil company had offered to expand its capacity to approximately four million tons within 18 months and even complete lubricating oil manufacturing complex of between 60,000 and 1,00,000 tons annual capacity within a further year. According to him, this expansion scheme was to be entirely financed by the company with no foreign exchange requirement from the Government; additionally, there was promise of a net saving in foreign exchange of Rs. six crores per annum. All this would have materialised by 1963, had early sanction been given to the proposal. But then, to date, no sanction has been forthcoming. As Mr. Campbell observed, "unless governed by a doctrinaire approach, it is difficult to appreciate the reasons for the delay in acceptance of such an attractive offer at a time when the country is hard pressed for foreign exchange."

Mr Campbell, however, also noted, at the same time, that there has been a slight change in the Government's policy with regard to the coal industry. He accordingly complimented the Government on its good pragmatic sense to encourage private collieries to increase production by allowing them to mine areas adjacent to them as well as non-contiguous or proximate areas which they had not been allowed to mine

before. A similar change in Government attitude has taken place in the case of fertilizers also.

While Mr. Campbell characterised the recent declaration by the Union Commerce and Industry Ministry that industry would be allowed to exceed the capacity licensed under the Industries (Development and Regulation) Act in so far as this could be done, by using indigenous raw materials and spares and incurring no further liability for foreign exchange, as "another triumph for pragmatism," he expressed the fear that the Government might have already licensed capacity which cannot be serviced by the foreign exchange that may be available in the near future, and pleaded for caution in the licensing of any further fresh capacity. He was right in remarking that "it would be a severe blow at the confidence which India is increasingly inspiring abroad, if new investors, whose projects are licensed, and who are given import licences for raw materials and parts to start with, were to find, after a year or two, that production was running well below installed capacity for want of either or both." Accordingly, he welcomed the appointment of a special committee to recommend a system of priorities in imports and the statement that a special group of officials was looking into the country's raw material requirements.

Alkali and Chemicals

FORWARD MARCH

FROM THE SPEECH of Mr. J. M. Lal, Chairman of the Alkali and Chemical Corporation of India Limited, delivered at the twenty-fourth annual general meeting, it is apparent that the Company is successfully marching forward in production, sales and its future plans. So far as the production of polythene granules is concerned, it is creditworthy that, although the installed capacity is only 3,500 tons, actually an output of 4,000 tons has been achieved largely on account of scientific study of the processes and increased efficiency in production. Paints are faring no less better. The increase in paints production is also due to the methodical and scientific study of the working of the plant. The record for sales is equally good. The Company's sales touched the figure of Rs. 5.4 crores in 1960 as compared to only Rs. 3.4 crores in the previous year. The noteworthy feature in the sales programme is the services provided by the Imperial Chemical Industries Technical Service Organisation to all its customers to help them use the products economically and with sound technical results.

The progress at the plant for making various chemicals for the rubber industry at Rishra is proceeding satisfactorily. And further prospects are bright. For the production of polythene the Government has now agreed that the Company may expand its capacity by more than 2½ times. Regarding paints, discussions are being carried on with the Government of India for expansion of the capacity and on the obtaining of extra capacity, it is expected that not only will the company be able to meet the internal demand but also be able to undertake exports successfully, which it has been able to develop over the last year. In addition to these products, investigations are in progress to increase the production of chlorine, caustic soda and the hydrochloric acid. The most helpful feature in the expansion programme has been the sterling finance provided by the U.K. Imperial Chemical Industries Ltd. for the import of plant and machinery. Last but not least, on the credit side is the establishment of a Craft Apprentice Training School, which, besides assisting the company in providing skilled craftsmen, has

also been able to train men on behalf of the Government.

Banking

THE INDIAN BANK: HIGHER PROFITS

THE INDIAN BANK LTD. Madras, in its fifty-fourth year has reached a stage when minor tremors in the Banking industry do not influence its working to any major extent. During the year to December 31, 1960, for instance, when the Pallai Bank failed and many other banks recorded adverse results, the Indian Bank actually increased its profits. From Rs. 36.84 lakhs in 1959 the net profits were recorded at Rs. 40.32 lakhs in 1960. It may be observed from the balance sheet published elsewhere in this issue that the deposits of the Bank dropped from Rs. 43.47 crores last year to Rs. 39.48 crores at the end of 1960. During the same period the advances too dropped but relatively to a lesser extent. The ratio of advances to deposits, therefore, increased from 66 last year to 69 at the end of the year under review. This naturally meant a higher income in the form of interest, which increased from Rs. 2.16 crores to Rs. 2.30 crores. The Bank opened offices, during the year, at Muthialpet (Madras) Neyveli, Vishakapatnam and Wellingdom Island.

It is to be noted that the Directors had already approved the payment of an interim dividend at the rate of 5 per cent and a bonus of 2½ percent (subject to tax) and the transfer of a sum of Rs. 2 lakhs to Sinking Fund. Now the Directors have recommended the payment of a final dividend of 5 per cent and bonus of 2½ per cent (subject to tax) making the dividend and bonus at 15 per cent.

BANK IN INDIA: IMPRESSIVE RECORD

AT THE 55th Annual General Meeting of the shareholders of the Bank of India Ltd., the Chairman, Sir Cowasjee Jehangir, struck a cheerful note on the working of the Bank whose profit of over Rs 103 lakhs for the year 1960 is about Rs. 20.5 lakhs more than the 1959 profit of about Rs 82.5 lakhs. The impressive feature is that adequate provisions are made at all stages and the final dividend of 12.5 per cent, subject to deduction of tax at the prescribed rates, is proposed. So far as the expansion programme is concerned, the Bank is to open new branches in nearly 40 places. It is also gratifying that the Bank has been able to develop substantial foreign connections which are bound to bring substantial benefits.

Dealing with economic issues, Sir Cowasjee Jehangir has struck a note of warning in regard to rising prices. Sir Cowasjee states that there has been a substantial rise in spending on the part of the Government on many 'rash' projects. Although it was not for the Chairman to name these enterprises, it is reasonable to infer that they possibly include the atomic power plant and the like whose economics is open to serious question. Then again, if the budget of 1961-62 is any indication, it is clear that the Government of India is the largest single spender. In the opinion of the Chairman, the root of all the troubles is the policy of the Planning Commission which has allowed its imagination to run wild without calculating the disastrous financial consequences of their 'rash' projects. Under the circumstances, Sir Cowasjee has called for a reduction in expenditure. The remedy lies only in good and efficient planning which alone will enable the Government to spend less and to borrow less money from all parts of the world. This will obviate the need for levying high taxation which will impose disproportionate burdens on different classes of society,

FROM THE CAPITAL'S CORRIDORS

FICCI MEETING

At the 34th Annual Session, held here on March 25 to 27, the Federation of Indian Chambers of Commerce and Industry adopted six resolutions, dealing with the Third Five-Year Plan, export promotion, streamlining of administrative machinery, transport capacity and movement bottlenecks and coal production and its movement.

The resolution dealing with the Third Plan stressed the need for reconsidering the role of private sector in the economic development of the country under the Third Plan. The resolution said "the distribution and outlay of (Third Plan) sources needs careful reconsideration. Any avoidable wastage or imbalance in the pattern of production and the misuse and malallocation of resources which they involve, will affect not only the rate of consumption but also the rate of savings and, therefore, the overall rate of economic growth. It is of necessity to ensure that the outlay on industries, power and transport sectors is maximised to the fullest extent practicable. Only then the foundation for self-sustaining growth can be laid. And it is also the surest way of restraining inflationary pressures. Inflation, which is usually measured by the rise in prices, occurs because the total demand on the nation's resources is in excess of the available supplies. The effective way of meeting the situation is by improving the supply position."

The resolution added: "Agricultural production requires to be stepped up, and policies in this behalf must be evolved on a pragmatic basis and implemented with vigour. Industrial production can be accelerated quicker if climate is created for the purpose, and industry and trade are given comparative freedom to go ahead with their business. There are many idle factors in India, both human as well as material, that could be activated. The growth of technical, managerial, entrepreneurial skill is of basic importance in this regard. The Federation is convinced that having regard to the unexploited resources in the country, which are estimated to be large, they should be brought into productive use speedily. And this will be possible through domestic effort supplemented by foreign collaboration provided the forces of development are assisted to play their rightful part. In this connection, the Federation would strongly recommend that the tax policy of Government should view management and entrepreneurial ability as a key economic resource that requires to be released and fostered through incentives so as to make possible and successful widespread capital investment for productive activity."

EXPORT PROMOTION

The resolution on export promotion said: "The Federation notes with concern that despite the measures initiated by the authorities to stimulate exports, the value of our exports has remained stagnant during the past few years at an annual average of less than Rs. 615 crores. In the opinion of the Federation piecemeal attempts for the solution of the problem and measures in the nature of patch work will not produce the desired results, and there is pressing need for a complete reorientation of the approach to the problem both on the part of Government on the one hand and the trade and industry on the other. It cannot be over-emphasised that having regard to the country's repayment obligations, the increased foreign exchange contents of the Third Five-Year Plan and the fact that the scope for any significant pruning of the country's import bill is very limited, there is imperative need for an all-out effort to intensify our export promotion drive. Those in industry and trade have a special responsibility in this behalf, and they should endeavour to promote exports by creating confidence in the minds of foreign buyers through

export performance and by following acceptable procedures, such as pre-inspection, arbitration and the like."

The third resolution demanded streamlining of administrative machinery, adding that there was vital need for improving administrative efficiency and integrity. "There is equal need," it said, "to simplify, co-ordinate and rationalise the system of submission of reports and information by industry and trade to the authorities." "The Federation", it added "would like to invite the particular attention of Government to:

- that there is too much centralisation of effective power at the higher level and there is need for much decentralisation to take quick decisions;
- that there is lack of proper co-ordination between various departments of Governments which often causes bottlenecks in production and distribution;
- that the existing administrative procedures relating to the setting up and expansion of industries need re-examination so as to eliminate avoidable delays and duplication, particularly in regard to industries set up as joint ventures with foreign collaboration."

This resolution also contained that "the Federation is of the view that top priority needs to be given to the streamlining of administrative machinery in the Third Plan with an emphasis on reducing needless restrictions on enterprise, as otherwise the expansion of the economy will be slowed down and at the same time the growing administrative machinery will unduly add to the cost of the execution of the Plan."

TRANSPORT BOTTLENECKS

Referring to transport bottlenecks, the Federation was of the opinion that the development of roadways was equally essential "in the context of the country's growing transport needs. It is common knowledge that Railways, inasmuch as they do not reach all the corners of the country, cannot handle the entire traffic; more so when they are not able to move, speedily and smoothly, even the traffic offered. Therefore, if a part of the traffic has been diverted to road transport, the road transport can hardly be blamed for that. Consequently, the suggestion that nationalisation of the entire road transport system would have to be attempted in suitable stages does not meet the situation and, if implemented, will aggravate the problem, and deny the user of transport the facility to choose the mode of transport best suited to his requirements."

"The Federation," the resolution said, "believes that a freer road transport policy will result in road transport effectively supplementing rail transport, thus augmenting transport availability for both passenger and goods traffic. The development of roads is an essential prerequisite for the growth of road transport. This important aspect has not received its due importance, and the Federation cannot help feeling that the authorities have not utilized, as they should have done, the heavy imposts collected from road transport for the development of roads." The resolution added: "The Federation would also urge that greater attention be paid to the opening of river routes throughout the country and establishing regular river transport services in such sections where they could operate immediately. In this connection, it views with grave concern the reports that some of inland waterways and ports are gradually getting silted up. If timely steps are not taken for dredging these, they will cease to be useful."

COAL PROBLEM

Coal was another subject on which a resolution was adopted. This resolution said: "The Federation regretfully feels that the shortfall in the coal production target during the Second Plan has been occasioned through failure to utilize effectively the available production potential. In spite of the many handicaps faced by the Private Sector of the Coal Industry, which amongst others include restrictions in expansion into new areas involving the working of easy deposits at relatively shallow depths, being compelled to accept an uneconomic price structure, and, to work under adverse mining conditions, its current rate of production is well in excess of its Second Plan target of 45 million tons. In this background the possibility of achieving the Third Plan target of 97 million tons must be viewed realistically having regard to the production of coal of the requisite quality. While the Federation welcomes the recent announcements relating to a more realistic interpretation of the Industrial Policy Resolution, which does not preclude the expansion of the privately owned collieries whether independently or in conjunction with the State, actual implementation has been vitiated by serious shortcomings and avoidable delays and restrictions."

The sixth resolution which the Federation adopted was on Land Ceilings. This resolution urged that agriculture should be operated as an industry. The policy of Land Ceilings, it claimed, went against increasing productivity.

WAGE BOARD FOR IRON AND STEEL INDUSTRY

The Government of India, it is understood, has decided to appoint a Wage Board for the Iron and Steel Industry. The announcement is expected to be made shortly.

Constitution of the Wage Board for the Iron and Steel Industry will be an important development in employer-employee relations in India. This will be for the first time that some major public sector undertakings—Rourkela, Bhilai and Durgapur Steel Plants—will be brought within the purview of a wage board. Fixation of wages through tripartite wage boards until now has been tried out in this country only in respect of private sector industries, namely, textiles, cement, sugar, jute and tea. Two State-owned units, however, were covered by the Cement Wage Board recommendations.

If the terms of reference of the Iron and Steel Industry Wage Board include the determination of the principles governing bonus as has been the case with the other wage boards, it will mean acceptance by the Government of the need to pay bonus to workers in public sector undertakings. This will also be a major departure from the present policy of the Government of India. Hitherto, workers in public sector undertakings have not been paid bonus, though in some undertakings there are in operation schemes for Payment of production, incentive or attendance bonus.

N.C.D.C. OPERATIONS

The central workshop of the National Coal Development Corporation, being set up at Barkakhana at a cost of nearly Rs. 1.5 crores, is understood to be nearing completion. A structural shop, a machine shop, an engine shop and a foundry and a smithy shop are said to have already been commissioned. Manufacture of some spare parts is also reported to have been started. When in full production, the workshop will annually turn out spare parts worth about Rs. 35 lakhs and structural and other steel fabrications worth about Rs. 25 lakhs.

The N.C.D.C., it is further learnt, has also set up an organization to look after the repair and maintenance of the machinery installed by it in its various collieries. Each group of collieries is now equipped

with a workshop where all kinds of machinery used in the opencast and underground mines are serviced.

To meet the growing requirements of technical personnel, particularly junior technical supervisory staff and technicians, the Corporation has established five mining training schools, with the usual complement of workshops, hostels and staff quarters, at a cost of about Rs. 40 lakhs. A sum of Rs. 16 lakhs approximately is spent every year on these training institutions. The Corporation has also set up twelve evening lecture centres. The five training schools and the twelve evening lecture centres are capable of training about 850 technicians a year. The Corporation feels that these training schools and lecture centres would ensure an adequate supply of skilled personnel required by the Corporation during the first three years of the Third Plan.

The Corporation also sends a number of its technicians to foreign countries for specialized training.

During the 4½ years of its existence, the Corporation has opened and developed ten new collieries. All of them are fully mechanized. The current rate of production of the N.C.D.C. collieries, both old and new, is 13.07 million tons per annum.

MOVEMENT OF COAL BY SEA

Consequent upon the decision to move another one million tons of coal by sea, the Government of India, it is understood, is examining some re-adjustment in rail and sea freight on coal meant for consumption in West India. Meanwhile, shippers have been persuaded to accept Rs. 35 per ton freight on coal movement to Gujarat and Saurashtra ports—the same freight as charged by them for Bombay.

THIRD PLAN WAGON PRODUCTION PROGRAMME

The Railway Board, it is learnt, has assessed that a minimum of 91,814 broad-gauge wagons, 21,116 meter-gauge wagons and 3,426 narrow-gauge wagons, in terms of 4-wheelers, would be required by 1965-66 for rolling stock rehabilitation purposes and for carrying the additional traffic to be generated by the Third Plan. A wagons manufacturing programme has been drawn up with these targets in view. It will cost nearly Rs. 236 crores.

INDO-PAKISTAN TRADE

Trade between India and Pakistan during the financial year 1961-62 is envisaged to be stepped up to about Rs. 12 crores — Rs. 6 crores either way. Of this nearly Rs. 3.5 crores will be on account of the shortfall in trade in the year 1960-61; this short-fall is contemplated to be made up in 1961-62.

At the "review talks" held here between India and Pakistan early this week, the two delegations, it is learnt, agreed that steps should be taken to facilitate further movement of trade between the two countries.

The 1960-61 ceilings on the value of trade between the two countries have been repeated for 1961-62. The carry-over of the balances from 1960-61 will be in addition to these ceilings, except in the case of livestock. Betel leaves have been moved to the category "miscellaneous commodities."

The ceilings on value of trade either way in 1961-62 would be as follows:—

Group A: Fresh fruits, fruit plants and seeds—Rs. 40 lakhs.

Group B: Raw cotton from Pakistan, bidi leaves, cement stone boulders and railway materials etc. from India—Rs. 150 lakhs.

Group C: Livestock, including horses from Pakistan—Rs. 5 lakhs.

Group D: Jute cuttings from Pakistan, steel materials and coal from India—Rs. 100 lakhs.

Group E: Miscellaneous commodities—Rs. 115 lakhs.

India, it is understood, had asked for a higher ceiling for raw jute imports, but as this item is linked to exports of coal and steel materials, in which India's supply position is not so comfortable, no agreement could be reached on this.

EXPORTS OF GOA

The present ban on export of necessities to Goa, Daman and Diu, imposed nearly six years ago, is likely to be relaxed early next month. This would enable Goans to obtain from India their essential requirements and sell to this country some of their basic produce. Before the ban was imposed, Goa used to import vegetables, rice and cloth from India and export coconut, arecanut, salt and mangoes to this country.

PROCESSING OF INDUSTRIAL PROJECTS

The Union Government, it is learnt, has decided to appoint an officer on special duty in the Ministry of Commerce and Industry to speed up processing of big industrial projects, particularly those involving foreign collaboration. Side by side, a handbook is being prepared detailing the industries eligible for foreign private investment in India. The handbook will clarify Government's policy on the matter and will lay down working rules which any official could apply without unnecessary reference to his superiors. Lack of prompt decision is one of the major obstacles to rapid development; the handbook now being prepared, it is hoped, will expedite decisions.

The list to be included in the booklet will clarify eligibility of various industries for being set up in the light of the priorities fixed for Plan programmes and the availability of foreign exchange for their execution.

PRAGA TOOLS FACTORY

An agreement has been signed between Praga Tools Corporation — a public sector undertaking — and CEKOP—a Polish organisation of machine tool makers—for collaboration in setting up a new factory at Hyderabad for the manufacture of light and medium varieties of machine tools. Praga Tools Corporation already produces machine tools and accessories worth Rs. 60 lakhs a year. When the new factory goes into production, the Corporation would be turning out machine tools worth about Rs. 2 crores per annum.

This is the first project to be undertaken under the Indo-Polish Economic Agreement signed in May last. The cost of the project is estimated at about Rs. 1.5 crores.

The Polish organisation has already been entrusted with the task of preparing the project report for the factory. The project report is expected to be received by September.

MACHINE TOOLS FACTORY IN PUNJAB

Of the two medium-sized machine tools factories to be put up by Hindustan Machine Tools, Bangalore, during the Third Plan period, one will be located in Punjab. This factory will have a production capacity of 1,000 machine tools (worth about Rs. 4 crores) per annum. The cost of the project is estimated between Rs. 5 crores and Rs. 7 crores.

An agreement for technical collaboration for the project was signed early this month with "Limex" when a delegation from Hindustan Machine Tools visited East Germany.

The Punjab factory will produce universal milling machines, production millers, dye sinking milling machines, gear cutting machines like shapers, hobs and grinders and special performance machines. The final selection of the site where the factory will be set

up and the other connected details will be settled when the HMT delegation returns from Europe.

Decision about the second medium-sized machine tools factory proposed to be set up under the aegis of Hindustan Machine Tools is expected to be taken shortly.

With the growing tempo of industrial development, demand for machine tools in India has been rising steeply; by the end of the Third Plan period, it is expected that demand would be of the order of Rs. 60 crores per annum. At present, bulk of the country's requirements of machine tools are met by imports. In 1960, domestic production in the public and private sectors, including the small-scale manufacturers, was about Rs. 10 crores.

FARMERS' CAR

The Union Ministry of Defence, it is learnt, has not yet finalised its proposals regarding manufacture of Farmers' Car. The Japanese manufacturers of this car with whom collaboration will be sought for this project, M/s. Komatsu Manufacturing Company, are studying the Indian conditions to determine what changes, if any, would be needed to make the car suitable for use by Indian farmers. Results of their study are awaited.

JANATA CAR

With the Farmers' Car proposed to be manufactured by the Union Ministry of Defence, the Janata Car Project is likely to be handled by the Union Ministry of Industry.

Dr. B. D. Kalelkar, Senior Industrial Adviser to the Government of India and a member of the Pande Committee on Small Car, now touring Europe in search for a suitable collaborator for this project, it is learnt, is exploring possibilities of entering into collaboration arrangements with the manufacturers of Volkswagen. Preliminary talks in this connection are understood to have taken place in New Delhi when the West German Minister for the Treasury recently visited India.

The Pande Committee has already examined offers from some manufacturers of small cars in Europe and Japan. It is expected to submit its report to the Government towards the end of next month. Among the offers so far received, the one by Renault (of France) is considered to be very favourable. The Renault car, if manufactured in India, is expected to be put on the market for about Rs. 6,000.

AUTOMOBILE ANCILLARY INDUSTRIES

A three-man T.C.M. team is touring India at present to conduct a survey of the automobile ancillary industries. Its terms of reference are:

1. To study, survey and evaluate proffered pattern of development of automobile ancillary industries in relation to the main industry;
2. To survey the capacity of existing ancillary industries and make recommendations for setting up additional capacity with minimum expenditure of foreign exchange on import of parts and raw material.
3. To determine the managerial and technical requirements, including quality control and standardization for early expansion and development of ancillary industries in India;
4. To suggest pricing and marketing practices for ancillary products both for original fitment and replacement purposes.

The team is expected to submit its report to the Government of India through the Technical Co-operation Mission.

THE INDIAN BANK LIMITED, MADRAS

(Estd. 1907)

Registered Office: "Indian Bank Buildings,"
17, North Beach Road, Madras-1.

To be placed before the Shareholders at the ensuing Fifty-Fourth Annual General Meeting to be held on 7th April, 1961, at the Registered Office of the Bank, "The Indian Bank Buildings", 17, North Beach Road, Madras-1.

DIRECTORS' REPORT

ONE HUNDRED AND SEVENTH REPORT

The Directors have the pleasure to submit a statement of Assets and Liabilities and of Profit and Loss Account of the Bank for the year ended 31st December 1960. The Auditors' Report is also annexed.

2. The Net Profit of the Bank for the year amounts to Rs. 40,32,080-89 and together with the sum of Rs. 80,143-18 carried from the previous year's account, makes a total of Rs. 41,12,224-07.

	Rs.	nP.
3. Out of this sum, the Directors have made the following interim appropriations:—		

An ad-interim dividend at the rate of 5% and a Bonus of 2½% (subject to deduction of tax at the prescribed rates) was paid which absorbed

To transfer to Sinking Fund

The Directors now recommend that the following further appropriations may be made:

To pay a final dividend of 5% and a Bonus of 2½% (subject to deduction of tax at the prescribed rates) thereby making

	Rs.	nP.
the dividend and bonus for the year amount to 15%	6,22,500	00
To provision for taxes	23,00,000	00
To transfer to Sinking Fund	2,00,000	00
To transfer to Bank's buildings account	30,988	00
To carry forward	1,36,236	07
	41,12,224	07

4. The Bank rate remained unchanged at 4%.

5. Offices of the Bank were opened during the year at Muthialpet (Madras), Neyveli, Vishakapatnam and Willingdon Island.

6. In accordance with Articles 92 and 93 of the Articles of Association of the Bank read with Sec. 256 of the Companies Act, 1956, four Directors, Messrs. R. Sundram Iyer, T. S. Kachapikese Mudaliyar, Kumbhara-rajah M. A. M. Muthiah Chettiar of Chettinad and R. K. Venkatachalam retire this year by rotation and they, being eligible, offer themselves for re-election.

7. Sri K. Arunachala Mudaliar resigned his seat on the Board on 2nd December 1960. In his place Sri C. Ramasubban was co-opted as a Director on 20th January, 1961.

THE INDIAN BANK LIMITED, MADRAS

Auditors' Report

We have audited the above Balance Sheet of the Indian Bank Limited as at 31st December 1960 and also the above Profit and Loss Account of the Bank for the year ended on that date with the books of account of the Head Office and Branches other than those in Malaya, and Singapore. The accounts of the Branches in Malaya and Singapore were audited by auditors qualified under the laws of those countries and appointed by the Board of Directors before the Companies (Amendment) Act 1960 came into force. The Bank has applied for necessary exemption to the Central Government. We report that:—

- We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit;
- Such information and explanations have been found to be satisfactory;
- The returns received from the Malayan and Singapore branches have been found adequate for the purpose of our audit;
- The transactions of the Bank as have come to our notice have been, in our opinion, within the powers of the Bank;
- In our opinion, and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1956 in the manner so required, subject to the note appended to the Balance Sheet.
- In our opinion, (i) the Balance Sheet gives a true and fair view of the state of the Bank's affairs as at 31st December 1960;
- (ii) the Profit and Loss Account gives a true and fair view of the Profit and Loss for the year ended that date and shows a true balance of profit for the period covered by the audit; and
- (iii) proper books of account as required by law have been kept by the Bank so far as appears from our examination of those books; and
- The Bank's Balance Sheet and the Profit and Loss Account dealt with by the Report are in agreement with the books of account and returns.

COMPANY AFFAIRS

T. STANES'S JUBILEE YEAR

It appears from the consolidated account of T. Stanes & Co. and its subsidiaries that the combined income of the company came to Rs. 2.44 crores during the year to September 30, 1960, against Rs. 2.15 crores in the previous year. Sale proceeds of the subsidiaries alone came to about Rs. 1.64 crores. The combined profit of these companies comes to Rs. 14.37 lakhs, against Rs. 13.82 lakhs in the previous year. The Stanes Motors (South India) Ltd., a subsidiary of the company, indicated satisfactory results. Supplies of cars and commercial vehicles of the company continued to improve during the later half of the year though it was restricted in the first-half. Only Bedford trucks, the Directors point out, will be progressively manufactured and Chevrolets will no longer be available as their production has ceased. The company had a good turn over, but the procurement of service parts was slightly difficult. The trading profits of the United Coffee Supply Company Ltd., another subsidiary of the company, though not spectacular, show sure improvement over the last year due mainly to increased sales of pure coffee. The company continued to sell loose tea because of a severe competition in the packet tea trade.

T. Stanes and Co. Ltd. in its golden jubilee year has recorded a profit of Rs. 10.37 lakhs. After providing for depreciation and other provisions like bonus etc, there is a balance of Rs. 8.25 lakhs. The directors have recommended the provision of Rs. 3.25 lakhs for taxation. An interim dividend at the rate of 10 per cent was paid in October on ordinary shares and now a final dividend at the rate of 17½ per cent is to be paid. A centenary bonus dividend at the rate of 5 per cent is also to be paid.

NIZAM SUGAR

In spite of the major breakdown in one of the plants of the company which forced stoppage of crushing for about a month, the Nizam Sugar Factory Ltd. during the year to June 30, 1960 crushed 4.92 lakh tons of cane and produced 51,199 tons of sugar showing a recovery of 10.41 per cent which was higher as compared to the results of

the previous year, when 4.43 lakh tons of cane were crushed producing 44,336 tons of sugar with a recovery of 10 per cent. A higher recovery was due to better quality of cane and more efficient working of the factory. The farms attached to the factory produced 2.24 lakh tons of cane at an average of 40.38 tons per acre; corresponding figures for the previous year are 1.88 lakh tons at an average of 35.95 tons per acre respectively, which again means better results for the year under review. Sales proceeds during the year came to around Rs. 5.98 crores against Rs. 5.79 crores during the previous year. The profits, too, were higher, at Rs. 63.10 lakhs, a significantly higher figure against the previous year's profit of Rs. 24.67 lakhs. The Directors have proposed the payment of a dividend on ordinary shares at the rate of Rs. 5.75 per share of Rs. 25 fully paid subject to deduction of tax which shall absorb a sum of Rs. 25.39 lakhs.

J. K. STEEL

J. K. Steel has achieved a fair amount of stability and in spite of an illegal strike for 71 days during the year from September 18 to November 27, 1959, the company recorded increased sales and higher profits as compared to the previous year. The sales reached a new high level of Rs. 1.24 crores against Rs. 94.9 lakhs during the previous year and Rs. 56.2 lakhs a year before.

The directors have reported that as a result of representations made to the Government, the supply position of raw materials for the rolling plant as well as wire rope plant has improved resulting in a higher production. The company also has expansion schemes in hand and has obtained licence for the manufacture of mild steel wires from the existing available capacity of its plant and has obtained licences for doubling the capacity of wire rope plant.

Profits during the year under review after making provisions for depreciation etc. comes to Rs. 13.12 lakhs against the last year's figures of Rs. 5.51 lakhs. The directors have recommended the payment of dividend on ordinary shares at the rate of Rs. 2 per share which is equivalent to 20 per cent subject to deduction of tax.

A Letter to the Editor

POWER PLANNING IN GUJARAT

The Editor,
The Eastern Economist,
New Delhi.

Dear Sir,

I venture to draw attention to a factual inaccuracy that has crept into the article entitled "Power Planning in Gujarat" which appeared in your issue of March the 10th. The article invites attention to "the ambitious project of running an express transmission line between Bombay and Ahmedabad" of which the Central Government was to bear a part of the project's cost, and which the then Bombay authorities were said to welcome and would even have been delighted to assist by sparing part of the Koyna power.

It is true that the Central Government mooted in 1959 a proposal to construct a transmission line between

Bombay and Ahmedabad, on the assumption that surplus power was available in the Bombay region for such transmission. The then Bombay State Electricity Board carefully examined the proposal and came to the conclusion that no such surplus power would be available and the then Bombay Government concurred with that analysis. This view of the authorities was conveyed to the Central Government and the proposal was dropped. It is thus not quite in accordance with facts to suggest as has been done rather superciliously in the article that "certain superior intellects in Gujarat" sacrificed the long term interest of the Gujarat State (which incidentally did not then exist) by turning down this 'wonderful' offer.

Yours sincerely,
H. M. Patel

New Delhi,
March 23, 1961.

**Announcing the start of another
foreign exchange saving project:**

TATA P&H EXCAVATORS

Tata Engineering & Locomotive Company Limited have the pleasure to announce the commencement of the progressive manufacture of Tata-P&H Excavators with the collaboration of the well-known American firm of Harnischfeger International Corporation.

Initial manufacture will be of the Tata-P&H Model 955A of 2½ cu. yds. capacity. From the very start, as much as 58% of the value of the unit will be manufactured in India. (Units will be ready for delivery ex Telco Works, Jamshedpur from December, 1961).

Tata-P&H equipment will be distributed in India by Voltas Limited who have a nation-wide service and spare parts organisation.

RECORD PRODUCTION AND PROFITS
MR. J. M. LALL ON THE ROLE OF RETAINED PROFITS
THE CONFIDENCE OF THE PRIVATE INVESTOR ABROAD

Speech delivered by the Chairman, Mr. J. M. Lall at the 24th Annual General Meeting at Calcutta on Wednesday, 22nd March, 1961.

Gentlemen,

The Audited Accounts and Directors' Report have been in your hands for sometime, and with your permission, I shall take them as read.

The results shown by these accounts need no emphasis from me; the figures speak for themselves as evidence of the most successful year in the Company's history so far. How have these highly satisfactory results been achieved?

PRODUCTION

In the year under review we had the benefit of a full year's production of polythene granules for the first time. The Polythene Plant, you will remember, has an installed capacity of 3,500 tons but, largely as a result of a methodical, scientific study of the working of the Plant, we were able to achieve an output of 4,000 tons. A notable increase was also achieved in the output of Paints and here again scientific study of the processes and increased efficiency in production planning were largely responsible. Even more paint could have been produced had it been possible to import a larger quantity of raw materials. We must expect this scarcity of imported materials to continue and we are, therefore, constantly seeking and evaluating raw materials produced in this country.

While the major increases in production have come from the two Plants I have mentioned, all other Plants also contributed.

SALES

Sales which, as you know, are made through our Selling Agents, Imperial Chemical Industries (India) Private Limited kept pace with this increased production and the final figures achieved were Rs. 5.4 crores as against Rs. 3.4 crores in the previous year. Throughout the year demand for all our products was in excess of our ability to supply and a ready market exists for any increase in output which we are able to achieve this year. An important part in the development of demand for our products, and particularly such materials as polythene and high quality paints, is played by the Technical Service organisation of our Selling Agents which provides a comprehensive service to all our customers and helps them to use our products economically and with good and sound technical results.

APPROPRIATIONS

Let me turn now to the proposals your Directors have made as to the use to which the available surplus of approximately Rs. 88.5 lacs is to be put. They have recommended allocations of Rs. 48 lacs to Reserves and Rs. 39.2 lacs to dividends.

Some of you may well ask why the Board have not recommended distribution of a larger part of the profits in dividends. The Board considered this mat-

ter very thoroughly and in their deliberations were guided by the following factors:—

- Last year we withdrew from the Dividend Equalisation Account Rs. 13.8 lacs, the entire amount standing to the credit of that Account. In addition, a sum of Rs. 10 lacs was withdrawn from General Reserves to make up the amount required for dividend on Ordinary Share Capital. The Board are of the opinion that these withdrawals should now be made good and the Reserves brought up to levels commensurate with the Company's activities.
- The Company's indebtedness to Banks stood at Rs. 1.24 crores at the end of the year.
- We have on hand a large programme of expansion which will require about Rs. 6 crores during the next 3 years or so.
- A progressive but consistent dividend policy is essential for the strength of the Company and prestige of its stock in the market.

Your Directors believe that self generation of resources is as important for the growth of a company as it is for the economy of a country. In achieving a state of "take-off" as the modern economist puts it, retained profits have a very important role to play. Nevertheless, your Board are fully conscious of their duty to the Shareholders and hope that you will not regard a dividend of 12% before tax, as inadequate.

The provisions in the recent Budget if accepted by Parliament will materially affect your company in the current year and in the future. Apart from the reduction from 25% to 20% in development rebate and increase in duty on the import of plant and machinery, substantial new excise duties have been imposed on polythene and caustic soda, and the duty on paints has been increased. For the year to September 1960 your Company paid excise duty amounting to approximately Rs. 12 lacs. For the current year which will only have 7 months of the new and enhanced duties, the excise bill will be Rs. 45 lacs and for a full year's operations the total excise duty may amount to as much as Rs. 70 lacs. As you will appreciate no Company can absorb such a large debit and the bulk of this must perforce be passed to consumers. We must realise, however, that competition in these products is growing and to increase prices to recover such a large amount from consumers is not likely to be easy.

I would like, at this stage, to refer briefly to the delay which occurred in the payment of the half yearly Preference Dividend which normally occurs in April and October of each year. The withdrawal of Section 18(3E) of the Indian Income Tax Act, 1960 raised certain difficulties in connection with the payment of Preference Dividends and there arose also considerable uncertainty as to Government's intentions regarding the treatment of tax-free Preference Dividends. In these circumstances, your Board thought it prudent to defer payment until the position was clear beyond doubt, but this clarification took a long

time to achieve and amending legislation was not passed until the end of 1960. A full year's dividend has now been paid in conformity with this legislation but my colleagues and I would like to express to Preference Shareholders our regret at the considerable inconvenience which was caused to them.

All our shareholders will, I think, be glad to hear that we have now been able to arrange with our Bankers that all future dividends can be paid at par at any of their branches.

PROSPECTS

So much for the past. What of the future? Production and sales in the current year have been satisfactory so far, and in line with the increased targets which we have set ourselves. Methodical studies of the working of each of our Plants and improvements in preventive maintenance are enabling us to increase production still further. In our caustic soda business Government has taken note of our difficulties arising from the substantial rise in the price of salt and has acted promptly to authorise us and other caustic makers to charge a higher price.

I referred in my speech last year to our plan for making various chemicals for the rubber industry at Rishra at a cost of Rs. 2 crores. Work is proceeding steadily on this project.

I have already referred to increases in output of polythene granules achieved by the application of Work Study techniques without any additional capital investment. Demand for polythene in India has grown so quickly that it has become urgently necessary to extend our capacity. Government has now agreed that we may expand our capacity by more than 2½ times and this expansion is being pushed forward as matter of the highest priority. As with the first Plant our technical consultants are Imperial Chemical Industries Limited, London, and I would like to record our gratitude for the prompt and effective help which they have given and are giving us, in order to bring this extra capacity into production within the shortest possible time.

I have also referred to the substantial increases which we have been able to achieve in the output of our high quality paints. Despite this, demand within India is increasing rapidly as a result of the country's general industrialisation, that it is urgently necessary to put in a substantial increase in capacity. This extra capacity will enable us to meet internal demand and, what is equally important, help us to expand the valuable export business in paints which we have been able to develop over the last year or so. Our proposals to increase our paints capacity are at present under discussion with the Government and we have every hope that the outcome will be successful.

In addition to these projects we are also actively investigating plans to increase our production of chlorine, caustic soda and hydrochloric acid.

These plans for new projects or substantial expansion of existing projects are made possible largely because of the readiness of our associates in the U.K., Imperial Chemical Industries Limited, to provide sterling finance for the import of plant and machinery.

Shortage of foreign exchange is one of India's major problems. I know that the Government of India are doing everything possible to find a solution to this problem and are meeting with a fair measure of success in arranging Government to Government or World Bank loans. I would like to suggest, however, that the Private Sector of the economy also is play-

ing a very important role in this endeavour. Willingness of foreign private investors to come into a country without any political pressure is indicative of the strength and stability of the economy of the country. Admittedly, the aggregate of such foreign private investment in any one of the years of the second plan is small in comparison with governmental aids but I maintain that the real effect of this foreign private investment in these years is seen not in the quantum but in the climate it has created. Governmental thinking overseas must be influenced to quite an extent by the independent expression of confidence by the foreign private investor.

STAFF AND WORKERS

May I turn now to the most valuable asset which your Company possesses, although you will not find it in the Balance Sheet: I refer of course to our staff and workers, without whose loyal support and conscientious work, machines, no matter how efficient or well designed, can achieve nothing.

Throughout the year we have laboured to build up a team spirit and a sense of common purpose among all sections of our employees. On the whole these efforts have been successful and the relationship between Management and Workers has been reasonably good. Differences there have been and still are but they are all, in my view, capable of a right and just solution if they are approached by both sides in a spirit of goodwill and with a genuine desire to find agreement. That such solutions should be found and found quickly is of importance not only to the employees themselves, to the Company and to its shareholders but, above these three, to the country as a whole.

During the year we were able to complete improved amenities for our workers by building more quarters for them, and arranging for subsidised accommodation in the West Bengal Government's Housing Project at Baidyabati.

Training is, of course, of vital importance to your Company and indeed to the country as a whole at this time of rapid development. To help meet the need for trained fitters and the like we have established a Craft Apprentice Training School, the aim of which is to provide your Company with a steady supply of skilled craftsmen. We have also undertaken to train such men on behalf of the Government of India as a contribution to the country's needs. Our policy of appointing Indian staff to responsible management positions has been assiduously pursued and I am happy to be able to report to you that with the exception of the Technical Director at Rishra the entire management of that complex chemical manufacturing site is in the hands of Indian staff and they are discharging their responsibilities most efficiently.

We had the privilege, a few weeks ago, to welcome to Rishra Mr. S. P. Chambers who is now the Chairman of Imperial Chemical Industries Limited, London. You will, I know, be pleased to hear that he was greatly impressed by all he saw at your Factory and paid particular tribute to the high morale and enthusiasm which he found there.

These then were the achievements of your Company in the year ended September, 1960. The years ahead hold out a great challenge to all who are concerned with the development of a vigorous and prosperous chemical industry in this country. They will bring their problems and their difficulties but they will also, I am sure, bring great achievements. In the building of this chemical industry your Company has an important part to play. We face that future with sober confidence.

NOTE: This does not purport to be a record of the proceedings.

MR. AL FOIL GOES OVERSEAS

"Westward Ho!" shouted Mr. Foil, importantly perched upon a tea chest, "I go as a Protector of Tea (Aluminium lining for tea chests and packages) and come back with foreign exchange. Busy voyage ahead, though," Mr. Foil continued shouting, "What with having to keep out the damp devil and keep in the tea flavour. But I am not worried. Have long experience in the matter of lining tea chests with aluminium foils which stand up to all sorts of ill usage like rough crossings and wet weather (the Bay of Biscay and the Channel y'know) . . . In fact, aluminium foil packaging keeps the tea full flavoursome and factory fresh right up to the tea lover's table . . . to England, America or any place in the world . . . I, Al Foil, alumnus of aluminium, guarantee satisfaction".

VENESTA FOILS LIMITED

KAMARHATI, 24 PARGANAS, WEST BENGAL

Selling Agents :

Tea Chest Linings : Williamson, Magor & Co. Ltd., Calcutta.

Foils and Container Sheet : Indian Aluminium Co. Ltd., Calcutta Bombay Madras and New Delhi

Long and extensive experience as Manufacturers of Aluminium Foils for packaging goods in the Cigarette, Pharmaceutical, Confectionery, Tea and many other Industries.

Centre For Training Instrumentation Mechanics: An agreement was signed recently between the Swiss Foundation for Technical Assistance, Zurich (Switzerland) and the Council of Scientific and Industrial Research for the establishment and operation of an Indo-Swiss Centre for training precision mechanics in the fields of instrumentation. The Centre will be a co-operative effort between the Swiss industry and the C.S.I.R. and is being established as a part of the Central Scientific Instruments Organisation which has, as one of its aims, the organisation of advanced training of technicians and specialized personnel for the Indian scientific instruments industry. The Swiss Foundations is an organisation of the private Swiss industry and has over 200 enterprises as its members. Under the agreement the Foundation will provide free of cost to the C.S.I.R. equipment worth one and half million Swiss francs and the services of 6 to 8 Swiss technical experts for a period of 5 to 8 years. The total cost of this assistance will be over 6 m. Swiss francs. The C.S.I.R. will be responsible for providing the buildings, the Indian staff and the necessary supplementary equipment, besides meeting the recurring expenditure for the centre and the local cost of the experts.

Life Insurance Corporation Business: The Life Insurance Corporation secured peak business during 1960. The new business amounted to Rs. 460 crores. The amount of new business completed during 1955, the year immediately preceding the year of nationalisation was Rs. 260.84 crores. Foreign business completed by the Life Insurance Corporation of India during 1960 was Rs. 9.70 crores. Foreign business in 1957 was Rs. 5.40 crores; in 1958 it was Rs. 5.62 crores and in 1959 Rs. 9.47 crores.

Special Indian Currency in Kuwait to be Withdrawn: The Government of Kuwait has announced its intention to introduce a new local currency, to be known as the Dinar, and the appointed date for the issue of this currency has been notified by the Government as 1st April, 1961. In consequence of this decision, it would be necessary to arrange for the withdrawal of special Indian rupee notes and coins now in circulation in Kuwait and the representatives of the Government of Kuwait and the Government of India have accordingly been discussing the arrangements to be made in this connection. The two delegates have reached complete agreement, as a result of the discussions, regarding the manner in which and the period over which Indian currency now in circulation in Kuwait is to be exchanged into the local dinars and the terms on which India's liability in sterling in respect of the notes and coins so exchanged is to be liquidated. The arrangements which have been agreed upon contemplate that an initial payment to Kuwait will be made soon after the Indian notes and coins now in circulation in Kuwait have been redeemed and that the balance of India's liability will be discharged in annual instalments over a period of 10 years extending upto 1971. The decisions reached as a result of the present agreement between Kuwait and India do not effect the circulation of special Indian notes or Indian coin in the other territories of the Gulf, where the existing arrangements will continue to be in force.

United States

Alliance For Progress: President Kennedy has invited the Republics of Latin America to join the United States in launching a vast new 10-year Plan for the Americans—a plan to transform the 1960's into a historic date of democratic progress. The President's proposal is a 10-point programme in which he calls on all peoples of

the hemisphere to join in an effort, unparalleled in magnitude and nobility of purpose, to satisfy the basic needs of the American peoples for homes, work and land, health and schools. Among the points in his programme are examination of commodity market problems, the stepping up of the Food for Peace Programme, request to Latin American Republics to contribute to the enrichment of life and culture in the United States and \$ 500 m. in U.S. funds for assistance.

U.S.S.R.

Planting New Vineyards In Azerbaijan: Spring planting of vineyards are under way in Azerbaijan. Grape and fruit growing is an important branch of Republic's agriculture which brings large incomes to be peasants. This spring the area under vineyards in Azerbaijan will grow by another 20,000 hectares. On the whole, almost 2 lakh hectares will be added to it in the 7-year period. Azerbaijan's grape goes into the making of high quality wines, many of which were awarded gold and silver medals at international exhibitions.

Super Powerful Steam Turbines: Over 9 million kilowatt is the total capacity of all the turbines manufactured in the USSR last year. Many Soviet hydraulic, thermal and gas electric machines are produced at the Turbine plant in the Ukrainian city of Kharkov. In particular, the world's largest steam turbine with a capacity of 300,000 kw. was manufactured there last year. Already the second 300,000 kw. turbine possessing exclusive productivity has been put on the test stand of this plant. It alone can produce as much electric current a year as all the electric stations of Tzarist Russia, in 1913. Next year a 500,000 kw. aggregate will be manufactured at the plant, to be followed by a 800,000 kw. unit. Now the designers are busy working on a super-powerful steam turbine with a capacity of 1.2 million kw. This giant will be twice as large as Great Britain's biggest thermal electric station at Castle Donington.

Soviet Netherland's Trade: The Netherland's trade mission which visited the Soviet Union late last year with the object of elucidating the possibilities of expanding trade between the Netherlands and the U.S.S.R. has published its report. It advocates a substantial expansion of trade between the two countries. The report emphasises the fast pace of economic development and advance in the living standards of the Soviet people.

United Kingdom

Indo-United Kingdom Trade In 1960: The continuance of the good commercial relations between India and U.K. is revealed by the figures of exports and imports between the two countries in 1960. India last year got from Britain goods worth Rs. 200.1 crores and she sold Britain products valued at Rs. 198.9 crores. Comparative figures for 1959 were Rs. 228.4 crores and Rs. 190.1 crores, respectively. Thus India's trade deficit in 1960 was reduced to almost vanishing point. India was the sixth largest market in 1960 for U.K. exports and ranked ninth as a supplier of U.K. imports from all sources. The U.K. is helping in various ways to enable India to pay for the increasing volume of imports needed to maintain expanding industrial economy. Indian imports have been paid for to some extent by U.K. Government aid—in 1960-61 new loans totaling Rs. 20 crores have been announced towards the cost of imports in 1960 (not counting the promised Rs. 40 crores as an initial offer of assistance for the Third Plan). Another useful source of finance comes from private investment by U.K. firms in Indian industry. Over the past ten years this has averaged Rs. 20 crores a year and a substantial part of this investment is used to pay for goods and services from the U.K.

Industrial Output: The level of United Kingdom's industrial output remains unchanged, according to the latest index of the industrial production published by the Treasury in London on March 21. Seasonally adjusted, the index is provisionally estimated at 119 for January (1954 taken as 100), compared with 120 for December. The provisional figures for January shows industrial production at the same level as in January 1960. Seasonally adjusted, the level of output in January shows no significant change from recent months. Any changes in the level of production brought about by the recent relaxation of the hire-purchase restrictions will probably not be reflected until the February index becomes available.

Norway

Automation On Board Ships: The Marine Technical Research Institute at Trondheim, Norway, is working on a project for a prototype tanker, the running of which will involve a high degree of automation. It is planned as a transporter of crude oil from the Middle-East to Northern Europe because this type of ship is expected to play an important part in the Norwegian Merchant marine of the future.

West Germany

TV Sets On The Increase: Five million TV sets are now registered in the Federal Republic of Germany where the television network transmits daily a joint programme for about four hours. This programme comprises entertainment, plays, operas, documentary reports and live reporting. There are transmissions of important political, cultural and sport events which often come from elsewhere in Europe or are retransmitted abroad as part of the Eurovision Exchange Programmes.

NEWS IN BRIEF

INDIAN

Eighty-seven companies with a total authorised capital of Rs. 11.73 crores were registered under the Companies Act during the quarter ending December, 1960, in the Northern Region. The region comprises the States of Punjab and Himachal Pradesh, Delhi, Uttar

Among the numerous measures adopted in recent years to stimulate exports has been the creation of a Corporation to provide protection to exporters against risks arising in overseas trade.

The Government of India have constituted a Co-ordination Committee for taking steps to check the further spread of horse sickness in the country and to take stringent measures for its eventual eradication. The Committee will co-ordinate all work connected with horse sickness and prepare concrete plans of action for combating the disease.

Additional production of 50 lakh maunds of cow's milk during the Third Plan has been recommended by the Central Council of Gramvardhana at a meeting under the chairmanship of Mr. U. N. Dhebar. The Annual General Meeting of the Council, which met in New Delhi recently, also approved higher targets for certain schemes in the Third Plan, designed to encourage milk production in cows and its economic marketing.

The stocks of foodgrains with the Central Government which amounted to 7.93 lakh metric tons on January 1, 1960, increased to 21.53 lakh metric tons on March 5, 1961. Besides, the State Governments also held a stock of about 8 lakh metric tons on March 5,

France

Exports Of The French Woollen Industry: Total sales of the French woollen industry amounted to 1,538 million new francs during 1960 (of which 1,418 million francs was accounted for by foreign countries and 119 million francs by the franc zone) compared with 1,325 million francs in 1959 (1,214 million francs abroad and 110 million francs in the franc zone), and with 959 million francs in 1958 (850 million francs abroad and 108 million francs to the franc zone). These figures are all the more favourable considering that the price of wool decreased in 1960, and as a result considerably larger quantities of wool were sold.

Production Of Machine Tools For Czechoslovakia: The Ets, Edmund Chevallier recently received new orders from Czechoslovakia totalling 2,550,000 new francs. Of this total, 800,000 new francs will be for the ingot and accessories department of the smelting industry and 1,750,000 new francs will be for special transformation machinery. The equipment order will be delivered in 1961, 1962 and 1963.

World Bank

Loan For Electric Power In Japan: The World Bank has made a loan equivalent to \$12 million for the expansion of electric generating capacity on the island of Kyushu, Japan. The loan will assist in financing the construction of a 156,000 kw. thermal power plant at Kokura in Northern Kyushu, one of the most heavily industrialized areas of Japan. This is the second loan made by the Bank for the expansion of the Kyushu Company's power facilities. The loan is for a term of 20 years and bears interest at the rate of 5½ per cent annually, including the one per cent commission which is allocated to the Bank's Special Reserve.

FOREIGN

British Overseas Airways Corporation is understood to be considering making new arrangements for insuring its fleet of 15 Boeing 707 and 19 Comet 4 jet airliners, unless agreement can be reached with members of Lloyd's about premiums.

Mr. Shoaib, Pakistan Finance Minister, has announced an upward revision in the estimates of the second Five-Year Plan to the tune of Rs. 3,000 m. The revision in the Plan had been caused by the changing world price situation and also by the buy-American policy, both of which were likely to upset the Plan's targets.

Russia and Mali have signed an agreement on economic and technical co-operation under which the African republic will receive a long-term credit of 40m., the Soviet news agency reported recently. The credit will be used by Soviet organisations to give technical assistance in prospecting for oil, gold and diamonds.

Sir Hugh Ellis Rees, of Britain, former Chairman of the O.E.E.C. is leading a 16-member World Bank economic mission to Spain. It will assist in working out a long-term development programme for the Spanish economy.

West German motor production has failed to keep up the tremendous burst of expansion with which it began this year, but February's results are still well above those of last year.

The first tanker load of crude oil from the recently discovered Italo-Persian offshore field in the Persian Gulf arrived in Bari recently. The 18,000 tons are to be processed in a refinery of which 50 per cent is owned by Standard Oil of New Jersey.

Company Meeting

THE BANK OF INDIA LIMITED

Extracts from the Speech of the Chairman, Sir Cowasjee Jehangir, Baronet, G.B.E., K.C.I.E., at the Fifty-fifth Annual General Meeting of the Shareholders of the Bank of India Limited, at Bombay on Monday, 27th March, 1961.

Ladies and Gentlemen,

I have great pleasure in welcoming you to this our Fifty-fifth Annual General Meeting.

In 1960, as in other years, the Reserve Bank of India have been vigilant in their efforts towards the proper development of banking in the country. We very much appreciate the consideration which the Reserve Bank of India have extended to banks. It is no small task to endeavour to watch and guide the large number of banking units—big and small—throughout the country. I would express the gratitude of my colleagues on the Board and myself for prompt information, advice and guidance given to our Bank from time to time by the Reserve Bank of India.

Taxation

I am personally of opinion that the recent Budget is framed on a fair basis. I am sure the Finance Minister expects to be criticised whatever he does by one school of thought or the other. A pertinent question has been asked as to how the Finance Minister was to raise funds for the Government if he did not do so by indirect taxation. My answer is that the Government should reduce their capital expenditure on rash projects which have no prospects of yielding good value for money spent. It is believed by many that this is due to the increase of corruption in the last few years and lack of efficiency and competent technical personnel in Government service. At the root of all the trouble is the policy of the Planning Commission who have allowed their imagination to run wild without calculating the disastrous financial consequences of their rash projects. Really good and efficient planning will enable the Government to spend less and to borrow less money from all parts of the world and thus reduce the demand for maintaining the high levels of taxation already imposed and for levying other taxes on all classes of the people.

The Government were spending crores of rupees and claiming that they had raised the annual income of the common man. I do not vouch for the accuracy of this claim but if this is well-founded it forms a very reasonable argument for indirect taxation. The Finance Minister must not forget that India is the heaviest taxed country in the world and that a certain class of people are made to pay almost the whole of their hard-earned income in taxation leaving little or nothing to live upon. Most of them are at present living on their capital. Highly placed officers both in public and private enterprises are made to pay a large portion of their hard-earned salaries in taxation leaving little for the maintenance of themselves, their families and their dependents. The only class of people that appears to be comparatively well off under present conditions is factory labour.

The main necessities of life are food, housing and clothes. Food and housing are the responsibility of the Government. Clothing is supplied by the private sector and, although the textile industry supplies cloth to the public at a cheaper price than supplied by many countries of the world to their people, the Government insist upon lowering the prices because it only affects the private sector but they do very little effectively to reduce the price of food or housing.

All-India Inter-Bank Agreement

In my last two annual speeches I have mentioned the All-India Inter-bank agreement for maximum rates of interest on deposits which the larger commercial banks, about 40 in number, other than the State Bank of India, entered into from October, 1958. Changes in the maximum rates of interest were made during the year from the 22nd August, 1960, and from the 1st October, 1960. I would like to see the State Bank of India, as the largest commercial bank in the country, also joining in the agreement. I understand that the Indian Banks' Association have been making endeavours in that direction. In this connection, I have to inform you that our General Manager, Mr. T. D. Karsara, has recently been elected Vice-Chairman of the Indian Banks' Association.

The Bank in 1960

The Bank's profit of over Rs. 103 lakhs for the year 1960 is about Rs. 20½ lakhs more than the 1959 profit of about Rs. 82½ lakhs. These figures of profit for the two years cannot be exactly compared. Part of the difference between them is because during the bulk of 1960 tax at an appreciably lower rate than in 1959 has been deducted at source from the Bank's investment income.

Before arriving at the profit figure we have, as usual, made appropriate prudent provisions. Sound banking calls for the setting aside of provisions relative to our commitments. Our business is appreciably growing. Our liabilities are increasing. Prudence dictates that, in such circumstances, adequate provisions should be made at all stages.

A final dividend of 12½ per cent, subject to deduction of tax at the prescribed rates, is proposed. This will absorb Rs. 37½ lakhs. An interim dividend of 7½ per cent subject to deduction of tax was paid in August last. The amount of that interim dividend was Rs. 22½ lakhs. The total dividend for the year is 20 per cent or Rs. 60 lakhs, subject to deduction of tax. This compares with 16 per cent, subject to deduction of tax, for 1959 and with 16 per cent, free of income-tax, for 1958. I think shareholders will be pleased at the dividend we are recommending.

The increase in the dividend proposed for 1960 goes to off-set only to some extent the reduction in the net payment caused by the changes made by the Finance Act of 1959.

Audit

The Companies (Amendment) Act, 1960, materially amended the Companies Act, 1956. Section 228 of the main act, as amended, makes audit of all branches of the Bank obligatory. The Central Government have power to exempt branches from being audited as required by the amended Section 228. For 1960, we applied to the Central Government for such exemption and it was granted. For 1961, we do not intend to seek any exemption. My colleagues on the Board and I are, on this point, at one with the legislature. We have a high regard for the safety provided by frequent audit.

Branches

The Bank has a programme of considerable branch expansion.

Staff Relations

During 1960, staff relations in the Bank have been

on a reasonably tranquil basis, but difficulties have not been absent.

General Manager

It is with great regret that I refer to the death during the year of Mr. T. R. Lalwani, General Manager of the Bank. He served the Bank for nearly 43 years, the last three years as General Manager. He enjoyed the confidence of the Board to a marked degree.

In Mr. Lalwani's place, the Board have appointed Mr. T. D. Kansara as General Manager.

Local Committees and Staff

I would express our appreciation of the aid given to us by our Local Committees at branches.

I express our thanks to our General Manager, Mr. T. D. Kansara, for his able management of our affairs and for his unremitting application to the Bank's business. Our thanks are tendered to the staff who have assisted in the Bank's working during the year.

Note:—This does not purport to be a report of the proceedings of the Annual General Meeting

March 31, 1961.

Note: (1) The population of Manipur, N.H.T.A. (Naga Land), N.E.F.A. and Sikkim are not included in the all-India figures.

(2) Population of each State or Union Territory has been adjusted as close as practicable to its present area and limits following the merger and reorganisation of States (1956). Figures for 1961 are provisional.

*The last census of Jammu and Kashmir State was held in 1941. For estimating the 1951 population the increase between 1941-51 has been taken as the mean of the increase between 1941-61.

A STATEMENT

"For India, industrialization is the surest road to peace and prosperity, and in the rapid growth of this nation, basic industries are essential to continued development. I am very happy that the Government of India has called upon my firm to take part in the planning and development of this country's basic industries. We would welcome any further opportunity of devoting our know-how to the advance of India's economy.

With my friends I hope that the real period of co-operation is still to come and that Rourkela is only a first step. In this venture we have worked together with highly qualified and able Indian engineers and workers whom to thank is a special pleasure to me."

Alfried Krupp
Rourkela, January 1960

150 YEARS
KRUPP
1811-1961

Rourkela -- completed in time to mark the conclusion of the Second Five-Year Plan -- is Asia's most modern steel plant. It is India's pride, but our's as well. 150 years of pioneering in industry, 150 years of world-wide experience went into Krupp's share of what His Excellency, President Rajendra Prasad, called a major contribution to India's nation-building efforts.

Dent in External Affairs

THE debate this week on the demands of the Ministry of External Affairs has revealed marked uneasiness in Parliament on the unwise complacency of the Ministry, particularly in South-East Asia. It was not to be expected that the grants would, in any way, be refused. But, undoubtedly, the tenor of opinion, even in Congress circles, was more on the side of Acharya J. B. Kripalani than on the side of the Prime Minister. This is so marked a change from the universal, almost mechanical, acceptance of the Prime Minister's statements on foreign policy in the past that one should ask seriously whether or not the dents made in the Prime Minister's armour on this occasion are of lasting significance. On a first showing, the Prime Minister's reply was inadequate, with its painful reiteration of the point that on our borders India is ready for all eventualities, but for no adventures in military or, indeed, in any other spheres. This is precisely the complaint against the Ministry of External Affairs. All initiative has departed from it so far as India's immediate responsibilities are concerned. So far as the Congo and distant places are involved, adventure and military risks are being taken without adequate calculation.

Undoubtedly, the feeling inside the country—which may or may not be reflected by the crushing defeat of the Congress in the New Delhi Parliamentary by-election this week—is that the Prime Minister's foreign policy on China has placed this country in a position of humiliation, by no means offset by the rising prestige of our policy abroad, particularly by the dramatic acceptance by the United States of neutralism as the correct policy for Laos, and, presumably, for other areas in South-East Asia. The point that was made in the debate that not a single newspaper in South-East Asia had carried a notice of the splendid Rangoon Report on the boundary question between India and China was driven home, and is now widely recognized as a major reflection of the failure of our publicity in this strategic area. Anyone reading this Report must be pro-

foundly convinced of the great worth of India's case on this particular question. Yet the People's Republic of China, with its constant refrain of the Panch Sheel and the non-aggression pacts, has created the impression that there has been no aggression, in fact; or, if there has been a temporary lapse, it can easily be corrected with the abundant goodwill which China is prepared to disseminate with non-aggression pacts, peace treaties and other general instruments of friendly diplomacy. The point driven home in the Rangoon Report that the boundary between India and China has been "defined by nature, confirmed by history and sanctified by the laws of nations" has passed entirely unnoticed. The corollary, which is that there is nothing to negotiate on a boundary which has been so precisely defined, has been lost because of the extraordinary incapacity of our diplomats in South-East Asia to seize their opportunity.

Something is surely wrong in this respect, and nothing was so weak as the Prime Minister's defence of the officers entrusted with this particular charge. In fact, the three officers he mentioned for distinction, have not served in South-East Asia at all. The point that China is winning all along the line diplomatically in South-East Asia, even to the point of creating a feeling that our unanswerable case is by no means documented, is the measure of the failure not merely of the officers concerned but the whole Ministry of External Affairs. Not the least of the failures of the Ministry of External Affairs—as the Rangoon document shows—is that the Chinese have quoted several statements of the Prime Minister of India in support of their case, some of them long after the "dispute" arose. It is incredible, in view of the precise information available in the Rangoon documents, that the Prime Minister should have admitted that the boundary in Ladakh and Tibet had not been defined and that a "dispute" had arisen about the boundary in the Western sector. Either the Prime Minister has not realised the

full significance of the Indian case himself or he has been inadequately briefed by his officials who allowed him to make these damning admissions.

The fact remains that the Ministry of External Affairs can no longer lay the flattering unction to its soul that it knows more about India's external affairs and their management than do other informed sources in the country. Acharya Kripalani was certainly right in complaining that the Minister in-charge of the Ministry of External Affairs, who is also the Prime Minister of India, is inevitably neglecting his portfolio. The answer that we need a very high-powered Minister of State to be in effective charge of detail is inescapable. But an additional Minister is by no means an answer to the whole disease. Chaos on compartmentalisation reigns supreme. Senior officers in the Secretariat are allowed to function without any integrated pattern of work. Thus the Commonwealth Secretary is responsible for South-East Asia, but not for China. Indeed, the Commonwealth Secretary is not even responsible for Canada, which is included in a strange division called "The Americas". One would have thought that China and South-East Asia would have been under a single integrated command, at least for administrative convenience. The whole Ministry of External Affairs has grown up haphazard with no pattern of forward thinking built into the system. Sometimes the Foreign Secretary, sometimes the Commonwealth Secretary, some-

times a Joint Secretary, sometimes a Deputy Secretary—sometimes none at all—handle compelling situations which result in hasty utterances by the Prime Minister which do serious damage to vital Indian interests. The thorough reorganisation of the Secretariat and the planned integration of its divisions between Joint Secretaries and Secretaries has now been driven home as a first necessity.

For the immediate present, while the reorganisation of the entire Ministry of External Affairs is pursued, there is the urgent problem of countering Chinese moves in South-East Asia, all of which have been designed—and that too successfully—to black-out India's case and to substitute Chinese thinking over the whole area. We need to throw into this battle the best talents that we possess, particularly in the field of publicity. Publicity means not only that copies of the Rangoon Report should be made available to all the newspapers and leading citizens of these countries, but that a personal explanation should accompany a concerted attempt to explain the issues involved. Perhaps the best way would be for Mr. J. S. Mehta, Director of the China Division and Leader of the Rangoon Delegation, and Dr. S. Gopal, Director of the Historical Division, Ministry of External Affairs, to tour over South-East Asia to explain to all those interested how deeply mistaken they are in assuming that there is any sweet reasonableness on the Chinese side.

Defence Ministry in the Dock

THE latest Audit Report of the Defence Services' Accounts contains several scathing criticisms on some financial irregularities committed by the Ministry and the slow progress made by some of its manufacturing concerns. The dust finds it difficult to settle over the "jeep" scandal. The Report refers to utter disregard to rules and regulations in allowing a senior official of the Indian Navy to continue to draw his full salary and allowances even though the officer concerned had been placed under suspension consequent upon the charge of a murder by him. The Comptroller and Auditor General has not been able to receive satisfactory explanation for this from the Defence authorities.

Mr. A. K. Roy in his Report has found grievous fault with the budgeting procedure adopted by the Ministry of Defence. Large savings in all grants (for the Defence Ministry), he says, have become regular feature for several years. Savings on budget estimates during the years 1957-58, 1958-59 and 1959-60 have been of the order of Rs. 10.02 crores, Rs. 22.68 crores and Rs. 17.59 crores. These lapses, he adds, show that estimates are prepared without concerted planning and properly assessing the spending capacity. To some extent over-budgeting may be justified because authorisation of excess expenditure by Parliament takes time and work cannot be held up for lack of authorisation especially in the case of Defence Ministry. But if they become a regular feature, these lapses can be hardly condoned.

Instances of "bad planning" and "lack of foresight" continue to multiply with the result that quite an appreciable amount of unnecessary expenditure, not to an inconsiderable extent in foreign exchange, has been incurred. Machinery and equipment worth lakhs of rupees, purchased

several years ago, is lying in stock unutilised either due to the fact that it was found to be surplus to requirements or owing to the reason that proper arrangements were not made in advance for making use of it; the cases in point are ordering of spare parts for mechanical transport vehicles at a cost of Rs. 2.64 lakhs, import of five sets of equipment by the Naval authorities at a cost of Rs. 2.5 lakhs when they had seven similar sets already in stock and import of equipment and machinery, costing Rs. 17 lakhs, for construction of two naval vessels. There have also been instances of unnecessary downgrading of vehicles due to improper maintenance, incurring of infructuous expenditure on conversion of a barge, acquisition of a launch and partial overhaul of nine aircraft which had to be cannibalised later for want of spare parts. Considerable avoidable expenditure has also been incurred on aviation fuel storage, illegal discharge of some temporary staff and un-economic acquisition of land for Defence establishments. Costly equipment such as a 10-ton capacity crane, power house machinery and weigh bridges, is lying idle and deteriorating for lack of proper maintenance.

There have been also cases of lack of proper inspection at the time of acquisition of stores and equipment. A dredger, purchased at a cost of Rs. 35 lakhs, had to be repaired soon after its arrival in India. Similarly, a newly constructed mine sweeper, costing about Rs. 48 lakhs, had a major breakdown during its maiden voyage and had to be repaired at a cost of lakhs of rupees which could have been saved if the purchasing authorities had shown a little more vigilance in ascertaining the guarantee period for it. Instances are also not lacking where expenditure was incurred without taking the necessary permission

from the Ministry of Finance. As many as 29 instances are cited in the Audit Report where expenditure of Rs. 2,000 or above was incurred without receiving the required sanction. Not all the cases are such where emergency requirements warranted incurring of the expenditure without proper sanction. This only shows that the Defence authorities have little regard for financial regulations. Considerable losses, amounting to nearly Rs. 17 lakhs, have also been incurred by the Ministry owing to non-revision of hire charges for military vehicles for over a decade during which costs have been progressively going up.

A more discomfiting disclosure in the Report, however, is that there is at present a good deal of slackness at various Defence Service manufacturing concerns, notably the Machine Tool-cum-Prototype Factory and some Ordnance factories. The Machine Tool-cum-Prototype Factory,

which went into production in January, 1953, is yet to show a return on the capital invested. To cap it, it had incurred upto 1958-59 a loss to the extent of Rs. 77 lakhs. Certain work orders placed on Ordnance factories nearly six years ago for the manufacture of stores have yet to be completed; as much as Rs. 9.53 crores had been locked up in such incomplete work orders by the end of 1958-59. The manufacture of tractors and trucks in Ordnance factories, undertaken two years ago in collaboration with a Japanese firm and a German firm respectively, is considerably behind schedule. There is trouble with the Avro in Kanpur. The prototype is running far above scheduled weight which will probably make it quite useless for civil aviation. It looks as though a major crisis on this will break in August. The country is often disturbed about other matters in Defence; it is time it took these financial irregularities also into account.

Rourkela—The Final Balance Sheet

THE inauguration of the wide strip mill at Rourkela by the Prime Minister on March 28, marks the happy completion of a massive effort in Indo-German collaboration which possesses certain distinct features of its own. The steel plant at Rourkela is the most "modern" of the three public sector units, and the only one in the whole of the Mainland of Asia to be operated by the L.D. process. It will provide key deficiencies in steel supplies—heavy plates for ship building, locomotives etc. and, when the cold rolling mill is completed in the middle of the current year, it will feed a very large number of industries with tin plate, which is in short supply currently. The plant is so designed as to make use of all its by-products in such a way that almost nothing goes to waste. Its fertiliser plant using hydrogen, freed when oxygen is used in the L.D. process, ensures one of the cheapest units in the world for fertilizers and a happy cost-reducing component for steel. For broad imagination in execution, both India and Germany can stake substantial claims.

No less than thirty-six German suppliers co-operated for this ambitious project, the leading part having been played by Krupp, Demag and Siemens. The plant is a model of German efficiency in planning and lay-out. It is to be conceded that co-ordinating the activities of no less than three dozen German companies was a difficult task; some confusion in the earlier stages was unavoidable but the final product bears testimony to the fine craftsmanship and engineering skill of the participants. A majority of the engineers who assisted in the erection of the plant are now planning to return to their country, though the services of nearly 200 technicians are being sought for maintenance purposes.

Shortfalls in production at Rourkela in relation to the installed capacity have come in for severe criticism in the thirty-fourth report of the Public Accounts Committee of the Lok Sabha. During April to August 1960, the output of pig iron and steel at Rourkela was less than fifty per cent of the rated capacity, mostly due to "the frequent break-downs in the dolomite calcining plant". The Director of Commercial Audit has also drawn attention to the loss in production while reviewing the accounts of the Rourkela plant for the fiscal year 1959-60. The critics, it

seems, have taken an unhelpful and petty view of the necessary preliminary troubles which are sure to be overcome within the next few months. The real danger in Rourkela is not any defect in the plant but the failure of Hindustan Steel to grapple with its own personnel problem. Even a casual visitor to Rourkela cannot fail to note the need for spontaneous, co-operative teamwork for the efficient working of the plant. Unfortunately, the "human factor" at Rourkela has been handled in an unimpressive manner, causing discontent amongst the Indian workers in almost every rank, from the unskilled worker upwards.

The decision to invite about 200 engineers for maintenance purposes is causing a little dismay amongst the Indian supervisory staff who seem unhappy over this decision. It needs to be impressed upon these Indian technicians—and it is here that the management of Hindustan Steel has failed—that the German technicians are not likely to stay here for ever and sooner they bend their shoulders to the task and take the responsibility of running the factory at an efficient level, the quicker would be the process of Indianisation of the plant.

A word needs to be said about the lack of spares which have from time to time hindered the smooth working of the plant. It has happened sometimes that a vital spare part has not arrived from Germany for days, necessitating closure of certain wings causing sizable losses in production. It is necessary for Hindustan Steel to keep its inventories of spares under constant check and adopt a judicious policy of keeping a comprehensive stock of essential spares.

And the German co-operation which started six years ago is not going to end here. Plans are now being laid in order to double the capacity of the plant during the Third Five-Year Plan so as to take its total capacity to 1.8 million tons. Rourkela is a living symbol of Indo-German co-operation and friendship and the country is indebted to the German Government and the German people who have rendered invaluable help in the erection of this unique plant. This is the time for a great broadening of Indo-German co-operation. Rourkela is a worthy base on which a much larger structure should be built.

A DELHI DIARY

TIME FOR TIMMY

DELHI is naturally divided hotly on personalities as I suppose it is divided on principles. We hear more, however, about personalities because somehow personalities are concrete while principles, in Delhi at least, are vague. However that may be, I am giving first place to Timmy—General K. S. Thimayya—because I feel that he has deserved (and even among those who disagree with him, he has captured) the spotlight this week. There are few soldiers in the Indian Union who will ever be able to attract respect, admiration and, in moderation, displeasure as Timmy did. His forceful utterances, his frank and open manner, and the image that he created of a typical Indian soldier, capable of doing every job from the jawan's right up to that of the Chief of the Army Staff, instilled in a very large number of people a feeling that he was something unique. Not being a soldier, I cannot speak of his basic military qualities which, everyone tells me, are superb, but I can say that his departure this week will leave a great gap in "colour" in the Indian military scene. Not even a Defence Minister who is the greatest controversialist of our time, or the new controversialists lower down in the Army will compensate in colour for the departure of Timmy. I bid him goodbye from these columns with a hopeful feeling that he will return to the Delhi scene in another capacity, in which his deep military knowledge and his great popular following will win more appreciation in official quarters than his current assignment has done. I hope no one will accuse me of having introduced a political note into high defence strategy!

RAP FOR THE CONGRESS

Part of the feeling of sadness at Timmy's departure is the belief that, on military matters, in particular in our current situation with China, his capacity to lead was greater than that of any Indian military officer before or since. Has this feeling flowed over a little into the political field? The pundits who now—unlike the astrologers of old—analyse events only after their occurrence, tell me that feeling on China has played a significant part in the election of Professor Balraj Madhok in place of the Congress candidate, Rana Jang Bahadur Singh, whose failure I mourn as becomes a good trade unionist concerned with the prestige of his profession rather than of the "larger" issues at stake. I avoided the hurly-burly last Sunday, and dreadful to relate, did not even record my vote. This was largely because I was attempting to keep the Sabbath holy, which means separate from politics. But in fact, the issues were so badly drawn on this occasion that it was impossible to know where to put a valuable cross.

CRICKET FOR DIPLOMATS

Another reason for my abstention—one for which I deserve ample forgiveness—is the fact that for the whole of this week I have been wrestling manfully with an official document described as the "Report of the Officials of the Governments of India and the People's Republic of China on the Boundary Question." It is priced deceptively at Rs. 3, but runs into well over 600 pages, though skillfully, after page 340 has been reached, there is a new numbering called 'CR' which leads one on for another 213 pages blissfully in the belief that they do not contain compulsory reading. In point of fact, references are so detailed that the authors of this splendid report compel one to read every line of the aforesaid addition—including some extraordinary notes such as these: "Ch'ien lung nei fu yu t'u map (1760)", "Chin ting hwang yu hsi yu t'u chih (1782)", "Chia ching chung hsiu ta ching yi tung chih (1820)", "Chin ting hsin chiah chih lueh (1821)"

I hope my Chinese has been somewhat improved in the process!

However, the ordeal has been made attractive by my setting the Indian and Chinese delegations on opposite sides of a cricket field. It is good to look upon diplomatic exercises of this kind as a game of chance (or is it skill?). In this particular case both the batting and bowling on the Indian side was markedly superior; largely, I suggest, because of the straight-bat technique which has not been practised in the People's Republic. So far as the documents are concerned, I am happy to note that India's batting average was higher than the Chinese in every sector—Legal Basis, Traditional Basis, Administration or Sectorwise. Thus on the Legal Basis we scored 114 runs against the Chinese 47; on the Western Sector we had 169 against 66; on the Middle Sector we scored 235 against 41; on the Eastern Sector 122 against 91. Our total score of 630 runs against the Chinese 245 would have entitled us to make them follow on. Happily for our side, which batted gallantly for six months in Rangoon, no follow on was proposed.

FOLLOWING ON

On the other hand, may I say that I am convinced that it is India and not China that needs to follow on? The great value of this report has been seemingly lost on the Indian public. I myself have not been able to obtain a copy of this scarce commodity until this week. I cannot see why such an important document was not printed in tens of thousands and distributed on, what is cheerfully described as a "global" basis, charity, of course, beginning at home. It is full of interesting sidelights on the Chinese character. There are cheerful contradictions on Tibet; for example, on page 247 it is pointed out that Tibet had, by Chinese admission, enjoyed treaty-making powers and the right of direct dealings with neighbouring States. On page 249 this is made more specific by the point that the "formalisation" of the McMahon Line was acknowledged by the Chinese Central Government of the time, yet the Chinese case is that the McMahon Line has never been "delimited". On page 274 the crooked bat has been exhibited perhaps more than anywhere else. The Chinese ask the extraordinary question: "Can it be said that a sovereign state has no right to reserve its position concerning question of its own sovereignty and to raise it on 'suitable' occasions?" This is great exercise called the art of timing. One waits for a long time to lull one's Panchsheelian friends into an appropriate sense of security; then one discharges a brigade or two in order to establish a claim which has never previously been made. This is not aggression; it is merely a border dispute, reserved for a 'suitable' occasion.

Thus it comes about that in the excellent principle in Panchsheel which refers to national integrity, silence "for the duration" is, for the Chinese, a golden rule. Amongst other things, Chinese diplomacy implies that boundaries are traditionally drawn as well as that they are non-traditional; that they are not delimited and that they are delimited; that maps in existence before the People's Republic of China are both correct and incorrect; in fact, that everything that a sovereign State does can be undone because of its sovereign right to act at any time considered suitable for the purpose. I have succeeded at long last, in persuading the Editor of 'The Eastern Economist' to examine this document which I have solemnly presented to him today on behalf of the External Affairs Ministry to do a Blue Supplement on Chinese Diplomacy which has now replaced that old version of Chinese torture by which a man was kept in two worlds by an extension between life and death indefinitely.

—ARGUS

THE WEEK'S NOTES

By-election

A MAJOR CONGRESS REVERSE

IN LAST Sunday's by-election for the Lok Sabha seat from the Capital city, caused by the resignation of Mrs. Sucheta Kripalani, the Jan Sangh candidate, Mr. Balraj Madhok, swept the polls, defeating his Congress rival by a solid majority of 9,581 votes and driving the remaining four candidates to the predicament of forfeiting their deposits. Mr. Madhok polled 47,184 votes as against the Congress nominee, Rana Jang Bahadur Singh, who got 37,603. Among the four to lose their deposits, the Hindu Mahasabha candidate polled a miserable 955. The Swatantra Party met this doom in its maiden contest, although its candidate made a better showing with 5,722. The fact that the Communist-supported independent candidate polled 10,479 votes indicates that party's relatively stronger hold.

The defeat of the Congress Party in what was regarded as a test by-election has several implications. When concession is made for the general low polls at by-elections, 44.7 per cent in a New Delhi constituency was a poor record. The victory of the Jan Sangh is primarily due to the energy and drive with which the party mobilised its election machinery. This could not have been possible without full enthusiasm at all levels from the leadership to the rank and file. But it must be recalled that in the general elections of 1952 Mrs. Kripalani, standing on the Congress ticket, defeated Mr. Madhok by a smashing majority of 54,000 votes. Factors other than organizational efficiency and enthusiasm of supporters also brought much accession of strength to the Jan Sangh. Central Government employees constitute a dominant force in the constituency and their resentment against the Government's relentless handling of their last year's strike as well as the subsequent withdrawal of recognition from their trade unions drove them into the Jan Sangh camp. If this was so, the sacrifice of votes on this specific score was a price well worth paying by the Party in power for pursuing a fearless policy in a grave national crisis, regardless of consequences to its own interests. The proximity of the general budget brought some casual advantage to the successful party.

But the deeper implications lie elsewhere. The fact that as high a proportion as 56.3 per cent of voters remained indifferent and did not cast their votes is significant. Obviously most of them were beyond the influence of the Jan Sangh. Many of them could have been drawn to the polling booths. The local leadership of the Congress and its organizers at the level below were lukewarm during the hustings. The choice of the candidate reduced their campaign to a mechanical activity and this was probably the major cause of the victory of the Jan Sangh. It speaks for a new threat. The tendency on the part of the High Command to impose decisions on the local leadership is hardening into a predominant trait. It is an unhealthy trait, highly injurious to the democratic base of the party on which its internal strength will always depend. Distribution of tickets at the elections ought to win overall approval of local leaders and workers. This warning has come at a propitious time when the general elections are not far off.

Sindri

SEARCHLIGHT

THE SEARCHLIGHT thrown on Sindri Fertilizers by the Estimates Committee in its hundred and twentieth

report to the Lok Sabha serves the purpose of analysing the snags in the working of this major plant which have caught public attention in recent months. Due allowance ought to be made for the fact that during the period covered by the Estimates Committee's report up to 1959-60 occasional shortage of coal was a contributory factor to the unsatisfactory level of output. But the fact remains that the noticeable decline from 1957-58 onwards cannot be explained away on the plea of coal shortage alone. In 1959-60 only 81 per cent of the rated capacity was used as reflected by the output of ammonium sulphate—the principal product of the factory. Production of ammonia, gas and coke also recorded declines from 1958-59.

The current difficulties of production at the plant at Sindri are attributed to requirements of overhaul of an unusual magnitude. The Estimates Committee could not avoid resorting to scathing criticism of both the management of the company as well as the Ministry for their silence on the report of the Zaheer Committee which investigated into the causes of the sharp decline in output. The principal finding of the Zaheer Committee to the effect that the generators were recklessly worked beyond permissible limits "to keep up flagging production" explains why the plant came up against the crisis of drastic overhaul.

The financial management of the plant reveals major spots of weakness. Depreciation raises the problem for hard thinking as regards revised appropriation of reserves. On March 31, 1959, the total value of the plant and machinery was Rs. 1,675.7 lakhs, as against which depreciation provided was Rs. 88.9 lakhs or half. This was after nine years had already run out as against the estimated life of the assets of 12 years, which may possibly be revised to 15 years. The Depreciation Fund has been utilized, curiously enough, in the expansion of the plant and there is hardly anything left to take care of replacement of the old plant. Hopes are pinned on raising enough reserves in the next six years. Net profits on the capital employed declined from 5.69 per cent in 1956-57 to 3.77 per cent and 3.79 per cent in the next two years. The last two figures strengthen the scepticism about the capacity of public sector enterprises to contribute impressive surpluses to finance outlay on public sector development—and fertilizer plants are ranked as pace-makers of surpluses.

Communalism

SUPPRESSION OR ERADICATION?

JABALPUR HAS forced an agonizing reappraisal of the strong roots which communalism continues to retain long after partition. In between there were some unfortunate incidents, and trends which gave a reminder that communalism was by no means a dead force in Indian political life. But it would appear that the Congress Party adopted an ostrich-like attitude to this question. Nevertheless, it has compensated for past lapses by reacting promptly to the latest resurgence of communalism in an ugly form.

Mr. Lal Bahadur Shastri carried the House with him, when, in the course of his reply to the debate on the Home Ministry's demands for grants, he asserted that the Preventive Detention Act would be used ruthlessly against mischief-makers and their sym-

thisers or patrons who capitalise on communalism. Currently the committee on communal harmony, appointed by the Congress Parliamentary Party, is seized of this problem and it is expected to make concrete proposals on Mr. Pahadia's resolution to put a legal ban on communal organisations. A legal ban on parties fostering communalism will require careful consideration at a high technical level. What exactly is intended to be banned is far from clear at this stage and it seems that there is not a little confused thinking about it as demonstrated by the shift in emphasis from organisations with communal or religious labels to communal activities of political organisations. In the case of the application of the Preventive Detention Act, in spite of Mr. Shastri's assurance of careful precautions against abuse of this power by the ruling party, the question of drawing up the list of potential mischief-makers and trouble-shooters cannot be left to the police or other administrative services alone. A workable judicial check seems desirable.

Mr Nehru put the correct emphasis when he stated that legal action either through preventive detention or a regular ban on communist organisations in contesting elections is not a sufficient answer to this deep-seated disease. Legal action will lead to suppression which may be useful and inevitable in the short run, but it may drive the forces of communalism underground and the question of their eradication would remain unresolved. Reorientation of thinking and of psychological attitudes on this issue is what is clearly called for. It ought to be brought about as an integral part of the drive to educate the public on political and social matters.

But the deplorable fact of Indian political life today is that expediency is a great ally of communalism. The Congress Party will have to do a good deal of real heart-searching. Its alliance with the Muslim League during the Kerala elections and current whispers about its feelers to enlist support of the revived Muslim League in Bombay to obtain a working majority in the Municipal Corporation after the recent election (if genuine) are deplorable lapses. Casteism is as much a threat to national solidarity as communalism is and in fact they are two facets of the same evil. Casteism is one of the powerful forces behind groupism in several State Congress organisations. Distribution of party tickets at elections on caste considerations is another grave surrender to expediency about which the Congress Party will have to do real hard thinking. This problem requires that correct psychological attitudes must be bolstered by conduct beyond reproach, regardless of some likely set-backs in the short run.

P & T

EXPANSION WITHOUT CONSOLIDATION?

NEWSPAPER HEADLINES have highlighted the recommendation made by the Estimates Committee that preferably loans from the World Bank and the Life Insurance Corporation should be obtained to provide adequate funds for the expansion of communications. The marginal allocation made in the Draft Third Plan for this purpose makes this course desirable. But it is equally important that attention should be paid to consolidating the expansion already achieved.

It is an undeniable fact that in the urban areas delays in delivery of telegrams and money orders have become chronic. The complaint procedure has little corrective value. Delivery of express letters has brought a bad name to the P & T Department. The fact of inordinate delays is admitted by the Minister

for Transport and Communications. But the attitude taken by him is curious. He said in the Lok Sabha in December last that if the express delivery system continued to involve deficits it would be closed down. This is certainly not the way of meeting a genuine public handicap. The Estimates Committee has rightly insisted that this essential facility ought not to be withdrawn on this score. The telephone service is still another indicator of P & T's standards of efficiency. In the capital city disturbances and simultaneous double conversations are quite common, while frequent connections with wrong members penalise the user who has to pay on the basis of number of calls.

It is understandable that in the rural areas difficulties of maintaining and disbursing cash should cause delays in the deliveries of money orders. But no such handicaps can be pleaded in respect of delivery of ordinary mail. At the present time about 43 per cent of India's 5.57 lakh villages enjoy the benefit of daily delivery service of mail on the basis of the criterion of receipt of 30 letters per week per village. This signifies the low volume of mail traffic. Even so, delays in delivery are inordinate in the fair weather season also when there are no handicaps of dislocation of road communications.

The services provided by the Communications Ministry are becoming increasingly indispensable appendages to normal business or professional activities. This lends urgency to a sustained drive for continuous improvement in standards of efficiency.

Lok Sabha

THIN ATTENDANCE

ON MARCH 29, the Minister for Works, Housing and Supply was caught napping. It was virtually the flag-end of the day's session, when, a little after 6 P.M. the Chair called upon him to reply to the debate on his Ministry's demands for grants. The Minister was taken unawares since he expected at least a moderate number of speakers to participate in the debate in which case his turn for reply would fall due the next day. He pleaded that his reply should be postponed to March 30 on the ground that the allotted time was meant to accommodate a sufficient number of speakers. Apparently, the reason was quite different. In deference to the Minister's wish the House was adjourned. Was it proper to insist on exhausting the allotted time when the House carries a very heavy agenda?

The report about this incident in the local press states that in the entire House there were only 10 members. This extreme degree of thinness speaks for the sense of duty and responsibility displayed by the people's representatives at the highest level. Members of the Lok Sabha who vie with each other in showing solicitude for the tax-payer during the general debate on the budget do not deem it necessary (in good conscience?) to keep vigilance on the disbursements of public funds to the spending authorities.

It is not merely the ordinary members of the House who lend support to its emptiness. This distinction is also shared at times by the occupants of the Treasury Benches. There have arisen some occasions when the Speaker was constrained to issue admonitions to erring Ministers for their failure to be in the House when their presence was required for business. Parliamentary standards may be judged by various tests. Among them attendance is an important index of members' earnestness.

The European Scene

TRADE WAR AND DISTORTION

From Our Special West European Correspondent

PARIS, April 2.

IF only all wars between blocs of nations were like the trade war between the Six and the Seven, into which West Europe is now divided! After three years of this famous war, no one has drawn blood and everyone is winning. With a little good management, this war could go on for ages yet, with victors, victors everywhere and no vanquished. All the 13 economies engaged in it are healthier than when it began, including even the British economy—the current speculative assault on sterling has nothing to do with cross-Channel trade losses. Participation in the struggle seems to be so invigorating that neutrals are eager to join the fray: Spain on the side of the Seven, Greece and Turkey on the side of the Six. The beauty of this curious war is that the real battle is done between allies on the same side, and a country that finds that it is strong enough to stand up to its allies is then able to deal more generously with its "enemies" in the other camp. For example, France who three years ago was too weak to face any outside competition has had to reform her affairs in order to live with her trade ally, West Germany, and is therefore able to deal at Britain and the USA such devastating blows as reducing her customs duties on British and American goods!

If things go on at this rate, each of the 13 countries will end up trading more freely with countries outside its own bloc than it did before the trade war started—while, of course, trading more freely still with countries that do belong to its own bloc. If that process be called the "economic division" of Europe, then the division has become more marked since the start of the year, and the building of a "bridge" between the two blocs has to that extent become more difficult. Admittedly, each bloc accompanied its recent decision to hasten its integration with protestations of its willingness to co-operate with the other bloc; formulae to that effect have become a ritual at all international conferences in West Europe. However the rival blocs now have a momentum of their own and it will take more than international conferences to impede their further, independent development. The vision of a 13-nation trading unit—a market of 300 million consumers, as it is called—remains lively in some quarters, inside the Common Market as well as among the Seven, but its chances of becoming reality are as remote as ever. Meantime, West Europe in practice is settling down to the regime of two separate trade blocs that must try to get along together with as little mutual damage as possible.

In that perspective, the series of Anglo-French trade talks which began last month and are to be continued next month are interesting, because they bring face to face the "extremists" of the two blocs; the country that thinks it has most to lose and the one that believes it has most to gain from the progress of the Common Market. At these meetings there is some general discussion of the possibility of fusing the trade blocs, but that is not very serious, since both know that it is too late or much too early to form plans in that sense. The main question concerns trade between Britain and France now that they belong to different trade blocs, and the way this issue is dealt with is watched by their partners as a test case. If the formation of rival blocs is really pernicious for Europe, its ill effects will show up first in Anglo-French trade. This is because Britain is by far the largest exporter of the Seven, while France is, if not the largest importer of the Six, the country whose retreat from high

tariffs is most discriminatory to outsiders and most favourable to her Common Market partners.

Once the British and French trade experts got down to facts and figures they discovered what the much talked of "discrimination, distortion and division" meant in actual practice. The figures are there. The Board of Trade has published Britain's 1960 export statistics which show that the island's sales to the Common Market increased by 10 per cent, or exactly the same as the increase in British exports to her partners in EFTA! That is, despite the advantage that British goods enjoyed in the seven-nation region because of discriminatory tariff cuts, and despite the disadvantage they suffered in the Common Market because of internal preferences between the Six, Britain did as well in one region as in the other. The discrimination was there, but the division did not appear. Equally important, Britain increased her trade with the Continent and that by the substantial proportion of one-tenth.

It must be admitted that the amount of discrimination was still moderate last year, because the two trade blocs were just beginning. Since then, the Six have increased their internal duty cuts by 10 per cent, and the Seven theirs by 20 per cent. It might be said that matters will worsen as each intensifies these internal preferences, but it would have to be confessed that there is no sign yet of disaster that was forecast three years ago. Moreover, other things have happened this year besides the internal duty cuts, and they are significant enough for me to hazard the prophecy at this early stage that British exports to the Common Market will increase this year again, and probably by more than 10 per cent. The first and most obvious is the upward revaluation of the currencies of two members of the Common Market, West Germany and Holland, which facilitates British sales to those countries. The second is the wholesale reduction of French import duties, by 7.14 per cent for most items and by 14.28 per cent for the rest. The next, just announced, is the total liberation (i.e. removal from the quota list) of a group of manufactures imported into France, many of them being British export specialities. This decision, which of course multiplies the significance of the duty cuts, will mean that from April 1 French imports have been liberalised to the extent of 95.75 per cent. (The balance that remains on quota relates to agricultural produce).

To these stimulating influences for British trade must be added the decision of the Common Market to move toward a common external tariff as though that tariff had been reduced by 20 per cent—which it will be officially when the Dillon negotiations in GATT succeed. Already this means, months before the GATT talks begin, that the rise of German tariffs made inevitable by a common external duty level is less severe, and the fall in the French and Italian tariffs more severe, than would have been the case. Finally, the level of business activity in the Common Market region has been maintained so far this year well above that of a year ago, even though the rate of expansion has slowed down. All of these factors added together suggest that British sales to the Common Market this year will be larger, despite the increase in internal preferences.

It is no answer to say that these stimulating influences could have been felt without the discrimination of the Common Market's internal duty cuts

and then Britain would have been better off still. On the contrary, all of them save the revaluation of the mark and the florin are direct consequences of the progress of the Common Market, and of the increased competitiveness of Continental industries that the Common Market made necessary. In other words, it is intensified trade within the region that is making possible intensified trade with countries outside that region, and in the first instance with the biggest and nearest, Britain. The same is true of the more active role that the Six, and notably West Germany, have consented to play in foreign development aid, which must have indirect but useful consequences for British overseas trade.

Another element in Britain's trade success in the Common Market is the fact that British exporters have been convinced by their own Government's propaganda that it is becoming much harder to sell in the six-nation region and much easier to sell in the seven-nation zone. So they have been making vigorous export-promotion efforts in this area, which have borne fruit. On the other hand, they have neglected export-promotion in the EFTA countries to the point where London is planning a campaign in favour of trade with Scandinavia, Austria and Switzerland. The fact is that business men everywhere overestimate the harmful effects of a tariff disadvantage and the beneficial effects of a tariff concession, and then, having made that error, do all they can to compensate for the former while leaving the latter to work "by itself." The upshot very often is that they lose nothing on the one hand and gain little on the other, because their own sales efforts are more important than the relative level of duties.

This is especially true of the sort of goods traded between Britain and the Continent. Granted that agriculture is everywhere solidly protected and that raw materials are duty-free or very lightly taxed, most of the dutiable commerce between advanced industrial nations is in manufactures and luxury foodstuffs, where quality, tradition, taste and snob-value are more im-

portant than the minor price discrepancies caused by differential duties. A certain type of Frenchman will drink Scotch, wear English suiting and ride in a Jaguar regardless of minor price changes, and certain type of Englishman will drink champagne and cognac (the real thing, not Spanish imitations) and insist that his wife follow Paris fashions similarly regardless of tariffs. (Though I was seeking only familiar examples, I have in fact just named some of the most important items in Anglo-French trade). This argument can of course be exaggerated: there must come a time when duty differentials affect trade, for otherwise free-trade areas, customs unions, common markets and the like would have no point. But that time comes later than is imagined, at least in the case of quality manufactures and characteristic foods and drinks, where trade channels show a resistance to change that surprises tariff commissioners.

Indeed, if discriminatory tariff manipulations go on while the absolute level of all duties is falling, as is now the case whether inside or outside the European trade blocs, and if they are accompanied by an abolition of the quota system and by sustained economic expansion in all the countries concerned, then the quantity of trade over all international frontiers can go on increasing and the most that can be complained of is "distortion" of traditional trade channels. On the much abused issue of "distortion" I shall quote the Basle economist, Professor Salin: "What else is the history of trade except one long series of distortions which have accompanied and caused the rise and fall of businesses, cities and trading states? To speak today of 'distortions' is to imagine that the trade channels of 1958 have become a norm. They have not, any more than the trade channels of any other year. Distortions of trade endanger only the fat and the lazy. For active business men they are an opportunity." This sort of language is welcome to developing countries, whose main ambition is to "distort" international trade very decisively in their favour, since its present "normal" course is grossly disadvantageous to them.

Bank vaults are always made of steel...
because steel is so dependable!

symbol of security!

THE UNITED STEEL COS. (INDIA) PRIVATE LTD.

Bombay • Calcutta • Madras

Through the years Steel has come to be considered the symbol of security... not merely physical security, but economic security as well! The larger the amount of steel a country produces, the higher the rung she occupies on the ladder of economically stable countries... the greater her credit in the international market. And that is why India today is striving so hard to raise her output of steel — Steel that will endorse her claim to economic stability... Steel that she can hold up to the world as a symbol of her security.

ajanta US-27A

Economic Report from the U.S.

UNEMPLOYMENT PROBLEM

WASHINGTON, March 29.

THE emphasis in Washington has shifted perceptibly in the past few weeks. It no longer seems to be a question of when the recession will end, but rather of how far and how fast the upturn will go. President Kennedy, the Chairman of his Council of Economic Advisers, his Secretary of Commerce, his Secretary of Labour, and his Budget Director are among the administration officials who are now on record, albeit still a little cautiously, as seeing an upturn in the making. And more and more private economists and businessmen are joining in the swelling chorus of confidence. Most estimates put the 1961 gross national product—the total output of goods and services—at a new peak of between \$510,000 million and \$520,000 million, compared with last year's \$503,000 million. To achieve a rate in that range, the GNP would have to rise by the fourth quarter to an annual rate of \$525,000 million or more, which would be about five per cent above the rate for the fourth quarter of 1960. Naturally, administration officials appear pleased that the recession seems to be ending only a bare 10 months after it began, that it has been held within clearly modest bounds, and that an upturn of some substance is in prospect. Nevertheless, one can still detect a note of dissatisfaction. There remains the vexing question of how close and how soon the recovery will come to achieving the goal of reasonably full employment.

At the last count, unemployment in the United States totalled 5.7 million, or 6.8 per cent of the labour force on a seasonally adjusted basis. President Kennedy's avowed aim is to bring that figure down eventually to four per cent, which would reduce the jobless total to three million or so, and would represent reasonable degree of full employment in the large, complex and highly mobile U.S. economy. The feeling is, however, that it would take a much higher recovery rate than is now anticipated to reach that goal this year. More likely, in the view of many experts, is a 1961 jobless rate closer to six per cent than four per cent, which would leave unemployment in the neighbourhood of four or five million. One of the problems is that unemployment in the United States is an amalgamation of several different influences. For instance, the economy must absorb about one million new entrants into the labour force every year. This means that joblessness can rise even when employment registers new monthly peaks—a paradox that has been evident on a number of occasions in recent months. Also, there are different kinds of unemployment. There is, for instance, a hard core of unemployables, generally unable or unwilling to work. There also is a more or less voluntary type of so-called frictional unemployment, which results from normal turnover and the movement of workers from one job to another. Just how much of the unemployment total these two types account for is a matter of debate, but it undoubtedly is considerable, running according to some estimates to upwards of two million.

This brings us to the cyclical unemployment—the joblessness that rises and falls with turns in the business cycle. During recessions, workers are laid off and job opportunities contract, while during upturns, workers are recalled and job opportunities expand. As business conditions improve, this type of unemployment can be expected to decline markedly. That will not necessarily be the case, however, with the most stubborn of all joblessness—the so-called structural unemployment. This is the result of changes within the economy itself—obsolescence of skills and displacement of workers because of technological advances or shifts in industrial and consumer demand.

It is generally agreed that over the long run there economic changes make for new industrial development, rising living standards, and greatly expanded employment opportunities. But over the short run they can

tries affected. Statistically, over-all employment figures in the United States are based on a nation-wide sampling of all persons who appear to be in the market for jobs, no matter how seriously or effectively. Hence, the rare totals make no distinction as to type and tend to include many "marginal" cases which would not be included in the unemployment statistics of most other industrial nations. It is interesting to note, in this regard, that Canada, the only other major industrial nation which uses an unemployment reporting technique similar to that of the United States, also has been recording relatively high jobless totals. Furthermore, one West European nation that undertook, experimentally, to count its unemployed by the U.S. method found that it yielded a total for the country four times as high as the official published figure. None of this is meant to minimize, nor should it minimize, the interest of the American people—who more often than not are their own severest critics—in reducing the U.S. unemployment total.

Obviously, the faster the economy grows, the more job opportunities will be created. If the growth rate can be accelerated sufficiently, the belief is the economy could absorb workers in growing numbers in all categories—including those newly entering the labour force, those laid off because of the recession, and those victimized by technological progress and other basic economic changes. Nor is this the end of the matter as far as the administration is concerned. High on its priority list for Congressional action is a measure to bring not only relief, but also retraining and industrial diversification to those "distressed areas" of the country where structural unemployment has been a problem. In addition, President Kennedy has set up a new group to study this and related problems. It is the advisory committee on labour-management policy, made up of representatives from the public, labour, business and the Government. The President has stressed the necessity for this new group, which recently held its first meeting in the White House, to examine ways of dealing with the effects of structural shifts in the economy, and of giving direction to wage and price policies that best serve the general welfare.

TRADE PROMOTION

Australia, New Zealand, and Fiji offer opportunities to exporters and importers and the International Division of the Bank of New South Wales can help those interested.

The Bank's complete banking service includes such specialized facilities as trade and industrial enquiries, economic and trade information, and a complete travel service. The Bank, through more than 1,000 branches and agencies, is closely and constantly in touch with industry, business, and agriculture in the areas it serves.

Enquiries may be made through your own bankers or direct to

BANK OF NEW SOUTH WALES

INTERNATIONAL DIVISION
John W. McEwen, Chief Manager

HEAD OFFICE: SYDNEY, AUSTRALIA

First and largest commercial bank operating in Australia, New Zealand, Fiji, Papua and New Guinea, with three branches in London.

WORLDGRAM

India

A New Industry in Mysore State: The Mysore Sugar Company Ltd., is sponsoring a new industry for undertaking the manufacture of cellulose acetate at Mandya. In this connection, Mr. V. Venugopal Naidu, Chairman and Managing Director of the Company, and Mr. T. Shamanna, Director of Industries and Commerce in Mysore, left Bangalore recently by air for U.S.A., U.K. and the Continent, to negotiate with the suppliers of the plant.

No Price Control in Southern Rice Zone: With the withdrawal of the price control order in Andhra Pradesh, there will be no price control on rice or paddy throughout the Southern Rice Zone comprising the States of Andhra Pradesh, Madras, Mysore and Kerala. The Government of India have rescinded from March 21, 1961, the Rice and Paddy (Andhra Pradesh) Price Control Order, 1960 which was in force in the districts of Krishna, West Godavari, East Godavari, Guntur, Warangal, Nizamabad, Chittoor, Srikakulam, and Nellore. In the other three States Madras, Mysore and Kerala the Price Control Orders were withdrawn towards the end of 1959.

United Kingdom

Automatic Garden Sprayer: An ingenious new automatic garden sprayer invented by a British entomologist has now been put into production by a London firm who hope, later this year, to produce a larger model suitable for agricultural use. First shown at the recent International Hardware Trades Fair, in London, the new sprayer has attracted inquiries and orders from 18 countries. It has been demonstrated in West Africa. The device is made of plastic and is therefore non-corrosive, and it can be attached to an ordinary garden hose. It includes a container, metrically calibrated, for any liquid chemical, and by centrifugal force the chemical is correctly diluted, whatever the water pressure. And, whether the three-position nozzle is set for jet or fine or coarse spray, the distribution is always uniform. The garden sprayer, it is claimed, simplifies and increases the efficiency of garden spraying. Work is now proceeding on an industrial model using the same principle. Such a spray, it is believed, would be of considerable value to farmers, market gardeners, and fruit growers in many parts of the world, and particularly where spraying from the air is not practical.

New Refractory Material for Radar Work: Development of an important new refractory material for radar work is going ahead at a factory in the North of England. The material called Termilode, enables a radar station to stand by or test on full power without transmitting a signal by which it can be detected and without causing interference to other stations. The manufacturers claim that the material represents a new break-through in the field of power absorbing loads. It combines the advantages of thermal shock resistance with chemical stability and controlled electrical properties. Loads are under development for a wide range of frequencies and Termilodes have been run successfully with a power dissipation of 8 kw (mean).

Vyon—A New Type of Plastic: A recently developed British plastic with valuable porous qualities is to be made more widely available for world export. Known as Vyon, its chief characteristic is its permeability—air, liquid, smoke or gas will pass freely through its surface. It also has the merit of being light in weight, is used for filtering acids it will not corrode. It can also be moulded. And it is hygienic—suitable for use with

food handling equipment,—and is inexpensive. It is made from high density polyethylene and the degree of permeability can be adjusted to the users' requirements. It has already been used for many industrial, scientific and medical purposes, but its potential range of uses is unlimited. Extensive tests for its use in orthopaedics were made at the Royal National Orthopaedic Hospital in Middlesex, England. One of the merits for Vyon in this field is that it permits the passage of water vapour and thus allows the evaporation of sweat—in other words a plastic that breathes! It is also used more successfully in the manufacture of nail arms for poliomyelitis patients.

U.S.S.R.

Soviet Union's Longest Gas Pipeline: The Soviet Union's longest and the world's most capacious gas pipeline will be laid between Gazli, Uzbekistan and the Urals under a plan which has been considered and approved by the Government. Work on the project is to start later this year, and the first stretch linking Gazli with Chelyabinsk is scheduled to come into service in 1963.

Thermic Drill for Glaciological Research: Electrically heated drill which will make it possible to bore a well 10 metres deep and up to 12 centimetres across in an hour in a glacier has been designed at the Kazakh Academy of Sciences. This instrument which can bore a well over 100 metres deep is designed to facilitate and accelerate glaciological research conducted by Kazakh scientists. For instance, the new drill is to be used this year for measuring the thickness of the glaciers in the northern Tien-shan. Labour consuming mechanical drilling is now used to measure the thickness of glaciers which involves the hauling of heavy drilling equipment to the mountains, besides electric and seismic surveys, based on wave reflection. However, the two latter methods do not allow the taking of samples from deep-lying ice strata. The thermic drill, designed by Nikolai Barvenko, is a brass tool containing an electric heating spiral. The tool altogether weighs 6 kilograms. It is fed by a portable electric station, which can be hauled to a height of 4 to 5 thousand metres by one horse power. The set is provided with a small pump to draw off the water appearing at the bore hole during drilling.

Czechoslovakia

International Trade Fair at Brno: The third International trade fair will be held at Brno from September 10 to 24. The Brno Trade Fair carries on the great tradition of the Prague Sample Fairs, one of the three Czechoslovak engineering exhibitions and of the two international trade fairs at Brno. The most important industrial branch of the Czechoslovak Socialist Republic and the basis of her national economy is the engineering industry, which assures her a prominent place also in the world economy. The main characteristic feature of the Brno Fair is its strict specialisation in engineering. The Brno Trade Fair is strictly specialised in products of the engineering and metallurgical industries, raw materials and semi-products allied to these branches, as well as consumer goods of an engineering character.

Canada

International Harvester Company's Achievement: International Harvester Company of Canada Ltd. is now producing two new light trucks which are completely flexible and tough, having considerable tensile strength. Canadian in design and which will compete directly and vigorously with vehicles now imported. The trucks

are the first of their type to be wholly designed and engineered in Canada for quantity production.

Norway

Royal Commission's Recommendations on Foreign Aid: A considerable increase in Norway's aid to underdeveloped countries will take place in the future if the recommendations of a Royal Commission on the subject are to be followed. The Commission headed by the Parliamentary Under Secretary of State for Foreign Affairs, Mr. Hans Engen, recommends that the final aim for Norway should be to spend one per cent of national income on aid to developing countries with an immediate starting contribution of $\frac{1}{4}$ per cent which in the present situation would be approximately \$3,750,000 annually, or more than 1 pound sterling per head of population. The development in the Congo has shown that in special situations one must be prepared to be required to contribute large sums of extra aid at short notice, says the Commission's report, which advises, therefore, that parts of the annual grants should be set aside in a reserve fund. The Commission suggests that a Board should be set up to co-ordinate all Norwegian aid to other countries. The Board should have a secretariat in Oslo and a Council of Representatives appointed by the Government. New contributions to various aid programmes since 1948 amount to £6,790,000.

Pakistan

Pak-Yugoslav Co-operation in Agricultural Development: The Yugoslav Agricultural Delegation arrived in Karachi on March 18. It is expected to remain in Pakistan up to April 8. During this period it has visited various stations in East and West Pakistan, where important agricultural development or research projects are located, including Peshawar and Warsak Dam, Lahore, Lyallpur, Multan and Khanewal and the Borewala and Tarnab agricultural farms.

Australia

Bigger Range in Stainless Steel: Probably no branch of industry has appreciated the advent of stainless steel more than the manufacturers of food-preparation and serving equipment. It has enabled them to make the modern kitchen clean, efficient and attractive. All types of kitchen service units, in stainless steel incorporating the most modern and ingenious labour saving devices, are now available to Australian and overseas buyers from G. H. Tallents Pty. Ltd. of Sydney. The range of units covers requirements for the home, catering establishments, and public institutions requiring storage cabinets and crockery dispensers. G. H. Tallents Pty. Ltd. have for some years been developing their own designs in serving units, and have supplied the requirements of a large number of hospitals in Australia and New Zealand.

NEWS IN BRIEF

FOREIGN

INDIAN

As a result of further review of the Export Trade Control Schedule, the Government of India have decontrolled 20 more commodities.

The Government of India have fixed the packing charges at Rs. 18 per metric ton of cement in 20 new as well as serviceable second hand DW heavy cess jute bags for the period commencing from April 1, 1961, up to June 30, 1961.

The Union Ministry of Education have initiated a project for the cheap publication in India of foreign scientific, technical and other works.

Foodgrains production prospects during the current year appear to be as bright as in 1958-59 (when the peak production of 75.5 million tons was obtained), according to the Annual Report of the Central Agriculture Department.

The stocks of foodgrains with the Government, which on March 31, 1960, amounted to 10.62 lakh metric tons; increased to 21.53 lakh metric tons on March 1, 1961.

The Labour Bureau of the Government of India has brought out the Indian Labour Year Book 1959—a standard work of reference on labour matters. The price of the publication is Rs. 18.50; copies can be had from the Manager of Publications, Civil Lines, Delhi-8.

A improved spin cooker has been designed at the Central Food Technological Research Institute at Mysore for the processing of semi-fluids and food production such as pulps, pastes, fruit juice, concentrates and soups.

The export of all logs from Ghana is to be the responsibility of the Timber Marketing Board from July 1, the Ministry of Trade announced recently. From that date the Board, which has been dealing with limited species only, will make all purchases for export.

British Overseas Airways Corporation has officially confirmed that it is considering the possibility of carrying at its own risk a proportion of its aircraft fleet insurance. Recent unofficial reports have suggested that discussions to this end have been held between the airline and various underwriters and insurance companies.

Shell Company of Qatar has struck oil during borings in the Persian Gulf some 80 kilometres off the coast of the Qatar Peninsula opposite the town of Doha. This was the third in the series of borings made with platform "Seashell" in water more than 30 metres deep.

Imperial Chemical Industries is to spend more than £6 million on modernising a large section of its Billingham factory during the last two years.

It is reported by the American Journal of Commerce that Congress is expected to move quickly to speed the progress of the Bill extending the current sugar Act until the end of 1962.

President Kennedy has signed US ratification of the treaty bringing into force the 20-nation Organisation for Economic Co-operation and Development. The new body, which will deal with aid to developing nations comprises the 18 members of the Organisation for European Economic Co-operation plus the US and Canada.

The Brazilian exchange reform, announced recently, is the first step towards the unification of the exchange rate structure that is scheduled to take place during the second half of the year.

REVENUE FROM LIQUOR

By

P. KODANDA RAO

WITH a view to realising a sizable revenue from Excise taxes on alcoholic beverages to augment the internal resources for the Third Five-Year Plan the demand is being pressed for the repeal of Prohibition where it is in operation and for the abandonment of it as a national policy as provided in the Indian Constitution. It is sought to be justified by the assumption that prohibition "failed to prohibit." In this connection it is relevant to recall that the Prohibition Enquiry Committee of the Planning Commission of the Government of India of 1955 found that Prohibition had justified itself where it was in operation and recommended its universalization. On the other hand, the Madhya Pradesh Prohibition Enquiry Committee of 1952 and the subsequent Andhra Pradesh Prohibition Enquiry Committee were dead certain that Prohibition had failed and recommended its repeal. It is significant that none of the three Committees defined the criterion of success or failure. But what is even more significant is that the Committees, which were critical of Prohibition and asked for its repeal, were equally critical of the Excise policy and did not recommend a return to the status quo ante. They advocated a new Excise policy which, if implemented seriously and sincerely, would hardly yield any revenue, if it did not involve a subsidy from the general revenues. On the other hand, it would serve the purpose of discouraging the consumption of illicit liquor deleterious to health by the provision of rationed quantities of wholesome liquor at prices low enough to compete successfully with illicit liquor.

As long ago as 1905 the then British Government of India issued a Resolution which declared that the objective of Excise policy regarding intoxicants was the reduction of consumption, and to the furtherance of it all considerations of revenue should be absolutely subordinated. Government sought to reduce consumption by the method of raising the Excise tax on the analogy of the ordinary trade law by which increase in price would automatically reduce consumption, or of protective customs duties intended to reduce imports rather than produce revenue. But this policy failed to reduce consumption. Instead, as the tax rose in incidence, licit consumption rose, largely because of the auction system, and illicit consumption also rose because it was cheaper than the licit and some consumers took the risk. In fact, the policy of reduction of consumption was not effectively carried out. The Andhra Prohibition Enquiry Committee condemned the policy as having been vitiated by the objective of maximum revenue than of minimum consumption. It characterised consumption of alcoholic beverages as an "evil" and Excise revenue as "tainted money", and quoted with approval that in the Excise policy of Sweden "the profit motive was entirely eliminated" as the State should not profit by what was considered an "immoral trade."

It also noted with regret that in India the bulk of the Excise revenue from intoxicants was paid by the poorest class of people. In the opinion of the present writer, it is perhaps the most iniquitous, the most inequitable and the most anti-social impost. The great bulk of Excise revenue is derived from the consumption of arrack and toddy which are consumed by people who are poorest economically and weakest politically. The tax is unconscionably high in incidence; it is collected mostly not when the tax-payer is sober but inebriate; it is collected, not by a tradesman with a per-

manent tenure who can set off losses of one year by profits of the next, but by Excise contractors who buy the right to sell liquor for a year at a time in public auctions and have perforce to make maximum profits within the time limit and for the purpose maximise consumption and indulge in several malpractices, including adulteration with illicit liquor deleterious to the health of the consumers. The Madhya Pradesh Prohibition Enquiry Committee found that the vicious element of speculation which underlay the auction system was a prolific source of a variety of scandalous malpractices and was largely responsible for corrupting the Excise Administration, and asked for its immediate abolition. While increase in the revenue from, say Sales-tax, is a welcome index of desirable rise in the standard of living, increase in revenue from intoxicants is a lamentable index of unhealthy consumption, for which Governments have been apologetic.

As regards violations of the law, Excise is no better than Prohibition, if the official figures of detected offences be any indication of the extent of violation. The Madhya Pradesh Prohibition Enquiry Committee found that illicit distillation offences were consistently more in the Wet than in the Dry half of the State! It was estimated by the American magazine, 'Life' that in America, where there is no Prohibition, illicit consumption was about equal to the licit. According to the Reports of Judicial Administration (Criminal) of Madhya Pradesh, quoted in the Report of the Madhya Pradesh Prohibition Enquiry Committee, the Police Acts were violated even more than the Excise or the Prohibition Acts. If the extent of violation of a law is a justification or its repeal, the Police Acts would have to lead the way. As regards loss of revenue, illicit consumption in the Wet areas lost as much revenue as in the Dry areas.

After condemning the current Excise policy, the Madhya Pradesh and Andhra Pradesh Prohibition Committees recommended a new policy of individual rationing of licit liquor with the price scaled down to such an extent as to compete successfully with illicit liquor and eliminate it. This policy is not calculated to produce any revenue, if it does not involve a subsidy. The justification for it is health; if some people will drink in any event, it is better that they consume pure licit liquor instead of impure illicit liquor which is deleterious to health. To this end licit liquor must be less expensive than the illicit. That health was the main consideration is evidenced by the fact that Prohibition is included in Art. 47 of the Indian Constitution dealing with health. As long ago as 1904 the then Government of the Central Provinces and Berar published a Resolution to say that liquor of guaranteed purity should be made available at the cheapest economic price to make illicit traffic unremunerative.

Even the most stringent Prohibition Act in India has not contemplated complete Prohibition, but provided for exemptions in the case of "foreign liquor" like whisky, etc. for the legal consumption of which permits have been issued to individuals under certain conditions on the basis of individual ration. Consumption on the basis of individual rationing has thus been part of orthodox official prohibition. Foreigners, particularly tourists, have also been exempted from Prohibition. The moral imperative of Prohibition is lost by such exemptions. It is best, therefore, to universalise individual rationing in quantities which will not pro-

voke the consumer into anti-social conduct. The Government of Madras, which has been the pioneer in the introduction of State-wide Prohibition in India and is wedded to it, has advocated individual rationing in its evidence before the Prohibition Committee of the Planning Commission.

The argument that Prohibition caused loss of revenue is invalid inasmuch as the loss was more than made good by other taxes. The Sales-tax was imposed for the specific purpose. It is merely replacing one tax by another and more paying tax.

Opium was a source of appreciable revenue to India till recently. Its prohibition lost some revenue. But it has not been suggested that it should be revived even for the Five-Year Plan.

At all events, revenue should not be even an incidental objective of the commerce in intoxicants. The Excise taxes on articles like matches, kerosene, betelnuts, coffee, tea, etc. in the current Budget have been severely criticised as undue burdens on the poor. Compared to them, the Excise taxes on intoxicants, made worse by the method of collection, are infinitely more oppressive on the poorest section of the people who consume arrack and toddy. To levy such taxes on such people for augmenting the finances of the Third Five-Year Plan is unconscionable to a degree. It would be unspeakable shame if, instead of improving on the British Government's professed policy of reduction of consumption of intoxicants without reference to revenue, the present Congress Government of Independent India, inheriting the mantle of Mahatma Gandhi, should bank on Excise taxes on intoxicants for revenue.

THE BUSINESS WORLD

Modernisation of Textile Industry

By CROESUS

COTTON textile circles have welcomed, both the unanimous report of the NIDC Working Group for the Cotton Textile Industry and the Government's broad agreement with the recommendations made therein. There was at no time any question about the vital need for modernisation of this industry and in regard to the wear and tear to which the industry has been subjected, especially since the Second World War. As early as eight years ago, the Ramaswamy Mudaliar Working Party appointed to go into this very question had reported that the machinery of most of the cotton mills in the country had become completely outmoded and required to be replaced urgently. Since then the position must certainly have deteriorated further, notwithstanding some replacement and modernisation that has taken place in the normal course. Unfortunately, the estimate of the cost of modernisation and rehabilitation of the industry, then and now, are not strictly comparable. Eight years ago, when the Working Party reported, not all the mills submitted returns; only 111 out of the four hundred and odd units did so. Furthermore, the Ramaswamy Mudaliar Working Party concerned itself only with the spinning and the weaving aspects and its report, accordingly, was not as comprehensive as that of the NIDC Working Group. Even the number of spindles and looms, for the rehabilitation and modernisation of which the 1952 Working Party had estimated an outlay of Rs. 49 crores, has gone up; the number of spindles and looms covered by the NIDC Working Group's report is 130 lakh spindles and two lakh looms, belonging to over 450 units.

It would be interesting to note as to who is responsible for the delay in implementing the recommendations of the 1952 Working Party. But considering the fact that the NIDC, the new organisation that was specially set up for the purpose, could do so much to modernise the jute mill industry, one cannot but draw the inference that either the cotton mill industry was not as quick as the jute mill industry to avail itself of the help of the NIDC or that the Government itself was stalling the whole question of modernisation of the cotton mill industry to appease labour interests, who then took the impossible and obstructive attitude that modernisation and rationalisation were intended only to throw out workers.

There is no use, however, at this stage to waste time over apportioning the blame as between the Government and the industry or for that matter the workers. But before the country can embark upon a really extensive programme of rehabilitation and modernisation which is bound to be a continuing process as we progress more and more industrially, the Government, the industry and the workers, no less than the consumers must regard timely and periodical rehabilitation and modernisation as a necessary national task. The Government must make it possible for the industry to plough back adequate resources to enable it to take up such work; industry and the workers must consider that they owe a duty to the community to keep intact and firm the fixed assets and hand them over to succeeding generation, and the consumers must be prepared to submit themselves to a degree of

sacrifice in the form of reasonable higher prices to make this possible. Unless these pre-requisites can be taken for granted, it is idle to talk in terms of even a minimum, let alone an ambitious, programme of modernisation.

On the face of it, the Working Group's estimate of the minimum overall outlay for rehabilitation and modernisation of Rs. 180 crores is a very large sum and not even the recent fairly satisfactory response to new issues by the cotton textile industry warrants the assumption that the industry can garner this amount through its resources or effort. Unless the Government is prepared to allow the industry to charge higher prices and make sufficient profits, which it may not be willing to do partly out of fear of inflation and partly out of deference to the clamour of the community, one cannot visualise how the industry can raise even Rs. 80 crores which it is expected to raise from its own resources, according to the Working Group. Similarly, one is at a loss to feel so optimistic as to expect a sum of Rs. 100 crores from the NIDC and other financial institutions when there are so many calls on these institutions and when there is a demand in certain quarters actually to wind up the NIDC itself. If, unfortunately, the latter clamour gains momentum and the existence of the Corporation is itself at stake, it is difficult to see how the important role assigned to the Corporation can be effectively fulfilled.

One of the tasks assigned to the Corporation is that along with other public financing agencies, the Corporation should try and issue sizable amounts by way of equity capital to mills which are in need of modernisation. While the Government has not made known its decisions on this recommendation, it may be suggested that there is an alternative approach that is worthy of careful examination. Some time ago, a leading industrialist had suggested provision of "Suppliers' Credit" as one of the solutions to the problem of inadequate internal resources for the industry. If the NIDC, or any other agency that may be entrusted with the role and responsibility proposed in respect of the Corporation, were backed up and empowered by the Government to guarantee such credit, it might be possible to expedite the programme of modernisation. This aspect of the question may well be examined by the proposed Textile Mills' Standing Advisory Committee which the Working Group has recommended and the Government has also agreed to set up.

As regards setting up of new units, Government's decision to allow installation of 1,25,000 spindles and 2,500 looms equipped with the latest type equipment, including the processing equipment, is to be welcomed; all the more, because the production of these units is proposed to be earmarked for export. It is needless to say, however comparable in quality, unless, our textiles can also compete in the world market as regards price, much headway cannot be made in pushing up our exports. It is as essential to ensure an economic price as it is to improve quality.

Perhaps, the most knotty problem that will be faced by those responsible for implementing the recommendations of the Working Group will be the

Your Income tax affairs need not worry you

Preparation of Income tax returns is a complicated matter these days. This need not, however, worry you.

You will find it to your advantage to place your Income tax affairs in the hands of your bank.

The State Bank of India will be pleased to undertake the preparation of returns, the checking of assessments and the submission of claims for refund of tax at moderate charges. The Bank will ensure that you obtain all the refunds to which you are entitled.

Why not talk things over with your nearest Bank Agent or write for information?

The State Bank's branch at Delhi, one of more than 909 offices waiting to serve you throughout India.

question of providing work for the surplus labour and of compensating the managements of the units that need to be scrapped. The Working Group has, no doubt, suggested the creation of a "closure fund" out of which compensation payments can be made to the scrapped units. But as regards providing employment for even 15 per cent of the workers expected to be rendered surplus over the next five years, one feels the Working Group is somewhat over-optimistic even after allowing for three-shift working by some more units of the industry than now. In other words, it is neither the unanimous recommendations of the Working Group nor their acceptance by the Government, not even the willingness of the industry to implement them, that can really help matters in this regard so much as the attitude of labour. In view of this, it may not be out of place to suggest that

both the textile workers and Government of India would do well to take a leaf out of the experience of the British textile industry in order successfully to meet the situation. Also the authorities should now begin to think seriously in terms of freeing the industry from the shackles of control so as to enable it to give of its best. Equally essential to consider is the question of a suitable agency for implementing the recommendations of the Working Group. There is an understandable disposition in certain quarters, evidently, arising from what happened to the recommendations of the Ramaswamy Mudaliar Working Party, that, unless a special agency is created for implementing the recommendations of the NIDC Working Group, the same story will be repeated.

Business Notes

Foreign Aid

HUNGARY'S OFFER

WITH THE offer of Rs. 8 crores credit, announced by Mr. Antal Apro, First Deputy Prime Minister of the Hungarian People's Republic, on the eve of his departure from New Delhi last week after an eight days' stay in this country as a guest of the Union Government, Hungary becomes the fourth (fifth if account is taken of the suppliers' credit made available by Rumania during the Second Plan period) Communist country to offer financial aid to India for her economic development. As is the case with the assistance made available by the other Eastern Bloc countries—Soviet Russia, Poland and Czechoslovakia—the Hungarian credit will carry interest at the rate of 2½% per annum and shall be repayable in Indian products, such as vegetable oils, tea, coffee, jute manufactures, shellac, iron ore, cotton textiles and engineering goods, over a period of eight to nine years. It can be utilised for financing exploration of bauxite reserves and for setting up projects, both in the public and the private sectors, for the production of alumina, aluminium, flour mills, pharmaceuticals, sheet glass, electric metres, seamless steel tubes and machinery for hydro-electric power stations. Hungary will finance with this credit not only supply of capital goods required for these projects but also the much-needed technical know-how. Details about the utilisation of the credit will be finalised in course of time through talks between the two countries at expert level.

The credit, though a modest one, is welcome; it will go some way to fill the gap in foreign exchange resources required for the Third Plan. Equally welcome is the textile testing laboratory gift made by Hungary.

With the assistance offered by Hungary, the total foreign aid promised by friendly countries for the Third Plan amounts to about Rs. 1,058 crores, including the PL 480 loan of Rs. 635.6 crores. Assistance promised by Communist countries totals Rs. 283.51 crores.

The picture of economic assistance that might be made available by friendly countries for the Third Five-Year Plan will become clear after the Aid-India Club, headed by the United States, meets in Washington towards the close of the current month.

Foreign Trade

NEW IMPORT POLICY

THE IMPORT policy announced this week for the period April-September, 1961, it seems, has been formulated to fall in line with the first half-year of the Third Five-Year Plan. The change-over from the Second Plan to the Third naturally necessitates a preparedness to meet growing requirements of raw materials and spares on account of the increased tempo of industrial activity. It also means an added effort to conserve foreign exchange in the light of the fact that

sterling reserves today are lower than they were at the start of the Second Plan.

The first important step taken to ensure sustained industrial production is the expansion of the list of items the import of which is allowed under the Export Promotion Scheme. This linking of imports of raw materials and spares to export performance of manufactures is apparently a step in the right direction. It is all the more reasonable that the manufacturers who cannot do well in the export market owing to factors beyond their control, will not be allowed to suffer. Moreover, the manufacturers producing items which are of importance to the domestic economy will not be affected adversely. Another gesture of some significance in the new policy is the stepping up of provision for licensing of "emergency spare parts", required to overcome an emergency breakdown of any production machinery, from Rs. 750 to Rs. 2,500 in an individual case.

An important step proposed in the new import policy as an end to conserve more foreign exchange is the banning or curtailing of imports of various items of consumption, many of which are produced in the country. The selection of these items has been made after an assessment of the performance of indigenous industries, the stocks position and the availability of goods against rupee resources and loans. It is expected that a saving of the order of Rs. 3 crores may be affected by this step. This saving, however, is not the only positive gain resulting from this measure; this step is also likely to provide a certain amount of filip to the indigenous manufacturers of these products.

I.F.C.

PARTICIPATION IN PROFITS OF BORROWING COMPANIES

THE BOARD of the Industrial Finance Corporation of India—I.F.C. (India) for short—which met in Bombay last week, discussed, *inter alia*, the question of the Corporation's participation in the profits of borrowing companies. This question, it may be recalled, had come up before the Board as early as in 1959, when its Chairman, Mr. K. R. K. Menon, had said: "...the Corporation's participation in equity capital should also be possible through the exercise of the right to convert loans into equities. Besides these facilities for profitably employing its funds, the Corporation should, in future, be able to share the profits of a concern financed by it—the method of sharing being negotiated along with the terms of a loan."

It is not clear whether the I.F.C. (India) or the International Finance Corporation was the first to moot this idea. Be that as it may, when the International Finance Corporation decided to participate in future profits and growth of business in the form of (a) a right to convert the loan or some part of it into some type of share capital or (b) a right to some addi-

tional income related to earnings, or (c) both, it will be remembered, there was a hue and cry in a section of the Press which strongly criticised the proposal. In view of this, the latest move of the I.F.C. (India) is bound to evoke comments and criticism. Meanwhile, the important question to decide is whether, as a sequel to this move, the financing agency will also try to secure a representation on the board of directors of the borrowing company and/or impose conditions in regard to distribution of dividends by it, as it well might. Whatever may be the justification, from a financial point of view, the proposal amounts to a certain encroachment on the inherent rights of shareholders of borrowing companies, who, after all, are the owners. Moreover, the I.F.C. (India) was meant only for providing loan capital and for underwriting new issues.

However, if the I.F.C. (India) and the world body with the same initial letters were to decide on such a course, borrowing companies would be left with only a Hobson's choice, unless, of course, they choose to raise their equity capital in preference to this move, so as to conform to the new directive of the Company Law Administration.

Paper

IMPORTS BY TRADERS

MR. B. M. CHOKSI in his presidential address at the annual general meeting of the Paper Traders' Association highlighted the fact that though output of indigenous paper was increasing significantly, it was still not sufficient to meet the rising demand. From the very fact that annual per capita consumption of paper in India is 2 lbs, as against 440 lbs in the USA, it is clear that consumption is bound to grow in the next few years at a much faster rate as a result of increasing prosperity and spread of education. Considering this trend, it can be observed that shortages are likely to persist and at least certain varieties of paper will have to be imported. Mr. Choksi complained that established importers of paper had been neglected as nearly three-fourths of the total quantity was imported by the State Trading Corporation and actual users or on the basis of barter or export promotion schemes. It may not be unwise to allow the established dealers to import and distribute a little more. This has one specific advantage in that, within the quota, they can import the precise quantities in measured quantities, thus eliminating a lot of waste. As Mr. Choksi pointed out, the State Trading Corporation had many times wasted the country's rupee resources and "often wrong imports were made" because the "personnel of the State Trading Corporation have no experience whatsoever regarding paper trade." This anomaly may not be as glaring as has been portrayed by Mr. Choksi, but the policy of paper imports certainly needs to be reviewed carefully in view of persistent complaints about imports of wrong types of paper.

Sugar

PERILS OF SURPLUSES

THE SPEECHES of two chairmen of sugar companies from the South, namely, Mr. C. R. Srinivasan of the East India Distilleries and Sugar Factories Limited and Mr. V. Venugopal Naidu of the Mysore Sugar Company Limited, dilate upon the same subject of the demand for sugar not being able to catch up with production. The closing stocks of sugar with all the factories on January 31, 1961 were reported to be around 13.57 lakh tons as against 8.10 lakh tons on the same date last season. This rising trend in stocks has created concern not only for the factories in the South but for all the factories in the country. The Indian Sugar Mills Association, with the active assistance of Ministry of Food and Agriculture, is endeavouring hard to export sugar to countries abroad and

especially to the U.S.A., though progress in this regard has been very slow and hesitant. The question that is being asked in the industry is whether the factories would be forced by sheer accumulation of stocks to slow down their production. If that happens, it would be an unfortunate event.

Both the factories have earned sizable profits which, however, are subject to the verdict of the Tariff Commission in regard to the profit-sharing formula. The Mysore Sugar Company has already set apart a substantial sum to meet this contingency. But it is not known whether the sum would be sufficient to cover the demands of the sugarcane growers under the new formula. Similar is the case with the East India Distilleries and Sugar Factories.

The factories in the South have enjoyed a special benefit in higher sale prices in relation to the prices fixed for the North Indian factories as they enjoy the benefit of the freight differential between the two areas. Now it seems that the production of the South Indian factories is gradually nearing the total demand of the Southern Zone, and the day is not far when demand will match the output of these factories. At that stage, it is sure that there will be no justification for providing a differential in any price fixation for the factories in the South. While the efficient units in this Zone will certainly be able to put up with this reduction in their selling price, some of the smaller inefficient units may have to undergo losses.

Banking

INCREASE IN PROFITS

FROM THE balance sheets of the Central Bank of India, the United Commercial Bank and the Indian Overseas Bank, it is obvious that there has been a considerable increase in the profits of these three banks in 1960.

The net profit for the year in the case of the United Commercial Bank, after providing for taxes and for all known and anticipated charges, and including Rs. 1,04,096 brought forward from the previous account, amounts to Rs. 68,46,870.98 nP. A sum of Rs. 13,00,000 has been provided for bonus to the staff and Rs. 30,00,000 have been transferred to the Reserve Fund which now exceeds the paid-up capital and stands at Rs. 2,05,00,000. Subject to deduction of tax, the Directors have recommended payment of dividend at the rate of Rs. 6 per share. The branch expansion programme of the bank has also proceeded satisfactorily; in 1960 branches were opened at Bhopal, Durgapur, Kota, Maligaon (Gauhati), Mandvi (Bombay), Nagapattinam, Pipri and Ranchi.

The Indian Overseas Bank reports a net profit of Rs. 44,66,422.74 nP. for the year under review. Provision for bonus to the staff is Rs. 5,50,000. Payment of dividend at the rate of 14 per cent per annum, subject to tax, is recommended. The bank has opened during the year branches at Amritsar, Ludhiana, Madras, Triplicane, New Delhi-Karol Bagh and Willingdon Island (Cochin).

The Central Bank of India have shown a net profit of Rs. 133 lakhs. In view of the high profits, a higher dividend has been proposed to the shareholders. For the year under review, the dividend works out to 12.88 per cent. With record profits, it is no wonder that the Chairman, Sir Homi Mody, had an encouraging and optimistic note to present to the shareholders. Dealing with the economy as such, Sir Homi Mody stated that the most disturbing element was the increase in prices. Since price stability is a pre-requisite for the success of any plan, one would agree with Sir Homi Mody that a more realistic fiscal and economic policy should be evolved to set the state of affairs right. Short-cut measures, however well meaning, will not suffice.

Machine Tools

PRAGA TOOLS EXPANSION PROGRAMME

AT THE sixteenth annual general meeting of the Praga Tools Corporation Ltd., Mr. S. Ranganathan, Chairman of the Board of Directors, stated that it had been decided that the Corporation should increase its output of machine tools from the present level of about Rs. 12 lakhs per annum to Rs. 120 lakhs per annum. The Polish Government would be supplying, on credit basis, a major portion of the plant required for this expansion programme. Of the Rs. 14.3 crores credit made available by Poland recently, Rs. 1 crore would be utilised for the Corporation for the purpose of setting up a complete new machine tools plant. A Polish organisation of machine tools manufacturers, CEKOP, has been entrusted with the task of preparing a project

report for this plant at a cost of Rs. 2.5 lakhs. The project report is expected to be ready by September, 1961.

The Corporation has entered into technical collaboration agreements with three British firms—Messrs. Kearney and Trecker C.V.A. Ltd. of Hove, Sussex, Messrs. F. Pratt & Co. Ltd., Halifax, and Messrs. A. A. Jones & Shipman of Leicester—for its expansion programme, costing Rs. 1.23 crores. As a result of these agreements, the Corporation will undertake manufacture of some new items like lathe chucks, drill chucks, tool and cutter grinders.

So far as the Balance Sheet of the Company is concerned, it is encouraging to find that after making the necessary adjustments for depreciation, development rebate, etc., there is a surplus of Rs. 3,72,667.

FROM THE CAPITAL'S CORRIDORS

TEXTILE INDUSTRY: JOSHI WORKING GROUP'S REPORT

The report of the NIDC Working Group for Textile Industry, which was set up in August, 1959, under the Chairmanship of Mr. D. S. Joshi, and Government's decisions on this report were placed in both the Houses of Parliament this week.

The Working Group has come to the conclusion that the position of the cotton textile industry has worsened progressively since 1952; the unit labour cost in the industry today is on the high side compared with many other countries.

The Working Group has called for a massive programme of rehabilitation and modernisation of the industry costing about Rs. 180 crores. The foreign exchange component of this expenditure is estimated at Rs. 83 crores, besides the expenditure to be incurred on importing spare parts for the existing machinery. The Working Group is of the view that exclusive attention in the matter of rehabilitation and modernisation to exporting units would not be practical or desirable in the long-term interests of the industry or the internal consumers. It says there should be some minimum modernisation of all the units of the industry.

The Working Group has expressed the opinion that since there has been lately a greater awareness on the part of the industry for a larger ploughback of profits, a sum of Rs. 80 crores would be found by the industry from its own resources for this modernisation and rehabilitation programme. The rest of the amount will have to be provided by lending institutions "at very reasonable rates with liberal concession in the matter of instalments and repayment." The National Industrial Development Corporation and other public financing agencies, the Group recommends, should issue sizable amounts to the industry by way of equity capital for rehabilitation and modernisation purposes. To augment industry's resources, restoration of third shift depreciation allowance has also been favoured by the Group. The industry has been advised not to hesitate to accept the remedial steps suggested by the lending institutions.

SURPLUS LABOUR

The Group has estimated that as a result of rationalisation through rehabilitation and modernisation of the industry, about 15 per cent of the total labour force employed in it will be rendered surplus. The Group says it will reduce the size of the problem of surplus labour if a provision is made for suitable gratuity on superannuation. Compensation by agreement may also be provided to achieve a further measure of rationalisation. The Group is of the opinion that it is time to cry a halt to any further recruitment of textile workers in the different centres as far as possible. A rigid badi list should be maintained in each area and persons should be put on this list only through employment exchanges where they exist. Simultaneously, the de-casualisation scheme should be applied to these workers to ensure that workers who are found surplus are made available alternative jobs. The Working Group adds that if third shift is resorted to to absorb this surplus labour force, workers should be offered continuity of service in the third shift and if the third shift is discontinued, the obvious course should be to restore status quo ante. The Working Group suggests that as far as possible three-shift working should be encouraged to enable speedy rehabilitation and modernisation of at least some of the sections of the industry which require such a measure as a matter of urgency. It recommends that some machinery should be devised, as proposed by the Textile Enquiry Committee (1958), to settle questions of rationalisation unit by unit.

Noting that there have been some cases of deliberate mismanagement in the industry, the Working Group recommends that people who are responsible for this mismanagement should be weeded out so that the industry can be built on strong and stable foundations. It suggests that the industry itself should remodel its managerial standards and improve them by collective thinking and pooling of knowledge. In cases where industrial units cannot afford the services of good technicians, a group of mills in one locality should employ a technician of high calibre as a common technical adviser. Similarly, in cases of mills where it is not possible to have independent technicians of high calibre, a panel of technicians in various branches of the industry should be prepared so that all mills should be able to draw upon their services when necessary.

SCRAPPING OF OLD UNITS

Where rehabilitation of any unit is not worthwhile the Group has recommended its compulsory scrapping. For payment of compensation to the units to be scrapped, the Group has suggested building up of a "closure fund" by levying some kind of licence fee or premium on new licences or expansions; payment of compensation has been recommended at the rate of Rs. 10 per spindle and Rs. 400 per loom. The Working Group considers it necessary that a continued examination of the cases of closure and sickness of textile units should be made by a small representative group (to be known as Textile Mills Standing Advisory Group or Committee) consisting of top level management, top-level technicians and representatives of labour and Government.

On principle, the Working Group does not consider that allocation of additional capacity should be governed by the volume of labour rendered surplus on account of rehabilitation and modernisation in each part of the country. As far as possible, licences for new capacity issued on the ground of closure of units which would be scrapped voluntarily or compulsorily should be allowed at the same place or in the same centre or in the alternative in the same State in any other centre, with the consent of the State Government concerned. All the new units to be set up should not be permitted to install outmoded machinery.

The Group is of the view that the minimum economic and workable unit of a textile mill in the present conditions should have 12,000 spindles and 300 looms. Gradually, this absolute minimum capacity can be raised to 18,000 spindles and 400 looms and ultimately to 25,000 spindles and 500 looms.

FIVE NEW UNITS TO BE SET UP

To step up exports, the Group has recommended setting up of five new units with a capacity of 25,000 spindles and 500 looms each and equipped with up-to-date types of machinery, including processing equipment. These units would produce faultless quality cloth woven on automatic looms; their entire output should be compulsorily exported.

The Working Group considers that in the national interests, textile industry should be regulated so that its expansion does not take place haphazardly. The Group has criticized the Company Law Administration for not enforcing rigorously the relevant provisions of the Companies Act to avoid delays in the publication of balance sheets and annual accounts. It considers that it would be desirable for NIDC to have a small strength of selected persons who could form into a recognised cadre in due course for being employed as resident directors and controllers of mills, wherever such appointments are necessary.

The Government is broadly in agreement with the recommendations of the Working Group. In its resolution, it has appreciated the need for modernisation and rehabilitation of the industry. It proposes to review the position during the Third Plan period so as to expedite the pace of modernisation, rehabilitation and diversification of the industry. A suitable machinery is being set up to analyse and help in resolving the problems of each individual mill as a result of rationalisation through rehabilitation and modernisation. About compulsory closure of mills, the Government has expressed the opinion that the problem bristles with practical difficulties and will need comprehensive examination.

The Government has also accepted the Working Group's proposal that five new units, with a capacity of 25,000 spindles and 500 looms each and equipped with most up-to-date machinery, should be allowed to be set up for production of faultless quality cloth for export purposes.

TEXTILE MACHINERY

During the year 1960-61, a number of schemes for the manufacture of several items of textile machinery were sanctioned. These include the manufacture of automatic looms, textiles pirms, knitting machinery, various Augusta systems, mercerising range, electric yarb baling presses, warping machines, battle bobbin-winders, high speed sizing machines, automatic reaching machines, jet air stenters, hot flue and stender clips. The manufacture of new items of textile machinery such as blowroom lines, soapers, calendar, bowls, continuous washing machines, ring travellers, pneumatic mangles, inspection machines, dyeing sleeves, etc. has also been taken up.

IMPORT POLICY

While continuing to be restrictive in various directions, the import policy for the half year April-September, 1961, announced last week-end, seeks to sustain industrial activity within the limitations of foreign exchange available and to ensure adequate utilisation of the country's industrial potential.

The new policy envisages more and more linking of raw material and machinery imports to exports of finished products. Import requirements of each industry and of each unit in an industry would be reviewed. On the basis of this review, each unit would be allotted a basic quota. Imports above this basic quota by any unit in an industry would depend on its capacity and willingness to export a certain percentage of its production. If an industry or a unit which is in a position to export but does not do so because of a sellers' market in the country, it would render itself liable for discrimination in the issue of import licences for raw materials over and above the basic quota. The import needs of industries which are not in a position at present to export their goods, e.g. pharmaceutical industry, will, however, be catered to fully.

Another important feature of the new policy is the removal of distinction between dollar and soft currency areas for purposes of grant of import licences. Licences, in future, will be issued as valid for "general area" covering all countries. Certain licences issued for the import of capital goods and heavy electrical products and for items covered by Export Promotion Schemes will, however, continue to be restricted to specific countries. No licences will be valid for import of goods from South Africa and South-West Africa as hitherto.

IMPORTS BANNED OR CUT

Import of 20 items by established importers has been banned. They include: German and nickle silver scrap; Wood working band saws; Leather belting; Jute bobbins; Transformers of rating not covered by S. No.

42(a)/II; Metal clad (or otherwise) switches and switch fuse units etc.; Air and oil circuit breakers upto 660 volts and cubicles and panels incorporating these; Air and oil circuit breakers above 660 volts and upto 11 KV and cubicles and panels incorporating these; Air and oil circuit breakers above 11 KV and cubicles and panels incorporating these; Cortisone and hydro-cortisone excluding preparations thereof; Iodides excluding their preparations; Prednisone and prednisolone excluding preparations thereof; Stoves and their parts (made of aluminium); Acetic acid; Case hardening compounds; Cuprous and copper suboxide; Mono-sodium phosphate; Nickel salts and sulphates; Lenses including focal blanks; Reversible level, Dumphy level and Indian pattern level machines under S. No. 92(g) (1) complete with stands.

Quotas for another 127 items have been reduced. They include: Bright MS and free cutting quality (high sulphur and/or Landloy) bars, rounds etc.; Iron/steel pipe fittings; Bifurcated rivots; Boot and shoe grinder; Files and rasps; Graphite crucibles; Fractional horse power motors; Pneumatic plants; Electric insulations; Cable accessories; Electric motor starters; High tension insulators; certain items of chemicals such as hydrosulphite of soda; Cation active finishing agents; Carboxy methyl cellulose and its salts; Sodium bicarbonate; Nickel salts; Barium chloride etc.; Coal-tar dyes; Card clothing and card accessories; Powdered milk, milk food for infants and farinaceous patent foods; Cutch; Gambier; Gum arabic; Dammer including unrefined Batu, certain items of drugs and medicines such as Oxytetracycline; Acid Salicylic excluding preparations thereof; Packing and Wrapping paper; Cotton fabrics; Garage tools; Miscellaneous hardware; certain items of motor vehicle parts such as Cylinder liners; Fitter/cleaner assembly; Piston rings; Radiator assembly and thin walled bearings, Time-pieces; Artists' brushes; Water meters.

Quotas for raw films, photographic sensitized material and electric carbons have also been slightly reduced. Newsprint imports, however, have been slightly liberalized.

LICENCES FOR ACTUAL USERS

The list of items for the import of which actual users will be granted licences has been expanded to include steel wire mesh and stainless steel wire mesh, German silver/nickel silver scrap, Zincon for use in ceramic industry and Rutile for use in ceramic and electric welding industries, film strips of scientific and educational character, Monosodium Glutamate, electro-medical apparatus, industrial sewing machines and their parts and pressure gauges. Face value provisions of such licences have also been liberalised in some cases.

The list of items the import of which is allowed under the Export Promotion Scheme has also been expanded. The new items brought under this scheme are ivory unmanufactured, stamping foils, pigment dye-stuffs, ferrules, China clay, paint raw materials, red phosphorous, refined sulphur, yellow poster paper and phodamine dyes. Imports of these commodities will be allowed against exports of manufactures of ivory, pencils and safety matches.

The provision for licensing of "emergency spare parts," i.e. spare parts required on immediate basis to overcome an emergency breakdown of any production machinery, has been increased from Rs. 750 to Rs. 2,500 in an individual case.

The basic period for a number of items has been extended. The more important items for which the basic period has been extended are tools and cutters, milling cutters, industrial exhaust fans and blowers, component parts of textile machinery, parts of domes-

tic refrigerators, parts of musical instruments, artists' brushes, rubber contraceptives, giant motors, motor cycle and bicycle tyres, tubes and flaps, tractor and off-the-road tyres, tubes and flaps, hearing aids, and parts thereof, pressure gauges etc.

Suitable increases have also been made in the validity period of a few items such as bright MS and free cutting quality (high sulphur and/or landloy) bars, rounds etc., ball bearings, roller bearings, tape bearings, special pumps for fused caustic soda or acids, vacuum pumps, paste boards and newsprint.

Licensing of paper has been decentralised. To avoid procedural delays in the issue of import licences, it is proposed to continue the scheme of "repeat" licensing introduced during the period October 1959—March 1960.

Import policy in regard to cardamoms, cassia, cinnamon, cloves, nutmegs, mace and betelnuts will be announced later.

EXPORT TARGET

The total saving in foreign exchange likely to result from the cuts in import quotas of established importers and by banning of import of some items is estimated to be around Rs. 3 crores. This saving may, however, be offset by higher imports by actual users and due to imports on rupee account.

The adverse balance of trade in 1960 is put at Rs. 376 crores; imports totalled Rs. 1,011 crores and exports, including re-exports, amounted to Rs. 635 crores. The target of exports during the current year remains unchanged at Rs 650 crores. Official circles, however, are of the view that this target may be exceeded by about Rs. 10 crores.

IMPORT OF TRACTORS

The Government has decided to consider applications during the licensing period April-September, 1961, for the import of agricultural tractors and garage tools under the U.S. Development Loan Fund. Two public notices have been issued stating the terms and conditions under which these licences would be granted.

Agricultural tractors below 50 H.P. would only be considered for licensing of imports on the condition that these tractors are purchased from the United States and a minimum of 15 per cent of the licences would be utilised by the licence-holders for the import of spare parts and components of the tractors sought to be imported against these licences.

Applications for the import of garage tools would be entertained not only from established importers, but also from transport authorities and other fleet owners and automobile manufacturers. Licences to established importers for this item would be granted on the basis of 50 per cent of half of their best year's imports. Applications from other categories of importers would be considered on ad hoc basis.

TOOLS AND ALLOY STEELS

Estimates of requirements have so far been made only of alloy steel sections with a minimum of chromium, nickel, molybdenum and other alloying elements which require special plants. Capacity already existing, or for installing of which licences have already been issued, is about 10,000 tons. It is estimated that the requirements of these steels at the end of the Third Five-Year Plan would be of the order of about 2 lakh tons per annum. As it takes some time for production to come up to capacity, it is proposed to licence adequate capacity to produce initially two lakh tons a year. The Central alloy steels plant will contribute about 50,000 tons. The ordnance factories will make available an-

other about 35,000 tons. A number of applications have been received for grant of additional capacity necessary to produce the balance of about one lakh tons. Decisions on these applications are expected to be taken in the near future.

For the manufacture of alloy steel castings and such alloy steels as do not need special rolling equipment, there is already a capacity of about 50,000 tons per annum installed in the country. A further capacity of 50,000 tons has been licensed upto now. The Government of India is considering the question of licensing an additional capacity of about one lakh tons for this category of steel.

CREDIT FROM HUNGARY

Hungary has offered a credit of Rs. 8 crores for economic development of India under the Third Five-Year Plan. This was disclosed by the First Deputy Prime Minister of the Hungarian People's Republic, Mr. Antal Apro, on the eve of his departure after eight days' stay in this country.

The credit, a bilateral one available for spending in Hungary alone, will carry 2½ per cent per annum interest and will be repayable in Indian products, such as vegetable oils, tea, coffee, jute goods, shellac, iron ore, textiles and engineering goods, in eight to nine years. It can be used for exploration of bauxite reserves and for setting up plants to manufacture aluminium, seamless tubes, pharmaceuticals, sheet glass, flour mills, electric meters and machinery for power stations. The projects which would be financed with this credit and technical assistance from Hungary can be both in the public and the private sectors.

Hungary has also made a gift of a textile testing laboratory. The gift has been accepted by the Government of India.

Mr. Antal Apro had discussions with the Union Minister for Commerce and Industry on prospects of increasing trade between India and Hungary. At present, the total volume of trade between the two countries is worth about Rs. 10 crores.

UTILISATION OF BRITISH CREDIT

Negotiations, it is understood, are in progress at present between the Governments of India and of the United Kingdom for the utilisation of the £30 million credit made available by the latter a few weeks ago for the former's Third Plan.

According to the tentative list of the projects to be financed with this credit, prepared by the Government of India, it is proposed to make use of this credit for (a) expansion for the Heavy Electricals Factory at Bhopal, (b) setting up of a fertiliser factory at Nabor-katiya, (c) putting up of the security paper mill (with Portal as technical consultants) and (d) establishment of a heavy plates and vessels plant. Some power schemes and expansion of Hindustan Cables are also envisaged to be financed with this credit. Part of the credit may also be utilised for import of capital equipment for some private sector undertakings—equipment for Leyland buses, textile machinery etc. The possibility of making use of a portion of the credit for constructing a ropeway in Jharia coalfields is also not ruled out.

The credit is meant to be utilised over a period of three years. The U.K. Government, it is understood, prefers utilisation of this credit to be evenly spread over the three years. Government of India, however, would like most of the credit to be made available in the second and the third year.

WAGE BOARD FOR IRON AND STEEL INDUSTRY

Behind the disclosure by the Union Labour Minister, Mr. G. L. Nanda, at the last meeting of the Informal Labour Consultative Committee of Parliament,

that the Government of India proposed to set up a Wage Board for the Iron and Steel Industry and that the Central Government was pursuing with the States concerned the transference of responsibility for industrial relations in the iron and steel industry to the Centre lies a prolonged tussle between the Union Government and the Bihar and West Bengal State Governments.

Control of labour-management relations in the iron and steel industry—a responsibility of the States under the Industrial Disputes Act, 1957—has been a source of immense power and influence which the State Governments are naturally unwilling to part with. In the latest communication from the Central Government to the two States on the subject, emphasis has shifted from gentle persuasion to firmness with reason. Apart from reiterating that in the context of planning, the iron and steel industry is vital to the development of the economy as a whole, the Central Government has impressed upon the States that a stage has come when there has to be some uniformity of policy and approach in regard to industrial relations in this vital sector of the economy. Only the Central Government can ensure this uniformity of policy. The case of the Central Government has been reinforced by almost unanimous stand taken by the employers and the workers in the industry.

This Wage Board is likely to be set up in the near future. Meanwhile, it has been decided that it would have a technical wing to apprise the work-load per man, as is the case with wage fixation in the steel industry in the United States.

COAL WASHERIES

The capacity of the Dugda and Bhojudih coal washeries, now under construction, is proposed to be expanded. The extent of expansion and the nature of additional facilities to be provided at these washeries will, however, be known only when the programme for additional production of coal at various collieries has been finalised and the washability characteristics of these coals determined.

MANUFACTURE OF SOLVENT EXTRACTION PLANTS

The Government of India, it is learnt, has approved manufacture of continuous type solvent extraction plants by the following seven manufacturers:

1. Messrs. Walchandnagar Industries Ltd., Bombay.
2. Messrs. Larsen & Toubro & Engineering Ltd., Bombay.
3. Messrs. Vasant Industrial & Engineering Works, Bombay.
4. Messrs. Associated Cement Companies Ltd., Bombay.
5. Messrs. Oil Corporation of India Private Ltd., Kanpur.
6. Messrs. Schantung Agencies, Calcutta.
7. Messrs. Scindia Workshop (Private) Ltd., Bombay.

The first five firms have already gone into production. The remaining two are likely to start manufacture by the end of the current year.

DEVELOPMENT OF SHIPPING

British shipping interests, it is understood, have shown some inclination to build the second shipyard proposed to be established during the Third Plan period. The possibility of British consultants preparing the project report for this shipyard is not ruled out.

Yugoslavia has offered a credit of Rs. 4.7 crores for supplying ships to India. Some Indian shipping companies, it is learnt, have started negotiations for placing orders on Yugoslav shipyards on rupee payment basis.

MINOR IRRIGATION SCHEMES

Good progress is said to have been made under the Second Plan in respect of minor irrigation projects in

various States. The importance attached to these projects by State Governments is revealed by the progressively increasing expenditure incurred by them under this head. Starting from a level of Rs. 14.6 crores in 1956-57, the expenditure on these projects went up to Rs. 19.11 crores in 1958-59 and to about Rs. 21.7 crores in 1959-60. Most of the State Governments are understood to have accelerated the tempo of execution of minor irrigation schemes. The following table gives the area brought under minor irrigation system in various States during the first four years of the Second Plan:

State	(Lakh acres)	
	Second Plan Target	Achievement of First Four Years of 2nd Plan
Andhra Pradesh	4.5	4.3
Assam	12.1	8.1
Bihar	17.4	18.8
Bombay	10.3	6.1
Madhya Pradesh	7.8	3.4
Madras	5.0	2.3
Orissa	3.0	1.2
Punjab	2.7	4.1
Uttar Pradesh	12.9	19.2
West Bengal	3.9	3.1
Jammu & Kashmir	1.2	Not available
Mysore	3.2	1.3
Rajasthan	2.0	3.7
Kerala	2.9	0.9
Union Territories	1.1	0.5
TOTAL	90.0	77.0

N.B.: The figures of achievement in the above statement are based on available estimates of achievement reported by the States. They are provisional and are subject to revision.

BRIEFS

The Government of India has licensed upto now production of all kinds of basic bricks, including magnesite bricks required by iron and steel industry, to the extent of 2,55,400 tons per annum. It is open to manufacturers to adjust their production of various types of these bricks according to demand.

Standard Motors Products of India Ltd., Madras, have applied for a licence for increasing their existing installed capacity for the manufacture of Standard '10'/ Standard Herald cars to 6,000 units per annum and for undertaking the manufacture of Standard (1-ton) trucks upto 1,500 units per year.

A World Bank team recently visited some States in the Indian Union with a view to examine the possibility of grant of loans by the International Development Association for construction of some roads and bridges. The views of this team are expected to be known in the near future.

A sum of Rs. 18.20 crores has been spent to set up at the three public sector steel plants units to produce by-products, such as crude tar, ammonium sulphate, naphthalene, sulphuric acid, benzene, benzol and crude anthracene. It is expected that by-products worth about Rs. 4.3 crores would be produced annually when these units go into full production.

The Union Government has decided to set up a high-power Control Board, on the pattern of the Chamber of Commerce, for expeditious execution of the Farakka Barage Scheme. The Board will consist of a representative each of the West Bengal Government and the Union Ministries of Transport and Communications, Railways, Finance and Irrigation and Power.

tings

AGA TOOLS CORPORATION LTD.

i S. Ranganathan, I.C.S., Secretary, Ministry of Commerce & Industry, Govt. of India

Member of the Board of Directors at the Sixteenth Annual General Meeting of the Shareholders held on March 27, 1961, at Hyderabad.

Gentlemen,

Since we met last on September 19, 1960, another year—really 9 months—of the Company's working is now ready for review. This period ended on 31st March, 1960. Under the amended Company Law the Annual General Meeting of the Shareholders of the Company should be held within a period of 6 months from the close of the accounting period. Our office will have to be strengthened to meet this new situation and this is being done. As a Government Company our accounts have also to be audited by the Auditor General and this again requires to be done within this short period. We are suggesting to the Auditor-General as well as to the Company's Statutory Auditors that they should consider undertaking concurrent audit in order to save time.

2. The audited statement of accounts together with the Directors' Report thereon have been with you for some time. This year, as suggested by the Government of India, we have also sent you a simplified Balance Sheet and Profit and Loss Account, so that those who are very busy and cannot find the time to go through the complete balance sheet could gain a clear picture of the Company from the simplified data we have given. With your permission I shall take the accounts and the report as read.

3. When I addressed you on the occasion of the last Annual General Meeting held on September 19, 1960, I referred briefly to the details of the expansion scheme which your Company was planning. We are glad to report that technical collaboration agreements have been signed with three British firms. The first is with Messrs. Kearney & Trecker-C.V.A. Ltd., of Hove, Sussex, for the manufacture of their well-known range of drill chucks in India. The second is with Messrs. F. Pratt & Co., Ltd., Halifax, for the manufacture in India of their range of lathe chucks, pneumatic chucks, magnetic chucks and pneumatic vices. This is a range which should prove very useful to the steel processing industry, as without these appliances the machine tools by themselves would not be adequately useful. The third agreement is with Messrs. A. A. Jones & Shipman of Leicester, for the manufacture of their Cutter and Tool Grinders in India by your Company. This is a new item to be taken up by the machine tool industry in India and your Company would be the first in the field.

4. As you may have read in the Press, the Polish Government have offered a credit to the Indian Government of Rs. 14.3 crores and out of this the Government of India has earmarked one crore for your Company for the purpose of equipping a complete machine tool plant. You would have seen from statistics given that only 20% of our production relates to machine tools; it is the Government of India's intention that our Company should increase the output of machine tools from its present level of about Rs. 12 lacs per annum to Rs. 120 lacs per annum. For this huge expansion, the Polish Government would be supplying a major portion of the plant on credit.

5. As a first step in this collaboration with the Poles, they have been asked to prepare a complete Project Report for a machine tool plant, capable of turning

out a certain quantum of machine tools per annum. Negotiations have been going on with CEKOP, an organisation in Poland which undertakes the design and supply of complete plants, and I am glad to report that on 24th March 1961, i.e., last Friday, our General Manager signed on behalf of our Company an agreement with CEKOP for the supply of this Project Report at a cost of Rs. 2.5 lacs. We expect the Project Report to be in our hands by about September next, but in the meanwhile discussions are going on between the respective technicians to enable your Company to book firm capacity in Poland against their 1962 production for the supply of certain general purpose machine tools required for the machine tool plant.

6. The Working Results for the 9 months period ending March 31, 1960, have not been as encouraging as we had expected. The average production per month does not measure up to last year's performance. As indicated in the Directors' Report this is largely due to the unsettled labour conditions that prevailed in the factory. I had mentioned on the last occasion, the rioting which took place inside the factory on 27th November 1959 and again in May 1960. In May 1960, some officers of the Company were actually assaulted. I would have preferred not to bring back to memory these unpleasant occurrences. I do so, however, as I feel that the labour has not yet quite settled down and there is still talk of strikes etc. I shall be the last person to say that labour should not ask for, in an appropriate manner, or be given what is their legitimate due, having regard to all relevant factors. But to create a state of uncertainty in regard to continued and increasing production or about peaceful conditions being available to work in, is not the best way of setting about this business. I do hope that labour will pay heed to this advice and recognise that in this Board of a Govt. Company, there is really no interest which would wish to deny them their fair share, out of their own production. Having said this, I shall not go into the details of the demands that have been pressed for from time to time, some times, in open flouting of previously mutually accepted settlements, the methods adopted to capture power by rival Unions etc. I shall mention only that your Board has appointed a Sub-Committee to go into certain demands now made. This Sub-Committee has met several times and is now currently discussing this subject with the Union. I hope the Board will soon have proposals that will be acceptable to labour, that will be within the Company's means and finally that the proposals will ensure a fairly long period of settled conditions which could be utilised to maximise production and take in hand the large expansion schemes with confidence.

7. After making the necessary adjustments for depreciation, development rebate, etc., the Balance Sheet shows a surplus of Rs. 3,72,667/-. Your Directors have proposed that this surplus should be carried forward and I feel sure you would find this proposal acceptable.

8. The Comptroller and Auditor-General in his comments has again invited our attention to the necessity to revise the method of evaluating the stock of finished goods. This has not been possible in the year under review but the revised method is being adopted in the accounts of 1960-61 and consequent on this a certain

amount of write-off is expected. In the circumstances your Board of Directors feel that it would be a prudent step not to distribute the very small surplus the present Balance Sheet discloses; it would be more appropriate to get the revaluation of finished goods done on the proper basis in 1960-61 before considering any distribution of dividends. Although, the financial position is thus only of a marginal balance having been reached, I feel optimistic about the trends and given the whole hearted support by labour, the Company should be able to register a leap forward in the next year or two.

9. Before I conclude, I wish to thank my colleagues on the Board for their active co-operation and guidance in all our deliberations. I also wish to express my appreciation to the officers and staff of the Corporation particularly those loyal workers who strove to restore a sense of responsibility in the organisation during a difficult period.

N.B.: The above does not purport to be the report of the proceedings of the 16th Annual General Meeting of the Company held on March 27, 1961.

THE MYSORE SUGAR COMPANY, LIMITED

BANGALORE.

Speech by Sri V. Venugopal Naidu, Chairman and Managing Director, at the Twenty-seventh Annual General Meeting of the Shareholders of the Company, held at Bangalore on Thursday the 30th March 1961.

Gentlemen,

I have great pleasure in welcoming you to this the Twenty-seventh Annual General Meeting of the Shareholders of the Mysore Sugar Company, Limited, and in placing before you for adoption the Report of the Directors and the Audited Statements of Accounts for the year ended 30th June 1960. Copies of these have been in your hands for some time and, with your permission, I shall take them as read.

Sri B. M. Krishnan, who was the Chairman and Managing Director of your Company for the last three years laid down his office on the 5th February 1961 on completion of his term and I have taken over from him. The Board of Directors have placed on record their appreciation of Sri Krishnan's services to the Company. I am happy to report on this occasion that Sri H. K. Veeranna Gowdh, one of your Directors, has been appointed as a Minister in the Mysore Government and I am sure you will all join me in wishing him a happy and successful term of office as a Minister. I earnestly hope that his rich experience and guidance will be available to the Company whenever they are needed.

The year 1959-60 was a notable one for the sugar industry and witnessed a significant rise in sugar production. As against 19.13 lakh tons of sugar produced in the country during the year 1958-59, the production during 1959-60 touched a record level of 24.24 lakh tons, representing an increase of 5 lakh tons in the course of one year. The demand for sugar has not, however, kept pace with the rising trend in production. The result is that there is heavy accumulation of sugar stocks with the factories and it is apprehended that the industry will be burdened with a carry-over of more than ten lakh tons at the end of this season, unless indigenous demand goes up appreciably or exports take place in sizeable quantities. It may be mentioned, in this connection, that export of sugar under the existing conditions is proving to be a costly affair involving loss both to the industry and the State Exchequer though exports have their advantage, in earning foreign exchange for the country.

The target of sugar production for the Third Plan is therefore tentatively fixed at 30 lakh tons, though there are indications of this figure being revised to 35 lakh tons. Towards this end, new factories are being licensed and set up and several existing units are also being permitted to expand. Our application for rehabilitation and expansion is also now before the

Central Government who will, I trust, consider our request very favourably.

A matter that has been agitating the sugar industry for some years past has been the Price Linking Formula designed to ensure payment of a deferred price for sugarcane by passing on to the growers a share of the sugar price. Although such a payment has become a statutory liability from the 1958-59 season, it has not been an easy matter to notify the formula in its complete form, for various reasons. The Government of India have now referred the formula to the Tariff Commission for examination with a view to modifying the existing formula or suggesting an alternative and simpler formula and at the same time to go into the claim of the industry for including a rehabilitation allowance in the sugar price, before it can be shared. After deep consideration, the industry has submitted to the Tariff Commission an alternative proposal. It is hoped that the Tariff Commission will soon evolve a fair and simple formula acceptable to all.

Another event of great significance to the sugar industry has been the publication in recent months of the report of the Central Wage Board for the sugar industry which was constituted in 1957 to go into the question of evolving a wage structure for the workers in the industry. The Board has examined the problem of wage fixation in great detail and has made a number of recommendations which have the effect of increasing the emoluments of the several categories of employees with retrospective effect from 1st November 1960. These recommendations have a vital bearing on the finances of the industry and their effect would be an immediate increase in the cost of production of sugar, as the Board itself has admitted. The recommendations have since been accepted by the Government of India, who have requested the employers, workers and the State Governments to take immediate steps to implement them. The Indian Sugar Mills Association has subsequently taken up this question with the Government.

As you would have seen from the Report of the Directors in your hands, our factory at Mandya had a normal season during 1959-60. The factory commenced crushing operations on the 2nd July 1959 and continued up to 7th February 1960, crushing 3,11,524 tons of cane and producing 31,550 tons of sugar. The corresponding figures for the previous season were 3,48,814 tons and 35,771 tons respectively. The production of sugar would have been higher but for the

fact that we did not receive the entire quantity of cane contracted for due to competitive price of jaggery. In spite of lower output, the quantity of sugar actually sold was higher than in the previous year and the receipts from sugar sales rose to a record figure of Rs. 430 lakhs. Control over distribution of sugar continues to be exercised by the State Government and with the improvement in the supply position, the public are now assured of plentiful supply of sugar at fair price.

At a time when our crushing season had well advanced, the Government of India increased the statutory minimum price of sugarcane by Rs. 5 per ton with effect from the 25th October 1959. This step, intended to give incentive to the cane growers and to maximise production has, however, affected us adversely. Having paid the usual cane price for cane purchased till 25th October 1959 it was rather inexpedient for us to increase the price for subsequent purchase and thus pay two different prices for one and the same crop. It was the intention of your Directors to pay an uniform average price for all purchases during the entire season. The suppliers insisted upon payment at the enhanced price from the commencement of the season and your Company had to pay this extra price to cane purchased prior to 25th October 1959. Though the selling price of sugar was increased, this increase in respect of stocks held on 25th October 1959 did not accrue to us due to the levy by the Government of India of a special Excise Duty. Thus, in the result, we had to pay higher price for cane from July 1959, while we lost the benefit of higher sugar price on stocks held, as special excise duty was levied on these stocks. Our representations for refund of excise duty in the peculiar circumstances of our case have not so far been fruitful. Your Directors are, however, hopeful that appropriate relief would be forthcoming and that we would not stand to suffer on this account.

Reflecting the higher tonnage of sugar sold and the higher price realised for sugar and despite the adverse factors referred to above, I am glad to say that the working of the Company during the year under report has yielded a gross profit of Rs. 42.31 lakhs, representing a sizable increase over the profit of Rs. 31.90 lakhs earned during the preceding year. This year too, the exact liability on account of deferred price for sugarcane, has not been clearly indicated. Pending determination of the actual amount as a result of the examination of the price linking formula by the Tariff Commission, your Directors have set apart a sum of Rs. 14,22,450, which would allow payment at an interim rate of Rs. 4.50 per ton of cane. Here I may say that the provisional additional price of Rs. 5 per ton for the year 1958-59 did not satisfy the cane growers and consequent on their resorting to a sudden strike and withholding cane supply to the factory, it became necessary to make payment at an increased rate of Rs. 6 per ton. The burden of this additional price, as also that on account of additional bonus paid to employees in respect of the year 1957-58, has fallen on the accounts for the year under review.

After meeting the above charges relating to previous years and providing Rs. 6,92,253 for depreciation and Rs. 13,50,000 for taxation, and after transferring Rs. 5 lakhs to the reserve for rehabilitation of Plant and Machinery, we are left with a net profit of Rs. 8,23,840 as against Rs. 6,54,699 in the previous year. Adding the balance brought forward from last year's account, the amount available for distribution comes to Rs. 8,69,012. As in the last year, your Directors recommend payment of dividend at 30%, subject to deduction of tax, so as to ensure for shareholders the same rate of net return that they have been accustomed to receive in the past.

The proposal for capitalisation of a part of our reserves by the issue of Bonus Shares is also pending

for some time and the recent reduction in the rate of tax on bonus shares should make this easier of implementation. It should therefore be, possible for your Directors to persuade Government of Mysore who are the major shareholders of this Government Company to agree to this proposal. Allied to the question of capitalisation of reserves is also the question of writing off the value of certain items of obsolete and un-serviceable stores and spares which may tend to inflate the real value of our assets. A solution of this problem is now engaging the earnest consideration of your Directors.

The scheme for expansion of the capacity of our factory to 3,000 tons of cane per day, of which you were informed last year, has not yet taken a definite shape, as we have not yet received the requisite licence from the Central Government. In consultation with experts, we have finalised the requirements of additional machinery to be installed for serving the three-fold objective of rehabilitation, modernisation and expansion. The whole scheme is estimated to cost about Rs. 115 lakhs and orders for machinery are expected to be placed with one of the approved sugar machinery manufacturers in India as soon as the licence is received. The programme is intended to be implemented in a phased manner over a period of three years. By far the greater portion of the expenditure would be on account of rehabilitation of old and overworked machinery, some of which have been in continuous service for over 20 years and are in immediate need of replacement in the interests of continued smooth operation of the factory. Apart from stepping up sugar output to as much as 50,000 tons per annum, the expansion programme would promote efficiency and economy in operation and thus bring about a reduction in the cost of production which is of paramount importance if we are to face the future with confidence.

We have succeeded in securing a licence from the Government of India for the manufacture of Cellulose Acetate at Mandya based on our alcohol. Considerable preliminary work in regard to this scheme had been covered by my predecessor, Sri B. M. Krishnan, including delicate negotiations with representatives of certain leading foreign firms and also financial institutions in the matter of securing suitable technical know-how and collaboration and foreign exchange resources. These had reached a crucial stage when I assumed office last month. I have now taken up the threads of the negotiations and active steps are now being taken for concluding satisfactory arrangements. While, at this stage, it may not be possible to disclose the nature of the arrangements or the details of the scheme, I may broadly say that the project envisages production of Cellulose Acetate Flakes suitable for manufacture of raw-film leaving a portion of the flakes to be processed into moulding powders. The capital cost of the project would be of the order of Rs. 3.5 crores and, as at present, a separate company is proposed to be sponsored for this enterprise.

Our relationship with our employees continued to be satisfactory and cordial, during the year under report and your Directors have no doubt that the employees will continue to extend their wholehearted co-operation at all times.

It only remains for me in conclusion to express my sincere thanks to my colleagues on the Board for their valuable guidance and co-operation. The Government of Mysore, and particularly the Chief Minister, have been very sympathetic towards the Company and we are grateful to them. The employees from the General Manager downwards, have served the Company in a loyal and efficient manner, under trying conditions, and they deserve to be complimented. Our thanks are also due to the cane growers who form an essential link in our industry."

THE EAST INDIA DISTILLERIES AND SUGAR FACTORIES LTD.

(Incorporated in England — The Liability of Members is Limited)

SIXTY-THIRD ANNUAL GENERAL MEETING

MR. C. R. SRINIVASAN'S REVIEW

Presiding over the Sixty-third Annual General Meeting of the Shareholders of The East India Distilleries and Sugar Factories Limited held at Madras on Thursday the 30th March, 1961, Mr. C. R. Srinivasan, Chairman, said:

"Gentlemen,

It is with much pleasure that I welcome you to this the Sixty-third Annual General Meeting of the Shareholders of this Company. The Accounts for the year ended 30th September, 1960, together with the Directors Report thereon, have been in your hands for the statutory period, and with your permission I will take then as read. You will have observed that during the year under review there have been no spectacular advances, but steady progress has been maintained on all fronts. Equally, during the year in which we now are, 1960-61, and in 1961-62 I do not foresee more than steady and sustained progress. In effect it may well be reckoned as a period of consolidation if it is borne in mind that we shall be paying interest on the loans raised to finance our Ammonium Phosphate factory at Ennore and it will only be in the latter part of 1961-62 that we may expect to start receiving compensating revenue coming in from this project.

2. I think it would be appropriate if I take this opportunity of reviewing the progress your Company has made since the war, and more particularly since 1956. Over this period, the Company's growth has certainly been considerable. In 1948, the year in which the management and control were transferred to India, our capital and reserves totalled £706,736 and our total assets were £1.6 million. At the end of the financial year 1955-56, during which the purchase of the Ordinary Shares of Parry & Company Ltd. took place, the consolidated capital and reserves of the Group rose to £1.8 million and the total assets to £5.2 million. On the 30th of September last these figures were £3.28 million and £7.4 million respectively. During the same period the Group excess of current assets over current liabilities has risen from £304,000 in 1948 to £1.56 million on the 30th of September, 1960.

3. These figures tell their own story of expansion and needless to say that shareholders' interests have benefited accordingly. Bonus issues have been made and the dividend has been maintained at a satisfactory level. Progressively the emphasis on the Group's expansion has been on the industrial sector and, more and more, the pattern of our business is changing. As a result of this policy, we have been forced with great regret to dispense with some of our agency representations in order to concentrate more of our finance and management resources on the administrative problems which are tied to the Group's industrial progress.

4. Today we own a large and efficient sugar factory at Nellikuppam, crushing over 2,000 tons of cane per crop day and producing, over a season, more than 30,000 tons of white sugar. I am proud to say that the factory is as efficient as any other in India, and continues to show us a satisfactory return on our capital employed there. It is perhaps desirable to draw your attention to the problems which face the sugar industry in this country and South India in particular. The Government of India in its present phase of expanding economy is naturally most concerned about the exchange earning potentials of every indus-

try. The potentials of this industry have not been overlooked, especially after our experiences in 1956 and 1957 under fortuitous conditions. Today, we have an excess of production over consumption of the order of 500,000 tons per annum. Many of you, I expect, will be familiar with the economics of exporting this surplus to foreign countries willing to pay only current world prices; in other words, to pay prices that will yield about Rs. 400 per ton ex-factory. I hope the representatives of the industry currently negotiating for the sale on favoured terms to the United States of America will be able to report some success. Whatever the measure of success, let it be remembered that it involves a large measure of sacrifice also — sacrifice to Government revenues, to factory profit and to consumer prices.

5. Despite the surplus of sugar available, we have the anomaly that control over price and distribution continues. To the extent that this control restricts sales, this continuation is bad, but one must, in fairness, recognize that the complete removal of control will increase the problems of arranging export of the surplus stocks and might well lead to forced sales at low prices by the financially weak units.

6. Government's task is to retain control without allowing it to restrict offtake in any way. Furthermore, for the exports even under adverse conditions to be maintained to the extent of 5,00,000 tons per annum, some control of production will have to be exercised. It may not generally be realised that the cane for the 1961-62 season is already in the ground. The earliest that action taken this year can be effective will be in 1962-63 season and delay beyond the end of this calendar year would mean one more year's delay with heavily increasing stocks. That the internal offtake may well catch up during the course of the Third Five-Year Plan is not beyond the bounds of reason, but until it does, the industry will have this difficulty to face.

7. Sugar producers in the South have benefited from the fact that their total production has been less than the demand and the price has been generally fixed by the cost of the sugar procured from North India; in other words, there has been a freight advantage which must inevitably disappear when the production in the South equals consumption. In common with other factories in South India, this Company has shared the freight advantage with the cane growers so that it is only a relatively small part of the reduction in price that I anticipate will fall on this Company. The balance, I am afraid, will fall on the cane growers in terms of a reduced bonus on the cane price.

8. Finally, the whole question of sugar price is at present before the Tariff Commission. A report was published in April 1960 which divided the country into four regions, the Southern region comprising the States of Andhra Pradesh, Madras, Mysore and Kerala. The Tariff Commission states that a fair return for the industry is 12 per cent on employed capital within which to meet commitments under bonus and gratuity, interest on borrowed capital, dividend on Preference

Shares, Managing Agents' commission and income-tax and, to quote the Commission's words, "finally leave a residue to a large majority of the units in all the regions to declare reasonable dividends". Obviously there is no margin with which Directors of sugar companies can rehabilitate their plant at costs which will absorb depreciation allowances four or five times over. It is precisely this point, namely the refusal of the Tariff Commission to take this in, that urged manufacturers to prevail on Government to make a second reference. I can only hope that the Tariff Commission will see facts as they are. Meantime, dependent on the price fixed, we have a contingent liability on the cane crushed since November 1958 under the Price Linking Formula announced earlier and still hanging in mid-air. For this, provision has been made in the accounts, but there is no means of knowing if this provision is adequate, for we do not know the extent of the ultimate liability, should it eventuate.

9. Our Pottery & Chemical Works at Ranipet which represent the other part of our old established industrial business continues to expand and, in pottery particularly, expansion has been considerable over the last few years. Development has been particularly significant in the case of sanitaryware for which, against the background of India's constantly improving standard of living, there is a growing — and I believe — stable market. We are now in the process of arranging for the installation of yet a third kiln in our Pottery Works involving an outlay of about Rs. 22 lakhs and I hope shortly to be able to announce to you also the conclusion of an agreement for technical co-operation with a British manufacturer of sanitaryware, whose name enjoys world-wide repute.

10. But our largest expansion in recent years has undoubtedly been in the field of fertilisers. Up-to-date, the bulk of our trade has been the preparation and selling of conventional mixtures suited to particular soils and crops, and of straight superphosphate, and while I believe our business in these lines will continue, we have, in order to keep abreast of the times and maintain our leading position, to ensure the availability of compound fertilisers which, in the more advanced countries, have virtually replaced the ordinary mixtures.

11. As I told you last year, with these thoughts in mind, we ordered a complete Ammonium Phosphate Factory from Messrs. Simon-Carves of Stockport, England, and this is now under construction at Ennore, about 8 miles north of Madras. The situation is excellent, work is progressing according to plan, and I have every reason to believe that, subject to no unforeseen obstacles cropping up, the factory will be in production by the middle of 1962. In its first stage it will produce about 50,000 tons of fertilisers. By modern standards this is a relatively small output but it would be as well to compare it with our present annual turnover in fertilisers of all description, including Superphosphate from our subsidiary, Andhra Fertilisers Private Ltd., which is in the neighbourhood of 160,000 tons per year. From this you will see that the Ennore Factory will make quite a substantial contribution to our turnover but there is no doubt that it would be in the best interests of the Company if the size of this plant, and its output, could be doubled. With this object in mind, the plant has been laid out in such a way that the additional equipment required to double the capacity can be installed with the minimum inconvenience and your Directors have already started to consider ways and means by which this expansion may be undertaken.

12. Additionally, we have just been advised, along with two very well-known American collaborators, of

the issue of a licence from the Government of India to erect a fertiliser factory at Visakhapatnam in the State of Andhra Pradesh, to produce more than 300,000 tons of fertiliser per year. In this case, a substantial part of the capital is being found by our American friends, International Minerals & Chemical Corporation of Skokie, Illinois, and California Chemical Co. of San Francisco so that our own contribution, although considerable to us, will be small relative to the total capital required. A new Company will be promoted in India for the purpose and the public will be invited to participate in the issue in ample measure. Our association in the new Company will be clear cut and we bring to the consortium a readymade fertiliser sales organisation which, suitably expanded, will be available to market the new factory's output. Negotiations with our American friends — to whom I would like to pay this tribute, that they have been most co-operative and understanding — have also been based on our having adequate representation on the Board of the new Company. The new Company will be Director managed. This new enterprise marks a great step forward, and I am sure Shareholders will share the satisfaction of the Board that we have, in these various ways, been able to consolidate our leading position, in the private sector, in the manufacture and sale of fertilisers.

13. All these items of expansion have required, or will require, further finance and as you know a successful 'Rights' issue of Ordinary Shares was made last September and is reflected in the Balance Sheet now before you. In addition we have arranged the following loans which are being drawn upon as required:-

The Commonwealth Development Finance Co. Ltd.	£ 600,000 = Rs. 50,00,000/-
The State Bank of India	= Rs. 180,00,000/-
Simon-Carves Limited	£ 275,157 = Rs. 36,68,760/-

These four items of finance were required specifically for our own new fertiliser factory at Ennore and we are confident that the contribution of equity capital which we have to make to the new Visakhapatnam Fertiliser Factory to which I have referred to above, will be provided from our own resources.

14. To complete the picture of our fertiliser activities, I would mention that the acid and superphosphate plant of our subsidiary, Andhra Fertilisers Private Ltd., at Tadepalle in Andhra State, came into production in November, 1960. This plant is designed to produce 50,000 tons of superphosphate per year, for which there is a ready sale in Andhra. While we have experienced the usual teething troubles, the plant can stand comparison, for design and efficiency, with any other similar plant in India. I have been surprised recently to note that remarks have been made in some quarters to the effect that Andhra is being neglected by industrial companies whose Head Offices may be in other States and, in particular, we appear to be regarded almost as if we were foreigners! I very much deprecate these examples of parochialism. I would remind our good friends in Andhra that this Company and its subsidiary, Parry & Company Ltd., were established with a Head Office in Madras long before Andhra and Madras became separate States. We have always regarded Andhra, Madras, Kerala and Mysore as the main areas of our operation and the fact that Parry & Co. Ltd. has for many years managed a sugar factory at Samalkot, the fact that we have now established a superphosphate factory at Tadepalle, and finally the fact that we are partners in the enter-

prise to set up a very much larger fertiliser factory at Visakhapatnam should, apart from the existence for very many years of branch offices in the main cities in Andhra, convince any reasonable person that we are very far from failing to play our part in the industrial development of Andhra.

15. It is customary for me to include in this speech some remarks regarding the Budget. I am happy to note the Budget has generally been well received and while necessarily austere, has on the whole distributed the burden of additional taxation in even measure. The real test is its reaction on the price level and a lapse of time is necessary to be reassured on this point. Meanwhile, I welcome the adjustments made in taxation of inter-Company dividends and the reduction of the tax on royalties payable to foreigners, which will surely encourage the inflow of outside capital which is sorely needed if we are to achieve the targets of the Third Five Year Plan. The tax concession to short term technical personnel is also welcome. I further welcome the reduction of the rate of tax on Bonus Shares and express the hope that next year it may be possible for the Finance Minister the targets of the Third Five-Year Plan. The tax altogether.

16. The industrial pace in India today is faster than anything we have previously experienced. We shall, however, always strive to keep in step and, if possible, one step ahead. It follows, therefore—and here I am looking well into the future—that as soon

as we have achieved some measure of consolidation after our two recent fertiliser developments, we shall almost certainly have to consider further programmes of expansion which will again require additional capital and one of which I have already mentioned, namely, the doubling of the capacity of the Ennore Factory and when that time comes I am confident that the goodwill and co-operation of Shareholders will be forthcoming in ample measure.

17. I conclude these remarks by expressing the sincerest appreciation of the Board of Directors of the excellent work put in during the year under review by all members of the staff and labour, and I personally wish to add to this my thanks to my Co-Directors who have sustained me with excellent advice and co-operation."

The Directors' Report and the Accounts for the year ended 30th September, 1960, were adopted and a Final Dividend on the increased Ordinary Share Capital of the Company at the rate of 14-2/7% subject to deduction of Indian Tax was declared for the year ended 30th September 1960 payable on 30th March, 1961.

Messrs. C. R. Srinivasan, T. S. Krishna and A. M. M. Murugappa Chettiar were re-elected to the Board and the Auditors, Messrs. Lovelock & Lewes were reappointed.

N.B.—This does not purport to be a report of the proceedings of the General Meeting.

General Manager

IN SERVICE LIES SUCCESS...

DAIRY & REFRIGERATION

Pioneers in dairy engineering, L & T have installed 44 modern dairies all over India, and now manufacture various items of plant and equipment.

EARTHMOVING & AGRICULTURAL EQUIPMENT

L & T have supplied to various projects earthmoving, land-clearing, excavation, logging and dredging machinery.

HEAVY PLANT

Paper machines, spray drying installations, sulphuric acid and solven extraction plants, and flour mills have been supplied to a number of industries.

ELECTRICAL EQUIPMENT & SWITCHGEAR

For hydro-electric and thermal power stations, L & T supply high quality electrical equipment, including substations and distribution installations.

DRILLING & MINING

To the Neyveli Lignite Project and other mining schemes L & T have supplied Bucket Wheel Excavators and Spreaders, drilling equipment and turbine pumps.

INDUSTRIAL APPLIANCES

Pharmaceutical machinery, automatic refrigeration controls, process control instruments, power saws, welding alloys and up-to-date bottling installations supplied to numerous concerns.

CIVIL ENGINEERING

L & T undertake various civil engineering works including designs. 'Turn-key' jobs, involving supply and erection of machinery and plant are an L & T speciality.

MANUFACTURE

At Powai Works, L & T manufacture various types of plant and equipment—Dairy, Chemical and Pharmaceutical machinery, Switchgear, Petrol Pumps, Cooling Towers, etc.

SERVICING

IN SERVICE LIES SUCCESS

The slogan sums up our view of the function we perform. In the world of commerce, lasting success comes only to those who are willing and competent to give service, as well as goods, to their customers. Every piece of equipment we supply is backed by a service organisation designed to keep it working at highest efficiency.

LARSEN & TOUBRO LIMITED

ENGINEERS

Bombay-Calcutta-Madras-New Delhi-Bangalore-Cochin-Ahmedabad

ERECTION

At Rourkela, L & T have erected 3 Blast Furnaces, a 'Pig' Casting machine, and the Rolling Mill Buildings—the more recent of the many erection contracts executed.

DAGGER BRAND DRILLS FOR LASTING PRECISION PERFORMANCE

BACKED BY YEARS OF TRADITION and rigid control at every stage of production **DAGGER BRAND DRILLS** (available in inch and metric sizes) assure precision performance.

They are made of superior quality steel, specially heat-treated to ensure long life and manufactured in India's biggest and most modern factory for small tools.

THE INDIAN TOOL Mfrs. Ltd.
101 Sion Road, Bombay 22

THE INDIAN OVERSEAS BANK LIMITED

Registered Office: 151, Mount Road, Madras-2.

(To be submitted to the shareholders at the Twenty-Fourth Annual General Meeting to be held at the Registered Office of the Company, 151, Mount Road, Madras-2, on Monday the 17th April, 1961 at 3-30 P.M.)

Directors' Report for the year ended 31st December, 1960.

The Directors have pleasure in submitting herewith the Balance Sheet and Profit and Loss Account of the Bank for the year ended 31st December, 1960 together with the Auditors' Report.

1959	PROFITS AND THEIR DISTRIBUTION	1960
Rs. 33,60,870 72	Net Profit for the year	Rs. 44,66,422 74
Rs. 2,03,141 06	Brought forward from last year	Rs. 1,26,011.78
	Less further amount transferred to	Rs. 45,92,434 52
	Reserve Fund	Rs. 18,50,000 00
		Rs. 9,00,000 00
Rs. 35,64,011 78	Transfer to Development Rebate Reserve	Rs. 50,000 00
	Provision for Bonus	Rs. 5,50,000 00
		Rs. 33,50,000 00
	The Directors have made the following appropriations:	
Rs. 12,50,000 00	Provision for taxation	Rs. 10,50,000 00
Rs. 6,25,000 00	Transfer to Reserve Fund	Rs. 1,92,434 52
		Rs. 45,92,434 52
Rs. 75,000 00	Transfer to Development Rebate Reserve	
Rs. 5,00,000 00	Provision for Bonus	
Rs. 24,50,000 00		
	The Directors recommend that the balance be disposed of as under:	
	Payment of dividend at the rate of 14% per annum	
Rs. 9,38,000 00	subject to tax	
Rs. 1,76,011 78	Carry forward to next year	
Rs. 35,64,011 78		

2. The Bank's business and profits continue to show good progress. During the year, four branches were opened at Amritsar, Ludhiana, Madras-Triplicane and New Delhi-Karol Bagh. Subsequent to the date of the Balance Sheet, a branch has been opened at Willingdon Island-Cochin.

3. In terms of Section 256 of the Companies Act, 1956 Messrs. V. S. Nataraja Mudaliar, O. Rm. Sp. Sv. M. Meyyappa Chettiar and M. Ct. Pethachi retire and being eligible offer themselves for re-election.

4. The Shareholders are requested to appoint Auditors for the ensuing year and to fix their remuneration. Messrs. Suri & Co., the retiring Auditors are eligible for re-appointment.

BY ORDER OF THE BOARD,

MADRAS,
6th March, 1961

M. Ct. Muthiah,
Chairman

Auditors' Report

We have audited the annexed Balance Sheet of The INDIAN OVERSEAS BANK LIMITED, MADRAS, as at 31st December, 1960, and the Profit and Loss Account for the year ended that date with the books of accounts at the Central Office and the Indian Branches and the certified returns received from the Foreign Branches and we report that:

- we have obtained all the information and explanations, which to the best of our knowledge and belief, were necessary for the purpose of our audit, and have found them to be satisfactory;
- the transactions of the Bank, which have come to our notice, have been within the powers of the Bank;
- in our opinion proper books of account as required by Law have been kept by the Bank so far as appears from our examination of those books and proper returns adequate for the purpose of our audit have been received from the branches of the Bank;
- the reports on the accounts of the foreign branches of the Bank audited by the respective qualified auditors have been taken into consideration together with such other particulars and information thereon made available at Central Office;
- the Bank's Balance Sheet and Profit and Loss account dealt with by this Report are in agreement with the books of account and returns;
- in our opinion and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1956 in the manner so required for Banking Companies, and on such basis the said Balance Sheet gives a true and fair view of the state of the affairs of the Bank, as at 31st December, 1960, and the Profit and Loss account gives a true and fair view of the profit for the year ended that date.

COMMODITY NEWS AND NOTES

PLANNED INDENTS FOR IRON AND STEEL

It has come to the notice of the Iron & Steel Controller that a large number of indents that have already been planned by the Iron and Steel Control are still outstanding on producers and re-rollers. In order to examine the position and expedite action, the Iron & Steel Controller desires that all consumers, including Government, semi-Government and other quota-holders and stockists, should submit to the Iron and Steel Controller (Statistical Section), 33, Netaji Subhas Road, Calcutta-1, statements showing category-wise outstanding position on producers/re-rollers as on April 1, 1961, indicating the name of the producer/re-roller, on whom indents have been planned, numbers and dates of works orders, and tonnage outstanding against each category. If consumers fail to give this information by April 30, 1961, there is likelihood of future indents of such consumers not being considered for planning.

IMPORT POLICY FOR NEWSPRINT

The policy regarding import of newsprint during April-Sept., 1961 is set out in the Import Trade Control Policy Book (Red Book) published recently.

Under the Policy, Actual User licences will be issued to publishers and/or printers of newspapers and of periodicals only for meeting part of their entitlement of newsprint on ad hoc basis and balance will be made available from stocks arranged through canalised imports and Nepa newsprint. The entitlement for newsprint for 12 months will be determined in consultation with the Registrar of Newspapers for India, Ministry of Information & Broadcasting, on the basis of page area, average number of pages published during 1957, regularity of publication and the circulation during 1959. On the entitlement thus worked out, a cut of 10 per cent will be imposed. Newspapers will be allowed to make good this cut from indigenous newsprint manufactured by Nepa Mills. This cut will not, however, apply to newspapers whose entitlement during the period (one year) is less than 100 tons. Separate applications for allocation of Nepa newsprint should be addressed to the Registrar of Newspapers for India, Ministry of I. & B., Udyog Bhavan, New Delhi. Those actual users whose entitlement would be 100 tons or above will be licensed to the extent of approximately 33-1/3 per cent for import from free resources and the balance of 66-2/3 per cent from rupee payment countries against contracts entered into by S.T.C. with various suppliers. Newsprint would be available under these contracts from U.S.S.R. and East European countries as well as from Scandinavian countries. The applicants should indicate the country or countries from which in order of preference, they would like to import newsprint against their entitlement. Licences thus issued would be allowed to be cashed to the extent of 50 per cent during April-September, 1961. The balance 50 per cent would be allowed to be operated only after 30th September, 1961. Requests for additional newsprint on account of increase in circulation during October, 1960 to 31st March, 1961 or after April, 1961 compared with the circulation of 1959, on which the basic quota is being determined, will be considered on ad hoc basis. Requests for such allotments should be made to the Registrar of Newspapers for India supported by a certificate from a Chartered Accountant showing the increase in circulation.

IMPORT LICENCES FOR STEEL ITEMS

The Iron and Steel Controller has announced in a public notice the import licensing policy for the period

April-September, 1961, for items licensable by him.

According to the notice, import licences during the period April-September, 1961, will be issued to established importers for the following items to the extent of the percentage of the base quota indicated against each:

- | | |
|---|-----|
| (1) Industrial scrap | 7½% |
| (2) Tool and Alloy Steel including stainless steel sheets thicker than 18 gauge | 10% |
| (3) Wire of all types excluding H.B. wire up to 14 gauge | 7½% |
| (4) Box trappings | 7½% |

Licences may also be granted to established importers for import of these categories, as well as categories licensable to actual users, provided the payment is made in rupees, under any of the trade agreements in force which provide for such rupee payment. Applications for such licences may be made to the Iron and Steel Controller in the form prescribed by him. Licences when granted will be subject to such conditions relating to price and distribution as the Iron and Steel Controller may impose. The applications should reach the appropriate licensing authorities by May 31, 1961.

PLENTY OF FERTILIZERS FOR JUTE

The fibre yield in jute plants is highly responsive to nitrogenous fertilizers, use of 1 md. 35 srs. of ammonium sulphate per acre giving 5 mds. of jute as additional yield and in many cases, more. There is plenty of fertilizer going round this year. It is time the jute growers obtained their requirements for use either as basal dressing where the crop is yet to be sown or for top dressing where the young plants are already coming up. The land in most jute growing areas is poor in soil-nitrogen as also in organic matter content. The best possible manuring of jute is a combination of 50 to 80 mds. of town compost, farmyard manure and cowdung used as basal dressing with 1 md. 35 srs. of ammonium sulphate top dressed (preferably in two applications) as plants become about one month old. Addition of organic manures will retain the tilth and optimum fertility of soil while the inorganic fertilizers will make available to the crop all the ready forms of nitrogen. The soil in certain parts of the jute growing States, particularly Cachar and Nowgong districts in Assam, North Saharsa, North Purnea and Kishanganj-Islampur in Bihar, the Dooars, West Burdwan, Bankura and Birbhum in West Bengal, Salepur (Cuttack) in Orissa, and Tripura, is acidic for which the use of lime is an essential corrective. Organic manures such as cowdung, farmyard manure, compost, etc., are to be put about a fortnight after the soil has been limed. Application of potash (25 srs. per acre) immediately before sowing will help increase the fibre yield. Use of potash before sowing is strongly recommended in areas where the stem-rot disease of jute is prevalent. For jute growing tracts in North Bihar application of super-phosphate at the rate of 1 md. and 35 srs. per acre in addition to potash before sowing will give the highest yield of fibre. Potash along with phosphate is a very effective balancing factor in the intake of nitrogen by jute plants. It prevents lodging of the crop and gives it resistance to diseases and drought through the development of sturdier tissue. A good fertilizer mixture for jute will supply nitrogen 30 lbs, phosphoric acid 20 lbs. and potash 30 lbs. The nitrogen content in the mixture may go up to 40 lbs. if the variety to be sown is White Jute (*Capsularis*), depending on the soil.

A glorious past, a striving present and a future bright with hope—this is India's destiny. As the sands run out and run out again, there is a new India emerging.

To help achieve this transformation, the A.C.C. now provides India with 35,00,000 tonnes of cement per annum and is stepping up production still further.

HINDUSTAN SHIPYARD AT VISAKHAPATNAM

LIGHTING BY PHILIPS

An area covering more than 67,000 sq. ft. in India's only shipbuilding yard at Visakhapatnam, a project of national importance, has been installed with Philips lighting to ensure round-the-clock, working efficiently and speedily. And, this has been found so satisfactory that Philips fluorescent lighting will shortly be introduced in the rest of the establishment.

Philips' exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy by providing the maximum illumination level at lowest running cost and

gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience as well as research and development aimed to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible *plus* of Philips' international experience and know-how.

FREE: For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.

PHILIPS INDIA LIMITED

JWTP 4442A

The United Commercial Bank, Limited

Report of the Directors

The Directors have pleasure in submitting their Eighteenth Annual Report together with the Accounts of the Bank for the year ended 31st December, 1960.

The net profit for the year, after providing for taxes and for all known and anticipated charges, and including Rs. 1,04,096-00 brought forward from the previous accounts, amounts to

Rs. 68,46,870-98

The Directors have transferred Rs. 30,00,000 to the Reserve Fund and provided Rs. 13,00,000 for bonus to staff. They now recommend the payment of a dividend at Rs. 6-00 per share, subject to deduction of tax, which will absorb Rs. 24,00,000, leaving an unappropriated balance of Rs. 1,46,870-98 to be carried forward.

The Reserve Fund of the Bank now exceeds the paid-up capital and stands at Rs. 2,05,00,000.

The working of the Bank during the year was satisfactory and profit showed an improvement over the previous year's figure.

Stringent conditions prevailed in the money market almost throughout the year.

During the year branches of the Bank were opened at Bhopal, Durgapur, Kota, Maligaon (Gauhati), Mandvi (Bombay), Nagapattinam, Pipri and Ranchi.

The Directors are thankful to the Shareholders and the clients of the Bank for their continued support. They also express their gratitude to the Bank's Advisers and Advisory Committees for their able help and guidance.

The Directors place on record their appreciation of the services of the General Manager and the Officers and Staff of the Bank during the year.

The Directors retiring by rotation under Article 92 of the Bank's Articles of Association are Mr. I. P. Goenka, Mr. Y. N. Mafatlal, Mr. R. L. Nopany and Mr. M. L. Tapuria, who offer themselves for re-appointment.

The Shareholders are requested to appoint auditors for the current year and to fix their remuneration.

Calcutta,
1st March, 1961.

On behalf of the Board,
G. D. BIRLA,
Chairman.

Report of the Auditors

TO THE MEMBERS OF THE UNITED COMMERCIAL BANK, LIMITED.

We have audited the attached Balance-sheet of The United Commercial Bank, Limited, as at 31st December, 1960, and the annexed Profit and Loss Account of the Bank for the year ended upon that date, in which are incorporated the Branch returns audited by the Statutory or other Auditors. The reports on the accounts of the Branches audited by other Auditors have been dealt with in preparing our report in the manner considered necessary by us.

We report that:

- we have obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purpose of our audit and have found them to be satisfactory;
- the transactions of the Bank which have come to our notice have been within the powers of the Bank;
- in our opinion, proper books of account, as required by law, have been kept by the Bank so far as appears from our examination of those books, and proper returns adequate for the purpose of our audit have been received from the Branches of the Bank;
- the Bank's Balance and Profit and Loss Account, dealt with by this report, are in agreement with the books of account and the returns;
- in our opinion, and to the best of our information and according to the explanations given to us, the said accounts give the information required by the Companies Act, 1956, in the manner so required for banking companies and, on such basis, the said Balance-sheet gives a true and fair view of the state of the affairs of the Bank as at 31st December, 1960, and the Profit and Loss Account gives a true and fair view of the profit for the year ended upon that date.

Calcutta,
1st March, 1961.

G. P. KAPADIA & CO.
K. N. GUTGUTIA & CO.

(vii) Additional demands of Rs. 2,61,316 = 77, Rs. 2,68,451 = 05 and Rs. 1,46,265 = 70 were rais- ed for assessment years 1953-54, 1954-55 and 1955-56 respectively by the Income-tax Officer assessing the Bank in India by adopting a totally new method. Appeals have been filed against these assessments. A similar issue for the previous year (viz., assess- ment year 1952-53) where a demand of Rs. 25,75,850= 29 was raised has been decided in favour of the Bank by the Income-tax Appellate Tribunal up- holding the method adopted all along which issue has not been agitated further by the Depart- ment. Accordingly, no pro- vision has been made for the demands referred to above and provision for all years to date has been made on the basis adopted all along in the past and accepted by the Depart- ment.

COMPANY AFFAIRS

CAWNPORE SUGAR: HIGHER OUTPUT

Cawnpore Sugar Works Ltd. registered an improvement in its working during the year to October 31, 1960. This was chiefly due to larger quantities of cane crushed at the three factories in U.P. belonging to the Company. The recovery, however, was not as good as that during the last year, primarily due to poorer qualities of cane available. The following figures indicate the cane crushed and yield during the last two years in various factories of the Company:

1958-59		1959-60	
Cane Crushed	Yield	Cane Crushed	Yield
24,58,381	10.39	21,64,607	10.13
26,10,426	10.45	27,41,394	10.37
32,28,729	9.28	40,23,926	9.11
22,91,761	9.69	30,07,414	9.40

This improvement was reflected in profits which during the year under review increased to 13.37 lakhs as against 6.78 lakhs during the previous year. The Directors have proposed to provide Rs. 1.60 lakhs for development rebate reserve. The balance of Rs. 12.68 lakhs is set off against the loss of Rs. 16.86 lakhs carried forward from the previous year. There still remains a debit balance of Rs. 4.18 lakhs in the profit and loss account. The depreciation provided by the Company on its fixed assets in the previous year was in excess of the statutory scale by over Rs. 10 lakhs. This amount has accordingly been written back and transferred to capital reserve.

The Directors have pointed out that the cane crop for the season 1960-61 and the supplies thereof so far have been quite satisfactory, and it is expected that the production will be at an increased scale at all the four factories.

Due to lack of funds the schemes for raising efficiency of two factories were not carried out. A sum of Rs. 11.08 lakhs was, however, spent towards additions and overhaul at these factories which is likely to improve their efficiency. Moreover a major part of the proposed expansion at the Marhowrah Distillery was completed.

ASSOCIATED BATTERY MAKERS: A NEW STATUS

The year to August 31, 1960, marks a distinct change in the production pattern of Associated Battery Makers (Eastern) Limited, inasmuch as there has been considerable progress towards completion of indigenous manufacture of articles which previously had to be imported. Exide, Dagenite and the other Automotive Batteries manufactured by the Company continued to enjoy, widespread confidence and patronage. The Company has continued with its policy of introducing improvements in design and production. This will enable it to meet the increasing demands resulting from the expansion of transport, electrification and industrialisation throughout the country. Implementation of this programme brought certain initial technical problems but results began to be seen towards the end of the year. Therefore, although the total sales of Rs. 2.06 crores are down by 9 per cent on those of the previous year the Directors consider that this is not discouraging in view of the basis which has been laid for the future.

In January 1960, the Company's legal status was altered to that of a public company. The issued capital was increased by Rs. 68 lakhs by the issue of 6,80,000 equity shares of a nominal value of Rs. 10 each at the issue price of Rs. 15 each. Out of this issue the existing shareholders took up 2,00,000 shares, of which 65,000 shares were in part payment of the Company's indebtedness on loan account to the existing shareholders, and 1,35,000 shares were in settlement of the purchase price of the entire issued share capital of Chloride & Exide Batteries (Eastern) Private Ltd., whereby that Company has become the wholly owned subsidiary of this Company.

The profit during the year came to Rs. 52.07 lakhs. After making provisions for taxation, etc., there was a balance of Rs. 33.7 lakhs. The Directors have transferred Rs. 4.07 lakhs towards fixed asset replacement reserves and Rs. 1.51 lakhs towards development rebate reserve. An interim dividend of 15 per cent less tax paid on the issued capital of Rs. 50 lakhs absorbed Rs. 7.50 lakhs. The Directors have now recommended the payment of a dividend on equity shares of Rs. 10 each at the rate of 10 per cent which will absorb Rs. 11.80 lakhs.

SEN-RALEIGH PREPARES FOR EXPANSION

The Directors have reported that during the year to September 30, 1960, the sales of Sen-Raleigh Industries of India Ltd., were recorded at Rs. 3.58 crores, showing an increase of 22 per cent over the previous year. The Directors have added that the production of the company might have been better but for difficulties in obtaining adequate supplies of raw materials. There was an increase in material costs mainly due to the imposition of excise duty on some bought-out cycle components. The company has received industrial sanctions from the Union Government for manufacture of House Service Meters and Bicycle Dynamo Lamps and expand the manufacture of chains. The Company may soon approach the shareholders for additional finances to execute these schemes.

The profit during the year came to Rs. 24.46 lakhs. The Directors transferred Rs. 1.18 lakhs towards development rebate reserve, Rs. 2.75 lakhs towards reserve for repayment of loans, Rs. 10 lakhs towards taxation equalisation reserve and Rs. 3 lakhs towards general reserve. A dividend at the rate of 8 per cent on ordinary shares has been proposed to be paid.

Production, Prices and Bank Money

THE informal meeting of the Parliamentary Consultative Committee on Finance last week has raised a new and unexpected limitation of bank advances. The Finance Minister is reported to have said that the proportion of bank finance in company capital formation has increased so much in recent years that the Government was contemplating measures to ensure a larger equity base for the capital of industrial undertakings. This suggestion is severely unhelpful at a time when the larger equity base cannot be found with free money. Indeed, for a matter of three years the Reserve Bank of India—and particularly, its imaginative Governor, Mr. H. V. R. Iengar—has preached to the scheduled banking system the necessity of going into medium term finance to assist industrialisation of the country. Both industry and the banks took this advice seriously. All of a sudden the Government has swapped its horses in mid-stream. Both industry and the banking system must wonder how they are expected to change their course at a time when alternative finance of the requisite proportions is just not available. One fears greatly that the net effect will be to slow down the floatations of new companies dependent not a little on bank underwriting.

The whole issue of production, prices and bank money in industrialisation was also the subject of Mr. G. D. Birla's presidential address last week at the annual meeting of the United Commercial Bank. Mr. Birla's thesis has two weaknesses which need to be admitted, but it must be recognised as a constructive contribution to the diagnosis of the current dilemma of production and prices. Mr. Birla's argument is to the effect that the answer to rising prices can only be pro- that the answer to rising prices can only be pro- duction. Controls represent only suppressed inflation with no chance of a long-period break-through. So far as industry is concerned, production cannot take place without finance; finance cannot take place adequately without advances from the bank. Since advances from the banks are limited by the volume of deposits, Mr. Birla argues, firstly, that measures should be undertaken to curtail non-banking lending by certain measures undefined; secondly, that the banks should be authorised to raise advances in the first

instance; these advances will eventually create deposits, and the essential temporary rise in the 'ratio' will be compensated over a short period of time.

On the face of it, the first portion of Mr. Birla's thesis, that controls without production are no answer to the price problem, has been proved, not merely in the Indian Union but in almost every country which has tried the arduous process of suppressing market forces without totalitarian powers of policing individual transactions. He is obviously right in arguing that, particularly when plans have been made to secure certain production rises, it is not open to the Government of India or any other authority to argue that these production rises are not to be attained merely because of pressure on prices. Therefore, a price policy which cuts at the planned targets is not a solvent of our problems, even if it were successful in holding prices. In point of fact, it would not be successful in holding prices because demand is constantly rising, and lower production will only mean higher prices. What is more questionable is that the solution is to be found in raising bank advances ahead of deposits. If Mr. Birla's argument were correct, namely, that advances create their own deposits, the last year should have provided ample evidence of the virtuous chain reaction which he proposes. The banks have increased their advances by Rs. 250 crores; even if all the rise in deposits were thus generated, Rs. 200 crores would not have returned to the banking system. This is, because it is more profitable to lend outside the banking system, as Mr. Birla foresees. But, since there is no means by which the non-banking system can be policed so as to lend at the same rate as banks do, how can this leakage from the banking system be stopped? Would it be wise for the Reserve Bank of India to follow Mr. Birla's suggestion that the risk should be run on advances merely because production needs further finance? The evidence of the last year, it must be admitted, is more on the side of the Reserve Bank of India's view that bank money does not, in the present circumstances, create deposits of anything like a similar magnitude so that there would be a recycling of bank deposits if advances were properly directed.

The current position, therefore, is by no means one on which an easy agreement will be reached, and certainly the Government of India, with the pressures exhibited in the Congress Party's informal price discussions last week, will not launch up on a policy of creation of bank credit which, somehow or other, seems to work in Germany or Japan. Mr. Birla was probably thinking of these countries when he advocated the course of action which does not seem to have the same relevance to this country.

On the other hand, the dilemma is not solved by refusing to recognise that a ceiling on bank finance will mean production cannot proceed at the rate of last year when it was nurtured with some risk by a rise in bank advances and in the 'ratio'. The ratio of advances and bills discounted to deposits has already passed the 70 per cent mark. It may not be possible to take it much above 75 per cent. Even if it were maintained at that figure, it would have been impossible for the banks to take up any considerable portion of the long-term securities which the Government of India intends to float in the Budget year. It is thus clear that the banking system is unable to take the combined strains of private sector production needs and the public sector demands. Political pressures decree caution on an adventurous course on advances ahead

The Crisis in Indian Sugar

WITH sugar production during the current crushing season expected to increase to about 30 lakh tons, the Union Food and Agriculture Minister, Mr. S. K. Patil—and still more the Indian sugar industry—is faced with the problem of abundance with a vengeance. Output of this order, coupled with the 5.5 lakh tons stock brought forward from the last season, will leave a surplus of nearly 14.5 lakh tons over an estimated domestic consumption of 21 lakh tons. A carry-over of 5 lakh tons is considered more than enough and the maximum which the industry, according to the President of the Indian Sugar Mills' Association, has the capacity to handle. We will, thus, have an exportable surplus to the extent of nearly 9.5 lakh tons.

The question of disposal of this huge surplus expeditiously has been quite legitimately exercising the mind of the industry which is finding it hard to service these stocks. The industry's resources are known to have been strained to the limit; so much so that it has given notice to the Government and the cane suppliers that it may not be possible for it to pay their dues unless the position improves in the near future. Since release of this large surplus on the free international market, at the current price, will involve a loss of the order of Rs. 35 crores, it is imperative that efforts to export a greater part of it to a preferential market like the United States should be redoubled. It is encouraging that Mr. Patil has planned to make a dash to Washington to seek from the U.S. Government an export quota of 5 lakh tons of sugar for this country.

Even if an export quota of this order should be available from the United States, we will have a surplus of nearly 4.5 lakh tons of sugar, out of which contracts for exports have been entered into to the extent of about 80,000 tons. We may be able to export another 40,000 to 50,000 tons in the free international market during the current

of deposits but equally they decree abstention from excessive monetary control.

All in all, the current debate has been nearly sterile. The strait-jacket in which the banking system has found itself because of the stagnation of deposits represents one of the deepest disorders in India's economic system. The answer must be the revival of deposits with deposit insurance, the opening of new branches in the rural areas and a rise of interest, all at the same time. If this trinity of operations is not successful quick enough, and on an adequate scale, the only answer for new finance must be larger foreign aid. It is necessary for the country to make up its mind as to whether it desires this increased dependence on foreign countries, because of the rigidities into which its own system will be put by the determination not to permit price rises and by the failure to restrict its planned appetite to the volume of its current resources. The moral period and the banking system does not quickly recover its old buoyancy, a rephrasing of the Plan is essential. It is well, however, to recognise that, whatever the additional pressures placed upon the country by the rise in population, any expansion of its current production targets can only be attained with some significant measure of price inflation.

year, leaving approximately 3.25 lakh tons for the disposal of which measures will have to be devised.

The central dilemma, however, is how to meet the loss on export of sugar. We can sell sugar in the free world market only at a loss of Rs. 300 to Rs. 360 per ton and to a preferential market like the United States at a loss of Rs. 150 to Rs. 190 a ton. To meet this loss, and to cover the increased cost of production, the Indian Sugar Mills' Association would like the Government to raise the controlled ex-factory price of the commodity by Rs. 5.51 per maund. However serious the industry's predicament, this is not a feasible solution politically. The sugar industry must not expect such a solution to be seriously considered with current political pressures. Indeed, it was unwise even to claim a price rise; there should, in fact, be a fall with decontrol. The industry must cease to shelter behind controlled prices.

The present crisis of the sugar industry has been the outcome of two factors; firstly, increase in cane supplies to factories, due partly to higher acreage under the crop resulting from the stepping up of the cane price by 3 annas per maund during the last crushing season, and partly owing to depressed prices of gur and secondly, the unwisdom of some units in the industry which, in order to boost their earnings by availing of the 50 per cent rebate on excise duty on production in excess of the last year's, purchased cane even from areas outside their reserved zones. The consumer can hardly be expected to pay for the miscalculations of the cultivator and the industry (both aided by the Government).

From where then should the loss be met? The excise duty on sugar in India today is clearly excessive. It is the view of this journal that an immediate cut should be effected in this levy to offset a major part of the increase in price war-

ranted by the loss on exports. The industry and the cane-growers will do well to meet some of the loss voluntarily out of their large profits in the last two years; it is said the industry and the cane-growers will be benefitting to the tune of nearly Rs. 9 crores if the current season's output amounts to 30 lakh tons as envisaged. Cultivators must forego their benefits under the price-linking formula. Linking of sugar exports to imports of some items which enjoy a high price in India today can also be helpful to meet the loss to some extent.

From the long-term point of view, if India is to emerge as a big exporter of sugar, it is essential that cost of production of the commodity should be brought down appreciably. The vested

interests—cane-growers, factories and the public exchequer—have enjoyed prosperity at an undue burden to the consumer. They should not go on expecting him to bear a burden when surpluses are so great. Cane prices must be brought down by an increase in yield per acre and abolition of an unworkable price-linking formula. The factories must face a free market price. The Government must limit its demands to what all can bear. Only decontrol can settle the appropriate market price. The industry which only a year ago sought decontrol is now recognizing serious disadvantages therein. But an unreal price will not give it the opportunity to sell stocks it is unable to hold. It is time market prices compelled the adjustments which are necessary over all elements of cost.

Central Government Employment

THE debate on the demands for grants of the Rehabilitation Ministry was valuable for the attention it focused on the future of this Ministry. The talk about its winding up has given rise to a sharp controversy—and quite appropriately. Mr. Mehr Chand Khanna's contention that the displaced population would be fully integrated with the rest of the population in a year's time will not be borne out, at least in West Bengal. Over 320,000 refugees in this problem State will not be integrated in so short a time. The difficulties of making the correct human approach to their resettlement in an atmosphere, surcharged with a high degree of sensitivity which is exploited by the politician, cannot be overlooked.

The abolition of the Rehabilitation Ministry raises another important problem, which is but a part of a comprehensive problem vitally concerned with the character of the Central Government employment. Assuming that the Rehabilitation Ministry is wound up in a year's time, no less than 8,000 of its employees will need to be absorbed in alternative jobs or thrown out on the streets. In fact, temporary staff of an unusually large size, in service over a long period of years, is an outstanding characteristic of Central Government employment. The two Pay Commissions have devoted quite a valuable part of their reports to an analysis of this delicate problem. Both the Commissions have recorded their categorical view that a high proportion of temporary employees must be reduced to sizable dimensions. There is certainly no reason why an abnormal ratio of temporary staff should exist in the Central Government employment other than railway employment.

Temporary staff is subjected to a number of handicaps, the most serious of them all being lack of eligibility for pension. The quasi-permanent staff, too, is subject to this disability. Nothing short of permanency entitles an employee to the benefit of a pension which is the basic insurance he has after retirement. In fact, want of confirmation and permanency amounts to a double-edged weapon. Absence of security about the future produces profound psychological repercussions which are as much harmful to the life of the individual employee as they are to the quality of the work which the Government gets in return for its

salary bill. Insecurity after the working life is exhausted dangles over the head of the unfortunate employee. It is to draw a totally wrong analogy by pointing out, as there has been an easy temptation to do, to the liability of an industrial employee to termination of service by notice of three months at the most. An industrial employee becomes conversant with a job for which openings are available outside his employing establishment. An employee who has spent a precious period of his career extending to about 10-12 years in Government service loses his capacity for change and jobs of a similar character are hardly available.

Rapid expansion of staff and the mounting volume of paper work have been vital traits of government employment in the post-war era and not even the United States has escaped it. The Hoover Committee found it difficult to prescribe any expeditious remedies to bring it within a manageable size. Even so, in the United States the proportion of temporary employees in the Federal Government service was reduced remarkably from 35 per cent in 1951 to 6 per cent in 1957. In the United Kingdom temporary non-industrial staff in Government employ declined from 44 per cent in April 1949 to 22 per cent in July 1955. But in India the ratio of temporary staff in the Central Government employment, other than the railways, continues to rule very high. Between June 1955 and June 1959 the reduction has been only of the order of 5.8 per cent from 64.2 per cent to 58.4 per cent.

Against the background of the requirements of the development programmes under the five year plans, this abnormal proportion is inexplicable except on the major ground of great circumspection in the matter of making posts permanent, when obviously there is little chance of their abolition. It would, however, be absurd to put a ban on fresh talent entering government service on the plea that all the non-permanent employees must be confirmed first in their posts. But there is no justification for keeping the staff temporary, as a principle of overall policy, after seven years at the most. The danger inherent in the present drift is that the phenomenon of a proportion of the Central Government employees remaining temporary all their life-time, which was brought before the public gaze by the First Pay Commission, will be the curse of an increasing number of victims.

THE WEEK'S NOTES

Space Conquest

THE FIRST SPACEMAN

YURI ALEXSEYEVICH GAGARIN, a young Russian air force officer of 27, sprang into world fame on April 12, as the first spaceman. He travelled in space in a 4.5-ton space ship and orbited the earth in 89.1 minutes at a minimum height of over 187 miles for a total length of 108 minutes. This historic achievement of Russia in science and technology has been rightly acclaimed as a great landmark in human progress and due praise has been showered on her from all over the world. Space travel for man has come within the range of reality at last. Actually the announcement of the first human traveller in space returning safe to earth was expected at about this time. Time may, perhaps, show whether any human passengers sacrificed their lives for the cause of science like Laika, the first animal space traveller. In August, 1960, thorough success was achieved in sending an animal passenger into space and bringing it back to earth alive. This was followed by further experimental flights to collect a wealth of data. Animals and insects were sent in large numbers as space passengers before risks were taken with the life of man in this venture.

In this unparalleled achievement Russian genius for progress in science and technology has been vindicated once again. Science recognises no frontiers of geography. If Russia has made history in the conquest of space, will America remain behind? America's "Project Mercury" (experimental flight to send man into space), scheduled for April 28, will eventually lead to the same result. The conquest of space by man opens up boundless scope for peaceful progress; but it also enhances his capacity to exploit it for forging new and deadly instruments of annihilation. It is to curbing the destructive potential of the conquest of space that the leading nations of the world will have to address themselves.

C.P.I.

SHOWDOWN SHELVED

ALL TALK of an open show-down between the rightist and leftist groups of the Communist Party of India at Vijayawada vanished into thin air. There was so much publicity given to the Dange thesis of the "national democratic front" and the Ranadive group's advocacy of an out and out pro-Chinese line. The initial stages of the proceedings of the Communist Party's Congress lent colour to the imminence of a sharp cleavage between the two groups and a bitter fight. Reports of the rightist group winning the first round and so forth kept this belief alive. Not that there was no heated debate on the theses of both the sides or that there was no confusion over ideological positions. Finally, of course, the rightist-sponsored resolution on policy was adopted. What is significant is that the much-advertised show-down gave way to compromise.

Neither the rightist group's plea for a tactical line to enable the CPI to function effectively in the present national mood in the wake of China's aggression nor the leftist group's attempts to revive the Telangana spirit were pursued to the point of forcing a positive decision. The truth of the matter was that the differences between the right and the left could not be disposed of until there was a decisive clarification of the Party's stand on the India-China border dispute. Unless this clarification came, the Party's precise posi-

tion could not be defined. Ultimately, unequivocal declaration of the Party's stand on this crucial issue was put off and shelter was taken behind a spineless resolution urging India and China to negotiate a peaceful settlement. This vacillation is obviously due to the stranglehold of the Party's basic allegiance beyond the national frontiers. If the much-publicized show-down was shelved, it is a pointer to the essential unity of the two groups on the over-riding question of world Communism. The attitude adopted at Vijayawada was presumably influenced by the advice offered by the powerful Russian fraternal delegation. It demonstrates the capacity of the two groups for flexibility to sink their differences in the interest of ultimate loyalty to international Communism.

Industrial Licensing

MIXTURE OF RECOMMENDATIONS

THE ESTIMATES Committee's hundred and twenty-third report on the Development Wing of the Ministry of Commerce and Industry is a curious mixture of recommendations—reasonable as well as questionable. The Committee has taken a good deal of pains to analyse the causes of the irksome delays in the procedure for industrial licensing and has made quite a number of valuable suggestions. The rigidity in routing an application for a licence in a strict order of succession through different channels involves considerable avoidable delays. Perhaps, this is also one of the causes why the Development Wing demands additional information on technical data from the applicants on a piecemeal basis. Copies of the application can be referred to most of the authorities simultaneously. In as many as 47 per cent of the applications, material additional information is called for. This is evidently due to lack of knowledge of the intricacies of the licensing procedure and the complexity of data required. The Estimates Committee, while it has rightly urged the suppression of the new class of objectionable intermediaries, comes to the balanced conclusion that it would be worth while encouraging the services of firms and individuals of proved reputation to act as technical agents subject to registration of names. The present free access to all and sundry, under the pretext of playing the role of intermediary, is responsible for many of the malpractices that have cropped up in the wake of industrial licensing.

In its enthusiasm to prescribe an idealistic policy, the Estimates Committee has seemingly outstripped the limits of its proper, though undefined, jurisdiction. It has assumed the role of a policy-maker and issued exhortations to the Development Wing on the purposive manner in which the instrument of licensing should be moulded and utilized. To this class belong its recommendations on the elimination of monopolies and the suppression of "the growth of industrial empires." In the hard reality of the dearth of financial and technical resources at the command of the private sector, one would be tempted to question where these "industrial empires" exist and how fast they are occupying the industrial sector. Concentration of economic power through effective command of monopolies is operating as a nightmare in the case of some. The Estimates Committee is the latest addition to this category. Monopolies do not exist in this country either in the form of curtailment of production or manipulation of the markets by means of schemes of pricing. If this peril raises its head, independent legislation will be required to stamp it out. The Estimates Committee is apparently unsure of the position it has taken and in quite an apologetic manner it explains how licences to bigger industrialists may be awarded in case others are not coming forward.

Vietnam

INFILTRATION

PRESIDENT DIEM'S re-election by over 80 per cent of the votes amounts to a reiteration of the verdict on his personal popularity. The referendum of 1956 installed him in power as the first president of the newly created republic and since then he has commanded respect as well as awe. It would have made little difference to the outcome of the election if his principal political rivals were free for the contest. This election was important for two reasons. It was the first based on adult franchise and despite the threats of the Communists, intermingled with isolated acts of violence, a great majority exercised their right. The estimate of 90 per cent having turned up for the poll will probably need to be taken with circumspection and final result after the full count will clarify the exact position. But the most significant fact is that there were no issues of policy involved in this election. The contest between the three candidates was settled by the personality factor.

A second five-year term is, in fact, a challenge thrown up at President Diem. This challenge comes from the Communist guerillas and it is becoming increasingly grave with the passage of time. The last twelve months have made a considerable difference, so much so that it has induced President Diem to give up his attitude of comparative complacency and acknowledge the reality of the danger. Communist infiltration is spreading rapidly not only in the northern region but in the jungle-infested west, bordering on Cambodia, and the central highlands, hitherto regarded as difficult of access to the rebels. Communist guerillas no longer operate as sporadic bands, but they are systematically infiltrating their forces in the interior, Saigon not being altogether immune. Villages are terrorised, communications disrupted by bridges being blown up, heavy casualties are being inflicted on the army deployed for their expulsion and in recent months the infiltrating forces have begun to levy taxes in the countryside. Perhaps it would be an exaggeration to depict the political scene showing President Diem as sitting on the top of a volcano. But the 9,000-strong Communist operators are a compact and fanatic force whose strength is not to be judged by their number. President Diem, however, is inviting discontent by his authoritarian methods, heedless of the counsel of his advisers to liberalise his rule to consolidate his power. If his victory at the election has made his tenure secure for another five years, he would find himself less secure to fight the infiltration.

Political Parties

A DANGEROUS PATRONAGE

THE HOME MINISTER of Uttar Pradesh, Mr Charan Singh, made startling disclosures in the Legislative Assembly the other day about sinister portents holding a threat not only to the maintenance of law and order but to the future of political parties. A probe into the membership of political parties in an unnamed district, carried out by the Minister with the assistance of the District Magistrate, revealed that the Praja Socialist Party with a membership in that district of 2,000 had 197 history-sheets on its rolls, the Socialist Party had 111 history-sheets out of its total membership of 3,500, the Communist Party 7 out of 300, the Jan Sangh 2 out of 2,000 and the Congress Party had 13 in its massive membership of 40,000. He also gave details of ex-convicts as members of the political parties in this district. The Minister tried to impress the gravity of the menace on the House and stressed its potential repercussions on the parties, particularly at the Panchayat level. History-sheets are abominable elements whose notoriety cannot escape the notice of local party leaders.

Harbouring them as respectable members of political parties is to extend a dangerous patronage and it is suicidal to resort to this practice for immediate gains, whatever they may be, if at all. This reprehensible tendency takes another ugly form, as the Minister bluntly stated on the floor of the House. He charged a certain variety of legislators with stooping to interfere with the administration of law and order for shielding offenders and then accusing police officials of dereliction of duty.

But a good cause may be spoiled by bad and tactless presentation. Mr. Charan Singh's appeal to the leaders of the political parties to deliberate in concert over this perilous patronage is unlikely to receive the response that it deserves without question. Not that party leaders are impervious to such a call. But they may take serious offence at the manner of disclosure and may refuse to accept his protestation that in making it, it was not his object to score a debating point over his opponents. He might have made his appeal effective, if he had kept the parties unnamed, as he kept the district unnamed. Open imputations may provoke deep resentment and the representative character of the sample chosen for the survey may be questioned—as also the quality of the scrutiny into the undesirable antecedents, if any, of a vast number of members of political parties. Low or high ratio of membership of known criminals is an absolutely irrelevant issue and the former cannot extenuate the guilt. It is of the utmost importance that, forgetting the Minister's indiscretion, political parties should get together to evolve a disciplinary code to banish this patronage. Failing that, the Congress Party must impose upon itself a self-denying ordinance.

The World Abroad

ARE YOU PAYING THE RIGHT SALARY FOR THE JOB?

By

ODYSSEUS

IN THE PAST twenty years the tremendous bargaining power built up by the trade unions in so many countries has led to disproportionately greater increases in pay for wage-earners than to salaried staff, who have also suffered widely from currency inflation. This has created problems which are discussed by Mr. Richard C. Smyth (President of Smyth & Murphy Associates, business consultants), in his "Financial Incentives for Management" (McGraw Hill, London, 1960, 66sh.), a book of great practical value to business men.

Mr. Smyth lists the basic objectives of adequate compensation (including salary, bonuses, profit-sharing, etc.) as: (1) to attract competent persons into executive posts from lower positions or from outside the company; (2) to retain them; (3) to induce them to put forth their best in sustained efforts.

The first need is to ensure carefully thought out and equitable relationships between the salaries of executives. In far too many companies all over the world, the salary structure has grown up haphazardly over the years. Often some determined executives have secured increases for their subordinates which throw the entire structure out of proportion. In others, certain departments are grossly underpaid. Mergers and take-overs may set up overlapping and distortions, which impede good personal relations and good work, and create an atmosphere in which responsibilities are avoided and "Passed to you" becomes the rule.

Mr. Smyth has no difficulty in demonstrating that salaries for particular jobs should not be based solely on the subjective personal guesses of the chief executive but as far as possible on quantitative job evaluations, which can be calculated in points, and he shows how a table such as the following can be worked out by scientific methods:

Position Title	Total Points
President	915
Executive vice-president	840
Vice-president, marketing	800
Vice-president, production	735
Vice-president, finance	730
Vice-president, research and development	720
Junior engineer	195
Regional auditor	185
Payroll supervisor	160

The next step is to turn these points into cash. Salaries depend on many factors, including a company's size, its prosperity or adversity, the nature of its in-

dustry, and the relation of the demand for executives, with the particular qualifications required, to the supply in the neighbourhood or in the country as a whole. If so, why not merely compare the salary paid a post in your company with the salary paid the same post in a company of your size in your industry and in business in general? Of course, if all business had the same posts, and if their duties were identical, no evaluation would be needed. But more often than not, posts with the same title are not identical. For example, in a U.S. company, the president is usually the chief executive. Yet in some firms, the president has a secondary role, and the chairman of the board of directors is the chief executive. In some, the title of vice-president is given only to heads of divisions; in others, the title is lavished around, either to impress customers or as a mark of honour instead of a pay rise. It is Mr. Smyth's experience that valid comparisons of posts between companies can only be made in about 20 to 40 per cent of cases.

The level of salaries, even for comparable posts in companies of the same size, varies greatly between industries in many countries. In Europe and the USA, certain industries such as pharmaceuticals, cosmetics, motor cars, textiles, and department stores, pay senior executives at the high end of the salary scale. In such industries, senior executives must make many, and quick, decisions involving large sums of money with big possibilities for profit or loss. But others, like electric power, communications, railways, banks, and insurance companies, pay executives less. Here, the range of decisions is often narrowed by government regulations, or decisions are fewer and can be made under less pressure, or involve smaller potential profit or loss. For example, in 1961 a typical president of a U.S. cosmetics manufacturing firm with annual sales of \$37 millions might have a basic salary of \$75,000, while a president of an electric light and power utility with the same value of annual sales might have a salary of only \$47,000.

In order to prepare a salary evaluation plan, you need to collect the facts about posts and pay in other companies from (1) annual reports, (2) trade associations, (3) business consultants, and (4) by special enquiries addressed to particular companies. Mr. Smyth recommends personal enquiries in case (4), as surveys conducted by 'phone or mail care usually misleading. Although competing firms in the USA may be ready to discuss their salaries and the duties that go with them, I foresee difficulties in Europe and Asia, where firms are apt to be jealously secretive and do not always appreciate the value to their industry of informal co-operation.

In order to prepare a methodical salary structure for your company, you should plot a graph in which the vertical gives the annual basic salaries, and the horizontal the post evaluation points. When you draw in the resulting curve, you will, unless your salary structure is already ideal, find dots above and below it. You make another graph of the average salaries

paid by other firms in your industry, and by superimposing this on your first graph, you see to what extent your salaries are above, below, or in line, with those of your competitors.

If your salaries are above the average for your industry, your justification to your shareholders will be that you are able to attract the best men and to retain them. If you are not, in fact, getting the best man, you are now in a position to consider whether there are faults of salary relationships inside your own structure, or whether your personnel management is poor, or what other causes there may be for your difficulties. Mr. Smyth's experience is that when companies find that their salary structure is below that of comparable firms, it comes as a surprise to them, and they seek to rectify it.

Actually, the pay curve finally decided upon in any given situation will depend on a series of considerations. The level and slope of the company's existing pay curve, the past practices of the organisation, the philosophy of the top management and the board of directors, in some cases the viewpoints of major shareholders or government agencies, the overall economic status and prospects of the company and industry, and level and slope of the pay curves of other companies in the same industry or business, and in industry at large, will all need to be reviewed.

When a post evaluation survey has been carried out, Mr. Smyth says that it is often found that from 5 to 20 per cent of executives are being paid less than, and 3 to 15 per cent more than, the minima. Such discoveries should not disconcert: they are precisely what these surveys are intended to reveal and to correct. Once salary ranges have been realistically established, it will be found that new staff can usually be engaged at, or close to, the minimum rates for their posts.

However, in periods of acute shortages of management personnel it may be necessary to pay appreciably more than the minimum of the range. An applicant with unusual experience and educational background

may well warrant a starting salary considerably higher than the minimum of the salary range for his position. Obviously, the higher the starting salary the fewer rupees will be left within the range for subsequent merit increases. Also, other executives in the same position may resent the higher starting salary of the new employee. Certainly, it is to the advantage of the company to hire qualified executives at the minimum of the realistic salary range for their positions or as little above it as is feasible.

Once permission has been secured to fill a vacancy, most department managers want it filled as soon as possible. As the search for applicants continues, there is a tendency to feel that a qualified person could be found if only the salary range for the position were not so low. Thus, subtle pressure is exerted constantly by department managers, and by those responsible for management recruitment, to increase the salary ranges or to start new employees higher within the established ranges.

Frequently, these pressures are the result of not spending enough money on the recruitment of management personnel or of not assigning capable enough or experienced enough executives to do the work of selection.

Actually, a rupee spent on the costs of recruitment administration is a far cheaper rupee than one added to the payroll. The rupee spent on recruitment costs is spent once and for all, but the rupee added to the payroll is spent every pay day. Also, the payroll rupee is often increased by about 20 per cent by fringe benefits, such as holidays, pension scheme, insurance, or other amenities. Too many companies are apt to raise their starting salaries to a higher level than is necessary in a properly thought-out salary structure and not to spend enough on the recruitment of executive staff. In any dynamic economy, it is wise to carry out salary structure reviews at least every two years.

In a final article next week, I will discuss bonus, profit sharing, and other schemes of incentives for executives.

The American President

THE USE OF POWER

By WILLIAM REES-MOGG

THE party divisions of American politics are less sharp than in most other countries, if only because a conservative Southern Democrat is so far to the right of a liberal Republican. Nevertheless, it is unusual for a party's supporters to express their pleasure at having lost an election. Yet this is now the attitude of Republican voters in the United States.

This is particularly true of Wall Street. The phrases all come to much the same thing: "Of course I voted for Nixon, but ..." "All our partners are Republicans, but I reckon ..." "I didn't vote for the guy, but this fella Kennedy is doing a fine job." It is not until you actually talk to a member of the Republican organisation itself that you meet much resistance to this point of view. Even with organisation Republicans there are no signs of the frantic hostility which the Republicans used to feel for previous Democratic Presidents.

What has President Kennedy done to achieve this extraordinary popularity, a popularity which also shows up in exceptionally favourable Gallup polls? There are several different answers to that question, but there is one answer which cannot be given. He has not had, or tried to have, a dramatic initial hundred days in the pattern of Roosevelt in 1933. He has not taken the initiative to push great measures through Congress, and if he had tried Congress would not have carried them. Even his present modest legislative programme is in surprising difficulties, and a larger programme was not feasible politically.

There is indeed a growing feeling in the United States that Congress is lagging behind public opinion, that it is still preoccupied with the issues of the 1950's (not to mention the 1890's) and has failed to appreciate that the public is behind the new President. One reason seems to be that the balance between the conservative and liberal forces in Congress is an extremely close one, turning on a margin of half-a-dozen votes in each issue. The mood of Congress is influenced by the closeness of its own power-struggle, a struggle which is still going on.

President Kennedy has, however, succeeded in establishing a remarkable direct association with public opinion, and he has used an unexpected instrument—the President's press conference—to do it. When I was over in Washington last month I was able to attend one of these conferences as a guest: it is an even more impressive performance to see live than it is on television.

The President has, of course, a remarkable vigour and youth. He looked tired, reasonably enough, during the press conference on Laos, but normally he leaves the impression of having plenty of energy in reserve. When one considers the sheer load of work on an active President this in itself is both exceptional and reassuring.

He also has a grasp of the whole range of policy of his administration. When I was there he was asked, without warning, a question about a redundant defence factory which the Government was selling in Michigan. He was able to reply in detail about the nature of the problem (the highest bidder wanted to demolish the factory; a lower bidder wanted to operate it).

This grasp of administrative detail is particularly important in the United States because of the relative weakness of the American civil service. Much of the time a British Minister can rely on directing his department, but can leave the implementation of policy to his

officials. In the United States a strong President has to provide not only the direction but also the energy of Government. The strength of the present administration has been created by the President personally.

There is also a new feeling in Washington that this is an administration which, perhaps for the first time, has a scientific approach to Government. The typical member of the present administration is an intellectual of about the President's age with a good academic training and a precise quantitative approach to political problems. The new Secretary of Defence, Mr McNamara, is a typical example—he was one of the originators of Operation Research in the U.S. Air Force during the war.

However, this cannot mean that the element of emotional sympathy will be left out of the new administration. The administration's sympathies are in fact already reasonably clear. It is anti-colonialist and on the side of the emerging nations. Unlike Mr Dulles it does not exclude neutralism by laying down the rule, which is better theology than politics, that he who is not for us is against us.

The new administration is sympathetic to sterling (mainly because of fear for the dollar) but not so sympathetic about British trading needs. It is pro-European, but determined to make Europe pull its weight in the world. If there is bargaining with the Common Market it is likely to be tough bargaining on both sides.

The U.S. public's honeymoon with its new President shows no sign of coming to an end. He is too decisive not to make some enemies in time, but he has made few so far and won many friends. Because of this decisive leadership he is likely to be followed in the world, but in the world too some countries (of which Portugal was perhaps the first) may resent the determined use of American power.

The European Scene

RUSSIA AND THE TRADE BLOCS

From Our Special West European Correspondent

PARIS, April 9

THE Russians have suffered two defeats in Europe this spring, or at least they have had to abandon hopes of two prizes that one day might have been theirs. The formation of two trade blocs in Europe left out in the cold several countries on the edge of the Soviet zone of influence: Finland in the north and Greece and Turkey in the south. These relatively poor nations could not afford to join their more prosperous western neighbours in ventures like the Common Market and Free Trade Area. If they had been cut off from richer western Europe by being excluded from those trading clubs, the Russian bear would eventually have swallowed them, at first economically but in the end politically too. Indeed the process of economic attachment to the Soviet zone was already far advanced. Greece, in particular, was commercially on the verge of falling into the Soviet orbit, despite her membership of the western political alliance, and her fall would have been hastened if the Common Market had begun to put up an external tariff that shut out Greek goods from their traditional markets to the north-west.

Fortunately, however, one aspect of the benign trade war between the two economic blocs is a sort of competition for satellites and clients. Each side has just succeeded in winning itself a satellite: the Free Trade Area pulled off the coup of attaching Finland to that association, and the Common Market immediately followed by placing Greece on a safe orbit from whence it cannot gravitate toward the Soviet system. Though each side has cried victory over the other, it is clear that the only loser is Russia who, moreover, will suffer a similar defeat when Turkey is securely attached to the western commercial system later this year. The competition between the trade blocs is keen enough for Spain to be practising the usual playing-off routine of "neutrals" who put themselves up for sale to the highest bidder; Madrid is sounding out both the Free Trade Area and the Common Market to see which will offer the more attractive conditions for Spain's membership. Greece, too, tried this technique with some effect when the negotiations with the Common Market began to drag last winter: Athens sent ministers to London to talk about trade, whereupon the Common Market increased its offer of investment capital to Greece. This brief essay in intimidation was not serious, for Greece's natural place is in the Common Market, but Athens was entitled to remind everyone that admission to one or other bloc was urgently necessary, the alternative being continuation of Russian commercial penetration.

The case of Finland was more complicated, since the Finns for their sins were well and truly under Russia's thumb; the Russo-Finnish trade pact binds the little country firmly to her great neighbour. This made it impossible for Finland to adhere to the Free Trade Area as a full member without granting Russia the same facilities as she gave her new partners. The Russians invoked the most-favoured-nation clause, which is of course pure hypocrisy on the part of a Communist state where the treatment that foreign traders get is not determined by tariffs and quotas but by central decisions of the planners. Thus a nation that favours Russia by lowering duties is never assured of being favoured in return; how much that nation sells to Russia conti-

nues to depend on the planners' decisions, so that "reciprocal" reductions of duties, etc. are meaningless. At all events, the members of the Free Trade Area simply rejected Russian requests for most-favoured-nation treatment and worked out a complicated way of associating Finland with their enterprise. Finland, as one party, and the EFTA, as a second party, have formed a subsidiary free-trade zone of two members; Finland gets the benefits of the Stockholm Treaty yet remains independent. On the one hand, Russians pretensions are checked, and on the other the danger is avoided of leaving Finland out on her own in Russia's shadow when her Nordic neighbours club together in EFTA. The solution is intricate and it remains to be seen how it will work, but it is already assured that Finland stays in the western trading world.

The ingenuity and rapidity with which this complex problem was solved by the Seven led some Swiss newspapers to comment patronisingly on the difficulties that the Six were having in reaching agreement with Greece. It was demonstrated, they said, that EFTA was a supple instrument for bringing nations together, whereas the heavy machinery of the Common Market made extension much harder. Actually, within a few weeks the pact between Greece and the Common Market was signed in Brussels. Admittedly, this pact, concluded after 18 months of close bargaining which several times seemed to be on the edge of failure, has now to be approved by the Greek Government and ratified by the Greek Parliament, approved by the European Parliamentary Assembly and the six-nation Council of Ministers and then ratified by each in turn of the six national parliaments. This is indeed heavy machinery, but it will work smoothly because all the economic issues have been settled and within a few months Greece will be the first associated member of the Common Market.

The setback for Russia is in this case considerable, which is why the agreement, favourably received by Greek national opinion, is being described by the Greek Communist Press as a "national disaster" that hands the country over bound hand and foot to "foreign capitalists" and ushers in a new period of slavery. In reality it liberates Greece from the dangerous and increasing dependence on the Soviet bloc. As everyone who has visited Greece in recent years knows, the country is flooded with Russian goods, from motor cars to watches, delivered at dumping prices as part of a concerted effort to incorporate Greece into Soviet economic sphere. Greece used normally to sell 45 per cent of her exports to the six nations now members of the Common Market, but as Italy gained preferences in that region for her citrus fruits, fish, dried grapes and tobacco, Greek agricultural exports to the north-west fell seriously. These goods had to be sold to the Communist countries in the north-east, in exchange for industrial imports from those states, and the consequent diversion of Greek trade channels was beginning to have evident political repercussions.

To bring Greece back to the western trading system meant admitting her agricultural exports to the Common Market, and if these were admitted at falling duties, as is the rule between full members, the compa-

tion for Italy (already the poorest member of the venture) would be severe. Besides, Greek tobacco and the question of a common agricultural policy raised difficulties for all the members, not only Italy. The price members would demand for these sacrifices would be freer entry of their manufactures into Greece, and that in turn threatened the infant and inefficient industries of the islands. To counter that, the more prosperous members had to agree to offer substantial loans for the modernization of Greek industry, and much of the dispute has been about the sum required. It is reported that the figure of \$130 million was settled on, this sum to be invested over five years by the European Investment Bank. The lenders, who will be the West Germans in particular, gain the right to see that these capital investments are efficiently disposed of; this is no doubt the enslavement to foreign capital referred to by the Greek Left.

The treaty between Greece and the Common Market is as intricate as the arrangement between Finland and EFTA. A customs union will be formed, coming into effect very gradually: 12 years for most products and 22 years for the others. Italy benefits from certain safeguard clauses, while Greece retains a number of "tariff-quotas," i.e. the right to continue to import duty-free quantity of goods from her traditional clients outside the Common Market. Here again, it remains to be seen how this arrangement works in practice but it is already assured that Greece's anchor is cast in a western port, so that the drift to the east ceases and might soon be reversed. Ulysses, it has been said, will henceforth be deaf to the songs of certain sirens. The asso-

ciation will have an undoubted economic cost for Greek industry, called upon to face up to some competition from Germany, but fresh capital will be available to assist it, and the five-year plan is guaranteed of fulfilment.

The difficulty of working out this project has convinced the Common Market negotiators that they cannot hope to repeat the arrangement in the more difficult case of Turkey, where, moreover, even larger capital investment would be required. The negotiations that begin next week with Ankara will be directed rather at a close trade agreement between the Six and Turkey. The economic question is complex but the political objective is the same: to ensure that Turkey does not suffer from integration in Europe to the point where she would be obliged to lean more heavily on Russia and the Communist bloc. The Six are in an optimistic mood and there has been talk of going on to similar arrangements with Israel, Spain and even the United Maghreb that could emerge if an independent Algeria united with Tunisia and Morocco—so that, in the end, the whole Mediterranean was virtually encompassed by the Common Market. It requires considerable enthusiasm to entertain that grandiose project at this date. Yet the political necessity to check Russian penetration in the region is obvious, at least by ensuring that economic integration in Europe does not leave a periphery of waifs and strays liable to be devoured by the Communist trading nexus. The ingenuity shown by both the rival commercial blocs, in the cases of Finland and Greece, confirms that this is perfectly feasible.

Economic Report from the U.S.

CREATION OF THE OECD

By GUY SIMS FITCH

WASHINGTON, April 5.

A NEW spirit seems to have come alive in that complex of nations which has come to be known as the free world. It is a spirit of rededication to the cause of human progress and well-being, through the practical and co-operative efforts of all nations, large and small, developed and developing. This spirit is rooted in the desire of the developing nations to achieve a better life, and in the willingness of the industrial nations to help them in this endeavour. It is sparked by the readiness of the industrial nations to join together in co-ordination and enlarging the assistance effort, and by the economic momentum which has seen them overcome past dislocations and arrive at new positions of economic strength. It is mirrored in the creation of the organization for economic co-operation and development (OECD), through which the industrial nations will harmonize national policies for the orderly promotion of economic growth, and will find more efficient ways to make capital resources available to the developing lands.

The OECD, which already has been ratified by the United States and Canada, is scheduled later this year to succeed officially the largely outdated and regional Organization for European Economic Co-operation (OEEC). The United States and Canada, only observers in OEEC, will become full-fledged partners in OECD, along with its 18 West European members. Japan, as a member of OECD's Development Assistance Committee, also will participate in the organization's studies of aid for developing lands. This committee already is functioning under the title of the Development Assistance Group (DAG), of which ten capital-supplying nations are members. They are the United States, Canada, the United Kingdom, Belgium, France, the Federal Republic of Germany, Italy, Japan, the Netherlands and Portugal, plus the Commission of the European Economic Community (EEC). DAG recently concluded its fourth meeting, in London, and is scheduled to meet again in Tokyo in July. The London meeting brought approval, in effect, of the concept that the aid total can and should be enlarged, although no precise formula was worked out with regard to each member's contribution. However, the meeting agreed on a study of principles for a fair sharing of the aid effort, with due regard to the circumstances of each country, especially its economic capability. Another important development was the agreement, in principle, that aid should be on an assured and continuing basis, with emphasis on long-term loans rather than short-term commercial credit.

Not the least of the meeting's accomplishments was the provision for permanent DAG officers—an indication that now, and later as part of OECD, its work has a long-range importance. Its Chairman will be from the United States, and its Vice-Chairman from France. For its part, the United States is planning to place its own foreign aid programme on a new footing, one that frankly recognizes the need for revamping old programmes and for achieving greater efficiency in budgeting for economic assistance on a long-term basis. It has been urging its OECD partners to do the same. The U.S. hope seems to be that the combined aid effort of the free industrial nations can

yield about \$8,000 a year in badly needed capital for the developing lands. A recent study by the OEEC reveals that from 1956 through 1959 the total flow of funds from Western Europe and North America to developing areas totalled more than \$27,000 million, for an average of about \$6,900 million a year. The United States provided about half the total, and about 60 per cent of all the governmental assistance.

A sum of this magnitude clearly does credit to the interest of the industrial nations in advancing the well-being of the less-developed regions. But it is the U.S. belief—one that seems to be gaining general acceptance—that other contribution, themselves the recipients of large amounts of U.S. aid in the past, have progressed economically to the point where they now are able to expand their aid programmes, particularly in the form of long-term Government credits, and thus take up a larger share of the total effort. Also gaining ground is the view that the recipient countries must carry out their own reciprocal obligations in this co-operative effort, this involves meaningful self-help programmes, including where necessary not only economic but also political and social reforms. Thus, it can be said that the world now stands at the threshold of an exciting new age. It is an age both of ever-present challenge and of prospective fulfilment, an age in which through the right kind of effort and co-operation, free nations can be partners in the great cause of advancing the welfare of mankind.

Steelmaking Plant Completed Ahead of Schedule:

With the completion of testing of the 100-ton open hearth furnace, the final unit of the melting shop, all the steelmaking facilities at Durgapur have now been installed. The work has been completed well ahead of schedule. Three furnaces went into production last year and dates for the commissioning of the others remain to be fixed. The steel-melting shop consists of seven open hearth furnaces of 200 ton capacity each plus the 100-ton furnace previously mentioned. The 100-ton furnace has been designed for the specific purpose of producing special steels for the manufacture of wheel sets for the Indian railways. The steelmaking plant embodies the most up-to-date layout and will, in full operation, produce a nominal 1 million ton of ingot steel per year. This plant was designed and built by a member company of Iscon—the British consortium building the steelworks at Durgapur.

India's Foreign Trade in Merchandise in February, 1961: The provisional figures of India's foreign trade in merchandise by all-routes sea, air and land—on private and Government accounts during February, 1961, according to information available in the Department of Commercial Intelligence and Statistics, Calcutta, are given below:

Exports	Rs. 53.25 crores
Re-exports	Rs. .34 crores
Imports	Rs. 74.32 crores
Balance of Trade	Rs. 20.73 crores

The figures exclude trade with Tibet, Sikkim and Bhutan, and the trade arising in the Andaman and Nicobar Islands and the Laccadive, Minicoy and Amin-divi Islands. In the case of Nepal, air-borne trade alone is included. The figures are exclusive of the value of certain consignments of private merchandise under reference to the customs for verification and of Government stores awaiting adjustment.

Table I below brings together the provisional figures for February 1961, along with similar figures for January, 1961, February, 1960 and the revised figures for February 1960:—

TABLE I
(In Crores of Rupees)

Foreign trade in merchandise	For the Month of			
	February 1961	January 1961	February, 1960	Provisional Revised
Exports	53.25	53.84	47.09	46.01
Re-exports	.34	.70	2.72	2.77
Imports	74.32	83.42	69.12	78.38
Balance of Trade in merchandise	—20.73	—28.88	—19.31	—29.60

The cumulative totals for the eleven months ended February, 1961, are shown along with the corresponding figures for 1959-60 in Table II.

TABLE II
(In Crores of Rupees)

Foreign Trade in merchandise	Cumulative totals of eleven months, April to February.			
	1960-61	1959-60	Provisional	Revised
Exports	579.30	590.37	577.45	
Re-exports	9.47	6.76	9.28	
Imports	924.29	751.02	859.43	
Balance of Trade in merchandise	—335.52	—153.29	—272.70	

Indo-German Project: Toshniwal Brothers Private Ltd., leading firm of Bombay, importing all types of scientific instruments and laboratory test equipments in collaboration with Hartmann and Braun of Frankfurt, Germany, proposes to set up a Rs 65 lakh plant in Ajmer (Rajasthan) for manufacturing annually Rs 60 lakhs worth of industrial process control and test equipment. The proposed plant will be the first of its kind for large scale production with possibilities of further expansion. Industrial licence has been obtained from the Government of India and land has been acquired for setting up the factory which is expected to be completed within the next six months. Part of the production is expected to be marketed by the end of 1961. The foreign exchange required for the proposed plant will be about Rs 22 lakhs. The Company is allowed to export its products to neighbouring countries like Burma, Ceylon, Pakistan and Nepal. The equipment to be produced are mainly used by paper, chemical, plastics and iron and steel industries.

Production of Malted Milk Powder: An improved process for the production of nutritive and palatable malted milk powder and allied products has been developed at the Central Food Technological Research Institute in Mysore. The new process makes use of solid powder, such as malt extract and milk powder as base material instead of fresh milk and malt liquor. Production is thus facilitated since the amount of water to be evaporated for preparing the product is reduced. The base materials required in the new process are ragi, jowar, barley, wheat and milk which are easily available in the country. The total capital outlay for a 300-ton annual capacity plant is estimated at about Rs 6.85 lakhs. In 1957 the total value of malted milk and malted milk powder imported was about Rs 95 lakhs. Since then, imports have been drastically reduced to about 5 to 10 per cent.

O.G.L. for Imports from Pakistan Issued: The Government of India have issued an Open General Licence for the import of four items produced or processed in Pakistan. The items listed on the O.G.L. are fish, not otherwise specified; fish, salted, wet, hide and skins, raw or salted, and kapok. Payments in respect of the last item viz. kapok under this O.G.L. will be made in non-convertible Indian rupees as provided for in the trade agreement between the Governments of India and Pakistan signed on March 2, 1960. The O.G.L. will be valid up to April 30, 1961.

National Federation of Co-operative Sugar Factories: To co-ordinate and facilitate the working of co-operative sugar factories and provide them technical and other assistance, a National Federation of Co-operative Sugar Factories, was registered on December 2, 1960. Other processing units set up in the first four years of the Second Plan, numbered 243, the agricultural commodities processed by them including cotton, paddy, groundnut and other oilseeds, etc.

United States

Assistance to Indian Products: Representatives of the United States and Indian Governments signed recently six project agreements allocating a total sum of Rs. 46 crores, the loan portion of U.S. P.L. 480 counterpart funds available to India. The agreements will cover rupee costs of thermal power stations at Chandrapura (Rs. 20.5 crores) and Barauni (Rs. 1.3 crores), a hydro-electric project at Barapani (Rs. 6.4 crores), extensions to thermal power stations at Durgapur (Rs. 3.4 crores) and Kanpur (Rs. 95 lakhs), and

the Trombay Fertilizer Plan (Rs. 13.4 crores). The entire estimated costs of all these projects are being financed by the United States. Agreements have already been signed with the U.S. Development Loan Fund for covering foreign exchange costs amounting to \$87.9 million. All these U.S. D.L.F. loans are repayable in rupees. Since India's Third Five-Year Plan calls for increasing agricultural production by more than 30 per cent, the Trombay Fertilizer Plant will be of considerable importance. The Third Plan contemplates tripling the output of nitrogenous fertilizers and increasing the output of phosphatic fertilizers by 6 or 7 times. Total U.S. assistance in India now stands at Rs. 1,808.9 crores.

United Kingdom

White Paper on National Income and Expenditure:

According to the White Paper on National Income and Expenditure published in London on April 5, the money value of goods and services produced in Britain was 6 per cent higher in 1960 than in 1959. This rise compares with one of 3½ per cent between 1958 and 1959. Investments in plant, machinery and building rose by over 9 per cent between 1959 and 1960. Consumers expenditure rose by nearly 4½ per cent, about the same as between 1958 and 1959. Both exports and imports also rose but as in 1959, the rise in imports (nearly 13 per cent) was larger than the increase in exports (6 per cent). The gross national product was valued at £22,292 million in 1960. Consumers expenditure was valued at £16,640 million. On the income side, the main changes were in income from employment (7 per cent higher) than the previous year. In income from self-employment (up 5 per cent), and in company profits (7 per cent higher).

U.S.S.R.

Soviet Sugar for China: It is reported that before the end of August, U.S.S.R. is to supply China with 5 lakh tons of sugar, on an interest-free loan basis. The loan will be returnable between 1964 and 1967. It has also been agreed that China's outstanding trade account for 1960 should be repayed to the Soviet Union in instalments within 5 years, without interest. Under the terms of the agreement signed recently, the Soviet Union will supply China this year with power and oil equipment industry, tractors, cars, rolled steel, non-ferrous metals and other items. China will continue supply to the Soviet Union of non-ferrous metals, tin, mercury, chemicals, woollen and silk textiles and other manufactured goods.

France

Construction of a New Uranium Ore Treating Plant: Following its plans for the chemical treatment of uranium ore at Bessines and Ecarpiere, the Kuhlmann Establishments has recently built another plant in Forez for the French Atomic Energy Commission (CEA). This plant is administered by the S.I.M.O. an affiliate of both Kuhlmann and CEA. It is able to treat 1,800 tons of uranium ore per year. The process which is being used at this factory for the first time and which is specially patented, makes possible the direct obtention of Uranyl Nitrate with an extreme high degree of purity.

Air France-Japan Airlines New Agreement: During January 1960, Air France and Japan Airlines signed an agreement to ensure close co-operation between the two in all commercial spheres. From 1st April, 1960, according to this agreement, Air France Boeing Jet Intercontinental have services operated under double flags of Japan Airlines and Air France. With effect from 1st April, 1961, the point operations have been extended to the south route Tokyo-Paris via

India. Air France Boeings operating through India now offer services as if jointly of both companies.

Kenya

Rayon Mill for Mombasa: Kenya is to partner Japan in £1 million project which will bring the first rayon cloth factory to East Africa. The factory is to be built at Mombasa on Kenya's coast, by the newly formed Kenya Rayon Mills Ltd. The Japanese Mitsubishi Group of companies will provide technical assistance as well as the substantial part of the capital. The Kenya product, which is expected to be on the market by about July 1962, will compete directly with Japan, which supplies most of East Africa's demand for rayon cloth. The factory plan for Mombasa will produce 15 million sq. yards of rayon cloth a year and several hundred Africans will be employed. The project will cover spinning, weaving, dyeing and finishing of rayon cloth. The whole installation will be one of the most modern in the world.

Trade in 1960: Compared with the figure of £99,892,377 in 1959, Kenya's total volume of trade during 1960 was £110,245,700. Domestic and re-exports total £40,195,463 compared with £38,384,831 in the previous year. As against £61,507,546 in 1959, there were imports worth £70,050,297 in 1960. Coffee remained the chief export earner.

Australia

Factory Production: Above the October 1960 level, the All-group index of Australian factory production in November 1960 rose by 1.9 per cent. This increase is attributed to a gain of 5.2 per cent in non-durable goods sector of the index. Compared with October, there was no change in durable goods section. The lack of change in the durable goods section is significant in the sense that this is the first occasion since the publication of the monthly index in 1957, that November production of durable goods has not been above output in the preceding month.

Yugoslavia

Health Insurance: According to data now available, health insurance covers nearly 18 million people, 97.4 per cent of Yugoslavia's total population. This figure is the result of the introduction of health insurance for more than 10 million peasants and members of their families. The health insurance scheme to include craftsmen is being prepared, so that shortly almost the entire population of Yugoslavia will be insured. As a result of the efforts in health protection of people in Yugoslavia, the mortality rate has dropped from 13.9 per thousand in 1949 to under 9, while the average age of Yugoslav is at present about 12 years longer than before the last war.

Trade with Soviet Union: An agreement on trade exchange for the period 1961-1965 was signed between Yugoslavia and the Soviet Union recently. The agreement envisages a doubling up in trade between the two countries. Yugoslavia will export cables, lead, ferrous metallurgy and chemical industry products, various industrial equipment and machines. By 1965 Yugoslav shipyard will build or the U.S.S.R. 16 tankers of 25,000 deadweight each, 9 ships of the tanker type of 10,000 deadweight tons each. In addition to this, Yugoslavia will supply to the Soviet Union with 3,500 tank wagons, electro-technical equipment, universal driers, complete equipment for fruit and vegetable processing, and other goods. The imports from the U.S.S.R. by Yugoslavia will include pig iron, oil derivatives, aluminium, coal, coke, rubber and other goods.

NEWS IN BRIEF

INDIAN

The State-owned Hindustan Machine Tools has announced its highest ever production, for a one month period, of 131 machines during the month of March, 1961, the previous best being 129 machines during March, 1960.

*

The Tariff Commission will be holding its public enquiry in connection with the revision of existing price linking formula for sharing the price of sugar between the cane growers and the sugar mills on April 14, 1961, in Madras. Public enquiry will also be held later in Bombay.

*

The collieries under the National Coal Development Corporation produced 1,229,025 tons of coal during March, 1961, corresponding to an annual rate of production of 15.85 million tons. The rate of production envisaged at the end of the Second Five-Year Plan was only 13.5 million tons.

*

The Tariff Commission has taken up for investigation the question of continuance of protection to the caustic soda and soda ash industries beyond December 31, 1961.

*

The Broach (Narmada) Project, at Navgaum, about 100 miles from Ahmedabad, in Gujerat State was inaugurated on April 5th. The project, on completion, will irrigate 9,62,588 acres of land annually in the Broach and Baroda districts of Gujerat.

*

Letters have been exchanged extending the validity of the Indo-Greek trade agreement and the lists attached to it until the end of 1961. The trade agreement, which has been first concluded in February 1953, had earlier been extended until December, 1960.

*

The Government of India is expected to take an early decision regarding the setting up of a free trade zone at Kandla. A special officer is being appointed to examine the comments and suggestions received from trade and business interests in India and abroad to the tentative scheme prepared by the Government.

*

Production of iron and steel by the Tata Iron and Steel Company at its Jamshedpur Works during March was better all-round as compared to the previous month. Saleable steel output rose to 114,900 metric tons from 94,200 tons produced in February, according to figures released by the Company.

*

The Integral Coach Factory at Parambur is in the process of diversifying its production. It is now proposed to build, in addition to integral coaches, rail cars and other varieties of passenger coaches.

*

The first All-India Seminar on the Economic History of India was held in Delhi from 8th to 11th April, 1961 under the auspices of the Delhi University.

FOREIGN

The United Arab Republic has signed a contract with £E6.4 m with Fiat of Italy for the construction of a factory near Cairo. The Company will start producing four cylinder cars within a year.

*

The South African Reserve Bank has reduced from 10 to 6 per cent the minimum reserve balances which commercial banks must maintain against demand liabilities payable in the Union.

*

Malayan production of tin metal in February totalled 4,065 tons. This is 11 per cent less than in January and is the lowest since April last year. Production in the first two months of this year has been 8,630 tons.

*

Plans for a new fibre manufacturing and marketing venture in Europe have been announced by Celanese Corporation of the U.S. and Farbwerke Hoechst A.G. of West Germany.

*

It is reported Britain, the U.S. and the Soviet were named recently among 25 countries whose representatives will plan the establishment of a U.N. Capital Development Fund for industrially underdeveloped countries.

*

Kaiser Bauxite has been awarded a contract to supply the U.S. Government with 400,000 tons of bauxite for stockpiling. Kaiser has, therefore, increased Jamaican output to full capacity and has reemployed some 200 workers laid off in December.

*

British Overseas Airways Corporation and Elder Dempster Lines are to dispose of their respective 16.1/3 and 32.2/3 per cent interests in W.A.A.C. (Nigeria), the company which operates Nigerian Airways.

*

The 1961 Sydney (Australia) Trade Fair, where Russia has booked nearly 30,000 square feet of space, is virtually sold out, and a second Sydney Trade Fair has already been officially announced for 1963.

*

The Bank of Japan has announced that Japan's balance of payments for February showed a surplus of \$63m. But receipts in the current account totalled \$39m. against payments of \$432m. This large deficit was attributed mainly to continued high imports of raw materials and machinery, and an unfavourable balance in invisible trade.

*

It is reported although the banks' advances to local manufacturers are no longer subject to the ceiling which was first imposed in August, 1958, Turkish industry as a whole is still extremely short of liquid money.

*

Pakistan has decided to establish another oil refinery. This time in East Pakistan at Chittagong with a capacity of 1m. tons. Steps are being taken to attract foreign interest in the project but no indications are yet available as to the sources tapped.

*

Greece and West Germany signed an agreement in Athens recently mutually guaranteeing private investments in each other's countries against discrimination and expropriation without compensation.

Special Article

TRENDS IN BANK DEPOSITS AND ADVANCES

STRINGENCY in the banking system has steadily grown since August 1960, with the result that the ratio of advances to deposits exceeded the 70 per cent mark in the middle of March 1961. This is not the first time that this ratio has overshot this point; as early as March 1957, it had risen even to 76.58 per cent. But the comparison of the ratio between March 1957 and March 1961 hides one important element which tends to lessen the degree of tightness. P.L. 480 funds credited to the State Bank of India have hitherto kept the advances-deposits ratio of the State Bank rather low and this had in the past tended to lower the level of ratio for all the scheduled banks taken together. The picture becomes clearer if this ratio is considered for all the scheduled banks after excluding the State Bank. In this way, the ratio is computed to be a little more than 80 per cent in March 1961, as compared to 81.6 per cent in March 1957. Thus tightness in the banking system is almost as high as in March 1957 and it is obvious that the scheduled banks are left with little room for manoeuvre. This fact is brought out clearly in Table I below.

TABLE I
CREDIT-DEPOSIT RATIO

Year	Highest	Lowest	Amplitude
1950	57.13 (April)	46.82 (November)	10.31
1951	65.37 (May)	56.77 (January)	8.60
1952	70.39 (March)	53.43 (November)	16.96
1953	63.52 (March)	52.30 (November)	11.22
1954	66.36 (May)	56.13 (November)	10.23
1955	66.07 (March)	58.03 (October)	8.04
1956	72.98 (March)	64.53 (January)	8.45
1957	76.58 (March) (81.60)*	61.47 (November)	15.11
1958	66.34 (March)	52.85 (November)	13.49
1959	62.00 (March)	50.34 (November)	11.66
1960	62.41 (December)	52.92 (January)	9.49
1961 (Upto March)	70.81 (March) (80.32)*	63.71 (January)	—

* Excluding the State Bank of India.

The basic reason for the intractable rise in the ratio since August 1960 has been the heavy demand for funds while deposits have persistently refused to expand. During the last 12 months, the advances of the scheduled banks have risen by more than Rs. 200 crores while deposits, instead of rising, have fallen by something like Rs. 26 crores during the same period. What are the reasons for the failure of the deposits to look up? Various explanations have been offered, the most important being the lack of confidence in the banking system following the failure of the Palai Bank and a sizable diversion of the surplus funds to the non-banking financial institutions because the rates of interest in the non-organised banking system are very encouraging as they rule above 12 per cent per annum. The higher rate of interest in the non-banking system is likely to continue its pressure on the available funds,

though the effect of the failure of the two scheduled banks in 1960 will slowly wear out and may very soon cease to operate as a factor restricting the flow of money into the banking system. The history of banking in industrially developed countries has shown that the competition between the banking and the non-banking sectors to attract surplus money in the economic system is always very keen, and the non-banking sector — because of the higher rates of interest (some-time more than double the rates prevailing in the organised sector) — is mostly successful in drawing larger funds to itself. This factor, it seems, will continue to operate in this country also. It is for the scheduled banks to intensify their activities and open new branches at places where fresh pools of incomes are being created so as to mop up the surplus funds. But this is only a long-term solution. Something needs to be done at once in order to break the vicious circle in which the banking system finds itself currently.

The increasing interest which the banking system in the country has taken in Indian industry has been unwisely decried in certain circles. With the expansion of the industrial sector of the country it is natural that the banking system should play a greater role in providing medium-term finance to industry. The analysis of the pattern of advances of the scheduled banks during the last decade (vide Table II on page 976 shows the important role played by the banks in providing finance for this vital sector of the Indian economy.

Between December 1950 and April 1960, the advances of the scheduled banks rose by Rs. 650 crores out of which Rs. 381 crores were advanced to industry. This fact may be illustrated in another way. In December 1950, the share of industry in the advances of scheduled banks was only 32 per cent. By December 1955, its share had risen to 34.3 per cent while in April 1960 it had grown to the level of 47.4 per cent. Figures for April 1961 are not available. But it is certain that the ratio of advances to industry in relation to total advances will be above 50 per cent. Part of the present tightness and rigidity in the banking system may be explained in terms of this increasing share of advances to industry also.

In order to finance this high level of advances, the banks during the last eight months have liquidated their investments in Government securities and since August 1960 their investments have fallen by Rs. 200 crores. This is rather an unhappy trend because it tends to put serious limitations on the loan component of the Third Five-Year Plan. The draft outline of the Third Five-Year Plan released in June 1960 had assumed that a sum of Rs. 850 crores would be borrowed from the public and here the banks were supposed to contribute a sizable portion.

How is this vicious circle to be broken? In order to assist the economy in continuing its upward trend in growth, it is necessary that the banking system should be relieved of its present stringency. Mr. G. D. Birla has put forward a constructive suggestion for reviving the bill market so that the channels of growth are not choked up. It is to be conceded that liberalisation of credit through the revival of bill market will have its repercussions on production and prices. While production will take some time to pick up, prices may rise in the short period. Foreign aid on a liberal scale could also be one of the instruments for curing the present malaise. But there is a limitation even on this course,

and it becomes obvious that in the present state of the economy, the Third Five-Year Plan may have to be re-phased so as to keep it within feasible limits.

Any new money pumped into the system either by deficit financing or through the bill market or through

foreign aid is likely to generate inflation in the first round. It is only in the second and third rounds when consumer goods increase in supply and match the increase in money supply that prices could be kept in check. Slight increase in the inflationary pressure seems inevitable for breaking the vicious circle.

TABLE II
ADVANCES OF SCHEDULED BANKS: 1950-60

(Rs. crores)

	December 1950	December 1955	December 1956	October 1957	October 1958	October 1959	April 1960
1. Industry							
Cotton Textiles	39.33	49.69	81.48	111.18	122.06	120.02	123.89

THE BUSINESS WORLD

Ideology and Reality

By CROESUS

THE GOVERNMENT is trying to develop a Welfare State in the country, consistent with the provisions of the Constitution. It has in the same spirit accepted the goal of a Socialistic Pattern of Society. . . But in a country with a large population which is growing rapidly, with the majority of the people at the subsistence level, with a minority having large fortunes, and with unlimited scope to produce more but with limited resources, human and material, to do so, a Socialistic Pattern of Society is not easy of realisation in the near future." Few will disagree with this considered conclusion of one of India's most eminent economists, Prof. C. N. Vakil, and it is just as well that this view was expressed by him in the course of his Walchand Memorial Lecture, last week, on the "Industrial Revolution in India."

It is a moot point whether even so doughty a captain of industry as the late Mr Walchand Hirachand, who could pioneer so many industries in the pre-Independence days, would be able to achieve half as much in the circumstances prevailing to-day. Apart from the cry of the wolf in the name of concentration of wealth and monopolistic tendencies in a few hands, which is a sufficient damper to the enthusiasm of any entrepreneur, the freedom enjoyed by private enterprise today is too severely restricted—restricted beyond the exigencies of the situation—by the maze of regulation (not necessarily always basic to the needs) and the Government departments which have grown more rapidly than the rate assumed in Parkinson's Law. As Prof. Vakil pointed out, this has led to certain defects. To quote his own words, "the personnel may not be trained and experienced; they may not be sympathetic in dealing with the problems on hand. The multiplicity of rules introduces an attitude of avoiding responsibility by some officers; decisions are not taken except at the highest level making for delays and frictions; complaints of the misuse of authority as in the grants and licences are common. A new class of intermediaries seems to have grown who make it a business to help those interested in seeing through their applications by methods which are not above board." Prof. Vakil is by no means the only one to hold such a view. Only a few days ago, the Estimates Committee of the Lok Sabha itself strongly criticised the cumbersome licensing procedure by pointing out that, as against the three-month limit set by the rules under the Industries (Development and Regulation) Act, it takes nearly 4.7 months, on an average, to obtain a licence. This was also the main theme of the presidential address at the last annual general meeting of the Indian Chemical Manufacturers' Association.

It might appear intriguing that, notwithstanding all these irritations and in spite of all the limitations imposed upon private enterprise thus, private enterprise should

still continue to be growing, as it has been. The simple explanation, of course, is the admitted dynamism and robust optimism of private enterprise. But, as Prof. Vakil observed, something must also be said for the change in the climate for private enterprise that has become noticeable for some time past. "There is," for instance, "increasing understanding in more recent times; private enterprise has established its position by good work and its contribution to the development process. Public enterprise has found by experience that success is not easy, that they are not above complaints and that they have yet to prove their capacity to earn profits. Though, for some time, public enterprise took the greater share of available investment, the logic of events seems to have brought an awareness that they cannot neglect private enterprise." As compelling a circumstance as any that has contributed to the change in the atmosphere for private enterprise, in my opinion, is the yet other factor indicated by the eminent professor, namely, "the increase in dependence on foreign assistance and the difficulties experienced by foreign governments to help at the government level and the willingness of the foreign private enterprise to come into the picture provided they are given adequate safeguards and facilities." This is quite obvious from the recent decision of the Government of India to keep in abeyance, as it were, their pet policy of nationalisation of industries for sometime. While all these have given sufficient encouragement to Indian private enterprise, one cannot yet say with any degree of definiteness that the party in power has abandoned its Socialistic Pattern of Society concept. On the contrary, the pronouncements of those at the helm of affairs leave no doubt whatsoever that they are wedded more strongly than ever before to this ideological concept. All the same, so long, at any rate, as there is, as between the private sector and the public sector, mutual respect, instead of friction, and co-operation, instead of conflict, we need not apprehend any setback to the healthy growth of our economy.

I think Prof. Vakil has rendered a signal service to the country by helping to provide the proper perspective to those obsessed with the notion that the operation of the present economic system has resulted in concentration of wealth or creation of inequalities. His thesis, that the very effort to produce more, whether in the public sector or in the private sector, creates new inequalities merits close and careful study by students of economics. In the words of the Professor, "Modern large-scale production results in some concentration of economic power. Besides, the rapid development of industry, however dispersed, creates new vested interests. . . . In spite of various restrictions and even heavy taxes, this situation creates new inequalities at a time when the objective of the country is to remove inequalities in the hope of bringing about a Socialistic Pattern of Society. In our efforts to produce more to fight the problem of poverty, we have to pass through stages of this nature, which

seem to be inconsistent with the declared policy of the Government."

All these go to confirm my conviction that the rate of economic growth is determined neither wholly by the extent of ambition of a country nor even by the extent of outside aid that that country may manage to secure, but is also conditioned by certain inherent inhibiting factors within the country itself. In the case of our country, moreover, what the authorities have undertaken is not merely economic development but an all round transformation. As the learned Professor noted, there is no parallel in the history of the whole world to the unique transformation that is sought to be achieved by the powers-that-be—a simultaneous transformation in economic, social, and political spheres for a large population in a peaceful

democratic manner and in a comparatively short time. This is, indeed, a great adventure, an adventure that is a challenge to, and calls for, the highest statesmanship and the wisdom of any one. Not until the four basic requirements which Prof. Vakil listed, namely (1) national consciousness with the desire to work for national unity, (2) avoidance of waste, both human and material, (3) sustained disciplined hard work, and (4) an intense desire to progress against all odds, are ensured,—and only the wisest statesmanship can do it—therefore, can this country hope to reach the so-called take-off stage. It is precisely these characteristics that may be expected to imbibe from the careers of our great pioneers like Mr. Wanchand Hirachand. The Maharashtra Chamber of Commerce could not have perpetuated his memory more fittingly than by arranging these Memorial Lectures.

Business Notes

Food

PROBLEM FOR WHEAT

THE ABOLITION of wheat zones, announced by the Union Food and Agriculture Minister, Mr S. K. Patil, last week, is indicative of the fact that the country has turned the corner on the food front, insofar as wheat requirements are concerned. Restrictions on the movement of rice remain. But with the encouraging final estimate of last year's crop at 33.7 million tons, the situation on this front too is likely to remain quite easy this year.

Removal of restrictions on movement of wheat is scarcely surprising. The step was inevitable in view of the prospects of a bumper harvest this year and an all-time record stock of nearly 2 million tons with the Central and State Governments. The change in outlook on the wheat front has not to an inconsiderable extent been due to import of foodgrains under the P.L. 480 Agreement signed late last year, by virtue of which 16 million metric tons of wheat would be arriving in India from the U.S.A. by 1964-65. The signing of this agreement had led to unloading of the hoarded stocks, both by the trade and the agriculturist, and has gone some way in curbing speculative tendencies.

The recent spurt witnessed in wheat prices in the main producing areas, though disconcerting to some extent, is not likely to persist long. The fall in prices in the main consuming areas is indeed welcome. With the freedom to move wheat from one State to another, it is expected that wheat prices will stabilize at reasonable levels in both the consuming and the producing States, thus, ensuring availability of this staple food to the consumer at a reasonable price and a fair return to the farmer.

In view of the increasing production of wheat in the country, as evidenced by the successively good harvests during the past three years, and the massive investment that is envisaged to be made in the agricultural sector of the Indian economy during the Third Plan period, is it not time to go in for a price support scheme for at least the major food crops? Some circles view this step to be unnecessary and uncalled for; in their opinion, with the country not expected to become self-sufficient in food in the near future, foodgrains prices are not likely to fall to a level which will yield an uneconomic return to the agriculturist. "The Eastern Economist," however, holds the view that fixing of "floor" prices for wheat and the other major foodgrains is now necessary to give incentive to the farmer to produce more and to provide

him a psychological satisfaction that if he produces more, his income will not be adversely affected. If food-grains prices do not fall below the "floor" level, there will not be any necessity for purchase of foodgrains by the Government. But if they do, the interest of the agriculturist will have to be safeguarded, lest there should be diversion of land from under food crop to commercial crops which in the expanding economy of India today are fetching fancy prices. Any diversion of land from under foodgrains to commercial crops will postpone the day of this country's becoming self-sufficient in food.

Petro-Chemical Industries

PRE-REQUISITES OF DEVELOPMENT OUTLINED

BOMBAY WAS appropriately chosen as the venue for the twentieth annual general meeting of the Indian Chemical Manufacturers' Association, held last week. In recent years, it may be noted, some Western India centres—particularly Pimpri, Greater Bombay, Bulsar, Baroda and Ahmedabad, among others—have acquired considerable importance, thanks to the development of numerous heavy chemical, fine chemical, dyestuffs and pharmaceutical industries in this region. The occasion was availed of, as usual, to review the progress of the industry, but with one difference, namely that Dr K. A. N. Rao, the out-going President of the Association, took complete stock of the progress made by the chemical industries in the country during the Second Plan period as a whole. This is just as well, as we have already begun the first year of the Third Plan period. Dr Rao alluded, among others, to the expansion of sulphuric Acid, Titanium Dioxide, Phosphatic and Nitrogenous Fertilisers and Penicillin industries, and to the establishment of various new industries, such as Industrial Explosives, Dyestuffs and Pigments, Polyethylene, Polyvinyl chloride and Saccharin Tetracyclin. He further disclosed that schemes had been on hand to take up, during the Third Plan period, the manufacture of intermediates for synthetic drugs and dyes, of streptomycin, phenol, synthetic detergents, trichlorethylene and chlorinated ethanes, etc., not to speak of petro-chemicals.

In regard to the last item, Dr Rao had some important comments to make. While welcoming the appointment of the Kane Committee to examine the development of this industry during the Third Plan period, he rightly questioned the wisdom of withholding information regarding the composition of the natural oil or gas that has been found in the country. Needless to say, petro-chemical industries cannot be planned unless the data about the composition of the natural oil and gas

are made available to interested parties. Recently, an announcement was made that a two-million ton refinery would be established in Gujarat to process the crude from the Cambay and Ankleshwar oilfields. The I.C.M.A. President was naturally concerned to know whether, unlike in the case of production from the Bombay Refineries which has been earmarked for the public sector, production from the refinery to be set up in Gujarat would be allowed to the private sector, although the presumption is that the entrepreneurs concerned would have made sure of this before risking any money or effort. Be that as it may, like all other industries, the chemical industry also has problems, both peculiar to it and those common to all others. But while not ignoring these, Dr. Rao did well to stress and highlight one of them, namely, the delay in the licensing procedure. In this connection, he made the worthwhile suggestion that all the three stages to be completed for securing a licence to start a new industry, viz. (1) grant of a licence under the industries (Development & Regulation) Act, (2) approval of collaboration terms and (3) issuing of an import licence for capital equipment where such import is necessary, might be taken up, more or less, at the same time, so that all avoidable delay in implementing a given project might be considerably reduced, if not avoided altogether.

Engineering Industry

PERFORMANCE AND PROBLEMS

THE GENERAL and electrical engineering industry recorded an improvement in its output during the year 1960 by as much as 15 per cent. The general index of industrial production during the same period went up by 8 per cent. This shows that the engineering industry has been among the major pace-makers. This fact is particularly significant because the engineering industry forms the base of the industrial structure in the country.

Mr P. Bhattacharji, Chairman of the Indian Engineering Association, pointed out at the Association's annual general meeting, held recently, that during the year the Government relaxed considerably the procedure for industrial licensing for a number of industries and also permitted the units with foreign exchange allotment for a specific capacity, to develop capacity in excess of that sanctioned, provided the foreign exchange expenditure was within the sanction. These measures have to some extent led to the improvement in the performance of the engineering industry.

Mr Bhattacharji, however, pointed out that certain weak spots still existed which seriously hampered growth. Foremost among these is the inadequate and improper supply of raw materials. It seems shortage of steel, the basic raw material for the engineering industry, has been posing a serious problem. As an illustration, he pointed out that four of the member firms who are leading wagon builders increased their capacity at Government's request and produced 13,000 wagons in the year ending June, 1958. Although demand for wagons continued, production during the year ending June, 1959, dropped to 6,500 and further to 6,200 in 1960. This was mainly due to shortage of steel supplies. It may be worthwhile to look into the details of the demands of engineering goods manufacturers so that the steel plants, now being commissioned, may try to meet them in terms of quality and specifications.

The Chairman also stressed the need for removing the bottleneck faced by the industry in respect of railway transport. He added that the industry has had to face great hardships owing to non-availability of wagons in sufficient quantity to move its raw materials and finished products. It is imperative, therefore, that sufficient railway capacity is made available to the industry. In view of the general tightness on the transport front, a closer scrutiny of wagon turn-round appears an immediate necessity.

Banking

DEPOSIT RATES

IN HIS speech at the Annual General Meeting of the United Bank of India Ltd., Dr N. N. Law, Chairman of the Board of Directors, stated, and rightly, that growth of deposits did not depend so much on the rate of interest paid as on the confidence in the banking system. In other words, he deprecated the recent upward revision in interest rates on deposits. Dr. Law is of the opinion that in order to create confidence in the banking system, a scheme for deposit insurance should be evolved quickly. The importance of the scheme lies not only in covering depositors' loss in case of bank failures, but more in its ability, as a tranquiliser, to bring about a general climate of confidence. An early adoption of the deposit insurance scheme has been stressed time and again in the columns of the "Eastern Economist," for it is considered to be the most effective instrument of restoring confidence in the banking system. In the recent developments the heartening factor to note is that the Government is giving a serious thought to this question and has made up its mind to introduce such a scheme.

Dr. Law admits that economic expansion calls for greater credit requirements for industry and trade. But that, in his opinion, should not eventually lead to bank finance replacing, even partly, the functions of owned capital. His plea is that low capital structure of an industry should not be strengthened primarily with the aid of bank funds. Tax concessions on that part of profits which is utilised to build up reserves, and thus to strengthen the capital structure, should be seriously considered by the Government.

Lynx's Offer

PUBLIC SUBSCRIPTION

LYNX MACHINERY Limited is offering for public subscription at par 2,99,000 equity shares of Rs. 10 each. The subscription list will open at the commencement of banking hours on April 18 and will close at the discretion of the Directors, but not earlier than the closing of banking hours on April 20. The offer when subscribed will raise the subscribed capital of the company to Rs. 60 lakhs; subscribed capital at present is Rs. 14,15,040 and shares to the value of Rs. 15,94,960 have been agreed to be taken up by the Directors, promoters and their friends and associates. The authorised capital of the Company is Rs. 2.5 crores, divided into 20 lakh equity shares of Rs 10 each and 50,000 cumulative redeemable preference shares of Rs 100 each.

As from November 10, 1960, the business of the partnership firm Lynx Machinery Company was taken over by this company. The company till now has been manufacturing concrete vibrators, concrete mixers, roller pan mixers and other equipment used in the building and construction trade. Now it has secured licences under the Industries (Development and Regulations) Act for the manufacture of engines, concrete vibrators, overhead travelling cranes and electric hoist cranes, concrete mixers, roller pan mixers, asphalt mixers and tar boilers. It is expected that indigenous production of these items will not only help in saving foreign exchange to an appreciable extent, but may also earn foreign exchange by way of exports to neighbouring countries.

Keeping in view that the company has always been earning profit and that there is increasing demand for building, road making and construction equipment, oil engines, cranes of various kinds and grinders and tools, the offer is likely to receive a ready response in the market.

Chemicals and Fibres

I.C.I.'S NEW SUBSIDIARY

WITH THE registration of the Chemicals and Fibres of India Limited, India will soon start producing a wide

variety of chemicals and the related products which hitherto have been imported at a heavy cost. The Chemicals and Fibres of India Limited is a new subsidiary of the Imperial Chemicals Industries (I.C.I.) and has been floated with an authorised capital of Rs. 10 crores. It will look after the parent company's manufacturing projects on the west coast of India. Negotiations are now in progress for the acquisition of a large site near Bombay. The development of this site will be phased over a number of years.

The Chemicals and Fibres of India Limited will be a public company in the capital of which the Indian public will be invited to participate in due course. Its Board of Directors, which includes two well-known Indian industrialists, Mr Neville Wadia, Chairman of Bombay Dyeing and a number of other companies, and Sir Raghvan Pillai, Managing Director of Martin Burn, will work under the direction and guidance of Mr. J. M. Lall, Chairman of the I.C.I. (India) Private Limited.

The formation of the Chemicals and Fibres of India Limited indicates the increasing interest which I.C.I. is taking in promoting the development of the Indian economy.

Roads Development

MORE ALLOCATION NEEDED

AT THE recently concluded annual session of the Federation of Indian Chambers of Commerce and Industry in New Delhi, when, among others, an important resolution on the problem of transport calling for co-ordinated development of rail, road, coastal shipping and inland waterways to meet the increasing

demands on the transport system during the third Plan was adopted, Mr. R. G. Saraiya rightly complained that, while the provision for railways had gone up, the allocation for road transport had remained stationary, if not lower. He had an opportunity very soon, again, to reiterate and elaborate this point when he presided over the eighth annual general meeting of the Indian Institute of Road Transport, held in Bombay, two weeks ago.

Mr. Saraiya first noted that the total allotment proposed for roads in the draft Third Plan amounted to Rs. 250 crores, including the amount likely to be available from the Central Road Fund. Incidentally, this is the same as was allotted in the Second Plan. According to him—and many others who have given some thought to this question—this amount is not at all commensurate with the important place road transport occupies in the life and economy of the nation. What is surprising is that the percentage of allocation to transport out of the total investment in every successive Plan has been becoming smaller and smaller. As Mr. Saraiya said, roads and road transport had an allocation of only five per cent of the total investment in the First Five-Year Plan; in the Second Plan, the allocation worked to only about four per cent while, in the Third Plan, the provision is an even smaller fraction of the total outlay, being only 2.45 per cent of the total investment! It is scarcely surprising, therefore, that Mr. Saraiya should have felt compelled to urge the authorities concerned to go into the matter dispassionately all over again and provide a higher amount for road transport. As he particularly pointed out, road transport has a large employment potential, besides entailing less foreign exchange.

FROM THE CAPITAL'S CORRIDORS

THIRD PLAN

THE National Development Council is meeting here on May 30 and 31, to consider the final draft of the Third Five-Year Plan, which is under preparation now in the light of the population trends as disclosed by the recent census and the various suggestions put forth by the N.D.C. at its last (January) meeting and by the five Parliamentary Committees which met in November, 1960.

The following subjects, it is learnt, are being dealt with more exhaustively in the final draft than was possible in the Draft Outline: (1) Social objectives of the Plan, including social security, reduction in income disparity and measures for taking the economy in the direction of Socialistic Pattern of Society; (2) Survey of natural resources; (3) Measures to raise domestic savings and to increase export earnings; (4) Measures for promoting rapid technological development and improvement of productivity; (5) Problems relating to price policy; (6) Problems relating to Plan implementation, operation of enterprises and improvement of administration in general; (7) Implications of democratic institutions at the district and block levels for the realisation of Plan targets, especially in agriculture; (8) Problems of regional development; (9) Programmes for the utilisation of rural manpower; (10) Rural electrification; (11) Linking of large and small industries; (12) Family planning; (13) Rural water supply; (14) Child welfare; (15) Scholarships; (16) Certain aspects of social security, including problems of Rs. 10,400 crores, as against Rs. 10,200 crores mentioned in the physically handicapped.

The Planning Commission has already put up the outlay of the public sector for the Third Five-Year Plan to Rs. 7,500 crores as suggested by the National Development Council at its last meeting. Of this, Rs. 6,300 crores will be the investment component. The investment to be made in the private sector is now envisaged at Rs. 4,100 crores. The total investment component of the Third Plan, thus, will be of the order of Rs. 10,400 crores, as against Rs. 10,200 crores mentioned in the Draft Outline.

The distribution of the outlay in the public sector as proposed now is as follows:

Heads of Expenditure	(Rs. crores)	
	Total Outlay Proposed	Outlay Proposed for States & Union Territories
Agriculture and Community Development	1,072	947
Irrigation (Major & medium)	656	651
Power	1,019	894
Village and small industries	256	136
Industries and minerals	1,526	76
Transport and communications	1,475	250
Social services and miscellaneous	1,296	946
Inventories	200	—
Total	7,500	3,900

In the light of the discussions which the Planning Commission has had with the State Governments, the physical targets of the Third Plan have been revised in certain respects. The targets for agricultural production now envisaged are: Foodgrains 100 million tons; Sugarcane (gur) 10 million tons; Oilseeds 9.7 million tons; Cotton 7 million bales. Jute 6.5 million bales (excluding Mesta). The targets fixed in the Draft Out-

line were: Foodgrains 100-105 million tons; Sugarcane (gur) 9-9.2 million tons; Oilseeds 9.2 — 9.5 million tons; Cotton 7.2 million bales; Jute 6.5 million bales (excluding Mesta).

The important changes made so far in the other targets are as follows:

(a) **Power:** Generating capacity is proposed to be increased from 5.7 million K.W. at the end of the Second Plan to about 12.6 million K.W. at the end of the Third Plan. The increase envisaged in the Draft Outline was 6.0 million K.W. Electricity generated is now estimated at about 45 billion K.W. hrs., as against 42.25 billion K.W. hrs., estimated in the Draft Outline. The number of villages and towns electrified is now estimated at 43,000, as against 34,000 in the Draft Outline.

(b) **Industry:** No significant changes have been made in the industrial targets. In several directions progress is being made in drawing up detailed plans, e.g. in steel, coal, fertilizers, etc.

(c) **Roads:** As a result of discussions with States, the additional mileage of surfaced roads is now estimated at 25,000 miles, as against 20,000 miles envisaged in the Draft Outline.

(d) **Housing:** The likely contribution by the Life Insurance Corporation towards housing is being taken into account in drawing up programmes for the Third Plan.

THIRD PLAN REQUIREMENTS OF CRAFTSMEN

The Planning Commission, it is learnt, has now assessed the requirements of craftsmen—fully skilled, semi-skilled and low-skilled workers taken together—during the Third Five-Year Plan at 12.7 lakhs — 6.7 lakhs required for public sector enterprises and 6 lakhs required for the private sector. This shows an increase of 2.7 lakhs over the estimates prepared by the Working Group on Technical Education and Vocational Training which had placed the public sector requirements at 6 lakhs and those of private sector at 5 lakhs. The requirements of skilled hands in engineering trades are now placed at 3.4 lakhs in the public sector and 4.7 lakhs in the private sector, as against Working Group's estimates of 3.5 lakhs in the public sector and 4 lakhs in the private sector. The requirements of non-engineering trades are now put at 3.3 lakhs in the public sector and 1.3 lakhs in the private sector as against 2.5 lakhs and one lakh estimated by the Working Group.

To meet these requirements, it is proposed to roughly double the existing number of industrial training institutes for craftsmen under the Directorate-General of the Employment and Training. The number of seats in these institutes will be increased from about 47,000 to over one lakh by the end 1963-64. It is estimated that about 2,00,000 craftsmen will be available from these institutes during the Third Plan period. Most of them will be trained in engineering trades whose requirements of skill are high. The remaining demand for craftsmen in engineering trades as well as in non-engineering trades will have largely to be met by other methods of training such as imparting of training by relatives or friends in self-employed establishments, acquiring of skill by labourers gradually in the course of their work etc. Training in skills that are peculiar to an industry will be provided within the industry itself through in-plant training programmes.

A big task lies ahead in the matter of craftsmen training; a task made complicated by lack of sufficient physical facilities for imparting formal training on the one hand and insufficiency of teaching personnel on the other hand. The first difficulty is tied up with the import of equipment from abroad involving foreign exchange. Sufficient arrangements are being made now, well in

advance, for training of instructors with the help of aid from Special Projects Fund of the U.N. The requirements of trained instructors during the Third Plan are assessed at 8,500.

ELECTRIFICATION OF RAILWAYS

With the energisation of Chakradharpurto-Adityapur (Tatanagar) and Sini-Asansol sections of the South-Eastern Railway and Gomoh-Gaya section of the Eastern Railway within the next three or four months, the three steel plants at Tatanagar, Burnpur and Durgapur would be served by electrically hauled trains. As electric traction expedites movement of traffic, the difficulty in transport of end-products from these three steel manufacturing units would be resolved to a considerable extent. Durgapur is already connected with Gomoh by electric traction.

The work of electrification of the Gaya-Mughalsarai section of the Eastern Railway and Tatanagar-Kharagpur section of the South-Eastern Railway is said to be progressing satisfactorily. Most of the ancillary works, including remodeling of the yards and building of staff quarters, loco sheds and remote control centres, has already been completed. With the energisation of Tatanagar-Kharagpur section, which is envisaged to be extended further up to Rourkela, the Rourkela Steel Plant will also be linked with electrically run trains.

During the First Plan period, electric traction on 1500 V direct current had been obtained on 246 route miles around Bombay and Madras to carry suburban traffic. By the end of 1958, Howrah-Burdwan section of the Eastern Railway on the main line and Sheoraphuli-Tarakeswar section on the branch line, with a total route mileage of 88, have been electrified on 3000 V direct current. Electrification work has also been completed on Dangoaposi-Rajkharswan section of the South-Eastern Railway.

During the Third Plan period, railways have plans to electrify about 400 track miles of the Sealdah Division of the Eastern Railway. Considerable preliminary work on this has already been completed. Sealdah-Ranaghat and Dum Dum-Bongaon sections of this Division are being given priority.

Civil engineering works have also been carried out on Madras-Billupuram section of the Southern Railway. Igatpuri-Bhusaval section of the Central Railway has been surveyed and the question of imbalance in the supply system due to traction load on single phase on this section is under investigation.

During the Third Plan period, Mughalsarai-Kanpur section of the Northern Railway is also envisaged to be electrified.

The pushing of the programme of electrification of the Indian railway system, however, depends, to a great extent on the supply of electric locos and other rolling stock. Plans are under way to undertake the manufacture of these at the Chittaranjan Locomotive Works and the Perambur Integral Coach Factory respectively. At present, the supply of electric coaches comes from Jasson & Co. Electric locos are being assembled at the Chittaranjan Locomotive Works. The manufacturing programme of electric locomotives and electric multiple unit coaches is expected to gain momentum when the Bhopal Heavy Electricals factory starts delivering the required traction equipment. Manufacture of this equipment, it is understood, has already been taken on hand.

Most of the electric traction to be undertaken during the Third Plan period, as has been the case with the projects completed during the Second Plan period, will be on alternating current system. For some time only freight trains will be hauled electrically on the sections being electrified now. Later on when more electric locos become available, passenger trains will also be run electrically.

BROADENING EQUITY BASE OF NEW COMPANIES

The Union Finance Minister, Mr. Morarji Desai, it is understood, opined at the last meeting of the Parliament's Consultative Committee on Finance that the equity base of the new companies being floated was unhealthy insofar as the promoters used very little of their own resources and depended largely on bank finance for the purpose. He indicated that the question was under consideration of the Government and measures would be devised to broaden the equity structure of the new companies in relation to bank finance.

Mr Desai is also said to have indicated at the meeting that the Government intended to introduce a Bill to amend the Income-tax Law in the light of the recommendations of the Tyagi Committee and the Law Commission's observations on the subject, during the current session of Parliament, with a recommendation that it should be referred to a Select Committee. The Select Committee would be required to report by the time the next session of Parliament starts. The Bill would then be considered for adoption.

MANUFACTURE OF GASKETS

The Government of India, it is understood, is examining a proposal for the manufacture of gaskets by a private sector company in collaboration with the Victor Manufacturing and Gasket Company of the United States. The scheme envisages supply of the entire equipment for setting up this unit by the foreign collaborators in the shape of their contribution to the share capital of the new company. The equipment is expected to cost Rs. 9 lakhs. No royalty is proposed to be paid under the collaboration arrangements.

The factory is to be located at Bombay. The principal raw materials to be used are asbestos sheets, steel sheets, synthetic rubber, chemicals, vegetable paper, etc., valued at approximately Rs. 21 lakhs per year.

The Victor Manufacturing and Gasket Company is one of the largest gaskets manufacturing concerns in the world. It supplies gaskets to the Ford Motor Company, the Chrysler Corporation and the General Motors, besides exporting its products to many countries in the world, including India.

Four firms already hold licences for the manufacture of gaskets in India. They are:

Company	Annual capacity (lakh Nos.)
Payen-Talbro (P) Ltd., Delhi.	83.5
Auto Spares (P) Ltd., Baroda.	210
Excelsior Needles Industries (P) Ltd., Ludhiana.	60
J. Barman & Co., Delhi.	90
Total:	443.5

The first of these four companies went into production in 1957 in collaboration with Payens, of the United Kingdom. The second company has no foreign collaboration arrangements. It holds a licence to manufacture oil seals and radiators as well. The proprietor of this company is a resident of Africa. He has recently applied to the Government of India for permission to raise a loan from the United Kingdom (to be repaid from his East African assets) to finance his manufacturing programme in this country. Particulars of collaboration arrangements entered into by the Excelsior Needles Industries and J. Barman and Company are not yet available.

MANUFACTURE OF COMPLETE CLUTCH ASSEMBLIES

Another private sector company has applied to the Government for the grant of a licence for the manufacture of complete clutch assemblies at Faridabad, near

Delhi. The following is the production schedule proposed to be followed by it:

Plan Period	Lines of manufacture proposed	Monthly installed capacity on single Shift basis
1961/62	Clutch plates comprising of Disc, Flange, Springs, Facings and Rivets	10,000 clutch plate assemblies
1962/63	Clutch Plates as above	30,000 clutch plate assemblies along with other parts
1963/64	Clutch pressure plates and other parts	10,000 complete assemblies
1963/65	Clutch pressure plates and other parts	30,000 complete assemblies

It is proposed to have collaboration arrangements with Lamellen Und Kupplungsbau Stuttgart, West Germany, and Maremont International Corporation, Chicago (U.S.A.).

At present, the following two firms hold licences for the manufacture of clutch assemblies for capacities indicated against them:

Name of Firm	Annual capacity in Nos.
1. Automobile Products of India Ltd., Bombay.	15,000
2. Turner, Hoare & Co. (P) Ltd., Bombay.	36,000

Of these two firms, the first one has already started production. The licence to the second one was issued only recently; it is expected to go into production soon.

The following firms are licensed for the manufacture of clutch plates and brake linings:

Name of Firm	Items Licensed	Licensed Annual capacity
Automobile Products of India Ltd., Bombay.	Complete Clutch assemblies Brake Linings	15,000 Nos. 84 tons
Asbestos Magnesia & Friction Materials Ltd., Bombay.	Brake Linings	1,146 tons
Auto Supplies Co., Delhi.	Brake linings and clutch facings	For a value of about Rs. 20 lakhs
Rane (Madras) Ltd., Madras.	Brake linings Clutch plates	180 tons 10,200 Nos
Turner Hoare & Co., (P) Ltd., Bombay.	Complete Clutch assemblies	36,000 Nos.
Hitkari Motors, Jullunder.	Complete Clutch assemblies	36,000 Nos. (Licence expected to be issued shortly).

Name of the Indian Company	Name of the West German Party	Items of Manufacture
(1) Delhi Garage (P) Ltd., New Delhi.	Helios-Apparate Wetzlar & Schlosshaver G.M.B.H., Hoidelbord.	Centralised lubrication equipment.
(2) New Standard Engg. Co., Ltd., Bombay.	Deprag Pressluft Maschinen Schulz K.G., Amberg/Opf.	Air Compressors.
(3) Engines Valves Ltd., Madras.	Alfred Teves, Germany.	A.T.E. Valves.
(4) Autometers (P) Ltd., New Delhi.	Motor Meter, W. Germany.	Automotive Panel Instruments.
(5) Coimbatore Armature Winding Works Ltd., Coimbatore.	Festo Maschinen Fabrik, W. Germany.	F.H.P. Motors.
(6) Assam Sillimanite Ltd., Calcutta.	Vereinigte Gross Almeroder Thonwerke, W. Germany.	Refractories.
(7) Bharat Timber Industries, Bombay.	Deutsche Holzveredlung, W. Germany.	Wood Processing industry.
(8) Century Rayons, Bombay.	A.K.V. Holland and Glaustaff, W. Germany.	Tyre Cord.
(9) Rayson Engineering Works Ltd., Calcutta.	Hoesch Export, GMBH, Dortmund.	Rail Equipment.
(10) Rightoids (Orient) (P) Ltd., Madras.	Hebborn & Co., W. Germany.	Ball point pens.

Another application has been received by the Government for the grant of a licence for manufacture of 5,000 clutch plates and 20 tons brake linings per month. This proposal is understood to be under consideration of the licensing authorities.

MANUFACTURE OF ENDRIN, CHLORDANE AND HEPTACHLORIE

The Mysore Fertilisers and the Mysore Insecticide Company, of Madras, propose to set up a plant for the manufacture of Endrin, Chlordane and Heptachlor. Within two to three years of the plant's going into production, it is proposed to manufacture, from basic raw materials, mostly indigenous, Polychlorodiene to the extent of 970 tons and Peracetic acid to the tune of 335 tons per annum. The raw materials to be used for the manufacture of Polychlorodiene will be Dicylopentadiene (imported) and Chlorine (indigenous). The raw materials to be used for the manufacture of Peracetic acid are Hydrogen Peroxide (indigenous) and Acetic Acid-Glacial (indigenous).

For the capacities proposed, the foreign exchange expenditure and savings would be as follows:

Item/Period	Expenditure	Saving
For the first 2-3 years*		
Endrin	4,413	12,207
Chlordane	212	1,663
Heptachlor	849	2,121
After 2-3 years		
Endrin	1,172	15,448
Chlordane	212	1,663
Heptachlor	342	2,628

It is proposed to have foreign collaboration with Velsicol Chemical Corporation which holds the patent rights for the manufacture of these three pesticides. Velsicol Chemical Corporation will provide the requisite technical know-how and also arrange for the necessary foreign exchange required for the import of plant and equipment. Terms of collaboration are reported to be under negotiation. The foreign exchange component of the machinery and equipment required for the plant is estimated at Rs. 100 lakhs, part of which is likely to be provided by the foreign collaborators in the shape of participation in equity capital of the new venture.

The foreign collaborators are prepared to assist in developing exports of Endrin, Chlordane and Heptachlor to be manufactured by this unit so as to earn foreign exchange necessary for the import of raw materials as well as for the payment of consultancy fees to them.

WEST GERMAN COLLABORATION WITH INDIAN MANUFACTURERS

During the year 1960, 32 Indian companies entered into collaboration arrangements with West German firms. The more important among these are the following:

Name of the Indian Company	Name of the West German Party	Items of Manufacture
(11) Teksons (P) Ltd., Bombay.	Autokuhler, GMBH Hofgeismar.	Complete Radiator both tubular and honey comb.
(12) Davenport & Company (P) Ltd., Calcutta.	Halssen & Lyon, Hamburg.	Buying and exporting tea to foreign countries.
(13) Automobile Industries & Agencies (India), Bombay.	Lamforder Metallwarrengesellschaft, Lamforder/HAMN.	Tie Rod Ends.
(14) Sinac Group (India) (P) Ltd., New Delhi.	Alfred Schuber Work zeng Und Apparatebau K.G., Kressbronn.	Knitting machines.

SUGAR CRISES

Sugar output during the current crushing season is now estimated to increase to about 30 lakh tons. This was disclosed by Mr. D. D. Puri, President of the Indian Sugar Mills' Association, at a news conference held here on Saturday last. With a carry-over of 5.5 lakh tons from the previous season, total availability of sugar in the current year will be of the order of 35.5 lakh tons. Consumption during the current crushing season is not expected to be more than 21 lakh tons. There will, thus, be a surplus of 14.5 lakh tons of sugar available for carry-over to the next crushing season and for export. Mr. Puri expressed the opinion that India today was in a position to export 9.5 lakh tons of sugar.

This unprecedented increase in sugar output has posed a serious problem for the industry to which reference was made by Mr. Puri at the news conference as also by the Union Minister for Food and Agriculture, Mr. S. K. Patil, at the last meeting of the Informal Consultative Committee of the Parliament. Mr. Puri was of the view that to meet the loss on exports and the increased cost of production, the industry should be allowed an increase of Rs. 5.51 nP per maund in the controlled ex-factory price of sugar—Rs. 3.82 to meet the loss on exports, Rs. 1.05 to meet the increased cost of production due to factors other than labour and 64 nP. to enable the industry to implement the recommendations of the Sugar Industry Wage Board.

Mr. Puri also disclosed that the Indian Sugar Mills' Association had informed the Central Government, the State Governments and the cane-growers that if the heavy stocks lying with the factories are not cleared in a reasonable period of time, the industry would not be in a position to pay their dues.

Mr. S. K. Patil, it is learnt, told the Members of the Informal Consultative Committee that the Government will have to subsidize export of sugar and that may mean hardship to the domestic consumer. The cost of production of sugar in India, he said, was about Rs. 700 per ton, while the international price ranged between Rs. 400 to Rs. 450 per ton. (According to Mr. Puri, the loss on export of sugar to the free world market today is of the order of Rs. 363 per ton). The position, he added, had become more difficult as a result of the recent Wage Board Award. Patient handling of the problem, he opined, was necessary.

Mr. Patil stated that when the Government gave incentive for production of sugar, it was not its intention that area under cane crop should increase. This, however, had happened, particularly in Uttar Pradesh where about 4 lakh additional acres of land were brought under this crop.

Mr. Patil is planning to visit the United States to explore the possibilities of exporting about 5 lakhs tons of sugar to that country. The U.S.A. pays 60 per cent more than the free world market price. This should cut the loss on export of sugar to a considerable extent. Possibilities will also be explored to seek some concessions on shipping freight if the United States is prepared to purchase a sizeable quantity of sugar from India. This will be done by shipment of sugar in vessels which bring P.L. 480 foodgrains from the U.S.A. A proposal to this effect is already under the consideration of the Union Ministry of Food and Agriculture.

SALE OF CHEMICAL FERTILIZERS

Mr. Patil also disclosed at the Informal Consultative Committee that the Government was considering to

make available artificial fertilizers to the farmer at as low a price as possible, as recommended by the Fertilizers Distribution Enquiry Committee. Informed sources indicate that the price may be cut by about Rs. 25 per ton.

TRANSPORT AND COMMUNICATIONS PROJECTS

The Union Minister for Transport and Communications, Dr. P. Subbarayan, informed the Lok Sabha last week that the Government proposed to set up another telephone factory and a cable factory during the Third Plan period.

Dr. Subbarayan also informed the House that the schemes for the development of Mangalore and Tuticorin ports had been included in the Third Plan.

RATIONALISATION OF IMPORTS, EXPORTS

The Government of India has announced the personnel and the terms of reference of a High-powered Committee set up to recommend rationalisation of imports and exports in the light of the requirements of the Third Five-Year Plan. Dr. Ramaswamy Mudaliar will be Chairman of this Committee. Its other members will be Mr. G. L. Bansal, Secretary-General of the Federation of Indian Chambers of Commerce and Industry, Mr. E. P. W. da Costa, Editor of the Eastern Economist; Mr. H. L. Khanna of the British India Corporation; Mr. J. M. Lall, Managing Director, Imperial Chemical Industries; Mr. P. A. Nariawala of the Tata Industries; Mr. S. M. Shah of the All-India Importers' Association; Mr. B. K. Kochhar of the State Trading Corporation and Mr. M. P. Mathur, Director of Export Promotion, Ministry of Commerce and Industry. Mr. Mathur will be the Secretary of the Committee.

The terms of reference of the Committee are:

(1) To enquire into the working of the import trade control, with particular reference to (a) the procedures followed in the formulation of import policy and methods adopted in dealing with applications for import licences to different categories of applicants; (b) the organisation of the existing machinery for import control and (c) any other matter incidental to the working of import control organisation.

(2) To examine questions relating to allocations for imports of raw materials and capital goods, with special reference to the requirements of the Third Plan.

(3) To review the efficiency of the existing export promotion measures and to make recommendations with regard to measures necessary to step up exports in the Third Plan period.

The economic development that has taken place in this country under the first two Plans has changed the picture of imports and exports considerably. A fresh review of the general import and export control policy is, therefore, considered necessary so that suitable measures may be devised for ensuring imports of important raw materials, machinery and capital goods.

IMPORT OF TYRES

The indigenous production of tyres falls short of demand by nearly 1.2 lakh tyres. This gap is being filled by arranging imports through the State Trading Corporation. During the licensing period October 1960—March 1961, the established importers were also given licences, to the extent of 75 per cent of their established quotas, for the import of various types of tyres. The total number of all varieties of automobile tyres actually imported during the period January-November, 1960, was 95,594.

COMPANY AFFAIRS

DUNLOP RUBBER

The sales of the Dunlop Rubber Co. (India) Limited, increased from Rs 25.87 crores during 1959 to 30.47 crores during the year to December 31, 1960. This increase in sales was reflected in profits which came to Rs 1.25 crores against Rs 1.18 crores during the previous year. As the graph below indicates, the capital employed has also increased during the last few years. The graph also shows that the turnover of the company has more than doubled between 1955 and 1960. The expansion might have been still more evident if the cost of imported rubber were not to go up during the last few years.

The development Rebate Reserve has been increased by a further sum of Rs 17 lakhs. The General Reserve has been increased by Rs. 37.50 lakhs. The dividend due on the Guaranteed Preference Shares for the year to 31st December, 1960 has been paid to the extent

A DECADE OF PROGRESS

of Rs. 1,80,000 and a further sum of Rs. 54,000 becomes payable under the Preference Shares (Regulation of Dividends) Act, 1960. The dividend due on the Second Preference Shares for the year to 31st December, 1960 amounts to Rs. 2.13 lakhs. In respect of the Equity (Ordinary) Shares, the Directors recommend a dividend of 21.5 per cent subject to income-tax. This is the same as the previous year and would absorb Rs 64.50 lakhs.

PUNJAB NATIONAL BANK

The working of the Punjab National Bank Ltd. during the year to December 31, 1960 shows an all-round growth in the business of the Bank. The deposit of the Bank declined slightly from Rs 141.16 crores at the end of 1959 to Rs 139.48 crores at the end of 1960. This was in a year when the Banking industry had a

difficult time. Advances of the Bank, however, increased sharply from Rs 72.51 crores at the end of 1959 to Rs 93.53 crores at the end of 1960—showing the strength of the Bank. It is reflected in the increase in the Balance Sheets total from Rs 179.56 crores at the end of 1959 to Rs 191.52 crores. There has also been an increase in the gross earnings of the Bank from Rs 7.98 crores to Rs 8.71 crores. This has resulted in an improvement in profits from Rs 84.20 lakhs in 1959 to Rs 118.04 lakhs in 1960.

Out of the profit of Rs 121.23 lakhs (including Rs 3.19 lakhs brought forward), a sum of Rs 12.50 lakhs has already been utilised for the payment of an interim dividend at the rate of Re. 1 per share subject to tax, leaving a balance of Rs 108.73 lakhs for appropriation. The Directors have provided Rs 53 lakhs for taxation and Rs 11 lakhs have been transferred to the Reserve Fund. A sum of Rs 27 lakhs has been provided for bonus to staff and Rs one lakh transferred to Charity Account, leaving a balance of Rs 16.73 lakhs. The Directors have recommended a final dividend at the rate of Re 1 per share subject to tax, absorbing Rs 12.50 lakhs making a total dividend of 20 per cent subject to tax, same as last year.

The management during the year continued to follow their policy of extending representation to new areas and during 1960, 16 new offices were opened making the total number of its offices 408 at the end of 1960.

Under the scheme prepared by the Reserve Bank of India, the Bank has taken over the Indo-Commercial Bank Ltd. Mayuram. The branches of the Indo-Commercial Bank Ltd. are functioning as branches of the Punjab National Bank Ltd. with effect from 25th March, 1961.

COMMODITY NEWS AND NOTES

EXPORTS OF WOOL

Exports of home grown wool from India during the fourth quarter of 1960 rose by 71 per cent compared with the previous quarter although they were 43 percent down on the fourth quarter of 1959. This brought aggregate exports for the year 1960 to 30.6 million lbs. which was 27 percent below the 42.1 million lbs. exported in 1959. Shipments to the United Kingdom and the Common Market fell by 17 and 48 percent respectively to 11.3 and 3.9 million lbs. By contrast, exports to the Soviet Union rose by 23 percent to 7.8 million lbs., but those to the United States were more than halved.

Exports of raw wool from India Thousand lbs. — Actual Weight			
	1959	1960	
Belgium	2,545	973	
France	2,061	1,696	
West Germany	2,118	671	
Netherlands	639	410	
Italy	82	114	
Total Common Market	7,455	3,864	
Soviet Union	6,316	7,788	
United Kingdom	13,618	11,251	
United States	12,858	5,677	
Other countries	1,864	1,971	
Total:	41,110	30,551	

Output of woollen and worsted yarn in the third quarter of 1960 at 8.4 million lbs. was 14 percent higher than in the previous quarter, but unchanged compared with a year earlier. This brought the total for the first nine months of the year to 21.4 million lbs., 4 percent less than in January-September, 1959. Production of woollen and worsted fabrics rose by 8 per cent between the two latest quarters, bringing the nine month cumulative to 11.2 million linear yards or one percent more than a year earlier.

INDIA EXPECTS RECORD RICE CROP

Production of rice in the 1960-61 season now promises to reach a new high level; India expects a record crop, while the estimate of Pakistani production shows some increase over the previous record outturn in 1959-60. This is revealed in the Commonwealth Economic Committee's Rice Bulletin issued in London. India's output is expected to reach 31,000,000 tons (47,000,000 tons in paddy equivalent)—substantially more than the heavy crop of 1958-59. In Pakistan, the second estimate puts production at 14,500,000 tons of paddy, as compared with the previous record of 13,900,000 tons in the final estimate for last season. The report says that trade in rice in 1960 so far recorded substantially exceeds the total in 1959; shipments from Burma and Thailand were large, and there was a marked expansion in exports from Cambodia, South Viet-Nam and the United States, while those from the United Arab Republic showed a strong recovery.

Dealing with exports, the report says: "Despite some tailing off in the last quarter of the year, total exports in 1960 so far recorded (excluding shipments from China to Soviet-bloc countries other than those reported by Poland) were over 400,000 tons above those in 1959. Both Burma and Thailand shipped rather more than in the previous year, but the most marked expansion was shown by Cambodia and South Viet-Nam." "There was a slight recovery in shipments of rice from Burma in December. Total exports during the year rose to 1,700,000 tons, the highest since 1957. Much of the recovery was due to the heavy shipments to Indonesia, which exceeded 500,000 tons. Shipments to India also

rose, although not to the level of 1958, while those to Ceylon were the highest since 1957. Consignments to Pakistan, although larger, were somewhat less than in 1959, and those to Malaya showed a considerable reduction, while there was some falling off in exports to smaller Commonwealth markets.

EXPORTS OF COFFEE

Out of the estimated crop of 49,380 tonnes for 1959-60 49,309 tonnes, comprising of 25,254 tonnes plantation, 6,711 tonnes Arabica and 17,344 tonnes Robusta, have been received into the Pool upto January 1961. The estimates for 1960-61 are currently placed at 52,100 tonnes made up of 30,500 tonnes Arabica and 21,600 tonnes Robusta. A quantity of 24,380 tonnes, comprising of 9,697 tonnes plantation, 3,482 tonnes Arabica Cherry and 11,201 tonnes Robusta, has been released in the internal market upto the end of October, 1960. Out of 20,600 tonnes, allocated for export, out of 1959-60 coffee crop, 15,925 tonnes, comprising 11,343 tonnes plantation, 2,505 tonnes Arabica Cherry and 2,077 tonnes Robusta, have been sold for export upto November 23, 1960. The quantities sold include (a) 129 tonnes of Station Selections sent to London under the Quality Control Programme, (b) 485 tonnes Plantation sold to German Democratic Republic and (c) 2 tonnes (one tonne Plantation and one tonne Robusta) sold to a firm in Hongkong.

RICE PRODUCTION: FINAL ESTIMATE FOR 1960-61

According to the Directorate of Economics and Statistics, Ministry of Food and Agriculture, the All-India Final Estimate of rice for 1960-61 puts the current year's area and production of the crop at 83,335,000 acres and 33,700,000 tons respectively. This is an all-time record. As compared with the partially revised estimate of 82,829,000 acres and 30,963,000 tons for 1959-60, the estimates for 1960-61 show an increase of 506,000 acres or 0.6 per cent in area and 2,737,000 tons or 8.8 per cent in production. The yield per acre for the current year for the country as a whole works out at 906 lbs.—an increase of 8.2 per cent over the revised yield rate for 1959-60. The increase in area has occurred mostly in the case of the winter crop and is shared mainly by Bihar, West Bengal and Assam. This is attributed largely to favourable weather conditions at the time of sowing. In Andhra Pradesh, Mysore and Orissa, there has been a considerable decrease in area generally as a result of unfavourable weather conditions at the time of sowing. The increase in rice production, reported mostly under winter crop, has occurred mainly in West Bengal, Bihar, Uttar Pradesh and Madhya Pradesh and to a lesser extent in Madras and Maharashtra States. This has been due to favourable climatic conditions. In the States of Andhra Pradesh, Gujarat, Mysore and Rajasthan, there has been a fall in production due to untimely and insufficient rainfall which considerably affected some of the important rice-growing districts in these States. In Madhya Pradesh also, the crop was affected to some extent in the rice-growing districts of Jabalpur, Mandla, Drug, Bastar, Rewa, Satna and Shahdol for want of rain in September, 1960.

The final estimate of rice, 1959-60 released last year placed the all-India area and production of rice for 1959-60 at 81,343,000 acres and 29,338,000 tons. Data for 1959-60 have now undergone revision in respect of a number of States particularly Orissa. In Orissa, the State Government has, for the first time, adopted the results of random sample crop cutting surveys for estimating area and production of rice and this alone accounts for a revision of 1.01 million acres in area and 1.52 million tons in production for 1959-60. The total upward revision in all-India estimates for 1959-60 is 1.57 million acres in area and 1.67 million tons in production.

THIS IS ONLY AN ANNOUNCEMENT FOR INFORMATION AND NOT A PROSPECTUS AND APPLICATIONS ARE INVITED ON THE BASIS OF THE PROSPECTUS COPIES WHEREOF ARE AVAILABLE FROM THE COMPANY'S REGISTERED OFFICE AND THE MANAGING BROKERS, BROKERS, MENTIONED HEREIN.

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take any responsibility for the financial soundness of any schemes or for the correctness of any statements made or opinions expressed with regard to them. The Central Government have granted licences (copies of which are open to public inspection at the Registered Office of the Company) for the industrial undertakings as set out in the Prospectus. It must be distinctly understood that in granting these licences the Government of India do not take any responsibility for the financial soundness of the undertakings or for the correctness of any of the statements made or opinions expressed in regard to it. A copy of this Prospectus, having attached to it the documents required by Section 60 of the Companies Act, 1956, specified here-in, has been delivered for registration to the Registrar of Companies, Bombay.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 18TH APRIL, 1961, AND WILL CLOSE AT THE DISCRETION OF THE DIRECTORS BUT NOT EARLIER THAN THE CLOSING OF BANKING HOURS ON 20TH APRIL, 1961.

OBJECTS OF THE COMPANY

The Company was incorporated on 10th November, 1960, generally with the aims, objects and purposes set forth in its Memorandum of Association and in particular to manufacture engines, cranes furnace equipments, road and building machinery such as concrete mixers, concrete vibrators, roller pan mixers and asphalt mixers, flexible shaft machines, engineering tools etc.

BUSINESS AND PROSPECTS

The Company has taken over the business of the partnership firm Lynx Machinery Company as from 10th November, 1960. The firm was established on 1st June, 1957 and since then has been engaged in manufacture of concrete vibrators, concrete mixers, roller pan mixers and other equipment used in the building and construction trade. The firm has been regularly earning profits. The Company has secured the necessary industrial licences under the Industries (Development & Regulations) Act, for the following products:

1. Engines.
2. Concrete Vibrators.
3. Over-head Travelling cranes and Electric Hoist Cranes.
4. Concrete Mixers.
5. Roller pan Mixers.
6. Asphalt Mixers.
7. Tar Boilers.

There is today an increasing demand for building, road making and construction equipment, oil engines, cranes of various kinds, grinders and tools which are

still being largely imported. The rapid industrialisation in India under the Second and Third Five-Year Plans envisages a large expansion of manufacturing capacities in all these items. Indigenous production of these items will not only help save foreign exchange to an appreciable extent but may also earn foreign exchange, by way of exports to our neighbouring countries.

LISTER ENGINES:

The Company has been granted a licence to manufacture 6,000 Lister B & D type Engines per annum in technical collaboration with the world-renowned manufacturers of oil engines, MESSRS. R. A. LISTER & CO. LTD., ENGLAND. These Engines are still being imported in India and have numerous applications in the Industrial and Agricultural field. The marketing will be undertaken by MESSRS. VOLTAS LIMITED, BOMBAY and MESSRS. BALMER LAWRIE & CO., LTD., CALCUTTA.

ALLAM VIBRATORS:

India has been regularly importing in considerable quantities Concrete Vibrators of the world famous manufacturers MESSRS. E. P. ALLAM & CO. LTD., ENGLAND. The Company has been granted licence to manufacture 1,200 vibrators per annum. The Company will manufacture a wide range of Allam Vibrators which will help to a great extent the construction programme envisaged in the Third Five-Year Plan.

CRANES:

(a) DEMAG ELECTRIC HOIST CRANES: M/s. DEMAG-ZUG G.m.b.H. OF WEST GERMANY, the world-renowned manufacturers of Cranes have agreed in principle to grant a licence agreement to the Company for the manufacture of Electric Hoist Cranes in Eastern India. In view of the rapid industrial development outlined in the Third Five-Year Plan, the demand for these Cranes already large, will further increase.

(b) SCHIESS-DEFRIES CRANES: Besides Electric Hoist Cranes the Company will also manufacture various other types of Cranes including Overhead Travelling Cranes, Goliath Cranes in technical collaboration with Messrs. SCHIESS-DEFRIES, WEST GERMANY belonging to the well-known industrial group of Messrs. Schiess. The cranes will be sold under the Trade Mark of Schiess-Defries/Lynx, and the licensed capacity will be fixed after one year of the Company going into production.

LYNX CONCRETE MIXERS:

The Company is regularly manufacturing various sizes of Concrete Mixers and already a large number of these machines are in use throughout the country. The Concrete Mixers manufactured by the Company enjoy a high reputation and are marketed by the well-known firm, MESSRS. HEATLEY & GRESHAM LIMITED. The annual licensed production capacity is 600 numbers.

LYNX ROLLER PAN MIXERS:

The Company has been manufacturing two types of Roller Pan mixers and the licensed annual production capacity is 228 numbers. These are also being sold by MESSRS. HEATLEY & GRESHAM LTD.

LYNX ASPHALT MIXERS AND TAR BOILERS:

The licensed capacity of Asphalt Mixers and Tar Boilers is 144 numbers each per annum. The Company will shortly undertake the manufacture of these machines because of the extensive road making programme envisaged in the Third Five-Year Plan.

OFU-LYNX RE-HEATING FURNACE PARTS:

An Agreement has been reached between the Company and OFU-LYNX PRIVATE LTD. for manufacture of OFU-LYNX furnace parts. Since MESSRS. OFU-LYNX are currently negotiating for large number of orders for furnaces it is expected that Company's production in furnace parts will be considerable. "OFU"

Furnace being very well-known the scope for this business in India is considerable.

BAXTUL FLEXIBLE SHAFT MACHINES:

Subject to the approval of the Government whereupon it will become effective, a technical collaboration agreement has been signed with a well-known British Firm, THE FLEXIBLE DRIVE & TOOL CO. LTD., ENGLAND, whereby flexible shaft machines like grinders, ship scaling machines, tube scaling machines and other engineering tools will be manufactured and sold under the Trade Name BAXTUL/LYNX. The Company's application for Industrial Licence and collaboration agreement are under the consideration of the Government. This scheme when approved by the Government will be a very profitable addition to the Company's manufacturing programme.

SKODA DIESEL ENGINES:

The Company is negotiating for the manufacture of certain types of well-known SKODA stationery and Marine Diesel Engines in collaboration with the renowned European concern of SKODA, CZECHOSLOVAKIA. The Company in due course will apply for the necessary Government's sanction for the implementation of this scheme. In view of the large popularity enjoyed by SKODA engines the benefits of this technical collaboration when the scheme is implemented will be considerable. Under this collaboration the Company proposes to manufacture higher horse power Marine and Stationery Engines.

In all these collaborations the Company will have the benefit of their full technical assistance and in most cases the Company will send Indian Engineers for training abroad.

LAND, PREMISES AND PLANT AND MACHINERY:

The existing factory premises of the Company are situated in the industrial area of Calcutta and comprises more than 13 Bighas approximately with structures covering an area of approximately 40,000 sq. ft. Adequate power and water supply is available. The Commissioners for the Port of Calcutta have indicated their willingness to give a long-term lease in respect of the plot of land of about 40 Bighas located in Kidderpore, on their standard terms and conditions. The Company proposes to erect a new factory for the manufacture of new products that is to say, Engines, Cranes, etc. on this plot of land. The Company has obtained necessary approval of the Ministry of Commerce and Industry for import of Plant and Machinery for a value of Rs. 30 lakhs for the various schemes sanctioned by the Government. As mentioned above, the Company is already manufacturing in its existing factory Concrete Mixers, Concrete Vibrators and other road building machinery.

PAYMENT TO PROMOTERS — PRELIMINARY EXPENSES:

1. Shri K. K. Jajodia, Shri R. K. Jajodia and Shri M. K. Jajodia are partners of the Firm whose fixed assets have been acquired by the Company and who will receive the purchase price of Rs. 14,00,000 for the same and a sum of Rs. 7,66,374.49 in respect of the current assets and liabilities which have been taken over by the Company at prices based on the Auditors' report as from 10th November, 1960.

2. The Promoters will be reimbursed of all the expenses incurred by them on behalf of the Company which are estimated at Rs. 50,000.

MANAGING DIRECTOR:

The Board of Directors have, subject to the approval of the Central Government being obtained, entered into an Agreement dated the 23rd March, 1961 with Shri K. K. Jajodia for the appointment of the said

Shri K. K. Jajodia as Managing Director of the Company.

The Agreement between the Company and Shri K. K. Jajodia provides inter alia that Shri K. K. Jajodia be paid by way of remuneration an annual commission of 5 per cent on the net profits of the Company as computed in the manner laid down in Section 198(1) of the Act with the usual perquisites and that in the event of the Company having no profits, or its profits being inadequate, in any financial year, he is to be paid a minimum remuneration of Rs. 30,000 per annum with the usual perquisites provided nevertheless the said Shri K. K. Jajodia shall be entitled to draw a sum of Rs. 2,500 per month towards his remuneration as Managing Director.

ESTIMATED PROFITABILITY

Since the Company has a running business, with the implementation of the expansion programme both in the present and new lines of manufacture, the Company is confident that within a short period the profits will be sufficient to provide an attractive return to the shareholders.

COMMENCEMENT OF BUSINESS

The Company has already obtained a Certificate dated 21st March, 1961 for commencement of business from the Registrar of Companies, Bombay.

MINIMUM SUBSCRIPTION AND CAPITAL OUTLAY:

The minimum amount which in the opinion of the Directors must be raised by this Issue and upon which the Directors can proceed to allot shares to the public as offered by this Issue has been determined at 1,49,000 Equity Shares (of the nominal value of Rs. 14,90,000) being only a part of this Issue out of which Rs. 12.90 lakhs will be utilised towards part payment of the purchase price of the land buildings, plant and machinery motor vehicles etc. and Rs. 2 lakhs will be for preliminary expenses, brokerage and expenses of this Issue.

Any amount by which the allotment to the public out of the present issue falls short of the amount to be raised from the public will be as required met by borrowings from Banks or from other sources in the usual course of business. Likewise, it is intended that the balance of Rs. 24,00,000 required to meet the total capital outlay as detailed below together with any increase there may be in the actual cost over the estimated cost of the plant and facilities will be raised by loans from the Company's Bankers or from other like sources against the fixed and other assets of the Company in the ordinary course of business. For this purpose the Company has already approached the Punjab National Bank Ltd. of Calcutta which has indicated willingness in principle to make available a substantial loan subject to the usual formalities being satisfied.

CAPITAL OUTLAY

The financial requirements of the Company will be made up as under:

	Rs. 84,00,000
1. Purchase price of land, plant machinery and equipment including cost of erection of machinery, construction of factory building, power house, etc.	Rs. 72,00,000
2. Preliminary expenses including brokerage and expenses of this Issue	2,00,000
3. Working Capital	10,00,000
	Rs. 84,00,000

SOURCES OF FINANCE

The above amount will be provided as under:-

(a) Subscribed Capital	Rs. 14,15,040
(b) Present Issue	Rs. 45,84,960
(c) Borrowings from Banks and other sources as and when required in the usual course of business	Rs. 24,00,000
	<u>Rs. 84,00,000</u>

EXPENSES OF THE ISSUE

The Expenses of the Issue other than brokerage are estimated at Rs. 75,250 and will be payable by the Company.

BROKERAGE

Brokerage will be paid to Registered Brokers on the recognised Stock Exchange in India and Banks at 0.18 nP. per share on allotment made in respect of applications bearing their stamps. Messrs. Lewis & Jones, Bombay, are the Managing Brokers to the Issue and will be in addition entitled to a commission of 0.07nP. per Share subscribed by the Public.

The total amount of brokerage payable by the Company will be Rs. 74,750.

The following is a condensation of the Auditors, report by the Auditors, Messrs. Singhi & Co. relating to the figures of sales and profits as published in the Prospectus.

	Sales Less Commission & Discount	Profit Before Provision for Taxation
	Rs. nP.	Rs. nP.
Year ended 31st May, 1958	2,79,165 93	10,044 82
Year ended 31st May, 1959	6,59,787 95	54,175 82
Year ended 31st May, 1960	18,54,009 38	1,61,380.44
Period from 1st June, 1960 to 9th November, 1960	6,23,473 11	2,42,212 88

ALLOTMENT AND SHARE CERTIFICATE

Where an application is rejected, or not accepted in full, the whole or any balance of the application money received will be refunded to the applicant within two months from the date of closing of the subscription list in which case bank commission, if any, will be payable by the applicant.

Share Certificate will be issued in exchange for letters of Allotment within 4 months from the date of allotment.

Company Meetings**THE UNITED COMMERCIAL BANK LIMITED**

Statement of Shri G. D. Birla, Chairman, circulated to the Members at the Eighteenth Annual General Meeting held on Wednesday, the 5th April, 1961.

Gentlemen,

You will notice from the Directors' Report and the Accounts of the Bank for the past year now before you that while the profits have maintained their upward trend and show a satisfactory expansion, our deposits were somewhat down after the rapid increases of the past years.

DEPOSITS

The deposits at the end of 1960 at Rs. 88.94 crores showed a decline of Rs. 7.74 crores against a rise of Rs. 18.40 crores in 1959. The fall is attributable to withdrawals of funds for business purposes, the sustained demand for bank credit and continued stringency of money practically throughout the year. The deposits of the Bank, however, have started going up since the date of the Balance Sheet.

CASH AND SECURITIES

Cash on hand and with banks and money at call and short notice were Rs. 9.57 crores and represented 10.8 per cent of the deposit liability. In 1958 and 1959 we made substantial purchases of Government Securities with a view profitably to invest funds which would otherwise have remained idle, but during the year under review we reversed the process in order to make funds available for advances to our customers. As a result of the realisation of part of our investments, our portfolio of Government Securities, Shares and Debentures declined from Rs. 40.79 crores to Rs. 33.88 crores. There was a further vigorous demand for funds towards the close of the year which was met by resort to loans from the Reserve Bank of India against Government Securities and Bills.

ADVANCES AND BILLS

Our advances rose over the year from Rs. 36.57 crores to Rs. 42.47 crores while our bills discounted and purchased showed a small reduction from Rs. 19.68 crores to Rs. 18.91 crores.

The Bank has been providing credit facilities to various types of Small Scale Industries. The number of industrial units to which credit facilities have been made available is over 650 of which individuals and partnership firms number nearly 550 and joint stock companies make up the remainder. The total of limits sanctioned is of the order of Rs. 4 crores and the actual availments exceed Rs. 2.50 crores.

LIQUIDITY

Our quick assets, viz., cash and free Government Securities amounting to Rs. 35.00 crores formed 39.4 per cent of our total deposits. The total of our liquid assets consisting of cash on hand and with banks, money at call and short notice, unencumbered Government Securities and Bills amounted to Rs. 53.91 crores and represented 60.6 per cent of our deposit liability as compared to 67 per cent twelve months ago.

PROFIT AND LOSS ACCOUNT

The year's working has resulted in a further rise in profits. This is due in a large measure to the higher average total of our advances and bills throughout the year, the operation for a full year of the reduction in interest rates on deposits which took effect from 1st September, 1959 and the increase in the lending rate brought into effect under direction from the Reserve Bank of India in October last. The improvement of

profits attributable to these influences was partially offset by the lock-up of funds in special deposits with the Reserve Bank of India which could otherwise have been used to liquidate the higher-interest-bearing loans from the Central Banking Institution.

The small rise in charges for interest on deposits and borrowings is due to the higher average level of borrowings from the Reserve Bank of India over the greater part of the year while working expenses like salaries and other operating costs have continued to rise.

The increased profits have enabled the Board to transfer Rs. 30 lakhs to the Reserve Fund and thereby raise it to Rs. 2.05 crores, which is Rs. 5 lakhs more than the paid-up capital of the Bank, and at the same time it has been possible to increase the rate of dividend to share-holders from 11 per cent to 12 per cent per annum, subject to tax. The amount allocated for bonus to staff has also risen from Rs. 11 lakhs to Rs. 13 lakhs.

RESERVE FUND

The year 1960 will be remembered as a landmark in the Bank's history, as at the close of this year, the Bank's Reserve Fund exceeded its paid-up capital. This Reserve Fund is built up entirely out of the profits within 18 years of Bank's existence — that too in spite of heavy taxation. It is always the policy of the Directors to strengthen the Reserves of the Bank to safeguard the interests of the depositors. I am thankful to the shareholders for their restraint in being content with modest dividends in the early years of the Bank's career to enable the Bank to build up the Reserves in order to strengthen its financial position. This is not to say that the shareholders have been starved of reasonable dividends because with growing prosperity, the Bank has paid progressively higher dividends.

INDUSTRIAL GROWTH

During the year under review industrial production grew at an accelerated rate. In the first ten months of 1960 industrial production showed a rise of 11.5 per cent as compared with 8.7 per cent in 1959 and 1.7 per cent in 1958. The basis of calculation of these index figures themselves requires to be re-cast inasmuch as it is felt that the weightage given to some of the older industries is not justified in the present circumstances and that the many new industries which have come into existence have not been assigned the importance that is rightly due to them. A provisional re-calculation by foreign experts of the index on a more rational basis would appear to indicate that the increase in production in the first ten months was not 11.5 per cent but 15 per cent.

MONEY SUPPLY

Money supply with the public at the end of 1960 was Rs. 2,630 crores made up of Rs. 1,885 crores of currency with the public and Rs. 745 crores of deposit money, i.e., demand deposits of the public with all the commercial banks. The increase in currency was Rs. 144 crores while the increase in deposit money was only of the order of Rs. 70 crores. Analysing the expansion of money supply in terms of bank credit, there was a sharp rise of Rs. 236 crores in the public's net indebtedness the banks which contrasts with a sizeable decline of Rs. 107 crores in 1959. The rise in bank credit to Government was only Rs. 43 crores in 1960 as compared with Rs. 246 crores in 1959. The gold and foreign exchange reserves, inclusive of the balances of Government of India abroad, declined in 1960 from Rs. 387.54 crores to Rs. 319.05 crores. The contractionist effect of the reduction in bank credit to Government and the decline in foreign balances has been severe and is reflected in the reduced liquidity of the banking system.

MONEY MARKET

The monetary climate in 1960 was far from comfortable and for the best part of the year the banking system had to operate under various restraints. Credit conditions were stringent, unrelieved by even occasional ease, and there was no sign of any downward tendency in advances during the second half of the year which, by tradition and past experience, is considered as the slack season. Bank credit rose rapidly, as usual, during the first four months of the year and thereafter the volume of credit continued, without contraction, at the peak figure of the year right up to the middle of December when the new season's demand made itself felt and advances, once again, resumed their upward trend. The increase in bank credit during January—April 1960 amounted to Rs. 165.89 crores while during the same period the deposit resources of the banks failed to grow to a corresponding extent but rose only by Rs. 102.56 crores. Whereas in 1959 bank credit shrank by Rs. 97.5 crores in the slack season there was no such contraction in the slack season of 1960; the return of funds from agricultural and other seasonal advances was obscured by the intervening increase in industrial advances. The exhortation addressed to banks by the Reserve Bank of India in April 1960 to bring about a reduction of Rs. 110 crores in advances by the following October proved impossible of fulfilment by most banks. Borrowings from the Reserve Bank of India and the State Bank of India reached the peak figure of Rs. 96.26 crores in March 1960 against Rs. 76.65 crores in March 1959. But, whereas in 1959 the banks were practically out of debt with the Central Banking Institution by June, the experience of 1960 was quite otherwise. During the slack season of 1960 the average borrowings of the scheduled banks from the Reserve Bank of India and the State Bank of India were Rs. 46.90 crores against Rs. 10 crores in 1959.

CREDIT CURBS

Early in March 1960, the Reserve Bank of India, presumably somewhat anxious about the size of the expansion in advances during 1959-60 busy season, came to the conclusion that there was excess liquidity with the banking system. Consequently, banks were required to maintain with the Reserve Bank of India special deposits amounting to 25 per cent of new deposit resources accruing with them after the specified date. Two months later, in May, the additional deposit requirements were raised to 50 per cent of new accruals. The selective credit controls of the Reserve Bank by directive ensured that banking finance was not available, or was available only upto specified limits, against particular commodities. At the same time the Reserve Bank of India made it clear that the object of the new measures was by no means to deny bank finance for legitimate productive enterprises. Since industrial production, in fact, grew stridently during the year, the expansion in the advances of the banking system can be seen to have been fully justified. But, with the accrual of deposits slowing down or ceasing altogether to take place, the fact that advances were sustained at a high level imposed a considerable strain on banks under conditions of restricted liquidity.

By September 1960 it was clear that the banks would be quite unable to bring about a contraction of advances of the order of Rs. 110 crores as desired by the Reserve Bank of India. Indeed, bank credit, which had gone up to Rs. 1130.38 crores on the last Friday of April, rose still higher to Rs. 1135.82 crores on the last Friday of September. In this knowledge and with the 1960-61 busy season not far off, the Reserve Bank introduced a fresh set of monetary measures. Banks were directed, with a view, no doubt, to inducing some voluntary restraint on would-be borrowers, that they should raise the average rate charged for their advances

by half per cent and prescribed a minimum of 5 per cent for advances. Secondly, on the analogy of regulation Q of the Federal Reserve Board's rules to which I have in earlier years made reference, the Reserve Bank of India set a ceiling on the rates of interest that banks could pay on very short deposits for periods of less than 21 days or repayable at 21 days' notice or less. Thirdly, the Reserve Bank of India also fixed quotas upto a maximum of which alone banks would be permitted to borrow at the bank rate of 4 per cent. Thereafter, in two slabs, the rate of interest payable on borrowings from the Reserve Bank of India was raised to 5 per cent and 6 per cent. This, in effect, set up a three-tier bank rate. Hence, with the level of commercial banks' borrowings from the Reserve Bank of India relatively high for the season, the new regulations induced a fresh wave of disinvestment in Government Securities accentuating the weakness in the gilt-edged market already brought about by the mass of State Loans pressed for sale on an unwilling market. The investment of scheduled banks in Government Securities declined from Rs. 787.52 crores in December 1959 to Rs. 744.86 crores in May in the first phase of disinvestment followed by a further decline to Rs. 633.47 crores in the second phase following the credit curbs. The running down of investments to a low level in relation to deposits would by itself act as a brake on the willingness of banks to sustain the continued upswing of advances except to the extent that the bill market scheme affords relief.

Since the turn of the year, in view of the pressure upon the resources of the banking system, the Reserve Bank has defroze the special deposits which had been maintained. However, all that this meant was that, in the relevant week, banks were enabled to reduce their indebtedness to the Reserve Bank of India.

TRENDS OF DEPOSITS

The fact of the matter is that the deposits of commercial banks are not rising as fast as they should to meet the growing needs of an expanding economy. In fact, of late, they are tending to become stagnant. In this situation the banks are stretching themselves to their utmost to meet legitimate demands seasonal and otherwise, of industry and commerce and in so doing are allowing liquidity steadily to go down. Between 31st March, 1955 and 31st March, 1959 currency in circulation increased by Rs. 424.10 crores while demand and time liabilities of scheduled banks rose by Rs. 692.41 crores without making allowance for the distortion introduced by the impact of P.L. 480 funds which upto May 1960 flowed into the State Bank of India and which thereafter has not only ceased to flow in but past accretions of which are being diverted to Reserve Bank of India in agreed instalments. Through this fast growth of deposits, the ratio of deposits to notes in circulation went upto 100 per cent. In fact, in June 1959, for the first time in Indian Banking history, the total deposits of scheduled banks at Rs. 1737 crores exceeded the currency in circulation of Rs. 1714 crores. The trend, however, has now been reversed and the pace of increase in deposits is slower than that of note-circulation.

There have been normal deflationary factors at work. Firstly, agricultural production in 1959-60 was down owing to climatic conditions. The production of foodgrains was about 5 per cent less than in the previous year while the out-turn of cash crops like cotton, raw jute and oilseeds declined substantially. This set-back in the income of the agricultural sector has its inevitable repercussion on deposits.

Secondly, the adverse movement in our balance of payment position gives room for thought; the growth of our exports, in spite of programmes of export promotion, is disappointing while imports continue to rise.

The contractionist influence of a balance of trade deficit is felt, not through a drop in active notes in circulation, but through a decline in bank deposits and a chain of changes in Government deposits and Reserve Bank's holding of Government Securities in the Issue or Banking departments. It seems probable that such an influence was indeed felt during 1960, and that this was the second reason why bank deposits failed to grow at a rate corresponding to the expansion in advances.

In the third place, Central Government revenues have proved buoyant. The revised estimates for 1960-61 disclose a considerable increase in Government's revenue, union excise duties being expected to fetch Rs. 15 crores more and taxes on income going up by Rs. 22 crores. Such perceptibly heavier tax collections, it is not to be doubted, will prove to be an additional drain on deposits.

In the fourth place, the very buoyancy of Central Government revenues enabled a reduction in the quantum of deficit financing. Thus, while Government expenditure itself should normally be expected to provide a fillip to bank deposits, the manner of financing or the disbursements was such as to greatly reduce the impact of the governmental payments on the rise in Deposits.

Lastly, it may be permissible to suggest that the various measures of credit control instituted by the Reserve Bank of India may well have had the effect of diverting financial resources from the organised money market into the unorganised non-banking sector of finance. There are reasons to believe that upto a year ago the non-banking sector was losing ground and the organised institutions gaining in strength and influence but it would appear that this trend has now been reversed with detriment to the deposits of the banking system. Neither the Government nor the Reserve Bank of India would welcome such a diversion of resources to the non-banking sector, for to the extent that the non-banking sector gains in strength the credit measures of the Government or the Reserve Bank of India will prove even less effective than they have been in recent years.

MOBILISATION OF RESOURCES

Everyone realises the vital need to provide not only working capital to industry but also its reasonable medium-term requirements of credit but the resources of the banking system are inadequate and resort to central bank credit, which can never be a substitute for bank deposits, is discouraged through penal rates of interest and anti-inflationary credit curbs. Demand for bank credits is running at a high level and has outstripped money supply. Lending rates of banks may, therefore, well rise rather than be held at present levels. Banks are being asked not to restrict lending for productive purposes but, clearly, there is a limit, dictated by considerations of liquidity and prudence, to their ability to go on expanding advances in the absence of a sustained rise in deposits.

So, if Industry is to develop to the full extent and stature visualised in the Third Five-Year Plan, it will be necessary to take steps to mobilise resources and channel them into the banking system. A solid basis for growth of deposits over a period is increased agricultural, industrial and mineral production. But, apart from this long-term objective, the existing resources should be mobilised. From the response to the new capital issues made in 1960 and on a sample analysis of the applications made, it would appear that a new class of investors is taking interest in new floatations, and this would point to the existence of a considerable amount of untapped resources in the country. This should be gathered and not allowed to go into the non-

(Continued on page 995)

A PASSENGER FROM CALCUTTA WRITES:

... Just a line to thank you and KLM for looking after us so well prior to our departure from Dum Dum, and during the flight to London. The service on the plane was excellent and the hostess charming ...

Fabrications to specifications

Under licences
from Messrs Fives-Lille-Cail,
France, who built the largest sugar and cement
plants in the world and have supplied Soviet Russia
in 1959 a five thousand ton daily capacity cement plant, we
manufacture machinery and equip complete sugar and cement plants.

We also manufacture and supply complete sulphuric acid and super
phosphate plants. We have secured orders for five complete sugar
plants, of one thousand tons daily sugar cane crushing capacity.

(Continued from page 992)

banking sector or be diverted in the form of direct deposits with industrial concerns or non-banking financial institutions.

One way of attracting money into the banking system is to bring down money rates in the non-banking section. Through liberal credits to banks by the Central Bank under the bill market scheme and a liberal lending policy by commercial banks, money rates in the unofficial markets could be brought down, and thereby the diversion of funds into the unorganised market could be stopped and the flow of funds thereto reversed. At the same time interest rates on fixed deposits with the banks should be raised to wean away funds from the unorganised sector and attract fresh funds from the public.

INNER RESERVES

In the recent budget of the Central Government, the Finance Minister has made a valuable concession in favour of public financial institutions providing long-term finance whereby they are enabled to claim a reduction in respect of transfers to a special reserve account of sums not exceeding 10 per cent of the total income of each year till the amount carried to the Reserve Fund becomes equal to the Paid-up Capital of the institution. I strongly urge an extension of this concession to commercial banks so that they may be enabled to strengthen their inner reserves. This will have the effect of making banking institutions impregnable.

Favourable conditions such as elimination of double taxation of dividends should be created for the establishment of Unit Trusts as a medium of so that small savings could be attracted into the capital market and a broader basis of ownership created for industry and finance.

THE THIRD PLAN

The Third Plan has got a tremendous task before it. The total investment is expected to be about Rs. 10,000 crores, out of which Rs. 4,000 crores is assigned to the private sector.

In order that the private sector may be able to accomplish this assignment it is essential that there should be availability of adequate finance for the purpose of new investment. The rate of interest is important but not as much as the quantum of available finance. I would, therefore, suggest that we take all necessary fiscal and monetary measures to hold the price-line, bearing in mind always that anything that constitutes an obstacle to production is not going to help us in fighting inflation. The pivot of the whole question, thus, is increased production. This requires

investment and adequate finance. Scarcity of finance ultimately must lead to restricted production and consequently to higher prices.

It would be prudent to keep all these important points before us because sometimes, in our zeal, we adopt a remedy which defeats its own object.

I would, therefore, state that while the credit restriction policy in the beginning was wise, latterly it was overdone. And the time has now come when we should review the whole position.

Sufficient finance could not be supplied by banks to industry unless it has got adequate deposits. I have a feeling that the inflow of money into the banks' coffers will be encouraged only by the liberal outflow of it—a well-regulated outflow for productive purposes.

The question, therefore, is which step—lending with a view to attract deposits or waiting for deposits before lending—is to be taken first. In the present circumstances the only way is for the Reserve Bank to liberalise the policy of accommodating the commercial banks in respect of bills and allow them to lend freely for industrial purposes. This, in the ultimate analysis, will bring in new deposits. Assistance by the Reserve Bank under the Bill Market Scheme, *inter alia*, will enable the banks to meet the growing demand of funds for industrial development. This may put the advance-deposit ratio of the banks but would keep their liquidity intact.

Secondly, if the rate of interest on deposits is raised reasonably this will help the banks in getting more money.

Thirdly, it is necessary to open more branches. And in this respect a planned policy by commercial banks in consultation with the Reserve Bank for at least two years ahead would be very wise.

Fourthly, it is essential to tap the agricultural resources which can only be done by opening small branches in rural areas. There are difficulties about it. These difficulties have to be tackled.

The Plan, in order to become a success, has to be supported by all sections of the economy, that is rural, urban, commercial, financial and so forth. The banks have to play an important part in making the Plan a success and the means suggested above, if adopted, would go a long way to create a more balanced and healthy situation.

NOTE: This does not purport to be a record of the proceedings at the annual general meeting.

UNITED BANK OF INDIA LIMITED CALCUTTA

Abstracts from the Speech addressed by Dr. N. N. Law, Chairman of the Board of Directors, United Bank of India Ltd., Calcutta, to the shareholders of the Bank at its Annual General Meeting held on 10th April, 1961.

Gentlemen,

It is my happy privilege to welcome you to this meeting. Last year your Bank has completed the first meeting. Last year your Bank has completed the first ten years of its united existence. It is heartening to note that during this period our basic progress has been satisfactory. We have been able to cross the aggregate peak deposits of the pre-merger period. We have closed 55 over-lapping branches and opened 24 new branches, a number of which are in previously

Despite the tendency of deceleration which marked the growth of bank deposits last year, we have been able to achieve an increase of Rs. 4.06 crores in our deposits, a rise of 8.5 per cent over 1959. Our advances portfolio has also registered an increase of 14.7 per cent over that of 1959.

MONETARY POLICY

The past year has been a significant one for Indian Banking. On the one hand, it witnessed efforts on the part of the monetary authority in playing its role

actively in an attempt to control the effects of various adjustments that were taking place in the economy. On the other, there were certain developments in the country inhibiting banking progress. In the monetary field, by and large, the Reserve Bank showed its alertness and did all that was within its powers to keep the situation under control.

In a situation where there is a narrow profit margin and a low capital structure of banks, (to which I shall be referring again later in this statement), the directive of the Reserve Bank in prescribing minimum lending rates and limiting the rate of interest on short-term deposits was most appropriate and timely. I have not yet been able to reconcile myself to the appropriateness of the removal thereafter of the ceiling on short-term deposit interest rates, particularly at a time when introduction of a Deposit Insurance Scheme will call for a rigid control in this regard.

DEPOSIT INSURANCE

In order to strengthen public confidence in banking, which was adversely affected during the past year, the Reserve Bank by sponsoring a scheme of Deposit Insurance is removing an important lacuna in the Indian money market mechanism. We now learn with a sense of satisfaction that the Government has, at last, made up its mind to give effect to the scheme. The Governor of the Reserve Bank is to be congratulated for having taken this right step for better development and growth of Indian banking. It is hoped that an appropriate scheme, suiting the needs of the situation, will be given effect to without further loss of time.

You would no doubt recall that as early as 1954, your Managing Director gave shape to his earlier suggestion, first made in 1948, that a scheme for Deposit Insurance be evolved and that over the past few years I have been advocating the establishment of an agency for Deposit Insurance as well as for rehabilitation of sub-standard units. The importance of Deposit Insurance lies not only in covering depositors' loss in case of bank failure, but more in its ability, as a tranquilliser, to bring about a general climate of confidence. However, this is not the end in itself. It is only a means to achieve the objectives of a healthy expansion and development of the banking system for sustaining the growth of the economy. Any scheme for Deposit Insurance, therefore, to be successful, will have to be designed with a view to taking care of the liabilities side of the banking balance sheet, the Reserve Bank taking care of the assets side.

CAPITAL STRUCTURE

Increased capital funds can be achieved in two ways, by augmentation of reserves from profits and by issue of fresh capital. I may point out, as the indices of variable dividend securities clearly show, that bank shares are not thought to have growth prospects. In such circumstances it becomes ruinously expensive—and uneconomic too—for banks to secure capital on the only terms on which such issues can be successful. In other words, the strength secured from an addition to capital is dissipated by the higher quantum of distribution required thereon. It would follow that whether for augmentation of reserves or for issue of fresh capital on equitable terms, the profit margins of bank operations must be enhanced.

Again, the liquidity position which the banks are required to maintain has an important influence on the profit levels which can be reached. Thus, capital funds, liquidity and profitability of a banking institution are mutually the cause and effect of one another.

LIQUIDITY

Under compulsion of circumstances liquidity is drifting downward. It is true that the liquidity position of banks in any country, at any point of time,

would be a reflection of the state of activity of its national economy, extent of banking habits and coverage and pressure of legitimate demand for credit; the liquidity of banks, in the conventional sense, will reflect the degree of development and integration of the overall economic fabric of the country. In a developing economy like ours with a limited banking habit, banking liquidity will naturally tend to be lower and the pattern comparatively rigid. More so, when massive planned efforts are being made to increase the tempo of economic activities. It is also true that in these days of advanced central banking, immediate liquidity problem no longer has the significance it had in the past. Yet the basic need for liquidity in banking business cannot be ignored or its importance minimised.

Admittedly, economic expansion calls for greater credit requirements for industry and trade. But that should not eventually lead to bank finance replacing even partly, the functions of owner capital. In so far as high taxation and low saving rate force this distortion, the phenomenon calls for immediate attention; this is important for the basic need for institutional growth. It seems that the low capital structure in the industry is being sought to be supplemented, to a noticeable extent, with bank funds. In so far as this tendency is responsible for the present expansion of bank advances, pushing up the advances-deposit ratio further, it could be said to be unrealistic and even disturbing; unless of course this is considered to be only a transitory phase.

PROFITABILITY

Another reason, may be the most important one, for the liquidity being placed low is the need for increased profits. The profit margins of the banks are already very narrow. With a number of major banks the profit, after deduction of taxes and bonus to the staff, for 1960, as ratio to deposits, ranges between 0.17 per cent and 0.30 per cent. To match the mounting operating costs, therefore, banks tend to seek better earnings through larger advances. Any increase in the quantum of profit has, thus, been the result of 'double shift' in advances. This can neither be regarded as normal nor be looked upon with complacency. That even such profit has evidently failed to allow for ploughing back and make up for the decline in the investment values, is all the more a matter for concern. There is an urgent need for a study of the structure of operating costs and operating earnings with a view to achieving a better differential.

It is surprising to note that while the advances-deposit ratio has been continuing to take an upward turn, the banks have thought it fit further to raise the rates of interest on short and other term deposits. We have been expressing our views against raising of interest rates and we still believe that the recent upward revision has been extremely undesirable step.

INTEREST RATES

Over the years it has been our confirmed conviction that by and large the growth of deposits does not depend so much on the rate of interest as on the confidence which the banking system inspires, availability of banking facilities and the quality of services rendered to the community. While most of the people still live at or below the subsistence level, it would seem incorrect to assume that a feasible rise in interest rates will stimulate savings as the base for bank deposits by curtailment of consumption, particularly when the value of the Rupee is declining. The step, on the other hand, will further add to the increasing expenses of the banks. If the increased expenditure were, instead, spent on opening branches in unbanked areas and improving the quality and diversifying the range of services, the banking habit would have been further

stimulated resulting in mobilisation of fresh deposits; that would have been a useful investment in the future.

The higher rates of interest paid on bank deposits may tend to push the bond rate upward in regard to the future borrowings of the Government. This will cumulatively add to the burden of servicing charges, which will, for obvious reasons, have to be met by progressive increase in taxation. Any disturbance on this account is likely to reflect itself by further complicating the difficult funding problem. In order, therefore, to prevent the servicing cost of the public debt from rising sharply, the interest rates prevailing elsewhere in the economy, particularly on bank deposits, will need to be kept under close control. The policy of varying the minimum lending rates of the banks, already initiated by the Reserve Bank, can effectively take care of the adjustments in the economy.

PEG THE RATES

In this connection, I would also point to the danger of uncertainty about the future course of interest rates. It is our considered view that in the interest of present investment and also in order to bring about a healthy growth of future investment, proper steps should be taken to remove any fears of capital depreciation. To quote Keynes, "the Monetary Policy which strikes public opinion as being experimental in character or easily liable to change, may fail in its objective."

I therefore suggest that the desirability of following the U.S. method of imposing a reasonable limit on interest rates on medium term and long-term public debt should be seriously considered. It may not be necessary, however, to adopt the American method of legislative provision; a stipulation as to the maximum rate

of interest to be offered incorporated in the National Plans, may, perhaps, serve the purpose equally effectively.

TAX CONCESSION NECESSARY

Returning to the question of profitability, I think that by increasing the rates of interest on deposits, the banks have again postponed the opportunity of raising their low profitability. It is high time that banks took a more realistic view of the situation, kept interest rates under control and tried other methods of improving their resources and profitability. While undoubtedly banks will have to make their own efforts in this regard, it is also our view that the banking system should receive apposite assistance from the concerned authorities. Tax concessions on that part of profits, which is utilised to build up reserves and thus to strengthen the capital structure, should, for example, be seriously considered by the Government.

CONCLUSION

Indian banking needs a major reorganisation and the urgency of a close study of the whole matter cannot be over-emphasised. In this connection, I am glad to mention that, your Managing Director, Sri B. K. Dutt, has given a timely lead. He was invited by Calcutta University to deliver a series of lectures as Prof. Benoy Kumar Sarker Memorial Lecturer for 1960. He selected "Monetary Discipline and Indian Banking" as the subject of his lectures. In these lectures, which are now available in book form, he has analysed in detail the prevailing situation in the Indian banking system and has put forward a number of ideas for its progressive development.

Take the guesswork out of Lubrication...

Chances are you do not use the right lubricant in the right quantity for the right machine. You may be replacing too many costly parts and writing it off as a normal maintenance expense. It isn't really—it is the result of faulty lubrication practices.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

The service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

PLANNED LUBRICATION—A VITAL FACTOR IN COST CONTROL

CALTEX (INDIA) LIMITED Bombay · New Delhi · Calcutta · Madras

CAL 5.01.P.

New power in industry

On a 600-acre site at Durgapur, amidst intense activity, the scene is being set for yet another vitally important contribution to India's industrial growth—a contribution made possible through the vast technical knowledge of ACC-VICKERS-BABCOCK LTD. (A.V.B.), a new and powerful industrial group formed by The Associated Cement Companies Limited, Vickers Limited and Babcock & Wilcox Limited.

Already, considerable progress has been made in erecting this new Industrial Plant. Workshops are rapidly taking shape and foundations are being prepared for some of the most up-to-date machinery in the world. Very soon now the A.V.B. Plant will be ready to make its contribution to Indian industry, and to help Indian engineers overcome some of the difficulties which have faced them for so long.

MODERN EQUIPMENT

Some of the most up-to-date industrial equipment of its kind in the world is being installed in the new A.V.B. Plant, from the radio-active cobalt X-ray equipment capable of X-raying steel plates up to a thickness of 6" to the vast 3,000-ton hydraulic press, the largest in Asia, designed to bend steel plates of up to 5" thickness. The workshops of A.V.B. are thus fully equipped to manufacture machinery for the cement-making and mining industries, thermal power plant and industrial steam-raising equipment equal to the best in the world.

VITAL ROLES

THERMAL POWER: A.V.B. have the technical knowledge, the men and the machinery to participate in the supply of vital plant to be installed in Thermal Power Stations throughout India. They will make a notable contribution towards the target set by the Government for erecting boiler plant and thermal power plant

to the value of Rs 34 crores per year by the end of the Third Five Year Plan.

CEMENT-MAKING MACHINERY: A.V.B. are already discussing projects which will enable them to supply machinery to help increase the output of cement for which the Government's target is 13 million tons per year at the end of the Third Five Year Plan. Not only will A.V.B. help to meet the exigencies of industrial expansion but they will ultimately contribute towards the earning of valuable foreign exchange through export.

SITE STRATEGICALLY LOCATED

A.V.B. have shown considerable foresight in the location of Durgapur as their base for operation. Close to the now well-known Durgapur Steel Project, they are within what is fast developing into the industrial heart of India. They are within easy reach of India's coal and general mining centres. The Port of Calcutta is only a hundred miles away, a factor which is of tremendous advantage for the import of special raw materials.

EFFICIENT STAFF

The new company has adopted a far-sighted policy regarding the housing of the staff at Durgapur. Resulting from this the AVB housing colony which is situated but a short distance from the factory site is one of the finest in India. The houses are modern and the colony itself will be completely self-contained with its own dispensary and its own shops, parks and playgrounds. Here will live the workers of the A.V.B. group from the man of the shop floor to the skilled engineers and advanced technicians, a team that will keep a close watch on this modern plant which will harness such a vital and powerful new force to Indian industry.

...a Powerful Partnership for Progress

The State of the Fifth Republic

WHAT has happened in Algeria implies nothing more or less than civil war in the Fifth Republic. The Fifth Republic came to power so smoothly that it has generally been assumed that the volume of popular support that General de Gaulle commanded was so great that disaffected elements would never dream of raising the standard of revolt. Events in Algeria always seemed to provide an exception to the rule, but even tried observers did not think that the army would go over in very large numbers to rebellion. Current reports are to the effect that the rebellion has ended abruptly and its ring-leader, ex-General Maurice Challe, has been captured and flown back to France to suffer trial for high treason which will probably end in the death penalty. General Raoul Salan is reported to have committed suicide, and Andre Zeller and Edmond Jauhaud seem to have disappeared. Thus the rebellion has disappeared as rapidly as it arrived.

All in all, the events of the last week, while shattering to the confidence of those who thought that the French army was united behind de Gaulle, have shown that the Head of the French State has still the substance of real authority both in France and across the Mediterranean. The explanation of this curious aberration of the Generals in Algeria is probably to be found in the extraordinary in-breeding which takes place amongst the French settlers and those who come under their hysterical influence. Now that the rebellions by both the *colons* and their ill-advised military friends have been substantially broken and General de Gaulle has scored a decisive personal victory, his policy in Algeria might be looked upon with more favour, or at least with grudging acceptance, which comes from the realisation of the absence of any real alternative. Whether or not the General's difficulties in Algeria shortly end with a vote for his proposals, the fact remains that there is no

other authority capable of enforcing uncomfortable reforms. This is the time to recognise that though Algerian independence may not look as complete as our own, General de Gaulle's proposed solution is the only immediately feasible approach. As always, in Bismarck's phrase, politics remain the art of the possible. That defines the limit of solution as it defines the limits of compromise.

There is for us in India a less happy implication of which we cannot fail to take some notice. The meeting of the Aid India Club took place in Washington in accordance with the schedule. Of course, no firm commitment about the quantum of aid which the principal donor, the United States is expected to give could be made because of constitutional reasons — the Foreign Aid Bill must first be approved by Congress. A happy circumstance of this year's meeting of the consortium was that for the first time France sent her representative as an observer — a prelude to her full participation as a contributing member. But she has been so much disturbed by security problem and, likewise, the United States also is called upon to devote first attention to the problems of the Cold War. In the short run, the prospect is quite uncertain, but even in the comparatively longer run it is less bright than what it was only a few weeks ago. France has not been a major contributor in this field, but the tide was turning and even in the Second Plan assistance was by no means small and assistance in the Third Plan was confidently presumed to be larger. It is evident that France cannot play the same part in the first two years of the Third Plan as she would have liked to. This is a measure of the extent to which political insecurity at home immediately with draws interest in assistance abroad. All these are melancholy thoughts, not the less depressing because they imply the obvious moral that the world of 1961 is still not ready for its responsibilities.

The Future of Panchayati Raj

THE debate on the grants of the Community Development Ministry last week afforded the country a remarkable opportunity for awareness of a new and relatively unknown movement—

Panchayati Raj. It may well be that, if Bhooda was the magic word of the fifties, the Gandhia expression of a non-violent revolution in the countryside, its virtue in the sixties will pass t

a much less publicised thing, Panchayati Raj. There is, indeed, no conflict between the two as is seen by the fact that the apostle of the Bhoo-dan movement, Mr. Jaya Prakash Narayan, is already wearing the mantle of the Panchayati Raj and spreading its gospel. This is appropriate; Bhoo-dan has come to stay but Panchayati Raj has still to win its spurs. It is precisely because both in assessment and in potentiality this is an unknown movement that one should heed the careful description of it that the Minister, Mr. S. K. Dey, found it possible to make. Few of those who were present would accuse him of being a visionary; he was very close to earth.

Panchayati Raj is the negation of monolithic politics; it is the biggest experiment at 'grass roots' democracy that India has undertaken since the Revolution. Because it is so much a 'grass roots' affair, and because the villages are so numerous, the picture will necessarily be uneven with surprising progress here and not-such-surprising neglect there. But, by and large, at least in the States which have had the movement for two or three years something significant has been done. A survey by the Indian Institute of Public Opinion in sixty Panchayats in the Punjab covering more than 100 villages seems to have come to the conclusion that the sources of devolution of power are real, that the elections that have been held are not merely fair, but are recognised as such, both by the public at large and the Panchayat members, and that a new feeling of initiative and self-help has crept into village counsels with the influx of significant new power. All this does not imply that 'grass roots' democracy is now ready for uncritical expansion. The secret of success has always been men. All that can be said is that a substantial development is taking place in the training of responsibility at what might be called the lowest political level.

The Minister who spoke with anxiety of the new difficulties enunciated six acid tests for the Panchayati Raj. These are so much the heart of the piece that it is worth repeating exactly what he said:

"The first test is, whether or not the panchayati raj system is making better utilisation of the Government staff and the resources that are being placed at its disposal. The

second is, whether it is promoting national priorities of its own. The third is, whether it is dispersing initiative both vertically and horizontally—vertically means a higher institution to the institution next to it; horizontally means to voluntary institutions of people, as many as there are, laterally. If it is a village panchayat, the village panchayat must try to get programmes implemented through associate voluntary institutions of people at the village level. Otherwise, we shall eventually encourage totalitarianism. The next test is whether or not there is better understanding of democracy in the people and whether or not there is better competence in our representatives and in our Government servants. The next is whether or not panchayati raj has been able to mobilise the idle resources, particularly the man-power resources in the villages. Last but not least is the test whether or not it has been able to ensure social justice, viz., assistance to the weaker sections of the village community."

One of the biggest difficulties in the immediate present is not merely the taking of power by the villagers, but the building of the bridges between the villagers through their Panchayats and the Block Development Officers and other servants of the State operating in what might be called a civil service environment. In the monolithic structure to which reference has already been made the civil servants have lost all along the line to elected representatives of the people who have not always been fully prepared to exercise the power they inherited. Much the same difficulty will arise many times over at the village level. One of the great questions in the present is whether the villagers and Block Development Officers will build better bridges than the politicians have built with the civil servants. Assuming this can be done, it may be that the structure of local self-government in India would be better built than the vast pyramid which has been borne on this widespread, but relatively unrespected, base. The instrument of success must be the harmony with which the various agents that have inherited power work with those who have tended to lose it. Much the greatest test of the new sarpanches is this capacity to recognise that in their moment of victory they need to become more responsible as representatives not only of their people but also of the nation.

cular glory at the Foreign Office. He was the Prime Minister's Number Two, and that was that. He was transferred to the Treasury, although he is certainly no economist or fiscal technician. But he is a well trained lawyer and, as such, has evidently developed the capacity for reading and imbibing a brief rapidly and competently. In his recent Budget speech he delivered the clearest of such addresses heard for some time past, he did so with great assurance and confidence. It was

moreover a speech full of ideas and decisions as well as wit and clarity.

The cynics will say that Mr. Lloyd is fortunate in the top civil servants surrounding him. But it needs a competent Minister to make such effective use of his advisers. Mr. Selwyn Lloyd is now confidently spoken of as a future Prime Minister. I would reserve my own judgment on this but having heard his recent performance in the House of Commons, I must admit that he has gained in assurance and stature in a remarkable manner since his transference from the Foreign Office to the next door Treasury building.

There is no doubting the quality of his Budget. In the first place there is its financial austerity—a word which can be used without any pejorative implication. The British economy is rather over-buoyant. Domestic demand is brimming over. That can be seen in the continuing deficit in the balance of payments. The first duty of the Budget was to curb the buoyancy of domestic demand and thus release more resources for export. The Budget is doing this by raising taxation to such an extent that the revenue surplus in the coming year is expected to reach the impressive total of £506 million which is only £69 million less than the capital payments which the Government will have to make in 1961-62. Not since the days of Sir Stafford Cripps have we seen such iron chancellorship. The Government will find itself in an exceptionally strong position during the coming year. The amount which it can collect by small savings alone will suffice to cover more than four times its net borrowing requirements. The Government will thus be a net purchaser of its own securities. It follows that this looks like a good year for gilt-edged securities and for British Government credit.

The tax changes have, of course, been dominated by the proposals to make considerable remissions to surtax payers. These do not become truly effective until the 1st January, 1963 and quite a number of the taxpayers for whom these favours are intended will, therefore, not live to see the day. When, however, they do become effective they will be very substantial, particularly on the lower and middle ranges of surtax payers. With the possible exception of India, we in Britain had the most sharply graduated system of direct taxation in the world. We shall still be among the leaders after the concessions become effective, but part at least of the injustice created by the fact that the commencement of surtax has remained at £2,000 per annum for 41 years, will have been removed.

The main counterpart to this concession is being provided by an increase in profits tax. Politically this may be an effective and judicious balancing trick, but there is no particular relationship between the two, other than the fact that the incidence of the concessions and increases respectively will be approximately the same both in the matter of timing and amounts.

By far the most interesting and probably most important aspect of the Budget proposals is the introduction of a new battery of economic controls in the form of powers given to the Chancel-

lor to change, or inaugurate, taxes between budgets. Now that the Government spends close on a third of the national product, the Budget is obviously the main economic control. Unfortunately, it comes but once a year, unless a dire economic crisis intervenes and calls for an autumn budget. The economic position tends to change appreciably within the year but only rarely so vehemently as to call for a supplementary budget. There is, therefore, a need for some elastic and flexible tax system where the rates can be adjusted to changes in economic conditions.

Two such flexible regulators are to be introduced. The first is the power being given to the Chancellor to raise or lower by 10 per cent of the existing rates of virtually all customs and excise duties. These duties now yield £2,000 million a year, so that the Chancellor is given the power to shift taxation within the considerable margin of £400 million. The second is a form of payroll tax which would be applied by a call on all employers to increase by anything up to 4s. per week the contribution they already make to the National Insurance scheme for each employee. At the maximum rate this could raise £200 million a year.

These are considerable powers and their grant raises an important matter of principle, namely that of the delegation to the executive of the right to change taxation which is normally jealously guarded by Parliament itself. Admittedly *Parliamentary resolutions* will have to be passed when these powers are exercised but one knows full well that this procedure is that of the rubber stamp and does not allow the detailed discussion and criticism of changes in taxation which occur when these are embodied in a finance bill.

This matter of principle may, however, be glossed over given the good cause for which these powers are being granted. In future the fiscal controls may result in less reliance on the orthodox mechanism of monetary policy, fewer changes in hire purchase credit restrictions and less dependence on abnormally high or abnormally low Bank rates. But the new regulators will bring their own particular problems. It may well be for example, that the knowledge that Chancellor has powers to raise or lower purchase tax will accentuate, rather than reduce fluctuations in domestic trade. When trade is booming and seems to call for an increase in duties, the purchasers will rush in and buy before the duty is raised. Conversely when trade is slack potential buyers will hold off in the expectation of lower purchase tax rates and trade will become slack still. The timing with which the new instruments are used will, therefore, call for considerable technical as well as psychological delicacy of touch.

The question which is now being asked is whether these regulators will have to be called into play this year. The answer is probably not, and for this the austere and anti-inflationary shape of the Budget can take the credit. Some concern must remain, however, as long as the balance of payments remains in such poor shape. But whatever the problems which the next few months may bring, the Government is better armed than it was before to attack them.

Guest Editorial

Mr. Selwyn Lloyd's Finest Hour

By PAUL BAREAU

Editor, 'The Statist', London

THIS year's British Budget was a memorable occasion and a great performance on all kinds of counts. It innovated new methods of economic controls, it produced dramatic changes in the incidence of direct taxation and, last but not least, it was important politically as evidence of the growing stature of the Chancellor of Exchequer, Mr. Selwyn Lloyd.

Mr. Lloyd did not cover himself with parti-

A DELHI DIARY

MUSIC HATH CHARMS

IN a week in which the hounds of war have been unleashed in Cuba and in Algeria, I might be expected to be in a belligerent, or at least in a militant, mood. Happily, I have found an escape from Politics, Parliament and the Press—the three difficult P's—in a cultural pursuit which has eliminated from my mind all the turbulence that one feels in the outside world. The occasion which wrought this miracle was the Delhi Music Society's presentation in a Pianoforte recital of Adam Harasiewicz, the young Polish piano player who has made history in more ways than one. At the age of 23 he won the coveted Chopin prize which is awarded once every five years for a performance of Chopin by a pianist between the ages of 16 and 32. I do not think the age limit has been any bar to the highest excellence, and, if the verdict on the performance last Saturday is any guide, I may say that Harasiewicz is already one of the world's greatest piano players. Incidentally, he has already won this reputation in many countries outside Poland, and I now place upon him an Indian reputation equal to those that he has won elsewhere.

It was very appropriate that Rajkumari Amrit Kaur, who introduced him in a few well chosen words, referred both to his genius and his youth. I might have added to his charm, because this musician has a smile almost always round the corner of his lips. He could not refrain from a grin when he was referred to as a genius. Near the end when he was driven to play encore after encore, his smile with his request "Now what would you like?" was as engaging as everything that followed. To the demand that he should play the Etude he said simply, "I will play a Mazurka first, so that you may relax. The Etude is so much like the Polonaise, in seriousness," all of which met with additional applause, since almost everything he said or did was just right!

The programme at the Sapru House concert, unlike the All-India Radio broadcast on Sunday, was also just right. It began with the Polonaise in C sharp minor and ended with the Polonaise in A flat major, the grand moving call to arms of Polish nationalism. Practically everything he played—even the funeral march, said to have been composed during one of Chopin's periods of depression — was full of bell-like clarity, each note almost separate from the rest. The programme contained, as is inevitable, some Mazurkas, two on the agenda and two off as encores. The Etude came in as an encore on Saturday, and was included as an original in the A.I.R. concert, but why did the great Polonaise in A flat major not figure on the radio? The net result of the contrasting programmes was to make the Sapru House performance look complete, and the All-India Radio performance niggardly by comparison. Neither the Ballade nor the Etude made up for the absence of the Polonaise and the Sonata in B flat minor. Is All India Radio a little out of touch with what Indian fans of Western music like? I speak my piece boldly. We want every day (and every night) calls to action; the Polonaise and the Song of Russia can be heard over and over again.

THE THREE PRINCIPLES

We have heard a lot recently about the five principles—more honoured in the breach than in the observance. But I propose to enunciate three principles in the context of a particular event, namely, the election of the Deputy Leader of the Congress Parliamentary Party which has been a subject of conversation throughout the week. Most of us took it for granted that Mr. Morarji Desai who had acted as Deputy Leader in the Prime Minister's absence would be elected by a unanimous vote. But we were reckoning without the large personal equation of Delhi. Personal equation has been running high this week and it is known that Mr. Jagjivan Ram has brought to bear on this particular problem a great deal of what might be described as gregariousness. However, this is not one of the principles I am describing. The principles I will mention are the principle of escape by which the Prime Minister is now remaining neutral and argues that this must be left to the Party to decide as it likes. Secondly, the principle of borrowed tensions by which some members of Congress Party are proposing an outsider — Hafiz Mohammad Ibrahim or Dr. Subbarayan — in order that the other claimants might continue their dissensions and differences or rivalries in private. Finally, there is the principle of inconsistency by which the Prime Minister will argue that it is appropriate in a democracy that the electorate should choose its own leader, and at the same time act in Uttar Pradesh differently from the way he acts in New Delhi. On this I can do nothing more than reproduce the naughty cartoonist, whom I have frequently called in to say my piece in these columns, but who has been absent for a long time. What cannot be said can at least be drawn!

"I am emphatically in favour of elections to all party offices."

THE WEEK'S NOTES

Laos

CEASE-FIRE BEFORE CONFERENCE

THE FIRMNESS shown by Britain (and America) in declining to agree to the Soviet proposal to hold the international conference of the fourteen nations while the question of cease-fire in Laos was kept undecided—and therefore open—has been rewarded. Russia's ambiguity on cease-fire was too patent on the face of her proposal to let Britain (and America) fall into the trap of holding the international conference under the almost certain shadow of continuing civil war and reduce the conference to a farce, unless concessions were made under the threat of increasingly aggressive military offensives. The Co-Chairmen of the Geneva Conference have sent a cease-fire appeal to the "military authorities, parties and organisations" in Laos and they have readily responded to it. The date of the international conference has been fixed on May 12 at Geneva and in the meantime the International Supervisory and Control Commission meeting in Delhi will prepare a report on its functions in Laos and will go on the spot to control the cease-fire on instructions from the Co-Chairmen. But all questions connected with the cease-fire are to be settled by negotiation and ultimate agreement by the "appropriate representatives" of the "military authorities, parties and organizations" in Laos. This significant qualification engrafted upon the cease-fire agreement will need to be constantly kept in view, since it may open up a possible loophole to thwart the cease-fire in the event of differences over who should represent Laos at the Geneva conference.

The considerable delay caused by Russia in accepting the well-established principle of cease-fire preceding a peace conference was not without purpose. Explaining the latest British proposal on Laos to Russia, Lord Home told the House of Lords on April 19 that "the air-lift of arms from communist countries (to the Pathet Lao forces) continues" and the same day Mr. Heath informed the Commons that the military initiative rested with the Pathet Lao-Kong Le forces and the threat of a major offensive being mounted by them remained. The British proposal to order cease-fire on April 20 has been delayed by five days — again, not without purpose. In the meanwhile, the Pathet Lao army has captured the strategic town of Vang Vieng on the junction of the roads leading to the administrative capital of Vientiane and the royal capital of Luang Prabang. The 14-nation international conference will carry its deliberations on the principle of neutrality and non-involvement in military pacts for Laos as laid down in the Geneva Agreement of 1954. The bone of contention at the conference will be the formation of the neutral government. The conference session will unfold the conflicting viewpoints on this crucial question.

Territorial Integrity

THE PENAL BILL

ON MONDAY this week the Lok Sabha passed the Criminal Law Amendment Bill which seeks to provide punishment for the offence of questioning the territorial integrity of the frontiers or any other part of the country or engaging in similar activity in a manner prejudicial to the country's security. This Bill has been introduced rather too late and Government certainly cannot escape genuine criticism for showing unmerited leniency to pro-Chinese elements in this country which have been carrying on subversive propaganda with impunity. This extraordinary latitude will hardly find a parallel in any other country. Mr. Lal Bahadur Shastri was forthright in making no secret of the fact that the activities of the Communist Party in the border areas had forced the hands of the Go-

vernment to put this measure on the Statute Book. The instance which he quoted about the "Janyuga", a Communist paper, expressing regret for the blunder of publishing the UP Government's appeal exhorting the people to fight China's aggression is only a typical case of anti-Indian attitude, which, by virtue of the documentary nature of the evidence, cannot be denied by the Communist Party.

The opposition to the Bill came from a solitary member, the spokesman of the Communist Party. Speaking on behalf of his party, Mr. Indrajeet Gupta tried to conjure up the picture of his party being made a "scapegoat" and of whipping up of "anti-Communist hysteria". This is a straight issue of China's aggressive and violent methods to grab Indian territory on her self-conceived claim that it belongs to her. India certainly cannot be expected to acquiesce in it. No question arises of making scapegoats of any persons or organisations. One thing which the Communist Party of India has persisted in doing with remarkable consistency is to avoid a straight and unequivocal declaration of its view whether it considers the occupation of Indian territory by China as an act of aggression or not. The Government and the people do not need any gratuitous advice from the Communist Party that a peaceful settlement should be negotiated with China. This is what the Government is doing on its own. But no national of this country can be allowed to jeopardise its security by propaganda against its territorial integrity in any form. There is nothing "draconian" about this Bill inasmuch as action will be taken only through the courts of law and a right of appeal to the High Courts can be exercised.

Linguistic Minorities

EDUCATION AND SERVICE

IT IS in the spheres of provision of educational facilities and entry into the service cadres of State Governments that the problem of linguistic minorities seems to assume special importance. This impression is irresistible from the third report submitted to Parliament by the Commissioner for Linguistic Minorities this week. As opportunities of employment increase and get diversified with the many-sided development of the economy, the attraction of government service as a career will wear out. From the long-term angle, therefore, educational problems will retain importance in policies for linguistic minorities.

The Commissioner's report tends to show that, broadly speaking, safeguards for linguistic minorities in the matter of education and government service are implemented in the spirit in which the Constitution has conceived them. The number of linguistic minority pupils receiving education through the medium of the mother tongue up to the secondary stage has continued to increase in the last three years. The Commissioner wants this principle to be extended to dialects. The State Governments are right in disclaiming this novel responsibility. Exceptions may be made where the number of students speaking a dialect is sufficiently large in particular pockets to justify expenditure which will need to be incurred in extending this facility to them. But how many dialects are fit to be adopted as media of instruction? Minority safeguards have no application to university education and the case for their extension at the university level is untenable—it will not be feasible to impart university education through the mother-tongue of the minorities. The correct solution lies in setting up separate colleges for them, which should be affiliated to appropriate universities outside the State, provided there are adequate numbers of students concentrated in the same centre. In any case linguistic balkanization at the university level in the States cannot be countenanced.

In respect of State Government services, the grievances of minorities do not appear to be serious. In most States the regional language is not a compulsory subject at the competitive examinations and successful candidates are under an obligation to pass a qualifying test during their probation. But in some States the effect including the marks obtained in the compulsory translation paper in the grand total is prejudicial to linguistic minority candidates. This ought to be avoided. The demand for recognition of minority languages as official languages loses force since even in no district of any State does the ratio of linguistic minorities to the population approach 30 per cent. Actually it would turn to be very low except in 3 or 4 States.

The Commissioner has appealed for a liberal administration of minority safeguards and his appeal should be heeded by the State Governments. In this sub-continental country with a large diversity in several spheres of life, emotional integration, although it will be slow in coming about, is the eventual solution to the problems of linguistic minorities as it is to a wide range of other problems.

The Commonwealth

ENTER SIERRA LEONE

YESTERDAY, APRIL 27, Sierra Leone achieved the status of a sovereign independent state. She will make a welcome addition to the Commonwealth Club. In her political and economic texture, she is much different from most other African colonies which are being emancipated in rapid succession. British dependencies have generally enjoyed a superior advantage over dependencies governed by other colonial powers in respect of progressive administration run partly by indigenous civil service men, a long period of training in self-government and a fairly good level of educational and political institutions. This small state with a population of 2.3 million got its first legislative council with a nominated minority of non-officials as far back as 1863.

Economic development, started on a concrete scale thirty years ago, has placed emphasis on agriculture, plantations and co-operatives. The discovery of minerals is recent but on an altogether unexpected scale—iron ore, chromite, titanium, platinum and bauxite promise substantial production. There already exists a flourishing trade in diamonds. During the post-war period, the external trade increased nearly six-fold. In 1959 imports were of the order of £23.5 million and exports £21.9 million, showing a deficit of £600,000. The sterling balances of over £6.5 million will provide an initial cushion for the import surplus which will necessarily be incurred for accelerated development of the economy in the wake of independence.

Sir Milton Margai, the Prime Minister, promises to steer a steady course for political progress and economic expansion. He has over eight years' experience in statecraft. As leader of the Sierra Leone People's Party as also of the United Front which negotiated the terms of independence, he enjoys the greatest measure of his people's confidence. He is a bridge between the regional divisions of the country—the colony and the sprawling Protectorate—as also between the tribal chiefs and the commoners. He has made no attempt to conceal his leanings towards Pan-Africanism, but he is too cautious and realistic to allow himself to be hustled by the extreme champions of this emotional movement. His stewardship ensures stability and steady progress for Sierra Leone.

Bastar

REDRESS AND GESTURE

IN RELEASING Mr. Pravinchandra Bhanjdeo, ex-ruler of Bastar, from preventive detention the Madhya Pra-

desh Government has redressed a wrong. The Advisory Board recorded its finding that the State Government had not made out adequate grounds for holding him in detention and it was appropriate that it did not stand on considerations of prestige in dealing with this finding. The picture of the situation in Bastar district appears to be confused, but certainly the ex-ruler's statement that his younger brother, who is now recognized as the ruler in his place, is being used as "a tool" smacks of propaganda intended for the Adivasi population of the district. Seven years back the ex-ruler's father had cautioned the Government of India to withdraw recognition from him because of his observed abnormal traits. Was the father also acting as a tool?

The incident of firing at Lohandiguda in which sixteen Adivasis were killed has been discussed and explained in Parliament. But the demand for a judicial enquiry into the firing may yet be used as a handle by interested parties, knowing its effect on the feelings of the Adivasis. Now that their ex-ruler has been released the Adivasis will appreciate the gesture. An objective probe into the situation in Bastar is essential to ascertain whether any other moves are necessary to assure the population that there is no attempt on the part of the Government to intermeddle with the Adivasi way of life. The State Government's public relations in this troubled district need to be improved.

Tourism

MONUMENTS CALLING

ONE OF the abiding secrets of India's potential to attract tourists from abroad, as also to encourage internal tourism, is her bountiful wealth of historical and cultural monuments. A motivation research conducted by the Pacific Area Travel Association has revealed that 31 per cent of the tourists from America are interested in seeing monuments and architecture in foreign countries. Furthermore, there is a growing and marked preference for travel to countries other than Europe. Both these trends argue for popularising tourist visits to India.

The fact that 31 per cent of the American tourists are interested in monuments does not by any stretch of reasoning mean that the others shun monuments and pieces of architecture. It highlights the priority. This is true in somewhat varying proportions of tourists from other Western countries too. In sum, therefore, the proportion of foreign tourists attracted by monuments is much greater. India can capitalise on this preference by paying greater attention to the upkeep, maintenance and attractiveness of the surroundings of her monuments and make them more appealing externally as they are internally. Jantar Mantar in the heart of the capital city is a typical instance. At the present time a nominal fee is charged for visits to some monuments, while in the case of a number of them no fee is charged at all. The small fee charged at present is intended to meet part of the cost of upkeep and maintenance, but it makes a poor contribution.

Last week Mr. Humayun Kabir disclosed that his Ministry had decided to levy a fee of 20 nP. on visitors to the Taj gardens at night time. It is a good beginning, but such fees bear no relation to the pleasure derived by the visitors. It is time the Government made a comprehensive investigation into the question of fees as they are actually charged at the present time and the level to which they can be raised without putting a disincentive burden on visitors. There is full justification for levying higher fees since they will have been charged for valuable invisible services rendered. In this respect India is miles behind most other countries which do not hesitate to levy a charge on the principle of what the traffic can bear.

The World Abroad

BOOST THAT GRAB INSTINCT

By

ODYSSEUS

ECONOMIC PROGRESS DEPENDS on the efficient working of the grab instinct—the hope of making more money.

This proposition makes some people see red. They say that men ought to make their best endeavours from a sense of devotion to the community. So, undoubtedly, many people do. But, to express it in extremes, a starving man has no margin of strength left to cultivate his social instincts, and, by and large, the better off a man is, the more often can he afford to disregard his acquisitive instinct and to act from selfless motives. You cannot found a Ford Foundation, or a Birla Education Trust, unless you have first made the necessary dollars or rupees.

Some people argue that hospitals, schools, and other good works, should not be left to the vagaries of private initiative but should be in the hands of the state. I readily concede that there is, in many instances, scope for state action in these spheres. But it should be kept within limits. Because, paradoxical as it may at first sound, the bigger the state's sphere of action, the more the acquisitive, and the less the selfless, instincts of the people are cultivated. Where the state undertakes complete welfare from maternity benefits, to free education, hospitals, and old age pensions, the masses' acquisitive instinct for ever bigger and better free benefits is strengthened, and their urge to cultivate their selfless instincts to aid, first, their families, and, secondly, their neighbours, is weakened. Moreover, when it comes to vagaries, those of the private individual are under a mass of family and neighbourly pressures that modify them, whereas the vagaries of government departments, and officially run institutions, are as hard to modify as it is to capture the rock of Gibraltar. The thing can be done, but it takes such time and effort that the ordinary citizen, or villager, without political influence, thinks in terms of trying to placate officialdom rather than to control it.

That the acquisitive instinct is held up to scorn in Socialist pattern states slows their economic advance, because instead of enlisting the interests of the masses in making themselves, and so the nation, richer, the pace is apt to be set by the slowest moving file in a government department. Moreover, if you spread the idea that financial gain is somehow less noble than other motives for work, you are helping to spread the idea that industry and commerce, which should attract the best talent if the nation is to get rich as quickly as possible, are somehow anti-social, or at any rate less noble than politics or government service. Government servants have no reason to scorn business men, and business men no reason to feel inferior. Government service, industry, and commerce should regard each other as partners in a common task—that of fulfilling the national destiny. Each is complementary to the other. Subtract any one of the three, and progress dawdles.

Although he does not spell them out in such detail, it is in the light of such considerations that Mr. Richard C. Smyth, president of Smyth & Murphy Associates Inc., US business consultants, outlines incentive bonus plans for business executives in his use-

ful "Financial Incentives for Management" (McGraw Hill. London. 1960. 66sh.).

In the USA and in the UK, a very large number of companies have bonus schemes, although industries vary. In some, such as retail trade, rubber, textiles, motor cars, and household appliances, over 75 per cent of companies use such schemes. On the other hand, industries such as banking, insurance, transport, and gas and electricity utilities seldom have them. Those industries normally use bonuses in which executives have to make quick decisions involving possibilities of big gains or losses.

Mr Smyth says that statistical analysis shows that those companies which pay the biggest bonuses make the most money and pay the biggest dividends. On an average, US companies tend to pay bonuses of 50 per cent of salary to their chief executive officer, while at the lower levels of management bonuses range from 15 to 20 per cent. In the past, there has been a tendency to pay a lower basic salary if a bonus is paid, but this reduces the incentive because it makes executives regard their bonuses not as extra rewards for better results but as part of their regular salaries which they have a right to expect.

FORD'S BONUS FORMULA

Most companies determine the size of their bonus fund according to a formula. An example is that of Ford Motors which allocates to bonus 6 per cent of the company's income before taxes, but after deducting 10 per cent on total capital invested. The total bonus is distributed among a company's major operating divisions on the basis of each division's performance; profits earned are usually the ultimate criterion, so that the incentive to increase efficiency in each division is strengthened. However, Mr Smyth points out that the allocation of the total bonus fund on a profit basis can pose problems as, for example, when a new division is losing money. So other criteria have to be considered. For example, the General Electric Co. assesses its more than one hundred divisions in terms of profitability; market position; productivity, or the effective use of human, capital, and material resources; product leadership; staff development; employee attitudes; public responsibility; and balance between long and short term goals. For each of these components, GEC formulates common indices of performance, but not common standards. Thus, the rate of return on investment is an index common to all businesses but the standard in terms of this index may be 20 per cent for one GEC department, 25 per cent for another, and 30 per cent for a third.

Bonuses can be distributed among executives on the basis (1) of individual performance; (2) of salaries; or (3) some combination of the two. It is difficult to find objective measuring rods for many executive posts, so that subjective judgements of individual performances may be inevitable. Nevertheless, an effort should be made to reduce the subjective element and Mr. Smyth suggests that one possibility is to identify the most important aspects of each executive post, weight each, and so assess the performance of the individual. For

example, analysis of a purchasing agent's post might be as follows:

	Weighting
Make sure plant has materials and supplies when needed	25
Keep material and supply costs to minimum	65
Secure best price on unused or obsolete equipment	10
	100

Of course, payment of bonuses is apt sooner or later to raise the old question "Is any man worth Rs 150,000?" Some shareholders argue that there should be a ceiling on the bonus payable to any one executive. Mr Smyth replies that any ceiling tends to stifle incentive and thus nullify the whole object of paying a bonus at all. Also, the most responsible senior executives, at the policy-making level, are those more likely to be affected by a ceiling than any others, yet it is precisely they who can do the most to ensure bigger profits. It is not in the interests of shareholders to discourage these responsible chiefs. Some shareholders urge that the payment of smaller bonuses would leave more for dividends, but this is debatable. For example, in 1955, General Motors paid the enormous bonus of \$95 m. to 13,284 executives. But with the corporation tax at 52 per cent, only \$46 m. of this \$95 m. would have been available as dividends to shareholders, and probably only half of this would have been paid out. Each shareholder might therefore have received only about 8 cents more per share. If General Motors bonus payments still seem large, remember that the company has paid them from 1918,

since when it has grown into one of the world's largest private firms, and that shareholders have reaped handsome rewards from this growth.

Since tax takes 78.3 per cent of income in the highest US tax bracket, US companies have devised what, under US law, are legitimate ways of making bonus payments which reduce taxable income. I have only space to mention one, which seems worth investigating in other countries. This is a share option scheme whereby an executive in, say, the 62 per cent income tax bracket is granted an option to buy, say, 3,000 of his company's shares at \$95 a share, selling on the market at \$100. The option is for five years. After three years, the shares stand at \$145 and the executive exercises his option and buys 3,000 at \$95 at a cost of \$285,000, which he then sells for \$435,000. He has made \$150,000 before taxes. If this \$150,000 were taxed at 62 per cent, he would make \$57,000 on the deal. However, his \$150,000 would in fact be taxed at the maximum capital gains tax, at present 25 per cent, and so the executive has made \$112,500 clear. One great advantage of such transactions is that it enables an able man to accumulate a private fortune of his own in these times of punitive income tax. It is as I have frequently argued here, to nobody's advantage that companies should be managed by purely salaried staff, who have never had the formative experience of taking risks with their own money. Such salaried employees tend to follow administratively safe courses and lack the drive and imagination which starts up new enterprises, which add to the wealth of the nation and give it a thrusting dynamic economy.

(This is the final article in a set of three on financial incentives in business.—Ed.)

India today is caught up in the feverish activity of industrial advancement. Projects are planned...dams are being built...all through the night we hear the ceaseless hum of men and machines at work. In the world of today, the economic development of a nation is gauged by her machines...and the STEEL consumed by them. In dams and bridges, in the railway and automobile industry, in the manufacture of the thousands of consumer goods, STEEL is necessary—absolutely necessary! And so steel has come to be indicative of the economic development of a country...indicative of what a country is worth in cold hard cash.

The European Scene

AN ECONOMIC POLICY FOR THE WEST

From Our Special West European Correspondent

PARIS, April 24

THE meeting that was held here on Tuesday and Wednesday of this week (April 18 and 19) of the "economic policy committee" of the Organisation for European Economic Co-operation was, on the face of it, just another routine conference of a rather academic (not to say sleepy) working group set up in 1956 to discuss the economics of inflation. The communique issued after the meeting did little to remove this impression. It announced the formation of two sub-committees to deal with problems of economic growth and with the international repercussions of domestic monetary policy. All the participants swore the customary vows of "a unanimous will to co-operate," and the expert sub-committees were told to report later. In short, the usual sort of ineffectual international economic conference.

In reality, the proceedings were very different. This did not appear in the communique but it was evident before the event, when President Kennedy took the unusual step of receiving the American delegation of "observers" on the eve of their departure from Washington for Paris and made a speech declaring that the Paris meeting "had a great and symbolic significance." The quality of the delegations also indicated that something was changed in the committee's destiny. The American team, for instance, although nominally only of observer rank, was led by Mr. Walter Heller, the President's economic adviser, and included Messrs. W. McChesney Martin of the Federal Reserve Board, Robert Triffin (author of a new world bank plan), Robert Roosa, Under-Secretary of the Treasury, etc. The British, French and other delegations were of similarly high calibre. Moreover the sub-committees whose appointment was the main upshot of the meeting will not be composed of the usual bright underlings, but of top officials who really play a part in forming the economic policies of the 20 member-nations, i.e. of all the non-Communist industrial powers save Japan.

What had happened was this. As everyone now knows, the old Organisation for European Economic Co-operation is on its last legs and will be succeeded later this year by the Organisation for Economic Co-operation and Development, in which the USA and Canada will be no longer observers but full members. To show the importance they attach to this new organism, Canada and the USA were the first (and so far the only) nations to ratify the founding treaty and to lodge their declarations of membership with the host-power, France. (For the OECD will continue to meet in the Chateau de la Muette, Paris HQ of the OEEC.) Rather than wait for the other 18 members to do likewise, so that the OECD will be officially born, the Americans decided to act in a hurry, if not strictly legally. They are treating the OEEC as though it were already the OECD and are not restricting themselves to the role of observers; quite the contrary, they are playing the role of leaders. Their idea is to use the coming months of the OECD's gestation as an experimental period in which many of their ideas on economic co-operation will be tried out.

Now the OECD when it gets going will have three main jobs: the expansion of world trade, aid to developing countries, and the harmonisation of economic expansion

inside the industrialised world. Nothing, that I know, has yet been sketched for its trade division; this will grow naturally out of the OEEC's main department. As for aid to developing countries, American ideas on this subject had an airing at the recent London meeting of the Development Aid Group, and studies were then commissioned that will be ready for the OECD when it is launched. As for the last subject, this is to be prepared by the OEEC committee that met this week in Paris and was given a new lease of life. It is of scarcely less interest to developing nations than the work of the group explicitly dedicated to their assistance, because a co-ordinated aid programme pre-supposes some measure of co-ordination of economic and monetary policy within the Western world.

This is so because, as we have seen in the last few years, one Western nation can be obliged to curtail its assistance to developing countries if another Western nation is stealing its gold reserves by following a different monetary policy. Balance of payments problems can interrupt the flow of aid even though all the aid given by Western countries added together could never by itself endanger the reserves of countries like the USA or the prosperous West European countries. Before the West goes further with a more ambitious assistance programme, it must ensure that each country's reserves are safe from veritable "raids" such as West Germany, for example, has practised on U.S. reserves in recent years. There are, of course, many other reasons why the 20 Western countries should want to co-ordinate their own development programmes (e.g. competition with the Soviet bloc) but this is the aspect of the affair that most concerns developing countries. In other words, the Western nations are not being "selfish" in putting their own harmonious expansion on the same footing as their assistance to backward countries; the first is an essential condition of the second.

The instrument chosen for this end was the economic policy committee of the moribund OEEC. This was set up five years ago to compare notes on anti-inflationary policies in various parts of West Europe. When all the major currencies became convertible for non-residents just over two years ago, and the inflationary danger having become much less acute in West Europe, the committee was given the task of discussing the harmonisation of economic policies. This subject became much more important when currencies were convertible, and more still as freer trade returned, since a discrepancy in economic policies between two nations would soon be punished by a flow of capital, first because of speculation and then by gold movements due to trade losses. This fact has been sufficiently illustrated in the last 12 months to need no elaboration; the considerable gold outflow suffered by the USA because of a difference in trans-Atlantic interest rates will serve as an example. Some measure of co-ordination between, at least, central banks was urgent to avoid violent migrations of capital which could jeopardise the loser-nation's economic expansion (witness the trouble Washington has had to stimulate the sluggish American economy during a period of diminishing reserves) and, possibly, also its assistance to developing nations. Actually, some measure of co-operation has already been achieved in a more or less informal way: there exists at this moment a gentleman's agreement between Western

central banks which has helped the dollar and probably saved sterling from serious trouble in March.

The problem is to systematise and extend this form of co-operation. Not however to codify it. The Americans have a horror of rigid treaties, which Congress would probably reject as limitations on the USA's sovereignty, and anyhow Washington thinks that even if a code contains nothing objectionable it should not look too "juridical" in a field where empiricism and tact are the main question. The Eisenhower Administration was even opposed to too frequent meetings in Paris of the OEEC's economic policy committee, though Heaven knows the five sessions it has held since April 1959 were academic enough. Last year the West Germans proposed a break with this academicism by presenting a "code of good economic behaviour," setting out the objectives that all the members should pursue in concert. The Kennedy Administration is no more inclined to accept a rigid code than its predecessor, but it is, on the other hand, keen to see the economic policy committee meet regularly, in fact to function almost permanently. Hence the shake-up at this week's meeting of that committee, which constituted, declared Professor Triffin, "a revolution in the methods of economic co-operation between the Atlantic nations."

As a trial run for the day when it will become one of the three main divisions of the OECD, the committee allocated to senior officials two important research tasks. The first concerns means to reduce the migration of short-term capital due to discordant monetary policies and, more generally, the effect on the stability and the internal payments problems of the West of various sorts of national economic policies aimed at domestic stability. This is a static problem, or at all events is not concerned with economic expansion. Individual nations use various

monetary measures (less frequently fiscal measures) as correctives, as anti-cyclical weapons, as stabilisers; the problem is what effect such short-term domestic actions have on the short-term problems of other nations. The second task relates to the dynamic problem of long-term expansion. The various nations are expanding at different rates over the longish period: some very fast like Italy, others more moderately like France, others hardly at all like Britain, and one—the USA—is actually in recession (or was until last month). Personally, I doubt whether there is any "problem" here, and it is only an obsession with keeping ahead of the Russians that makes it appear that there is one. Unlike the suicidal and mutually conflicting gold-grabbing game that nations play for reasons of short-term stabilisation, the fact of different growth rates probably just has to be accepted. The "Western alliance" is a political notion and does not denote an economically homogeneous bloc; it is utopian to conceive of equal long-term growth rates throughout the OEEC region plus North America. However, there is the question whether some nations are expanding at the expense of others, using techniques that (temporarily) benefit them and restrain expansion elsewhere. The answer to this question is probably No, but it would be profitable to study it for there is much to be learnt from the various methods used to promote expansion.

Such questions will be examined by the working group appointed this week. It will seek to pin down the exact causes of expansion, show the respective roles of public and private investment and study the relation between expansion and price movements. No overall "Western development plan" will emerge; one cannot imagine plans for expansion that would work both in Italy and the USA, or even in France and Britain. But the West could move toward a common policy or attitude on the major question of the age.

THE MAFATLAL FINE SPINNING AND MANUFACTURING CO., LTD.

Registered Office:

"Mafatlal House", Backbay Reclamation,
BOMBAY-1.

NOTICE

NOTICE is hereby given that the Thirtieth Annual General Meeting of the Shareholders of THE MAFATLAL FINE SPINNING AND MANUFACTURING COMPANY LIMITED, will be held at the Registered Office of the Company at Mafatlal House, Back Bay Reclamation, Bombay, on Monday, the 15th day of May, 1961 at 4-00 P.M. (S.T.) to transact the business as specified in the Notice dated 31st March, 1961, already posted to the shareholders of the Company individually.

By Order of the Board of Directors,
NAVINCHANDRA PURSHOTAMDAS & CO. LTD.
BOMBAY, Yogindra N. Mafatlal
31st March, 1961. Director,
Managing Agents.

SPACEMAN DOWN TO EARTH

By ANDREW BOYD

IN one sense, the Soviet rocket experts' success in shooting Major Gagarin round the world in 90 minutes is an illustration of everything that is wrong with Russia. In another sense, it is a hopeful portent for both Russia and the other nations which would like to live Russia more easily than they can do now.

Any visitor to Russia who manages to escape from the officially approved tours of show places, and succeeds in making contact with individual Russians in a normal way, is struck by several things that the official propaganda always suppresses. The individual Russian spends much of his life struggling with the cumbersome inefficiency in organisation that obstructs every kind of activity. He struggles—without much success, in most cases—for a little privacy in a life that is crushingly regimented. His mental horizon is limited, and his natural curiosity curbed, by the thick veil of secrecy that surrounds everything his rulers do not want to be known. And he is apt to have a deep sense of inferiority, an instinctive belief that life is better in the outside world. (I have met this sense of inferiority, astonishingly, even in some of the guides officially appointed to make sure that visitors see only the best things that Russia can offer).

This sense of inferiority among Russians, still remarkably strong after over 40 years of intense propaganda about the superiority of the Soviet system, largely explains the colossal effort now being made to focus attention on the successes of the "space race", the one field in which Russia is incontestably ahead of all other countries. As at the time of the first "sputnik" in 1957, the Russian people is again being told, at great length and with endless repetition, that Major Gagarin's flight is "proof" of the superiority of the Soviet System. On visits to Russia since 1957, I have found the sputnik label on everything imaginable from pencils and notebooks upwards—including filter tip cigarettes packaged in American style; now, the same may be expected again. The foreigner may find it all rather chauvinistically offensive, and reminiscent of the arrogant way in which, for example, the German Nazis used to boast about their fine new motor highways as "evidence" of superiority. But Mr. Khrushchev and his colleagues are quite right in thinking that their people's feeling of inferiority still needs to be treated with massive doses of propaganda.

Their difficulty, however, is that the Russian people are becoming more sophisticated, and impatient with the "circuses" that have so often been served up as a substitute for "bread". It is revealing that "Pravda" and Moscow broadcasts have hastened on to say that success in the space race will surely be followed by improvements in the standard of living of ordinary people. Like many other visitors, I have encountered Russians who, while quite naturally proud of their country's technical achievements, complained angrily—even to a foreigner—about the lavishing of so much money and equipment on rocketry instead of on things that would make everyday life easier. And some Russians have told me that it is nonsense to believe the official Soviet claim that the space rockets are a piece of purely peaceful scientific research; as they saw it, their government would not have spent so much money on rocketry if there was not an obvious military reason for doing so.

Military or not, Major Gagarin's flight, like earlier Soviet exploits in rocketry, was treated as a military secret, to a degree that is possible only in a country like Russia, where there is no independent press, no parliamentary questions, and no freedom of movement for ordinary people, let alone for foreigners. Nothing was revealed about where the Gagarin flight began or ended, for example. Presumably the rocket was launched from one of the Soviet bases in Central Asia, not far from Tashkent, where foreign experts believe Russia does much of its test firing of missiles; but that is only guesswork. In Soviet Asia, all travel, both by foreigners and by Soviet citizens, is rigidly controlled, and vast areas are effectively sealed off. Only in these conditions could such spectacular activities as the launching of huge rockets and the return to earth of space capsules be surrounded in tight secrecy; only a totalitarian government could mobilise its people to rejoice over an exploit of which they had no independent evidence.

Paradoxically, then, when the Soviet government claims this space flight as proof of superiority, it is pointing to something which symbolises some of the worst and most backward features of the Soviet system—features which, one must hope, will be moderated and perhaps disappear as Russia progresses; features which certainly account for much of the uneasiness with which other countries regard Russia now.

The brooding secrecy which makes such a mystery of some aspects of Major Gagarin's flight is all the more striking in view of the tremendous publicity given to strictly selected facts about it. This kind of smothering secrecy, and the tight regimentation required to impose it, are, I believe, becoming increasingly intolerable for intelligent Russians. As information from the outside world seeps in, scepticism about the "line" propagated by the official press monopoly, and irritation at the inadequate news it gives, both seem to be growing, together with a sense of frustration at the restriction of free movement. Curiosity grows with education. Russians, even more than foreigners, would like to know the full story of the Gagarin flight, and they cannot be happy when they consider the "top secret" system that stops them knowing it.

Again, Russians as well as foreigners are now liable to realise that the technical triumph of the flight shows how relentlessly the Soviet planners have concentrated funds, resources, and trained manpower on projects in this military secret field. Reactions to the 1957 sputnik showed that some of them already felt that the priorities imposed by the planners were wrong. Russians are no longer easily satisfied by a few glittering show pieces; they seek a levelling up all round. They contrast Moscow's efficient underground railway with the country's appallingly bad roads. The contrast is even more painful between the absolute priority given to the rocketeers, and the shortages and bureaucratic obstructions that bedevil the life of the ordinary man.

It is difficult to generalise about a whole nation, but I think many other observers share my impression that the Russians, with their revolution over 40 years behind them, are less and less easily mesmerised by

gigantic new projects, and instead are tending to seek satisfaction in their private lives, to the extent that they can win some privacy from their suspicious masters. The Press and the Communist Party ceaselessly denounce these tendencies, and demand that each citizen should put all his effort into organised collective activity; the space rockets are held up as examples of the triumphs of collective work. But the trouble is that the regimented, monopolistic system, with its ruthless distortion of the economy to give top priority to strategic projects such as rocketry, allows very few Russians any real satisfaction from organised collective activity. All such activity is obstructed by a cumbrous bureaucracy in which the higher ranks have little incentive to make changes that might endanger their privileges, while the lower ranks are afraid either to criticise their superiors' policy or to take decisions themselves.

Protest is occasionally voiced, if cautiously. Ilya Ehrenburg, for example, in his latest novel, "The Spring", compares the discontent of a painter making fat fees out of "official" Soviet art with the happiness of another artist who chooses to express himself in his pictures—although this means living in poverty. In a more general sense, many Russians show their desire for a system that would give more encouragement to individual initiative, more freedom to think for oneself, more attention to the little things that matter in every-

day life, more justice for the weak as against the privileged and powerful.

The space rockets, which ought to uplift the imagination of mankind, thus at the same time embody much that is retrograde and undesirable in the Soviet system: top-secrecy, military priority, draconian discipline, fear of authority; the ruthless diversion by a monopolistic state apparatus, immune from criticism, of resources that might have been used for human welfare, but which are instead used primarily for political and military prestige. That is the dark side of these artificial "moons". But there is also, I think, a bright side. It is arguable that the Russians' deep sense of inferiority, to which I have already referred, is largely responsible for their suspicion of foreigners, their readiness to accept absolutist rule, their predilection for secrecy, and the often transparently absurd boastfulness of their official propaganda. If successes in space help to rid them of their feeling of inferiority and some of these difficult attitudes, so much the better. We shall be that much nearer to the day when "co-existence" means what it says, instead of meaning, as it so often does now, a form of "apartheid". Meanwhile, if the claim that the space rockets "prove" the superiority of the Soviet system galvanises other countries into doing more to develop the full potentialities of 'their' systems, so much the better too. But one hopes they will choose more down-to-earth ways of showing their ability to improve the lot of mankind.

Economic Report from the U.S.

ECONOMIC UPTURN

By

GUY SIMS FITCH

WASHINGTON, April 18.

ECONOMIC news of the past week has led more than one usually cautious analyst of the U.S. business scene to offer the judgment that the recession probably hit bottom in February, and that a sustained recovery may well have begun in March. Cited, in particular, are increases during March in personal income and industrial production. The increases reflected adjustments for seasonal factors, which means that they exceeded the expansion one normally expects at this time of the year. Taken as a whole, the personal income of all Americans rose in March for the first time since last October, reaching a seasonally adjusted annual rate of \$409,600 million. This was only a shade below the all-time high reached last October, and represented an increase of \$3,400 million over the February rate. \$1,200 million of the February-March increase represented gains in wage and salary payments, the largest single component of the personal income total. Included was the first rise in manufacturing payrolls since last May, when, it is now generally agreed, the recession began. These income increases are reflected in the March advance in industrial production. The advance was fractional, to 102.4 per cent of the 1957 average from February's 101.9 per cent, but it was the first such rise since last July. Output of both durable and non-durable goods increased. Gains were registered in a variety of industries, including iron and steel, textiles, chemicals, commercial and farm equipment, and such consumer goods as apparel, furniture and some appliances.

There were, of course, earlier scattered signs of an impending economic upturn, such as reported gains in automobiles, steel, copper, building materials, and a number of other industries. But now the turn-around in two of the most important broadly based of the business indicators lends substance to the view that a general recovery in economic activity is in fact under way. To many experts, however, an even more fundamental indication of a general economic resurgence may well have made an appearance a few weeks ago, in the form of a truly monumental study of the National Bureau of Economic Research. A noted private, non-profit group, the Bureau for some 40 years has made a speciality of analyzing business cycle trends. It has pioneered, in particular, in the use of certain sets of statistics, or business indicators, to measure movements in general economic activity. Its latest study, published in two volumes totalling nearly 1,000 pages, represents the result of years of continuing research in this field, refining and bringing up to date its highly respected analyses of economic trends.

On the basis of this latest study, one can conclude that the U.S. economy is passing, or may already have passed, from a stage of contraction to one of expansion. This conclusion emerges from the Bureau's projection of 12 leading indicators — that move up or down in advance of general economic activity. In addition, the Bureau has set up nine coincident indicators, which tend to move with the economy, and six lagging indicators, which tend to follow general economic movements.

For the present discussion, it is the role of the 12 leading indicators that is particularly enlightening. For nine of them have showed definite improvement in the last few months. The factory work week, the rehiring rate in manufacturing, new orders for durable goods, housing starts, commercial and industrial building contracts, the index of stock market prices and the index of industrial raw materials prices all have risen, while factory lay offs and the liabilities of business failure have declined. Interestingly enough, the Bureau's method of analysis has called the turn on every recent swing in economic direction. It admittedly is more difficult, of course, to assay the probable rapidity and duration of upturns or downturns, and the Bureau does not consider itself as essentially a forecasting agency. But its studies appear to confirm the appraisal that this last recession began about May of last year, and has been both brief and mild. What may be even more important, the Bureau's studies have provided a highly useful tool which is being used increasingly not only by economists but also by businessmen and government officials to make more accurate assessments of underlying economic trends. This, in turn, has helped make possible more effective programmes for keeping business swings under closer control, and hence for contributing to economic stability and growth.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LTD.

(Incorporated in England)

NOTICE

Notice is hereby given that the Board of Directors of this Company have declared payment of a Final Dividend on the Company's Preference Stock for the year ended 31st March 1961 at the rate of £2-14-8.16/49d. per cent less Income Tax at 7s. 9d. in the pound equal to £1-13-6d. per cent. Payment will be made on 25th May, 1961 to those stockholders whose names are registered in the Company's Stock Register on 5th May, 1961.

Applications for transfers received in this office before 12 O'clock noon on Friday, the 5th May, 1961, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above dividend.

BY ORDER OF THE BOARD
H. C. BOWKER
AGENT.

VICTORIA HOUSE,
CALCUTTA, the 20th April, 1961.

Reducing

MATERIALS & INVENTORY COSTS

Adds Directly to Profits

Do You Know that 60 nP Represents the Average Purchase Price of Materials for all Industries per Rupee of Production Cost in India ?	Do You Know that 2% Saving in Materials Cost EQUALS 17% Extra Sales ?	Do You Know that All Progressive Industrialists Can Reduce Purchasing & Inventory Costs by at least 5% ?
--	---	---

We have highly qualified specialists under the guidance of Mr. A. R. Palit who has had twenty years' purchasing experience in India and the U.S.A.

Our Consulting Service Offers you

- Complete advice regarding setting up an efficient materials and purchase management department including store-keeping and stores inventory-control; or the modernising of your existing operations.
- Analysis of your particular purchasing and inventory-control problems for specific recommendations for greater efficiency including ways and means for cost-reduction.
- Detailed advice on store-keeping and stores inventory-control.
- Introducing application of modern methods in your organisation under our supervision.
- Tailor-made instructional courses.

A. R. Palit & Company Private Limited

Industrial & Materials Management Consultants
P.O. BOX 671, NEW DELHI.

WORLDGRAM

India

Estimates of National Income: The 8th issue of the annual paper on national income released recently by the Central Statistical Organization reveals that the national income of India (at 1948-49 prices) was Rs. 11,760 crores in 1959-60 and Rs. 11,650 crores in 1958-59 compared to Rs. 10,480 crores in 1955-56 at the beginning of the Second Five-Year Plan. The per capita income at 1948-49 prices has been placed at Rs 291.6, Rs. 292.6 and Rs. 273.6 in the years 1959-60, 1958-59 and 1955-56 respectively.

*

Central Revenue Collections for February, 1961:

The revenue realised from items on which duties are levied and collected by the Central Government in the first eleven months of the financial year 1960-61 amounted to Rs. 741.86 crores. Of this, Rs. 69.42 crores were collected during February, 1961. The corresponding figures for the first eleven months of the financial year 1959-60 and for the month of February 1960 were Rs. 658.87 crores and Rs. 67.46 crores respectively.

*

Indian Standards Convention 1961: This year the 6th Indian Standards Convention is being held at Kanpur. The subjects of topical interest of the convention are productivity in building designs and constructions, certification marking, packaging, company standardization, metric system in engineering industries, universal count system in textiles, housing and preservation of documents, safe use of electricity in homes, and non-destructive testing of metals. Standards conventions which have become an annual feature of I.S.I. activities are held in different industrial centres of the country. Previous conventions were held in Calcutta, Bombay, Madras, Delhi and Hyderabad.

United Kingdom

Big British Guiana Irrigation Scheme Completed: Black Bush Polder—one of the biggest all-British irrigation schemes completed since the war, which includes the reclamation of 30,000 acres of swamp—has been opened by the British Guiana Government. Details of the scheme and the speed and smoothness with which it was carried out was given by the contractors, Pauling & Co. (Overseas) Limited, London. The scheme, which cost £2,750,000 and was jointly financed by the United Kingdom and British Guiana Governments, has been completed one year ahead of schedule and will enable the reclaimed land to yield 17,500 tons of rice a year. It has also provided four settlement areas to accommodate 1,500 families, each of whom will have a 2½ acre house plot and a 15 acre (average) rice field.

Australia

New Textile Fibre From Broom Shrub: The Australian Textile industry is interested in claims by two brothers in Melbourne that they have produced a new textile fibre from a local shrub which grows prolifically in Victoria. The plant is the broom (genista), and the patent holders state that the fibre can be used for the manufacture of all linen goods, as well as canvas, sacking, twine and string. It is claimed that the shrub in cultivation resists climatic changes, and requires little attention. All of it except its thick stem, can be used to produce the fibre, while its leaves also make an excellent dye. Its slim, whip-like branches are processed

chemically and the skin off the branches eventually becomes the fibre. This is subjected to further processing, and is separated finally into four or five grades. The two brothers, Greek-born Demetrius and Efthimios Kondos, did two years' research before they obtained their patent.

Switzerland

Industrial Achievement In The Field Of Nuclear Energy: Two Genevese plants, the "Ateliers des Charmills and the "Ateliers de Secheron" recently received an important order in the field of nuclear energy. The machine to be built is a special one for loading and unloading the fuel elements of a nuclear reactor, called the Dragon. It is an advanced type now being made in the United Kingdom, under the aegis of the Organization for European Economic Co-operation and Development, within the framework of a common undertaking, in which 12 European countries, including Switzerland, are taking part. Offers for the construction of this special machine were submitted to international competition, so that the obtaining of this order constitutes an important success for Swiss industry. The machine in question is the fruit of both studies and experiments undertaken over a number of years already, in the domain of atomic engineering, by the two companies concerned. This machine, which is about 44 feet in height, is built within the reactor pressure vessel and possesses a grapple that can be operated in five distinct movements, which is able to seize and place the fuel elements. These movements directed by remote control, have to be executed with the greatest precision. In addition to the machine itself, the delivery to be made by the two Genevese companies also comprises various accessories to be mounted in the reactor and in the control board.

Italy

Lubricants Factory: Europe's largest lubricant factory with an annual capacity of 2 lakh tons will be erected by Esso Standard Italiana at Rasiom near the Augusta Refinery. The new factory is scheduled to start production in 1963.

*

Floatation Of A Loan: A contract was recently signed between the Southland Development Fund and a Swiss Banking Group for the floating on the Swiss market of a 50 million Swiss francs (over 7 billion Italian lire) bond-loan. The money raised with this loan is to be invested for the industrial development of Italy's depressed areas.

France

Deposits In Savings Bank: In January 1961, the excess of deposits over withdrawals in all savings banks in France was 470 million new francs compared with 417 new francs in January, 1960. This excess balance breaks down into the following categories: 325 million new francs in ordinary savings banks (299 million new francs in 1960), 140 million in national savings banks (148 million in 1960,) and 5 million in credit savings banks).

*

Unemployment In France: On March 1, 1961 the number of unemployed of all ages aided by the French Government was 38,500 compared with 27,000 on 1st February, 1961. Of these respective totals, 27,780 com-

pared with 26,530 were aged less than 60. On the same respective dates, there were 1,48,046 compared with 1,48,922 unsatisfied requests for employment, and there were 28,513 compared with 23,739 unfilled offers of employment.

Austria

Resin Production: After a considerable setback in 1959, Austria's resin industry proved capable in 1960 of making up for the lost territory. The situation on the European resin market changed suddenly last year when South American and British firms started large-scale purchases. In the Piesting valley, Lower Austria, a type of pine is grown, that is remarkable for its high resin yields of excellent quality and that is not to be found elsewhere in Europe except for the Black Sea coast and Southern Spain. Thus, Austria's resin industry was able to derive particularly profit from the change in the market situation last year.

Israel

Rapid Strides in Industrialisation: Industrialisation in Israel has advanced with rapid strides. Industrial output has grown four-fold, Industrial exports excluding diamonds have increased 14-fold. Israel is already making significant parts both in quantity and in quality of the country's army equipment.

Yugoslavia

Exports and Imports in 1960: Yugoslav's 1960 export programme called for 175.2 billion dinars worth of exports. According to the programme the share of industrial product was fixed at 117.3, agricultural products at 53.4 and forestry products at 4.5 billion dinars. The programme called for an 8.4 per cent increase of industrial exports by comparison with 1959, a 72.8 per cent increase of farm deliveries and a 12.5 per cent rise of exports in the forestry sector. The programme was fulfilled by 97 per cent, exceeding the level reached in 1959 by 18.8 per cent. The 1960 import programme called for 226 billion dinars worth of imports. Imports of raw-materials and producers goods was fixed at 143.0 billion, consumer goods 18.2 billion, foodstuffs 4.5 billion, equipment 50.0 billion, while another 11 billion dinars were earmarked for the purchase of various other goods. According to the data of foreign trade statistics, commodity imports in 1960 were valued at 248.0 billion dinars. Raw materials and semi-finished goods for production purposes accounted for 140.6 billion dinars, spare parts 70.8 billion and consumer goods 36.7 billion. Food imports were valued at 22.6 billion dinars.

Brazil

Caterpillar plant Makes Bulldozers: The first Bulldozer was recently unveiled by Caterpillar of Brazil in its Santo Amaro, State of Sao Paulo, Plant. It is identical with the United States' produced model 12-E. This versatile piece of machinery is powered by a 115 HP diesel engine. It has a total weight of ten and one-half tons, six forward gears and two reverse ones, being able to accelerate to over 18 miles an hour. Today Caterpillar is making over 2,000 different parts in its Santo Amaro Plant.

E.C.E.

Coal Situation in Europe: Developments in the European coal situation in 1959-60 and the repercussions on the coal industry are examined in a new report "The Coal Situation in Europe in 1959-60 and

Future Prospects" issued by the Secretariat of the United Nations Economic Commission for Europe. The profound structural changes taking place in the European energy balances are common with those of East and West, says the report. Although the incidents of these changes on the coal market and industries differ in many respects between the two regions and even from country to country, these structural changes have formed the background to the reappraisals of the coal industry's plan that has been made in a number of countries and which are taking place in others. It is now generally recognized that the post-war phase of energy's shortage which lasted upto mid-1957 has given way to a phase of abundance and that this phase is likely to prevail for some years to come. At the time when the demand for energy exceeded the supply, the greatest possible production of coal from European areas was the main target. The reversal as between supply and demand coincided with a marked decrease in prices of forms of energy which were competing with coal from West European areas, in particular fuel oil. The sudden and radical change and the competitive situation is partly due to inequality in competitive conditions which are frequently regarded as incompatible with the principle of fair competition. The recession and the pressure of intensified competition have led to the sellers crisis in the West European coal industry and to the elimination of considerable capacity which is economical according to the new standards.

United Nations

Estimates of World and Continental Population: The table below presents adjusted estimates of the 1959 mid-year population of the world by continental divisions. It should be noted that like those in the Demographic Yearbook, these aggregates do not coincide exactly with the sum of the figures for individual countries because they include, in addition, adjustments for over-and under-enumeration, over-estimation, categories of population not regularly included in the official figures and approximations for those countries which have not yet provided official 1959 data. The estimates in thousands are as follows:

World Total	..	..	2,905,000
Africa	..	..	236,000
North America	..	..	261,000
South America	..	..	137,000
Asia	..	..	1,622,000
Europe	..	..	423,000
Oceania	..	..	16,100
U.S.S.R.	..	..	210,500

E.F.T.A.

Swedish Trade with E.F.T.A.: On July 1, 1960, customs were reduced for the first time with EFTA. During the following six months Swedish trade with the other EFTA countries was characterised by a marked expansion. The imports from these countries increased by 14 per cent, i.e. twice as much as the imports from the EEC countries. The exports to the EFTA countries increased by 20 per cent and those to the EEC countries by 16 per cent. Swedish imports in 1960 totalled 14,888 million kronor and in 1959 12,488 million kronor, whereas the export values were 13,285 and 11,424 million kronor respectively, which means that the excess imports were 1,603 million kronor in 1960 and 1,064 million kronor in 1959. The imports from the EFTA countries represented in 1960 a value of 3,629 million, and in 1959, 3,043 million kronor. The corresponding export figures were 4,567 and 3,852 million kronor.

NEWS IN BRIEF

INDIAN

The National Small Industries Corporation has further liberalised its terms for the supply of machinery to small-scale industrial units on hire purchase basis.

The scheme enabling Government servants to retain with Government their provident fund money for three years after retirement, has been extended for a further period.

Inter-State movement of ghee with differing chemical values is to be completely banned unless sealed under 'Agmark', the seal of purity and quality, issued by the Agricultural Marketing Adviser, Union Ministry of Food and Agriculture.

The Government of India's Study Team on Co-operative Training has recommended that the co-operative movement should ultimately take over the responsibility and programme of co-operative education and training. The building up of Co-operative Unions in all States has been advocated with a view to assuming this responsibility not later than the end of the Fourth Plan.

A note prepared by the Union Ministry of Labour and Employment, reviewing the working of the Code of Discipline and Implementation Machinery, shows that there has been a steady and significant decline in the number of man-days lost since the enforcement of the Code in June, 1958.

It is reported two processes on resin emulsion from cashewnut shell liquid and dispersion resins from cashew nut shell liquid have been developed at Railway Testing and Research Sub-Centre, Chittaranjan.

The first batch of Indian technicians for training in the operation and maintenance of a refinery left for Moscow recently. The trainees will stay in the USSR for a period of nine months during which they would be given intensive course in all aspects of maintenance of a petroleum refinery.

In terms of the ad hoc agreement for the pricing of major petroleum products, between the Oil Companies and the Government in force since April, 1959, reductions in prices offered by the companies were mopped up by the levy of additional duties under the Mineral Oils (Additional Duties of Excise/Customs) Act, 1958, which are borne by the companies themselves so that the prices to the consumer are not affected thereby.

The Government of India has agreed to allot Rs. 12½ lakhs for carrying out comprehensive examinations in order to prepare a project report including preparation of designs for a barrage, in the Tonle Sap Sector of the Mekong River Project.

An improved process for preparing Benzyl Chloride has been developed at the Regional Research Laboratory, Hyderabad, as a result of which higher yields of pure Benzyl Chloride have been obtained.

It was revealed in the Lok Sabha by Dr. B. V. Keskar, Minister of Information and Broadcasting, that only three small transmitters and some spare valves of the total cost of about Rs. 40,000 were lying in stock. Out of these, two transmitters costing Rs. 34,600 approximately were likely to be installed at Madras and Calcutta shortly.

FOREIGN

Another sign that the recession in the US economy is coming to an end is shown in a report by the American Iron and Steel Institute that steel output in the week ended April 15 was the highest in ten months.

It is reported New Zealand will lodge a formal application for membership of the International Monetary Fund, the World Bank and the International Finance Corporation.

Gold and Sterling balances held abroad by the Australian Central Bank continued to rise in the week to April 12, gaining £A2.6 million at £A313 million. The figure has risen by £A14 million over the past four weeks.

The Pakistan Government on the recommendation of the Tariff Commission has raised the import duty on electric motors of sizes upto five horse-power from 12½ per cent to 15 per cent 'ad valorem'. This measure which will remain in force for three years, has been taken to give protection to local manufacturers.

Volkswagen, the West German motor vehicle manufacturer, has now acquired full ownership of the Australian Volkswagen Company, by purchasing the interest held by two Australian concerns, LNC Industries and Regent Motors Holdings.

A meeting of European bankers is likely to be held in Paris at the end of this month or early in May to discuss the question of financial aid to Brazil. It is expected that the meeting will settle the details of a standby-credit designed to help Brazil.

Ohio oil, the US independent company with a stake in an important Libyan oil field, has now received approval from the Spanish Government to build a 25,000 b/d refinery in Northern Spain. It will be built within three years at a cost of about \$18 million.

Signor Mattei, President of Italy's State-controlled ENI-AGIP Oil Corporation, announced recently that it had discovered big new deposits of natural gas in the Abruzzo region, East of Rome, and in Sicily.

Israel is about to join the over-growing list of countries establishing their own petro-chemical industries. A joint venture by Israeli, US and Brazilian interests envisages the investment of £5 million sterling in a complex of four plants in the Haifa area, using materials supplied by the Haifa Refineries.

A pilot plant set up by Jamaica pottery, a subsidiary of Worcester Royal Porcelain Company, is now experimentally producing chinaware, ceramic test pieces and glaze compositions in Jamaica.

According to unofficial investigations foreign participation in Austrian companies in 1959 represented a nominal capital of Sch. 3,719.4 million.

An easier way than this

to keep cool,

shut out outside noise,

flies and mosquitoes,

prevent dust

or draughts

and damp,

is to invest, in a

Crystal room air conditioner

A Voltas Crystal air conditioner cools a room, cuts down outside noise and allows you to work, relax, or sleep undisturbed. It creates a cool climate healthfully free of dust, damp and insects.

This hardy machine, specially designed for India's difficult climatic conditions, is built to last you many years.

With a Voltas Crystal you get famous Voltas Service—the best in India.

More people buy a Crystal than any other air conditioner.

TRENDS OF WAGES & PRODUCTIVITY IN INDIA

By

R. D. VIDYARTHI, Ph.D.

IN the present economic situation of the country when large-scale investment is taking place in the public and private sectors giving an upward turn to prices, and with a foreign exchange crisis, the urgency of stepping up production, augmenting exports and keeping costs within check is being realised at last. The success in tackling these problems, however, depends upon the competitive position of the industry and its profitability. A higher order of industrial efficiency which tends to lower production costs can alone rescue the country from the present economic dilemma. In this context a scientific study of labour costs and productivity is a matter of considerable importance.

It has been observed that over the years material costs have been rising by no small degree and simultaneously earnings of labour have been mounting up under various tribunal awards, collective agreements and the like.

The Census of Indian Manufactures gives details of wages and money value of concessions in respect of 29 industries for which Census is taken. In the following table an attempt has been made to indicate the trend of money and real wages per worker in certain selected industries and the average for all industries:

TABLE I.
MONEY AND REAL WAGES PER WORKER IN CERTAIN SELECTED INDUSTRIES

Industry	1948			1951			1954			1957		
	Wages per Worker (Rs.)	Index of Wages	Index of Wages after Deflation	Wages per Worker (Rs.)	Index of Wages	Index of Wages after Deflation	Wages per Worker (Rs.)	Index of Wages	Index of Wages after Deflation	Wages per Worker (Rs.)	Index of Wages	Index of Wages after Deflation
1. Cotton Textiles	1,107	100	100	1,239	121	112	1,327	124	120	1,457	152	132
2. Jute Textiles	730	100	100	839	124	115	978	138	134	1,053	166	144
3. Iron & Steel	1,284	100	100	1,884	159	147	1,960	158	153	2,150	192	167
4. General and Electrical Engineering	975.9	100	100	1,213.8	124.4	115.3	1,336.1	129.5	125.5	1,493.0	152.5	126.4
5. Sugar	586	100	100	681	125	116	739	130	126	824	162	141
6. Chemicals	803	100	100	1,087	146	135	1,235	159	154	1,433	205	178
7. Paper and Paper Board	805	100	100	1,113	149	138	1,034	132	128	1,248	178	155
8. Cement	679	100	100	1,025	163	151	1,411	214	208	1,381	233	203
TOTAL*	904	100	100	1,063	127	118	1,157	132	128	1,285	163	142

* All the twenty-nine industries included in the Census.

N.B.: 1. Wages include money value of benefits, privileges, etc.

2. The index is represented by simple unweighted wage relatives calculated for each year over 1948.

3. The index of wages has been deflated with the official All-India average consumer price index numbers adjusted with 1948 as base.

It will be observed that in almost all the industries wages have increased between 1948 and 1957 almost uniformly. Taking all the industries into consideration over 1948 there has been an increase of 63 points in money wages and 42 points in terms of real wages. In some of the industries the increase has been of a much higher order.

An analysis of wages and money value of concessions shows that whereas wages which include cash payments, namely, basic wages, dearness allowances, bonuses, over-time payments, shift allowances, leave wages and paid holidays have almost doubled, money

value of benefits or privileges, on the other hand, which include besides the employer's contribution to the provident fund, (i) all payments made by way of pensions, gratuity, retrenchment and lay-off benefits, compensation of work injuries, occupational diseases, maternity benefits, sickness benefits, contributions made to Employees' State Insurance and other social security measures, and concessions in food articles, fuels, household accommodation, electricity, water, sanitary service, transport facilities etc., and (ii) subsidies involved in the operation of medical facilities, educational facilities, recreation facilities, entertainment facilities and other welfare projects such as canteens, creches etc., have

more than doubled. It is thus that a large component of the earnings of labour is directly due to the obligations imposed by various labour laws enacted in recent years.

Higher wages alone, however, would not be re-

garded as hampering industrial growth if they were accompanied by far higher rate of productivity. Productivity is defined as the value added by manufacture per person employed. In the following table indices of productivity in certain selected industries have been given:

TABLE II.

INDEX OF PRODUCTIVITY IN CERTAIN SELECTED INDUSTRIES

Industry	1948			1951			1954			1957		
	Value added per person employed (Rs.)	Index of productivity	Index of productivity after deflation	Value added per person employed (Rs.)	Index of productivity	Index of productivity after deflation	Value added per person employed (Rs.)	Index of productivity	Index of productivity after deflation	Value added per person employed (Rs.)	Index of productivity	Index of productivity after deflation
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
1. Cotton Textiles	2,262	100	100	2,176	96.2	115.2	2,003	88.5	93.3	1,917	84.7	93.4
2. Jute Textile	1,235	100	100	1,856	150.3	179.9	1,520	123.1	129.7	1,463	118.5	130.7
3. Iron & Steel	2,624	100	100	3,354	127.8	153.0	4,959	189.0	199.0	5,671	216.1	238.4
4. General and Electrical Engineering	1,470	100	100	1,902	128.5	107.4	1,979	133.7	126.9	2,822	190.6	172.8
5. Sugar	1,718	100	100	1,910	111.2	133.1	2,313	134.6	141.9	2,492	134.6	148.5
6. Chemicals	2,513	100	100	3,831	152.4	182.4	4,474	178.0	187.6	5,932	236.1	260.4
7. Paper and paper board	1,811	100	100	3,249	179.4	214.7	3,167	174.9	184.3	3,794	209.5	231.1
8. Cement	2,212	100	100	3,346	151.3	181.1	5,759	260.3	274.4	4,168	188.4	207.8
Total*	1,862	100	100	2,127	114.2	136.7	2,175	116.8	123.1	2,452	131.7	145.3

* All the twenty-nine industries included in the Census.

N.B.: 1. Productivity has been measured in terms of value added by manufacture per person employed in an industry.

2. Index of productivity has been deflated to eliminate price factor with the official index number of wholesale prices adjusted with 1948 as base.

From this table it may be observed that on the whole productivity has increased by about 8.6 points between 1951 and 1957. One disconcerting feature is that while wages have been continuously rising, productivity has fallen in 1954 over 1951 by about 13.6 points whereas in the same period wages rose by 10 points. Similarly between 1951 and 1957 while wages rose by 24 points productivity rose by only 8.6 points. In the cotton textile industry productivity has been on the decline except in 1951 when it rose by 15 points. In the jute industry too the highest increase was in 1951. It fell sharply in 1954 and did not show any significant improvement later. On the other hand, in iron and steel, general and electrical engineering, sugar, chemicals, paper and cement industries, productivity has increased which may be attributed to the high degree of mechanisation which has been achieved in these industries during the period under review.

A study of the increase in employment of capital indicates that greater productivity in metallurgical and engineering industries and chemicals has been due more to the degree of mechanisation achieved. This is borne out by the information given on page 1081 in regard to total fixed capital employed per worker in certain industries and also the average for the 29 industries covered by the Census.

Between 1948 and 1957 taking all industries into consideration, capital employed has increased by about 152 points. In textile industries like cotton and jute while capital employed has increased in varying degrees,

and so have money and real wages, productivity has shown a falling trend. On the other hand in those industries like iron and steel, general and electrical engineering, chemicals, paper and cement where productivity has shown discernible increase, capital employed has also increased either to the same degree or much more than the increase in productivity. The irresistible conclusion is that the part played by employment of increased capital on increasing productivity is more significant than by any other single factor. This is borne out by the fact that in order to have an increase in productivity of about 45 points, emoluments have been increased by 42 points whereas total fixed capital employed per worker has increased by 152 points.

In short, increases in real wages have been higher than in productivity for which higher rate of increase in productivity is necessary to bring India in the front row of big and powerful industrial nations. Labour and management should devise ways and means of reducing the unit cost of production on the one hand and increasing productivity on the other. In a competitive economy and in a buyers' market increased costs cannot be passed on to the consumers. In an expanding economy it may be expected that over the years national output would rise more rapidly than population making possible a greater 'per capita' consumption of goods and services and higher living standards. This is what happened in the U.S.A. But in the case of India sustained effort at planning is a new experience and

will take time to produce results. Under such circumstances efforts to push up wage rates faster than productivity will react mainly on the price level and may effect little if any gain in living standards. Be-

sides, it will tell heavily upon India's ability to compete in foreign markets. India has to make a great effort in order to be able to catch up with industries of other countries and compete effectively in world markets.

TABLE III.
TOTAL FIXED CAPITAL EMPLOYED PER WORKER IN CERTAIN SELECTED INDUSTRIES

Industry	Year			
	1948	1951	1954	1957
1. Cotton Textiles	Amount (Rs.) .. 717	1124	1328	1833

A Letter to the Editor

FROM BALLOONS TO BRASS TACKS

The Editor,
The Eastern Economist, New Delhi.
Sir,

Your timely article "Ideology and Reality" has indeed focussed the searchlight from the ever-expanding balloons of doctrinaire socialism on to the ever-elusive brass tacks of economic realism. Even granting that our spiritual heritage makes incentives irrelevant, and the average Indian is Gita-motivated in the mundane matter of wanting the fruits of his labour, is there a more effective and more economical way of ensuring the four basic requirements quoted by you viz., (1) National consciousness with the desire to work for national unity; (2) Avoidance of waste, both human and material; (3) Sustained disciplined hard work; (4) An intense desire to progress against all odds, than a single-minded effort for nation-wide education, especially of the women. More so, because, every time you open a school, you can close a prison and close a hospital. When you educate a boy, you educate a man; when you educate a girl, you educate a family.

Not all the lavish schemes for National Discipline, nor all the hackneyed exhortations for unity, nor the best conceived legislation to ban this and penalize that, will yield the unfailing results happily assured by educated motherhood. This is true at all levels, particularly of the social strata which provides the highest statesmanship and wisdom to effect this "simultaneous transformation in economic, social, and political spheres in a peaceful and democratic manner."

What a price we are paying to learn the elementary wisdom that prevention is better than cure, and that it is better to put a strong fence round the top of the cliff, than an ambulance down in the valley! There is nothing else which can ensure that even the most perfect constitution does not become a mere scrap of paper, particularly in so divided a country whose fatal pock marks of preventive detention and "dangerous Patronage" (your page 963) already spell a speedy death to the substance of freedom.

NEW DELHI,
April 17, 1961.

Yours etc.,
SHANTHI RANGARAO.

ANNOUNCEMENT

The following Annual Numbers of THE EASTERN ECONOMIST are available for sale. Special concession may be given to educational institutions, libraries and students, if a single order exceeds Rs. 50/-.

1. India & the World and India in 1950 Rs. 5/-
2. A Social History of the Indian People & India in 1951 Rs. 5/-
3. India & the Free World and India in 1952 Rs. 5/-
4. India in Asia & India in 1953 Rs. 5/-
5. India in South East Asia and India in 1954 Rs. 5/-
6. India & the Communist World and India in 1955 Rs. 5/-
7. India in 1975, A Study of the next Twenty Years & India in 1956 Rs. 7.50
8. India & the Middle East and India in 1958 Rs. 7.50
9. India and Europe & India in 1959 Rs. 10/-
10. India & North America and India in 1960 Rs. 10/-

THE BUSINESS WORLD

Wanted: New Tools for Export Drive

WHAT are the chances of raising India's annual exports to the level of Rs. 800 crores per annum on the average during the Third Five-Year Plan as compared to the average of Rs. 615 crores during the Second Plan? There are, on doubt, numerous factors which have operated in the past to vary India's exports and some of them, such as international recessionary trends are out of our control. But there are certain other factors which lie within our grip and which can be utilised in order to raise the level of India's exports. Two of these are the exploration of foreign markets for our goods through new marketing tools and the reduction in the cost of our manufactures so as to compete both in quality and price with other countries.

The first factor has come in for considerable discussion in recent months, though no concrete measures have been taken so far in order to press it into service. It is a well known fact that India's exports have relied heavily on traditional items, such as, tea, jute manufactures and cotton textiles. With the rising tempo of industrial development in the country the supply of industrial goods is rising steadily and it is here that an encouraging scope for expansion in the export trade lies. Unfortunately, no serious attempts have been made to explore the potential markets for India's new goods. This can only be done by conducting on the spot market surveys in foreign lands. There are fast developing markets in East Africa, the Middle East and the South-East Asian region where India's new industrial products can find a ready market. Indian firms have not ventured so far to examine the peculiarities of these markets. They have not attempted to enlist the services of experienced organisations in marketing research to find for them the "facts" about these markets. They have failed to adopt the strategy of aggressive selling abroad to raise India's exports. The President of the Indian Council of Foreign Trade at the recent Export Convention held in New Delhi stressed this point in these words: "Extensive and constant on-the-spot studies should be made of the markets and the manufacturer or exporter should make it a point to produce and supply such type of goods that are needed in the export market instead of trying to sell

what they are making or offering for sale in the domestic market". It may be stated that market analysis is a continuing process and unless the business houses keep themselves informed about the trends in these markets through their own experienced marketmen or through consultants, it may not be possible for them to capture new markets or to consolidate the gains already made.

Even after the markets for India's new engineering goods have been located, the question of competition will need to be tackled. It is no use throwing up hands in despair, saying that we are not in a position to face competition with Japan and other industrially advanced countries who have a low cost structure. If the cost price of our products is not in line with the international price level, some drastic measures will need to be taken. Indian manufacturers will without doubt need incentives so as to meet the losses for sales in the international markets. What form should these incentives take? There is an erroneous impression in this country that the consumer should be made to pay for the losses incurred by our exporters in the foreign markets. Taken to its logical conclusion, this approach might lead to disastrous consequences by imposing a crushing burden on the domestic consumer. One of the most fruitful suggestions put forward in this regard relates to the linking of new import licences for industries with exports. It should be made necessary for every new unit to export a certain fraction of its product abroad. Unless some such restrictions are imposed and the Indian manufacturers are forced to sell abroad, the future for India's export does not look very bright.

In the sphere of small-scale industries particularly, the Government will have to provide proper incentives if the objective of enhanced exports in the coming years is to be achieved. The cost structure of our industries in certain respects has become extremely rigid. Wages, for example, which are generally linked with the cost of living indices continue to rise from year to year. The raw material prices also have been under pressure. In these circumstances, without the active support of the Government through "fiscal incentives", our exports have no chance of looking up.

Labour Policy in a Vacuum

By
CROESUS

BY some fortuitous coincidence, both the President of the Employers' Federation of India (E.F.I.), Mr. Naval H. Tata, and Mr. Surendra P. Hutheesing, President of the All-India Organisation of Industrial Employers' (A.I.O.I.E.) devoted their presidential addresses at the last annual general meetings of these respective organisations to the urgent need for reorientating the labour policy of the Government. Despite the vigorous

defence of the Government's labour policy by the Gujarat Chief Minister, Mr. Jivraj Mehta, who inaugurated the 28th Annual Session of the A.I.O.I.E., at Ahmedabad, last week-end, it should be evident to anyone from his speech itself that conditions as they are in this country are still not ripe enough for experimenting with some of the innovations which the authorities are impatiently trying to introduce. As Mr

Hutheesing rightly pointed out in the course of his speech, "economic development is an intricate complex of activities. Such words as "social justice", "participation of workers in management", "socialism" and even "democracy" can be easily stretched to the point of meaninglessness. At the 28th Annual General Meeting of the E.F.I. also Mr. Tata made this point, and perhaps more specifically, when he said: "In outlining the labour policy of our country, the primary concern of the Government has been the attainment of the goal of social justice, particularly in respect of the industrial workers. The enthusiasm with which this laudable objective is sought to be attained has made the authorities underrate and ignore, to some extent, the hard economic facts which govern the implementation of the principle of social justice. To evolve a wage structure, measured in terms of social justice, is (or is it "may be"?) a legitimate prerogative of the State; but whether such a wage level can be sustained by the national economy is a question which requires serious consideration....."

If Mr. Tata confined himself thus to the question of whether a given wage level could be sustained by the national economy, Mr. Hutheesing went a step further to make the point that, even if a given wage level could be sustained by the national economy, the wage rate in a given industry must bear relation to its capacity to pay. "It is sometimes conveniently forgotten," he said, "that the wage rate that an industry should pay must be related to the wage rate that the industry can pay in the particular economic circumstances in which the industry finds itself. The capacity of the industry to pay a level of wages depends upon the particular conditions of productivity and demand. What may be feasible for one industry may not be feasible for the other, for the demand for labour is derived from the general state of demand for the product and the specific condition of production and cost. Again, the wage rate that an industry can pay must take into account the requirements of an industrial growth. In this broader perspective, the problem of wage payment forms part of general problem of economic growth." This is precisely what Mr. Tata also meant when he remarked that "we are passing through a period where the impact of economic factors on labour policy has assumed such proportions that labour problems cannot be treated in isolation."

In order to prove this thesis, Mr Hutheesing instanced the example of the sugar industry which is finding it extremely difficult to implement the recommendations of the Wage Board. Of course, wages do not constitute the only component of the cost or price structure of a commodity. There is also the price of raw materials. It is the unfortunate lot of the sugar industry to be faced with demands for an increase in both wages and price of raw materials, namely, sugarcane. However justified, however desirable or however important from a political point of view these increases may appear to be, the fact remains that, if Indian sugar has to be exported, as it must be if our sugar economy is not to be disrupted again, the sugar industry is not only in no position to increase the present levels of wages and cane prices, but will in fact, have to reduce them; alternatively, the exported sugar must be subsidised by the Indian consumer or the taxpayer. How anomalous this would be becomes patent when it is noted that India is among the first three largest producers of sugarcane in the world and that our total production of white sugar alone has exceeded the total internal demand (this should normally have brought down sugar prices to the consumer, unlike today).

In this context, it is not clear how any government can be so cavalier as the Gujarat Chief Minister to

make a sweeping statement that, "if an industry has no capacity to pay, it has no right to exist". However, he was careful enough to add the proviso "except for national reasons." Even here, he insisted that a 'living wage' should be assured to the workers. The thesis that no worker should be denied his 'living wage,' as Dr. Mehta put it, will not be disputed by even the most reactionary employer today. But what this term 'living wage' constitutes, or ought to constitute, should be beyond dispute if the unfortunate controversy that followed the decision of the 15th session of the Labour Conference in respect of the "need-based" wage is not to be repeated. It is necessary also to refer here to the constructive suggestion of Dr. Mehta when he observed that what we should aim at is a "living wage" for each worker and the gap between the "living wage" and the "minimum wage" (it is significant that he did not use the expression the "need-based" wage) should be adjusted by taking into account the paying capacity of the industry.

Now, the need for any adjustment in wages stems primarily from the changes in price levels, mainly in the upward direction. Although it is difficult precisely to fix the responsibility on any one agency for rising prices, it would be dogmatic to assert that it is the manufacturer alone that is responsible for soaring prices and to accuse him of extortionate profit, as some people are apt to do. To quote Mr. Tata, "such inflationary pressures as we have experienced in recent years have not, in all cases, been unconnected with labour policy decisions." Government can not any longer disclaim a share in the responsibility for the soaring prices. It is not merely the generous awards in industrial disputes of our industrial tribunals but also the taxation policy of the Government that is responsible for this trend. According to the E.F.I. President, approximately 20 per cent. of the ex-mill price of cloth goes to the Union Government by way of excise duty. This is, of course, in addition to the tolls exacted by the different State Governments by way of sales taxes not only on the finished product but also on raw materials.

What is not easy to understand, in these circumstances, is the attitude of the powers-that-be who, while continuing to maintain that there is no discrimination between the public sector and the private sector as regards labour matters, and also to insist on the private sector, whenever there is a rise in the cost of living, offsetting this rise by increasing the quantum of dearness allowance almost mechanically, are not, at the same time, prepared to ask the public sector industries also to follow suit. This is not only a "dual standard of social justice," as Mr. Tata described it but also an indictment on the public sector of its incapacity to pay its employees dearness allowance on an automatically adjusted scale or on a sliding scale as prescribed by its own industrial tribunals for the private sector. In pointing this out, it must not be assumed that the industrial employers always raise this bogey in order to take shelter behind a fallacious theory. What is suggested is that the whole question needs to be considered by all those who have the interests of the country at heart.

Both the E.F.I. President and the A.I.O.I.E. chief also dwelt on the highly controversial question of bonus. Fuel was added to the fire of this controversy, as it were, by the recent announcement of the personnel of the proposed Bonus Commission by the Union Labour Minister. Fortunately that issue has been settled, at any rate, for the time being; it is, I am afraid, bound to take a long time before a satisfactory solution is found. Bonus, which began as a "voluntary gesture", has since come to be described as "ex-gratia payment"

and, lately, as "compensation against sub-standard wages." It is the last interpretation naturally that has evoked very sharp differences.

Be that as it may, as Mr. Hutheesing maintained the demand for bonus of the kind obtaining in our country is almost unheard of in other countries. An uncertain element like bonus can have no place in any wage structure. There is, therefore, ample scope, as he suggested, for the Bonus Commission to think whether or not bonus is an appropriate method of adding to the emoluments of labour. Mr. Tata, however, was more emphatic. "It is neither in the interest of the workers nor of the employers," he said, to continue this form of uncertain annual payments, because it raises hope in

the minds of the workers, which, if unfulfilled, through no fault of the employer, would result in a feeling of serious frustration." In order to ensure industrial peace, he said: "I for one would be happy if this uncertain element is eliminated through suitable adjustment in the wage structure." It would have been helpful to all concerned, had Mr. Tata outlined the adjustment he has in view. That would perhaps have provided a constructive alternative to the bonus system and we would have known the reactions to it of both the workers and the Government. Anyway, it is not too late even now, and it is to be hoped that he will avail himself of the next public utterance that he makes to think aloud on this subject.

Business Notes

Textiles

MORE QUOTA FOR THE MILL SECTOR

IN VIEW of the increase in the rate of growth of our population and the resulting rise in the demand for cloth consumption during the Third Plan period, the call of the Government to the cotton mills to step up their production by 10 per cent during this period is understandable. Needless to say, the textile industry will readily respond to this call, provided, of course, the various difficulties in their way are removed. If, in the course of his presidential address at the 19th Annual meeting of the Saurashtra Millowners' Association, held in Ahmedabad, last week, Mr. Shantilal Mangaldas still reiterated the millowners' plea that the quota of cloth production assigned to the mill sector during the Third Plan period should be adequately increased, it is probably because he feels this is the only way to augment cloth production in the country. Now the total output in the country in 1960 was only 7,243 million yards, made up of 5,048 million yards of mill cloth and about 2,195 million yards of handloom and power loom production. According to the Draft Outline of the Third Plan, it will be remembered, the target has been fixed at 9,300 million yards, which means an additional production of a little over 2,000 million yards above the total output recorded in 1960. The problem then is how best to allocate this additional production among the various sectors of the industry so as to achieve the total output desired. It is natural that every sector should claim a maximum share out of the additional production needed, but it is upto the authorities to be pragmatic in their decisions; they should be influenced not by rosy promises for the future but by actual records of production so far. On this reckoning, Mr. Mangaldas was justified in holding that the non-mill sector of the industry would not be able to deliver the goods and insisted that the responsibility of the failure of any of other sectors to achieve the target should not be fixed on the mills, as is sought to be done so often. It is significant that speaking for the mill sector, he assured the Government that the mills could increase their output by ten per cent if they were assured of the right type of cotton in adequate quantities, as also fuel in time. In this connection, the President of the S.C.M. Association also suggested that permission be granted for the expansion of the units which have an installed capacity of less than 25,000 spindles and 600 looms in order to increase cloth production in the country. This will also make for more economical production.

Referring to the difficulties being faced by the mill industry, Mr. Mangaldas urged that either the Central Government or the concerned State Government should actively persuade labour unions to come to a definite arrangement with the managements so as not to impose unjustifiable additional burdens on the industry by way of wage-bills unrelated to productivity. At the same time, he did well to ask for a reasonable assurance from the

Government that it would not bring pressure on the industry again to reduce prices, as the industry has already done its utmost in this behalf.

Jessop and Company

POWER: THE MAJOR BOTTLENECK

THE CHAIRMAN of Jessop & Co. Ltd., Sir B. P. Singh Roy, in his speech, dwelt at length on the difficulties faced by the Company at its 29th Annual General Meeting. Shortages of steel, transport facilities, foreign exchange, electric power, and finance were described by the Chairman as the major hinderances responsible for not attaining higher results in production. Difficulties in obtaining import licences were responsible for a shortfall in production of Electric Multiple Unit Coaches. The Chairman emphatically stated that unless this difficulty of licences was removed, it would not be possible to place orders for the equipment abroad which in other words meant a gap in the production of EMU coaches. Apart from the dislocation that this inevitably would cause in the company's manufacturing programme, the shortfall in EMU production is to be regretted because of the pressing demand for such coaches. However, to fill the gap in production, the Coach Works is to take up the manufacture of Broad Gauge Motor and Parcel Vans and Broad Gauge Well Wagons. Strenuous efforts were also being made to raise production of diesel road rollers.

The major bottleneck, the Chairman emphasized, was felt in regard to finance and electric power. Although it may be possible to raise more finance by borrowing from the banks against securities, but that would not be sufficient for expansion and rehabilitation programme. Under the circumstances, it appears that share capital may have to be raised further. In regard to power the need was to remove the shortage at the earliest, as without it, it may be difficult to operate the Company's Works on both the shifts.

New Venture

TYRE TUBE VALVE MANUFACTURE

FOR THE manufacture of tyre tube valves, a new company has been formed under the name of Schrader-Scovill Duncan Ltd., with an authorised capital of Rs. 2 crores. In the beginning the Duncan Brothers and Company Ltd., Calcutta, will hold 49 per cent shares and the rest will be held by the Scovill Manufacturing Company, a world-wide reputed concern for the manufacture of tyre tube valves. Public participation in the share capital will be invited at a much later stage.

The formation of this company is the result of an agreement concluded recently between the Scovill Manufacturing Company, U.S.A. and Duncan Brothers & Co. Ltd. First of its kind in India, the plant will be

located near Bombay and will commence operations in 1962. Incidentally, Duncan Brothers & Co. Ltd., are the first in this field who have been recently associated with the setting up of plants for Woolcombing and manufacture of Carbon Black. As the manufacture of tyre tube valves is a highly specialised process, the technical know-how will be provided by the Scovill Manufacturing Company, who have already established plants in the U.K., Canada, Australia, France, Brazil and Mexico.

The establishment of this new venture is heartening in the sense that with the manufacture of tyre tube valves in this country, a considerable amount of foreign exchange spent on their import would be saved. Since Schraders have no manufacturing operations in Asia or Africa, it is expected that tyre tube valves manufactured here might be exported to neighbouring countries and thus help augment country's foreign exchange earnings.

Fertilisers

REFINERY GAS AS FEEDSTUFF

A CONTRACT for the annual supply of 50,000 tons of refinery gas for a minimum period of 10 years by Burmah Shell to the Fertiliser Corporation of India was signed in Bombay last week. The contract, which joins the private and public sectors in a common goal of meeting India's vital requirements, is the largest in India for the supply of petroleum products. The Trombay fertiliser project would be the first in India to use refinery gas. It is expected to start production towards the end of 1963 or early in 1964 at the annual rate of about 350,000 tons of fertilisers (equivalent to 90,000 tons of nitrogen and 40,000 tons of phosphate) and involves a capital outlay of Rs. 25 crores.

The refinery gas will be used as feedstock for the manufacture of nitrogenous fertilisers, using the well-known Shell gasification process, — a process developed by Shell scientists for the production of nitrogenous fertilisers using any petroleum feedstock. The advantage of this process, namely its ability to use any type of petroleum feedstock, makes a significant contribution towards solving the imbalance of the oil industry in India.

The Chemical Construction Company of the United States was recently given a contract for the supply of equipment and plant for the Trombay fertiliser project. The contract is to be financed out of a loan of 30 million dollars given by the Development Loan Fund.

Small-scale Industries

PROBLEMS AND SOLUTIONS

THE PROBLEMS faced by the small-scale industries in India and their possible solutions were the subjects of Mr. G. V. Puranik, Chairman of the All-India Manufacturers' Organisation's speech at the A.-I.M.O. and Small-Scale Industries Convention held on 21st April in New Delhi. While expressing satisfaction at the emphasis laid by the Planning Commission in the Draft Outline of the Third Five-Year Plan on the need for improving technical and organisational efficiency of small-scale industries and pointing out that the actual investment in village and small-scale industries in the private sector will be about Rs. 225 crores against an investment of Rs. 100 crores originally estimated in the Second Plan, Mr. Puranik stressed the need for raising the financial allocation in the public sector for small-scale industries from Rs. 107 crores to Rs. 232 crores as recommended by the Small-Scale Industries Board,

The point was made that the areas benefited by various schemes for the development of small-scale industries were mainly urban which were already de-

veloped and were in a position to command required facilities like power, water, drainage, market, etc. It was the plea of the Organisation that at least half the number of proposed industrial estates should be set up in rural areas and that each State should set up a semi-autonomous corporation for the development of industrial estates. It was also argued that much of the overhead costs, for example, power, roads, drainage, etc. should be provided by the Government because it is not possible for small entrepreneurs, with their meagre resources, to arrange for land, buildings and other facilities. A plea was also made for the Government to see that supplies of raw-materials and machinery were made available to small-scale industries to the required extent. Opening of raw-materials depots in strategic centres, as recommended by the Small-Scale Industries Board, should also receive the favourable consideration of the Central and State Governments.

Mr. Puranik also made the plea for the need for small-scale industries receiving a progressively larger share of orders placed by various purchasing authorities of the Central and State Governments, Defence Services and the Railways. He also recommended setting up of a polytechnic in every district to meet the shortage of skilled workers and supervisors in small-scale industries. He urged collection of adequate statistics of production for future planning. His suggestion of a detailed survey of the various large industries in the public and private sectors for determining the items which can be produced during the next five years by the small-scale industries as feeders or ancillaries is worth pursuing.

THE INDIAN BANK LTD.

HAVE PLEASURE IN ANNOUNCING ENHANCEMENT IN THEIR RATES OF INTEREST ON DEPOSITS

Certain items of enhancement are :

Savings Bank Accounts	.. From 2½% to 3% p.a. (From 1-4-61)
Deposits fixed for 12 months and over but less than 24 months.	.. From 3½% to 4% p.a. (From 15-3-61)
Deposits fixed for 60 months and over.	.. From 4½% to 5% p.a. (From 15-3-61)

For further particulars please apply to the nearest branch of the Bank.

G. S. SUNDARAM

SECRETARY

FROM THE CAPITAL'S CORRIDORS

TAX CONCESSIONS

IN the Lok Sabha last week, the Finance Minister, Mr. Morarji Desai, announced certain additional tax concessions while moving the Bill to give effect to the financial proposals of the Government of India for 1961-62. Taking into account the views expressed during the general discussions in Parliament and the criticisms received from the trade and the public, the Finance Minister had announced certain concession while replying to the general discussion in the Lok Sabha on March 17. Since then, further discussion seems to have convinced him about the necessity of making further adjustments which will help in removing general hardships without sacrificing substantial revenue.

A relief has been proposed in respect of inferior coffee only. As it would be possible to distinguish inferior varieties of coffee from plantations or arabica coffee, the evasion of revenue could be avoided. He has proposed to give relief by reducing the duty on robusta and liberia varieties of coffee to the original level of Rs. 41.35 per quintal.

The concession announced on March 17 in respect of powerloom units having three or four looms was not considered adequate. The self-employed weavers working in small units with three or four looms found it hard to retain their position. The Finance Minister has now proposed to give complete exemption to all powerloom units with three or four looms manufacturing cotton, rayon or silk fabric provided they work only one shift. The same benefit is extended to powerloom units manufacturing woollen fabrics, if the number of looms engaged does exceed two and the units work only one shift a day.

The proposal to levy a higher rate of duty on fabrics produced on automatic looms has been primarily formulated with a view to export promotion. It is proposed to withdraw this surcharge in respect of 70 per cent of the production. The duty has been linked up on the balance with exports so that the surcharge will be actually payable only on the quantity by which the exports made by a manufacturer during any half year fall short of 30 per cent of the fabrics produced by him on automatic looms during the same period.

The Finance Minister has introduced a compounded system of levy by which the manufacturer would be able to pay the duty on yarn woven into fabric by composite mills, together with the existing duty on fabrics at the rate of 1.2 per square metre of the fabric produced. Cotton yarn on count up to 40 if issued in hanks has been exempted from duty.

In respect of new excise duty on woollen yarn, instead of ad valorem assessments, compounded facilities have been given and provision for alternative specific duty for all woollen yarn has been made. For worsted yarn the specific rate would be Rs. 2.10 per kg if the yarn is 60s and above, Rs. 1.60 per kg if the yarn is below 60s. For other than worsted yarn the rate at 40 nP per kg. has been proposed. While the average incidence of these will be slightly lower than that on the basis of all the ad valorem rates, it will also eliminate administrative defects.

In the budget proposals the Finance Minister had exempted from duty small manufacturers of glass and glasswares, chinawares and procelainwares employing not more than 5 workers. In view of the genuine difficulties of cottage units, the exemption has been extended to all manufacturers of glass and glasswares who do not employ more than 20 workers, do not use power and use only broken or waste glass as raw materials. Similar concessions have been proposed to be extended to the manufacturers of chinawares and porcelainwares who do not employ more than 15 workers. Similarly the

limit of concessions to manufacturers of cosmetics and toilet preparations has been increased from 50 kg per month to 75 kg. per month.

The Finance Minister has proposed to exempt 25 per cent duty chargeable on copper and brass sheets, circles etc. which are issued out from the rolling mills without trimming and cutting. Corresponding concession in case of bronze sheets and circles will be 20 per cent. This is to provide some relief to small utensil manufacturers who have to pay full duty on untrimmed sheets, a part of which is left as scrap. Exemption is also being given in respect of strips of copper and copper alloys used for making zari, stars, spangles, anklets etc.

In consideration of the established practice of the manufacturers of patent or proprietary medicines to issue samples, duty free clearance has been allowed in respect of clinic samples issued for laboratories, hospitals etc. upto a maximum limit of 5 per cent of the total duty paid. Plastic moulding powder manufactured from scraps of plastics have also been exempted from duty.

The refrigerators used for cold storage depots etc. for preservation of food will not be subject to duty. Air conditioning machinery employed not for comfort but for preservation of food will, therefore, be exempt from duty. Moreover, the countervailing duty paid at the time of import of compressors when used in refrigerators produced in the country will also be adjusted.

Customs duty on "textiles manufactures not otherwise specified" was increased from 50 per cent to 100 per cent. Duty on nylon twine imported for the manufacture of fishing nets will be at 50 per cent ad valorem in cases in which import licences are issued on the recommendation of State Directorates of Fisheries.

Customs duty on newsprint, unglazed or machine finished in reels was enhanced from Rs. 3.10 per quintal to Rs. 7.50 per quintal and on newsprint of other sorts imported in reels from Rs. 3.60 per quintal to Rs. 9.0 per quintal. Relief has been proposed by reducing the rate of duty on the former category of newsprint to Rs. 5.00 per quintal and that on the latter to Rs. 5.50 per quintal. Many small newspapers make use of newsprints in sheets on which the duty was raised from Rs. 4.10 per quintal to Rs. 10.30 per quintal. The duty on this category of printing paper has been reduced to the pre-budget level of Rs. 4.10 per quintal.

Along with the increase in excise duty on rayon yarn, the customs duty was also increased to include the countervailing duty. Now the customs duty has been proposed to be reduced to the extent of 65 nP. per kg. for yarn of below 75 deniers and correspondingly less for other varieties.

DIRECT TAXES

The tax structure applicable to foreign companies has been proposed to be simplified. According to the provisions contained in the Finance Bill the dividends received by a foreign company from a non-subsidiary Indian company formed after March 31, 1959 and before April 1, 1961 are taxable at 53 per cent while dividends received from such an Indian company formed on or after April 1, 1961 are taxable at 40 per cent. It is proposed that the rate applicable to the dividends on both these categories may be fixed at 40 per cent.

As far as the proposal to restrict the allowance of entertainment expenditure in computing the taxable income from business is concerned, the limit prescribed in the case of companies has no adequate justification. The proposal to disallow in respect of non-company assesseees may lead to genuine hardship in some

cases. An amendment has been proposed so that in the case of non-company assesseees the status quo may continue.

The proposal to allow initial depreciation for houses build by employers for the residence of low paid employees has been extended so that the scope of this concession would apply to the buildings which are constructed to meet the welfare requirements of such employees such as hospitals, schools, canteens, libraries, etc.

The Finance Minister saw no justification for the abolition of the tax on bonus shares, particularly on bonus shares issued out of share premium amounts. Similarly he expressed his inability to accept this suggestion that the reduction of the tax rates from 63 per cent to 50 per cent in the case of royalties paid to foreign companies should apply to all payments of royalties whether they are in pursuance of agreements entered into before or after April 1, 1961.

The net effect of all these concessions including those announced on March 17, is expected a revenue loss of Rs. 6.14 crores in full year.

FOREIGN ASSISTANCE: SECOND PLAN

The total amount of authorised external assistance in the form of loans and grants, both in the public and private sectors, up to March 31, 1961 was Rs. 1,857.68 and Rs. 652.82 crores respectively. At the end of the Second Plan period Rs. 1,030.29 crores had been utilised out of the authorised loan of Rs. 1,857.68 crores. An amount of Rs. 827.39 crores is, therefore, carried forward to the Third Plan. The authorised loan for the Second Plan period comprised Rs. 1,604.11 crores in foreign currency and Rs. 253.57 crores in rupees. At the end of the Second Plan period out of the amount utilised Rs. 936.59 crores was in foreign currency and Rs. 93.70 crores in rupees, leaving a carryover of Rs. 667.52 crores in foreign currency and Rs. 159.87 crores in rupees. The authorised grants totalled Rs. 652.82 crores up to the end of March, 1961. Out of this Rs. 234.95 crores had been spent by the end of the Second Plan period, leaving a carryover for the Third Plan on April 1, 1961 of Rs. 417.87 crores. The authorised amount of grants comprised Rs. 395.96 crores in rupees and Rs. 256.86 crores in foreign currency. Out of the amount utilised Rs. 5.08 crores was in rupees and Rs. 229.87 crores in foreign currency, leaving a carryover of Rs. 390.88 crores in rupees and Rs. 26.99 crores in foreign currency.

FOREIGN ASSISTANCE: THIRD PLAN

The fourth meeting of the consortium countries and institutions interested in development assistance to India, convened by the World Bank, was held in Washington on Tuesday, April 25. Previous meetings were held in August 1958, March 1959 and September 1960. The meeting, was presided over by the Chairman of the World Bank, Mr. Eugene R. Black. The representatives of the Governments of Canada, Germany, Japan, the United Kingdom and the United States of America attended the meeting. The International Monetary Fund and the Governments of Austria, France, Denmark, Norway and Sweden sent observers. Italy has declined to attend. Leaders of the delegations were Mr. J. F. Parkinson of the Department of Finance of Canada, Dr. Hans Henckel of the Ministry of Economics of Germany, Mr. Makoto Watanabe of the Finance Ministry of Japan, Mr. Denis Rickett of the U.K. Treasury and Mr. John M. Leddy of the U.S. Treasury.

The meeting was convened to review India's foreign exchange requirements for the period of the Third Five-Year Plan and to consider the amount and nature of the further external assistance which might be made available to meet these requirements. Mr. B. K. Nehru, India's Commissioner-General, was in New Delhi last week to apprise himself with the latest balance of payments position and the foreign assistance requirements of the Third Five-Year Plan.

According to the latest available estimates, foreign assistance required for the Third Five-Year Plan is placed at 5,500 million dollars. This estimate is based on rough calculations; the actual assistance required may be much more. The estimates are exclusive of surplus commodity assistance, such as under P.L. 480 from the United States. The balance of payments position indicates that India needs, immediately, 638 million dollars, 300 million dollars for repayment of debt and 100 million dollars for new projects in the Third Plan. Remaining 238 million dollars are required to sustain India's economy. Unless this minimum sum of 638 million dollars were forthcoming, India would default in payment of its dues; 127 million dollars to the International Monetary Fund and 43 million dollars to Germany in addition to private sector firms.

The meeting of the Aid India Club is, therefore, very significant for the Indian Economy. The U.S. Administration, it is learnt, is willing to go all out to help India. It has, however, been delayed by the lack of Congressional authority to provide aid immediately. The decision of the U.S. Congress on the aid programme for under-developed countries will not be known before July. The U.K. has already indicated the amount of initial credit it could give (30 million) and so has West Germany (400 million marks). The final picture will be available only after the meeting. It is expected that for the Third Plan larger proportion than hitherto received will be 'untied.'

It is gathered that the following industries in the private sector are likely to be considered at the Aid India Club, for which foreign exchange will be needed during the Third Plan period.

	(Rs crores)	
	Total Third Plan Outlay	Foreign Exchange Component
Non-ferrous metals	60.00	30.00
Industrial machinery	99.28	54.00
Machine tools	20.00	11.00
Structural fabrication, railway wagons, etc.	10.50	5.00
Tractors, earthmoving equipment, etc.	10.00	6.00
Ball bearings	9.00	5.00
Electric Motors and transformers	11.00	7.00
Cables and wires	13.00	8.00
Other electrical industries	8.00	5.00
Heavy chemicals	39.00	16.00
Miscellaneous chemicals	9.00	4.00
Drugs and Pharmaceuticals	10.00	3.00
Dyestuffs	7.00	2.50
Rayon and staple fibres	75.00	45.00

Sugar	100.00	11.50
Other large scale industries	54.90	26.26

CONTROVERSY OVER COAL FIELDS

The West Bengal Government has, it is learnt, given notice to the Union Government of its intention to move the Supreme Court to declare the Coal Bearing Areas (Acquisition and Development) Act, 1957, ultra vires of the Constitution on the ground that the Centre was not competent to enact the legislation. The State Government has already filed a suit in the court of the Subordinate Judge, Asansol, against the National Coal Development Corporation praying for permanent injunction against acquisition proceedings in the Raniganj coalfields in West Bengal. The Coal Bearing Areas

(Acquisition and Development) Act provides for greater public control over the coal mining industry and its development through acquisition by the State of unworked land containing coal deposits. Till the end of March 1961, the Union Government had acquired about 14,500 acres of land for coal mining under the Act and had sanctioned compensation amounting to over Rs. 33 lakhs, of which Rs. 28.73 lakhs had been paid.

SUPPLY OF SPARES

Fifteen contracts have been concluded with U.S.S.R. for the supply of spares. The basis of the contracts were: The price of spare parts valued at Rs. 2.1 crores included in the original contract was at the notional average price per ton which was agreed to be paid for the main plant and equipment. (ii) In the case of non-proprietary articles such as Ball and Roller Bearings, competitive quotations were invited and the Soviet offer was found to be the cheapest. (iii) In other cases the prices were settled by mutual negotiations.

MANUFACTURE OF DRUGS

A company, Indian Drugs & Pharmaceuticals Limited, has been registered to implement the four drug plants to be set up with Soviet collaboration; four units being (i) Antibiotics Unit at Rishikesh; (ii) Synthetic Drugs Unit at Sanatnagar, Hyderabad; (iii) Surgical Instruments and Medical Appliances unit at Madras; and (iv) Phyto Chemical Unit at Neriyanamangalam in Kerala. Detailed project reports are expected shortly from Messrs Technoexport of Moscow, with whom the contracts have been placed.

PAPER MACHINERY

Licences under the Industries Act, have been issued to two parties for the manufacture of paper machinery in Calcutta and Ahmedabad respectively. It is proposed at present to issue licences to two more parties for the manufacture of paper machinery in Saidapet (Madras) and Poona respectively. The location of the units to which licences had earlier been given are: Jamshedpur (Bihar)—One unit; Dalmianagar (Bihar)—One unit; Calcutta (West Bengal)—Three units; Rourkela (Orissa)—One unit; Shahbad (Mysore)—One unit; Bombay (Maharashtra)—One unit; and Poona (Maharashtra)—One unit.

ORISSA MINING CORPORATION

The Orissa Mining Corporation Limited, a joint venture of the Central Government and the Government of Orissa was incorporated in 1956 for the purpose of raising, assembling and transporting iron ore and other minerals and also for organising transport facilities to and at Paradip port. The authorised capital of the Corporation is Rs. 50 lakhs and the paid-up capital is Rs. 15 lakhs.

Actual mining was started in Tungaisuni and Maharaipur mines in June-July, 1957. A third mine was started in January, 1960. The production of iron ore from these mines was 32,224 tons, 47,450 tons and 48,908 tons for the years 1957-58, 1958-59 and 1959-60 respectively. The Corporation has been granted further mining leases for iron ore and manganese in Bonal area and prospecting licences for iron ore, manganese and chromite. Chromite production is expected to commence in 1961-62. The minimum programme envisages a target of 8 lakh tons of iron ore, 25,000 tons of chromite and 20,000 tons of manganese by the end of Third Plan. The Corporation has secured from the State Trading Corporation a contract for 50,000 tons of iron ore on F.A.S., Calcutta basis for disposal of its Sakradibi ore.

INVESTMENT OF L.I.C. FUNDS

Finance Minister, Mr. Morarji Desai, set at rest any controversy over the decision by the Government of India on the Estimates Committee's recommendation that all investible funds of L.I.C. should be taken over by the Government. In a reply to the debate on the Finance Bill in the Lok Sabha, Mr. Desai pointed out that it was not a simple matter which could be disposed of easily. The present policy of investment, he declared, would

stand until a decision to the contrary was taken, after a thorough examination.

NEW PIPE LINES

A legislation is likely to cover the requirements of future pipe-lines in the country. It has been decided that in view of the proposed construction of product pipe-lines from Barauni to Calcutta and Barauni to Delhi in the foreseeable future, the legislation for acquiring right of way may be processed in consultation with the States of West Bengal, Bihar, Uttar Pradesh, and the Union territory of Delhi. Ministry of Railways have, it is gathered, agreed as a very special case, to the placing of Oil India's crude oil pipeline on the railway bridge over Brahmaputra.

MINING DISPUTE

The Government of India have, it is learnt, referred for adjudication to the Industrial Tribunal, Bombay, the dispute existing between the manganese mine owners in the States of Maharashtra and Madhya Pradesh and their workmen. The schedule in regard to the dispute reads: Whether the state of affairs in the manganese industry as a whole, excluding the Central Provinces Manganese Ore Company Limited, in the States of Maharashtra and Madhya Pradesh has substantially improved since the quarter ending December, 1959 and after signing of the agreement on December 14, 1959 between the Mineral Industry Association and the Rashtriya Mangane Khandan Prantik Kamgar Sangh? If there is substantial improvement, whether the concerned mine owners are in a position to pay bonus to the workers in their manganese mines and if so to what extent?

ASSISTANCE TO SUGAR FACTORIES

Owing to a substantial increase in production during the current sugar season, many of the sugar factories were faced with genuine difficulties by way of finding adequate financial resources to enable them to pay their dues to cane-growers and hold such large stocks over a period of months. In order to assist them to tide over this temporary difficulty, and only as a very special case, the Government of India have agreed to allow sugar factories to defer up to a maximum of three months, the payment of 25 per cent of the total excise duty including additional excise duty, payable on each consignment of sugar (other than Khandasari or Palmyra sugar) when it is cleared from the factory or other authorised non-duty-aid premises for storage. It is added that the grant of this extraordinary facility would be limited only to actual clearances made on or before September 30, 1961, and will not in any case be extended beyond that date.

WELFARE FACILITIES FOR MINERS

The tripartite Industrial Committee on mines other than coal, at a meeting held in Delhi and presided over by Mr. Gulzari Lal Nanda, Union Minister of Labour & Employment and Planning, approved a proposal to set up an Iron Ore Labour Welfare Fund, on the pattern of the Coal Mines Labour Welfare Fund. The Fund would be utilized for the benefit of the labour employed in the iron ore mining industry in regard to the improvement of housing, public health, sanitation, water supply and medical, educational and recreational facilities. The Fund would be created out of a cess to be levied on the iron ore production. It is estimated that Rs. 30 lakhs would be needed to provide for welfare measures on a satisfactory scale to about 41,000 workers engaged in this country.

Regarding the extension of Minimum Wages Act to employment in various non-coal mines, Mr. Nanda gave a directive that all formalities required in this connection should be completed expeditiously. A time limit, he pointed out, should be fixed for all the various stages necessary in applying the Act. It was agreed that a notice of 14 days should be given under the Code of Discipline before a strike or lockout was resorted to in the iron ore mines. Apart from this the report and recommendations of the Manganese Poisoning Enquiry Committee were adopted.

COMMODITY NEWS AND NOTES

BAISAKHI LAC CROP 1961

According to the preliminary estimates of the Baisakhi lac crop 1961 issued by the Indian Lac Cess Committee, a total quantity of 6,75,000 maunds is expected to be produced this year as compared to 8,95,000 maunds last year and a normal production based on the average of 10 years preceding 1960 of 7,36,000 maunds.

The crop is below average this year as due to a very small katki crop in 1960 there was shortage of brood at the time of infection. The prices of sticklac have also been low which has been discouraging to the cultivators.

The total production of 6,75,000 maunds is made up of Bihar 3,10,000 maunds, West Bengal 1,05,000 maunds, Madhya Pradesh 1,94,000 maunds and 66,000 maunds for other States.

Abstract General Preliminary Report on the Baisakhi Lac Crop for the year 1961, as compared with the finals for last two years along with the normal yield (average of final estimates of 10 years preceding 1960), State by State.

(All estimates are in maunds)

State	Preliminary 1961	Final 1960	Final 1959	Normal yield (average of final estimates for 10 years preceding 1960)
Bihar	3,10,000	4,32,000	3,34,000	3,31,000
Madhya Pradesh	1,94,000	2,80,000	2,04,000	3,16,000
West Bengal	1,05,000	1,12,000	66,000	1,33,000
Maharashtra	25,000	25,000	12,000	25,000
Uttar Pradesh	25,000	28,000	16,000	13,000
Orissa	4,000	4,000	4,000	3,000
Gujarat	4,000	5,000	4,000	6,000
Other Indian States	8,000	9,000	10,000	9,000
Total (Indian Union)	6,75,000	8,95,000	6,50,000	7,36,000

Remarks: The crop is late this year in Madhya Pradesh and is expected towards the end of May. If the prices remain at the current un-remunerative levels only part of the crop reported above may arrive. The estimates for 1960 are being revised.

EXPORT OF RAW WOOL

During 1960 exports of raw wool fell by 72 per cent to 30.6 million lbs. as compared with the 1959 exports of 42.1 million lbs. This was preceded by a 24 per cent rise during 1959 over the year 1958 when shipments totalled 34 million lbs. The 1960 figures are the lowest since 1955. This fall in exports has been due to the wide disparity between rates in Indian and in foreign markets. Exporters have been unwilling to follow the market down to the lower levels it has touched during the year, and so sales to the traditional markets (U.S.A. and U.K.) have dropped. Russian buying may have been an important factor.

This country took 7.8 million lbs. — 23 per cent more than in 1959. When it is expected that Russia, (buying wool with funds accumulated from a Rupee payment agreement) is likely to enter the market, sellers hold back for better prices.

Statistics of the internal consumption of indigenous wool are confusing. In spite of the shortage of imported wool, the organised mill sector apparently used slightly less in 1960 than in 1959. But reports from the major as well as the smaller outlying markets are that stocks are not accumulating. Where then is the surplus, it is asked.

BEARING THE LOSSES ON EXPORTS OF SUGAR

The Government would bear the losses sustained in the export of sugar, at least for the first year, if the sugar industry agreed to implement the wage board award to sugar factory workers, said the Food and Agriculture Minister, Mr. S. K. Patil, in the Lok Sabha, while replying to the debate on demands for grants for his Ministry. Hitherto the industry had borne these losses. Ruling out any immediate possibility of lifting controls on the sugar industry, the Minister said if all controls on sugar were lifted now, prices would collapse and the whole industry would "go to dogs." It would not be in the interests of cane-growers either, he added. Mr. Patel denied there was any crisis in the sugar industry. The difficulty in export, Mr. Patil said, was that the internal price of Rs. 700 a ton was about Rs. 300 higher than the international price. Mr. Patil said that subsidies asked to cover export losses should not be grudged because the sugar industry which was the "milk cow" has yielded in the last ten years excise of Rs. 250 crores to the Centre and Rs. 100 crores to the States.

COMPANY AFFAIRS

BHARAT COMMERCE: A NEW LOOK

It may be recalled that Bharat Commerce and Industries Ltd. was facing a crisis in 1954 when there was a debit balance of more than Rs. 42 lakhs in the accounts of the Company. In the annual report of 1954, the Directors had mentioned that the shareholders were asked to decide whether the company should be taken into liquidation or the activities of the company be continued in some other spheres. It may now be recorded that the confidence reposed by the shareholders in the Directors and the then Managing Agents of the Company has been more than justified. In a span of seven years, the financial position of the Company has undergone a complete metamorphosis. Against a debit balance of over Rs. 42 lakhs in 1954, the Company now enjoys a sound financial position.

During the year to December 31, 1960, there was a trading profit of Rs. 36.10 lakhs. Apart from the current provisions, a sum of Rs. 9 lakhs has been provided on account of depreciation for the previous years. In view of the satisfactory results, the Directors have decided to pay dividend on both preference and equity shares. For preference shares dividend is for 1959 and 1960, at the rate of 9 per cent per annum subject to taxation. Dividend on equity shares is proposed to be paid at the rate of 50 nP. per share of Rs. 10 each.

There were 17,600 ring spindles and 8,864 doubling spindles installed in the mills at the end of 1959. During the year 1960, 2,640 ring spindles were added, thus bringing the installed capacity to 20,240 ring spindles and 8,864 doubling spindles at the end of 1960. As reported last year, the Directors had planned to raise the capacity of the plant to 30,000 ring spindles. Owing to delay in the delivery of machines, the expansion programme could not be implemented in time. The Directors now expect that the expansion would be completed by about the middle of the current year.

The Directors of the Company have added that they have been exploring the possibilities of expanding activities of the Company. A composite textile mill with 302 automatic looms and 15,000 spindles situated at Nanjungud near Mysore belonging to Kapila Textiles Mills Ltd., (in liquidation) was advertised for sale on February 18, 1961, under orders of the High Court of Mysore, Bangalore. The Company's bid for Rs. 22 lakhs being the highest was accepted by the Official Liquidator subject to the confirmation of the said High Court. Objections against the said sale have been filed by a party. The decision of the High Court is awaited. The Company has also received a licence for the manufacture of H.T. and L.T. Porcelain Insulators in the State of Rajasthan. Efforts are being made on the part of the Directors to acquire another Staple Fibre Spinning Unit for which negotiations are going on. A few other schemes are also engaging the attention of the Directors who are endeavouring to find some new avenues which may have reasonable chances of being profitable.

PREMIER FERTILIZERS

Among the new industries licenced by the Government of India, Messrs. Premier Fertilisers (Managing Agents: Emcete & Sons Private Limited, Madras) have been licenced to manufacture 16,500 tons of sulphuric acid and 40,000 tons of superphosphate per annum. The Company has taken steps towards implementing their project at an early date. The formal inauguration of civil works at their newly acquired site at Cuddalore O.T. was performed recently by their Chairman, Shri M. Ct. Muthiah. Contracts for the civil works have been finalised and actual construction work is being taken up and is expected to be completed in six months. The foreign contents of the plant and machinery are likely to be shipped between April and

August, 1961. According to present indications the factory is expected to go into production by the end of this year.

ESCORTS LIMITED: PLANS FOR EXPANSION

The Board of Directors of Escorts Limited New Delhi, in their meeting held recently have recommended a gross dividend of 16 per cent to the shareholders. The shareholders under Section 15C would enjoy the benefit of tax-free dividend up to the extent of about 25 per cent of the dividend. The total profits of the Company for the year ended December 31, 1960, are Rs. 24.28 lakhs. The Board of Directors have recommended Rs. 3.05 lakhs as Development Rebate Reserve and Rs. 2.70 lakhs as General Reserve (Rs. 1.90 lakhs in 1959).

Escorts Limited, it is reported, are putting up a factory for the manufacture of motor-cycles and scooters, for which the Company has obtained an Industrial Licence and 23 acres of land in Faridabad (near Delhi). The Company has negotiated the purchase of plant and machinery under long deferred terms of payment to the extent of Rs. 1 crore. All payments for these projects are payable in rupees and no foreign exchange is involved. The Company has further decided to increase the production capacity of Pistons from 300,000 to 500,000 per year. Similarly, the subsidiary companies viz. Goetze (India) Private Ltd. and Sharpedge Private Ltd. have planned to expand their production.

The Company has made satisfactory progress in setting up the factory for X-Ray equipment under Westinghouse Licence and expect to be in production before the end of the year. Pistons manufacture has progressed according to plan.

The Directors also added that the Company has been given Industrial and Import Licences for manufacture of Railway Shock Absorbers and Heating Elements. To meet the capital requirements for all the new projects the Board of Directors have decided, subject to the permission of the Controller of Capital Issues, to issue new Rights shares on the basis of 1 for 1 Equity share at a premium of Rs. 3 per share. Similarly, the Directors have also decided to issue 9 per cent Preference shares to the extent of Rs. 8 lakhs; most of which are expected to be allotted to the foreign collaborators against technical 'know-how' and supply of plan and machinery.

THE STANDARD MILLS CO., LTD.

Registered Office:
"Mafatlal House", Backbay Reclamation,
BOMBAY-1.

NOTICE

NOTICE is hereby given that the Sixty-Sixth Annual General Meeting of the Shareholders of THE STANDARD MILLS COMPANY, LIMITED, will be held at the Registered Office of the Company at Mafatlal House, Back Bay Reclamation, Bombay, on Tuesday, the 16th day of May, 1961 at 4-00 P.M. (S.T.) to transact the business as specified in the Notice dated 31st March, 1961 already posted to the Shareholders of the Company individually.

By Order of the Board of Directors,
FOR THE STANDARD MILLS CO., LTD.

Managing Director's Speech

THE DUNLOP RUBBER CO. (INDIA) LTD.

MR. JOHN LUCKHAM'S REVIEW

The 35th Annual General Meeting of The Dunlop Rubber Co. (India) Ltd., was held in Calcutta on 27th April, 1961. Mr John Luckham, Managing Director, said:—

Gentlemen,

The Directors' Report and Accounts have been in your hands for some time, and with your permission I will take them as read.

THE YEAR'S TRADING:

Our Ambattur plant reached full production during the year and even with higher output from Sahaganj, we were still unable to meet the demand for our products. With the increasing demands of Government, vehicle manufacturers and transport operators, a difficult situation arose in the Replacement market for truck and bus tyres. In consultation with the Government of India we took a leading part in moves by the Tyre Industry to encourage the formation of Tyre Dealers' Associations to ensure equitable distribution of the sizes in short supply at list prices, and I am glad to say that the majority of these Associations have functioned efficiently and to the satisfaction of both Government and truck operators. The manner in which this task was carried out reflects great credit on both tyre dealers and consumers.

Our tyres continued to find ready acceptance with consumers and we were able to make increased supplies of our Highway truck and bus tyres, which proved extremely popular. Our car tyre remains the first choice of the discriminating motorist.

There was a further increase in bicycle production during 1960 and it became difficult to meet all the demands made on us for cycle tyres and rims. However, I am glad to say that we were able to step up our exports of cycle tyres to South East Asian markets and thus make a contribution to Government's export drive.

Sales of Industrial Rubber Products increased partly as a result of additional output from the Vee Belt expansion, mentioned in my speech last year. The equipment for an expansion of Conveyor Belting manufacture has been installed and trial production is in progress. With the increasing demand for this product during the Third Five-Year Plan, we are confident of utilising this capacity in full.

Dunlopillo sales showed a further gain but despite the substantially higher output achieved through increased productivity, we were still unable to meet the demand. The requirements of the car manufacturers show an upward trend and the fulfilment of the targets of the Third Five-Year Plan for vehicle production will necessitate an increase in our manufacturing capacity.

EXPANSION PLANS

You will see from the above that there is still a big demand for many of the Company's products which cannot be met, and the Directors have in hand a further major expansion of the Company's business, particularly in respect of our factory at Ambattur. This will require a substantial amount of foreign exchange and in order to arrange this a short visit to the U.K. was recently undertaken by myself and your Finance Director. I am pleased to say that, subject to Government approval, we are able to report that Dunlop Rubber Company Limited, London, are prepared to put the necessary sterling at our disposal initially in the form of a loan to be converted to equity capital at a later date. Negotiations and discussions with Government are now in

progress but the Directors are not yet in a position to put forward their recommendations regarding capital reorganisation.

RAW MATERIALS:

The consumption of natural rubber in India has been rising at a faster rate than production, and we are therefore increasingly dependent on imports. However, there are signs that long-term steps are being taken to improve production. Moreover the opening of the Government sponsored synthetic rubber factory in 1962 and the development of plans to produce locally other important raw materials such as rayon, rim strip, carbon black and certain rubber chemicals will greatly reduce the industry's import requirements, and so save foreign exchange.

FINANCE BILL, 1961:

The recent Budget proposals did not change the rate of Company taxation but they did enhance the amount of tax payable by companies through reducing the allowance in respect of Development Rebate from 25 per cent to 20 per cent. However, the increase in certain customs duties will have an adverse effect on costs whilst the relief in respect of excise duty on cycle rims will not benefit our Company. The introduction of a slab system for charging excise on cycle rims on the same principle as cycle tyres, would have been more equitable.

The reduction of the tax on bonus issues from 30 per cent to 12½ per cent is a step in the right direction but we are of the opinion that this tax should not be applied to Reserves created on account of Share Premiums.

PROFIT AND LOSS ACCOUNT:

The profit for the year after providing for depreciation, interest and taxation was Rs. 1,24,56,228 compared with Rs. 1,18,04,533 for 1959. As you will have seen from the Directors' Report, the profit after tax as a percentage to sales declined from 4.56 per cent last year to 4.08 per cent. This was almost entirely due to the high cost during 1960 of imported natural rubber, which we were not able to recover fully in our selling prices.

Excise duty is almost Rs. 1,72,00,000 higher than 1959 due to the higher volume of sales on the one hand, and the new levy of excise duty on cycle rims which was effective from 1st March, 1960, which accounted for approximately Rs. 59,00,000 of the increase. It is relevant at this stage to mention that the high excise duties leviable on our products absorb a considerable amount of working capital which earns nothing for the Company. This is a matter which is constantly under consideration by your Directors, and was represented to the Reorganisation Committee for Central Excise Duty when they visited Sahaganj recently.

The Tyre industry has borne a major burden of excise duty for many years and now the net has spread from the finished article to include certain raw materials, and has also been imposed on certain process materials inside the factories. The administrative difficulties and additional work which these latter extensions involve are considerable.

The amount of Bank Overdraft Interest this year has also substantially increased due to the higher working capital requirements arising from our increased trading activities and the increase in the rate of interest from 5½ per cent to 6 per cent from 1st October, 1960.

As you will have already observed, a sum of Rs. 17,00,000 has been transferred to Development Rebate Reserve and a sum of Rs. 37,50,000 is appropriated to General Reserve.

The Directors are recommending an ordinary dividend for 1960 at the rate of 21.5% subject to tax, which is the same rate as last year.

BALANCE SHEET:

The net increase in Fixed Assets during the year was approximately Rs. 22,00,000, principally on account of Plant and Machinery. Stock Inventories increased by Rs. 84,00,000 on account of the higher level of output and sales, coupled with the increased cost of raw material previously mentioned.

Investments have risen by approximately Rs. 2,00,000 due to increased deposits with the Madras Electricity System and the Railways.

Sundry Debtors have increased in line with the larger volume of sales, as have also the current balances with the Customs, Railways and other authorities.

On the liabilities side, the larger borrowings through bank overdrafts, usance promissory notes and acceptances have been necessary to finance the larger working capital required for the greater volume of output from both our factories.

INDIANISATION AND MANAGEMENT TRAINING:

In pursuance of our policy of progressive Indianisation of the Management cadre we continue to pay special attention to training which we regard as being of vital importance. Our staff must be kept fully conversant with the latest techniques and methods of manufacture and with future technical and production developments in the Dunlop Group. We are fortunate in being able to send selected personnel to our associated factories in the United Kingdom, Germany and France, and in recent months eleven senior employees from our factories have been overseas for this purpose. It is hoped that foreign exchange restrictions will not prevent us from continuing this policy.

There are also growing facilities for normal management training within this country and in particular I would like to express our appreciation for the good work which has been done by the Administrative Staff College at Hyderabad. We are taking full advantage of the opportunities which that institution offers and several of our Managers have already completed a course there.

EMPLOYEE RELATIONS:

Last year I mentioned in my review the labour unrest early in 1960 at the Sahaganj Factory. Since then I can report that labour relations there have been satisfactory. Established negotiating procedures have been followed, go-slow tactics have been discontinued, and discussions between Management and workers have been fruitful, particularly in respect of increased productivity, with greater reward to our workers. I am hopeful that our relationships with our employees in both factories will continue to be good, and that our future problems can be satisfactorily solved in the constitutional framework that exists.

We have worked towards building up a team spirit throughout our factory organisations, which will stand us in good stead in the future. Working and living conditions for our employees are regularly considered, and improvements have been made in welfare facilities and factory working conditions.

I believe there is a growing realisation that the Company's achievements are attributable to everyone concerned — shareholders, management and employees, whether in the factory or the office. All are inter-

dependent and the success and welfare of the Company relies on the contribution each one makes.

I am sure that you will wish to join the Directors in extending their sincere thanks to all who have continued to give staunch and loyal service.

NOTE: THIS DOES NOT PURPORT TO BE A RECORD OF THE PROCEEDINGS OF THE ANNUAL GENERAL MEETING.

A CORRECTION

THE MYSORE SUGAR COMPANY LTD., BANGALORE

The following two paragraphs 'A' and 'B' be read respectively before and after the Chairman's Speech published in the issue dated April 7.

'A'

Speech of the Chairman, Sri V. Venugopal Naidu at the 27th Annual General Meeting.

The Twenty-seventh Annual General Meeting of the Mysore Sugar Company Ltd., was held at the Registered Office of the Company at Bangalore on Thursday the 30th March, 1961, under the Chairmanship of Sri M. Mallaraj Urs — in the absence of Sri V. Venugopal Naidu, Chairman and Managing Director, who is on foreign tour. Moving the adoption of the Report and the Accounts, the Chairman made the following speech at the meeting:

(Speech published in the issue dated April 7.)

'B'

The Report and the Accounts for the year 1959-60 were adopted and a dividend of 30% subject to deduction of tax was approved. Sriyuts T. Shamanna and Dharmaprakasha L. S. Venkaji Rao, were elected as Directors in place of the two retiring Directors.

With a vote of thanks to the Chair, the meeting terminated.

BANGALORE,
Dated 31st March, 1961

T. HANUMIAH,
Secretary.

Company Meeting

JESSOP AND COMPANY LTD.

CHAIRMAN, SIR B. P. SINGH ROY'S ADDRESS TO THE SHAREHOLDERS AT THE 29TH ANNUAL GENERAL MEETING

Gentlemen,

It is with pleasure that I welcome you today at the Twenty-Ninth Annual General Meeting of your Company. For want of suitable and comfortable accommodation in your Head Office, it was decided to hold the Meeting in the Room of the Bengal Chamber of Commerce. I hope this meets with your approval.

As it will appear from the Board of Management's Report, the year ended 31-10-1960 was not free from difficulties. The early part of the year was badly affected by shortages of steel. Things are no doubt better now but we have a long leeway to make things really satisfactory. Though the availability of steel has improved, we find ourselves hampered by shortage of transport facilities both in bringing materials to our Works and in removing finished products. The shortage of foreign exchange also affects us as many other concerns.

A factor which affected the working of the year under review was the prolonged delay in establishing manufacture of the new BOX wagon which replaced the old four-wheel covered goods wagon which was one of our chief lines of production. Because of the shortage of certain components, which the Railways had contracted to supply, the outturn of these wagons in the year ended 31-10-1960 was only 145, representing sales value of about Rs. 61 lakhs. At such a rate of output production was uneconomical. It should be realised that these wagons replace an older type of which we had thirty years manufacturing experience so that production ran at over 2,500 a year, or about Rs. 300 lakhs. The effect on the working of the Company is therefore obvious. The position has since improved, and is still improving, but it has a long way to go before the old level can be reached.

Another factor affecting the year's working was the contract for Electric Multiple Unit coaches. This was an entirely new venture and like all new ventures, relatively unremunerative in its early stages when all the teething troubles must be overcome. With the rapid industrialisation of the country, a company like yours is expected to make its contribution to the development of our industries and in that connection the undertaking of new lines of manufacture by this company is not only desirable but essential.

We expect to complete delivery of the 18 Electric Multiple Units (3 coach) for Bombay in June, 1961. After some considerable delay we were given in June, 1960 a further order for 21 E.M. Units (3 coach) with two spare Motor coaches and 35 Special Trailers for Bombay. I regret to state that the import licence for the special electrical and mechanical equipment required has not yet been issued in spite of sustained efforts on our part. Until the import licence has been received it is not possible for us to place order for the equipment abroad and this means that there will be a gap in production of E.M.U. coaches of approximately 7 to 9 months. Apart from the dislocation this must inevitably cause in our Works due to break in continuity of manufacture, this short fall in E.M.U. production is even more regrettable at this time when there is a pressing demand for such coaches.

In order to fill the gap in production the Coach Works will take up the manufacture of Broad Gauge Motor and Parcels vans and Broad Gauge Well wagons. The expansion to the Coach Works which I mentioned in my address last year, is now nearing completion.

Much of the essential plant for the new Bogie Works, which has been set up to manufacture the all-welded bogie for the Box wagons, has now arrived and is being installed. Although further plant has yet to be received, we are now transferring manufacture of the BOX bogies to this Works and this should ease the load on the Structural Works where this work is at present carried out.

The demand for our diesel road rollers continues unabated and we are making strenuous efforts to raise production beyond the target of 200 rollers per annum. With this end in view we are setting up a new works on our own land in Dum Dum, which will specialise on the manufacture of road rollers and allied equipment. Apart from freeing capacity in the existing Structural and Mechanical Works where our road rollers are at present built, the new Works will be better equipped to meet the growing demand which will rise further with the tremendous increase in road building in the Third Five-Year Plan.

We have now finalised arrangements with our collaborators, Messrs. Aveling-Barford Ltd., England, to manufacture the transmission for our road rollers and the necessary amendment to our manufacturing licence has already been obtained from the Government of India. All the special purpose plants have been ordered from abroad and when these are finally received towards the end of the year, we shall be able to take up the production of the transmission and will then have achieved almost 100 per cent indigenous content as the engine is now made in Madras.

We are experiencing the greatest difficulty in recruiting skilled craftsmen for our Works. The shortage of skilled workmen is a factor which must retard expansion of the Engineering industry unless immediate steps are taken to train our young men along the right lines to meet the growing demand. This matter has been given the fullest consideration by your Board and it has been decided to extend the present Apprentice Training Scheme by setting up a Training School on land we have in Dum Dum.

You will have seen from the published accounts and the Board of Management's report that the Works' output during the year under review was Rs. 906 lakhs as compared to Rs. 648 lakhs during the previous year. This represents an increase of 40 per cent which, I hope you will agree, is a remarkable achievement in the course of one year. Owing to the still uncertain supply position of matching steel and of components, particularly those which have to be imported, it is rather hazardous to make a forecast of output during the current year 1960-61, but the trend of production in the first few months indicate that the year's output will probably increase by about 30 per cent over that of 1959-60. Our order book is excellent and the demand for our products continues to be good.

As you will have read in the daily press, there is an acute shortage of electric power prevailing at present and should the position deteriorate any further, severe cut in the supply to our Works may be imposed with most serious results. Your Board is watching the position anxiously.

Since my address was printed there has been further deterioration in the supply of electric power due to the closing down of the Cossipore Generating Station. We have now been advised by the Calcutta Electric Supply Corporation that from the 17th April, 1961, they have arranged to let us have our maximum power demand between the hours of 8-30 a.m. and 5-30 p.m. but no industrial power will be made available to us outside this period. This means that those sections of your Works which operated on both day and night shifts will be restricted to working on a single shift only. This will necessitate the laying off of several hundred workmen while output will be seriously affected.

I understand that while the immediate power crisis is likely to be relieved by the 8th May, 1961, no real improvement can be expected for a further 6/8 weeks.

I hope that no efforts would be spared to remedy this serious situation which would affect production not only of your Company but industrial output in general in this region.

As you must have noticed, the company's financial position has improved considerably in the last two years, but the continued rise in production and the need for expansion and rehabilitation are creating ever-increasing demand for additional finance. If, in addition, any important new line is taken up, demand for capital will be still greater. Your Board has, so far, avoided raising further share capital, which understandably would place additional burden on you, but I am afraid this cannot be postponed indefinitely. We have recently had the limit of our borrowing from bank increased by Rs. 50 lakhs. Our securities may be adequate for getting some more accommodation from the bank and we may succeed in doing so but this will be too inadequate for our needs. Moreover, it is not only desirable but essential to maintain a

proper balance between share capital and our borrowing.

In the Board of Management's Report the circumstances leading to the decision to buy over Jessops — Calcutta Ltd., London, and to convert it into a wholly-owned subsidiary of your company have been fully explained. The London company has become a wholly-owned subsidiary with effect from 27-3-1961. I need only mention here that the purchase of that company has been effected on very favourable and satisfactory terms.

The enactment of a law towards the close of 1960 regulating the payment of dividend on Preference shares has since set at rest the unfortunate controversy in this regard created by the Finance Act of the same year, although the solution is not wholly satisfactory from the point of view of the shareholders affected. For the financial year 1958-59 they received a gross dividend of 7.41% and a net dividend of 5% after deduction of income tax, whereas from 1959-60 onwards these figures will be 6.50% and 4.55% respectively.

Gentlemen, I would like to make mention of the most valuable asset your company possesses. I refer to the team of Staff and Workmen built up over the years and whose loyalty and hard work have enabled your company to prosper and grow to its present size inspite of some serious difficulties it had to face in recent past due to reasons well known to you. I am sure you would wish me to express our sincere thanks to all those in the company's employ who have contributed to the excellent results shown in the accounts before you. We are now about to complete the preliminary work necessary for the introduction of the incentive system at our Works, to which I referred in my address last year. As I then explained, this requires the most careful consideration as we handle a wide range of products.

Finally, I cannot close without referring to the retirement at the end of March this year of Mr. S. S. H. Sitwell, a Member of the Board. Mr. Sitwell has been in the company's employ for over 32 years and we will greatly miss his wide experience and guidance.

This does not purport to be a record of the Proceedings of the Annual General Meeting.

ARTIST'S IMPRESSION of the administrative building of ACC-VICKERS-BABCOCK LTD. in Durgapur

New Power in Industry

NERVE-CENTRE of ACC-VICKERS-BABCOCK LTD. in Durgapur

MARK THIS administrative building of ACC-VICKERS-BABCOCK LTD. which is fast nearing completion in Durgapur. Very soon busy design engineers, led by experienced men from AVB's overseas collaborators, will occupy the largest portion of it...giving initial shape to the power that AVB will add to Indian industry from its plant nearby.

This building will be the *nerve-centre* of AVB. Here the finest engineering minds will study, design and draw up plans that will 'tailor-make' mining and cement-making machinery, and vital steam-raising

plant for the many thermal power stations to be installed in the country during the Third Five Year Plan.

To ensure that steam-raising and industrial boiler plants give optimum performance, it is imperative that they be 'tailor-made' to suit varying local conditions and requirements. Here at this *nerve-centre*, all the advanced technical knowledge of AVB will be utilised *to the fullest extent*, to ensure that each project is designed for the finest possible performance.

...a Powerful Partnership for Progress

ACC-VICKERS-BABCOCK LTD.

16, Queen's Road Estate, Bombay 1.

CALCUTTA OFFICE: Ilaco House, 1 & 3 Brabourne Road, CALCUTTA 1

Works: Durgapur, West BENGAL

JWT:AVB 2141

SMARTNESS THAT MATTERS...

"Clothes make the man" says the age-old Proverb. They not only impart smartness but also give that air of self-confidence to a man which is so necessary in all walks of life.

The State of India's Payments

THERE has been resoundingly good news this week; the more gratifying because it appears at one of the weakest spots of the economy. This is the powerful shot in the arm that India's balance of payments are likely to receive by the two agreements signed on Monday by which the United Kingdom has committed herself to provide a credit of Rs. 53 crores for India's Third Plan. Of this, Rs. 13 crores is "free" immediately and, it is believed, that of the remainder, Rs. 20 crores will be 'untied' and will also be available for support of our current balance of payments. In this imaginative gesture, the United Kingdom's understanding of India's difficulties has shown itself in a practical and, perhaps, in a symbolic manner. It is hoped that it will provide an example for imitation, which is still the sincerest form of flattery. Of particular interest is the point that the loan is for a period of 25 years and no repayment of any kind is required till 1966 and there is also a further possibility of some years of "grace". Even if this transaction stood alone, it would change the sense of crisis in India's immediate payments problem. But there is also evidence that in the preliminary Aid-India meeting in April, the United States proposals for assistance for two years were substantially larger than previously envisaged, and, while many loose ends need to be tied up before the next meeting at the end of May, the United States outlook might be comparable in opportunity and understanding with Britain's.

It is possible now to review the state of India's payments in the light of concrete assistance that has come from Britain and the preliminary conversations in Washington which suggest a lively sense of favours to come. India's balances which were down in the week ending April 21 to Rs.

128.8 crores will receive about Rs. 10 crores "free" from Germany, and Rs. 10 crores from Britain and, therefore, will rise very early to Rs. 148 crores. Thereafter, the behaviour of the balances will be subject to the adverse payments in the lean months, and there will be need of utilisation of the British additional credit as well and some American untied assistance. It is a reasonable presumption that the balances will not go substantially below Rs. 110 crores at the end of the adverse period of India's trading account, which might be still October. Thereafter, there is some ground for the belief that they might recover in a few months to the figure of Rs. 150 crores. During the Third Five-Year Plan, this is likely to be the amplitude of movements of the sterling balances — about Rs. 150 crores in the good season and about Rs. 110 crores at the low point at the end of the bad season. If, in fact, the dimensions of the movement can be kept within these figures, they would permit of an import licensing policy similar to the one currently in force. One can look upon this conclusion with a far lighter heart than one could dare to present to the figures released in the first week of April.

It may be that the turning point in India's economy is also being reached on the rupee front. It has been noticed that the aggregate deposits of the banks were Rs. 20 crores higher than on March 31 in each of the weeks ending April 7, 14 and 21. This looks as though an auspicious season for the economy is arriving. At any rate the stock exchanges seem to have sensed the two hopeful indications of recovery on the foreign exchange and rupee fronts. It is hoped that they will not allow optimism and pessimism to overtake operations unduly. All in all, however, there is justification for subdued optimism in the light of the latest turn in economic events.

Laos: After the Cease-Fire

AT long last, fighting stopped on the vital fronts south of Vang Vieng in Laos on Tuesday night. On Wednesday "talks" on a general cease-fire were taking place according to General Phoumi Nosavan, but at the time of writing the precise nature of the decisions reached does not seem to indicate a final agreement on the line of the cease-fire. Nevertheless, the cease-fire itself is a temporary victory. The real danger is that this temporary success will lead the Indian public to believe that all is well in Laos. This is very far from being

the case. Much more will be heard of Laos, just as a good deal more is to be heard from the Congo. Indian opinion, which is now beginning to wonder whether the Congo venture has been worth the price, should be kept informed of the dangers of the Laos situation. Undoubtedly, the situation is different in that we have a greater interest in Laos which is nearer home. But, equally, the fact that the Cambodian Head of the State, Prince Norodom Sihanouk, has come out clearly with the view that he will not

lend his good offices for a settlement makes things more difficult, and it is probably true that the Laotian King's opposition to the proposed Geneva Conference makes the constitutional position of intervention very questionable. In the Congo at least, the United Nations was called in by what seemed at that time to be the highest constitutional authority. In the confusion which prevails in Laos, the King alone can be deemed to be the only constitutional authority of the State, and since the King is not a party to the Geneva Conference, one wonders how the Conference can decide on a solution without involving itself in intervention contrary to the principles of the United Nations.

On the other hand, even if the Geneva Conference is not held, the position is by no means stable. The Pathet Lao have used every day of their military advantage to control a larger, and more strategic, area in Laos. The cease-fire has thus found them in a position of strategic advantage. Should the King resist an agreement acceptable to the Pathet Lao, undoubtedly it will be in a position to resume hostilities and possibly to secure an overwhelming military success. It is not unlikely that it will suit the USSR to let the Pathet Lao reopen hostilities, should the King be unable to obtain a solution. It is extremely unlikely meanwhile that a Geneva solution will cut the Gordian knot.

The Nunmati Refinery: An Uneconomic Venture

THE Nunmati refinery, the first one to be set up in the public sector, will perhaps go down in the economic history of India as a monument to the colossal waste of the limited resources available for the country's development. The inordinate delay in setting up this refinery, as also the second one at Barauni, has already cost the country over Rs. 200 crores in foreign exchange. Had these two refineries been commissioned into production according to the world standards of utilisation of an oil reserve in two to three years' time after striking oil — Nahorkatiya oilfield was found to be commercially exploitable as long back as 1953 — India would have saved all this valuable foreign exchange. Apart from this loss, the cost of setting up the Nunmati refinery is also going to far exceed the original estimates. The refinery was expected to cost only about Rs. 11 crores — Rs. 13 crores if the cost of the township and water supply, etc., is included. This estimate has already been revised upward to nearly Rs. 19 crores and by the time the refinery, along with its township, is completed, another Rs. 4 to 5 crores would have been spent, bringing the total cost to approximately Rs. 23 crores. This cost by all standards is exorbitant for a refinery having a capacity of 0.75 million tons; probably with a similar investment a far bigger refinery—having nearly four times the capacity of the Nunmati refinery—could have been set up near Calcutta as recommended by the Experts Committee appointed by the Union Government in 1955 under the Chairmanship of Mr. S. S. Vashist.

The Vashist Committee's report today, perhaps, lies buried in some pigeonhole of the Union Ministry of Fuel. The report was not made public allegedly in "the public interest". This Committee, after careful consideration of all the possible sites for setting up a refinery to process the Nahorkatiya crude, including Gauhati, Barauni, Faqirabad and Tejpur, had unanimously recommended the putting up of a 2.5/3 million tons capacity refinery at Budge Budge, near Calcutta. The reasons put forth by the Committee for its

There are thus as many uncertainties now as there were at the beginning. It is a mistake to assume that a cease-fire, which merely removed current hostilities, in itself provides any solution. Nor is it clear that the physical presence of the International Commission in Laos — which the Russians have held should follow a cease-fire — contains much promise of success though there is no point in an International Commission's staying in Delhi once it has been formally appointed. It should go forthwith to Laos, but unwise hopes should not be attached to the physical presence of the Commission there. The Polish member of the Commission, independent as he has always been, will be subject to pressures, and, on the whole, the Canadian member will follow the British line influenced by American overtones. Since on matters of policy a majority decision will not be effective and unanimity is to be secured, India's third vote of the Chairman may be of no avail. Thus one can look upon the cease-fire with very little satisfaction. A way is now open for a long process of diplomatic manoeuvring for position, which means that Laos will be unsettled for many months to come. It is vital that India should not, in these circumstances, commit herself to a course of action which will depart from our strictly neutral position in the controversy.

selection of the site were sound indeed. The Committee, it is understood, had pointed out that apart from the considerations of setting up a refinery on the sea coast in line with the latest trends all the world over, Budge Budge had a distinct advantage in respect of availability of labour, construction costs, marketing of its products, etc. Besides, the requirements of the Assam region were already being met by the Digboi refinery of the Assam Oil Company, which after meeting these requirements fully was even exporting quite a good proportion of its products to the neighbouring States of West Bengal, Bihar, Bhutan and Sikkim. An added advantage of setting up a refinery near Calcutta would have been that the pipeline which was proposed to be laid for bringing crude from Nahorkatiya to the refinery could have been utilised at a later date, when the crude reserves of this oilfield had been exhausted, to transport its products to Assam areas.

All these weighty considerations were thrown to the winds and crucified at the altar of politics. The site chosen for the Nunmati refinery is not an ideal one. The Manager of the refinery, Major-General Sardanand Singh, makes no secret of it. This is also evident from the mounting cost of construction. The Nunmati refinery stands on soft soil in a seismic belt; to safeguard the structure reinforcing of foundations has had to be done at a tremendous expense. The cost of setting up the refinery has also gone up appreciably due to transport bottlenecks. The river transport and the ghats near Gauhati were not designed to handle heavy and over-sized equipment. The meter-gauge railway system that connects Assam with the adjoining States has also proved to be a big handicap in transportation of machinery and equipment for the refinery. The only advantage which was sought to be achieved by locating the refinery at Nunmati has also proved to be elusive. The main consideration that prevailed for selecting Nunmati as the site for this refinery was that it would have opened up new employment avenues for the Assamese. A visit

to the refinery would show that the labour employed there has been imported not only from the adjoining States of West Bengal and Bihar, but also from such far off places as U.P., Nepal and Punjab.

The transport bottleneck which the refinery will have to face in marketing its products can also not be ignored; the refinery will have to market its products for a considerably long time to come outside the Assam region. For this purpose, a products pipeline may have to be laid at an appreciable cost. Besides, the pipeline that connects the Nunmati refinery to Nahorkatiya oilfields will practically go waste in another 15 to 20 years' time; the crude reserves of Nahorkatiya — estimated at around 44 million tons — would be exhausted by then. In view of all these facts, one is inclined to infer that the Nunmati refinery will be an uneconomic unit whose cost of production may be anything up to 60 per cent higher than that of a refinery located at a more suitable site.

Confusion in Madhya Pradesh

DR. KATJU has invited upon himself the verdict of inability to steer the affairs of his State with a firm grip which any Chief Minister must possess. His stewardship is being challenged not only by the Opposition Parties but, often times, by those who are supposed to strengthen his hands and stand solidly behind him. Perhaps, he is not a solitary Chief Minister to find himself in this predicament. Others who are placed in a similar awkward position are victims of the machinations of adventurous aspirants to power. While Dr. Katju is not free from this menace, which plagues the Congress Party in many States, he has exposed himself to the serious and genuine charge that he is failing to keep himself armed with aids and resources without which no head of government can control and direct the administration of the State.

His blunder over Bastar has brought a bad name not only to himself but to the Government of India, which, acting on his advice, withdrew recognition from Maharaja Pravinchandra Bhanjdeo, the ruler of the tribal district. It need not be disputed that this ex-ruler has his own eccentricities — some of them intolerable. There could be no greater proof of his eccentricity than his quixotic threat to revive the Chamber of Princes. But they could have no more than nuisance value to Dr. Katju's Government. The irritation which he continued to cause after his deposition deserved only to be ignored. But instead, Dr. Katju took the hasty and impatient decision to put him under preventive detention, with the result that, when the State Advisory Board returned a verdict of no substantial grounds disclosed to justify detention, he had to retrace his step with loss of face.

It is not only in regard to the ex-Ruler that Dr. Katju has erred but he has erred in assessing the Adivasis too. Their opposition to a Government-nominated priest at Danteshwari in substitution of the ex-Ruler could have been easily anticipated. Apart from this highly emotional issue, the Adivasis have numerous economic grievances, like deprivation of free gains from the forest wealth of the district, which impelled them to muster in hundreds for a spectacular demonstration. The theory that these demonstrators (some of whom were under the influence of liquor) were hirelings is as stupid as it is hollow. Inferences about their intention to indulge in acts of violence were drawn too hastily and without sufficient warrant. The police of-

Nothing, of course, can be done now to undo the blunder which has been committed. The refinery is at an advanced stage of construction; it is likely to be commissioned by the end of the current year. There is, however, need to avoid such mistakes in future. Present is hardly the time for allowing politics to override all economic considerations. The money that could have easily been saved from this costly venture by adhering to the Vashist Committee's report could have been better utilised for putting up some gas-based industries in Assam. That should have placated the local politicians.

The Nunmati refinery suffers from another defect as well — and a major one. The refinery at present has only one distillation unit which will have to be shut for at least one month every year for overhauling. During that period this lifeline of valuable industrial fuel would go dry creating undue complications. It is hoped that a standby distillation unit will be provided at the refinery at not-too-distant a date.

officials, responsible for this serious miscalculation of judgment, resorted to firing on the Adivasi mass and the result was that the twelve fatal casualties at Lohandiguda made a deep scar on the hearts of these innocent people and generated intense bitterness and resentment. Bastar, although outwardly quiet is seething with unrest. There can be no question of the restitution of the ex-ruler, but it is crystal clear that assuaging the masses and removing the present feeling of unrest has now become a matter which will have to be tackled at a level higher than Dr. Katju's Government.

Mr. Nehru was brutally outspoken in castigating the Congress leaders of Madhya Pradesh for their lukewarm or neutralist attitude to the riots in Jabalpur, Saugar, and so on. But the reaction of these misguided persons to the castigation is best exemplified in the resolution which the Pradesh Congress Committee adopted on communal disturbances. The pacifying role which Congressmen played in these occurrences has been asserted and a scape-goat has been made of officials who have been censured for their "inefficiency, slackness and untactful handling of the situation."

Conflict between the ministerial wing and the organisational wing which has now become chronic in the Congress Party is the curse of Madhya Pradesh also. The PCC Chief, Mr. Moolchand Deshlehra, has been an active rival to Dr. Katju and if collecting of signatures against the Cabinet Ministers is freely resorted to by the PCC, it is only one of the weapons of harassment used against the Chief Minister. In Madhya Pradesh regionalism is a great source of worry and weakness. The Gwalior region (virtually co-extensive with the former Madhya Bharat) and Vindhya Pradesh bear a grudge of subordinate treatment at the hands of the dominant group from Mahakoshal. Extreme demands continue to be made on the Chief Minister, including regional representation on the Cabinet. It is no argument to urge that Dr. Katju can bear no responsibility for these root causes of the mess that is witnessed in Madhya Pradesh. It was precisely to curb factionalism and regionalism that the High Command relieved Dr. Katju from the Central Cabinet to wear the difficult mantle in the former Madhya Bharat. Who can say that he has measured up to expectations? His age and health make it all the more necessary that a careful search ought to be made to effect a change at the helm of affairs in Madhya Pradesh.

A DELHI DIARY

FROM PRECEDENT TO PRECEDENT

IF procrastination is the thief of time, may it be that procrastination is also the solvent of some political tensions? Perhaps for this reason the Prime Minister — the supreme doctor of the Congress Party's choice — has decreed that elections for the Deputy Leaders — not one but two — should be held only during the next session of Parliament. There is here not any religion of escape, but, as I have discovered, for the first time, a policy broadening from precedent to precedent. Quite unknown to me — such is the state of my ignorance — history provided a solution of the current tangle ten years ago when Maulana Azad agreed to allow Mr. Gopalaswami Iyengar to be a Deputy Leader of the Party in another House. Thus, it comes about that in deciding to have two Deputy Leaders, the Prime Minister has not invented a device which keeps both Mr. Jagjivan Ram and Mr. Morarji Desai in the field, but merely revived a solution which looks as though for all time it will continue to provide dual deputy leadership. Thus, in the best of all possible words, procrastination and precedent have effected a temporary solution of the kind which I described last week as a buried tension.

As to exactly what is buried, my friends keep on giving me their own analyses of the extraordinary situation which arose before, and, in a sense, after, the Prime Minister cut the Gordian knot on Monday. Some of my friends tell me that this is a purely "personal" contest for future leadership of the Congress Party. Others tell me that it is a conflict between the Right and the Left, since rumour has it that Mr. Krishna Menon has been working behind the scenes for Mr. Jagjivan Ram, and so, they say, has been Mr. K. D. Malaviya. In some (undefined) sense, they are scions of the Left. I have not been able to verify either of these statements and I publish them here as hearsay for anyone to question. Finally, there is the suggestion that the contest is not a personal one or a Right and Left one, but a straight issue of Hindi-speaking areas against non-Hindi-speaking areas. Uttar Pradesh and Bihar cannot, it seems, be easily relegated to a subordinate position in the future scheme of things, and, therefore, it appears that claims must be contested here and now to every senior office in the Congress Party. It is possible that not one, but all three, of the aforesaid factors are operating. But one can be a journalist in Delhi and earn one's living the hard way — as I do — and be blissfully ignorant of these undercurrents which my friends clearly see, but which I am unable to locate. All in all, however, the events of the last fortnight have left in me, as in most people here, a sense of deep disappointment that the struggle for power should have reached the lengths that it has done while the Prime Minister is still here to warn and admonish. Even his declaration that a Deputy Leader of the Party was "unimportant", failed to vacate aggression, if I might so describe the operations that have sullied the fair name of the Congress in this capital city. But, perhaps, democratic politics is like that, and the best way to settle an issue is to face a hard election with a certain amount of hard feeling, before and after. Only it seems to me that none of the hard feeling will disappear when the approach is as emotionally powered as it was on this occasion.

FAITH ABROAD

I must move to a happier subject. This is the expression of the faith that we have received this week from the United Kingdom and the United States (the latter a little vague still) in respect of the financing of the Third Plan. The noises that I hear from afar sound too good to be true, but the two agreements signed by Sir Paul Gore-Booth and Mr. L. K. Jha, our Secretary for Economic Affairs, last Monday, are con-

crete enough. "The Eastern Economist" has said its piece separately, but I insist on saying a slightly different one. This is that India's foreign exchange for the Third Plan, which seems to have caused much anxious concern, is likely to be the lesser of the two gaps on which our progress is poised. The greater crisis is disorderly development with inflation which, to my mind, is a more dangerous disorder than the merciful restriction of the Plan by the absence of foreign exchange in a "rush", with printed rupees overflowing. Ordered development is, according to Colin Clark, a much better kind of growthmanship — happy word! — than the 'hit and run' methods which we tend to adopt when we get good gusts of fortune in the form of foreign exchange windfalls from abroad. In the Second Plan, for example, the cutting back of the Plan in 1957, particularly in transport, was a major disaster as anyone who has studied the current movements of coal can abundantly illustrate. I am hoping very much, now that some foreign exchange has arrived, it will not be eagerly seized by all and sundry so that we will have nothing left to utilise on expanding transport and power (or is it power and transport?). Who, having gone through the last fortnight in Delhi, (and I am told a somewhat worse fortnight in Calcutta) can fail to appreciate that power is, in our age and time, the only manna from Heaven? Let us not make a mistake, particularly in mid-summer, and bring in any amount of machinery in any industry in preference to power, if it means shutting off fans in the middle of the day and lights at dinner time. I propose nothing more or less than a hard core in the Third Plan in which the power targets shall be raised by 20 per cent while everybody scrambles for the remainder. The most important thing to be done in the revision of the Third Plan is to capture the economic heights again, and to let fierce competition fight for the leavings. No doubt, in the socialist pattern of society, this will be described as the worst form of competitive capitalism, but I still think that rationing by the market is much better than that by decree of the Planning Commission. If power is short, everything else stagnates. I might say it is the second stage of that profound truth — "where wealth accumulates, men decay".

FROM BEARS TO BULLS

The week, I am told, has led to a massive onslaught by bulls on bears. I am neither myself a bear nor a bull and cannot describe the experiences incidental thereto, but careful reading of economic journals seems to suggest that Indian bulls are working on the side of history. There is bullish fever in Wall Street following, it seems, a purely negative point, the absence of a deep recession, and stock markets are even going up — inexplicably — after Cuba. In Britain there has been a tonic in the form of Mr. Selwyn Lloyd's Budget, although, as a good economic historian will tell you, the upward movement began long before it. Can it be that, when the whole international world is getting cloudier and cloudier, the business world thinks that the new worlds to be conquered in outer space suggest that some momentous technological expansion of markets is imminent?

THAT MYSTERY OBJECT AND THE LOO!

From the mysteries of high finance — foreign exchange and bull-bear business — I only ask a question in regard to the mystery object seen by residents of Diplomatic Enclave at 11 P.M. on Monday. It was not a shooting star or a flying jet; what was it? I am deeply concerned. Signs and portents are appearing too close to me for my comfort. I am, therefore, leaving Delhi shortly for a long vacation; I wish my Delhi Diary readers luck; they'll need it. The Loo also — here she comes!

ARGUS.

THE WEEK'S NOTES

Birth Centenary

RABINDRANATH TAGORE

ON MONDAY, May 8, Rabindranath Tagore's birth centenary will be celebrated all over India and also in several other countries. The spontaneity and enthusiasm with which the celebrations are being organised form a tribute to his literary excellence and to the philosophy of life which he propagated and practised. If "Gitanjali" brought him into the limelight of world fame, there are Tagore's other works which are no less shining. His published verse and dramas, we are told, amount to 150,000 lines, or their equivalent; while his non-dramatic prose—novels, short stories, autobiography, criticism, and essays of many kinds—is more than twice as much; and there is a mass of uncollected material which is being periodically released through the "Visvabharati Quarterly". He was a life-long devotee of Nature and her beauty in countless forms and to him Nature was an open book from which he could draw endlessly. With him it was a passion to interpret the varied and ever-changing moods and forms of Nature to which he gave concrete expression in prose and verse. It is this innate quality which has enabled him to hand down to his own generation and generations to follow a wealth of ideas, dreams and thoughts. This invaluable legacy has been a profound source of joy and inspiration to thousands in this country as well as abroad.

The most apt description of Tagore can be found in Nehru's "The Discovery of India" where he says: "Tagore, the aristocratic artist turned democrat, with proletarian sympathies, represented essentially the cultural tradition of India, the tradition of accepting life in the fullness thereof and going through it with song and dance..... Tagore was primarily the man of thought..... he had a world outlook and was at the same time wholly Indian". Rabindranath's personal creed and conviction are best told in his words: "There are two things you must carry with you everywhere as an old student of the Visva-Bharati. Never give up your freedom of mind to friend or foe. Keep the windows of your mind open and free. Fanaticism is death to the human mind. And secondly, never think of any man, however little he might appear, as anything less than a man, a member of the great community of mankind, and never, as the member of a caste or a community or a nation or a race". It was his constant endeavour throughout his long life of eighty-one years to bring the message of love and peace to a world torn by greed, jealousy and rivalry. His faith in the essential oneness and indivisibility of humanity and in the 'one world' ideal was unshakable. His God is with and within man in the vices and virtues, in the sorrows and sufferings, in the dust and dirt of his daily life. In his vision, God and man merged to make a complete entity. Man was to him the most sublime of all truths, the apex of God's creation. He looked forward to the opening of a new chapter in man's history with the spirit of service and sacrifice.

MOTILAL NEHRU

TOMORROW, MAY 6, marks the end of the week-long birthday centenary celebration to honour the memory of one of the foremost builders of Free India — the late Pandit Motilal Nehru. He lived the full biblical span of life of three score and ten. His association with politics dates to the early part of his career at the bar, but his association with the Indian National Congress goes back to 1892 in which year he appeared on the Congress platform as a member of the reception committee at the organisation's session at Allahabad. With Gandhiji's emergence on the political scene came

his conviction that the country was ripe for mass struggle and he showed the heroic spirit in him in discarding without the least hesitation his adherence to the moderate creed and plunging into field of battle ready to take any risks as a deliberate choice. In 1921 the entire country was moved by the noble spirit of sacrifice of this Amir, who, overnight, became a Fakir — in the service of his nation and his people. For a full decade until his death he was second to none in guiding the destinies of the freedom struggle, of course, with the exception of Gandhiji. Anand Bhavan at Allahabad, which he handed over to the Congress, became the hub of all political activity. Motilal Nehru fought many a constitutional battle with the British Government inside the legislature, but it is by the battles he fought outside that he will be remembered more in history.

His heroic spirit was matched by honesty and candour. In 1930, without the least hesitation, he confessed to a sense of failure in promoting unity between the two major communities in the country. Next to freedom, no cause was dearer to his heart than that of communal unity. In an age where religious prejudices vitiated the national cause, he had the vision to see that not religious differences but economic grievances were really at the root of disunity. The message which he gave, only a year before his death, to base Hindu-Muslim unity on an economic basis should ring clearly even today when the elusive problem of communal unity is demanding the most anxious attention. It is only proper that the Centenary Committee is raising a fund of Rs. 10 lakhs in his memory to institute an annual award of Rs. 5,000 to a national of this country who makes the greatest contribution to the cause of promoting Indian unity.

Uttar Pradesh

THE ELUSIVE ACCORD

THE MANNER in which Mr. C. B. Gupta is facing the logical consequence of his elevation to the office of Chief Minister of the State should give enough cause to the High Command to grow wiser — and perhaps sadder. Under the Congress constitution Mr. Gupta cannot simultaneously hold the two top positions of Chief Minister of the State and President of the Pradesh Congress Committee. After his capture of the position of Chief Minister it is obligatory on him to resign the office of President of the PCC. This rule of disqualification to hold two posts simultaneously in the Ministry and the PCC executive also applies to Mr. Gupta's lieutenant, Mr. Mangla Prasad, who is the General Secretary of the PCC and also a Minister in his cabinet. The Congress President has addressed a strongly worded letter to Mr. Gupta reminding him bluntly that the moment he accepted the office of Chief Minister he ceased to be the President of the PCC and the same position arose in the case of Mr. Mangla Prasad.

Nevertheless, the indomitable Mr. Gupta has deliberately chosen to take his own time to decide when the formal election of new office-bearers in the PCC should take place. Here it must be recalled that since the two secretaries of the PCC are the nominees of the President of that Committee, their reappointment also becomes necessary. Mr. Gupta has taken time to entrench himself in the PCC even when he would not formally be in it. He has agreed to Mr. Nehru's nomination of Mr. A. P. Jain as President. Naturally, the General Secretary ought to be chosen with the consent of the PCC chief. All along Mr. Gupta has attempted to create the impression that he is relinquishing his hold on the PCC by giving up the

office of President, but at the same time he has been insisting with unusual perseverance that Mr. Mangla Prasad should remain the General Secretary. It is only now as the date of the PCC meeting — May 15 — is approaching that Mr. Gupta is reconciling himself to the inevitable. He has given up his untenable stand as regards Mr. Mangla Prasad as General Secretary and, according to reports, he has reached an agreement with Mr. A. P. Jain to the effect that the present two secretaries would retain their positions. Whether this is the result of an accord or of Mr. Gupta's uncompromising attitude can be anybody's guess. Mr. A. P. Jain's capacity to function effectively as President of the PCC will depend in a substantial measure on the calibre of the new General Secretary to withstand, whenever occasions arise, the pressure of the two secretaries who enjoy the blessings of Mr. Gupta. Mr. Gupta has managed to take enough time to consolidate his position inside the PCC and he has rushed forward with the appointment of many of the district observers for the forthcoming general election. But the dissident group of the ex-Ministers (in the Sampurnanand Cabinet) obviously will not oblige him and diplomacy for accord will now shift to the controversial issue of nominations of district observers.

The Congo

TURN OF THE TIDE ?

MR. KASAVABU'S bold bid to seek the greatest measure of agreement, among the three factions in the Congo which really count, by free discussion at the round table conference convened at Coquilhatville was certainly a brightening feature in the tedious drama of politics in that trouble-torn country. The preliminary talks between the parties to explore the area of possible concord, which normally precede any round table conference, were not held by Mr. Kasavabu. This crucial fact easily explains the subsequent developments at the Coquilhatville conference which have completely stalemated the talks. Mr. Gizenga, the leader of the Lumumba group, who is in a position to deliver the goods within his sphere of influence around Stanleyville, has not so far participated. Not much is known about the success which has attained Mr. Kasavabu's efforts to ensure his co-operation.

But at the very outset of the conference it became clear that Mr. Tshombe was absolutely in no mood to tolerate Mr. Kasavabu's agreement with the UN authorities for removal from the Congo of any foreigners (advisers, mercenaries and the like) who are there without the authority of the UN. His vehement denunciation of this agreement was the signal for an endless war of debate at the conference. It was quite evident that Mr. Tshombe would not surrender his claim to his supposed independent status in Katanga and hopes of bringing him round to the acceptance of a really effective central government authority emanating from Leopoldville have receded further than before. Nevertheless, his Belgian advisers who had accompanied him to Coquilhatville were put under arrest. Then followed quick developments culminating in the detention of Mr. Tshombe under military guard. The only liberty allowed to him was that of attending the round table conference. He continues to remain under detention at Coquilhatville as officially disclosed on behalf of Mr. Kasavabu.

With only one party left to operate freely at the conference, it is not at all clear what purpose it may serve. Even assuming that Mr. Tshombe, conducted to the conference under the Central Government's military guard, "participates" in the talks and an agreement is evolved, it will be of little effective force as any agreements obtained under duress can be. The Katanga Government can at any time repudiate it and that Government's strong man, Mr. Monongo, the Minis-

ter for the Interior, is there to do what Mr. Tshombe is prevented from doing. This is not to blame Mr. Kasavabu for the turn of events as it has actually taken, for it should be easy to appreciate that the course which has been adopted under his name was conceived and carried out by Col. Mobutu. In fact, report at one time had it that the Colonel had put even Mr. Kasavabu under arrest. This well meant turn of the tide to keep the Congo middle of the road and free from pressures either from Belgium or Russia has come to an abrupt stop. But the situation in the Congo goes on changing only in an atmosphere of confusion and it may be that Mr. Tshombe may see reason to abandon his untenable attitude backed by an external sanction.

Legal Practitioners

CONSOLIDATING THE LAW

THE DISCUSSION in the Lok Sabha on the Bill to amend and consolidate the law relating to the legal practitioners, the Bar Councils and the constitution of an All-India Bar was inspired by the basic urge to elevate the dignity and status of the profession of law. A forceful expression of his urge was the unanimous support given to the demand that the Chief Justices should be associated with the Bar Councils. But this issue was pre-judged by the judges themselves. Mr. A. K. Sen informed the House that the decision of the Chief Justices not to participate in the Bar Councils was communicated to him while the Bill was pending consideration before the Select Committee. Nothing could be done at this stage to alter the situation. Here it would be pertinent to ask how far the English precedent in this behalf and the purpose behind it could have been of value to India. In Britain the association of judges is highly cherished to raise the dignity of the Bar Councils and the profession as also to create an atmosphere, following the example of the judges, to keep the members of the profession aloof from involvement in politics. It is an undisputed fact that the association of the judges with the Bar Councils would have undoubtedly gone to raise their dignity. But about isolation from politics, it is difficult to be confident that this object would have been achieved here in India. On the other hand, it is likely that the partiality for politics might have possibly spread from the bar to the bench. Already, there are reasonable grounds for misgivings that a questionable convention is sought to be created. The Government's policy of conferring diplomatic and political assignments on retired High Court judges is bound to exercise positive, though indirect, influence on the judges about their likely post-retirement prospects in this novel sphere.

As for the financial status of legal practitioners, on which their position as props of justice depends, views were expressed in opposite directions. At the one end, there ran the argument that ceilings should be placed on the fees, and therefore on the earnings, of practitioners on the ground that justice should be made cheap. This argument rests on two apparent fallacies. First, it is wrong to presume that a ceiling is desirable and can be enforced on legal practitioners' earnings and that talent could flourish in an atmosphere where incentives are choked up. Second, it is an error to think that the high cost of justice is due to the fees payable to advocates. At the other end came the suggestion that a monthly emolument of Rs. 150 should be paid to each beginner advocate for a period of five years or until he commands practice sufficient to bring him within the application of the Income-tax Act. Charity would most assuredly strike at the root of dignity. Further, there is no reason why the legal profession should be singled out for such a privilege in discrimination against other professions of value to the society. It was appropriate that both the viewpoints were rejected.

The World Abroad

QUESTION MARKS OF INDIAN HISTORY

By ODYSSEUS

ALTHOUGH BRITISH RULE in India ended fourteen years ago, British interest in India, measured in terms of the spate of books that continue to be published about all aspects of Indian history and civilisation, is perhaps greater than ever before. The latest addition to the overflowing library of British books on India is Mr. Michael Edwardes's "History of India From the Earliest Times to the Present Day". (Thames & Hudson. London. 1961. Price 45sh.)

Is there anything new to be said about Indian history? Yes, because all histories of the past are meant to answer the questions being asked in the present, and as values, judgments, and interests, change with every generation, no definite history, putting the past into perspective once and for all, can ever be written. No history would be written if the historian were merely trying to slake our thirst for knowledge or facts. That Aurangzeb held Sivaji captive in Agra is a fact. But facts are of no value unless they are interpreted. Once interpreted, they offer an enrichment of the spirit, which leaves the reader better equipped to enjoy, or a lesson which enables him the better to cope with, the realities of contemporary life. The degree to which he is better equipped depends on the experience of men and affairs and the judgment that the historian is able to bring to his interpretation. The best histories are, of course, written by those who approach their subject with the detached interest of the academic scholar, but I hazard the guess that the best of the best histories have not been written by men who have been nothing but scholars all their lives. For example, before Macaulay published his great History of England in 1839 he had been called to the bar, had been a Member of Parliament, and Law Member of the Government of India. Among modern historians the late Louis Namier saw active service in the 1914-18 war, and was a member of the Foreign Office for several years, while the late Maulana Azad brought a life-time of experience in politics and public service to his writings.

An historian amasses vast arrays of facts in his researches. From these he selects what he regards as of interest to his readers, i.e., as relevant to the questions that press on us today. As the German historian, Max Weber, said, each historian not only asks his own questions but chooses which he will ask from a variety of possible questions. Because men feel dissatisfied with the choice of questions and the explanations that satisfied their fathers and seek to uncover new meanings for themselves, history is subject to continuous re-interpretation.

A CURIOUS FACT

It is a curious fact, which opens up vistas of interesting speculation, that (prior, at any rate, to the advent of the British) India's chief literary class, the Brahmins, were not much interested in the writings of history. As Mr. Edwardes observes, quasi-historical works do exist, but they are usually half romance and half history, in which it is difficult to decide which statement refers to the real and which to the imaginative. Most contemporary, pre-British, Indian historical material comes from Greek, Latin, Chinese, and Muslim writers.

I throw out the suggestion that Hindus felt little urge to ask questions of their past because the cohesiveness of the caste structure acted as a steel frame which preserved the peoples of India socially amidst the political vicissitudes of rising and falling kingdoms. As a broad, and certainly over-simplified generalisation, I suggest that the Indian social structure's powers of absorption over all foreigners, until the British arrival, removed incentives to seek explanations of present woes from the past.

But, as has often been observed before, the difference between the British and other foreign invaders was that the British did not settle in India and, retaining their links by sea with their own civilisation, had also the material strength to impose profound changes on the centuries-old Indian pattern.

The first to feel the need to tackle the riddles of India's past were 18th century British administrators, like Warren Hastings, who asked in effect "What is there in India's past which can help us to solve the problems of our relations (a) with the peoples inside our territories and (b) with the other powers in the subcontinent?" Next, the early 19th century British writers, Elphinstone, Montgomery Martin, Thornton, Keene, James Mill, Wilson, and others, asked "What lessons does Indian history suggest that would render our administration more efficient?" If you are interested in the questions that they asked, and the problems they were trying to solve, and the remarkable degree to which their influence persists in the institutions of Indian government and law today, read "The English Utilitarians in India", by Eric Stokes (Oxford Univ. Press. 1959).

The impact of the British on India gave rise to nationalism which sent Indians in search of their own past to answer such questions as "Why did we fall victims to foreign conquest? What glories did the foreigner destroy?" and British historians to ask "What right have we to be in India?". It is a salutary warning to the guileless non-specialist reader, who believes whatever he reads because it has achieved print, to recall that the Indian answers were often, consciously or unconsciously, conditioned by the urge to compensate for the doubts and difficulties of the present by conjuring up visions of past "golden ages" like that of Asoka (273—232 B.C.) and Chandragupta II (384—415 A.D.), in which the land flowed with milk and honey, and that the British answers were often conditioned by the thought "Will this make for easier and quieter government?".

As British rule drew to its end, the polemical note begins to die down and we get such truly great historical landmarks as H. G. Rawlinson's "Cultural History of India" (1938), whose answers are likely to remain topical for years to come, the splendid researches of late Sir Jadunath Sarkar, and the brilliant canvasses of Sirdar K. M. Panikkar.

THE END OF BRITISH RULE

The end of British rule evokes new questions. Mr. Edwardes is one of the new generation of British writers who ask "What is there in Indian civilisation which

can enrich our own culture? What has been the impact of Britain on India and of India on Britain? What justified our presence, what our departure?" and of Indian writers, such as Professor S. R. Sharma, who seek directives for independent India's future, in such admirable works as "The Making of Modern India" (Orient Longmans, 1951).

Mr. Edwardes says that, faced with 5,000 years of Indian history, too many books consist of collections of dynasties with value-judgments attached to names here and there, so that the people of India disappear from view, and he proclaims his intention of recapturing the life of the people within the framework of political events. The result is an honourable failure. Mr. Edwardes's effort to cram political, cultural, and economic developments into 350 pages leads to such compression that he too often becomes a mere compiler of facts, which, without interpretation, are difficult to follow and impossible to remember, and he has recourse to the cryptic value-judgments which he rejects. With so vast a panorama, the historian must choose whether to write a political, economic, or cultural history, and allot himself space enough to give meaning to his choice. Mr. Edwardes's heroic attempt at the impossible is all the more to be regretted in that he has read widely and his observations are often penetrating.

Among Mr. Edwardes's merits are his many extensive quotations from contemporary sources not always available to the general reader. Thus, he quotes the colourful description given by the Chinese pilgrim Hsuen-tsang of King Harsha's great religious synod at Kanauj in A.D. 643, and, from the Padsha-nama of Abdul Hamid, culls a day in the life of the Emperor Shah Jahan, and offers a varied anthology of 19th century writers. It is true that the people of India do emerge from time to time in his pages, but they are too often sandwiched between long political

synopses. One of the most fascinating descriptions of the life of the peasantry around Delhi district in the late Mughal and early British periods is in Percival Spear's "Twilight of the Mughals" (Cambridge Univ. Press, 1950.) As further editions of Edwardes's handsome volume, with its 127 superb photogravure illustrations and its 21 useful maps, are likely to be called for, I urge him to include an extract from Spear in his anthological pages.

To any newly arrived member of Delhi's ever changing diplomatic enclave, or to any visiting expert, who wishes to grasp much of the significance of the contemporary Indian scene that will otherwise escape him, I commend the following introductory histories of India, which each have their special excellences:

"A Short History of India", by W. H. Moreland & A. C. Chatterjee. Longmans Green.

"A Survey of Indian History", by K. M. Panikkar. National Information & Publications. Bombay.

"The Rise and Fulfilment of British Rule in India" by E. Thompson & G. T. Garratt. Macmillan. Although published in 1935, this remains unbeatable in its own sphere.

Of biographies of Mr. Nehru there are scores. My choice is that by Michael Brecher (Oxford Univ. Press, 1959). Every historian has his bias, as we have noted, but I forgive Mr. Brecher for what I regard as his bias because of the scrupulous footnotes in which he indicates his sources. Mr. Brecher's book is set in perspective by the references to Mr. Nehru in Maulana Azad's "India Wins Freedom" (Orient Longmans, 1959)—a fine book by a great man.

Finally, get hold of Mr. Edwardes's new history, as a bedside book to dip into.

The European Scene

THE DEGRADATION OF AN ARMY

From Our Special West European Correspondent

PARIS, April 30.

THE French Army this month reached the lowest point of degradation by inflicting on itself a humiliation more severe than the most abject defeat in war: the loss of its own unity and the denial of its *raison d'être*, obedience to the State. An army that raises the flag against the Law, that divorces itself from the nation and that fragments into rival bands has repudiated every article of the military code of honour, debased the career of arms and destroyed the foundations of its own efficacy. From this pitiful condition, the French Army will take many years to recover for it will need time to regain the confidence of the rest of the nation and more time still to put meaning back into the clichés about service and obedience that constitute much of the rather frugal morality of the soldier. Amid the carnival of anti-militarism that is beginning in this country, it is perhaps too bold an enterprise to seek to explain, without seeming to apologise for rebellion, how an army with a long tradition could be brought to such a pass. Yet unless it is to lapse into the twin follies of pacifism and anarchism (which even the present Indian Government declined to do, despite its Gandhian heritage), the modern state must rehabilitate, in its limited sphere, the military morality that a demagogic anti-militarism condemns.

It would be too easy to point out that France was saved from her soldiers last week only by her soldiers, and notably by the greatest of them. General de Gaulle's rather exiguous mental furniture, with its antique curios about glory, prestige and national honour, is in fact the product of the military code, and it was all that stood between France and the factious generals last week-end. They would have made short work of a Cabinet of ordinary politicians, such as crumpled up before a similar threat in 1958. The "masses", to whom interested demagogues are now generously awarding the credit for the victory, would have provided no obstacle — except in so far as they became the vehicle for the arrival of a Communist dictatorship. Leaving aside the recourse to a popular uprising, which in present circumstances could only have meant the installation of the Communists, the sole opposition to military insurrection was the prestige and the characteristic prejudices of another soldier.

Though this consideration precludes the most facile people-versus-army sort of anti-militarism, it leaves it to be explained how the military caste came to be so divided against itself as to endanger the State, all the nation's interests and the security of its neighbours. No doubt, the official case as it will be presented in coming weeks will be to stress the limited number and restricted audience of the factious generals: they could do little more than seize a radio station and a few offices and even then only with the aid of the Foreign Legion and for four days at that; most of the Army remained loyal, the crazy enterprise was doomed to failure, etc. However, much of this is wisdom after the event and it is possible that events could have taken another turn. An escapade that depends on winning the allegiance of wavering officers is naturally

decided in the first few hours, when sheer chance can determine whether the flames spread like wildfire or remain localised to burn out quickly. It is no explanation, when the enterprise fails, to claim it was never serious. No Frenchman can be content with the story that the whole affair was the desperate gamble of a handful of eccentrics, for one knows only too well the forces that were ready to back them at the first sign of success. Foreigners above all, will inevitably identify the whole nation with the crimes committed by men wearing her uniform and her highest honours.

This is just. For no matter how infinitesimal the minority that the rebellion represented, the whole nation owes an accounting for the fact that it was led precisely by its eminent servants whose uniform and rank symbolise in time of danger the ideal of national unity. In such an accounting heavy responsibility must be placed on just those democratic politicians who today are most scandalised that the Army could forsake its tradition of unquestioning obedience to the State. The soldiers' morality, I have said, is a frugal one and indeed it consists in a single article, obedience, on every occasion and to the neglect of every other consideration, even of life and limb. We who follow other callings are entitled to consider this simple and ancient morality too elementary, even stultifying, but if we are to live behind the shelter it provides — and above all if we are to use and exploit it as politicians do — we need to respect it and know the limits to which it can be driven.

None of this was done by the democratic politicians who for 15 years have been throwing the French Army into one absurd venture after another, sending it to wars that could never be won, requiring it to win military victories that were at once turned into political defeats, using the devotion of soldiers to cover the stupidity of politicians — and then throwing up their hands in surprise when at the end some generals refuse to obey. It is indeed the role, and the honour, of the Army to be the mere instrument of the civilian power. Yet that "instrument" is composed of living men, whose notion of honour, and sensitivity to humiliation, may be simple, but are at least livelier than those of politicians. Shut them up for 15 years in the nightmare world of senseless colonial warfare, ask them to do the impossible and then tell them it was useless anyhow, exile them from their country by shifting them from one hopeless colonial struggle to another, degrade their function from that of warfare to the role of police and propagandists, politicise their officer corps by entrusting civilian administration to them, demand obedience to a series of ephemeral and contradictory Cabinets — and you have created the conditions for a military putsch.

The very type of such politics was the Suez expedition. Conceived, bungled and aborted by politicians whose flexible morals allowed them to be merciless to little Egypt while they cringed before great Russia, this expedition was brilliantly executed by British and French soldiers for whom, from the strictly operational point of view, the conquest of Port Said was a victory

India

Huge Nylon Igloo for Delhi Fair: One of the most intriguing items at the Indian Industries Fair at Delhi in November will be a huge nylon "airhouse"—an igloo-like skin of tough coated nylon fabric which literally has no visible means of support. It is held up solely by a constant supply of low pressure air blown in by electric fans. The airhouse on show will measure 70 ft. by 40 ft. by 20 ft. but bigger ones can be made. It is light in weight, easy to handle, folds into a compact bundle for storage and transport, is completely waterproof and extremely strong and durable. Absence of supporting poles makes it particularly suitable for temporary warehousing, travelling exhibition, emergency hospitals and so on. In Britain a house has been built beneath one. The airhouse at the Delhi Fair will be shown by British Nylon Spinners Ltd., the largest producers of nylon yarns in Europe and the Commonwealth, who will use it to house an impressive display of a hundred different articles made from nylon yarns. These will include immensely tough and long-lasting conveyor belting and a wide range of fishing nets of types now used extensively in India and elsewhere because they last longer and catch more fish.

*

Tractors and Farms Equipment Limited: Tractors and Farms Equipment Limited, Madras, which has been jointly formed by the world-wide Massey-Ferguson Organisation and Simpson and Company Limited, of Madras, for the manufacture and marketing of Massey-Ferguson tractors and farms machinery in India, has assumed distributional control in North India for all Massey-Ferguson products. This makes Tractors and Farms Equipment Limited sole distributors of M-F Equipment in India, and provides a direct link through a national Main Dealer network, between factory and customer in all parts of the country. The distribution of Massey-Ferguson Tractors and farms machinery in North India has been controlled hitherto by Escorts Limited, Delhi, under an arrangement between that Company and Massey-Ferguson Limited, Toronto, which was amicably terminated recently.

*

Manufacture of Chemicals and Fine Chemicals: For the manufacture of chemicals and fine chemicals, a new company has been formed under the name of Dr. Paul Lohmann (India) Ltd. The technical collaborators are Dr. Paul Lohmann Chemische Fabrik of Emmerthal, West Germany. A manufacturing licence for producing 54 items of chemicals has been obtained by the company, and the total output is estimated to be 3.36 million lbs. of organic and inorganic chemicals. The value of such output, in terms of retail prices, is calculated to be Rs. 1 crore per annum. The technical collaborators will be represented on the Board of the Indian company by two directors and adequate provision is being made for the availability of technical 'know-how' and research. Management of manufacturing techniques is to be vested in West German specialists, so that the best possible control over quality of the products is vouchsafed.

The new issue on the formation of this company is for an amount of Rs. 30,00,000 of which the Indian Promoters, Directors and their friends and the Associates will take up Rs. 6,00,000. The West German firm of Dr. Paul Lohmann Chemische Fabrik will be allotted Rs. 4,00,000 worth of equity shares against plant and equipment to be supplied to the Indian company. Both the terms of the technical collaboration and the

allotment of such shares to the West German firm have received the approval of the Government.

United States

Financing of Power Plants: Two U.S. Government loans were recently approved which will finance installations providing more than 300,000 kw to India's electric power generating capacity. The entire anticipated cost of the two projects located in Orissa and Madhya Pradesh will be met by U.S. Government credits. In recent months, the United States has concluded similar agreements with India for the construction of 5 other projects. In all, the United States is financing the entire cost of constructing power facilities which will produce more than three-quarter million kilowatts. The two new power stations will be built at Talcher in Orissa and at Amlai in the Birsinghpur District of Madhya Pradesh. The U.S. Development Loan Fund will give loans totalling \$41.4 million (Rupees 19.7 crores) to meet the costs of acquiring equipment, materials and services abroad. Rupee costs of the project such as payments to workers and purchase of materials in India will be met from loans totalling Rs. 51.1 crores from the sale proceeds of U.S. agricultural commodities supplied to India.

Germany

Air Taxis: Industrial companies use executive aircraft for speedy transport, and many of them have even built their own air-fields. Others again use what are called "air taxis" which are available at every air-port. The "air taxis" offer 4 to 5 seats and are ready to take off within ten minutes after being hired. They provide a valuable service in times of urgency. Owing to the high operating costs, however, they are not still quite numerous. Less costly, however, will be regular near distance airline transport which, apart from the air taxis service will be organised in the densely populated areas. The first envisaged line will operate on the route Dusseldorf-Cologne-Luxemburg-Saarbruechen, which is to be served every morning and afternoon. A great and profitable future is expected for this near distant air transport which is to connect the international airports.

Pakistan

Road Link with Iran: The question of alignment in Pakistan of the coastal road, a Cento Project, has been considered by experts in the light of the decision of the Government of Iran to connect the road at Pishin, on the Pakistan-Iran border. The experts have recommended that the alignment of the coastal road may be shifted to about 60 miles away from the coast, but parallel to it along the already existing jeepable track from Bela to Pishin passing through Bazdar, Hoshab, Turbat, Tump and Mund. The Pakistan alignment will meet the Iranian alignment at Pishin. It has also been recommended that the port towns of Ormara, Pasni, Gwadar and Jiwani should be connected with the proposed highway through link roads. The 410-mile coastal road, envisaged as an all-weather black top road, was jointly sponsored by Pakistan and Iran as a joint project approved in 1957. This will open up new areas in the former Baluchistan.

*

P.I.A. to Build Model Hotels: Work on the construction of a chain of model hotels proposed to be built by the Pakistan International Airline at all important cities including Karachi, Lahore, Rawalpindi and Peshawar is

expected to start by the end of the current year. The blue-prints of the proposed hotels are being prepared and it is expected that Karachi will be the first to have a 100 room modern hotel under the plan.

Australia

Taxation Concessions in Drive for Exports: Rebates of pay-roll tax and special income taxation concessions for the export industries, as well as an additional outlay of over £220,000 a year for overseas trade promotion, have been announced by the Australian Government in its plan to increase exports. The rebate of the pay-roll tax will be 12½ times the proportion of the increase in export sales of a business over the average for the base years 1958-59 and 1959-60 to the total income of the business from trading. It will operate for three years beginning July 1st last. The Government will also consider the question of financial assistance for a limited period to assist in the establishment of a regular shipping service between Australia and South America, and will open Trade Commissioner posts and institute a trade publicity programme in South America. Trade missions will also be sent to South America and to Eastern Mediterranean countries.

*

New Factories for Copper Wire and Cables: The latest companies to announce a new project for the manufacture of copper wire and cables are Metal Manufacturers Limited and Cable Makers Pty. Ltd. They will spend more than £500,000 to establish non-ferrous metal fabrication and cable factories in Perth, Western Australia. One will produce copper wire and strand and annealed copper tubing and the second factory will make thermo-plastic insulated cables and copper wire.

United Kingdom

Rise in U.K. Savings and Investment: The upward movement in investment in machinery, plant and buildings in the United Kingdom which began in the second quarter of 1959 continued throughout 1960, and in the second half of 1960 this type of investment was 8½ per cent higher than a year earlier. These facts are brought out in the latest estimates of national income and expenditure in the fourth quarter of 1960, published as an article in the April issue of Economic Trends by the Treasury in London. There was also a rise in total personal income in the United Kingdom of 6½ per cent between the fourth quarters of 1959 and 1960. At the same time, personal saving rose steeply during 1960, partly as a result of a fall in borrowing on hire-purchase and from banks following the credit controls imposed in April. As a consequence, the rise in consumption in 1960 was modest (less than 3 per cent between the fourth quarters of 1959-1960) and most of it occurred before the middle of the year.

*

Building Nuclear Power Station in India: One of Britain's three consortia building atomic power stations is to tender for the nuclear station to be built in India at Tarapur. At places like Tarapur, where coal or other fuel was not readily accessible, the advantage favouring atomic stations were greater. Coal would have to be transported over long distances in great quantities to feed a conventional generating station at Tarapur, whereas the 1½ tons of fuel per week required for an atomic power station of 250 megawatt capacity could be carried in a single aeroplane. The cost of generating electricity by

nuclear means in Britain was falling and was likely to be as cheap as generation by conventional means in the not very distant future.

France

Output of Bicycles and Motorcycles: The total output of motorcycles was slightly higher during February and totalled 77,282 units compared with 72,918 units during January. However, this was less than that for February, 1960. The output of heavy scooters was not affected by this increase. The total output for the first two months of 1961 totalled 1,50,200 units compared with 1,58,474 units during the corresponding month of 1960. Bicycle production has increased, largely due to the population increase and the expansion of post-educational classes which obliged young students to travel to educational centres, which they often do by bicycles. The average monthly production is 55,000 units, with Peugeot heading the list of manufacturers.

Yugoslavia

Zagreb Fair: Over 31 billion dinars (about 40 million dollars) worth of business was concluded at the International Zagreb Spring Fair from 14th to 23rd April, the management of the Fair announced recently. Most of it about 25 billion dinars was accounted for by home trade, 3.1 billion by exports and 2.9 billion dinars by imports. 468 Yugoslav and 168 foreign exhibitors from 18 countries took part in the Fair this year. Eleven specialised exhibitions were organised as part of the fair.

Mexico

Payments Agreements with Spain: The payments agreement signed more than 12 years ago by the Spanish Foreign Currency Institute and the Mexican Authorities is to continue without substantial modification. The maximum value of bilateral transaction covered by the agreement will continue to be 3.5 million dollars, notwithstanding a Spanish Institute request for an increase in that amount during negotiations proceedings conducted with the Banco Nacional de Comercio Exterior, S.A. and the Bank of Mexico.

Bolivia

Inter-American Bank Loan: The Inter-American Development Bank has announced approval of a 10 million dollar loan to the Bolivian Development Corporation, to be financed out of the Bank's Special Operations Fund. Reimbursement will be made in part in Bolivian currency. This is the second loan to be supplied by the Bank since it began operations in October, 1960. Bolivia will use the funds to carry out a series of projects in the fields of agriculture, industry, mining, electric power, irrigation and drainage. These investment areas were considered by an Inter-American Development Bank delegation to be the best suited for putting an end to the weakened state of the Bolivian economy. Loan proceeds will be devoted to the following specific projects. Agriculture: A programme for improving cattle and sheep breeding, mechanizing private farms, and granting credits for agriculturists through the Bolivian Agricultural Bank. Mining: Credit grants for medium-sized mines. Industry: Small loans for re-equipping industrial firms and increasing their range of activity. Irrigation and drainage: Improvement of cultivable land use on the high plateau and in Villamontes to encourage resettlement of the interior of the country. Electric power: The operation of mobile units to supply thermoelectric power to the cities of Cochabamba, Sucre, Potosi, Santa Cruz, Tarija, Trinidad, Riberalta and Cobija.

NEWS IN BRIEF

INDIAN

Indian railways have created an all-time record in transportation of goods by loading more than ten million wagons during the year just ended.

*

The award of President's Gold Medal and two cash prizes are to be made for outstanding contributions in the field of agricultural implement manufacture. The first prize will be the President's Gold Medal and a cash award of Rs. 3,000 and the second prize will be a cash award of Rs. 2,000. The awards are being made under a scheme sanctioned by the Indian Council of Agricultural Research.

*

A tripartite delegation will represent India at the Seventh Session of the Inland Transport Committee of the International Labour Organisation to be held at Geneva from May 8, 1961.

*

The Government of India have decided to set up a separate cell for soil conservation in the catchment areas of river valley projects in the country.

*

India's export of coal to Pakistan went up by about 13,000 tons in March as compared to the previous month.

*

Mr. S. K. Sen, Chairman, Mica Export Promotion Council, revealed recently that export of Indian mica in 1960 declined to Rs. 10.64 crores in value from Rs. 11.14 crores in the previous year.

*

The Government of India has decided to entertain applications for the import of textile machinery from France during the licensing period April to September, 1961 under the French Credit Scheme.

*

The Government of India has announced that the last date for authorising the commodity agents of the bartering contractors for the import of cotton staple 1-1/16 inch and above has been extended to May 31 from May 1.

*

The Government of India has decided to raise the present limit of 8 per cent protein content in guar gum meant for export to 9 per cent on dry basis with a tolerance limit of plus or minus 0.5 per cent, says a Press Note issued by the Joint Chief Controller of Exports.

It is reported that the Amalgamated Export Corporation had shipped 11,000 cycles to Egypt. The Corporation had plans to export as many as 25,000 cycles during the current year.

*

Out of Rs. 528 lakhs, inclusive of interest overdue to the Rehabilitation Finance Administration as on December 31, 1960, a sum of Rs. 9,415 i.e. 0.018 per cent has been written off so far.

FOREIGN

A £1.4 million project for the production of a wide range of tyres in the Federation of Malaya was announced by the Dunlop Rubber Company recently. Agreement has been reached with the Malayan Government to establish a factory which will be built on a site already acquired at Petaling Jaya.

*

An agreement between a US steamship line and a Soviet, company, believed the first of its kind, has been filed with the Federal Maritime Board.

*

Japan's balance of international payments in March produced a surplus of \$19 million compared with one of \$63 million in February, the Bank of Japan announced recently.

*

It is reported, the last of the rectifier equipment for extensions to the aluminium smelting plant of Ardal og Sunndal Verk in Ardal, Norway, is being completed in the Rugby Works of Associated Electrical Industries.

*

The Moscow Trade Fair will be the springboard of a new drive by the British Government to increase trade with the Soviet Bloc. British exports and re-exports to the Sino-Soviet bloc rose from £103 million in 1958 to £120 million in 1960 and imports in that period increased from £121 million to £164 million.

*

It is reported, a Canadian Trade Development Plan for tax incentives for export industry is being closely studied by the Government.

*

The Italian State Railways are believed to be studying measures which would provide for increases of 15 per cent on present passenger fares, 10 per cent for goods and 20 per cent for parcel carriage rates.

*

The number of foreigners coming to the UK last year totalled 1,731,658 compared with 480,066 in 1959, according to figures issued by the Home Office in a White Paper recently.

*

Overseas Chinese, American, British, Swedish and Filipino businessmen are putting in an initial investment of \$1 million (Hong Kong) to set up an Instant Coffee plant in Hong Kong.

*

Australian wool production for 1960-61 is now expected to total 1,616 million lbs.—about 1 per cent above previous estimates. Mr. J. S. Gale, President of the National Council of Wool Selling Brokers, said the production estimate—expressed in terms of the greasy equivalent—was still below last year's output, which totalled nearly 1,690 million lbs.

*

The Japanese Ministry of Trade has announced that foreign exchange worth \$16.75 million would be allocated for imports of electrolytic copper, copper-based alloys, scrap copper and scrap copper-based alloys.

*

Daimler-Benz, the Stuttgart motor concern has been granted a DM60 million (about £5.4 million), 15-year line of credit at 6 per cent by Deutsche Bank.

STEEL CASTINGS

Steel Castings up to 3 tons are produced to B.S.S., I.R.S., or customer's specification in the most modern and mechanised steel foundry at the Kulti Works of the Company.

PRESIDENT KENNEDY'S CUBAN BLUNDER

By

WILLIAM REES-MOGG

THE French Generals have discovered that the trouble with conscripts is that one cannot rely on them to mutiny. They have also learned that the trouble with de Gaulle is that one cannot rely on him to panic. These two miscalculations have brought to an end several distinguished military careers.

While the French Generals were making their miscalculations about Algeria the President of the United States was making equally serious miscalculations about Cuba. In the event, however, the French Generals destroyed themselves—to the great advantage of the free world — while President Kennedy, though by no means destroyed, committed a blunder which weakened his prestige at home, and greatly damaged the favourable image of him which existed, abroad.

There is already an apocryphal story in London of a Conservative backbencher who started his speech to the local women's association last week-end with these words. "People have been saying that what we need in this country is a youthful, vigorous, dynamic and imaginative leadership like President Kennedy's; after Cuba, how grateful we must all be that our leadership is nothing of the kind".

Mr. Maurice Cowling, the Cambridge don who is probably the finest intellect of the young right-wing Conservatives, made the same point in a letter published in 'The Times' last Tuesday. He asked "whether the Bow Group still believes this week, as it did last, that what the Conservative Party needs at the highest levels is a dash of the Kennedy touch?"

Cuba and Algeria have radically altered the balance of economic as well as political forces in the world. In the first place the failure of the revolt in Algeria has greatly strengthened General de Gaulle's position in Europe. It has removed a threat which was hanging over his regime; it has made possible and even likely a settlement of the Algerian War. If the Algerian War is settled then the French economy will be relieved of a serious economic strain.

Unfortunately, the strengthening of General de Gaulle's influence, while admirable in many ways as a symbol of the strength and survival of France, is, obviously, less favourable for Britain. But for French policy, which General de Gaulle has endorsed, Britain would already be a member or close associate of the Common Market, without damage to the Commonwealth. Again and again Britain has made concessions to the French point of view, and again and again new objections have been raised. French policy is to keep Britain out of Europe, and anything which makes General de Gaulle stronger makes it more difficult for Britain to join Europe.

There are, therefore, drawbacks even to something as desirable as General de Gaulle's victory. There are very few compensations for President Kennedy's defeat. The invasion of Cuba was a policy which could only conceivably be justified by success, and perhaps not even by that.

In international terms this failure throws open again the leadership of the broken Alliance. The United States remains the only possible leader of the Western Alliance, but has long ceased to be the automatic one. Under President Eisenhower the leadership was forfeited because it was not exercised; President Kennedy, by disappointing great hopes, has at least temporarily lost the lead by forfeiting confidence. In Britain, the American attitude toward Suez and Mr. Lodge's unctuous reproaches in the United Nations are only too vividly remembered. The United States may well have been right then to appeal to international morality, but can hardly apply morality to the British case and expediency to her own.

The loss of prestige of the American administration must also affect economic confidence. The recovery on Wall Street and the recovery in the dollar both relied to a large extent on the attraction of President Kennedy's personality. Little was achieved, but much was expected. The faith in President Kennedy was indeed justified in that his policies were far-reaching and imaginative. It was no wonder that they appealed to the world and to the United States; the confidence that was generated was damaged severely.

Journalists, it is often said, exaggerate; they exaggerate on the way up and they exaggerate on the way down. Certainly no one even has supposed that President Kennedy was infallible — though even those who expected him to prove fallible can hardly have expected this particular mistake.

What will be needed now is a longish period of rebuilding. It is absolutely vital that President Kennedy should avoid an obsession with Cuba; if he dies with Cuba written on his heart he will be a quite intolerable nuisance while he remains in office. It is vital that he would recover the character which had been accepted as his, a character which combined caution with strength, which acted on clear-headed calculation and not on false and optimistic expectations.

This recovery is essential to the world because the system of the free world needs a President as strong as Kennedy seemed to be. It needs it to solve its many economic problems; it also needs it to solve the Berlin crisis which is looming up in October. It has to be remembered that a weak President can do nothing; he lacks the power to stand firm, but he also lacks the power to negotiate or retreat.

Special Article

THE REGIONAL PATTERN OF INCOMES, 1955-56 TO 1960-61

THERE is great interest in the pattern of distribution of the increase in national income which occurred during the Second Plan. The official estimates, however, do not present any precise information beyond 1959-60—the fourth year of the Second Plan, and the official agencies have not so far presented the State-wise distribution of this increase in income. The National Income Unit of the Central Statistical Organisation has estimated that India's total net output increased by 12.2 per cent only in the first four years of the Second Plan. According to the major economic indicators, the last year of the Second Plan was an extremely favourable one both in the sphere of agriculture and industry and unofficial estimates indicate that the increase in the national income in 1960-61 might turn out to be around 7 to 8 per cent above 1959-60. Thus it is estimated that in overall terms the Second Plan may result in a total

increase of 20 per cent in national income at constant prices.

In its latest "Quarterly Economic Report" the Indian Institute of Public Opinion has set out the regional growths in income between 1955-56 to 1960-61. The State-wise computations made by the Indian Institute indicate a slightly higher increase in national income. As against the all-India estimate of a rise of 20 per cent in national income, the regional pattern yields a result which is higher at 23.5 per cent in real terms. This can be explained by the fact that the two approaches are slightly different and the estimates in the case of certain States have been made for the last year on the basis of certain indirect evidence.

The table below sets out the estimates of the Indian

Institute for all the States of the Indian Union, not at constant prices but at current prices. The total rise in national income at current prices is estimated at 51.4 percent. Naturally this includes the element of rise in income due to the inflationary increase in prices. While the wholesale price index shows a rise of 34 percent and the all-India cost of living index indicates a rise of about 29 percent, it is estimated that the increase in national income due to the higher prices was not more than 27 per cent in the estimates presented in the table. If the effect of the rise in prices is eliminated, the absolute increase in national income works out to be around 24 percent. This again confirms, by and large, the estimate of the Economic Intelligence Unit of the Indian Institute of Public Opinion.

The analysis presented in the table highlights the fact that the increase in national income in the case of agriculture was the highest at 62 percent followed by industry at 56 percent and the tertiary activities at 38 percent. It is to be conceded that economic development during the Second Plan has occurred in a slightly uneven manner in the various sectors. This element of uneven growth is exhibited significantly in the case of industry and tertiary activities than in the case of agriculture. For instance, in the case of industry, the highest percentage growth is indicated by Orissa as against the lowest percentage rise in Rajasthan. In a similar manner, Maharashtra seems to be at the bottom of the list in the case of tertiary activities, while Assam tops the list in this case.

In agriculture, Punjab has been the most prosperous State and has scored over all other States. Its rise in agricultural income at current prices by about 102.9 percent is the highest amongst all the

States of the Indian Union. At the lower end of the data lie the States of Madhya Pradesh at 40.8 percent, and Bihar at 41.0. While the growth in national income in the agricultural sector continues to be dependent upon favourable weather to a certain extent yet the investment which has been made during the last decade in the agricultural sector has provided an element of stability which tends to narrow down the large fluctuations between the best and the worst years.

If the estimates of the Indian Institute of the rise in national income at 23.5 percent is confirmed by official estimates later in the year, then the Second Plan would fall short of its rise in national income by less than 2 percent. The gap in the case of the per capita income would, however, be much larger because the latest census has revealed a rate of rise at 2.1 percent per annum which is significantly above the estimates assumed in the Second Five Year Plan. According to the present estimates, the rise in the population of the country during the last 5 years was of the order of 11 percent. The per capita rise thus turns out to be 12.5 percent in 5 years or 2.5 percent per annum. On the basis of the official estimates, however, the rate of rise may be slightly less than 2 percent per annum.

Regional disparities in per capita income are as wide as in the case of the State incomes. Assam and Rajasthan seem to have advanced below 5 percent. The States with less than 10 percent advance in per capita income during the Second Plan are Andhra, Bihar, Maharashtra, Madhya Pradesh, Mysore and Uttar Pradesh. The per capita income in the Punjab on the other hand has increased by as much as 26.4 percent. Gujarat, Orissa and West Bengal are also considerably above the all-India average.

THE BUSINESS WORLD

Common Man and the Cotton Mill Industry

By
CROESUS

IF one wanted to condemn India's Five-Year Plans and the Planning Commission and to discard both of them like the proverbial throwing out of the bath tub with the baby, no greater and better excuse than that provided by the availability of cotton textiles to the Indian consumer at the end of two plans would seem to be necessary. It must be shocking to any one to note, from the speech of Mr. Krishnaraj M. D. Thackersey, Chairman, Indian Cotton Mills' Federation, at the Third Annual General Meeting held last week, that "the availability of cotton textiles, which was 15½ yards during the pre-war period, has after 21 years and two plans remained static at the same level, the actual figure for 1960 being 15½ yards—taking the population of that year at 430 million." How grave the situation from the point of view of catering to the common man's wants is will be evident from the calculation of Mr. Krishnaraj of the minimum 'per capita' requirement of cloth of 21 yards. I do not think any one will seriously challenge this calculation which I reproduce in full: "If only one pair of shirts and one pair of 'dhoties' can, with continuous use, be made to last eight months, a man will require 14 yards in eight months, that is 21 yards in a year. If a pair of 'sarees' and a pair of blouses can similarly be made to last eight months, a woman will also need 21 yards per year. There can be many regional variations in the clothing requirement, depending upon climatic conditions, the custom and usage, the type of clothing used by various strata of society, etc. But providing for other items like underwear, bedsheets, chaddars, headwear, towels, etc., the minimum requirement for a reasonably modest standard of living may, by and large, be put down at 21 yards 'per capita'."

Against this actuality, it is difficult to believe how all the tall promises of an increase in the standard of living made in one plan document after another will carry conviction with the common man. It was high time, therefore, that somebody told the people in plain language as to who is responsible for the low 'per capita' availability of cotton cloth today. Although it may seem like high pressure (or even "tendentious") publicity, the ICMF Chairman did well in putting into proper focus the performance of the different sectors of the Indian cotton textile industry. Thus, according to Mr. Krishnaraj, out of some 6,600 million yards made available to the civilian market in 1960, about 2,250 million yards were supplied by the decentralised sectors, that is, the handloom and the powerloom sectors. It would be instructive to compare this performance with the targets fixed earlier by the Government. As against the official estimates of around 1,850 million yards, the handlooms produced only 800 million yards in 1960; against the official estimate of 350 million yards, the powerloom sector, however, accounted for 1,400 million yards. The mill sector, on the other hand, was responsible for 4,350 million yards for civilian consumption and 690 million yards for exports, or a total of 5,040 million yards, as against the official target of 5,000 million yards. It is thus seen that, despite the enor-

mous expansion by the powerlooms, the decentralised sector as a whole could not deliver the goods and yet, strange to say, the Planning Commission has decided that, at the end of the Third Five-Year Plan, the country should produce 9,300 million yards in all, out of which the share of the organised sector, that is the mill industry, should be only 5,800 million yards, while those of the handlooms and other decentralised sectors should be 2,800 million yards and 700 million yards, respectively. Even assuming that these targets are going to be fulfilled by the respective sectors, it is necessary to note here that the common man is not assured, even at the end of the Third Five-Year Plan of his minimum requirement of 21 yards; he will get only 18 yards! Possibly, it may be much less, thanks to the twin uncertainties of the rate of growth of our population and the extent of performance of the decentralised sectors.

There is yet another factor making for uncertainty, namely the delay in the grant of industrial licences to the mills that may want to expand. It is estimated that something like 18 to 24 months would be required for the grant of an industrial licence to install sanctioned capacity. If the powers-that-be are not prepared favourably to respond to the plea of the mill industry to raise its quota of production, they should at least expedite the grant of licences to the organised sector to the extent of installed capacity warranted by the target assigned to it so as to enable it to fulfil it. The "industry", as Mr. Krishnaraj declared, "earnestly desires to fulfil the target that may be allotted to it, so that it should be rid of controls and restrictions, which bring satisfaction neither to the consumer nor to the industry, but make for constant friction and irritation all round."

It is thus easy to understand the disgust of the industry to put up any more with controls and restrictions. It is foolish to think that controls can work miracles, regardless of the operation of the inexorable laws of supply and demand. What the ICMF Chief remarked, therefore, namely that "the consumer will have to pay for his clothing requirements the price dictated by the law of supply and demand, and control at the mill stage, or may be even at the wholesale stage, offers no solution to the problem of ensuring a proper price for the consumer", is particularly relevant. "The one and the only solution", as he said, "is to bring about parity between supply and demand."

Lest what has been stated above should be misconstrued by any one that the mill industry does not seem to be very keen on playing the game with regard to prices, it is necessary to add that the industry has not only accepted the reduction in prices suggested by the Government but has endeavoured its best to enforce the reduced prices through voluntary effort. It is needless to labour the point how difficult it is to regulate prices of cloth produced by so many units producing so many different varieties and on equip-

ment varying so greatly. There is hardly any precedent to this sort of regulation. This apart, it is a stupendous task to fix the prices of current as well as new sorts produced by all the mills and to link them to quotations of comparable sorts produced in the past.

Notwithstanding all this, the question of what is a reasonable price level for cotton textiles apparently remains unsolved, as witness the enquiry by the Tariff Commission, which is presently seized with this problem. As Mr. C. H. Campbell, Chairman of the Swan Mills Ltd., observed at the Annual General Meeting of the Company last week, "it will be extremely difficult, if not impossible, to arrive at a realistic cost structure for cloth which is produced in so many thousands of different varieties and qualities. To the man in the street, the appointment of a Tariff Commission might appear to indicate that cloth prices are unreasonably high and that, as a result of the Tariff Commission enquiry, cloth prices may be further reduced. It should be borne in mind, however, that, with the increase in the price of cotton and the increase in the wage bill as a result of the Wage Board Award, there is every likelihood that, in the case of certain qualities, prices fixed by the Tariff Commission may be higher than current prices." This warning, in my opinion, has come at a very appropriate time, because, in fixing the prices, the Tariff Commission will certainly be called upon to provide for the rehabilitation programme of the industry. That the rehabilitation of the industry is long overdue is universally accepted. So also is the fact that this will entail a very heavy investment. The NIDC Working Group has estimated that, even for a modest scheme of modernisation and rehabilitation, a sum of Rs. 180 crores would be required over the next five years, the industry being called upon to find, out of its own reserves, as much as Rs. 80 crores for this purpose. Unless, therefore, suitable provision is made for including this item in fixing cloth prices, the rehabilitation programme may not materialise to the extent necessary. But the country cannot risk a contingency such as that, especially after last year's decline in our exports of cotton textiles to 690 million yards of cloth and 14 million pounds of yarn from 810 million yards of cloth and 21 million pounds of yarn

in 1959, not to speak of the target that we demanded for ourselves at Buxton of 1,000 million yards. Mr. Krishnaraj seemed to console himself by saying that, despite the decline in the quantum, there was no fall in value, that is in the foreign exchange earned by exports of cotton textiles. That, however, is a very poor consolation. Anyway, it is significant he was not himself satisfied with the performance and felt compelled to urge: "It is needless for me to impress upon the industry our national duty to make constant endeavours for improving exports". While it is laudable of him categorically to state that, in spite of our shortcomings in the matter of quality and costs arising from the use of old machinery, everything would be done to reach our export target of 861 million yards in 1961, it is for the Government, on the one hand, and the workers, on the other, to eliminate the shortcomings both as to quality and costs. If it behoves labour to co-operate with the industry in raising production in the manner suggested by Mr. Krishnaraj, it behoves Government to lessen the impact of its excessive excise duty. The heavy burden of this duty should be obvious to anyone from the experience of the Swan Mills since the introduction of the excise duty on cloth in 1949. The Chairman of Swan Mills has estimated that, whereas the total profits after tax paid to the Government over this period amounted to only Rs. 2.38 crores, the total excise duty paid to the Government was no less than Rs. 3 crores. According to another estimate, the organised sector of the cotton textile industry has to pay more than Rs. 86.25 crores per annum, by way of different taxes and levies to the Union and State Governments. There should certainly be scope for some reduction in this heavy burden on the industry, if only because it is an industry on the export performance of which the country is dependent to not a small extent for earning its foreign exchange. On their part, the cotton mills in India should also deem it their duty to make a sizeable contribution to the country's export trade and not remain smug and complacent, being assured of a vast domestic market. For so long has this charge been made against our cotton mill industry that it can pretend not to be aware of it and, much less, not to take it seriously enough.

Business Notes

Capital Formation

PLEA FOR "INVESTMENT RESERVE"

WHEN A country embarks upon an ambitious programme of industrialisation, the need for capital formation assumes more than ordinary significance. It is especially so in the case of developing countries like ours. It is now known that, during the Second Five-Year Plan period, there was a considerable increase in investment, both in the public and the private sectors, despite a shortfall of about 20 per cent in the attainment of the public sector investment targets in real terms. In the context of the imperative need, on the one hand, and the known shortfall in the investment target, on the other, it becomes necessary to make special and positive efforts to encourage investment and capital formation during the Third Plan period. Helpful suggestions in this behalf like those put forward by Mr. Lalchand Hirachand, President, Maharashtra Chamber of Commerce, at the second quarterly general meeting, held in Bombay last week, therefore, require to be taken note of particularly by the powers-that-be.

One of Mr. Lalchand's suggestions was that the Government should consider the efficacy of the scheme of "Investment Reserve" on the pattern existing in Sweden, whereby an industry can be allowed to set apart up to 40 per cent of taxable income to be invest-

ed in an approved industry or in the expansion of its own industry. Such investment, he stated, is allowed to be deducted from the taxable income, on condition that the reserve is utilised for the purpose earmarked, within five years. It may be noted here that a step has already been taken in this direction by Pakistan where a concession on similar lines is given up to 20 per cent or Rs. 8,000, whichever is less. According to Mr. Lalchand, a tax relief of this kind would go a long way towards attracting dormant capital and accelerating industrial expansion in the country.

While on this subject, the M.C.C. Chief criticised the recent enhancement of the tax incidence on earned income of over one lakh of rupees and expressed the view that, whereas the State Exchequer might not earn much revenue out of the proposed enhancement, the enhancement as such would certainly leave an adverse psychological and economic effect on capital formation within the country. The country at present has the highest incidence (80.5 per cent, as against 77 per cent prior to the increase) in the matter of direct taxes and the effective rate of taxation is higher in India than in the U.S.A., Canada, or France, he pointed out.

Mr. Lalchand's reference to the Third Finance Commission and his plea for a higher allocation for the State of Maharashtra out of the divisible pool of income-tax—he said that this should be 80 per cent on

the basis of population, 10 per cent on the basis of industrial production and 10 per cent on the basis of collections—will no doubt strengthen the hands of the State Government. In this connection, he pointed out that, while the number of income-tax payers was less than a million, the industry group occupied a very significant position 'vis-a-vis' the share of the industrial sector to the over-all collections. According to him, the total contribution of the industrial sector to the tax revenue of the Centre and State Governments comes to Rs. 837 crores in a year out of a total revenue budget of both the Centre and the States of Rs. 1,352 crores. Accordingly he felt that the allocation to Maharashtra, as also to other States, should be on the basis of the total tax collected by the Centre, inclusive of income-tax, property tax, gift tax, expenditure tax, wealth duties and death duties, etc. He further wanted the allocation to be expressed as a proportion of this total sum with weightage to be prescribed on the basis of collection for the industrial labour population in the State and other liabilities which urbanisation entails. Drawing attention to the fact that the requirements of the States had been increasing year after year, he contended that the allocation to the States from out of the divisible pool also should be proportionately enhanced.

Sugar Industry

THE PRICE-LINKING FORMULA

A CONFERENCE for discussing the various aspects of the application of the price-linking formula in the sugar industry was convened by the Tariff Commission towards the close of last month in Bombay. Mr. K. R. P. Aiyangar, Tariff Commission Chairman, explaining the scope of the conference, said it related only to the deferred basis of sharing extra-price realizations. In fact, he said, the question of giving the cane-grower something in addition to the cane price, even after making the initial payment of the fair minimum price fixed by statute, had been under consideration for a long time and recalled how the price-linking formula, which was mooted in 1953 and further discussed at the Tripartite Conference at Nainital in 1954, had undergone several changes, mainly because of difficulties experienced in evolving a simple formula for price-sharing which would further its objectives. However, the statutory formula of 1958 (Gopalakrishnan Committee Formula) for sharing extra price realisations, which was intended to be applied for 1958-59 but had yet to be enforced, had failed to secure general agreement among the interests concerned. Even the SISMA formula accepted on a voluntary basis had not secured general agreement.

According to all available evidence, therefore, the 1958 formula does not seem to have either promoted cane yield per acre, or production of better quality cane giving a higher recovery of sugar, but, on the other hand, has encouraged growth of cane acreage, and that in areas not best suited for it. No wonder then that the formula has been characterised as "one-sided" and "inequitable" and as "redundant in a controlled economy". In the context of the new basis of fixing sugar prices, as recommended by the Tariff Commission, these formulae, including the simple price-linking of the UP, require large-scale modifications, as some of the factors already included therein have been inconsistent with the method of costing adopted. However, the Commission seems to feel that the formula proposed by the UP for the sharing of the extra realisations on sales of sugar by sugar manufacturers, over and above the statutory price where it applies and the relevant price in other non-control areas which would have been normally applicable on the basis of the Commission's schedule, suitably amplified as has been suggested by the Commission itself, might prove more acceptable. Expressed as a formula, it would be like this: $X/100 \times S - F/C$, where "X" represent the growers' share, "S" the statutory

price, "F" the ex-factory fair price for each factory on the basis of duration and recovery, and "C" quantity of cane crushed per maund of sugar. After referring to all these, it is significant that, on the strength of the results of the experiments carried on by the Central Sugar Institute about evaluation and control of cane, Mr. Aiyangar feels that an equitable system of fixing of cane price on sugar content basis could not only be evolved but also be more acceptable to the understanding grower than the sharing or linking formula.

The T. C. Chairman next examined the present statutory price and said, significantly enough, that it gave to the cane growers a margin of return which compared favourably with that from alternative crops. "It has, therefore, been contended," said Mr. Aiyangar, "that the price-sharing formula should apply only to the extra realisation, if any, of a producer over the statutory prices fixed on the cost schedules." If not for all times, this formula might be found suitable at least as a transitory arrangement, he said, if the consensus of opinion was in favour of linking cane price with sugar recovery and quality.

Mr. Aiyangar also dealt with other important issues arising from a consideration of the price formula, such as (a) whether or not the formula should apply to the areas where sugar is under price control and then to other areas where there is no such control though its effects may be felt there, (b) the incidence of rehabilitation, and (c) the high cost of sugar. As regards the first, it was the TC Chairman's view that the matter had to be considered from the point of view of the industry as a whole and also with due regard to the interest of the consumer of sugar, an article of general consumption. While not denying their respective claims to the cane grower and the sugar producer, he made the point that the consumer too has a claim to the reduction in price, if this can be effected on account of the economies in production.

Touching upon the incidence of rehabilitation, the T.C. Chief recalled how the request of the industry in this behalf had been turned down on a previous occasion, but referred, nevertheless, to the industry's contention that, if additional economies had accrued to the factories through their efficiency in production or by other reasons, they should not be shut out from utilising any such earnings in part for the purpose of augmenting resources for rehabilitation of plant and machinery. Of course, he did not commit himself further to raise any hopes.

In regard to the present high cost of sugar in the country, Mr. Aiyangar opined that prices of cane and sugar should be properly correlated in order to stabilise the sugar industry. According to him, it is noteworthy, the present statutory formula can not arrest the spiralling costs and hence his plea for a pricing formula for both the raw material and the finished product which would directly link up with the quality of the raw material. As a long-term solution to this problem, he said, the sugar content of the cane should be the main determining factor for allowing any premium or deferred price over and above the minimum price to the grower.

Aluminium Industry

NEED TO AVOID OVER-EXPANSION

WHILE SHAREHOLDERS of the Indian Aluminium Company Limited will appreciate the steady progress made by the concern, reflected in a net profit of Rs. 12 million in 1960, as compared to Rs. 8 million in the previous year, the Chairman of the company Mr. K. C. Mohindra, in his address at the annual general meeting

of the shareholders has expressed certain doubts and concern at the future prospects of the industry. A target of 87,500 tons output by 1965-66 has been fixed for the aluminium industry in the Draft Outline of the Third Plan, against which 52,500 tons are already being produced. Work on the balance of 35,000 tons is expected to start shortly. As against this production capacity, the current consumption of aluminium is around 44,000 tons. There are indications that the production target may be revised to 150,000 tons in the Plan, and if all the pending proposals come to fruition, the supply potential would be raised to nearly 200,000 tons—a five times jump over current consumption within five years. The possibility of exports taking care of over-supply is a mirage, for India cannot hope to compete in the world market with high costs. The recent sugar crisis is still too fresh in our minds to allow us to commit the same blunder in respect of aluminium. Thus, Mr. Mahindra has advised caution and careful planning of the future expansion of the industry. Further, he points out that India is currently power hungry and its bauxite resources, though apparently considerable, are far from being proven in quantity and quality sufficient to sustain a prodigious rate of growth. It is only prudent that any future expansion of the aluminium industry should be based on intense and detailed field investigations and market surveys. Approval and execution of any crude and half-baked schemes have obviously to be avoided.

Rubber Industry

DUNLOP'S EXPANSION PROGRAMME

MR. JOHN LUCKHAM, Managing Director of the Dunlop Rubber Co. (India) Ltd., indicated at the annual general meeting of the company, held recently at Calcutta, that the products of the company were finding ready acceptance with the consumer. In fact, there was general shortage of supplies in the market and the company took leading part in moves by the tyre industry to encourage the formation of Tyre Dealers' Association to ensure equitable distribution at list prices of the sizes in short supply. The Managing Director added that to meet the additional demand which is likely to be created during the next few years, the company had plans to expand its capacity. This would require a substantial amount of foreign exchange, for which the company had approached the Dunlop Rubber Company Ltd., London. It is likely that the company would get the necessary sterling funds, initially in the form of a loan to be converted into equity capital at a later date. The company was, therefore, negotiating with the Government regarding capital reorganisation.

Mr. Luckham also indicated that the company had made considerable progress in the manufacture of industrial rubber products. The company had installed the equipment for an expansion of conveyor belting manufacture and trial production was in progress. The output of Dunlopillo had also increased through higher productivity, but the demand was still rising. One handicap experienced by the company, in this respect, was the shortage of raw materials. The output of natural rubber was not enough but, as the Managing Director pointed out, the opening of the Government-sponsored synthetic rubber factory in 1962 would be able to provide some relief.

Killick Group

EXPANSION SCHEMES

MR. A. N. HAKSAR, Chairman, Killick Industries Limited, at the annual general meeting of the company, held recently at Bombay, pointed out that the company had had to incur huge expenditure which was not of a recurring nature. Naturally, therefore, certain amount of strain was recorded this year in the working of the companies associated with the Group. It may, however, be observed that these companies are carrying out a programme of expansion. The Kohinoor

Mills, for instance, installed new machinery and made certain improvements in its present set-up. Similarly, the electricity companies continued to enlarge their capacity to meet the additional demand. The Surat Electricity Company's diesel plant was being called upon to bear an increasing burden to sustain the interests of South Gujarat Grid. All these schemes had involved considerable expenditure and were bound to show improved results in the next few years.

The Chairman was hopeful that the company would be able to carry out efficiently the responsibilities as managing agents of several industrial undertakings. It appeared that both expansion in the present industries and diversification of resources to include certain additional industries in the Group was quite in line with the tempo of industrial expansion in the country.

Industrial Relations

LABOUR IN MANAGEMENT

MR. GULZARI LAL NANDA'S inaugural address at the recent session of the Standing Labour Committee deals comprehensively with most of the live problems in the field of industrial relations and among them labour participation in management is undoubtedly important. It is significant that Mr. Nanda has emphasized the need for a solid base of education for labour in the problems of management as a condition precedent to its progressive participation in management. The need for workers' participation in management to give the worker a sense of belonging to the unit in which he works has been accepted on all hands. Such participation is bound to promote an atmosphere of peace conducive to the removal of differences by free consultation before they divide the two parties more apart.

At the present stage, stress ought to be laid on labour's association with management and this is implicit in the Minister's emphasis on education to prepare labour for its new responsibility. Considered from this angle, it is difficult to accept Mr. Nanda's unqualified contention that in all establishments where representative trade unions are functioning, 'prima facie' a case should be deemed to have been made out for introducing labour participation in management. It is not enough that there should exist a representative trade union in an industrial unit. There must be further 'prima facie' evidence that members of the union have received the minimum training to understand the problems of management, to formulate informed views on them and to make constructive proposals for their solution. Only then can labour make a real contribution to decisions at the level of management.

Mysore Kirloskar

NEW ISSUE

FOR EXPANDING its activities, Mysore Kirloskar Limited has decided to issue for public subscription 15,000 equity shares of Rs. 100 each and 25,000 redeemable cumulative participating preference shares of Rs. 100 each. The subscription lists open on May 15, 1961 and will close on May 17, 1961, or later at the discretion of the directors. The preference shares are redeemable not before June 30, 1975, and not later than June 30, 1980.

A minimum return of 8 per cent has been guaranteed if the Company declares an ordinary dividend at a rate below 12½ per cent. But if a dividend of more than 12½ per cent but less than 15 per cent is declared, the preference shares will be entitled to 9 per cent return. In case the dividend declared on equity shares exceeds 15 per cent, the return on preference shares will be stepped up to 10 per cent. Keeping in view the soundness of the concern, a ready response of the public towards this issue is a foregone conclusion.

FROM THE CAPITAL'S CORRIDORS

APPRENTICESHIP TRAINING

IT is proposed to enact a comprehensive legislation on apprenticeship training in industry, repealing the existing Apprenticeship Act, the provisions of which have become out-dated and totally inadequate to meet the present situation arising out of our fast-expanding industrial economy.

While certain establishments like the Railways and Defence in the public sector and Tatas in the private sector have been administering training programmes on a systematic basis for the past many years, industry in general has not as yet organised such programmes fully. A few industrial units are training a very limited number to meet their special requirements. As observed by the Labour Investigating Committee in 1943, "there is no scheme of apprenticeship for the bulk of industrial workers in this country and the usual method of imparting training in large-scale factories is to recruit raw youth and put them on to the least skilled occupation in a factory, such as that of a doffer boy in a cotton mill. In some cases, relatives of the working people are preferred for work and are allowed to assist them on a nominal wage. Obviously, this is a most unsatisfactory procedure to follow." To remedy this state of affairs, it is proposed to enact legislation for the following purposes:

- (i) to regulate the programmes of practical training in industry in such a way as to conform to the standards, syllabuses, period of training etc. prescribed by the Central Apprenticeship Council; and
- (ii) to utilise fully the facilities available in industry for imparting practical training.

PROPOSED LEGISLATION: SALIENT FEATURES

The principles suggested by the Small-Scale Industries Board and approved by the National Council for Training in Vocational Trades were examined by a Special Committee, consisting of representatives of the three recognised all-India employers' organisations and the Ministry of Labour and Employment, under chairmanship of the Minister of Industry, which made certain amendments to meet the point of view of the employers in general. The salient features of the proposed Legislation which have been accepted by Industry in general, will be as follows:

(1) The Act should be a self-contained one. The apprentice will not be governed by the different labour and factory laws. Matters relating to his health, safety, welfare, payment of stipends, compensation for injury etc. will be provided for in the proposed Act itself.

(2) Provision will be made in the Act or in the rules to be framed thereunder for the execution and registration of apprenticeship agreements; medical examination of apprentices; minimum educational standards for admission; period of apprenticeship training; conditions under which apprenticeship could terminate; maintenance of records of progress of apprentices; payment of stipends; hours of work, etc.

(3) Provision will be made for setting up Central and State Apprenticeship Councils consisting of representatives of employers in the public and private sectors, Government officials and experts to advise the Central and State Governments respectively on all administrative and technical matters relating to the training of apprentices in industry. The National Council of Training in Vocational Trades will co-ordinate all programmes for training in vocational trades in the country, conduct Trade Tests and issue National Certificates in craftsmanship including apprenticeship in "designated trades."

(4) Provision has been made in the bill for extending the compulsory apprenticeship scheme by stages to different industries and areas according to need.

(5) Based on the available facilities in each "designated" trade in an establishment, the Union Govern-

ment in consultation with the Central Apprenticeship Council will fix the maximum number of apprentices that could be taken in these trades. Where training has to be provided in the national interest to meet special shortages, the establishments where adequate facilities do not exist, will be provided with the required facilities and financial assistance by Government for creating additional facilities.

(6) On completion of apprenticeship in the designated trade, the apprentice will not be bound to serve the employer training him; nor will the employer be bound to offer employment to the apprentice. During the period of apprenticeship, an apprentice will be governed by the disciplinary procedure in force in the establishment. (The Employers have proposed that a provision be made in the Act to the effect that an apprentice will not participate in strikes and that he will not be allowed to be used for strike-breaking purposes. It is felt that such a provision is not necessary. Since, during the period of strike in an industry, there would be no arrangements for the training of apprentices, there is no point in enforcing the presence of the apprentice during the strike period. Again, the apprentices will be so small in number and their standard of skill so limited, that no employer will be able to use them effectively for strike-breaking purposes. In view of this, the provision suggested by the Employers seems to be superfluous and it may not be necessary to incorporate this in the Legislation. It may be mentioned that it is proposed that the Industrial Disputes Act should not be applied to Apprentices under this schemes.)

(7) While Government will undertake the responsibility for providing related instruction, industry, will be responsible for in-plant training.

(8) Powers will be taken for making Rules under the Act, delegation to States of such powers as are considered necessary and for imposing penalties for the proper enforcement of the Act.

EXPORT PROMOTION

As reported earlier in these columns, the Government of India is entrusting the task of export promotion to the State Trading Corporation. To achieve this objective, the S.T.C. will to some extent be a competitor to the private export trade.

The State Trading Corporation, it is learnt, has entered into an agreement with Sukab, of Sweden, under which it will be exporting to Sweden commodities like tea, coffee, oilcakes, cotton textiles, leather manufactures, handloom fabrics, carpets, manganese ore etc. to be sold there at the prevailing market prices. The loss on the sale of these commodities will be met by imports from Sweden of goods like newsprint, wood pulp, ball bearings, special steel, etc. Sukab is a private organisation recognised by the Swedish Government as dealing in exports from that country.

The State Trading Corporation is also opening an office at Zurich to step up trade with Switzerland. The modus operandi of this office will also be similar to the pattern being developed for Indo-Swedish trade. Similar arrangements, it is learnt, have also been made with the Italian firm Cogis.

RAILWAY GENERAL MANAGERS MEET

According to the latest assessment, railways will be required to carry by the end of the Third Plan period an originating goods traffic to the tune of about 244 million tons per annum, as against 235 million tons estimated in the Draft Outline of the Third Plan and 154 million tons actually moved by them at the end of the Second Plan. The problems arising out of moving an additional 90 million tons of goods traffic by the end of the Third Plan period and the measures to cope with a traffic of this order were discussed here at a three-day meeting of the Railway General

Managers with the Railway Board, which concluded on April 29.

At the meeting, it was decided to step up the loading of wagons by about 10 per cent during the current financial year. This would entail an additional loading of nearly 2,000 wagons per day over all the zonal railways. It was also decided that trade and industry should be persuaded to load an additional ton or two in each wagon. This would enable railways to lift nearly 4 million tons extra with the existing rolling stock.

Emphasis was laid during the general discussions on the need for improved turn-round of wagons, larger engine mileage per day and holding of meetings between operating chiefs of adjacent railways quite frequently to smoothen working. Stress was also laid on expeditious expansion of line capacity on various routes. Doubling of tracks, already undertaken or programmed, including Baoridand-Anuppur, Anuppur-Katni, Nergundi-Khurda Road, Dornakal-Vijayawada and Ratlam-Nagda sections, it was emphasised, should be carried out on highest priority basis. For the purposes of running box-wagon trains, it was suggested that extension of loops and strengthening of track should be taken up where necessary. It was also decided that heavy trains of 3,600 tons should be worked by double-headed steam locos until diesel locos were available.

It was revealed at the meeting that during the past few months loading on broad-gauge railway system had increased by 6.6 per cent and on meter-gauge railway system by 2.7 per cent compared to the corresponding period of the previous year.

Among the other subjects discussed at the meeting were technical problems pertaining to better use of engines, larger workshop production through extension of the incentive scheme, fuel economy, intensive utilisation of goods stock, recommissioning of condemned wagons, prevention of damage to or loss of goods in transit, speedy disposal of claims, safety on trains, provision of drinking water supply at all stations etc.

NAHORKATIYA - MORAN OILFIELD — 100th WELL SPUDDED IN

The hundredth well in the Nahorkatiya-Moran oilfield was spudded in on Wednesday. This oilfield has shown very good promise. Of the 85 wells completed in the Nahorkatiya region, 74 have already been tested. As many as 60 wells have proved to be oil producers, 7 have yielded gas and only 7 have proved to be dry holes. In the Moran region, 13 wells have been completed so far and the fourteenth one is being drilled. Seven wells in this region have yielded oil, one has yielded gas and five have proved to be dry. There are plans to drill another 100 to 150 wells in this oilfield at a rate of 25 wells per year. The average cost of drilling and testing a well is Rs. 12.5 to Rs. 13.1 lakhs, of which 38 to 40 per cent are the overhead expenses. The cost is kept low by expeditious drilling—a well with a normal depth of about 10,000 feet is drilled in less than 15 days, as against nearly six months taken by the Oil and Natural Gas Commission to drill a similar well in the Sibsagar and the Rudrasagar area.

According to the latest estimates, the Nahorkatiya-Moran oilfield possesses oil reserves to the tune of 44 million tons and gas reserves of the order of 700,000 million cubic feet (equivalent to about 17 million tons of oil). In view of the encouraging results of the recent few drillings, expectations are that oil reserves ultimately may go up to 60 million tons.

This oilfield will supply crude to the two public sector refineries at Nunmati and Barauni and also a small quantity to the Digboi refinery whose oil reserves are nearing exhaustion. Supplies to the Digboi refinery will be governed by the Promotion Agreement signed between the Government of India and the Burmah Oil Company, the two partners in Oil India Limited. The Assam Oil Company, which owns the

Digboi refinery, is a subsidiary of the Burmah Oil Company.

Some crude is being supplied to the Digboi refinery at present at a "provisional" price. The formula which will ultimately regulate the price of Nahorkatiya-Moran crude is currently being worked out by the Union Ministry of Fuel in conformity with the Promotion Agreement which envisages that the price could be at par with the landed cost of imported crude at Calcutta or it could be fixed on the basis of the cost of production plus reasonable commercial return. The latter basis, experts opine, can be costly in the long run for incentive to work efficiently is killed by it.

The total cost of development of this oilfield, inclusive of the cost of laying the pipeline to carry crude from here to Nunmati and Barauni, is estimated at around Rs. 72 crores. The cost of laying the pipeline is placed around Rs. 44 crores.

The work on the 16" diameter pipeline which will connect the Nahorkatiya oilfield with the 0.75 million tons capacity Nunmati refinery, is expected to be completed by the end of the current year, well before the refinery goes into production. The pipeline on this 250 miles section has already been strung and laid under ground except in some difficult areas. The work of laying the pipeline in these areas is expected to be completed in another few days before the monsoons set in their full fury. There will then remain only the task of constructing pumping stations and repeater stations which can be carried on even during the monsoon season.

The work on the second section, that is from Nunmati to Barauni, over a distance of nearly 460 miles, will be taken up in right earnest after the monsoons. The laying of this 14" diameter pipeline is expected to be completed some time in the middle of 1962 when the 2 million tons capacity Barauni refinery is likely to be commissioned.

AOC MAY BECOME RUPEE COMPANY

The management of the Assam Oil Company, it is learnt, is examining the possibilities of converting this concern into a rupee company by associating Indian capital with it. Details about the evaluation of the present assets of the company are being worked out. As soon as this work is finished, an approach will be made to the Union Government for the grant of the necessary permission.

BRITISH CREDIT FOR THIRD PLAN

Two agreements, one providing for a loan of Rs. 40 crores and the other for a credit of Rs. 13.3 crores, have been signed between the Government of the United Kingdom and the Government of India. The grant of these loans had been announced by the UK Government sometime ago.

A welcome feature of these two credits is that they are to be repaid in 25 years, the first instalments falling due in 1968 and 1966 and the last ones falling due in 1986 and 1985 respectively.

The Rs. 13.3 crores loan will be a convertible or "free" one which can be utilized to meet the balance of payments deficit during the current financial year. Of the other loan, only half will be tied to specific projects and the remainder will be available for importing unspecified types of capital equipment and machinery. Among the projects which will be financed through the tied portion of the Rs. 40 crores loan are expansion of the Bhopal Heavy Electricals, fertilizers plant to be set up at Nahorkatiya, Hindustan Cables (West Bengal), and security paper mill to be put up at Hoshangabad (Madhya Pradesh).

Another loan of Rs. 26.66 crores is understood to be under negotiation between the Government of India and the U.K. Government. This will provide foreign exchange for the expansion programme of Durgapur Steel Works.

MOVEMENT OF COAL BY SEA

The Minister for Mines and Fuel in the Union Government introduced a Bill in the Lok Sabha last

week seeking to raise the excise duty on coal from Re. 1 per ton to Rs. 4 per ton. The yield from this additional levy will meet the extra cost of coal transport by sea and for operation and maintenance of the Central Ropeway project.

IMPORT OF TRACTORS

A sufficient number of tractors to meet the essential requirements of the country are proposed to be imported from the United States, the Soviet Union, Czechoslovakia, Poland and Rumania at normal market prices. The makes proposed to be imported are those which have already been made use of in this country and found suitable for the Indian conditions.

To meet the requirements of spare parts, apart from the existing provision of 50 per cent quota for established importers, arrangements have been made for the import of spares along with tractors up to a certain percentage of the value of licences.

As regards indigenous production one firm out of the four licensed under the Industries Act for the manufacture of agricultural tractors had produced 123 units till the middle of February last. Another firm which had been granted a licence for import of components is expected to go into production shortly. The issue of import licences for machinery and components in respect of the third firm is at present under consideration of the Government of India. This firm is also likely to start production in the near future. The fourth firm has had some difficulty with its foreign collaborator and this has delayed its manufacturing programme. This firm is now understood to be negotiating with some other foreign companies for technical collaboration.

Besides these four firms, an application has been received from another firm for the grant of a licence under the Industries Act for the manufacture of agricultural tractors. This application, it is learnt, is being scrutinized by the authorities.

MANUFACTURE OF COAL MINING MACHINERY

The coal mining machinery plant, being set up in the public sector at Durgapur, envisages production of spare parts not only for the complete machines which this plant will be manufacturing but also for the existing machines in operation in the country. This project will be completed in two stages. At the end of the first stage, it will have an output of 30,000 tons per annum. Under the second stage, the capacity is envisaged to be stepped up to 45,000 tons per annum. There are at present several undertakings in the country engaged in the production of various parts of coal mining machinery such as haulages, conveyors, power-driven pumps, etc. Some more schemes for the manufacture of coal mining machinery and various components of such machinery have also been approved by the Government. These units are expected to go into production in the near future.

MANUFACTURE OF COAL WASHING PLANTS

The Government of India, it is stated, has no proposal under consideration to appoint a technical committee to go into the question of local manufacture of coal washeries. A licence has already been granted to an existing engineering unit to manufacture coal washing and preparation plants. One more proposal has been received by the Government for setting up a unit to manufacture coal washing plants. This proposal is said to be under consideration of the Government. When these two units go into production, the foreign exchange component of setting up of coal washeries will be reduced considerably. At present, a coal washery capable of treating 250 tons of raw coal per hour is estimated to cost around Rs. 1.8 crores, of which the foreign exchange component is about Rs. 1 crore. If a coal washing plant is manufactured indigenously by Indian parties, its cost is estimated to be about Rs. 2 crores, of which foreign exchange component will be nearly Rs. 63.88 lakhs.

BOKARO STEEL PLANT

Too much, it appears, has been read into Prof. J. K. Galbraith's remarks, at his recent press conference, about the fourth steel plant proposed to be set up at Bokaro. The U.S. Ambassador had expressed the opinion that India's growing requirements of steel are increasingly being recognized and that U.S. assistance towards the expansion of steel industry in this country would be made available on practical considerations rather than on ideological or theoretical ones. In some circles these remarks have been interpreted as meaning that the U.S.A. might offer aid to set up the Bokaro Steel Plant. It is, however, not yet certain whether the U.S. interests will be prepared to compromise with the ideological approach of the Government of India to set up this plant in the public sector.

The Bokaro Steel Plant, it has been finally decided by the Government, will be set up in the public sector. It may be recalled that a reference to this was made by the Prime Minister sometime ago. Mr. Nehru had said that the Government was not opposed to private sector re-entering the steel industry, but so far as the Bokaro Plant was concerned, there was no question of its being handed over to the private sector. Private enterprise could be entrusted with the task of setting up any other steel plant after the Bokaro Plant. It appears, the U.S. Ambassador's reference to American assistance being available for setting up a steel plant in this country refers not to the Bokaro Plant, but to another steel manufacturing unit which may be set up after that.

So far as the financing of the Bokaro Plant is concerned, the position has not yet been cleared up. Neither the British nor the Germans have shown any inclination to join hands with the Government to set up this plant. The American, however, are welcome to come in at the Steel Ministry's terms, namely, making available of foreign exchange component of this public sector project to be commissioned under the supervision and direction of Dastur and Company. Efforts are also being made to interest Russians in setting up this plant. The Russians, if they come in, will be on familiar ground as they are already collaborating in setting up the Barauni Oil Refinery and the Ranchi Heavy Machine Building Plant. Bokaro is in the vicinity of Barauni and Ranchi.

NAHAN FOUNDRY

The first stage of expansion of the Nahan Foundry Limited, which will raise the foundry capacity to 3,000 tons per annum, it is learnt, has been completed. Work on the second stage which envisages raising of the capacity to 5,000 tons per annum is well underway. The machinery required for this phase has been already installed.

To diversify its production programme, the Nahan Foundry has undertaken the manufacture of electric motors of ratings from 4th H.P. to 10 H.P., metric weights, motorised mono-block pumps, centrifugal machines and horizontally worked cane crushers. The possibilities of manufacturing improved types of agricultural implements at this Foundry are also being explored.

MYSORE IRON AND STEEL WORKS

The management of the Mysore Iron and Steel Works is likely to be transferred to a Corporation or a company to be set up for the purpose shortly. The Government of India had advised the Mysore State Government to take this step. The State Government has accepted this advice.

FERTILIZER POOL

The Fertilizer Pool will continue so long as availability of fertilizers falls short of demand. Fertilisers produced by the private sector companies will be purchased at a price which is paid for similar types of the product to similarly situated public sector factories. In addition to the pool price charged by the Central Government from the States, the States will add a small margin to cover distribution charges.

COMPANY AFFAIRS

THE STANDARD MILLS

The Indian textile mills have increasingly followed a programme of reorganisation and renovation during the last few years. The Standard Mills Company Limited during the year to December 31, 1960 made considerable progress in this respect. A sum of Rs. 2.66 lakhs was spent on buildings and another amount of Rs. 45.03 lakhs was spent for additions to the machinery and plant. This improvement was reflected in profits which increased to Rs. 49.56 lakhs during the year under review as against Rs. 33.35 lakhs during the previous year. The Directors proposed an appropriation of Rs. 6 lakhs towards general reserve and Rs. 10 lakhs towards dividend equalisation reserve. A dividend at the rate of Rs. 30 per share of Rs. 100 each was proposed, subject to deduction of tax, which will absorb Rs. 32.43 lakhs.

MAFATLAL SPINNING

Considerable progress was made during 1960 by the Mafatlal Fine Spinning and Manufacturing Co. Ltd. in respect of reorganisation and renovation of machinery and equipment. A sum of Rs. 2.10 lakhs was spent on extension of buildings and a sum of Rs. 30.13 lakhs on additions of new machinery and equipment. The Company imported a number of automatic looms for replacement of ordinary looms.

The profit of the Company for the year came to Rs. 24.09 lakhs out of which a sum of Rs. 2 lakhs was transferred to general reserve and Rs. 3 lakhs to dividend equalisation reserve. The Directors proposed a dividend at the rate of Rs. 30 per ordinary share of Rs. 100 each. This will absorb Rs. 17.40 lakhs.

THE SASSOON SPINNING

The profit of the Sassoon Spinning and Weaving Company Limited for the year ended December 31, 1960 came to Rs. 10.07 lakhs which was considerably higher than the previous year's figures of Rs. 4.12 lakhs. The sales during the year were higher at Rs. 5.76 crores against previous year's Rs. 5.32 crores. Naturally, the stocks were lower by about 20 per cent. A sum of Rs. 3 lakhs has been proposed to be transferred from general reserve. The Directors have proposed the payment of a dividend of Rs. 1.70 nP. per share of Rs. 10 each. The Company has made considerable progress in the field of reorganisation and renovation; a sum of Rs. 24.023 was spent on buildings and Rs. 32.41 lakhs on additions to machinery and plant. The Company is, therefore, likely to record considerable progress during the coming years.

DEVIDAYAL CABLE INDUSTRIES

Apart from its present contribution to the extent of saving Rs. 40 lakhs in foreign exchange in the year 1960, the new Devidayal Cable Factory, it is reported, will produce winding wires, cables and insulated transformer strips etc., valued at Rs. 1.5 crores, which would mean a net saving of about Rs. 70 lakhs, annually, in foreign exchange, by cutting down imports.

Devidayal Cable Industries (Pvt.) Ltd. came into being in 1955 with the merger of Indian Insulation Industries (Pvt.) Ltd. The production was initially very nominal (150 tons annually, valued at Rs. 10 lakhs). With steady and continuous expansion, the production, and correspondingly the sales, including those of winding wires, increased to 1,300 tons, valued at Rs. 73 lakhs, in the year 1960.

The Managing Director of the Company purchased in 1960 the latest American machinery for the manufacture of rubber and plastic insulated cables. The production of these cables is expected to be 24 million yards annually, valued at Rs. 72 lakhs. In addition to this new cable plant, substantial expansion, in the shape of additional plant for the production of winding wires has been made by purchasing and installing new machinery capable of manufacturing fine gauge wires to 47 SWG, upto 100 tons monthly. The Company has also finalised technical collaboration with a reputed foreign company for the manufacture of nichrome wires and strips.

In the near future, say by 1963, the Company plans to go into the manufacture of underground cables. For this the Directors hope to negotiate collaboration with some foreign firms.

THE TATA IRON AND STEEL COMPANY LIMITED

REGISTERED OFFICE: **Bombay House,
24, Bruce Street,
Fort, BOMBAY-1.**

NOTICE

NOTICE is hereby given that the Register of Members and the Transfer Books of the Company will be closed from Monday, the 29th May, 1961, to Friday, the 23rd June, 1961, both days inclusive.

Notice is also hereby given that the dividends for the year ended 31st March, 1961, when sanctioned, will be made payable to those shareholders whose names stand on the Share Registers of the Company on Friday, the 23rd June, 1961.

Dated at Bombay this 28th day of April, 1961.

COMMODITY NEWS AND NOTES

ALL-INDIA FINAL ESTIMATES OF BLACK PEPPER 1960-61

The All-India Final Estimate of Black Pepper, 1960-61 puts the current year's area and production at 234,700 acres and 26,200 tons as against the partially revised estimate of 233,800 acres and 26,300 tons respectively for 1959-60, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. The increase in acreage during the current year is due to the increase in area in Kerala State because of favourable weather conditions at the time of sowing. The nominal decrease in production of Black Pepper during the current year is accounted for by Kerala State, which is due to unfavourable weather conditions at the time of the flowering and growing periods of the crop.

EXPORT OF RAW WOOL

The following statement shows the export of raw wool to U.S.S.R. and other countries and its value during 1960 and 1961 (January):

Quantity in '000 lbs. and value in thousands of rupees

	1960		(January) 1961	
	Quantity	Value	Quantity	Value
U.S.S.R.	7,774	21,353	7	17
Other countries				
U.K.	11,234	29,285	711	1,774
Denmark	320	1,068	9	27
West Germany	669	1,443	26	70
Netherlands	369	660	20	38
Belgium	972	2,541	37	108
France	1,735	4,127	97	241
Italy	115	348	—	—
U.S.A.	5,569	16,087	332	915
Australia	1,405	4,064	209	586

Total	30,503	81,728	1,448	3,776

ALL-INDIA FINAL ESTIMATE OF GROUNDNUT, 1960-61

The All-India Final Estimate of Groundnut, 1960-61 puts the current year's area and production at 15,455,000 acres and 4,354,000 tons respectively, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. As compared with the partially revised estimates of 14,864,000 acres and 3,942,000 tons for 1959-60, the estimates for 1960-61 show an increase of 591,000 acres or 4.0 per cent in area and 412,000 tons or 10.5 per cent in production. The increase in area during the current year is contributed mainly by Gujarat and to a lesser extent by Rajasthan and Punjab and is attributed generally to favourable climate conditions at the sowing time. A decrease in area has, however, been registered in Andhra Pradesh and Maharashtra States due to unfavourable weather. The increase in production during the current year is accounted for mainly by Gujarat, Maharashtra, Madhya Pradesh and Mysore and is attributed generally to favourable weather conditions during the period of growth of the crop. The increase in production in Gujarat is also partly due to increase in area sown to this crop. The All-India Final Estimate of Groundnut, 1959-60 placed the area and production of the crop for 1959-60 at 15,305,000 acres and 4,390,000 tons. The large downward revision in production is mainly on account of the adoption of the random sample crop cutting survey estimates by Andhra Pradesh and Mysore.

AMERICAN COTTON ALLOTMENT COMPULSORY

The Textile Commissioner has received representations from some mills requesting exemption from requirement to purchase American cotton stapling 1" and below, recently issued under P.L. 480 — purchase authorisation 39-55 — and allotted to them. The Textile Commissioner wishes to make it absolutely clear that these allotments are compulsory and no representations for exemption will be considered nor any correspondence entertained in this respect.

PRODUCTION AND EXPORT OF OPIUM

According to the Annual Report on the operations of the Narcotics Department for the year ended September, 1960, the two Government Opium Factories at Ghazipur and Neemuch showed a net profit of Rs. 109 lakhs—an increase of Rs. 28 lakhs over the previous year. There was improvement in other directions as well. Production and export of opium during the year were higher than in 1958-59. The area under poppy cultivation was 105,250 acres as against 74,205 acres in the previous year. The production figure also rose to 24,491 maunds as against 20,422 maunds in the previous year.

Export of opium amounted to 624 tons, valued at Rs. 4.59 crores—an increase of 104 tons valued at Rs. 77 lakhs, over the export of 1958-59. The total sale of alkaloids in the year rose to 4553 lbs. from 3775 lbs. in the previous year. The purchase price of opium was fixed on a sliding scale ranging from Rs. 33.50 to Rs. 38.50 per seer. Payment made to the cultivators amounted to Rs. 3.4 crores as against Rs. 2.7 crores in the previous year.

Fabrications to specifications

Under licences
from Messrs Fives-Lille-Cail,
France, who built the largest sugar and cement
plants in the world and have supplied Soviet Russia
in 1959 a five thousand ton daily capacity cement plant, we
manufacture machinery and equip complete sugar and cement plants.

We also manufacture and supply complete sulphuric acid and super
phosphate plants. We have secured orders for five complete sugar
plants, of one thousand tons daily sugar cane crushing capacity.

Company Meetings

CHAIRMAN'S SPEECH

INDIAN ALUMINIUM CO., LTD.

The following is the text of the speech delivered by Mr K. C. Mahindra, Chairman, Indian Aluminium Company, Limited, at the Annual General Meeting of the Company held at Calcutta on 27 April, 1961.

I have pleasure in welcoming you to our 23rd Annual General Meeting.

The Directors' Report submitted to you along with the audited accounts for the year 1960 provides information on the year's operations. I am happy to report that production and sales again reached new high levels in 1960. The steady progress which your company has been making over past years is reflected in the financial accounts which are before you now for your consideration.

During 1960 your company earned a net profit of Rs. 12 million as compared to Rs. 8 million in the previous year. A large part of this increase was due to the much smaller provision for development rebate in 1960. Nevertheless, you will agree that the financial results are gratifying. This has enabled your directors to recommend the payment of a higher dividend this year at Rs. 1.50 per ordinary share. Dividend on the preference shares has been recommended in accordance with the Preference Shares (Regulation of Dividends) Act 1960, and the company's Articles of Association. The Directors have proposed a transfer of Rs. 5 million to the General Reserve and a carry forward of Rs. 4.99 million under surplus account. You will no doubt appreciate that in a capital intensive industry like aluminium, it is prudent as well as necessary to plough back a portion of our surplus so as to meet the requirements of a growing industry like ours.

For the last few years, the corporate shareholders of this company have been enjoying—in respect of the ordinary shares issued in late 1956 and those issued upon conversion of Loan Stock since 1957—the benefits of Section 56A of the Indian Income Tax Act, that is, exemption from super tax on dividends. It now gives me considerable pleasure to announce that the benefits of Section 15C of the Indian Income Tax Act, which provides for five years' tax holiday for newly established industrial undertakings for which your new smelter at Hirakud qualifies, will be available to all shareholders both ordinary and preferred. For the year 1960, the Income Tax Officer has authorised your company not to deduct tax on 12 per cent of dividends and we propose to act accordingly. The percentage of 12 per cent has been fixed on a provisional basis and the shareholders will have to wait until the company's tax assessment for the year 1960 is completed before the full and final estimate of this benefit is obtained and on the basis of which tax relief, if any, may be claimed by the shareholders in their own assessments.

Because of our plants being located in different parts of the country, a very serious problem which we have to face is that of transport. The uncertainty of wagon availability forces the company to increase its inventories thereby tying up extra capital and also compelling the company to utilise more costly road transport.

Coal is a commodity most seriously affected and it appears there is no remedy for the immediate future. The Railways claim that they are carrying all the traffic that they are supposed to according to the Second Plan estimates. Various remedial measures are being discussed by the Government especially for the high

priority industries, e.g. steel, public utilities, etc. But for industries like aluminium, which enjoy no special priority, the prospect of improvement in transport bottlenecks do not appear to be hopeful. The company is pursuing this matter with the Government in the hope that some action may be taken to solve our difficulties in this regard.

Last year I spoke to you about the new excise duty levied on aluminium products. During the year 1960 we have faithfully collected Rs. 5.5 million as excise duty from our customers and paid this amount over to the Central Government. We are, however, worried about the way in which excise officials are interpreting the duty regulations. Excise duty is normally payable on shipments to customers, but not so in the case of aluminium. The officials have ruled that duty must be paid on all shipments of ingot from our smelters to our fabricating plants. Thus, excise duty must be paid on all aluminium in the pipeline and in our fabricating plants. From our annual statements you will see that we have so far paid no less than Rupees one million on this account. The requirements of working capital for this capital intensive industry are thereby further increased, and so also is the debit for interest. In addition, duty paid on ingot which is ultimately wasted in fabricating plants as 'melt loss' is never recovered. Thus you get an amazing result: the producer of aluminium is paying excise duty on something which is non-existent and can be shipped to nobody.

In our opinion the above difficulty and the unwarranted expenses arising therefrom, can be easily and sensibly eliminated by allowing us to move ingot and fabricate it 'in bond'. Such a procedure is not very uncommon, but so far it has not been possible to persuade the excise officials to see our point of view. Our losses on this score will multiply as our current expansion projects are put into commission, and it is desirable that the Central Board of Revenue take steps to remove this unfair burden at an early date.

Under the 1961-62 budget proposals the Government has extended the scope of excise duty to include aluminium pipes and tubes. Further burdens have been imposed on your industry by way of increased customs duty on imported machinery and reduction of tax concession in the form of development rebate. These proposals will have the effect of further increasing our cash requirements.

As to the company's expansion programme, satisfactory progress is being made at all locations. Barring any untoward happening, it is expected that the second extrusion press at Alupuram and the additional pot-line at Hirakud will be ready to go into operation before the end of the year. Expanded facilities at Belur and Muri are likely to be ready by the middle of next year. Your directors are anxious that your company continue to play its leading part in the development of aluminium industry in India and with this in view proposals for further expansion of the company's activities are under constant review.

1960 has been a good year for India and a particularly eventful one for the aluminium industry. The

last 12 months have witnessed a more than ordinary increase in the tempo of economic activity. A high level of industrial output especially in steel, buoyant central revenues, a slight improvement in export earnings despite initial setbacks, are some of the significant gains recorded. The year ended on an optimistic note and the outlook for 1961 is heartening.

Last year from this Forum I extended a hand of welcome and co-operation to two new entrants in the aluminium industry. I did not know then, nor did I anticipate, the wild scramble which has since ensued amongst the top flight producers of the world to stake a claim in the developing market in India. It does appear strange and perhaps ironic to me that international groups would take a leaf out of the Indian book of experience—a book which ruefully reveals our short horizons, our quest for the quick rupee, our inability to learn the long and tedious track to true industrialisation. There may have been justification 20 years ago for such mental attitudes, in as much as the protectorate or colonial era in India deprived the nationals of the country of learning by experience the vicissitudes of industrialisation. With the withdrawal of the British the hitherto financial and the trading classes in India plunged into the industrial vortex hurry scurry in many directions, but still with an eye for a quick rupee. They did not stop to take a long-term view; they did not stay to learn from the industrial revolution in Europe of the mid-19th century or even from the later hot-house developments in U.S.S.R. Last quinquennium has however showed a welcome change and long-term investments have become fashionable. It is therefore doubly strange that in the specialist field in which your company has pioneered the way, there should emerge a movement reminiscent of the old, old colonial days and ways. Crude and half-baked schemes, based on little or no field investigations or market surveys, and not even presuming to be economically viable, are presented to the public in India, endorsed by reputed concerns of international renown.

The deposits of bauxite ore on which the schemes are based have not been thoroughly field-tested for quality or reserves. Availability of firm and continuous power nor the ultimate costs thereof have been assured. Costs of production, in some cases based on questionable exchanges of metal for raw materials and/or equipment, have not been spelt out and are bound to be unnecessarily high. We in India should look at these proposed new schemes carefully before supporting them, and we should look at them through the factual eyes of experience and viability and not be carried away by mere enthusiasm for expansion.

But why this sudden display of interest in the Indian markets? We know that aluminium industry in the West and in North America has had a bad two years; there is a glut of primary metal and smelters have been working on restricted production. In Europe where smelter operations do not match the requirements of the fabrication units, conditions are not so depressing, and North American groups have moved 'en masse' into the European markets. India is slowly emerging as perhaps a desirable non-aligned area and may be, quick rupees can be made. It surprises me, however, that when our own planning techniques are being remodelled and reshaped in the light of experience over a decade, a throw-back emerges as a gift from the West. Alignments of resources with projections of demand become awry and we have begun to wonder if there has not been gross under-estimation of what country has in physical resources for aluminium development and what the country can consume. Our friends from the West did not perhaps reckon with the one obvious consequence of such a presentation, namely, the overall socialistic thinking of the planners. If the development of a basic commodity like aluminium is such a

gold mine, Government would not like to be left out. Offer of plant and techniques from a communist country has provided the opportunity for a Minister to say that a new aluminium unit will be set up in the public sector!—a consequence which, I am sure, will be irksome to many of the new aspirants.

Rational misjudgments do occur in every large effort but where there are scarcities of resources and of technical knowledge, where the purchasing power of the market is phenomenally low and therefore will take time for the upward geometrical surge, there is critical need for prolonged and deep look into the purposes and end products of investments and of potential investors. Aluminium industry is voracious in its appetite for capital. To produce a ton of primary aluminium one needs an investment in capital equipment and facilities almost ten times what it would need to produce a ton of steel. Let us look at the picture-projections for the next 5 years.

The demand for all non-ferrous metals during the Third Plan period is expected to go up and since aluminium is the only non-ferrous metal which can be indigenously produced, in adequate quantities, considerable thought is being given to its development. The draft outline of the Plan has set the target at 87,500 tons by 1965-66. Out of this 52,500 tons is already in production or under construction while work on the balance of 35,000 tons is expected to start shortly. As against this the country is currently consuming around 44,000 tons of metal.

Recently, however, there has been talk of raising the target for aluminium production to 150,000 tons, and if I am to add up the pending proposals supply target would be nearer 200,000 tons—a five times jump over current consumption within 5 years. That exports will take care of oversupply is a mirage, for India cannot hope to compete in the world market on level terms with strong international groups. We know that with our scattered deposits of ore, expensive power and comparably more expensive costs of installation, India will remain a high cost producer. Oversupply has its own quick nemesis and while I favour planning on an ambitious scale, I would nevertheless counsel prudence in weighing the adverse effects which might result from commitments which are premature for the stage of development which the industry has reached in this country. There is no surer way to discourage investment than to encourage over-optimistic growth and invite idle capacity—a fact that has been amply demonstrated even in highly developed economies. Moreover, India is currently power hungry, and its bauxite resources, though apparently considerable, are far from being proven in quantity and quality sufficient to sustain a prodigal rate of growth. The economic supply of these major raw materials is vitally important to the health of the aluminium industry, and, in my view, the country cannot afford to embark too hastily or too lavishly upon new and grandiose schemes, without the most careful thought for the prudent utilisation of these resources.

A noteworthy development, which also suggests the wisdom of temperate planning, and which is of great potential importance to the nascent industry of this country, is the announcement made by our Canadian associates, Aluminium Limited, that a basically new process—the first major technological change in the put into semi-commercial operation in Canada. The large power requirements of the existing process, or its dependence upon bauxite, but it does give promise of considerable savings in other elements of production cost, and particularly of substantial reduction in capital costs. The new experimental plant will be

completed early in 1962, with a production capacity of six to eight thousand tons of aluminium per year. It is expected that operation on this scale for a couple of years or so will be required to determine whether the estimated savings in capital and operating costs can be realised in large-scale operations.

In the light of these impressive possibilities, which we are watching with interest and care, the risks inherent in over-expansion take even clearer form. However, there are many factors to be considered into the formulation of future plans, and all are receiving the constant and critical attention of your management. We do not intend to keep static, but neither will we lose touch with realities and sound business principles, and I express the hope that Government, in its planning, will continue to maintain a similar outlook.

We have lost during the year the able direction of Mr. Vance Echols, who retired from India for family reasons.

THE BRITISH INDIA CORPORATION LIMITED

Address by Shri H. S. Chaturvedi, Chairman and Managing Director, to the Shareholders of the British India Corporation Limited, at the Forty-first Annual General Meeting of the Corporation held in Kanpur on Wednesday, 26th April, 1961.

Gentlemen,

It is my happy privilege to welcome you to the Corporation's Forty-first Annual General Meeting.

The Audited Accounts and the Directors' Report for the year ended 31st December, 1960, have been duly issued to the shareholders, and with your permission, I shall take them as read.

In my address to shareholders last year, I referred to the turn for the better in the Corporation's affairs after a period of great anxiety, and to the improved trading results for 1959. It gives me great pleasure to be able to report steady progress and further improvement in 1960. The net profit before taxation during the year amounted to Rs. 90,93,242 as compared with Rs. 63,09,042 in 1959 showing an increase of nearly Rs. 28 lakhs. The Corporation's recovery is further reflected in the reduction of the bank overdraft by over a crore of rupees as compared with last year.

On the side of dividends, you will notice from the Directors' Report that all arrears on Preference Shares will now be cleared, and that it has at last been possible to recommend the declaration of a dividend on the Ordinary Shares. In considering the dividend policy, your Directors are of the view that in order to strengthen and sustain the Corporation's financial position in the interest of future development, it is essential to plough back into the business a reasonable part of the profits. Accordingly, a sum of approximately Rs. 31 lakhs has been retained in the business out of the available trading surplus. In addition, a sum of Rs. 10.20 lakhs, that being the net surplus from the sale of fixed assets, has been transferred to Capital Reserve and Rs. 1.67 lakhs, that being the profit on the realisation of investments, has been transferred to Investment Reserve.

APPOINTMENT AS SECRETARIES AND TREASURERS

The appointment of the Corporation as Secretaries and Treasurers for five years of the Elgin Mills Co., Ltd., Cawnpore Textile Ltd., Cawnpore Sugar Works Ltd., Champarun Sugar Co., Ltd., Saran Engineering Co., Ltd., and Brushware Ltd., all of which were for-

His contribution to the Company's progress was dynamic and we were sorry to lose his services. Pending the appointment of a new Managing Director the Board entrusted the charge to Dr. Horwood who has been with the Company for some years, but unfortunately is also due to leave shortly. Your Board realises that quick changes in top management are not healthy, but in specialised fields where talent is very scarce it is inevitable that movement of skilled personnel must go on until we are able to develop such resources indigenously and in plenty.

Once again I am sure that shareholders would wish me to convey their thanks to the Company's able management team and to workers and staff who have served the Company well during the past year.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

merly under the Managing Agency of Begg, Sutherland & Co., Ltd., is a significant landmark in the history of the Corporation. Begg Sutherlands, which, since 1946, has been a wholly-owned subsidiary of the Corporation, will, I hope, soon be merged with the parent company. The appointment of the B.I.C. as Secretaries and Treasurers of the above six Companies, will ensure continuity of sound management and will, I sincerely hope, be in the best interests of those Companies.

I now propose to comment briefly on certain aspects of the working and activities of the Corporation's woollen textile, leather, cotton textile, and sugar units.

WOOLLEN BRANCHES

The Lalimli and Dhariwal Mills have on the whole done well in maintaining satisfactory production. These units, which were the first of their kind to be established in India have achieved a unique reputation over the years for the superior quality of their products. It has to be borne in mind, however, that the manufacture of specialized lines, for which there is a great demand, requires high grades of imported wool. In order to preserve their good reputation and to maintain production at two shift level, regular supplies of Merino and other high grade wools have to be assured. To this end the Corporation seeks the sympathetic and timely assistance of the Government in granting adequate import licences for raw materials essential for the production of specialized lines.

In my address last year I referred to the urgency of rehabilitating the plant and machinery of our Woollen Branches. Most of the Machinery is about fifty years old, and some of it dates back to 1880. A stage has been reached when productivity is bound to suffer if steps are not taken to re-habilitate the present plant, much of which is now obsolete and uneconomic. To earn foreign exchange, which is so vital to the future of the country, we must first improve our competitive power in the production of high quality goods at reasonable prices. This will to a great extent depend on our ability to modernise the existing plant.

Our technicians have prepared a blue-print of rehabilitation programmes with the aid of foreign experts,

and we shall soon be approaching the Government for import licences to implement the first part of the scheme.

LEATHER BRANCHES

The Corporation's Leather Branches, as you will observe from the Directors' Report have in 1960 made a small profit for the first time since 1953. This sign of slow but sure recovery from a very serious situation is naturally gratifying to us. The incidence of excise duty on leather footwear, and the shortage of good quality hides are, however, factors which adversely affect our leather industry.

The value of export from the Leather Branches in 1959 amounted to Rs. 44 lakhs. In 1960 the value had increased to Rs. 55 lakhs. I am also glad to report that recently the Cooper Allen Branch has obtained a substantial order for the supply of boots to the National Cadet Corps.

COTTON TEXTILE UNITS

The Corporation's two subsidiaries, Elgin Mills Co., Ltd., and Cawnpore Textiles, Ltd., have shown very satisfactory results. Trading conditions for the cotton textile industry, were, on the whole, favourable during the year under review. The satisfactory performance of the mills was, however, due mainly to the maximum utilisation of productive capacity, and concentration on new lines, which have increased the range of their products.

The export contribution of the Cotton Textile units has been outstanding, and export orders valued at approximately two crores of rupees were executed during the year.

Though cotton textile prospects are on the whole good, the recent Budget proposals in the shape of additional excise duty and other duties on dyes, chemicals, packing materials and yarn for manufacture of cloth will have the effect of increasing production costs of cotton cloth.

SUGAR UNITS

The six Sugar Factories in the Group achieved improved working results during the season 1959-60. Due to a substantial increase in the production of sugar and decline in internal consumption resulting in the heavy accumulation of sugar stocks, the Sugar Industry is however, passing through a critical phase. The position is such that the sugar factories in the Group are finding it difficult to pay for sugarcane and also to meet the governmental dues in the form of purchase tax and excise duty. We now depend upon Government to take effective action to overcome this crisis in the Sugar Industry, which is particularly serious in U.P. and Bihar, where the Group's factories are situated.

LABOUR

I am glad to report that relations with workers have been, on the whole, reasonably satisfactory. Far be it for me to suggest that there have been no differences. They do arise from time to time, and we have endeavoured to approach their problems in a spirit of goodwill. The Corporation maintains three Settlements for our workmen, the running costs of which are about Rs. 3½ lakhs annually. Besides housing at national rates, the amenities provided include

free dispensaries, libraries, play-grounds, schools, and free educational facilities for workmen and their families. To maintain our good relations, your Directors have decided to make an ex-gratia payment of two annas in the rupee to all workers on their basic earnings in 1960.

GENERAL

The year 1960 may well be reckoned as a year of consolidation. We are now in a position to launch a programme of rehabilitation and modernization, without which we cannot prosper in this age of growing competition. The year 1960 was encouraging in the sense that it was a year of steady progress on all fronts. For this, credit goes to a great extent to our workmen and employees in all grades, who have by their loyal services contributed to the prosperity of the B.I.C. as a whole. I thank all of them sincerely. It is in a spirit of sober confidence that we can now face the future.

In the end I must thank my worthy co-Directors who have sustained me with excellent advice and co-operation.

It is now my pleasure to move that the Directors' Report be adopted and that the Accounts for the year 1960 be passed, but before this Resolution is seconded, I shall answer to the best of my ability any questions which shareholders may like to ask on the Directors' Report and Accounts now before you.

THE BUCKINGHAM & CARNATIC COMPANY LIMITED

CHAIRMAN'S SPEECH

Presiding at the Fortieth Annual General Meeting of the Shareholders held at the Company's Office at Madras on Friday, 28th April, 1961, Mr. E. F. G. Hunter said:-

Gentlemen,

It is my privilege and pleasure to welcome you to this Annual General Meeting of The Buckingham & Carnatic Co. Ltd., and with your permission I propose to take as read the Directors' Report and the Accounts and Balance Sheet for the year 1960.

Trading conditions showed a marked improvement during the year under review. That better conditions prevailed in 1960 was indeed fortunate, as your Company along with others in the cotton textile industry had to meet a substantially higher wage bill as a result of the implementation of the recommendations of the Central Wage Board for the Cotton Textile Industry. The improvement in the demand for cloth experienced in 1960 and so far maintained in 1961, it is hoped, will continue in order that the industry may retain the capacity to meet the heavier burden. But demand alone is insufficient and if the industry is to remain capable of paying higher wages — to be increased again in 1962 in accordance with the Wage Board recommendations — and to continue to prosper, it will also be necessary to increase production, by implementing "rationalisation as soon as possible" which the Central Wage Board stressed in their recommendations. You will be pleased to learn that negotiations have commenced with the Labour Union to implement the Wage Board's recommendations in respect of rationalisation and agreement has been reached on the procedure to be followed. I most sincerely trust that tangible results will be achieved during the current year.

As stated by the Chairman in his speech last year, the textile industry then faced a serious crisis owing to the failure of the Indian cotton crop during the 1959-60 season. However, by strict controls, rationing and the import of short staple American cotton, Government was able to keep the industry supplied, though mills had to pay much higher prices. Also larger allocations of long staple foreign cotton were made to mills to enable them to spin finer counts and to reduce consumption of Indian cotton.

Despite these measures the carry over of Indian cotton at the beginning of the current cotton year was as low as 9,98,000 bales, i.e., approximately 46 per cent less than at the beginning of the previous season. Fortunately the 1960-61 cotton crop is promising and a total yield of 52½ lakh bales is expected. Rationing and other controls are still in force and to improve the stock position Government has decided to import more short staple American varieties. Prices, however, continue at a high level and it is feared that Mills will have to pay inordinately high prices for the short staple American cotton to be imported.

Although as noted in the Directors' Report your Company's sales reached a record figure, yardage of

cloth produced was, due to finer production, lower by comparison with the previous year. However, the improvement in your Company's exports was against the trend of India's export of textiles during 1960 and reflects the resolution with which this particular aspect of your Company's business was pursued. The incentives offered to those who make this effort in the overseas markets, where conditions and competition are getting increasingly difficult, serve as a great encouragement and it is hoped that Government's present tendency to water down these incentives will be reversed.

For the satisfactory sales of your Company's products in India we have much to thank the wholesale and retail dealers throughout the country and shareholders will be interested to know that at the instance of a number of the larger retailers in Madras, an All-India Binny Group Dealers' Conference was held in Madras early in February 1961. Over one thousand dealers from all over India, representing all the territories of our Guarantors, attended. The conference, which was held in the Rajaji Hall and Gardens, which were kindly loaned by the Government of Madras, was a great success in every way and gave your Sales organisation an excellent opportunity of dealing with day to day problems and difficulties. Mr. Kanungo, the Union Minister for Commerce, very kindly attended the opening session.

The policy of extending indirect taxation by the application in the Budget of 1961 of further Excise Duties, will have the effect of spreading the collection of tax over the community as a whole, and in my view is to be welcomed, even though the new duties have not been accompanied by any proposals for reducing direct taxation or for providing incentives. However, one would have thought that the levies by way of excise duty and handloom cess already borne by the cotton textile mill industry, which on the sales of your Company in 1960 together amounted to over Rs. 54 lakhs, were heavy enough and that the fresh imposts on cotton textiles proposed in the 1961 budget were unjustifiable and, in the light of the concern expressed by Government over cotton textile prices, illogical. It is particularly unfortunate that the proposals for additional Excise Duties on cloth and the new Excise Duty on yarn were not framed so as to make their impact and the manner of their collection quite clear, as following their announcement the industry was thrown into considerable confusion.

The subsequent decision to compound the proposed duty on yarn into a duty on cloth was welcomed by mills, but the introduction of an excise levy on automatic loom production, subject to relief on export performance, is unwarranted. Any form of penalty which does not apply equally to all mills can only be considered discriminatory and this levy is certainly no incentive to progress or to modernisation.

The B. & C. Mills which have a high proportion

of automatic looms have always done their best to earn foreign exchange by exporting. As I mentioned earlier, your Company's exports improved in 1960 and this improvement was against the trend of the country's textile exports. How then, can it be said to be equitable if Government, while encouraging mills to export on the one hand, dampens their enthusiasm by introducing such an unfair impost.

Your Mills do not export grey cloth. The exports are all dyed and finished products which require large quantities of indigenous and imported dyes and chemicals. Under the export promotion scheme, according to their exports, your Mills are entitled to licences for dyestuffs and chemicals and so when it was recently announced that import entitlements so earned could only be used to 65 per cent of their face value, one began to wonder whether Government really appreciates the effect of some of its decisions on mills such as yours which, over the years, have a record for exporting of which they are justly proud.

I can assure you that representations have been made in the proper quarters and I hope that wiser counsels will prevail so that those mills, such as yours, which utilise all their import licences for dyestuffs for their own purposes, will not have to surrender 35 per cent of their value to indigenous dyestuff manufacturers.

The artificial limitation of production of cotton textiles by the Mill Industry, effected by the control of looms and spindles installed, has produced in India's expanding economy the conditions which could lead to an inflationary rise in cotton textile prices, especially as Third Plan Targets appear now to be outdated having in mind the provisional figures of the recent census. But the textile industry, conscious of the need to maintain a stable economy, and in response to Government's appeal, has voluntarily regulated its prices. Meantime, the Government of India has appointed a Tariff Commission to enquire into fair prices of cotton textiles and yarn.

As Members will have seen from the souvenir booklet issued with the Annual Accounts, your Mills were honoured, on the 20th February, 1961, by a visit from His Royal Highness, The Prince Philip, Duke of Edinburgh. It was my privilege and that of some of my colleagues on the Board, to conduct His Royal Highness around the Mills, and I gained a strong feeling that he was most impressed by everything he saw. It was a most memorable occasion and it was indeed a great distinction for your Company to be selected for the visit.

Turning now to the dividend, the rate recommended by the Directors will bring the total distribution for the year 1960 to more than 50 per cent of the assessable income, less the tax thereon, and the provisions of Section 23A of the Indian Income-tax Act which apply to this Company, will, therefore, be met by the declaration of the final dividend proposed.

In accordance with the terms of The Preference Shares (Regulation of Dividends) Act, 1960, which received the assent of the President of India on the 28th December last, the dividend on the Company's 7½ per cent Cumulative Preference Shares has been amended to a dividend of 9.75 per cent, from which the Company is obliged to deduct tax pursuant to Section 18 (3D) of the Indian Income-tax Act. An additional dividend of 2.25 per cent was declared and was paid on the 17th February, 1961, to adjust the dividend already paid in respect of the year 1960. Henceforth the Preference Dividend will be paid by

two instalments each of Rs. 4.875 per share less tax, on the 1st January and the 1st July of each year.

The Companies (Amendment) Act, 1960, also received the assent of the President of India on 28th December, 1960, and was brought into effect from that date, and the Accounts before you have been drawn up in accordance with the Companies Act, 1956, as amended by the new Act. Many new restrictions have been imposed on Companies, and many of the new provisions, for example those affecting inter-corporate investment, the payment of dividends, special audits etc., have no parallel in any other country in the world, and must further inhibit good management and enterprise. Many of the two hundred and eighteen clauses of the new Act will mean more paper work and time wasting form filling, which besides adding to cost, must result in a diversion of effort and create new difficulties for administration.

It was mainly because of the various restrictions on Managing Agents imposed by the Companies Act, 1956, and the further restrictions which were at the time contemplated by the Amending Bill, since enacted, that Binny & Co. (Madras) Ltd. decided in 1959, after consultation with your Directors, to relinquish the office of Managing Agents of your Company which they did with effect from 31st December, 1960. With the approval of the Government of India, Managing Directors were appointed to take over the management of the Company from 1st January, 1961. The Managing Directors appointed have all had long experience in the management and business of your Company, and in this way continuity has been ensured. Officers and staff who had previously been engaged, as employees of Binny & Co. (Madras) Ltd., on the business of your Company, also accepted employment with the Company from the 1st January, 1961 and I am pleased to report that the transfer of the management, which had been carefully planned, took place without any hitch and caused no disturbance whatever to your Company's business.

I am sure you will wish to join the Directors in expressing thanks to the retiring Managing Agents, Binny & Co. (Madras) Ltd., and their staff, for the valuable services rendered to your Company since the present Company was incorporated in 1920, and under whose management your Company has indeed expanded and prospered.

On your behalf I would also like to record appreciation of the services of the Mill Manager, Mr. Molyneux, who was appointed a Managing Director with effect from 1st January, 1961, to his officers, staff and the workpeople at the Mill, whose efforts in 1960 have contributed to the satisfactory results recorded in the Accounts before you.

I should be failing in my duty if I did not express my gratitude to my colleagues on the Board of your Company for their unstinted help and co-operation at all times.

Before concluding I would also like to refer to the valuable services rendered to the Company by Mr. E. J. M. Leigh who had been associated with your Company for over 32 years, and was your Chairman from 1958 up to the end of 1960. Mr. Leigh retired from India in February 1961.

Note: This document does not purport to be a report of the proceedings of the General Meeting.

KILLICK INDUSTRIES LIMITED

CHAIRMAN'S SPEECH BY SHRI A. N. HAKSAR

Gentlemen,

The Report and Accounts for the year are not as satisfactory as I would have liked them to be. Although I have no wish to make any excuses, I would like the shareholders to appreciate that during the year under review, we were subjected to certain strains and stresses and were forced to incur certain expenditure which I sincerely hope is not of a recurring nature. Overall, I can hope that 1961 will show a modest improvement over the current year. The Managing Agency side of the business will, I think, definitely show better results. I cannot be so sanguine regarding our subsidiaries, Killick Nixon & Co., Ltd., and Stamco Industries Ltd., but I believe that these Companies will eventually become useful earning members of the Group through it will take some time.

The Kohinoor Mills has, one can hope, turned the corner. New machinery has been installed and improvements in working are already evident. The results for 1960 are substantially better than those of 1959 and would have been better still if large amounts had not been paid out in retrenchment and other compensation.

The Electricity Companies continue to enlarge their service to their respective communities. The enormous expansion in demand for power for industry and homes in the Bombay Suburban area has created difficulties over the procurement of materials. In turn this has meant that applications for power are running ahead of services connected. The Surat Electricity Co., in common with the rest of the Licensees in South Gujarat, has been subject to control on new connections and its diesel plant is being called upon to bear an increasing burden to sustain the interests of the South Gujarat Grid. The Ahmedabad station is more than fully loaded and in fact steps are being taken by the Government to effect measures to bring about some form of rationing of power. This is most unfortunate but absolutely necessary. The silver lining in the cloud, however, is that 60 MW of new plant is scheduled to be brought into commission—30 MW by March 1962 and the balance one year thereafter.

The Shivrampur Syndicate Ltd. increased its sales of Manganese Ore in the last year but, I am afraid, this increase was mainly due to the fact that during the year Manganese Ore exports were permitted against Barter transactions by the Government. Otherwise, Indian Manganese Ore continues to be uncompetitive, generally speaking, in the International market. It is well known that many new mines have been developed in recent years in several countries such as Brazil, South and West Africa, etc. During the same period, F.A.S. costs of Indian Ore suffered unavoidable increases due to additional imports such as increased royalty rates and Railway freights. The latter difficulty remains unresolved even today and unless adequate relief is granted soon, I cannot visualise an encouraging future for Indian Manganese Ore exports.

The Hingir-Rampur Coal Co.'s position has shown considerable improvement although, in common with other collieries, it is faced with a serious shortage of railway wagons for the movement of coal supplies, and recently the stocks have reached an unprecedented high

level with the result that production of coal has had to be curtailed.

The Steel File Factory at the Chandivli Industrial Estate has been suffering from labour problems. It is to be hoped that the Union will show a more positive spirit of co-operation to enable this Factory to improve its contribution to your Company's profits. There is no doubt in my mind that given stable conditions and trouble free working, this factory can make considerable profits.

Turning to the affairs of the Company's Subsidiaries, you will notice that the working results of Killick, Nixon & Co. Ltd., show a considerable improvement compared to the previous year. From a loss of Rs. 2 lakhs for the year 1958-59, the Company has shown a reasonable profit of Rs. 1½ lakhs for the year 1959-60. There have been some setbacks during the current year, but every effort is being made to rectify the position.

Stamco Industries continue to show a loss, but I believe that the measures now being undertaken will reverse this tendency. I am very pleased to report that consequent to the visit to the Stamco factory by two Directors of Caribonum Ltd., Leyton, U.K., which is one of the major manufacturers and suppliers of carbon paper and stationery products throughout many markets of the world, that Company has agreed to provide financial and technical assistance to develop our production and sales. While no spectacular results should be expected in the near future, I believe that this Company will eventually take its rightful place in the industry in India today.

Although our new Subsidiary, A. R. Haseler Ltd., shows a loss up to 30th September, 1960, the date of acquisition by Killick Industries Ltd., the working since that date has shown an improvement, which I hope will continue.

We expect to receive a handsome return during the current year on our investment in Snowcem India Ltd., which Company is now developing a considerable demand for its products and hopes to continue to increase its range of cement speciality products.

What of the future? In the immediate years ahead, your Company will continue to have great responsibilities as Managing Agents of large-scale industrial undertakings. I have always believed and continue to believe that the good Managing Agents serve a most useful function and I trust that Government will continue to recognise their usefulness. Nevertheless, in the circumstances obtaining today, I think you will agree that it is only prudent that your Company takes steps to broaden the range of its activities by investing in industrial undertakings either directly or through subsidiary Companies. Although at the moment the industrial potential of Killick Industries Limited and the Subsidiary Companies is not all that I could wish, I believe that this diversity of business will in due course not only contribute to the country's expanding economy but will directly benefit you all as shareholders of this Company.

Note: This does not purport to be the proceedings of the Annual General Meeting which can be seen by any shareholder on request.

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

"Consent of the Central Government has been obtained to this issue by an Order of which a complete copy is open to public inspection at the Registered Office of the Company". It must be distinctly understood that in giving the consent, the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to the same.

A licence has been granted to the Company by the Central Government for effecting substantial expansion of this Industrial Undertaking, a copy of which is open to public inspection at the Registered Office of the Company. It must be distinctly understood that in granting the licence, the Government of India do not take any responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to them.

A copy of the Prospectus having attached to it the documents required by Section 60 of the Companies Act, 1956, has been delivered to the Registrar of Companies, in Mysore, Bangalore for Registration.

The subscription list will open at 10-30 A.M. on the 15th day of May, 1961, and will close at 3-00 P.M. on the 17th day of May, 1961, or later at the discretion of the Directors.

Applications must be made for a minimum of 8 shares or multiples thereof, each lot of 8 shares made up of 3 Equity and 5 Preference shares.

THE MYSORE KIRLOSKAR LIMITED

Yantrapur, P.O. HARIHAR (Mysore State)

(Incorporated on the 7th day of April, 1941, under the Mysore Companies Act, and now an existing Company within the meaning of Section 3 of the Companies Act, 1956).

The Mysore Kirloskar Ltd., have decided to issue 15,000 Equity shares of Rs. 100 each and 25,000 Redeemable Cumulative Participating Preference shares of Rs. 100 each. The Preference shares are redeemable not before the 30th day of June, 1975, but not later than the 30th day of June, 1980.

The Preference shares bear a firm return of 8 per cent if the Company declares dividend below 12½ per cent on Equity shares. If the Company declares more than 12½ per cent but less than 15 per cent dividend on Equity shares, the Preference shares will get 9 per cent; and if the dividend declared on Equity shares exceeds 15 per cent, the Preference shares will get 10 per cent. This will be the maximum dividend payable on Preference shares.

UNDERWRITERS TO THE ISSUE

The Life Insurance Corporation of India,
Jeevan Kendra,
J. N. Tata Road, Bombay-1.

Messrs R. R. Nabar & Co.,
Share & Stock Brokers,
31, Dalal Street, Fort, Bombay-1.

Carrier serve you faithfully at the Ashoka Hotel, New Delhi

We're at your service 24 hours of the day. Constantly. Quietly. Reliably. Our main concern: your comfort. At the Ashoka we keep you cool in summer, warm in winter. Protect you from dust, damp and insects, too.

We're air conditioning people. Don't like speaking out of turn. Let others do our talking for us. They'll tell you about the many hotels we've air conditioned. All the climate control and refrigeration jobs we've done. Tell you about dependable

Carrier equipment. Voltas' expert installation and service. Don't really need credentials. Our clients recommend us to their friends. "Carrier and Voltas," they say, "are the people who know air conditioning best".

Some other hotels and restaurants air conditioned by us:

A. Firpo Ltd., Calcutta
Gaylord, Bombay
Great Eastern Hotel Ltd., Calcutta
Hotel Ambassador, New Delhi
Hotel Imperial, New Delhi
Hotel Janpath, New Delhi
La Bella, Bombay
Maidens Hotel, New Delhi
Taj Mahal Hotel, Bombay.

Spaceman the Second

COMMANDER Alan B. Shepard, the world's second spaceman, has, not unnaturally, overflowed into high politics. Much of the elation in the Western world at having a real spaceman in its midst has raised anew odious comparisons as to the respective merits of the two projects. The verdicts only add to the confusion. Measurements of the gap between the United States' space effort and the Russians' vary from as much as ten years to less than a year. Mr. Dean Rusk seemed confident to prophesy that the United States would have a man in full orbit round the earth before the end of the year. Those who are not possessed of the extremely technical information, on which such predictions are based, will wonder whether or not this optimism is justified.

Odious comparisons in these cases are not only inevitable, but must, in fact, be made, for much more hangs on spacemanship than the mere prestige of the contending nations. While currently everyone protests loudly that the mysteries of space technology will not be used for destructive purposes, it is easy to see that the rockets being developed for this purpose can easily be attached to nuclear warheads operating with extreme accuracy, and presumably with great selective power. The fact that the Russians have been able to obtain much greater speeds and have put into orbit much greater weights than the United States seems to suggest a powerful military advantage which it is foolish to ignore. Gun-boat diplomacy may have ended, but everyone knows that the power of bargaining collectively or otherwise in an armed neutrality depends on the strength of the contending powers. In courage

and in endurance there is probably no difference between an American and a Russian spaceman, but the gap in rocket technology may take many years to bridge. Meanwhile, the West, in spite of its brave showing this week, is definitely at a disadvantage in bargaining with the Russians.

The effect on India of these achievements should not be associated so much with the possibilities of the uneven war between the contending parties in the Cold War as with the transmission to ourselves of some of the new knowledge which is being generated by the development of space research. First indications are that the problems of technology connected with spacemanship and indeed, with all the problems of space travel, including radiation and cosmic rays research, are currently in India in a state of great neglect. This may be true of a great deal of general research in the Indian Union, particularly in the field of pure mathematics, where recent indications are to the effect that India is losing ground very rapidly. The welcome success of other countries in elevating the human mind should not bar us from a searching scrutiny of our own educational deficiencies; not all knowledge can be easily borrowed. Scientific education in the Indian Union is in a state of stagnation from which we should rouse ourselves without delay. It is sincerely to be hoped, now that the University Grants Commission has a distinguished scientist at its head, some active steps will be taken to promote life in the senior schools of physics and mathematics in the country, so that at least our Universities will be conversant with the tremendous advances which the challenge of spacemanship has thrown before the world.

Exports: How much? To whom?

THE appearance of the main figures of the Working Group engaged in import and export trends have done much to dampen enthusiasm on the settlement of the Indian foreign exchange gap raised by preliminary optimistic estimates of American aid and British "free" credit. Broadly, the feeling has grown that if the United States is willing to put up one billion dollars to cover the first two years of the Plan, friends in the Aid-India Club might, after certain political obstacles are removed—such as the West German elections at the end of this year—provide the balance. Thus, while it has been noted that the United States offer is conditional—and all conditional offers mean that much water must flow under the bridge before the

offer reaches maturity—there is justification for the view that the foreign exchange paper figures of the Plan might be met. But this week the release of the figures of the Working Group as well as Sir Donald MacDougall's expert opinion is to the effect that the gap would be of the order of Rs. 500 crores more than in the Draft Outline as a result of both capital and maintenance imports having been severely underestimated.

What is the way out of this major dilemma, since it would appear that our friends abroad are not prepared for additional commitments; nor, indeed, have we presented any for their consideration. Sir Donald takes the view that not only should India ask for more aid, but also raise her

exports in the next five years to Rs. 1,000 crores per annum in preparation for an all-out effort to take them to Rs 1,500 crores a year at the end of the Fourth Plan. The question which everyone will ask is how practical this target is; to whom are these additional exports to be directed? Almost nothing is known of the likely rates of rise of Indian exports in the major markets of the world in the next few years. But it is now becoming clear that the biggest market in the world is that of the European Economic Community which has shown a quite remarkable rate of growth ever since 1953. In 1959, imports of all types of goods by this community were 77 per cent higher than in 1953, compared with a world increase of 44 per cent. The rise in manufactures was 113 per cent at current prices, but West Germany actually had a rise of 283 per cent. Indeed, West Germany now dominates the import picture with a rise between 1953 and 1959 of over 300 per cent in imports and a rate of rise which is as high as it ever was. It is followed by France, and currently by Italy, which was previously a slow mover, and then by the Netherlands, Belgium, Luxembourg. Obviously, India has not given to this most rapidly growing market the attention that it deserves. The fact that we have an obstinate current deficit with West Germany, which has been a constant cause of concern, should have attracted us particularly to promotional efforts there. Unfortunately, our efforts in this direction have been both half-hearted and, on the whole, ineffective.

It is clear that if India is to raise her export target by even Rs. 50 crores per year, she can

The Nahorkatiya Pipeline Project

FLYING from Gauhati to Mohanbari, one can spot a new contour that has been drawn on this attractive landscape, over a distance of nearly 250 miles, by burying about four feet underground a mighty 16" diameter snake. A similar contour will shortly start coming up over a distance of about 470 miles from Gauhati to Barauni when the tail portion of this snake, 14 inches in diameter, is laid to rest with all modern scientific ceremonies. The snake, however, is nothing else but the thin-walled, woven-glass-mat covered and bitumen-coated steel pipeline meant for transporting the black gold of Nahorkatiya to Nunmati and Barauni refineries. A feat of engineering skill, this pipeline, the first one to be laid in India, is estimated to cost Rs. 44 crores and is considered to be the most economical mode of transporting Nahorkatiya crude to the two public sector refineries—to bring this crude to Nunmati and Barauni by rail, it is estimated that 18 trains of normal length would have been required daily, which task was obviously beyond the scope of the meter-gauge railway system that connects Nahorkatiya with Bihar State today.

Comparisons have been made between the cost of construction of this pipeline and those laid recently in Pakistan and in the United States and Canada. It is alleged that the cost of the Indian project is approximately twice as high as that of the Sui gas pipeline or of laying an oil pipeline in the U.S.A., and 25 per cent more than what is generally the expense incurred in Canada. Frankly speaking, this writer held the same view before he had an opportunity to study the project on the spot. The difficult terrain through which the pipeline passes, the monsoonish climatic conditions of the region, the hazards of transporting material and machinery to the site of the project and the peculiar chemical proper-

ties of the Nahorkatiya crude have, however, compelled him to revise his opinion to a great extent. In Europe, transport costs are against her. But Africa and South-East Asia are her "natural" markets and they too will develop, though potentially they are much smaller than those presented by the industrialised countries or that large group of countries on rupee payment which is itself the creator of exports, meaning the importers from these countries build the exports without any significant assistance from the Indian seller.

Obviously, the time is ripe for a major study to be undertaken of India's relations on the one hand with the European Common Market, and with the rupee countries on the other. It is presumed that most South-East Asian countries would also be willing to do substantial trade on rupee account provided imaginative projects of this kind could be developed. A first step in the analysis of the problem should be the release of the Working Group studies and Sir Donald MacDougall's reports. Thereafter, the almost insuperable problem that besets India by the expanded gap must be approached in the first place by an all-out export drive; secondly, by a stand-by credit arrangement until the drive matures or, less happily, by a reduction of imports when the foreign exchange is just not available. On all grounds, there is reason to believe that the Government of India has thought inadequately on the problem, and the business community even less. This is surely a time for a major Export Conference which might well work on the dismal data papers which Government seems to have in relative abundance at this time.

ties of the Nahorkatiya crude have, however, compelled him to revise his opinion to a great extent.

A glance at the various components of the cost of constructing the pipeline will evince that as much as nearly Rs. 3 crores had to be spent on research, setting up of a crude conditioning plant and providing for costly reciprocating plunger pumps in place of centrifugal pumps, to make the viscous and waxy Nahorkatiya crude pipelineable—an expenditure not normally required to be incurred elsewhere. The cost has been further inflated by the need to complete the work in a short span of time to make up for the delay on the part of the Government to reach a decision on exploitation of the Nahorkatiya oilfield and to avoid suspension of work during the long spell of monsoonish weather; an additional "spread", equipped with an extra set of machinery, has had to be provided on account of this. The difficult terrain, which must have considerably boosted the cost on survey and demarcation of the area for the pipeline, has cost additionally not only on transport of material and machinery to the site, but has also necessitated carrying of the pipeline through river beds, over rail/road bridges or on support of suspension bridges at no less than 78 places. The total cost of laying the pipeline across these rivers is estimated to be around Rs. 4 crores, out of which nearly Rs. 91 lakhs have been saved thanks to the decision of the Railway Board to allow it to pass over the Brahmaputra bridge (this saving would have amounted to about Rs. 1.1 crores had this decision been taken expeditiously). Another nearly Rs. 2 crores have had to be paid to the Central Exchequer in the form of duty on imported pipes, machinery and equipment which are expected to cost approximately Rs. 13 crores. The lack of technical know-how indigenously has probably increased the cost by

yet another couple of crores of rupees. The high cost of construction of industrial and residential buildings in Assam areas—nearly 170 per cent more than elsewhere in North India—has further swelled the expense bill by about Rs. 50 lakhs.

Taking all these facts into consideration, one would be inclined to infer that the cost of constructing the Nahorkatiya-Nunmati-Barauni pipeline is not unreasonably high. The valuable experience gained by the Indian personnel associated with the construction work will be an asset that can be drawn upon for undertaking similar tasks in future — for laying products pipelines

Foreign Private Investment

THE Government's recent statement on a "rationalised" procedure for processing projects involving foreign private investment could have been issued with considerable advantage towards the middle of the Second Five-Year Plan, when acute difficulties of foreign exchange put a brake on the progress of several private programmes of expansion and selectivity was essential. However, it has now come at an appropriate time when the foreign private investor is evincing real interest in the scope which the Third Five-Year Plan opens up for the entry of foreign capital in this country. The reform, based on simplification and expeditious settlement of applications to start projects, either independently or in collaboration with Indian investors, is purely procedural. All the same, it is calculated to facilitate the inflow of private capital on a larger scale than heretofore as many doubts and apprehensions are being positively cleared.

The major criticism against the previous procedure is being met. Responsible business opinion abroad (of which the views expressed by the Federation of British Industries are typically representative) holds that the climate for foreign private capital in India and the country's remarkable record of permitting repatriation of profits as well as capital are features of basic value which have sustained the attraction to the investor. Because of this assurance reinvestment is expanding with a full sense of confidence. But the jungle of regulations and procedural formalities which has grown around industrial licensing not only mars the value of these features but operates partially as a deterrent by reason of the inordinate delays involved, the hardships and vexation caused and the uncertainties created in pursuing the follow-up procedure, necessitated by the routing of the applications through a number of official channels. A unified authority will now deal with the applications of foreign investors, while routing through different authorities in the various ministries will be eliminated by direct consultation with them. The senior official, who has been appointed in the Ministry of Commerce and Industry specially for the purpose of this scrutiny, will, nevertheless, have to wade through the mass of controls and regulations. The superfluous and unimportant among them could not be scrapped in the course of this reform as they amount to substantive provisions in contradistinction to procedural formalities.

The enumeration of industries made in the statement to indicate the spheres in which foreign investment is welcome ostensibly includes two dozen industries, but some of them are omnibus classes covering several industries. Care has been taken to stress that this list by no means exhausts the scope for foreign private investment; it is merely illustrative. In fact the emphasis on flexibility has been amplified with reference to

from Barauni to Calcutta and Delhi and oil pipelines in the Cambay and Ankleshwar region.

It is indeed gratifying to note that despite so many blanks in the scheme when the work on this pipeline was taken in hand and in spite of innumerable odds, the project will be completed strictly according to the schedule and at a cost not exceeding the original estimates; it may, in fact, be finished earlier and probably with a substantial saving. This speaks highly of the planners of the project. It is an example which those incharge of public sector enterprises might well emulate.

Schedule A of the Industrial Policy Statement of April 1956 which defines the field earmarked for the public sector and it has been pointed out that private participation in this area is permitted where public interest demands it. Most of the industries mentioned as belonging to the category in which foreign capital may not be required ordinarily, are those from which it is being repatriated—for instance, plantations—or those where foreign capital is consolidating its position rather than expanding it. The merit of the explanation really lies in offering a wide choice for investment.

Our pre-occupation with accelerated development of export industries is most likely to give rise to some misgivings in the mind of the foreign investor. It is likely they have been generated by isolated instances in which foreign-owned subsidiaries were being persuaded to contribute their valuable co-operation in promoting exports. It is neither the policy nor the intention of the Government to single out subsidiaries of foreign parent companies for obligatory exports. The statement clarifies the position when it points out that projects of foreign investment which promise to give a boost to exports will receive special encouragement and goes on to add that the foreign collaborator's overseas marketing organization may not necessarily be linked with the joint venture in India. It is problematical how far foreign private investment will flow into Indian export industries. One of the potent factors which influence the inflow of foreign capital is the overseas investor's object of overcoming the handicaps created by import restrictions in India—quotas and tariffs—by starting production in this country. This is welcome inasmuch as it fits in with the Plan programmes.

The limitation on the capacity of the liberalised procedure for entry of foreign private capital ought to be borne in mind. Explaining the vital point that there is no rigidity about the ratios in which foreign and Indian investment should collaborate, the statement makes the point that one determining factor is the amount of foreign technical skills offered. A higher ratio to foreign capital on the score of provision of valuable technical know-how will not be sufficient in itself. Already there is the standing grievance that our official definition of a technician for purposes of tax relief is narrow since it is restricted to a technician engaged in putting the plant into operation and even so conventional allowances are not made in granting tax exemption. And now Mr. Selwyn Lloyd's tax relief in the UK (which accounts for two-fifths of the foreign private investment in this country) to the medium income brackets will make relief granted in India less attractive. A healthy beginning is made with this procedural reform to stimulate foreign private capital. But its practical utility will be conditioned by corresponding substantive reform.

A DELHI DIARY

THE week has been thrice blessed. To begin with, it was sanctified by the centenaries of two great heroes of Indian nationalism—Pandit Motilal Nehru and Dr. Rabindranath Tagore. The rejoicings at their centenaries have exceeded all expectations and while, naughtily, I sometimes wonder how much of the enthusiasm is artificial, I suppose a good deal of it is real. Secondly, the week has brought an abundant flow of confidence into Indian athletics and sport. A magnificent effort has carried an Indian climbing expedition to the top of Annapurna III, winning almost the highest distinction in this field for the first time for an Indian mountaineering group whom we have tended often not to rank lowly in the field. At the same time, in the Davis Cup meeting at Delhi, India triumphed over Japan 4:1 in an exciting performance in which a new star, Akhtar Ali, has suddenly entered the tennis firmament. I applaud his coming, because I understand that he comes from a fairly humble walk of life. While this is vindication of the socialist pattern of society, the chances of such persons having the same opportunities to play in great matches is not guaranteed by the Indian Constitution. Finally, — and for the feminine of the species, the most happy of all—was the Dowry Bill passed with applause by a joint session of both the Houses of Parliament on Tuesday. All in all, the week has, therefore, brought in a full toll of happy events.

RABINDRANATH TAGORE

On Rabindranath Tagore I dare not say a disrespectful piece; but there are many people who feel that the magnitude of the centenary celebrations, both at home and abroad, went not merely far beyond their own expectations, but reflect an impact on Indian consciousness of the greatness of Tagore which is not deeply shared outside Bengal. In particular, amongst the middle-class intelligentsia outside Bengal the tremendous ascendancy which Tagore has enjoyed in the current celebrations over Motilal Nehru, has come in for comment in New Delhi. There was no reason to diminish our respect for Tagore, whose grand versatility as well as burning nationalism deserve the unending admiration of the Indian people; but why was it necessary in the process to diminish the importance of Motilal Nehru, one of the grandest and most colourful of our national heroes? One of the consequences of an abundantly rich year of births has been some inequality in the distribution of the glory thereof. Pandit Motilal Nehru has probably been bereft of some of the honour which was his due, and it may be that Pandit Madan Mohan Malaviya and the great scientist, P. C. Ray, will suffer severe oblivion since it is extremely unlikely that heroic measures to revive memories of this kind can be undertaken four times a year.

It is, in fact, a little bit of surprise that the Government of India threw itself into the Tagore celebrations with an abandon which was a slight denial of the great necessity of hard work in order to honour the great heroes of the Revolution by constructive effort to imitate their own passionate dedication. Monday was a day of complete cessation of work almost all over the country, it being a bank holiday, and many things more, so that almost no one could work. Even journalists like ourselves who are compelled relentlessly to follow the heavy rush of events, were deprived of liftmen—or are they now elevator-operators?—and had to make their way up exacting stairs at all levels from the ground. It is not, perhaps, unnatural that, in the circumstances, our great admiration for Rabindranath Tagore has undergone what might be called a temporary, and somewhat irritating, eclipse. Of course, since the lives of great men all remind us that we can make our lives sublime, these petty irritations are wholly out of place. But I have no intention of leaving, like

them, my footprints on the sands of time. I am too human!

THE DOWRY BILL

Few of us — largely, I suppose, because of the fact that we do not see the feminine view in this matter—have thought the excitement over the Dowry Prohibition Bill, which required a joint session of both the Houses of Parliament to resolve the differences between them, was justified. Some of us, no doubt, have received dowries and some (less happily) have not. Those of us who have received dowries, I think have had the good sense to recognise that they belonged not so much to us as to the new family, just as one receives various wedding presents. They all go into the pool and—reactionary man that I am—I believe that, if the older generation transfers gifts—or should I say resources to bring the analogy into line with the Planning Commission documents?—to the next generation, not much harm can be done. The young can always use these resources, it seems to me, more profitably than the old. The dowry system was, therefore, an opportunity not only to place a young couple on its feet, but also an instrument to effect that happy redistribution of wealth which continues to be the passionate goal of the socialist pattern of society. Now that dowries are legally prohibited—although, this I am told means that they are by no means eliminated—there will be a tendency for fathers and mothers to retain as much of their property to themselves and compel natural love and affection to do what a healthy monetary inducement so happily assisted. All in all, like the Indian Constitution which gave equality to women in law, but with no bar on customs, I expect things will go on very much as they are. Nevertheless, I suppose women have found the fifth freedom which is that they can enter holy wedlock without having an undue amount of gold on their persons or a significant bank balance in somebody else's name. Some members of Parliament tell me that this is the best that can be done in the socialist pattern of society, and I accept with good grace the fact that taxes on matrimony are thus being reduced. I might mention that that is the only tax which is likely to be reduced in the aforesaid socialist pattern. And it is a tax on the aged or aging which has been turned into a tax on youth!

My views are not those of the gentleman below!

What a Life!

We've passed a law that you must grow up faster!

ARGUS.

THE WEEK'S NOTES

The Dowry Bill

EFFICACY

FOR THE first time in the history of India's Parliament the two Houses held a joint session. A unique occasion such as this must require a unique purpose. It is difficult to be sure that this was so in case of the first joint session. Two controversial clauses in the Dowry Prohibition Bill necessitated this session, but it may be questioned whether the Bill merited the distinction which befell it.

The definition of the Bill along with the explanation attached to it and the penal clause together with the proviso were storm centres of the controversy. The essence of the definition of the term dowry consists in the phrase, money or property given as consideration for marriage. But gifts of any kind of substantial value can be made, without being branded as consideration for marriage, if they are made out of affection and by pure volition. It is difficult to produce evidence as to whether money or property was given voluntarily by way of gifts or whether it was given under pressure as consideration for marriage. It would be still more difficult for the judges to draw the correct inference from the circumstantial evidence. The line of demarcation between the legal proof of volition and that of compulsion is obscure and in such a delicate matter genuine evidence will be hard to get. The penal clause now provides a safeguard against malicious prosecutions or prosecutions for black-mail by providing that the State Government's prior sanction should be obligatory for any prosecution under the Act.

It can hardly be argued seriously that social-moral reform can be brought about by legislation. Ultimately, social reform is a function of arousing the social conscience. The utmost that can be conceded is that the present Bill will prescribe, as the Law Minister claims, norms or standards of social behaviour. It is well-nigh impossible to prohibit dowry by law. The community will need to wait until dowry disappears, as any other tyrannical social custom disappears, by social advancement over a period of time.

"Far Eastern Survey"

THE END OF THE JOURNEY

AFTER A quarter of a century of devoted service to the cause of vital research in Asian affairs, the "Far Eastern Survey" reaches the end of its journey. Mr. William Holland's valedictory note, displayed on the front page of the February issue, which has just arrived, has a touch of pathos which can hardly be escaped in bidding farewell. Of far greater significance, however, is the legitimate feeling of pride and performance with which the American Institute of Pacific Relations can look at the enviable record which the journal, it sponsored, is leaving behind. Twenty-five years is by any test not a brief span in this sphere of journalism dedicated to exacting academic research in problems of live interest. Asian affairs are no doubt making a deep impact on the American mind, as they impinge more and more on America's foreign policy and, by implication, on her security. The "Far Eastern Survey" was a faithful and disinterested guide to its American readers, ranging from the academician and the professional politician to the layman.

But it was not the American reader alone who had the privilege to draw upon the fruits of the patient research of its contributors. This distinction was shared by students of Asian affairs outside America, including, of course, the Asian countries too. They, no less than the American reader, will miss their scholarly companion. But it is some satisfaction that the void will not be left unfilled. In 1935 the "Far

Eastern Survey" replaced the "IPR Memoranda". Now, "Asian Survey" takes its honoured place. All these twenty-five years the torch was borne by a succession of able editors and it is a laudable achievement which redounds to the credit of this journal that it introduced to the world of Asian research a band of young American scholars.

It is not without a struggle with inadequate resources, extending over full seven years, that the "Far Eastern Survey" is lying to rest. Journalism has its tribulations in every land, but in spite of them the cherished tradition of service goes on.

Inter-State Waters Dispute

THE KRISHNA - GODAVARI COMMISSION

THE CENTRAL GOVERNMENT is to be congratulated for having shown firmness, perhaps for the first time, in dealing with an inter-State dispute instead of following a policy of drift leading to the grant of concessions to the disputants on an ad hoc basis. It was clear for a considerable time now that negotiations between the three State Governments of Andhra Pradesh, Maharashtra and Mysore on the distribution of the waters of the Krishna and the Godavari would have dragged on without a reasonable prospect of termination at an early date. On May 3, Mr. Jaisukh Lal Hathi, Deputy Minister for Irrigation and Power, made the announcement in the Lok Sabha about the appointment of the Krishna-Godavari Commission under the chairmanship of Mr. Gulhati. It now transpires that the riparian States in question were not consulted on the appointment of the Commission or its terms of reference. This inference is suggested by the statement issued by Mr. D. Sanjivayya, Chief Minister of Andhra Pradesh. Apparently, the Central Government wanted to forestall likely disagreement among the States Governments on the appointment of the Commission. If this inference is correct, it may serve as a valuable precedent on likely future occasions. Mr. Sanjivayya has argued the point that the agreement on the sharing of the waters of the two rivers between the five riparian States concluded in 1951 was arrived at after detailed discussion and investigation and it could not be revised until its span of twenty-five years had run out. This argument is plausible. The parties to the 1951 agreement were the former States of Bombay, Hyderabad, composite Madras, Madhya Pradesh and Mysore. Territorial re-organisation of the States which vitally affects the sharing of waters, makes it necessary that the agreement should be reopened.

Besides this, there are certain important points at issue on which expert technical opinion must be sought. To mention some of them. The calculation of the discharge of the waters of the Krishna at Vijayawada and other points is said to be in error by 8 per cent. Likewise the factor of regeneration, it is contended, ought to be taken into consideration. Regeneration in technical parlance implies the quantity of water which flows back after utilisation in the irrigation canals into the main streams of the river and its distributaries. Technical opinion is not final on the point whether regeneration lends itself to precise assessment. Another important point of dispute is dependability of the flow of waters and it is the case of Mysore and Maharashtra that the flow dependability factor in the case of the Krishna has been over-estimated by 9 per cent at 86 per cent. Then there are differences of opinion about the commandable areas of the rivers. Finally, there is the vital question of determination of the availability of surplus waters.

Under the Inter-State Waters Disputes Act, the Central Government is empowered to impose its decision on the States. It is to be trusted that the three States will gracefully accept the findings of the experts.

Ceylon

THE STATE OF EMERGENCY

THE VERY fact that the state of emergency declared in Ceylon on April 17 last has had to be continued even now is indicative of the gravity of the situation created by the agitation of the Tamils over the language problem and the measures of repression taken by the Government to counter it. The picture of what exactly is happening in the affected Northern and Eastern provinces is quite obscure and it should be obvious that censorship which has been clamped has hindered rather than helped either the Government or the people. When this question was raised in the Lok Sabha on May 5, the Prime Minister declared the policy of the Government of India which was to treat the issue as an internal problem of Ceylon. But certain views expressed by Mr. Nehru are significant. He pointed out that Tamils of distant Indian origin who have settled in Ceylon for over six centuries and completely severed their relations with India are as much Sinhalese as any citizens of Ceylonese descent. The implication is that it would be a wrong policy to prolong their condition of statelessness. Tamils of recent Indian origin who have emigrated to Ceylon are mostly the nationals of India and in respect of these persons anxious enquiries made by the Government of India with the Government of Ceylon regarding the security of their lives and property have brought forth the assurance that this would certainly be looked after.

If censorship has made the outflow of authentic information difficult and given a handle to loose rumours, a glimpse of the happenings in the affected areas was available in the course of a 2-hour debate in the House of Representatives on the state of emergency. Opposition parties and groups used expressions which gave enough indication of military excesses having been committed. Mr. C. P. De Silva, Leader of the House of Representatives, denied the allegations about excesses, but it is reassuring that a careful enquiry and corrective measures, if necessary, have been promised. Nevertheless, it would appear that the Government is not in a mood to relent as would be clear from Mr. De Silva's assertion in reply to the debate that a solution to the language problem will have to be found within the framework of the Official Language Act. The Tamil speaking population of Ceylon, (more than half of which is of remote Indian origin), accounts for something like two million or one-fourth of the country's total population. Considering the fact that language has deep roots in the minds of men, attempts to evolve a formula on the basis of a compromise after normal conditions are restored would be in the interest of peace and harmony in the island.

Backward Classes

RESERVATION IN THE SERVICES

A RECENT judgment of the Supreme Court on the constitutional question of reservation of posts in government services in favour of backward classes is of far reaching importance in view of the interpretation it puts on the scope and character of the reservation. The fundamental right of equality of opportunity to all citizens in the matter of employment and appointments to posts in services under the various governments, guaranteed by Article 16(1) of the Constitution, is qualified by Article 16(4) which enables the State Governments to reserve posts for backward classes, when, in their opinion, they are not adequately represented in the services. Article 335 provides for reservation of posts for members of schedule castes and scheduled tribes, subject to the condition that the efficiency of the administration is not impaired.

The appeal arose out of the decision of the Madras High Court on a petition for issue of a writ of mandamus restraining the Southern Railway authorities from giving effect to the Railway Board's circulars reserving a certain proportion in the selection posts of certain categories of employment for scheduled
