The car that gives you more!

The STANDARD TEN undoubtedly offers more value for your money. The excellent 948 cc Overhead Valve engine gives you outstanding performance with remarkable economy. The smart styling and distinctive dual tone colouring of the STANDARD, makes it a stand out anywhere. While its sturdy construction is guaranteed to give you reliable service. The STANDARD also offers spacious seating accommodation, which is situated within the wheelbase, to give you maximum motoring comfort and pleasure.

The 948 cc. Overhead Valve engine gives superbly sustained performance with remarkable economy.

The spacious interior provides comfortable seating room for 4-5 persons, and the four wide doors which are hinged forward, make getting in and out easy.

The thoroughly tested suspension, provides an exceptionally comfortable ride over the roughest surfaces.

The spacious boot provides ample room for luggage.

The Standard Ten is backed by a 6 month guarantee, and the world wide Stanpart Service.

IN SERVICE  LIES SUCCESS...

DAIRY & REFRIGERATION

Pioneers in dairy engineering,
L & T have installed
44 modern dairies all over
India, and now manufacture
various items of plant
and equipment.

EARTHMOVING & AGRICULTURAL EQUIPMENT

L & T have supplied
to various projects
earthmoving,
land-clearing,
excavation, logging
and dredging
machinery

HEAVY PLANT

Paper machines, spray drying
installations, sulphuric acid and solvent
extraction plants, and flour mills have
been supplied to a number of industries

DRILLING & MINING

To the Neyveli Lignite Project and
other mining schemes L & T have
supplied Bucket Wheel Excavators
and Spreaders,
drilling equipment
and turbine pumps

**ELECTRICAL
EQUIPMENT &
SWITCHGEAR**

For hydro-electric
and thermal power
stations, L & T
supply high quality
electrical equipment,
including substations
and distribution
installations

CIVIL ENGINEERING

L & T undertake various civil
engineering works including designs.
'Turn-key' jobs, involving supply
and erection of machinery and
plant are an L & T speciality

MANUFACTURE

At Powai Works, L & T manufacture
various types of plant and equipment—
Dairy, Chemical and Pharmaceutical
machinery, Switchgear, Petrol
Pumps, Cooling Towers, etc.

**INDUSTRIAL
APPLIANCES**

Pharmaceutical
machinery, automatic
refrigeration controls,
process control
instruments, power
saws, welding alloys
and up-to-date
bottling installations
supplied to numerous
concerns

ERECTION

At Rourkela,
L & T have erected
3 Blast Furnaces,
a 'Pig' Casting
machine, and the
Rolling Mill
Buildings—
the more recent of
the many erection
contracts executed

SERVICING

IN SERVICE  LIES SUCCESS

The slogan sums up our view of the function we perform.
In the world of commerce, lasting success comes only to
those who are willing and competent to give service, as well
as goods, to their customers. Every piece of equipment we
supply is backed by a service organisation designed to
keep it working at highest efficiency.

historic voyage ended as the steamship "Enterprise" reached Calcutta on 9th December, 1825. The first steam-powered vessel to make the England-India run, the 500-ton "Enterprise" won a cash prize of Rs. 100,000 offered by Calcutta's trading community for this truly pioneering achievement. Her captain on the hazardous voyage round 'the Cape' was James Henry Johnson, Commander, Royal Navy, and a hero of Trafalgar.

Though the "Enterprise" was the first ocean-going, partly steam-propelled ship to arrive at any Indian port, small steam-powered craft were being built in Calcutta as early as 1823.

Among the oldest and best known marine and general engineering firms in the country, a privately-owned concern known as Reid & Company's Hooghly Dock (founded 1819), the forerunner of The Hooghly Docking & Engineering Company Limited, was already flourishing before the introduction of steam to India.

The 'Hooghly Docks' are a part of the vast industrial and engineering organisation of Martin Burn Ltd., an organisation which is playing an important role in India's industrial progress.

TOP MANAGEMENT

WILL WISH
TO LISTEN TO THIS

All over the world, insurance protection for employees while in service and satisfactory benefits on retirement have become accepted features of sound business management. Life Insurance and retirement incomes are indeed being regarded as a primary need as essential as food, clothing and shelter.

Progressive employers in our country are realising that the introduction of such employee benefits results in improved employer-employee relations, higher efficiency and increased production. An ever increasing number of prudent employers are adopting the Group Insurance and Superannuation Schemes — employee insurance and retirement schemes streamlined and perfected by the Life Insurance Corporation of India.

Today top management wants to know what exactly these Schemes can do for them, what the financial implications are likely to be and what precisely is the nature and scope of the benefits offered. Broadly, the Schemes fall into two categories.

Group Insurance Scheme: offers low cost Life Insurance coverage on a Group basis to employees and gives real security to their dependants.

Superannuation Scheme: provides a source of steady and life-long pension to employees after their retirement (with or without Life Insurance cover).

Some features common to both Schemes are:

- 1 They can be instituted without any extra cost to the employer
- 2 Employers' contributions to such Schemes are allowed as normal business expenses for the purpose of income-tax
- 3 Most of administrative work with regard to these Schemes is done by the Life Insurance Corporation of India.

Special features of Group Schemes:

- 1 For groups of prescribed size, attractive reduction in premium rate is allowed
- 2 All the members are covered under a single Master Policy
- 3 Flexibility—the benefits can increase from year to year.

The Group and Superannuation Schemes create a new atmosphere of employee loyalty and a sense of gratitude. They operate like a voluntarily organised Social Security Insurance in miniature.

Please let our Group Representative come and explain the details to you without any obligation whatsoever.

Speeding prosperity to the countryside

Speeding over all our highways and through most of our byways, is a stream of TATA-MERCEDES-BENZ trucks, hauling varied freight to outlying districts from busy industrial cities, and bringing prosperity to the countryside. You can always see these forerunners of prosperity—powerful, reliable TATA-MERCEDES-BENZ trucks parked at the village fair. Such a welcome and reassuring sight, both to villagers and travellers—for TATA-MERCEDES-BENZ trucks are an acknowledged sign of ever-increasing prosperity.

Not by Words Alone...

The story is told of St. Francis of Assisi, that he once stepped down into the cloisters of his monastery, and laying his hand on the shoulder of a young monk, said, "Brother, let us go down into the town and preach".

The venerable father and the young monk set out together, conversing as they went. They wandered down the principal streets, and wound their way through alleys and lanes, and even to the outskirts of the town and the village beyond, until they found themselves back at the monastery again.

Then enquired the young monk, "Father, when shall we begin to preach?"

And the father looked kindly down upon his son and said, "My child, we have been preaching; we were preaching while we were walking. We have been seen...looked at; our behaviour has been remarked, and so we have delivered a morning sermon. AH! MY SON, IT IS OF NO USE THAT WE WALK ANYWHERE TO PREACH UNLESS WE PREACH AS WE WALK".

DES... it is no use that we walk anywhere to preach unless we preach as we walk in building the India of our dreams... there is little room for preaching by mere words what we needed are DEEDS... And DEEDS include higher production of some ESSENTIAL commodities like

CEMENT... THE GREAT MODERN MATERIAL OF BUILDING CONSTRUCTION...

In 1952, we had placed at the Nation's disposal over 1,32,000 Tons of Cement.
In 1954, we had produced over 2,02,000 Tons of Cement.
In 1958, we produced nearly 3,50,000 Tons of Cement.

This year... in 1960...

We expect to place at the nation's disposal over 3,60,000 Tons of Cement

BECAUSE INDIA NEEDS MILLIONS of TONS of CEMENT...

for Building the richer and prosperous India of our dreams...

It's always
the *name*
that people
look for

Whether you buy a machine or a yard of cloth it is the confidence you have in the NAME that counts. Confidence comes from experience—your own experience and the experience of people whose opinion you value. That is why the name of BINNY is one that you can trust.

BINNY'S fabrics available in cotton, silk, wool and mixed varieties in a wide range of colours and designs — products of The Buckingham & Carnatic Company Limited and The Bangalore Woollen, Cotton & Silk Mills Company Limited — are famous throughout India and overseas because of their enduring high quality.

BINNY'S engineering connections offer a wide range of Engineering Products needed in India's expanding industry. To mention a few: light and heavy electrical plant and equipment, sugar machinery, cranes, dredgers, diesel engines, boilers, industrial

insulation, cables, pumps, high grade paints and many other items.

BINNY'S ENGINEERING WORKS PRIVATE LIMITED are manufacturers of machinery and plant for the sugar, chemical and other industries, fabricators and erectors of structural steelwork, of steel tanks and vessels, producers of ferrous and non-ferrous castings and of light forgings and ship repairers.

BINNY'S offer shipping, stevedoring and insurance facilities. They are also booking agents for sea and air travel.

You can rely on

BINNY

BINNY & CO. (MADRAS) LTD., 7, Armenian Street, MADRAS 1

Today a plaything in a child's hands...But it has already played its part in a cycle

of events that will change his future...this fragment of a crate which brought to the project site a great conveyor belt or lengths of high pressure hose or, perhaps, Dunlopillo for the new workers' hospital—all of it helping to build something big and grand.

The project? One of scores going up in each Five Year Plan with the promise of a better life for the people of some forgotten region.

Steel forms the core of any economic plan for a better future. For, without steel, the wheels of old industries cannot move and new ones cannot be fashioned. Like a stone dropped into a pool, steel acts on the economy in widening ripples, touching all aspects of our economic ventures.

That is why in the Third Five Year Plan, the stress has again been given on a greater output of steel. In the next five years, we propose to go forward from the Second Plan target of 6 million to 10.5 million tons of ingot steel. The steel plants at Rourkela, Bhilai and Durgapur, nearing completion, will be expanded and a fourth plant will go up at Bokaro.

Already, the products of the three plants have given a great fillip to industries. The Re-rolling Mills, started for ballers few years ago, are now happily placed, thanks to ballers from Bhilai. Pig iron from all the plants is feeding the nation's foundries.

And this is just the beginning. As new industries, envisaged under the Third Plan come up, more and more steel will be needed, and Hindustan Steel will set the pace for the growth of the country's economy.

INDIA AND NORTH AMERICA

Thou hast nor youth nor age;
But, as it were, an after-dinner's sleep
Dreaming on both.

—WILLIAM SHAKESPEARE
Measure for Measure

Thou hast made me known to friends I knew not.
Thou hast given me seats in homes not my own.
Thou hast brought the distant near, and made
a brother of the stranger . . .
When one knows Thee, then alien there is none,
Then no door is shut . . .

—RABINDRANATH TAGORE
Gitanjali

We must return to the generous spirit in which the original Point Four Programme was conceived, stress our positive interest in, and moral responsibility for, relieving misery and poverty; and acknowledge to ourselves and the world that, communism or no communism, we cannot be an island unto ourselves.

—PRESIDENT JOHN F. KENNEDY

India's expanding economic needs are driving her hard, albeit vaguely, in search of a new route to prosperity. In this search she may well stumble on the pattern developed in the United States, with which she has so much in common. If, under the altered circumstances of the twentieth century, the American experiment could be successful in India, that would be evidence of its abiding character. In this sense, the United States is also being tested on Indian soil.

Foreign Affairs, Vol. 34, No. 4, p. 672

India and North America

Preface

FOR the Annual Number this year "The Eastern Economist" has chosen the spacious theme—India and North America. In a sense, as with all recent Annual Numbers, the theme may be said to have chosen itself. The dominant place that the United States of America has reached in both our political and economic calculations has made it necessary, in almost every recent Annual Number, to commit not a little to the study of economic and political policies in that country. In the current year, however, the emphasis is different. The United States occupies the centre of the stage; at least if the stage be construed as the environment of systems in which one can best highlight India's own political and economic problems over the rest of this century. This stage has also been chosen this year because of the rise (and fall) of the Summit and of the inevitable role that the United States must play in a new top-level meeting between the leading protagonists of the Cold War, and it may be, in a very short time, a shooting war, at least in Laos and the Congo. It is significant that as 1960 ends, an American plane has been shot down in Laos by a plane bearing Russian markings; thus at least the shadow of a real war is uncomfortably close to the Indian Union. Quite apart from the Summit and the high controversies that surround it, the pattern of economic co-operation between India and the United States spells either success or failure of our Third Five-Year Plan. Not, indeed, that, in the last analysis, our future is committed wholly to the United States. What cannot be accomplished in the Third Plan might still be accomplished in a longer period through the assistance of other nations. Nevertheless, at the present time, and in the form in which we have phrased our Third Five-Year Plan, our dependence on the United States has been made inescapable. In this sense, therefore, the United States is not merely a prop to India's future economic life, but very near its heart core.

AMERICA AND EUROPE

American ideas and experience are, in a sense, offshoots of European tradition and practices. To the extent that they are, this Annual Number might be deemed to be a continuation of last year's in which the subject was 'India and Europe'. America, to the extent it is European, has its soul set in the tradition of Greece and of Rome. It is a partner in the glories as it has been a partner—active or passive, as the case may be—in the degradation of Europe which has taken place in two world wars in this century. But although North America has been born out of Europe in both its incarnations—the United States and Canada—it has been born different. The particular contribution of this Annual Number is its description of the difference in relation to India's current political and economic philosophy. Again, just as America's political and cultural approach is so largely European, but has some unique ingredients of its own, so has its economic life. That economic life is based, indeed, on the industrial and agricultural revolutions in the European Continent, the seeds of which were transplanted early in the United States and now, in both the United States and Canada, have tended to outshine the countries of their birth. Here the differences rest not so much on method as on degree. The continental character of the economic operation has tended to give to the United States a capacity in terms of mass production, which is not yet

within the range of Europe to encompass in any one country, or even in the new 'Six' or the new 'Seven'. Thus even the spacious patterns of co-operation in the European Community and in the Free Trade Area are both very inadequate parallels to the Continental systems of the United States and Canada. In the sense that the United States has exploited the central ideas of the industrial and agricultural revolutions, its economic ideas are European, but the American experience both in economic and social terms, resulting from the many-sided and massive character of its economic system, has carried the thinking of men far beyond the stage when European practice was the glass of fashion and the mould of form. Productivity—and the relentless search for new techniques to attain it—has been an overpowering American contribution to modern industrial societies. Europe is catching up, but where, as in the automobile industry, the size of the market is the condition of optimum productivity, can the gap wholly disappear?

THREE CENTRAL IDEAS

There are, in fact, three central ideas in the economic sphere on which North American Continent can claim to have carried through the world's secondary revolution, not necessarily basically superior but still different from that of Europe in the nineteenth century. These are largely concerned in outline with factors in economic growth, but in detail with a massive trinity, technology, a combination of mass production and mass selling and, finally, a freedom of social movement in which the classes on the American Continent are merged into a far more integrated whole than Europe even after two world wars has been able to attain. A great deal of this Annual Number is concerned with an analysis of the American genius for technology, sales, and economic and social equality. They have produced a system of living which is sometimes called the 'American way of life'. This way of life has its critics, but it is believed that, for the development of human personality, it contains some of the best that the world has seen. Whether it can be rebuilt in India is another thing. It is extremely unlikely that it can be, or even if it could be, it would not be desirable to imitate it too closely. But at least we should know what is worthy and possible of imitation; here at least we can, and should, copy. Not because imitation is the sincerest form of flattery for we do not need to flatter anybody. But because, in the political and economic haste with which we are oppressed, we cannot test all things and determine which are good by individual experimentation. Mahatma Gandhi, because he was operating in the more leisurely pre-Independence age, could experiment fearlessly with truth and let the Indian people wait, a little breathlessly, upon his experience. The processes of economic change will not tarry for any individual now. In any case, therefore, the pressure of destiny is upon us. We need hastily to comb the world for experience since our external pressures and our internal capacity to solve problems are badly out of step. It is believed that in the dilemma which faces the Indian people for the rest of this century, with economic haste imposed on us from without and considerable economic inexperience within, the American example of a society in which free men, similarly placed over the last three hundred years, have found solutions in which both freedom and opportunity could be

preserved for all, is of special relevance to our society. There is, perhaps, no society in which the fruits of ancient knowledge and current experience have found such congenial company.

THE OLD AND THE NEW

Running continuously through, like the connecting thread of any comparison between India and North America, must be the sense of distance in time and, in some respects, in depth between the old and the new. The coming of the United States—as has already been indicated—was invested with much of the tradition of the Old World. Nevertheless, it was possible for Canning, a great British Foreign Minister, “to call in the New World to redress the balance of the Old”. It may be that the wheel is coming full circle and that, in the somewhat different conditions of today where popular opinion is increasingly an instrument both of power and of influence, the United States will need to call in the Old World to redress the balance of the New. In this sense, the dialogue between the old and the new has somewhat changed its character since the days, a century ago, when the distinction between the old and the new worlds had vital political and economic connotations.

NOW ONE WORLD, NOT TWO

To the sociologist and the student of societies, however, every bit of the difference remains. In a new society expanding more against “the virgin wilderness” than against any opposition in custom, a profound freedom, and even licence, builds a daring character, both national and individual, which can have no correspondence in the old world overridden by the crust of custom and the force of habit—religious and otherwise. It has been said that America was born “with the morning noises of three million square miles of virgin wilderness” and a good deal of the substance of the difference was put by Jacques Crevecoeur, the Hudson Valley farmer in the 1770's when he said: “A European, when he first arrives, seems limited in his intentions as well as in his views, but he very suddenly alters his scale . . . he no sooner breathes our air than he forms new schemes and embarks on designs he never would have thought of in his own country. . . . The American is a new man, who acts upon new principles.” An American historian, Frederick Jackson Turner, thought that the frontier dominated American politics as well as American democratic life. “The most important fact of the frontier”, he said, “has been in the promotion of democracy here and in Europe.” The old and the new have in fact mingled together. Neither Turner's frontier theory nor what was called the ‘germ theory’ of a solid European past transplanted across the Atlantic fits the American scene. The central ideas of the United States are both old and new, and it is because there is this mixture that the United States is a country whose history it is well worthwhile for us to explore for ourselves. For India, the oldest of living civilisations—China, Egypt and Babylon have all undergone major transformations, which make their ancient civilisations more dead than alive—the battle of incorporating the new into the pattern of the living old presents a perennial dilemma. The New presents itself in relentless introduction of modern technology, with the social environment suited to its propagation. The Old rests mainly in the background of religious thought and the structure of Indian culture which is backward, rather than forward, looking. The contrasts might be well expressed in the contradictions between Mahatma Gandhi and Jawaharlal Nehru, although they are often described as the teacher and the disciple. There is truth in both the old and the new, whether in person or institutions, but truth here is not indivisible; its many-sided facets are appearing in the Indian Union under

deep conflict, resolution of which is likely to take us at least a century.

On the economic plane, the United States is of special value because of the massive character of economic progress which it has been able to generate over the last hundred years. How far the Indian picture can emerge on parallel lines is the central question of the economic review which forms the core of this particular study. “The Eastern Economist” believes that the expansion of the market under the force of numbers, if not under the second dimension of a rapid rise of individual incomes, will give the Indian Union, at the end of this century, a system comparable in national income with America of twenty years ago. More precisely, it is estimated that if the forces of economic progress which have already expressed themselves in the Second Five-Year Plan, could be extended over another forty years, we might have at the end of that period a national income in the neighbourhood of a hundred thousand crores of rupees or about 200 billion dollars at the current rate of exchange. It is true this is only two-fifths of the current national income of the United States, though great statisticians, like Colin Clark, would be disposed to estimate India's real income (as distinguished from her money income deduced from a parity rate) considerably higher; perhaps nearly as high as the United States' stands today in real terms. Then there would be a real economic comparison between the India of 2000 A.D. and the United States of 1960; the “lag” would only be forty years.

BEYOND THE PALEY REPORT

In two respects, namely, that this study of the Indian Union goes well beyond 1980, and because the parallels between India and the United States in income add a further dimension to the argument, it might be claimed that the study of India and the United States here presented goes well beyond the Paley Report. This is not a claim intended to detract anything from the supreme achievement of the members of the Paley Commission. Their model for projections continues to be our own for the period to which they apply. The extensive use made of their method in the 1956 Annual Number—India in 1975—has now been augmented by further detail in regard to the United States drawn from their pioneering studies. Fortunately, America has also not stood still since the Paley Report appeared. Resources For the Future, Inc. have made projections for 2,000 A.D. which are used as central to comparisons to fill the gap between the Indian Union in 2000 A.D. and the United States forty years from now. Both in method and in detail, the Paley Report and the Resources For the Future, Inc. have provided spacious benchmarks from which much of the argument of the Annual Number proceeds. “The Eastern Economist” wishes to record, not for the first time, its deep indebtedness to the authors of these reports who have freely placed vast detailed information within its reach.

DEDICATION

Finally, a last word on the purpose with which this study has been designed. It is believed that in histories of great nations, there are times when the spirit of confidence and daring lags because the outlook on the future is clouded with uncertainty. In India we now live in one such time. The people of India have not yet caught the fire of their Destiny. This responsibility, like the burdens of office, cannot be taken from them by authors, economists, or journalists of whatever kind. But it is possible to throw into the common pool the vision splendid of a better world. Meanwhile, in humility and hesitation, these pages are again dedicated to the Indian people whose future may still be decisive not only for themselves, but for all the world.

PART A

A POLITICO-ECONOMIC PROLOGUE

The American and Indian Revolutions: Parallels

IT is often forgotten by Indian political commentators that the United States provided, in its time, as great a focus of the revolutionary idea as did the fiery French Revolution. Indeed the American Revolution was prior to and probably inspired France's, even though it lacked popular passion. It was, in every way, a more controlled operation with the leaders of the Revolution not succeeding one another fitfully, but with an established and continuing place in the life of the country long after the Revolution might be said to have stabilised itself. The Indian Revolution, with its emphasis on order and non-violence, was more akin to the American Revolution than to any of those great outbursts of political passion which have shot their way bloodily into power. But the parallels between the American and Indian Revolutions are not to be found only in the relative moderation with which they were both waged. The parallels go deeper; the Revolutions might even be said to spring from the same hard source.

BORN OUT OF COLONIALISM

In the first place, both the American and Indian Revolutions were born out of Colonialism. In a sense, the Colonialism of the eighteenth century was very different from the Colonialism of the nineteenth century, because the Industrial Revolution had not then been harnessed to remote political control. The American insurgents were primarily concerned with the exercise of this remote control without adequate representation of local sentiment. The Boston Tea Party was much more an objection to the levy of taxation without representation than a revolt against the incidence of the tax itself which, in the light of the twentieth century experience, must be deemed ridiculously trivial. The men who opposed Colonialism in America were country squires drawing their inspiration from legal and political philosophy rather than from economic exploitation. In the Indian case, the leaders of the Revolution operated much more on the basis of the professed evils of exploitation of the masses. But here too, one must observe that the leaders were essentially intellectuals concerned with the political rights which they had been denied by a foreign government. It is no accident that in both countries the Revolutions were presided over in the main by practitioners of law.

THE HISTORICAL CONSEQUENCE: PARTITION

If the sources of the two Revolutions were similar, so, perhaps, accidentally, were the consequences in terms of the division of the areas involved. The determination of the United States to rebel was not followed by the Canadian colonies and, in fact, the differences between the United States and Canada, resulted in a partition of the North American Continent, which has a parallel in the division of the Indian sub-continent into India and Pakistan. The fact that the American and Canadian systems have stood apart, notwithstanding the fact, that after 1860, there has been no defence on the frontier, seems to suggest that partition conceived at moments of great political strain might have abiding consequences over decades. In the case of Canada and the United States there was, in fact, a war of partition—the War of 1812—very real in its severity, as those who have seen the frontier forts in the Canadian province of Ontario or in the corresponding areas of the United States, can well testify. It took about fifty years for the North American Continent to iron out partition animosities between Canada and the United States. This is a reminder to our American friends that the passions between India and Pakistan

have had a counterpart in their own history in which the embers took more than half a century to die away. An attempt to iron out differences between India and Pakistan by an appeal to high-minded generosity often runs counter to the deepest scars which history has inscribed in all countries which were divided by partition, not excluding the North American Continent itself.

REPRESENTATIVE GOVERNMENT

So far as the United States and the Indian Union are concerned, the arrival of freedom coincided with introduction of a fairly new experiment in political administration. The roots of democracy had grown both in the American continent and in the Indian sub-continent before the great written Constitutions were adopted in the United States and the Indian Union. But the substance of the change is not diminished by the fact that “representative” institutions were in existence in some form or other. The American and Indian Constitutions are almost unique to the extent they have handed, at one great stroke, sovereign power to all their people.

THE CENTRE AND THE STATES

In both India and the United States the continental unity of the States is protected by the federal, rather than the unitary, idea. In both cases, the fear that the Centre would be weak as against the States has been entertained, and not a little of the denial of the truly federal character of the Constitution in both cases is to be traced to the fact that in the first few years of the Constitution the Central authority was unduly fearful of the “ravages” of the State power in terms of any erosion of a single-minded policy for the country as a whole. Washington and Hamilton, in the first ten years of the operation of American Constitution, were deeply fearful that the thirteen colonies would fall apart. We in the Indian Union are reflecting not a little of these fears when we talk about “the rise of the States” and local or “parochial” feeling. The strains on the exercise of federal power must necessarily be great in a continental political system where emotional integration can never be complete. What is not realised is that in the event it has been proved in the United States that the great centralisers—Washington and Hamilton—not the States, were in error. The United States, until its Civil War came to threaten the very life of the Union, was able to maintain its unity on the basis of increasing divergence between the States. The idea that powerful States would necessarily reduce Central unity has been shown in the American context to be totally untrue.

HEROES DOWN: PEOPLE UP?

The great lesson to be learnt by us from the United States is in this pattern of political proportion which has been maintained between the Centre and the States; also between the heroes of the Revolution in their time, and the growing impersonal characteristics of “popular” opinion. The great differences between Alexander Hamilton and Thomas Jefferson inscribed for all time in the Federalist papers, present even to this day a vivid picture of the character of our own dilemma. Can the people be trusted? Can regionalism and local interests be prevented from eroding national unity and can the States take a long-period view of the relations between States' rights and federal authority? The answer of the United

Part A—A Politico-Economic Prologue

States was eventually given in the age of Jefferson by a clear mandate by the people to the people and against centralisation. It was found that the genius of the American people rested far more in the principle of delegation and free enterprise than in the centralising doctrine of Alexander Hamilton. If the eighteenth century were our own, one might conceive Hamilton as a spokesman of planning; although he was the friend of the rich and drew in 'The Money Power' (in order to enforce his distrust of the people), he might have been a supporter of a centralised system under what would be called a socialist pattern of society. The parallels between the United States and the Indian Union cannot, of course, be driven beyond a certain point. If, however, we look upon George Washington and Mahatma Gandhi (in spite of their differences in regard to the use of military methods) as supreme heroes of their respective Revolutions, Jawaharlal Nehru and Alexander Hamilton might conceivably be looked at in parallel terms. Jawaharlal does, indeed, possess some of the aura of the Father of the Nation and in a greater degree than did Alexander Hamilton. Nevertheless, the picture, bearing in mind the differ-

ences in time and in international environment, is one which warrants the belief that India may be on the point of making the vital decision of turning down the prescription of her heroes in order to follow her natural genius.

If, indeed, there is this parallelism, may it not be that India before the century is out, will find her Jefferson, who, perhaps, combined with a Supreme Court Justice, like Chief Justice Marshall, will enable the transition to be made from Jawaharlal's centralised monolithic system of power and from the socialist pattern of society back to the Jeffersonian concept of individualism based on the freedom of the States, maintained, in turn, on the freedom of men and women to build their own political institutions true to their own natural genius and inclinations. While we wait anxiously for the day in which the Indian people will so express themselves, in favour of themselves against both Big Government and Big Business as such, there is everything to be said for a closer study of the American experience in political and economic affairs. Here, if anywhere, is a chance for history to repeat itself in the truly grand manner.

The American and Indian Power Systems: Contrasts

IT has already been indicated that historical trends make the American and Indian Revolutions look alike. They were both born out of Colonialism; they both found an escape in the democratic faith and their continental character imposed on both a federal structure. It is easy to believe that systems so alike in their sources of birth and so similar in the pattern of the solution which they chose for the framework of both political and economic life, would have lasting resemblances in every way. This is not the truth. It will always be a moot point as to the extent to which the sources of resemblance and the sources of divergence are greater between the two systems. In this article an attempt is made to underline the points of difference to set against the parallels of the previous piece.

THE CLASS STRUGGLE: HAVES AND HAVE NOTS

In the first place, it is too often forgotten that the political system which the United States inherited was basically that of a prosperous society. India came to independence and to political statehood, so to speak, under very difficult pressures; those of poverty and destitution are likely to dominate outlook for a generation. The men who made the United States were gentlemen squires, operating a system of agricultural development in which fragmentation of holdings and dire poverty in the Indian sense were quite unknown. To this extent, the tensions of the body politic were basically non-economic. It is true, as time wore on and as the centre of gravity of the United States shifted westward with the rapidly changing frontier, suspicion of "the money power" of the East and of the growing populations of the West began to divide the nation on economic issues; indeed, the final clash between North and South, which culminated in the Civil War, was struck on a basically economic question, namely, slavery. Nevertheless, there are few societies that have ever existed, in which the classic class struggle of Marxism and the battle between the rich and the poor was less present than in the United States. Thus it came about that the clash between ideas was basically a clash between members of the same governing class. Washington, Jefferson, Hamilton, Madison and Adams were men all of whom had an essentially similar approach to basic economic

issues. The problems of centralisation of economic policy and the controversy on the Federal Bank are minor compared to the massive agreement on what might be called the capitalist method of organisation. Socialism had not yet come in that age, but, had it arrived, it would have been held back by the structure of American society as it is today.

Very few Indians of the present time recognise that the American and Indian experiences stand poles apart, largely in terms of population and the contents of the minds of the two peoples. While the population of the United States is nearing half of ours, it cannot be forgotten that soon after the American Revolution arrived in 1789, the thirteen colonies had only four million people. Even in 1820 there were only nine and a half million people and though American population in the nineteenth century doubled every twenty years, it rose no faster than the country could fairly readily absorb with a relentless levelling down of differences. A common language rose superior to every elements of division. Every second American generation had English as its mother tongue, and thus the terrible mutilating effect of regional languages in our time was not an American encumbrance. Perhaps more than language is the extraordinary encrustation which centuries have given to Indian political thought; there are as many fissiparous tendencies as there are religious communities.

The United States, whether it was Presbyterianism with the old dedication of the Founding Fathers, or Catholic in the more easy-going tradition of Lord Baltimore in Maryland, was basically Christian, held together by the common precepts of the Bible in whatever version it was read. The wars of religion were thus notably absent, although it is not until 1960 that a Catholic has succeeded in becoming President of the United States. The barriers which have arisen on all hands in the Indian Union between Hindus, Muslims, Christians and Sikhs and scheduled castes have no counterpart in the United States. With the multitude of the Indian population with its traditional ways of life so set apart, ironing out of differences in the Indian Union has not yet been accomplished. Put other-

Part A—A Politico-Economic Prologue

wise, a single statehood came easily to the United States; in India, notwithstanding the great spurt of nationalism in the Gandhian age, we are still bitterly divided. Nor is a purely economic solution an answer to what John C. Calhoun, in the United States, called "the signs of particularism and the consequent threat to the United States." The founders of what was called 'the American system' were imbued with the idea that great mobility was the answer to differences. Calhoun put it well in 1817, when he said: "We are greatly and rapidly—I was about to say fearfully—growing. This is our pride and our danger, our weakness and our strength.... Let us then bind the Republic together with a perfect system of roads and canals. Protection would make the parts adhere more closely.... It would form a new and most powerful cement." Who in India can proclaim that roads and movement will provide a bond of union? The more some Indians are divided from their parent States, the more insular they become. Dandakaranya is a case in point. Thus Indian unity has far deeper obstacles that union encountered in the United States.

These elements point to a natural hiatus between the federal idea in the United States and in the Indian Union. In the United States it was possible for Jefferson to win his victory of "delegation" to the States because there were no basic economic liabilities which the Centre alone could face. The position of the Indian Union is quite different. There is hardly a single State which is prosperous enough to finance its own development. The monolithic Centre has arisen as much because of the economic props that the Centre provides to the States as it does from the fact that the leading

heroes of the Revolution preside at the Centre and not at the States. It might be said that while "a popular" revolution would tend to be a centralising influence, it quickly dispersed power in the United States, whereas in India it had quite the contrary effect. In the United States, a federal Constitution was initiated in which the States truly enjoyed residuary powers. In particular, the States born in the next forty years were almost laws unto themselves. In India no such freedom has been granted to the States since the powers of finance and mobilisation of resources are much more heavily with the Centre than with the States. To say that both systems are federal is, therefore, to ignore a fundamental difference. India is federal in theory, monolithic in practice; the United States was federal in theory, but almost entirely dispersed in practice, at least until great Presidents like Abraham Lincoln and Franklin D. Roosevelt charged the central machine with powers which compelled the reluctant States to conform to Central policy.

Thus one might argue that the pattern of Indian development, at least in its political bearings, will be very different from that of the United States. Quite apart from the fact that a ready acceptance of authority is enshrined in Indian religious and political experience, the great divisions between the States and the power of the Centre in financial and fiscal terms, will weigh heavily against States which do not conform to Central directions in terms of economic policy. A long course of controversy between the Centre and the States is likely to be instituted before the liberty which the States enjoy in the United States finds general acceptance in this country.

The Canadian Compromise

IF the differences between the constitutional outlook in India and the United States are marked, is there any middle way to be found in Canadian practice? "Canada and the United States," it has been said, "live in a kind of symbiosis—two organisms separate and distinct, each with its own ends and laws; but highly interdependent, indissolubly sharing the same continent environment and, in spite of a great disproportion in wealth and economic power, each necessary to the other." It is not to be expected in these circumstances that Canadian practice would deviate very markedly from that of the United States. Yet one of her paradoxes, both in politics and economics, is that it does. This is particularly true of the political springs which surround what might be described as the Canadian way of life. In the first place, Canada was not born out of Colonialism as were the Indian Union and the United States. Indeed, the revolt of the thirteen colonies only led a considerable number of citizens of what is now known as the United States, to pass into the neighbouring province of Upper Canada and to development settlements in Ontario, which were to maintain steadily and even passionately, their links with the British Crown. It has been said, and truly, that Canada is in outlook more British than American. She has a written Constitution enacted by the British Parliament and an unwritten Constitution wholly derived from that of Great Britain. A moderation, almost British in character, pervades her political life; the symbol of this link, the House of Commons in Ottawa, is as true a reflection of Westminster as the world could ever build.

THE PERFECT FEDERATION?

There are, however, essential elements in the Canadian picture which are more akin to the United States than to Britain. In the first place, Canada has a Federal Constitution assigned to her by the British North

America Act of 1867. This federal Constitution is almost unique in the place it gives to the province of Quebec where there has been kept alive, as if by complete insulation, a French-Canadian community, still speaking its French and living according to the tenets of the Roman Catholic societies of an earlier vintage. The Constitution of Canada also permits the Roman Catholic minority in Ontario and the Protestant minority of Quebec to run schools which they had at the time when the Act of 1867 was not there. This means, in effect, right to separate school systems maintained by the taxes levied by the minority who are exempt from taxes to maintain the schools of the majority. Kerala might well have taken a leaf out of the Canadian book!

LESSON FOR INDIA

Nowhere in the world can one envisage the degree of local autonomy such as that given to the province of Quebec to live its own provincial life free of federal interference. Thus there has grown a precedent, gracious and understanding, which overrides the passion for unity or unification in a continental system. It has worked well, and the fact that the Canadian system is deliberately bilingual is perhaps evidence that a single national language is not a necessary condition of emotional integration; also the granting of special powers to a State is not a weakness in the federal structure. If it had been possible for the Muslim minority in India to be treated in the same manner as the French-Canadians, who knows, the Canadian experiment might have found a tremendous parallel in Indian soil?

Unfortunately, that was not to be. But this does not make it any the less desirable that Canadian practice in terms of finding a middle way between the "loose" federation of the United States and the "strong" federation of the Indian Union should not influence thinking

Part A—A Politico-Economic Prologue

as the bonds of union in the Indian Union tend to decrease. It is inevitable that, as the heroes of the Revolution depart and as nationalism, which was the common goal of the Indian people, takes on a less enthusiastic form, the tendency in certain areas in the Indian Union to resent an imposed language (which is now proposed to be Hindi in Devnagri script) and to accept a Central Government dominated by particular States (Uttar Pradesh and Bihar) will grow and result in the making of a plea for decentralisation. It is time, therefore, that we examined the possibility that the rights given to the province of Quebec in the British North America Act of 1867 might provide an escape when pressures in the States exceed the power of India's Central Government to enforce cohesion.

There are many who view with considerable alarm the restiveness in the South against Hindi, in particular the agitation sponsored by some political parties, notably, the DMK, to call in secession should an attempt be made to enforce Hindi as a rule over the whole country. There are a great number of people in the Indian Union who consider a single language as an essential bond of unity. This it has been seemingly in the United States; this it has not been in Canada. The fact that the Canadian political system has weathered

so well every storm since 1867, must lead one to suppose that it possesses the power of survival in conditions not necessarily those of Canada only. There is everything to be said for the looser federation which Canada has evolved in the face of widely different cultures of her English and French populations. One of the great lessons that Canada can teach the Indian Union is that it is possible, under diametrically opposite cultural, religious and language systems, to build a coherent Central policy, at least if coherence implies the absence of any attempt to oppose the Centre by force. Given, as we have been in India, a will to accommodate ourselves peacefully to a critical situation, there is no reason why the discontents frequently expressed against Northern dominance should not be reflected in India's body politic. There can well be two stages in the "loosening" of India's monolithic federal structure. The first stage may be one in which all States benefit equally by delegation of Central authority and the second one in which particular States in which fear of the Centre is greater or where privileges of minorities are safeguarded, come to have a looser form of Central control. North America—both in the United States and Canada—offers illustrations of the wisdom of latitude in the exercise of federal constitutions.

The Permanent American Revolution: Economic Change

THE United States has frequently been described as a permanent revolution, and so, indeed, particularly in the economic sphere, it can properly be described. A small agricultural society has now been transformed into the most massive economy the world has seen in every section: agriculture, industry and tertiary occupations. The national income of the United States in 1960 has passed the five hundred billion dollar mark; at the current rate of exchange in Indian currency this would be about Rs. 240,000 crores nearly twenty times the national income of the Indian Union. Over the past seventy-five years, the United States' rate of growth has been approximately 3 per cent a year compounded. This was also a short period rate of growth from 1946 until 1960, though there are particular years in which it has been slower. A great social revolution has accompanied the creation of wealth and, in particular, has demonstrated the point that massive production in a democracy is the greatest of all income levellers.

THE SOCIAL REVOLUTION

Over 70 per cent of American families are now in what is described as the middle income bracket with dollar equivalents of income between 14,000 to 17,000 rupees yearly. About the same number have money in savings account and 34 million American families, or about 53 per cent, own their own homes. The share-owning of American corporations is broadly based with direct participation by 15 million Americans, but, with Mutual Trust funds giving an interest three to four times greater. Slowly, but not less surely on that account, the great inequalities of wealth of the nineteenth century are being evened out. It has been said that this is making a classless society.

A classless society has two components; one is in terms of income and, what goes with it, namely, the standard of living and the manner in which one can "carry" oneself before one's neighbours. Keeping up with the Joneses is an essential characteristic of a proudly individualistic society. This does not imply that the Joneses are everybody. But there are sufficiently large pools of well-to-doness. The social factor

in poverty, which is a sense of inferiority, tends to disappear. In the United States, just twenty-five years ago, there was, particularly in the South and amongst Negroes, a deep feeling of basic inferiority based on a differential in income and, where segregation applied, on great differences of opportunity. Nobody need suggest that those differences have been abolished, but everyone will agree that the great decisions which are leading to their gradual extermination have already been made by the federal authority, and are slowly being enforced by the societies in which poverty occurs even if not as a legislation by the State Governments. The concept of mass production and distribution resulting in lower cost to the mass consumer has been one of the great instruments in the equalising of incomes and consequently of abolition of the sense of inferiority which inequality brings.

The other component of equality in the permanent American Revolution is to be found in the opportunities available to talent. The breakeven point, in every case and everywhere, in business, politics or education, is extraordinarily high as a result of the extreme competition that exists in every field. Nevertheless, the social ladder is more open than in any country in the world. No ostracism pertains to any calling, and it is perfectly respectable for students to earn their keep as waiters and waitresses whilst struggling through college. At the other end, there are millionaires who started as newspaper boys, meaning that lack of education has not been a major barrier in the upward rise. Less fortunately, it is possible to fall in the social ladder. It may be two generations from shirtsleeves to shirt-sleeves.

It is because of this economic and social revolution aided by the graduated income-tax and far-reaching social security legislation, that the basic inequalities of what is often described as the capitalistic system do not in the United States conform to the Marxian prediction. Again, vitality of the American system is due to an intense interest in accommodation and a willingness to accelerate and accept change. Every decade has brought

Part A—A Politico-Economic Prologue

its own artificial means for the acceleration of economic growth.

The instruments of growth are similar in essence to those in every country, but the United States has developed, every decade, its own version of a component to make it in its operation almost unique. American technology has been able to exploit the conditions of change in a manner in which no other economy has yet succeeded in doing. By the thirties of this century improved technologies produced a wide range of synthetic fibres, plastics and synthetic chemicals, like synthetic rubber, which are now working deep even into the under-developed economies. The fifties of this century have produced the peculiarly American innovation of 'Automation' raising productivity per worker in a manner which still seems incredible to other advanced societies. The new electronic inventions, such as computers of various kinds, have practically all been first sponsored by the United States. The secondary character of the American operation has been the making

of new markets to absorb the inventive character of producers. Here the United States has been able to produce a great range of salesmen of genius so that increasing returns were not held back by reason of the limitation of the market when the problems of production were solved. Finally, there has been in the instrument of finance a capacity to operate on a scale which defies comparison with other countries in the world.

In all these fields the past is practically no measure of the future because the power of invention and technology in every case is unpredictable. It might seem that the safest course of looking into the future is to assume no change in the present technology. But it has been said truly that to assume today's rate of technology for the future is just about the surest way of going wrong. The permanent revolution in technology in the United States is gathering force. What might be the significance of these factors in Indian economic progress? To these it is necessary to turn.

American Ingredients in Indian Economic Progress

THE PROMISE OF PLENTY

IN PART B—An Economic Review—the great parallels which exist between the Indian and American economic systems are analysed in detail. It is argued there that the richest and the poorest countries in the world have at least their systems in common. They are massive in a continental sense, meaning that foreign trade covers only a relatively small fraction of the national income; raw materials are drawn largely from within and so are effected sales of finished products. As income rises a new discretionary factor enters into mass income. In the United States it is multiplied by the high level at which income stands. In India we have no high level, but we have a large population and the beginnings of the mass consumption society are already emerging. In the sixties we are in a 'take-off' which the United States passed with the attainment of the high maturity stage at the end of the last century. Before the end of the century India, it is argued, will also be a mass consumption society sharing the major elements of American ingredients of growth.

UNDER-DEVELOPMENT: NO BAR

Too often it is assumed that technology in the American sense has no application to under-developed countries. The standing answer to this is a case history. This has been well described in a study of Science and Resources prepared by Resources for the Future, Inc. In the case of Puerto Rico, the general view that it was a most unlikely site for chemical industry because it had none of the resources such as cheap hydro-electric power, oil or gaswell, or salt mines, died hard until, what is described as, Operation Bootstrap was under way. It was found that all the elementary industries, like food processing, yarn making, weaving, net making, garment making, leather making, furniture making and the like, were no more profitable than the average and often as unprofitable. The average profitability was only 10 to 15 per cent a year of capital invested before taxes. During the same period profits averaged 20 to 25 per cent on paper products, electrical and electronic equipment, cements, pharmaceuticals, plastics mouldings, more or less in the order named. Nylon, Rayon, rubber, rubber thread and pads were in advanced demand.

That the Puerto Rico experience has relevance to India, is seen by the high profitability of the rayon industries; by the evidence that synthetic rubber and the chemical industries will race ahead as in advanced countries. This raises at once the question as to how an under-developed country like India can import advanced American technology to sustain this advance. Here the answer has already been given by private industry on both sides which has executed a series of collaboration agreements. By and large, both foreign exchange and know-how are coming along together. A great complementary bond between American and Indian industry is springing up both in the field of basic metals—aluminium, for example, with both the United States and Canada—and in fertilizers, synthetic chemicals, pharmaceuticals and so on. This is a bond by which the great advances in technology in the United States will be transmitted to India without India's having to go through the process of independent invention for which we are quite unprepared. In other words, one of the ingredients of Indian growth will be the import of technological know-how through blueprints, reports and patent rights and advice from professional consultants; a second—and it may be a more important consequence of American collaboration in the Indian Union—is likely to be in terms of management. Not, indeed, that the American genius for sales will be able to operate in the Indian context with the same reckless daring as it does in the United States. Nevertheless, the pattern of operation is likely to conform increasingly to that of the great American corporations with a degree of planning in detail currently obtaining only in a few Indian business houses.

Apart from the development of sales inside, managements of the large international American companies are likely, once based inside this country, to develop a sales potential for Indian manufacturers using their international connections. This has been in operation in Japan, and it has stimulated Japanese exports particularly to the United States. One can look both in respect of technology and sales, therefore, to the American co-operation as an element of transferring a portion of the American processes of industrial operation to this country. In a sense there is a curious paradox in the American outlook in regard to protectionism at

Part A—A Politico-Economic Prologue

home and the export of the technological know-how abroad. It is not often realised that the great American Corporations selling know-how and market knowledge abroad are limiting the capacity of their home units to exploit international markets. The exports are made, in fact, from companies which do not, in the main, remit export earnings back to the United States. Thus the United States technology and sales are not necessarily, on balance, factors in the improvement of the United States balance of payments. At the same time, most American industrialists are willing to participate with foreign firms and to co-operate with the Government programmes of training foreign technicians in the setting up of the highest industrial production and sales standards and full utilisation of their domestic research. Thus the ingredients of the American forms of industrial growth are not hampered by that passion

for secrecy which prevented the under-developed countries in the early years of this century from acquiring industrial techniques capable of competing with Europe or the United States. One may hope that this tremendous change in outlook, which is beginning to catch on in Europe as well as in the United States, will transfer to the Indian scene the main means of mass production which has been the instrument of lower costs, in practically every industry in the United States.

How is this pattern of economic co-operation and the needs of the United States and India to develop on parallel lines likely to affect their political and economic policies for the rest of this century? That is a question which can be answered hopefully; surely it will affect the character of our political relations when current prejudices on both sides have died away.

Conflicts in Foreign Policy

ISOLATIONISM VERSUS INTERVENTION

It has been said, and with profound truth, that one constant theme runs through the history of America's foreign policy, dominating every debate and every significant decision from the birth of the great Republic. The burning question has been whether the United States should participate wholly in world politics or withdraw unto itself; the choice has been between involvement and isolation, between alignment and neutrality. In the early days of the United States, the emphasis was very much in the direction of isolation. This culminated in the Monroe Doctrine which chose the Western Hemisphere as the area of American influence and practically declared a policy of non-intervention in Europe. Variants of the Monroe Doctrine presided over foreign policy for more than a century and the current of isolation, led by opponents of Franklin D. Roosevelt, hindered America's entrance into World War II. It also hindered Woodrow Wilson in World War I, and in the end defeated him after the Treaty of Versailles by the failure of Congress to ratify the Treaty. The current of 1947, until the present time, is sharply on the other side. The United States is now frankly interventionist. The Western Hemisphere no longer bounds its interests; they are global, that is, coterminous with the whole world.

Indian opinion has often failed to understand this oscillation of American policy between isolation and intervention. Broadly, the issue is not one of principle, but of expediency which in some form or another expresses itself in the foreign policy of every country. There are times when a country plays an international role; at other times it may feel that it should concentrate more upon its national affairs. The test is not whether these roles are consistent by themselves: they are clearly not, but they acquire consistency when looked at in terms of the changing national interest. The Monroe Doctrine was in the national interest of the United States for most of the nineteenth century. The Marshall Plan and the creation of Atlantic Community—from which America had shrunk for over a century—was the expression of the needs of the mid-twentieth century. Two major considerations dominated this choice: the first was military security and the second the strategic need for economic raw materials. Both provide justification for America's choice.

MILITARY SECURITY

The problem of protecting itself from attack has naturally had over time a very variable strategic com-

ponent. So long as the United States could only be approached by sea, only a Power with supreme naval capacity could be deemed a severe danger to United States' security. Her relations with Britain, which was the greatest naval power before World War I (and even protected American life-lines in the Pacific and the Indian Oceans) meant that the United States had no fear of invasion. This apparently justifies her reluctance, both in World War I and World War II, to intervene early in the rise of Germany as an aggressive European power. Germany never had the naval apparatus wherewith to threaten the United States. The problem of Japan was beginning to be different in the late thirties, and this explains why the United States was far more concerned about threats of Japanese ascendancy than it was by the senior partner in Axis strategy.

Naval considerations dominated thinking right up to World War II, and even today substantial emphasis in the United States stands on protecting its sea shores by adequate submarine flotillas. Nevertheless, the emphasis is no longer on any particular enemy or locality since the coming of the missile age has removed from the United States the protection which came from the fact that it was almost impossible to discharge heavy punishment on the American Continent from a European or Asian source. This is one of the main considerations which has changed the thinking of not merely the Pentagon, but of the whole American people towards internationalism. For the first time, the United States land mass is vulnerable to a major military operation from enemies abroad. Thus isolationism is no longer a feasible military proposition. The United States, which had no military need of allies for a century, is now in desperate need of alliances both from the point of view of military defence and attack. Even, therefore, if its economic interests were not major considerations in the new balance of power, the United States strategically would have had to change its isolationist outlook under the Pentagon's imperatives.

ECONOMIC RESOURCES

The second major element in the new internationalism of the United States is connected with its serious deficiency in major industrial and economic materials required to sustain its production, as well as maintain its strategic development in the field of defence. The Paley Commission has published an impressive list of shortages the United States may suffer even during the period up to 1975. It has indicated, amongst other

Part A—A Politico-Economic Prologue

things, the United States' dependence on foreign oil and on a very large number of metals. The United States' imports, to name only a few which have "strategic elements", are aluminium, bauxite, beryl, cobalt, coconut oil, cryolite, diamonds (ind.), feathers and down, flourspar, glass (optical), graphite, lead, magnesium, mercury, mica, monazite (conc.), palm oil, platinum, quinidine, rubber, sperm oil, sisal and tantalite. These are to be found in various portions of the world; some happily in the Western Hemisphere, but not a few elsewhere. To sustain its economic production, the United States would need considerable quantities of these commodities even if there was no defence element involved. In view, however, of the possibility of having to contend with an enemy capable of occupying some sources of these supplies, the United States has to maintain a foreign policy capable of at least denying these supplies to its potential military opponents. Much of ambivalence in American foreign policy is the consequence of this need for preclusive action.

Both because in the new strategy the United States needs allies abroad, and because its economy is now reaching beyond its own sources of raw materials in many respects, the twentieth century has decreed for its a departure from the self-sufficient isolationism of the nineteenth century. In the Indian Union, where a great deal of the "bigness" of American production is not understood, and where the cost factor in producing substitutes, synthetic or otherwise, has not been sufficiently appreciated, there is frequent questioning as to whether or not the United States is justified in casting

its mantle over countries merely because its raw materials are to be found there. In particular, the questioning of the United States' alignment with forces which may reduce its capacity to follow what India would describe as an anti-colonial line, has been written into its dependence on political allies as well as on economic resources abroad. This is merely one limitation of the dimensions of a foreign policy, when one loses the quality of independence of an earlier age.

THE PRICE OF LEADERSHIP

Quite apart from these strategic pressures on the United States, there is the fact that it has emerged, after the War, as an unquestioned leader of what can be described as the Free World. Leadership in an international community cannot be the same as leadership in an individualistic group. There must necessarily be in the process of such leadership concessions to group opinion such as the United States had inevitably to make in its association with what is described as the Atlantic Community. A policy of restraint in criticising France in Algeria and Morocco, for example, is a part of the price for the Atlantic Alliance. It is significant that Mr. Nikita S. Khrushchev, Prime Minister of the Soviet Union, is equally willing to pay this price in order to obtain the support of General de Gaulle. This is not, therefore, as Lenin might have put it, a necessary corollary to Capitalist Imperialism. It is merely a condition of the balance of international power, which, in turn, is a necessary condition of survival in the second half of the twentieth century.

The Cold War in Indo-American Relations

THE fundamental divergences between American and Indian foreign policy spring from the fact that the United States, at this time, is the leading protagonist in the Cold War and that India is largely outside it. In this sense India can afford to be isolationist as the United States was in the nineteenth century and for a portion of the twentieth century. The time may come when our security will call for the operation of the conditions which press on the United States now. But that time seems to be far away, and India's traditional policy in the twentieth century can well be that of the United States in the nineteenth century, with, of course, only that degree of difference which living in the twentieth century world necessarily implies. Meanwhile, it is possible to look upon the more particular sources of disagreement in terms of American policy in the last decade.

DOCTRINE OF CONTAINMENT

The first element of difference is in regard to the attitude towards the Union of Soviet Socialist Republics. The reflection of this attitude is the Cold War; the means of expression of what has been described as the Doctrine of Containment. The essence of the Doctrine of Containment was the building up not merely of allies, but also of military bases from which American forces could, at short notice, strike at targets in the Soviet Union. To India, anxious to stay neutral and outside the Cold War, this doctrine has naturally been unacceptable, and it may be that India's view on this problem was not merely wise in terms of Indian interests, but might have had strategic advantages for other nations. Undoubtedly, most of the countries in which the Americans have had bases have now to reckon with Soviet military might. But apart from this, the military argument seems to have been overdone, and in view of the deterrent effect of nuclear power everywhere, one wonders whether additional

bases, some of which employ conventional weapons, will be in a position to deter aggressive action by the Soviet Union. The political current in the USSR, at any rate under Nikita S. Khrushchev, has been the other way. It would seem that the policy of military containment has been pursued both beyond the needs of military necessity in the missile age and political wisdom in the Age of Khrushchev.

PAKISTAN

More directly connected with the Indian Union has been the United States' military alliance with Pakistan. Here the fear that Pakistan forces could be used aggressively in Kashmir has been an underlying cause of continuing concern. India has been unwilling to recognise that. While this military alliance had a possible connection with the Doctrine of Containment, that justification over-ruled every other. Indeed, there is also something in the view that Pakistan's additional military capacity has engendered more defence expenditure on the Indian side, thereby detracting India from her economic development. On the other hand, it is fair to claim that American economic assistance to the Indian Union has steadily grown and is now considerably more than any military aid that Pakistan has enjoyed. All in all, therefore, it would appear that Indo-American tension, arising out of Pakistan, is on the decline. Perhaps more so after the Indus Waters Treaty has been signed and at least one major hurdle between India and Pakistan has been overcome.

SEATO

A potential difference, which has not been hitherto so emotionally charged, is America's participation in the South-East Asia Treaty Organisation with its headquarters at Bangkok. Here the Indian view, which is that Asia needs no military alliance or props, has not been accepted by many countries, notably Thailand,

Part A—A Politico-Economic Prologue

Laos and South Vietnam, and the fact that pressure, which is being brought by both sides on local Governments, seems to suggest that a position of complete neutrality is not necessarily solution of the particular problem. However, the condition of Laos also suggests that intervention by itself is no solution. The question arises as to what should be the balance between American intervention and Asian neutral opinion in this area. Until the appropriate balance is struck, undoubtedly, American intervention, contrary to India's ideas of reconstituting the Commission and letting it operate according to its own judgment, will be a source of difference.

THE CONGO

Pakistan and SEATO do not represent the only major sources of difference at the present time. The Congo, as recent debates in the United Nations have shown, presents a picture of even more acute difference between the United States and the Indian approach. Both are ostensibly supporting the United Nations, but, undoubtedly Indian sympathies are with Mr. Lumumba while those of America are much more with Colonel Mobutu. This is a part of the reflection of the Cold War; one in which, unhappily, India's attitude seems a little compromised by the Russians who are taking a similar view. Nevertheless, this is part of an approach in which India stands by a politically elected Government, whereas the United States is dominated by the consideration of keeping Russian elements

out of the picture. Colonialism is only incidental to the bitter fruits of the Cold War. We wish the Belgians out: the United States is far more concerned about preventing the Russians from coming in. Because the Cold War dominates the approach to this matter (and India sometimes ignores American interests in the Cold War), it is not likely that an agreement will be reached early. But the tensions are not all that deep.

Over and above the real differences there thus emerge differences as a result of pressures at a particular time. There happens to be a personal equation which, from time to time, widens these differences. How far this personal equation is represented by Mr. V. K. Krishna Menon, who constantly arouses opposition in the United States, and how far it is intrinsic to Indian foreign policy, it is difficult to say. But the fact remains that India and the United States have not infrequently in recent months voted in the United Nations on opposite sides. Perhaps not too much should be read into these divisions. The broad current of Indo-American co-operation can take in its stride minor disagreements—provided they can be kept minor. India's interests, obviously, require that she should not, at this time, make a major enemy of the United States; equally India with her large population and her tremendous influence on public opinion in the Afro-Asian world, is too important, strategically, for the United States to barter away her goodwill. It is, therefore, likely that impersonal interest on both sides can remove, in time the obstacles which stand in the way.

Motivation: National Aspirations and Fears

MUCH of the politico-economic dialogue between North America and India is connected with what is frequently called national psychology rather than what is loosely described as the national character. National psychology is as changing as national character, but it is possible to see foreign policy more clearly in terms of the oscillations of national aspirations and fears than in terms of broad generalizations on what is described as national character. Considerable research, sponsored particularly by the Institute for International Social Research, Princeton, N.J., by Mr. Lloyd A. Free and Dr. Hadley Cantril, has now given us some fairly precise evidence of the manner in which national aspirations and fears operate in various countries. It is a piece of good fortune that the United States and India figure in the list of countries in which these studies have been undertaken. In the Cultural Section, some figures have been reproduced in regard to aspirations and fears of Indian and United States students in which not a little resemblance is displayed in these broad categories. One contrast is marked. There is amongst United States students a very high percentage of those who fear war or live in fear of war. The figure is 38 per cent, which is, not unnaturally, also the figure of those who ardently desire peace. In India, notwithstanding much emphasis on the need for peace, stress is elsewhere both in respect of students and in respect of Parliamentarians. Sixty-five per cent of India's Parliamentarians interviewed attached the highest importance to an improved standard of living, followed, with a great gap by a high priority for democracy (25), education (22), social justice (20) and socialist government (20). If one can conclude anything from these figures, it would appear that even amongst our Parliamentarians, and certainly amongst our students, the passion for economic progress is supreme and that for political means relatively lower. This presents, in a sense, a major background of the differences between national

aspirations and fears as they now arise between the two countries. In the United States, where the economic battle has been largely won, the main emphasis is on security whether one looks at it in terms of aspirations or fears.

The national psychology of the United States may thus be expected to respond to a policy which protects the United States rather than a policy which risks its political and economic security, for what might be called humanitarian considerations. In its political context, this means continuous tension because, even while peace is sought, the fear that the United States might be outwitted is a continuous possibility. Undoubtedly, the great majority of people in the United States would even support the U-2 flights over the Soviet Union because of this passionate feeling for security at almost any price. By contrast, in the Indian Union, relatively neutral to its external security — except from the People's Republic of China — the U-2 flights over the Soviet Union will naturally awaken no sympathy. On the other hand, the underdeveloped areas of the world will err greatly if they imagine their own economic development, which is their top priority, is equally urgent to richer countries and can be seen in same light from the United States or from any of the other countries of the world. There are sections in North America who will recognise that the political and economic security of the United States is involved in raising living standards elsewhere in the world. But as against the long-term objective of raising these standards and the short-term objective of providing immediate defence against a military enemy, no one need doubt where the United States choice would rest. This is not a difference between the Government of the United States and the American people. Broadly, the passion for security is so great that the increase in defence expenditure, a military alliance policy, provided it can be 'sold' as an appendage to security, and

Part A—A Politico-Economic Prologue

expenditure which might be related to keeping military allies in good economic heart will always receive preference to economic aid for purposes of straight development. Similarly, the suggestion that even though the United States has a serious balance of payments problem, its obligations to underdeveloped countries will override its own direct needs, will always encounter severe obstacles. Thus, the dialogue between the United States and India will always be hindered by the United States' sense of insecurity and the high priority which defence receives in that country and India's feeling that the United States might take larger chances on the military front in order to increase the proportion of the national income committed to economic aid for underdeveloped countries.

FOREIGN AID

Quite apart from the current feeling of insecurity in the United States, national psychology on both sides has to take account of the giving and receiving element in foreign aid. On the Indian side, largely because of our colonial past, the view that aid and even abundant private foreign investment, implies some loss of freedom will die hard. On the American side, there is a lack of willingness in Congress to assign funds under the direction of Governments whose attitudes to economic affairs may not conform with that of the majority in the United States Congress. Thus aid to India has encountered, as during the negotiations for wheat loan, hard words on both sides. Happily, this has not prevented a great stream of aid and assistance culminating in the great P.L. 480 deal under which India is to receive in the next four years 17 million metric tons of foodgrains. However, the broad feeling that aid is not a permanent solution of India's problems is possibly widespread on both sides; India would naturally be much happier if she could repay sums borrowed even in rupees, and secondly, if borrowing could be reduced by greater expansion of trade and less dependence on aid.

Thus it comes about that the present represents no equilibrium between Indian and American emotional attitudes towards one another. In the United States, because there is a deep sense of insecurity and the Soviet Union is regarded as the arch enemy, India's friendliness with the Soviet Union raises emotional overtones which sometimes result in expressions of personal anger and distrust. The Americans feel some-

times that India has lost the grand tradition of moral leadership of Mahatma Gandhi. By contrast, in the Indian Union, pre-occupied by the problems of economic development, the sense of proportion displayed in its expenditure by the United States awakens some considerable criticism. It is argued that if upwards of fifty billion dollars can be spent per year on the defence expenditure by the United States, a tenth of that sum spent on economic development in underdeveloped countries would make for far greater world welfare. On both sides, the attitudes are happily not very rigid, but there is still a great gap in regard to the conflicting demands of American national security and world economic development. Most of these have their roots in the changing national psychology in which American insecurity and the Indian impatience for economic progress represent the greatest fears and the greatest aspirations respectively.

It is difficult to determine whether or not national attitudes, which thus differ, can be changed in the short period by carefully prepared programmes of explanation. There are groups in the United States which are anxious that economic assistance should take a substantially larger share of America's international obligations. There are also in India persons who think that at the present time the volume of foreign aid which India receives forms too high a part of our capital needs. The view is probably held that there is a degree of instability in India's economic development so long as her foreign exchange needs are kept so high as to involve such marked dependence on a particular country. If this should lead to a constructive programme for the study of the use of economy in foreign exchange as well as in rupee capital in which the country is short, it can do good on both sides. For if fewer demands are made on the United States and economic development is nevertheless not hindered, both ends of policy — which are to reduce differences and to expand the area of welfare — will be achieved. It is not impossible that if instead of a dialogue in persuasion on the basis of the central tenets of psychology in both countries, an attempt was made to assist India to use non-capital intensive methods of raising productivity widely, a greater service would be done than by approaching the problem purely from the public relations side. Nevertheless, there is here a substantial room for the operation of both political and economic imagination. The question which arises is whether or not this is being adequately deployed.

Indo-American Relations: The Future

THE argument of the pieces that have gone before suggest that the structure of Indian political opinion in international affairs is necessarily different from that which motivates American policy today. It has been suggested that the difference is partly of time; Indian "neutrality" occupies a stage historically not unlike the isolationism of the American Monroe Doctrine of over a century ago. But the difference is not only one of time but also of geography. It is in the interest of the democratic Asian world of the twentieth century to insulate itself from European quarrels, while protecting itself from Communism at the same time. It is of the essence of North America in the nuclear age that it should protect itself by having European allies with military power, but it is equally in the interest of the United States that as great a portion of the Asian world should be precluded from joining the Communist bloc.

It is in terms of the pursuit of a larger area of

neutrality in the Asian and African continents that the divergent opinions on the Cold War and Communism can be partly reconciled. It is sincerely to be hoped that Indo-American differences, which have fluctuated wildly over the decade, will now grow less. Perhaps as India becomes more willing to take a forward place in international affairs, the existing polarisation of the policies between "neutral" nations and the protagonists of the anti-Communist world will diminish. The most important element which is making for that diminution is the structure of Indian life based on the democratic faith and the opportunities which a large element of freedom in the economy continues to provide to those who can rise without the protective banner of State Socialism. The economic parallel is not too close because a 'have-not' society needs props in Government enterprise which the United States has seldom needed to the same extent. It is not inappropriate that a larger place for public enterprise has been advocated by Professor John Kenneth Galbraith, who is not alone in

Part A—A Politico-Economic Prologue

seeing the virtues of public enterprise in underdeveloped economies.

Over the next forty years, if only the political differences can be kept from vitiating the flow of economic co-operation, the ground for which has been well watered and is now bearing fruit, one might prophesy that a major improvement of Indo-American relations is written into historical trends. At present, America is affluent; we are desperately poor. They are powerful with supreme economic power; we are populous without being powerful. But assuming that we can build our economy with foreign assistance and that American technology and salesmanship are to play a major part in increasing Indian efficiency, there might be a readier appreciation in time to see the common purposes of our efforts. In conclusion, perhaps one might argue that much of the similarity in outlook that exists is hidden by the differences in politics which have been described in the two previous articles. It might be appropriate here to reproduce a comment and a prophecy made four years ago by the same writer in 'Foreign Affairs' which it seems might bear repetition.

"One of the unfortunate by-products of the Cold War is this failure on both sides to see clearly the common bonds of political philosophy and economic practice between India and the United States. In an important sense, it is the United States, more than any other country, that India is copying. The character of Indian expansion bears more than superficial resemblance to the expanding economy of the United States after 1868. The growth of the American and Indian economies springs from the same basic economic strength—the presence of large internal markets and the means to supply them from within. With their

continental character both countries can develop their own supplies of foodgrains and industrial raw materials enabling them to finance a far higher rate of economic development than hard-pressed economies such as those of Britain or Japan.

"The parallels with the United States, both in politics and economics, are now becoming so clear that one might hazard the guess that between 50 and 100 years from now, the Indian Union will possess an economy as massive in terms of productive capacity and of welfare as that of the United States today. It is appropriate that this should be accomplished with the active assistance of democratic countries which have both an ideological and strategic interest in assisting Indian development, now running a classic race with the People's Republic of China.

"It might be remembered that it was in his search for a new route to India that Columbus first stumbled on the Americas. Out of that great accident there came a faith; and after a faith there came a civilization; out of that civilization came abounding prosperity. In a sense, therefore, India, or at least the vision of her splendour, was a condition in the making of America. The wheel is coming full circle. India's expanding economic needs are driving her hard, albeit vaguely, in search of a new route to prosperity. In this search she may well stumble on the pattern developed in the United States, with which she has so much in common. If, under the altered circumstances of the twentieth century, the American experiment could be successful in India, that would be evidence of its abiding character. In this sense, the United States is also being tested on Indian soil."

PART B

AN ECONOMIC REVIEW

India and North America: A Study in Economic Growth with Projections to 2000 A.D.

THE Indian economy has demonstrated a continuous dynamism and buoyancy during the last decade. This is an entirely new experience for this country. It is no doubt instructive to seek parallels in the world from where guidance could be had for the probable future growth of the Indian economy, say during the next four decades. If the projections are based on reasonable assumptions and the prototype selected is one which has reasonable possibilities of fruition, there is no reason why the exercise should not be attempted. The problem is to select the right model and for this purpose, there is no better model of growth than that of the United States of America.

During the last decade, abundant literature on the economics of growth has been produced and quite a sizeable portion relates to the growth of the under-developed countries. Not all this literature has ready application to the Indian case but there is enough which can provide guidance to our aspirations in this particular field.

Indian economic development, it must be remembered, is still hinged to a free market economy. The planners have rejected the totalitarian techniques and economic progress is being attained while retaining all the democratic essentials. It might be argued that the character of economic growth in India is not much different from that planned in the East European countries and more recently in the People's Republic of China but it should be clearly noted that the lessons of planning from the totalitarian countries have only very limited application in the democratic set-up of the Indian Union. Also, the Indian Union is a vast sub-continent and the diversities prevalent within its bounds prohibit learning of any lessons from such smaller economies as the United Kingdom, Japan, the Netherlands, etc. Moreover the "open" economies of the United Kingdom and Japan which depend upon the outside world have very little real application in this country; our imports are important, but they still comprise less than a tenth of the national income. The countries which India most resembles in this age of the "take-off" are continental ones.

The problems in India are similar to those which the United States faced 150 years ago. The fact that per capita consumption level in India today is pitifully low as compared to the United States, which is the richest country in the world, need not deter us because there are few economies with which India can be compared except with the United States of America in terms of the pattern and growth of progress. The dispersion of income scale between India and the United States of America may be large but there is no other country or prototype which will be as suitable as that of the United States of America.

A comparative study of the Indian economy and that of the United States is likely to yield a fruitful analysis because of the essential likeness between the two countries in regard to the principles of democratic behaviour and markets based on individual preferences. It is forecast that the Indian economy in the next four decades may possess a massive structure comparable to the United States of America of today. It is a fortunate accident that we are seeking American assistance not only in terms of financial help but also for technical "know-how". There is a widely prevalent belief in this country that this experience on the economic level is likely to produce far-reaching and binding relations between the two countries.

Nearly 150 years ago, the United States looked for new frontiers in its vast continental area in order to increase production. In the case of the Indian Union, the frontiers explored are not in terms of geography but in terms of the quality and range of new production. Here pertinent reference needs to be made to the increase in yield or productivity which is likely to be a key to the future economic progress of the country.

The economic progress registered during the last decade has raised great hopes in the sense that three major factors of growth have taken a dynamic turn. The rate of savings has substantially increased so as to promise early completion of the take-off stage; a sizeable development in the capital goods industries has already taken place and a substantial rise has occurred in consumer spending on "discretionary" elements. Over the decade 1951 to 1961, national income has risen at the average rate of 4 per cent per annum. Per capita income has also risen at the average rate of 2 per cent per annum. The rate of savings has crossed the critical limit of 5 per cent and is now estimated to be around 8 per cent per annum.

India and North America have some similar characteristics such as, vast area and unlimited resources both in terms of manpower and natural resources. Whereas the "take-off" in the case of the United States occurred nearly a century ago, the Indian Union has just broken through all the obstacles to reach the "take-off" stage. A fact which needs to be remembered is that the Indian Union need not go through the same technological "hit and miss" process through which Western Europe and the USA passed during the last 100 years. The rate of growth in the Indian economy is anticipated to be much faster because she can now "skip" certain processes in technological growth which look superfluous in view of the latest technological growth. That considerably reduces the time that the Indian Union may take in attaining "maturity" as well as reaching the goal of "high mass consumption."

The Population Perspective

THE UNITED NATIONS has attempted an estimate of the total world population and has come to the conclusion that in 1959 it had already reached the level of 2.9 billion persons. The coverage related to about 270 separate geographic areas including China with an estimated population of 669 million; India takes the second rank with 403 million, the USSR the third rank

with 209 million and the United States the fourth rank with 178 million. These four countries together add up to about 1.5 billion and account for more than half of the world's total population.

In 1950, the total world population was estimated to be around 2.5 billion. Between 1900 and 1950, the

increase was of the order of one billion. The present rates of increase indicate doubling of the population from 2.5 billion in 1950 to 5 billion by the end of the twentieth century.

The population problem has become "explosive" in view of the fact that major growth is anticipated to take place in the economically backward areas, thus pushing downwards the already extremely poor standards of living. It has also made the task of promoting economic development in these areas extremely difficult without reversing the present trends in the growth of population. It is feared that failure to check the population of the under-developed countries might land the world into serious consequences. That is why the developed countries who have taken upon themselves the responsibility of providing aid to the under-developed countries have been recommending to these countries to formulate programmes designed to deal effectively with the problem of excessive population growth.

The pattern of growth in population may be divided into three stages. At the first stage, the high mortality rate is more or less balanced by the traditionally high birth rate. For most of its history, the world has been in this stage. Infant mortality is high and life expectation is short. The net result is a stable population or at most only a slow increase. Today only the least developed areas, such as, those in Central Africa, fall within this classification. At the second stage, the modern health techniques enter into the picture causing rapidly decreasing mortality rates but with the maintenance of the relatively high birth rates. This combination results in extremely high rates of population increase—as high as 3.5 per cent per year in certain cases—which may result in doubling the population in the short span of 20 years. The present estimates show that nearly 75 per cent of the world population falls in this category. Then comes the third and the last stage. Only about 20 per cent of the world population is in this stage which is characterised by a low mortality rate and a low fertility rate. Like the first stage, the result is static or only a moderate in-

crease in population. The United States of America, Canada, Europe, Australia and New Zealand fall within this category.

The second stage referred to above is an artificial stage. Introduction of advanced medical and public health techniques produce rapid results in lowering the death rate. In the normal course of events, the slow but steady advance in human knowledge would gradually decrease mortality rates and with some lag, fertility rates would decrease also.

The basic cause of the present rapid rate of increase in the world population is the declining mortality rate rather than a marked increase in the fertility rate. There has been some increase in the level of fertility also in response to improved health levels. It is but natural to expect, under better conditions of health, that the women in the backward countries would live to the end of the child-bearing period. Better conditions of health have reduced the number of miscarriages and stillbirths.

The United Nations estimate of world population at 7 billion in 2000 A.D. is based on the assumption that during the next 40 years the increase in population in Africa, Latin America and Asia would be at extremely high rate. This fact is illustrated in Table I below.

It is assumed, for example, as shown in the Table below, that the Asian population from 1975 to 2000 A.D. would rise by as much as 75 per cent or nearly 3 per cent per annum. "The Eastern Economist" does not subscribe to this view. It is believed that the rise in living standards will certainly restrict the size of the average family and keep the population pressure within reasonable bounds, though the upward rise in numbers would continue. Similar is the case with estimates made in regard to Africa, though there is not much difference of opinion in regard to other areas. Quarter-

century Projections made by "The Eastern Economist" are set out in Table II below. Table III below sets out the world population projected up to 2000 by continent.

The Royal Commission on Canada's Economic Prospects has projected the population of the world up to 1980 at 3.7 billion. The figures in Table III up to 1980 are of the Canadian Royal Commission. Projections for the next 20 years have been attempted by the Research Section of "The Eastern Economist".

In 1956, in the Annual Number of "The Eastern Economist", population projections up to 1975 were attempted. The estimates of "The Eastern Economist" published in 1956 and those of the Royal Commission

of Canada are almost identical, as the table below clearly shows:

(In Millions)

Year	Estimates of "The Eastern Economist"	Estimates of the Royal Commission of Canada
1960	2,842	2,810
1965	2,996	3,000
1970	3,159	3,220
1975	3,400	3,460

STAGES OF ECONOMIC GROWTH
IN SELECTED COUNTRIES

INDIA'S SECTOR-WISE DISTRIBUTION OF NATIONAL INCOME
(1950-51—2000-01)

U. S. A. PERCENTAGE DISTRIBUTION OF NATIONAL INCOME BY INDUSTRIAL ORIGIN

India And North America: The Next Forty Years

AN ATTEMPT is made here to forecast the probable trend of the Indian economy and the economies of Canada and the United States during the next forty years. It is to be conceded that all projections are a translation of the past experiences coupled with present knowledge and anticipated future economic developments. At the beginning of the present century, any attempt to portray the shape of things to come sixty years hence would have been a gross underestimate. The arrival of the Sputnik Age is a phenomenon which could not have been foreseen even a decade ago. Anyhow, keeping in view all these limitations, "The Eastern Economist" has attempted not only a historical economic study of India and North America but has also endeavoured to outline the probable future course as well.

The present task of "The Eastern Economist" has been greatly simplified by certain pioneering studies in this field. US President's Materials Policy Commission Report on the American economy in 1952, regarding the free world resources provides estimates of demand for raw materials till 1975. The Royal Commission of Canada has also projected the Canadian economy in relation to the free world and the Communist Bloc countries till 1980. Both these reports have thrown up valuable suggestions in the matter of forecasting the future economic trends in the world. Also, Mr. Harrison Brown has, in a general manner, attempted a picture of man's natural and technological resources a hundred years hence. "The Eastern Economist" has drawn heavily from all these and many other pioneers in the field of forecasting, and has applied its own knowledge and judgment in projecting the past trends into the future.

TECHNOLOGY AND GROWTH

One of the major factors in the rapid growth of the United States' economy was the technological revo-

lution which steadily raised productivity in terms of "output per man-hour", i.e. the constant dollar value of goods and services produced in relation to the hours of all persons employed. This measure may also be described as "real product per man-hour". It takes into consideration not only the manpower utilised but also employment, unemployment, labour costs, levels of living and other elements. The average annual increase in productivity in the United States since 1947 has been a little above 3 per cent per annum. In agriculture, the annual average percentage rise is more than double of the non-agricultural sector. In other words, productivity in the agricultural sector is a little more than 6 per cent per annum.

The factors which determine productivity are wide and varied. General economic conditions marked by recession or prosperity, utilisation of capacity, technical knowledge, technical skill-level of the labour force, etc. all operate to affect the level of productivity. It needs to be remembered that economic growth in the United States is partly influenced by the expansion of the labour force and partly by the rate of gain in output per man-hour. The labour force in the United States has been steadily rising both because of a vast increase in the rate of population and widespread immigration, though the major contribution to productivity came from a steady rise in output per man-hour. Long period trends between 1909 to 1958 showed an average annual increase of 2.3 to 2.4 per cent per year on the usual straightline method. The average annual increase in productivity for the total private economy was higher for the post-war period of 1947-1959 than for the long-term period of 1909 to 1959. At the same time, a review of the movement of productivity during the last 50 years shows that the post-war period was not unique in the exhibition of an encouraging rate of rise in productivity. During the span of the last five decades, there were certain short-

ON THE ROAD TO PROSPERITY

PLANS are meant for the prosperity of the people. It is when all classes of people clearly grasp what they mean and what they have achieved and give their active cooperation in their further working, that the great targets envisaged in the various fields of development can be reached.

What have the plans achieved in Andhra Pradesh so far?

* The great Nagarjunasagar Dam is going up rapidly—It has risen to about 100 ft. in parts already; and work on both the main canals is progressing up to the 50th mile. Several other irrigation projects have been completed or are nearing completion.

* Production of electricity is going up steadily. Now 2408 villages are electrified in the State, while the figure was only 700 at the beginning of the Second Plan. The Upper Sileru Project and the Srisailem Hydro-electric projects will further immensely raise the output of power.

* Production of food grains in the State, which was 55.37 lakh tons at the beginning of the Second Plan, has now exceeded 62 lakh tons.

* Community development work is now in full swing in 305 blocks covering nearly two crores of population.

* The number of educational institutions of all varieties is steadily expanding. Finishing touches are being given to the scheme of universal free and compulsory primary education for the age-group of 6-11 years to be launched during the Third Plan

But these are only a few. Our ambitions for the Third Plan are many and high. Help the plan and help yourself.

Department of Information & Public Relations, Andhra Pradesh, Hyderabad.

term periods in which the average increase was higher than the long-term rate.

The United States experience shows that the major factors affecting productivity are, (1) technology, (2) level of investment, (3) availability of electric energy per man-hour, (4) growth of non-production workers in manufacturing and (5) research. Technological advances since 1947 have been rather rapid and it seems that the era of automation started in right earnest with the end of the Second World War. There was urgent need for a vast revolution in technology in the United States because of the unprecedented back-log of demand kept in check by the six-year old war. Technological changes have been widespread and they have affected all sectors of the economy including consumer and producer goods, industry, agriculture, and "service industries. Production processes have undergone vast changes, but the motive elements remain doggedly those described above.

The increase in productivity has also been accompanied by a substantial growth in the amount of "fixed capital available per worker". It is estimated that equipment per person in 1956 was almost twice as high but plant per person was only slightly higher than the level prevalent between 1925 and 1929. Most of these increases occurred during the post-war period. Capital stock rose by 82 per cent, employment by 35 per cent between 1925-1929 to 1956. Total man-hours, however, increased only by 9 per cent.

New productive techniques and new products are a consequence of a long-term investment in technology, assisted by research. Although the research element has been a constant feature of the American economy for many years, it seems to have received special emphasis in recent years. More and more individual producers are establishing research facilities in

order to bring about improvement in productive processes and introducing new features so as to keep up with the new tastes in the economy.

THE PALEY REPORT

The patterns of past and projected rates of growth in materials demand indicate that the US economy nearly doubles its total supply of goods and services in 25 years. The Paley Commission set out its anticipated rate of growth between 1950 and 1975 broadly on this overall rate of growth. In the years between 1900 and 1925 and again between 1925 and 1950, the economic forces in the United States more than doubled the total output of goods and services. Between 1950 and 1975, these factors are expected once over again to double the gross national product.

In regard to the demand for durable goods, it is expected that their total production between 1950 and 1975 would rise more slowly than the total GNP. This is because 1950 was an abnormal year in which a "bulge" in the long-term growth trend for durable goods appeared. There are certain essential raw materials whose consumption is anticipated to rise much faster than the general four per cent rate of growth. In this category stand the key materials, such as, aluminium and rubber. Even iron ore, copper, zinc and tin are expected to rise much slower than the overall rise.

The estimates made by the Paley Commission assumed that the raw materials would be freely available at approximately the prices prevailing during 1950. This is an assumption which facilitates the problem of projection; otherwise it is known that in the case of a number of commodities, the projected demand is greater than the prospective supplies at the assumed 1950 prices

and therefore the future price is likely to be higher and the level of consumption correspondingly low.

Amongst the fast growing uses, such as aircraft, plastics, insecticides, the new synthetic fibres, the estimate has been made that the rise in 25 years would be of the order of 400 per cent. These products defy projection in terms of the broad aggregates and even in terms of specific products. These are in fact new industries which are likely to grow at a steeply high rate and even their stable place in the economy is not established.

While it is estimated that in the US economy, in particular, there is likely to be no new demand for agricultural machinery, for new telephonic equipment and ship building, it is anticipated that the demand for new railroad equipment and the number of trucks in use will grow at a very fast rate. Number of trucks in use is expected to rise by 150 per cent in 25 years. Thus, after the fast-growing industries, the demand for trucks seems to be the highest. Then follows the demand for new rail-road equipment and the number of automobiles in use. Printing and publishing also is anticipated to rise at the rate of 3 per cent per annum. The Federal Reserve Board indicated that printing and publishing almost doubled in the years from 1925 to 1950. There are no indications available to show that the doubling in the next 25 years may not occur but a somewhat lower figure was chosen because it was felt that the size of the average newspaper and magazine is not likely to rise as much in the next 25 years as it did in the past.

In regard to population, the assumption is made that the rise would be of the order of 27 per cent which would communicate a similar rate of rise to the labour force. The projected increase in population to 1975 is based on the past trends in birth rates, death rates etc. The labour force is also expected to rise at the same 27 per cent and here the Bureau of the Census estimates have been pressed into service. Historically the labour force in the United States of America has constituted a remarkably stable fraction of around 56 per cent of the population, 14 years of age and over. The same criteria when applied to the 1975 population yields labour force of the order of 82 million persons in 1975. It is again assumed that 4 million will be in the armed forces, 7½ million employed in agriculture and about 2½-3 per cent of the total labour force unemployed.

PROJECTED GROWTH OF THE UNITED STATES ECONOMY AND ITS DEMAND FOR RESOURCES BETWEEN NOW AND THE END OF THE CENTURY

Some examples from work in progress on "Resources in the American Future"

The President's Materials Policy Commission in June 1952 made the following major projections on economic aggregates in percentage terms from 1950 to 1975:

MAJOR END - USES & ECONOMIC AGGREGATES

End-use or Aggregate	Approximate percentage growth from 1950 to 1975
Population	27
Labour Force	27
Gross National Product	100
Gross Private Domestic Investment	40
Construction (Total)	30
Residential Construction	15
Private Non-residential Construction	50
Demand for new producers' durable equipment	50
Demand for new consumers' durables	40
Demand for new passenger cars	15
Demand for new appliances	50
Demand for new automobiles and trucks	33-1/3
Number of dwelling units in use	50
Number of automobiles in use	75
Number of trucks in use	150
Demand for new rail-road equipment	100
Demand for new agriculture machinery	—
Demand for new telephone equipment	—
Printing and publishing	75
Paints	50
Shipbuilding	—
Fast-growing uses (aircraft, plastics, insecticides, etc.)	400

RESOURCES FOR THE FUTURE

"The Resources For the Future, Inc." has for five years put in considerable research in order to forecast the probable demand for resources between now and the end of the century. An incomplete picture of some of the work which has been done is given on the graph on page 54. This graph shows how the selected items shown therein are inter-related and how the estimated future demand in regard to the consumption items is closely related with the growth in population and the

general economic growth of the economy. The graph particularly highlights the numerous close relationships which need to be anticipated in a study of this kind. It, however, does not attempt to demonstrate all the inter-relations. For particular items there has been computed a considerable range within which they may lie. The figures given in this graph lie between the high and the low projections in each of the item. For particular items such as cotton, lumber, where substitutes of high order are anticipated in the future, a lot of uncertainty naturally prevails.

The Long-term Growth In National Income: India, U.S.A. and Canada

NUMEROUS RESEARCH workers in the United States have attempted to piece together the available information in regard to the total supply of goods and services since 1799 and a long-term series is now available on a comparable basis. (See Graph on p. 50). The national income of the United States of America rose steeply after 1939. The depression of 1929 had for sometime slowed down the rate of growth. Between 1799 and 1899, the total volume of the United States national income rose in a very slow manner. A real push came with the turn of the century and within 40 years, the total volume of goods and services multiplied 4 times. The overall historical growth of the US national income has been at 3 per cent per annum. The rise in the gross national product has been at more than 4 per cent per annum. In 1960, the gross national product at current prices crossed the \$500 billion mark.

This steep rise in the gross national product has brought about certain structural changes in the US economy. This is made apparent by a study of the percentage distribution of national income by industrial origin. Way back in 1799, the economy of the United States of America was like that of the Indian economy, dependent on agriculture to a very large extent. As much as 40 per cent of the national income came from agriculture while industry provided less than 5 per cent. The steady growth of manufacturing industries necessitated a shift from agriculture to industry. In terms of the total volume of goods and services today, the share of agriculture is hardly 5 per cent while industry contributes 6 to 7 times the total contribution of agriculture. Trade, transport and communication and other tertiary activities count for half the volume of the total national income generated in the United States of America.

The industry-wise distribution of gross domestic product of Canada, for the period 1927 to 2001 A.D. is set out in the Table on page 60. It will be seen that the volume of gross domestic product is likely to rise by nearly 3½ times during the next forty years. At 1949 dollars, the value of Canadian gross domestic product was estimated in 1953-55 at 17.44 billions and it is likely to increase to 61.71 billion dollars, on the average, for the last decade of the century.

The steady growth in the domestic product is likely to be attained by increasing the "business sector" and reducing the agricultural sector. In the period 1927-29, the share of agriculture in Canada's gross domestic product was 23.4 per cent. It dwindled to only 12.7 per cent between 1953-55 and if the present trend is continued, it might be reduced to nearly 5-6 per cent in the next 40 years. It is the "business sector" which has the possibilities of growth and will account for 87.1 per cent of the total gross domestic product as against 77.1 per cent in the period 1953-55.

A projection which has been worked out for the Indian Union upto the end of the present century follows the same pattern. It is anticipated that, whereas at present the Indian Union receives half of its national income from agriculture, 40 years from now the contribution of agriculture will be reduced to one-third of the total size of the national income. Industry, which forms 10 per cent of the total national income today will rise to about 25 per cent, thus leaving about 40 per cent for transport, communication, services and other miscellaneous tertiary activities. This is illustrated in the graph on page 49 and table on page 60.

Per capita national income in the Indian Union at the end of the present century is estimated to be Rs. 1,157 at 1952-53 prices—nearly four times the present level. The total volume of national income is estimated at 913.9 billion rupees—nearly seven times the estimated level in 1960-61. In terms of income per worker, the picture is more encouraging showing a rise from about Rs. 800 to about Rs. 3000 per annum. These results are summarised in the table below:

Year	Population (Mlns.)	Labour Force (Mlns.)	National Income (Rs. blns.)	Per Capita Income (Rs.)	Income per worker (Rs.)
(At 1952-53 Prices)					
1960-61	431	162	131.1	304	809
1970-71	528	194	209.8	397	1081
1980-81	608	239	346.2	569	1449
1990-91	693	272	571.2	824	2100
2000-2001	790	310	913.9	1157	2948

In terms of dollars the per capita income works out to a little more than 200, which means that the per capita income in the Indian Union in 2000 A.D. will be lower than even the present level in the United States and that the gap between the two countries would certainly widen in the future.

Emphasis has to be laid not on the gap between the per capita incomes of the two countries but on the fact that 40 years from now the Indian economy will have broken through the clouds of poverty. The progress of the economy would be automatic because by that time the essential characteristics of economic growth will have been attained. Great changes in technological research would have been acquired. The primitive modes of agriculture, industry and transport would have by that time become a thing of the past and the total volume of goods would steadily rise because of the increase in productivity per-man-hour.

The technological changes brought about by industrialisation will not only increase the productivity of

(Continued on page 60)

* Gross Domestic Product.

the organised industry but will also employ an ever-increasing number of the labour force. The fear that technological changes would throw vast numbers of labour force into the pool of the unemployed is founded on wrong premises. In the West as well as in the United States, it has been proved that the increase in industrialisation is accompanied by a rise in the standard of living of the worker which in turn exerts

pressure on the industrial structure because of the demand for new types of goods and services. The arrival of the mass market creates such a pressure on the economy that it becomes impossible to cope with the multifarious demands of the prosperous community. Thus, 40 years from now the Indian economy will have the capacity to meet the demands of the people for goods and services of new types and tastes.

INDIAN UNION: SECTOR-WISE DISTRIBUTION OF NATIONAL INCOME

(At 1952-53 Prices)

(Rs. Billion)

Sector	1960-61	1970-71	1980-81	1990-91	2000-2001

N.S.I.C. FORGES AHEAD...

** Contracts valued at approximately Rs. 8 crores have been secured by the small units with the assistance of the Corporation.

** About 4,125 machines both imported and indigenous worth over Rs. 3.8 crores have been supplied to small units on easy instalment payment basis.

** Besides exporting leather footwear and stockinette valued over Rs. 176 lakhs, small scale industries products valued over Rs. 50 lakhs have been marketed under the various internal Marketing Aid Schemes of the Corporation.

** Factory buildings costing approximately Rs. 75 lakhs in the Industrial Estate at Okhla (Delhi) and Naini (Allahabad), have already been constructed and expansion programme of the former estate estimated to cost Rs. 45 lakhs is under execution.

** A Prototype Production & Training Centre at Rajkot has already been set up; 75 per cent of the work of construction of workshop buildings for another such Centre at Okhla, has also been finished. These Centres will impart training to artisans and develop prototypes of machine tools for production on commercial scale by small scale units.

Do you own a small scale unit or wish to start a small scale industry? You can also avail of the benefits of our Schemes.

Please write for details.

India and North America: Agriculture Wide Contrast

THE Indo-Gangetic plain is not less fertile than the north-central and the western States of the U.S.A. or Canada. Nor is the soil of berar area in any way inferior to the land of the cotton belt of the United States. The Mahanadi and the Godavari deltas are as productive as those of the Mississippi and Alabama rivers. India has nearly 160 million hectares of land under cultivation against 188 million hectares in the United States. Yet India is a net importer of food-grains, while the U.S.A. is known as the 'bread-basket' of many a nation in the 'free world'. India also does not export quantities of agricultural produce on anything like the scale on which the United States does. Nor has Indian agriculture to support such a vast industry as the American agrarian economy has to do. No doubt, India's population is nearly 2.4 times that of the United States, but per capita consumption of food in India is only half than in the U.S.A. and per capita consumption of industrial goods made from raw materials supplied by agriculture even less.

What accounts for this vast contrast in agricultural output in India and the United States, especially when there is not much difference in area under cultivation and fertility of soil in the two countries? An

attempt is made in this piece to provide an answer to this crucial question and to fix the period in U.S. economic history in which the American agriculture was approximately at the same stage of development at which Indian agriculture is today.

An attempt is also made here to forecast the demands which the Indian agrarian economy will have to meet upto the year 2000 A.D. It is obviously hazardous to project the demand pattern of all the agricultural products during the next forty years, for the indeterminate factors are far too many. So estimates have been prepared primarily so far as our food requirements are concerned. About the expected demand for other agricultural products projections are only broad in nature.

Having thus set the minimum targets of production of various agricultural commodities for the next four decades, an attempt is made to lay down a programme how we should plan our agricultural development. The way U.S. agriculture has developed, especially since the turn of the twentieth century, has the most valuable moral for us. It can be the beacon light in our determination and pursuit of achieving the prosperity that America enjoys today.

Farm Yields in India and North America

HOW DOES the present-day Indian agriculture compare with that of the United States and Canada? Tables A-1 to A-6, showing the yields of principal crops in the three countries, should give an idea of how backward agriculture in this country is compared with the agrarian economy of North America.

As is evident from table A-1, India last year had nearly 12.75 million hectares* of land under wheat cultivation and produced only 9.89 million metric tons† of the commodity. The United States had about 21.45 million hectares under this crop and produced 36.67 million metric tons. In Canada, 11.25 million metric tons of wheat were produced in 1959 on an area of about 9.33 million hectares. The average per hectare yield of wheat in India thus works out to nearly one-half the yield in the United States and Canada.

Even though rice cultivation is not so widely practised in the United States (Americans generally eat wheat) as it is done in India, yield of this commodity per hectare there is nearly three times what it is in this country. Rice cultivation in the U.S.A. is restricted to about 575 thousand hectares of land on which in 1958 an output of 2.01 million metric tons was raised. In India nearly 33 million hectares of land are sown with paddy every year and the total production ranges around 30 million metric tons.

The difference in the yields of coarse grains (see table A-2) is even more pronounced. In the United States in 1958 as many as 96.55 million metric tons of maize were raised on a cultivated area of about 29.67 million hectares, while India produced only 3 million metric tons from an area of 2.2 million hectares. Canada in this year produced 759 thousand metric tons of maize from 202 thousand hectares. The Canadian

and the U.S. peasants thus raise nearly 4 to 4.5 times maize per hectare than the Indian agriculturists do.

The unit area yield of barley in India is slightly less than one-third its yield in the U.S.A. and about one-

Acreage under pulses is not much in the United States and Canada. The vast difference in the yield per hectare there and in India is, however, apparent from the table in column 1.

* Production of cotton is in terms of lint and in thousand bales of 177.8 kgs. each.

† Production of jute and mesta is in terms of dry fibre and in thousand bales of 181.4 kgs. each.

The yield pattern of other crops also unfolds the same story. In the United States 4.79 million hectares of land were put under cotton in 1958 and they yielded 2.51 million metric tons of this fibre. India during this year produced only 837 thousand metric tons from an area of 8.02 million hectares. In the United States in 1958, thus, nearly 5 times as much cotton was raised from one hectare of land as was done in India.

In 1959, the U.S.A. had (Table A-4) 666 thousand hectares of land under groundnut cultivation on which a production of 722 thousand metric tons was raised. India in that year produced 4.46 million metric tons of groundnuts from an acreage of 6.19 million hectares. Linseeds output in India amounted to 432 thousand metric tons from 1.59 million hectares of land, as against 577 thousand metric tons from 1.27 million hectares in the United States and 450 thousand metric tons from 0.97 million hectares in Canada.

Production of cottonseeds and rapeseeds in India in 1959 was 1.36 million metric tons and 0.82

BEST TO GIVE BEST TO GET

Take just one convenient stop for all your shopping : the nearest Bata store. Here you'll find a cosy selection of footwear—right for everybody, for your family and your friends. Bata shoes make the most welcome of gifts, for they give comfort and pleasure the whole year round.

MAJ.58.11A

Approved Suppliers to State & Union Governments and in Rate Contract with DGS&D.

KERALA**MARCHES****AHEAD :.....**

The State Government runs several industrial concerns for the people's benefit and prosperity.

Among these concerns are :—

1. TRAVANCORE RUBBER WORKS, TRIVANDRUM.

Manufacturers of quality rubber goods for all purposes :—

- i) Industrial.
- ii) Automobile.
- iii) Surgical and Laboratory.
- iv) Cycle.
- v) Foot-wear.
- vi) Toys and Materials for domestic use.

LATEX CUSHIONS A SPECIALITY.

2. TRAVANCORE PLYWOOD INDUSTRIES : PUNALUR.

Manufacturers of high-class Tea Chest Panels, Chair seats Battens, Commercial size panels and Decorative panels.

3. GOVERNMENT CERAMIC CONCERNS, KUNDARA.

Producers of India's superfine China Clay. Specialists in high-class crockery and electrical, and refractory porcelain.

4. KERALA GOVERNMENT CERAMICS, KUNDARA.

New concern started for production of high-class crockery and insulators.

5. GOVERNMENT OIL FACTORY, KOZHIKODE & SHARK LIVER OIL FACTORY, TRIVANDRUM.

Manufacturers of Adamin (Concentrate) and Shark Liver Oil—Vitamin supplements for children, mothers and convalescents.

SEA-GOLD-BLENDED SHARK LIVER OIL—The full complement of Vitamins A & D is ensured in this preparation at a low cost.

6. KERALA SOAP INSTITUTE, KOZHIKODE.

Makers of high-class toilet, washing, medicated, shaving and other kinds of soaps.

7. GOVERNMENT HYDROGENATION FACTORY, CALICUT.

The only vanaspathi factory in the public sector.

8. KERALA GOVERNMENT CYCLE RIM FACTORY, TRIVANDRUM.

A new venture in Industrial Development—High quality component for the "poor man's car".

(INSERTED BY THE DEPARTMENT OF INDUSTRIES & COMMERCE, KERALA)

million metric tons respectively from an acreage of 7.79 million hectares and 2.9 million hectares. The United States produced 5.43 million metric tons of cottonseeds from 6.1 million hectares; production of rapeseeds there is only negligible. Canada produced 81 thousand metric tons of rapeseeds from an area of 86 thousand hectares.

Average per hectare yields of oilseeds crops in North America, thus, work out to approximately 1½ times those in India.

Among "other crops", tobacco and sugarcane are the only farm products that are grown in both India and North America. In 1958, India produced 256 thousand metric tons of this commodity from a cultivated area of 375 thousand hectares. The United States and Canada in this year produced 787.5 thousand tons and 89.5 thousand tons respectively from an acreage of 436 thousand hectares and 54 thousand hectares. In North America, thus, they grow on one hectare of land nearly 2½ times as much tobacco as we in India do. Yield of sugarcane in the United States, however, is not much more than in India.

YIELDS IN THE PAST DECADES

Though per unit area yields of various crops today are substantially higher in the United States and Canada than the ones obtained in India, the difference was not so great only about thirty years back, if, of course, allowance is made to the fact that the Indian soil had been depleted of its fertility by cultivation through ages, while most of the land in Canada and the U.S.A. had been under farming for only a century or so. As table A-6 shows, wheat yield per hectare in India was 890 kilograms before World War I, 750 kilograms in late twenties and 760 kilograms in mid-thirties. The unit area yield of wheat in the United States during the three corresponding periods was 1,080 kilograms, 1,040 kilograms and 960 kilograms respectively. In Canada, the yield was 1,460 kilograms, 1,370 kilograms and 780 kilograms respectively during the three periods. As regards maize, India produced in late twenties just about half the quantity that was raised from one hectare of land in the United States. Rice yield too at that time was slightly more than one-half. So was the yield of cotton.

Sources: The Conditions of Economic Progress by
Colin Clark; F.A.O. Production Yearbook
1959; Monthly Abstract of India (C.S.O.)

An interesting fact that emerges from this table is that while unit area yields of all the four crops — wheat, maize, rice and cotton — had been going down in India right upto the year 1951-52, when the First Five-Year Plan was launched, they were more or less stationary, except in the case of rice, upto 1925-29 in the United States; in Canada wheat yield, however, had been decreasing upto this period. In early thirties, the yields of wheat, rice and maize went down slightly in the United States too, presumably due to the Great Depression which hit the agricultural economies most. But they recorded a smart recovery during World War II and thereafter. Cotton yields, of course, started moving up in the United States, even during the period of Depression.

Judged from the trend in crop yields per hectare, as indicated above, Indian agriculture in early fifties,

when planning started in this country, was more or less at the same stage of development at which the United States and Canadian agriculture was in 1940's. If farm yields in North America went up considerably during World War II and the years following it, under the impact of huge demand, especially for foodgrains, emanating from West European countries — American agricultural development in the previous few decades had become substantially dependent upon exports of surplus farm product, particularly to the Continent of Europe, which induced the farmers to go in for more and more improved methods of cultivation — Indian agriculture, undoubtedly, has received great stimulus from the planned development that has been undertaken in this country during the past ten years. The increase in per capita income, though modest, generated by the first two Plans, and the rising tempo of industrial activity, have created in India a growing market

but
we know
where
we're
going...

Sea and sky and sand...and fringing the shore the swaying palm trees. A scene of timeless beauty, and incidentally, one of nature's most efficient distribution set-ups.

The palm tree casts its fruit into the open sea to be carried away with the ebb tide, and to be washed up again on some distant shore, so that one day, there will be palm trees there, too.

DISTRIBUTION is our business too. But we at Voltas have this advantage over nature...we know where we're going! Nothing is left to chance. No matter where our

customers are, they are certain of getting the goods and services they require.

Voltas have, over the years, built up a highly adaptable and trusted distribution system to move goods manufactured anywhere in the world, to anywhere in India.

Our stocks-sales-service-engineering organisation is nation-wide, and covers every important distribution and consumption centre. Voltas give you...

What is wanted • Where it's wanted • When it's wanted

for agricultural products. The Indian peasant has obviously come to realise this and is changing his outlook as is evident from his gradually taking to improved methods of cultivation.

The annual rate of increase in total farm output in India today — about 4 per cent — compares favourably with the annual growth in agricultural production in the United States in 1940's as is clear from the following graph:

GRAPH A-1

TOTAL FARM OUTPUT IN U.S.A. (1910-1959)

LIVESTOCK YIELDS IN AMERICA

Not only have farm yields been going up in North America during the past two or three decades, there has been also a distinct improvement in the yields of livestock. This is apparent from the graph given below:

GRAPH A-2

LIVESTOCK PRODUCTION IN U.S.A. PER BREEDING UNIT OF LIVESTOCK

Milk yield per cow in the United States in the recent years has been around 6,200 lbs. per annum,

while in India average output per milch cattle is only about 500 lbs. That there has been not much improvement in milk yield per cattle in India in the recent years is obvious from the following table:

TABLE A-7

OUTPUT OF LIVESTOCK PRODUCTS

(In thousand metric tons)

Country	Milk		Meat(a)	
	1948-52	1958	1948-52	1958

Figures in brackets relate to the period January-June, 1960.

a. Includes beef, veal, pork, mutton, lamb, edible offal, poultry, horse and other animal meat.

† Relates to 1956.

* Partly estimated.

During the five years 1948 to 1952, India on an average was producing 17.49 million metric tons of milk per annum. In 1956, it produced 17.86 million metric tons. The number of milch cattle in the meantime went up by about 4.5 per cent, as is evident from table A-8.

Indians generally not being meat-eating people, not much attention is paid in this country to the development of meat yielding capacity of cattle. In the United States, as in most of the European countries, constant efforts are being made to increase meat yields as well. An instance of this fact is the rearing of pigs there on scientific lines.

The U.S. Agricultural Revolution

WHAT ARE factors that have contributed to the increase in farm and livestock yields in North America during the past twenty-five years? These factors are almost common to the United States and Canada. So they are discussed here as they have operated in the U.S. economy.

"Land butchery" — the process of cultivation of land carelessly for some time and then giving it up when its fertility declined — had come to an end in the United States by about the middle of nineteenth century. Thereafter, with good arable land becoming scarce, U.S. peasants held to their already acquired lands and tried to raise production by effecting improvements in the methods of cultivation. The great revolution in transport that came during these years linked the United States agricultural economy to the European market. The true impact of this, of course, was felt during World War I, when Western Europe became all the more dependent on American farm output. This great upsurge in demand was met by U.S. peasantry more by extension of cultivation to the semi-arid areas west of the 98 meridian than by raising in any substantial measure the yields from land already under cultivation.

This process came to an end by 1920. Since then not much extension in area under cultivation has taken place in the United States; more and more attention has been paid to increase yields per unit area.

There have occurred during the past three decades four major developments in the U.S. agrarian economy which have led to nearly doubling of farm yields. They are: (1) increased use of tractors and other farming machines; (2) increased use of chemical fertilizers; (3) expansion in irrigation facilities; and (4) introduction of hybrid maize and commercialization of soybeans cultivation. The first three factors have aided in raising farm yields in general, while the fourth one has helped in boosting corn yields and production of meat and milk.

USE OF LABOUR-SAVING DEVICES

The use of labour-saving devices in U.S. agriculture started as long back as the first half of the last century. With vast tracts of land waiting for being brought under cultivation by a population by no means large, this, of course, was a natural development.

The early years of the nineteenth century was a period of the axe and the hoe in U.S. agrarian economy. It was a period when the American farmer was at work behind the plough leisurely drawn by the slow-moving ox. Oxen furnished the chief draft power for ploughing in the U.S.A. in the first quarter of the nineteenth century. In 1830's, however, the ox started yielding place to the horse when times warranted speedier cultivation; by these years there had occurred in the off-the-coast areas of the United States a marked shift from subsistence to commercial farming, caused by the emergence of town life, consequent upon development of industry. The process of the horse taking over from the ox as draft animal for ploughing was facilitated by the improvements effected in this period in farm implements; lighter ploughs and harrows, reapers and threshing implements had been developed by the American genius by this time.

These mechanical innovations were perfected during the latter half of the nineteenth century and were in widespread use in U.S. agriculture at the turn of the present century. At this time another far-reaching development took place. The internal combustion engine had been invented and steam started substituting animals in many farming processes.

TRACTORISATION

By 1920, tractors were in use on farmlands in the United States in quite a good number. But their widespread use was delayed due to two reasons. The tractor of that time was not an all-purpose one and also it was too expensive (\$4,000 to \$5,000) for the average

"What wonderful tea!" said my sister-in-law, Kamala, whom I was meeting for the first time. I breathed a sigh of relief for I was not a little nervous about Kamala's visit.

"Your bride's not only pretty, Ramesh-bhai, she has a magic touch with tea" said Kamala to my husband.

"Oh, it's no magic at all!" I said. "I never serve anything but Brooke Bond's Supreme Tea... by far the best that one can get and it's not expensive at all. The very least I can do for honoured guests like yourselves!"

Light yet full-bodied, Brooke Bond's Supreme Tea is the finest achievement of people who have been blending superior teas for over 60 years.

farmer to buy. Its cost of operation was also pretty heavy; it required 1,500 to 5,000 lbs. of coal and 12,000 to 25,000 lbs. of water for about 10-hour operation.

The substitution of gasoline as fuel in tractors, perfection of pneumatic tyres for them, invention of attaching implements and their large-scale production since the twenties have increased their deployment in US agriculture. Today, there would be found only a small number of farms in the United States where ploughing and other agricultural operations are not carried on by means of tractors and their attached implements. In 1958, there were 4.75 million tractors in use in the USA—practically one in each of the 4.8 million farms in the country—against 3.8 million in 1951, less than 1.5 million in 1939 and about 250,000 in 1920.

The use of combined harvester-threshers in U.S. agriculture has also gone up appreciably in the past ten years. In 1951, there were only 887 thousand harvester-threshers in use in the United States. In 1958, their number rose to 1.06 million. As table A-9 shows, the U.S.A. is the country which leads in the world in the use of combined harvester-threshers.

USE OF CHEMICAL FERTILIZERS

The second factor that has helped in raising farm yields in the United States during the past twenty-five years, more particularly since the end of World War II, is the increased use of chemical fertilizers. Artifi-

What a change in 50 years!

Electric lights are fast replacing kerosene lamps, modern buses ply where bullock carts once were the only means of transport, industries are springing up everywhere...

In bringing about this transformation, metals have played a vital part. Aluminium, for instance, is fast replacing other metals and wood, in industry and the home. Regarded with little favour only twenty years ago, aluminium has today become the engineer's favourite light metal. It is used in the manufacture of a wide range of products from structurals and window-frames to foil and collapsible tubes. In the form of paint, aluminium provides protection against corrosion... is attractive in appearance.

The wider acceptance aluminium enjoys in the country today is largely due to the ceaseless efforts of Indian Aluminium, pioneer and leader of India's aluminium industry. Indian Aluminium today accounts for almost 90% of the country's production and is helping India attain self-sufficiency in aluminium and aluminium products.

cial fertilizers appeared on the American scene pretty late, though they had passed the experimental stage around 1875 and were in widespread use in some of the advanced countries of Europe — the United Kingdom, Germany, the Netherlands, Sweden and Denmark — before World War I. The slow application of chemical manures in U.S. agriculture in the first quarter of the present century is probably explained by the fact that fertility of soil in most parts of the country had not been depleted so much by that time.

Chemical fertilizers became increasingly in demand in the United States during and after World War II which produced tremendous upsurge in demand for the American farm produce. During the War, the agrarian economies of many West European countries were emaciated by the onrush of Hitler's forces and maintaining of Allied armies in far-off theatres of War was to a great extent dependent on supplies from the U.S.A. American industry was also expanding fast during this period.

The availability of chemical fertilizers, however, was only limited in the United States at that time as indigenous production was not so large and imports too could not be effected to any great extent. Only about 1.3 million metric tons of artificial fertilizers were used per annum, on an average, by U.S. agriculturists during the five years to 1939.

As availability increased, application of fertilizers went up in the United States. By 1950-51, consumption of fertilizers in the U.S.A. increased to about 4.3 million metric tons. By 1958-59, it went up further by nearly 150 per cent to 6.47 million metric tons. The

U.S. agriculturists, however, do not use even today as much quantity of artificial fertilizers per hectare of land under cultivation as the farmers in some other advanced countries do. This is evident from table A-11

Like most of the advanced countries of the world, application of artificial fertilizers in the United States is not confined to any one type of fertilizer; all the three varieties of plant nutrients — nitrogen, phosphoric acid and potash — are being extensively used in the U.S.A. Of the total U.S. consumption of 6.47 million metric tons of chemical fertilizers in 1958-59, 2.35 million tons were nitrogenous fertilizers, 2.23 million tons phosphoric fertilizers and 1.89 million tons potash fertilizers.

EXTENSION IN IRRIGATION

Not much thought had been given to the provision of irrigation facilities in U.S. agriculture in the nineteenth century as well as in the first two decades of the present century, as farming there till the outbreak of the World War I was mostly confined to areas which had sufficient rainfall. Expansion of agricultural activity to the west of 98 meridian during the War, however, necessitated increasing interest to be taken in this field, for these areas were semi-arid as they did not receive timely rainfall in sufficient quantities. The hot climate of this region also did not allow moisture to be retained by the soil for any long period. Around 1920 attempts were made to evolve dry farming techniques for this region, but they proved not very successful. So provision of irrigation facilities was considered to be essential if farming activity was to be fostered in the western States.

Irrigation facilities started to be developed in the United States in right earnest after 1920. By 1949, as many as 26 million acres of land had been brought under irrigation, mostly in the seventeen western States. Compared to 1939, area under irrigation in the U.S.A. has increased by nearly 43 per cent and today roughly 30 million acres of land are irrigated in this country.

HYBRID CORN

While the above-mentioned technological changes were revolutionising the U.S. agrarian economy, two momentous developments took place in crop technology. These were the perfection of hybrid corn and commercialisation of soybeans production. Hybrid corn was introduced, after years of experimentation, in about 1926. It increased the yield per acre by nearly 20 per cent. Between 1936 and 1946 the acreage planted with hybrid corn increased rapidly — from 2 per cent to 91 per cent of the land under corn cultivation. Soybeans, unlisted in the crop census of 1910, became in 1950's the fifth leading crop in terms of cash sales and sixth in terms of acreage. (Soybeans yield a variety of human and animal food products and are extensively used in plastics manufacture.)

Great improvements have been effected in the past two decades in other seeds as well.

PRICE SUPPORTS

Growth of tractorisation, increased use of chemical fertilizers, expansion in irrigated area, introduction of hybrid corn and commercialisation of soybeans cultivation, of course, are the primary factors that have led to increase in farm yields in the United States in the past twenty to twenty-five years. But mention must also be made of some other factors that have contributed in their own way to the raising of farm output during this period. Along with the increase in the use of chemical fertilizers, consumption of insecticides and other chemicals has gone up which has helped in eradicating plant diseases; aerial spraying has been successfully resorted to in this respect. Scientific soil testing is also undertaken in the United States to a greater extent now than it used to be done in the first quarter of the present century.

The increase in farm yields per unit area as well as in total output, however, could hardly be sustained, especially after World War II — when European demand tapered off, consequent upon rapid advance in agriculture there — but for the fact that industry was expanding fast and the U.S. Government took energetic measures to support farm prices. Surplus produce was siphoned off by the Government at support prices and used for the purpose of extending aid to the needy countries like India, either in the form of outright gifts or on deferred payment basis.

LIVESTOCK YIELDS

The rapid increase in livestock yields in the United States during the past three decades has been the result of two major developments. Firstly, agricultural scientists have made giant strides in livestock husbandry and evolved methods to improve cattle breeds. Secondly, vastly increased output of corn has provided nutritious feed for cattle.

Greater attention is now being paid in the United States than ever before to the protein, vitamin and mineral requirements in meat, dairy and poultry feeding; more recently, they have adapted antibiotics and hormones to animal nutrition. Selective breeding, partly through artificial insemination, has raised pro-

ductivity of livestock in all directions. The swine and poultry industries have benefited from disease control.

AGRIBUSINESS

The transformation that U.S. agriculture has undergone in the recent past has resulted in a new development which might, in the years to come, bring about another revolution in the American agrarian economy. Of late, there has been a closer integration of business and farming and this is remaking the U.S. family farm in the image of a small business undertaking. The individual farmer is becoming a link in the chain of suppliers and processors for the big city corporations which deal in farm products. The essence of this "agribusiness" is that farmers become contractors, turning out products at known costs and prices, instead of producing for a free market with a free price system. The most to benefit from this process, so far, have been the agriculturists who combine poultry, beef and pork supply business with farming operations.

In nutshell, what is the most important development that has revolutionised agriculture in the United States? As the following table, which sets out a comparison of the broad categories of farm expenses in 1910 and 1950, shows, it is the increased mechanisation and application of modern technology to both the farm and the livestock, which has resulted in more than quadrupling the gross farm income in the U.S.A. in a period of barely 40 years. No allowance has been made in these calculations for changes in price level. But even then the figures speak eloquently. Outstanding, indeed, is the increase in expenses on account of motor vehicles and purchase of seeds, livestock and fertilizers.

TABLE A-12

FARM PRODUCTION EXPENSES, BY CLASSES, UNITED STATES, 1910 AND 1950

Item	(In million \$)

KERALA'S THIRD PLAN

ANOTHER BIG STEP FOR A RICHER
AND MORE PROSPEROUS KERALA -

- * to raise national income
- * to achieve self-sufficiency in food
- * to expand small-scale, village and large-scale industries.

To tackle the special problems of the State like high density of population, growing food deficit.

- * acute unemployment
- * the agrarian nature of State's economy.

Industrialisation, the only solution for Kerala's Chronic Problems.

Kerala with her unlimited natural and manpower resources offers wide scope for establishment of industries in all sectors.

Government assure peaceful industrial climate and assistance by provision of land, supply of cheap power and financial participation in appropriate cases.

Modern Technology And Indian Agriculture

COMPARED TO the progress that the United States and Canada, as also the other advanced countries of the world, have made in the use of modern technology to increase farm and livestock yields, the progress registered in India so far is far from encouraging. In many parts of India, the same age-old farming practices are still in vogue; most of the land continues to be ploughed by wooden ploughs drawn by oxen. The methods of cultivation, in this country, however, have begun to be changed of late in the light of the experience of the more advanced countries, but the pace of change is only slow as yet.

Mechanisation has been resorted to in Indian agriculture only to a limited extent. Though there are nearly 30,000 tractors in use in this country today, they are to be found only in areas colonised after World War II (the Tarai region), in farm-lands where cultivation is carried on on co-operative basis, on State model farms or on large estates where the educated among the agriculturists have taken to farming. Elsewhere tractorised cultivation is hardly to be seen. The reasons for this, however, are not far to seek. Majority of the agriculturists in India are poor and have small and uneconomic holdings (unlike the United States where the peasantry is prosperous and the size of an average small household farm is about 125 acres) which do not permit cultivation by tractors. Moreover, cheap labour is available in abundance.

The use of such improved implements as iron ploughs, seed drills, wheat threshers, paddy weeders, groundnut decorticators and sugarcane planters is likewise restricted in India, the main reasons for this being the poor financial position of the average farmer and scarcity of steel.

APPLICATION OF CHEMICAL FERTILIZERS

The need to restore to the soil its fertility by application of manures has been felt in India for a long time. But it has been only in the recent past that artificial fertilizers have started to be made use of in this country. Application of chemical fertilizers in India today is far behind their use in the United States, Canada and the other advanced countries of the world. India consumed in 1958-59, per hectare of cultivated land, 1.8 kilograms of all the three types of artificial manures as against 14.6 kilograms in the United States, 233.3 kilograms in Japan, 202.7 kilograms in the Netherlands, 56.4 kilograms in France and 36.3 kilograms in Italy.

Not only the total quantity of artificial fertilizers used in India is small, the proportion in which the three types of chemical manures are used in this country is also improper. Whereas all the three plant nutrients are extensively used in advanced countries, in India nitrogenous fertilizers account for the bulk of the consumption; the use of phosphoric and potash fertilizers is far too behind.

The late use of chemical fertilizers in India as an aid to increase farm productivity is due primarily to three factors: (1) the prejudice peasants here had till lately against their use; (2) low level of literacy in the country-side; and (3) the weak economic position of the farmer. Due to concerted efforts that have been made during the past ten years to popularise the application of chemical fertilizers, the prejudice of the Indian peasant against their use is fast disappearing. The financial position of the farmer too has improved

as a result of the first two Plans. These two factors have helped considerably in increasing the use of chemical manures in India as is evident from the following table.

TABLE A-13

CONSUMPTION OF CHEMICAL FERTILIZERS IN INDIA SINCE 1951

(In '000 metric tons)

Year	Nitrogenous fertilizers (Ammonium Sulphate)	Phosphatic Fertilizers	Potash Fertilizers
1951-52	286.9	7.0	7.8
1952-53	281.0	4.7	3.2
1953-54	333.2	8.3	8.7
1954-55	470.0	15.0	14.5
1955-56	523.2	13.0	11.0
1956-57	650.8	15.9	11.1
1957-58	N.A.	21.9	15.8
1958-59	812.8	27.6	16.8
1959-60	1,117.7	39.5	29.5

Source: Report of the Fertilizer Distribution Enquiry Committee, Ministry of Food and Agriculture.

Nitrogenous fertilizers are in great demand by the Indian peasantry today and their use in the past two years has been hampered by restricted supplies. For

instance, demand for these fertilizers in 1958-59 was estimated around 1,524 thousand metric tons, while only 812.8 thousand metric tons were made available for distribution. In 1959-60 demand increased to about 1,910 thousand metric tons, while availability was not more than 1,117.7 thousand metric tons.

IRRIGATION AND SEEDS

Far greater use of technology in Indian agriculture, however, has been made in respect of provision of irrigation facilities and seeds. Giant dams have been built in the past few years, impounding many a river to provide water for irrigation and production of electricity. The number of medium and minor irrigation

works is also multiplying fast. Nearly 70 million acres of land are expected to be brought under irrigation by March next, as against 51.5 million acres in 1950-51.

Great strides have been made in the past few years to provide improved varieties of seeds to the agriculturist. In the Third Five-Year Plan it is proposed to intensify efforts in this direction and cover by improved seeds nearly 90 per cent of the total area under cultivation. Crop-wise, the area which is proposed to be covered by improved seeds by 1965-66 is shown in table A-14.

Increasingly more attention is also being paid to soil conservation and plant protection.

LIVESTOCK AND TECHNOLOGY

Though ambitious plans have been prepared to improve the quality of cattle in India, the success achieved so far has not been significant. Partly it is due to the fact that implementation of these programmes has lagged behind. The huge number of unnecessary cattle which the Indian soil has to support has also been a hindrance in the way of the development of Indian animal husbandry on scientific lines.

INDIA TWENTY YEARS BEHIND USA

Judging from the application of technology to Indian agriculture, one is inclined to infer that the agrarian economy of India today is perhaps at a stage of development at which US economy was in the latter half of 1930's. This inference read with the observation made on page 73 leads to the conclusion that agricultural development of this country is about 20 years behind that of the United States.

WHAT SECRET POWER DID THIS MAN POSSESS?

BENJAMIN FRANKLIN
(A Rosicrucian)

WHY was this man great? How does anyone — man or woman — achieve greatness? Is it not by mastery of the powers within ourselves? Know the mysterious world within you! Attune yourself to the wisdom of the ages! Grasp the inner power of your mind! Learn the secrets of a full and peaceful life!

Benjamin Franklin — like many other learned and great men and women — was a Rosicrucian. The Rosicrucians (NOT a religious organization) first came to America in 1694. Today, headquarters of the Rosicrucians send over seven million pieces of mail annually to all parts of the world. Write for YOUR FREE COPY of "The Mastery of Life" — TODAY. No obligation. Consumption Pattern In India And North America

NOW BEFORE we proceed to estimate the demands that Indian agriculture will be required to meet during the next forty years, it is imperative that we should have at least a rough idea of how standard of living in this country stands in comparison with that in the United States and Canada and also how consumption of major foodstuffs has varied in the three countries in the past few decades; this comparison will provide a good basis for our calculations of future consumption pattern of major food groups in the Indian Union.

Tables A-15 to A-19 reveal that per capita consumption of food (without regard to the type of food consumed) in India is just about one-half of the quantity consumed in the United States and in Canada. In terms of calorie and protein content an average Indian's daily food contains 2,380 calories and 47 grams of protein, whereas an average American's diet contains 3,100 calories and 93 grams of protein. An average Canadian consumes food which gives him 3,110 calories and 95 grams of protein per day.

CHANGES IN DIETARY HABITS IN USA AND CANADA

With the growth in their income and lightening of the chores of their daily work, eating habits of the people of the United States and Canada have changed radically over the past few decades. While the total quantity of food consumed has gone down slightly in the United States and increased somewhat in Canada, there has occurred a marked shift away from the con-

sumption of cereals and potatoes and towards greater intake of fruits, vegetables, fats and meat products "Housewives (In North America) no longer insist that their families eat meat and potatoes for dinner and porridge for breakfast. Salad and juices, especially fruit juices, help vary the diet and improve its nutritive content."

The graph A-3 and the table A-15 show how eating habits have changed in the United States between 1910 and 1958. An average American in 1958 ate slightly less per day than he did in the latter half of 1940's and before World War I. His annual consumption of cereals and potatoes went down from 287 lbs. and 198 lbs. in 1910-14 to 181 lbs. and 129 lbs. in 1945-49 and further to 149 lbs. and 110 lbs. in 1955-58. His intake of dairy products increased from 469 lbs. in 1910-14 to 543 lbs. in 1945-49 and decreased to 534 lbs. in 1955-58. Per capita annual consumption of meat, fish and poultry went up from 150 lbs. in 1910-14 to 158 lbs. in 1945-49 and further to 174 lbs. in 1955-58. Intake of dry beans, peas, nuts and soya products has remained more or less the same, while that of sugar and syrups has increased slightly. An average American's daily diet today (65.8 ozs.) consists of 6.5 ozs. of flour and cereal products, 0.7 ozs. of dry beans, peas, nuts and soya products, 4.8 ozs. of potatoes, 20.5 ozs. of dairy products and eggs, 7.6 ozs. of meat, fish and poultry, 2.9 ozs. of butter, fats and oils, 17.4 ozs. of fruits and vegetables, 4.7 ozs. of sugar and syrups and 0.7 ozs. of coffee, tea and cocoa.

Issued by the Director of Information & Publicity,

A S S A M.

Similar trends have been witnessed in Canada. Per capita annual consumption of cereals and potatoes there has gone down from 402 lbs. to 311 lbs. between 1935 and 1955. Intake of fruits and vegetables has gone up from 140 lbs. to 305 lbs., of meat and eggs from 169 lbs. to 203 lbs. and of fats and oils from 16 lbs. to 29 lbs. Consumption of dairy products has, however, remained more or less the same all these years. An average Canadian's diet today (61.5 ozs.) consists of 7.3 ozs. of cereals, 6.4 ozs. of potatoes, 4.7 ozs. of other starches, 7.4 ozs. of fruits, 6.0 ozs. of vegetables, 1.3 ozs. of oils and fats, 19.6 ozs. of dairy products (including butter), 6.1 ozs. of red meat, 1.2 ozs. of poultry meat and 1.5 ozs. of eggs.

NO APPRECIABLE CHANGES IN INDIA

No appreciable changes appear to have taken place in the dietary habits of the Indian people during the past 15 years for which some authoritative data is available. An average Indian today consumes more or less the same quantity of cereals as he did some 15 years ago. His consumption of pulses, sugar and jaggery has increased slightly, but his intake of oils, vegetables, fruits, milk and milk products, meat, fish

and eggs has gone down from 10.70 ozs. to 7.92 ozs. per day.

TABLE A-17

DAILY INTAKE OF FOODSTUFFS IN INDIA
(Averages: 1935-49, 1955-58)

(In ozs. per capita)

Foodstuffs	N.A.C. Recommended allowance	Mean intake 1935-48	Mean intake 1955-58
Cereals	14	16.62	16.59
Pulses	3	2.26	2.39
Leafy vegetables	4	0.85	0.71
Other vegetables	6	4.10	3.20
Ghee and Oils	2	0.92	0.52
Milk & Milk Products	10	3.31	2.81
Meat, Fish & Eggs	4	0.94	0.47
Fruits (and nuts)	3	0.58	0.21
Sugar & Jaggery	2	0.67	0.71
Total Cereal Foods	14	16.62	16.59
Total non-Cereal Foods	34	13.63	11.02

Source: Nutrition in India (1946-48).

A notable fact that emerges from these comparisons is that while the diet of an average American and a Canadian is rich in nutritive foods, the diet of an average Indian is quite poor. Compared to balanced diet requirements, the food of an average Indian today contains more than the required quantity of cereals and far less the quantity of vegetables, fruits, milk and milk products, sugar and meat.

The clothing pattern in India is, of course, quite different from that of the United States and Canada, firstly because of the difference in climate and secondly due to wide disparities in income per capita. Broadly speaking, an average Indian consumes about one-sixth the quantity of cloth—cotton, woollen and rayon all combined—than an average American or a Canadian does.

BRING MORE POWER
TO THE GRID

An ultimate installed capacity of 200,000 KW at the newly set up Thermal Power Plant at Durgapur and another of 600,000 KW, the biggest ever planned in the East, at the Thermal Power Plant proposed at Bandel, will bring tremendous power to the national Grid. The Kuljian Corporation have been appointed as technical consultants for both these projects of the West Bengal Government.

In India, the Kuljian Corporation operate a fully equipped design and engineering office, offering specialised service and 'know-how' on every aspect of planning, engineering, construction and initial operation. With highly qualified Indian and foreign experts and sustained by Kuljian's diversified experience, the Corporation practise the famous 'Kuljian Method' which has been successfully tested on five Continents in power projects—steam, internal combustion and hydro-electric.

Also consultants in India for:

- Bokaro Thermal Power Station, D.V.C.
- Durgapur Thermal Power Station, D.V.C.
- Bokaro 4th Unit Extension, D.V.C.
- C' Station, Delhi Electric Supply Undertaking
- Barzuni Thermal Power Station, Govt. of Bihar
- Cambay Thermal Power Station, Govt. of Gujarat

Future Demand Pattern In India

THE HIGH standard of living that the people of North America enjoy today is undoubtedly the envy of the Indian people as also of all the other comparatively less developed countries of the world. It obviously sets the targets of consumption which we should try to achieve by 2000 A.D.

India, of course, may not be able to attain in the next four decades the high rate of food consumption that prevails in the United States and Canada today, for the simple reason that there is at present in this country a heavy backlog in the supply of supplementary and protective foods. Moreover, by 2000 A.D., population of India would have gone up by 360 million persons. What, however, we must achieve by then is at least the balanced diet as recommended by the Nutrition Advisory Committee.

ed quantities, India, with cereals production of over 60 million tons in the past two years, would have become self-sufficient so far as staple food supplies are concerned. But that has not been the case as yet and it will not be the case in the next ten to fifteen years.

The deficiency in the supply of supplementary and protective food, at least for another ten to fifteen years, has obviously to be made up by intake of foodgrains in a greater quantity than that recommended by the Nutrition Advisory Committee. Table A-22 sets out the pattern of demand for foodgrains, for the next forty years, on the basis of accelerated demand for them. It has been assumed that at least 17.4 ozs. of cereals and 3.5 oz. of pulses will be required per adult unit per day during the next five years if a modest advance is to be made in the provision of food in terms of calories.

* N.A.C. : Nutrition Advisory Committee.

† Net requirements.

The minimum food consumption requirements of the Indian Union in the next forty years on the basis of balanced diet are set forth in table A-20. Table A-21 gives an estimate of total foodgrains requirements on balanced diet basis. Seed, feed and wastage requirements have been included at the rate of 12½ per cent of total output and those of stock and safety margin at the rate of 10 per cent of total production. Had protective and supplementary foods been available in the requir-

It is not thought to be practicable that an average Indian's diet in 1965-66 will have the required number of calories and adequate amount of protein as recommended by the Nutrition Advisory Committee. So, for the basis of calculation of foodgrains requirements in 1970-71, it has been assumed that a minimum of 17.5 ozs. of cereals and 4.5 oz. of pulses per adult per day will be needed to make the diet a wholesome one.

In the next ten years it is construed that

* N.A.C. : Nutrition Advisory Committee.

consumption of cereals will remain at 17.5 oz. per adult per day, while that of pulses will decline to 3.5 oz. The measures that would have been taken in the meantime to increase the supply of protective and supplementary foods would make it possible to decrease the consumption of pulses.

By eighties it is presumed that supply of fruits, vegetables, milk and milk products and ghee and vegetable oils will be more or less in proportion to the balanced diet requirements. So consumption of cereals and pulses is likely to decline to some extent—not appreciably because some allowance will have to be made for the fact that Indians generally are not meat-

eating people. Consumption of cereals and pulses during this decade has been taken at 17 ozs. and 3 ozs. per adult per day.

In the nineties, supply of supplementary and protective food is expected to increase further. This will result in decreased intake of cereals and pulses. So consumption of these two foodstuffs per adult unit per day during this period has been taken at 16.5 oz. and 2.5 oz. respectively.

To the net consumption requirements have been added the requirements of seed, feed and wastage (at the rate of 12½ per cent of the total output) and of stock and safety margin (at the rate of about 10 per

TABLE A-22

NATURAL KHASI SILLIMANITE

THE SUPER REFRACTORY

Specially suitable for lining furnaces, kilns or tanks, Sillimanite has natural advantages over any other manufactured refractory, bricks or blocks.

With its low thermal expansion at 1600°C, Sillimanite lasts longer and reduces replacement costs. Sillimanite bricks of 8" (or even 6") thickness will give better service, cut down the load on furnace structure, fuel and increase the melting area.

CRUSHED NATURAL SILLIMANITE

Unlike other refractories, Natural Sillimanite needs no calcination before use in ceramics or brick and block making. Sillimanite crushings are extensively used in manufacturing Ceramics for sparking plugs, fuses, etc.

Electric elements for fires, hotplates, immersion heaters, muffle furnaces, etc.

Scientific Apparatus, e.g. Pyrometer sheaths, Crucibles, Extruding Dies.

Sizes Available—

1" 5x5—10x10 mesh.

cent of the total production). The overall demand for foodgrains in India on the above basis thus works out to 109.5 million tons (cereals 91.2 million tons, pulses 18.3 million tons) in 1965-66, 124.0 million tons (cereals 101.4 million tons, pulses 22.6 million tons) in 1970-71, 139.4 million tons (cereals 116.2 million tons, pulses 23.2 million tons) in 1980-81, 151.4 million tons (cereals 128.8 million tons, pulses 22.6 million tons) in 1990-91 and 163.7 million tons (cereals 142.1 million tons, pulses 21.6 million tons) in 2000-2001.

If, however, account is taken of the fact that feed requirements of livestock will go up (especially of the milch cattle) and growing urbanisation will necessitate greater allowance to be made for stock purposes, the

above estimates may prove to be only conservative (provided, of course, population growth maintains the assumed trend).

Now we turn to the likely demand pattern of other agricultural products during the next forty years.

The demand for cotton is closely linked with the demand for cotton textiles. In arriving at any precise future demand for cotton, a reference has necessarily to be made to the probable demand for cotton textiles. In a later section dealing with cotton textiles, estimates have been made in regard to the probable pressure of demand on this industry. It is assumed, for instance, that per capita consumption of cloth may not rise beyond 35 yards at the end of the present century.

On this basis, demand for cotton textiles has been computed, adding to that the demand of yarn from hand-looms and powerlooms and the pressure caused by exports of cotton textiles. Taking all these factors into consideration and employing a rough and ready formula that 1500 yards of cloth are equivalent to a bale of cotton, estimates have been made in regard to the demand for cotton, decade by decade, for the next forty years. As against the present demand of about 6 million bales, it is estimated that demand will rise to 8 million bales in 1970-71 and to about 20 million bales in the last year of this century. How is this demand to be met? Shall we continue to depend on imports to meet our needs? For a long time, it seems, imported long-staple cotton will be needed for manufacturing fine cloth. But imports of superior quality cotton will have to be balanced by exports of our inferior short-staple cotton if we are to become self-sufficient in raw cotton requirements.

JUTE

For any reliable forecast of the future demand for jute goods, an analysis has necessarily to be made of not only the internal sources of demand, but also the world demand for jute goods. Dr. P. C. Bansal, in an article published in The Jute and Gunny Review (June 1960 issue) has made an assessment of the probable future world demand for jute products and India's share therein. He has come to the conclusion that, while new uses for jute are being found out, the threat to our jute manufactures from substitutes is real, and will determine to a large extent the future demand for jute products. Moreover, the latest techniques in bulk handling have also reduced the demand for gunnies. Taking all these factors into account, he has estimated that total demand for jute and mesta in the Indian Union will rise steadily to 14 million bales

in 1980-81. If the growth of economy takes place in the manner it has been visualised, the probable demand for jute and mesta will be in the region of 20 million bales at the end of the century. In other words, between 1960-61 and 2000-01, total output of Indian jute and mesta will have to increase nearly three-fold. Competition from Pakistan and other African countries is anticipated to be severe, but the overall world demand is expected to provide markets big enough for all the producing countries.

TEA

During the last decade domestic demand for tea has increased substantially. From about 7 ozs. in 1948 per capita consumption has steadily risen to about 11 ozs. in 1960. Production of tea has also increased; in 1958 and 1959, it was significantly above 700 million lbs. The setback in 1960 did lower the level of production somewhat, but it is anticipated that output will continue the upward course to meet the demands of both the domestic market and the foreign countries. By 1965-66, production is likely to rise to 850 million lbs. out of which 34 per cent will be for domestic consumption and the rest for exports. Bearing in mind the pattern of growth in domestic consumption as well as the demand from foreign countries, projections have been made which show that by 1980-81 the demand will amount to about 1,350 million lbs., nearly double the present level. At the end of the century, the demand is likely to be about 1,900 million lbs.

SUGARCANE, OILSEEDS, COFFEE AND RUBBER

Estimates have also been made on a rough and ready method, in regard to the future pattern of demand for such important agricultural commodities as sugarcane, oilseeds, coffee and rubber. Results are summarised in the table below:

TABLE A-24

DEMAND PATTERN OF OTHER AGRICULTURAL PRODUCTS (1960-61 TO 2000-01)

Item	1960-61	1965-66	1970-71	1980-81	1990-91	2000-01
1. Fibres

* Excludes synthetic rubber.

An Agricultural Policy For India

SO THE DEMANDS that Indian agriculture will be required to meet, if this country is to achieve in the next forty years anything like the prosperity that North America enjoys today, are stupendous indeed; they call for herculean efforts. But the task is by no means beyond India's capacity. What is required is a strong determination to achieve the goal and the translation of that determination into action.

The way US agriculture has developed during the past few decades has some lessons for us; we will do well to grasp them. The economic systems of both India and the United States are continental in character; both the countries have vast domestic markets for their products, agricultural as well as industrial. Further, in both the countries, an individual's right to own

property is guaranteed under the Constitution. The pattern of development to India, therefore, can very well be similar to that of the United States, especially when India has chosen to tread the path of democracy.

The most important lesson that India has to learn from the United States in the field of agriculture is that if farm and livestock yields are to be raised, there is no other short-cut to achieve this than through massive application of modern technology to both farming and animal husbandry. And there is no escape from increasing yields per unit area and per head livestock in this country. With land resources limited, the growing needs of an expanding population can only be met through higher yields. Increase in population will require shifts in the pattern of land use; land available

TRENDS IN AGRICULTURAL PRODUCTIVITY : 1909 TO 1958

for cultivation will gradually become less. And land can be released from cultivation—especially when it has to meet far greater demands than it does today—only if yields per unit area are pushed up. That has been the process in the United States and elsewhere. It cannot be different here.

GRAPH A-4
SHIFTS IN LAND UNDER CULTIVATION
IN U.S.A.

FERTILIZERS AND PESTICIDES

The only way to increase farm yields in India in the immediate future is through application of more and more fertilizers, pesticides and insecticides. It is heartening to note that realisation has dawned on the Government that import of chemical fertilizers to augment the meagre domestic supplies will pay more than depending on imports of foodgrains, even on PL 480 account, to meet deficit of food in the country. Relentless efforts that are being made to increase production of fertilizers by setting up new fertilizer factories in the country are equally welcome. But, while increasing the availability of fertilizers through greater indigenous production and more imports, attempts should be made to diversify their application. True, nitrogen is the limiting factor of fertility of soil in India. But the Indian soil does react favourably to potash and phosphoric acid when applied in conjunction

with nitrogenous fertilizers. A study made by Potash-chem in Bombay and Madras sometime ago confirmed this.

IRRIGATION AND SEEDS

Along with fostering the use of fertilizers, it is imperative that irrigation facilities should be developed fast and improved seeds should be made available to the agriculturist in the requisite quantity; then only the fullest benefits of use of fertilizers would be derived. The past mistakes of digging distribution channels after the completion of irrigation works have obviously to be avoided. The seeds distribution system has also to be improved; complaints have not been infrequent in the recent past of seeds being made available to the agriculturist sometimes even after the sowing season. The setting up of a separate corporation in the public sector to handle the work of multiplication of seeds and their distribution would be a step in the right direction; the task will only grow in the years to come.

Extension of the package programme for agriculture, under which all the means of agricultural production are provided to the agriculturist in adequate quantities at the right time can also go a long way in raising farm yields. There is also need at present to fix support prices for foodgrains as with the conclusion of the Indo-U.S. food deal last year, the food situation in this country has changed radically. This is necessary to avoid any shift in land from under foodgrains cultivation at least till the time yield per unit area goes up substantially.

MECHANISATION

From the long-term point of view it is essential that we should start thinking in terms of mechanising our agriculture. Tractorisation in India can, of course, progress only slowly. The holdings of majority of Indian agriculturists being small and uneconomic, their financial position being vulnerable and labour being available in abundance in the countryside, resort to

Source: F.A.O. Production Yearbook, 1959.

large-scale tractorisation can be thought of in this country only in the distant future when growth of industry and the tertiary sector would be able to decrease the pressure of numbers on land or when co-operative farming on small and uneconomic holdings becomes the order of the day. In the meantime, efforts should be directed to foster the use of lighter and smaller machines as is done in Japan where size of land holdings is as small as in this country. The Government, it is understood, has already sanctioned the setting up of a unit to manufacture Japanese type farm machines and implements in India in collaboration with a Japanese firm. These machines and implements may be made available to the Indian peasant on hire-purchase basis.

While it is understandable that the tractor can be made use of in Indian agriculture only to a limited extent at least for many years to come, it passes one's comprehension why retrograde steps should be taken to drive it out of use in areas where it has already been harnessed for various agricultural operations. An instance of this is to be found in the decision of the U.P. Government to apply land ceilings on farms in the Terai region. These farms, compact blocks and quite efficiently managed as they are and on which heavy investment and permanent structural improvements have been made, should have remained exempted from the purview of land ceilings according to the declared agrarian policy of the Government. The excuse for breaking up these farms to resettle refugees from East Bengal does not hold water. These refugees could be resettled elsewhere.

The long-term agricultural policy has also to have as its component the bringing of culturable wastes under the plough. There are nearly 21.5 million hectares of potentially productive land which are lying unused in India today. It should be our aim to harness this land for cultivation in the next ten to fifteen years. The difficulties in the way would be many, but they are not insurmountable. The Uppal Committee, which at present is going into the question of utilization of wastelands in India, has already submitted its proposals in respect of reclamation of culturable wastes in the Punjab, West Bengal and one or two other States. The State Governments, which are the primary agencies

connected with this work in this country today, would do well to concentrate their efforts in this direction. The record of some of the States in respect of this crucial activity so far has been far from encouraging. It is hoped remedial measures in these States will be taken soon.

To increase the supply of supplementary and protective foods, it is essential that proper attention should be paid to development of fisheries, poultry, fruit and vegetable gardening and improvement of livestock. In a way this should have top priority in our plans, for if development in these fields lags behind, our dreams of having balanced diet in the next fifteen to twenty years would be shattered. If, on the other hand, supplies of these foods can be increased in a short span of time we can release some land from foodgrains cultivation for growing industrial raw materials.

Not all the supplementary and protective food that we produce today is being utilised fully. Attempts need to be made to make full use of the existing resources through better preservation and transport of these food materials.

The supply of milk and milk products can, however, be increased only if the quality of our milch cattle is improved. The biggest hurdle in the way of improving the quality of livestock in India is the disproportionately larger number of cattle that we have. Religious sentiments of the majority of Indians do not allow slaughter of even the unnecessary and useless cattle, especially of cows. Their number can only be decreased, and that too gradually, by such measures as compulsory confinement of studs kept for natural service, mandatory castration of young ones not required for breeding and compulsory sterilisation of surplus cows and heifers etc. There is need also to reorientate crop pattern so that production of animal feed may be increased. In the United States and Canada, nearly 90 per cent of corn produced goes to feed cattle. That explains the high milk and meat yields of the livestock there. In India this position can arise only when enough food is available for human consumption. Extension of mixed farming can, however, be helpful in this regard in the short-term.

KALINGA TUBES

for
WATER & GAS

Kalinga Tubes is first to manufacture steel tubes and pipes in India — also first to export earning valuable foreign exchange. The company's expansion scheme is well in hand. By 1961 the present rated capacity of 40,000 tons per annum will exceed 100,000 tons. The company expects to manufacture more than 300,000 poles annually.

Industrial Growth—Lessons from American Achievements

MASSIVENESS OF U.S. ECONOMY

Americans spent in 1959, 28,000 million dollars or roughly more than the entire outlay of India's Third Plan, on their clothing and about 10,000 million dollars, i.e., slightly less than the first Five-Year Plan outlay, on personal services ranging from cosmetics (\$2,500m) to dry cleaning expenses (\$1900m). The massiveness of such an economy appears on first sight something which is on too fantastic a level for any other country to aim at. For India, whose national income is roughly 6 per cent of America's can American experience be of any practical utility?

More than the present, the future outlook for Americans is so spectacular as to be for us breath-taking. Within the next ten years American Gross National Product is expected to increase by 50 per cent touching, what appeared before an unlikely achievement, of 750 million dollar level. Even this level is destined to be one of a short period glory, only to be surpassed by the two trillion economy which is over the corner by the turn of this century. Thus, it is more the causes that are to be probed rather than the physical divergence, for the former may provide pointers to things that could be emulated while the stupendous physical quantities can help in no way but leaving one in awe.

Such spectacular rises in the United States economy are essentially the results of three factors. Firstly, the technological revolutions in both the processes of production as well as management and sales, that contributes so much for a better and more economical use of materials (which are bountiful for America to start with, but which are not likely to last at this rate of depletion) and secondly, the continuous increase in labour productivity, which again has touched during 50's the unprecedented 3 per cent annual increase. Lastly, but by far the most important differential advantage, America has and will have over the other industrially advanced countries, is the existence of mass markets at home, enabling firms to put in costly programmes for developing the first two contributive factors by large research outlays and larger capital outlays.

It is the last factor coupled with the equally abundant supply of raw materials that makes it possible for India to aim at perhaps with an equal success, such hopeful future, bountiful as well as lasting. The bounty of American resources is mainly due to the late start in their exploitation as compared to old world. But India, though its outer soils are exploited from times immemorial, has vast resources within it, whose utilisation has but commenced recently. Thus, India is, perhaps, a "newer world" as compared even to America and its potentialities are bound to be as breath-taking, if not more. As about markets, India is the largest free market available anywhere in the world with about 400 million people with practically unlimited wants.

America and India are incomparable in physical terms as at present. But in perspective there seems to be nothing, which makes comparability of these essentially continental economies with large free markets and large resources, really untenable.

MASS MARKETS—AS DRIVING FORCE

The United States accounts for 44% of the world's manufactures and an equal amount in world's mining output. But against this, it is interesting that American share in the world's trade is rather small (8% on

average) when compared to smaller economies who are more dependent on external resources. This relative self-containment of America is typical of such continental system and India, when once it attains the status of self-generating economy, is bound to be of a similar type. Thus, in both cases, it is the markets within that would provide spurts to industrial production.

American disposable incomes by 1975 would rise to a level 500 billion dollars, i.e., as much as the total G.N.P. in 1960. Apart from the vast magnitude of this consumer spending, it is the radical change in the pattern of such spending which has the greatest significance. This rise in incomes leaves roughly half of it in the "discretionary belt" that is where choice, and a multiple choice in general, over the spending of this is provided to consumers. What would be the Indian experience in this respect?

GROWTH IN "DISCRETIONARY" MARKETS

Since independence both the industrial growth as well as the pattern of consumption show trends which are similar even though in physical quantities the rises are highly modest. On these trends, per capital incomes are expected to increase more than three times and per worker incomes for the first time touches almost Rs. 3,000 level by the turn of this century. The discretionary component is steadily rising and by 1970-71, it is expected to reach 27% of the total disposal income. On the basis of National Income projections provided in an earlier section and assuming the capital formation or savings takes away successfully 14%, 17%, 19% and 20% in the decades ending 1970, 1980, 1990 and 2000, the disposable incomes will be of the order of Rs. 49 billion in 1970-71 and would rise to a level of Rs. 241 billion by the end of the century. This seven-fold rise in National income would generate "discretionary income" which will be of the order of 33% of the total disposable income or in other words a five-fold rise since 1970-71. This phenomenal increase will have effects on production in general and particularly of durables and indirectly on such basic materials like steel, which will be as spectacular as have happened in America. The per capita income of Rs. 1,157 leading to a family income of around Rs. 5,000 will have as explosive results as even now the 5,000 dollar level exerts on an American family. What this 'income explosion' would mean in terms of demand for goods and in consequence on the Industrial Production is examined in brief in the following sections.

These should confirm, that quantitatively however, dissimilar is the comparison—even by the turn of the century India's steel production may be still roughly half of the U.S.A.'s—when the pattern or structure of society industrially as well as otherwise is considered there could be no doubt as to the absolute relevance of this comparison.

Nowhere, perhaps, such a huge potential driving force in the shape of free and large home markets for furthering of industrial production can exist. No proviso to exclude the U.S.S.R. and China to this statement seems to be necessary. The rates of growth in centralised economies and in the recovering European economies are, no doubt, higher. In fact, the declining proportions of American share in world's output since 1953 clearly indicate that growth even in the free under-developed countries and in free Europe have been progressive. Within a given time which cannot certainly be a short one even in case of Russia, whose rate of growth has been ruling at twice

the level as in the U.S.A., a comparable giant to the U.S.A. in terms of gross national product is a remote possibility. But still, in sheer diversity, and in welfare terms, meaning thereby not only the quantity of goods but of quality of choice that is provided by the economy, a comparison with the U.S.A. can only be sought among free economies with mass markets. India is, perhaps, the only country which can generate and sustain such levels of production, consequent on huge markets it can have, in some future time, however distant it may be.

The massive character of the American economy which has been described does not entirely explain precisely how the dynamic character of the American economy has established itself at what, over a long period, is described as an all-time high. For the period from 1868 to 1929, the average rate of growth according to Prof. Kuznets was 3.8 percent per year. On this basis, which is also reflected in the post-war experience from 1945 to 1959 considered as one piece, the United States doubles its gross national product over twenty years. Should this continue, the G.N.P. of 500 billion dollars today would become a thousand billion dollars in 1980, and 2,000 billion dollars in 2000. This is the current G.N.P. of the world. In other words, forty years from now, the United States itself might have a G.N.P. equal to that of the entire world at the present time. It is not likely that any group or units will become competitive with the United States at this rate. This has decisive economic and military implications. It is extremely unlikely although this point is often argued, that the Communist countries will catch up with the Free World.

The fact itself is probably less important than the means by which the built-in strength of the American economy has been maintained over so long a period of time. The unique character of the American economy is that the productivity of the economy shows itself in every sphere, agriculture, industry and the tertiary occupations—in the last more than in the first two. The growth of "services" is currently more dynamic than the growth in both agriculture and industry. But the essential mark of American development is the application of 'scale', a phenomenon not visible in other countries. The Americans have succeeded in adding a new dimension to the capacity to produce and the capacity to consume which has produced this out-sized giant producing and consuming apparatus. The effect of size is fundamentally to be associated with two concepts.

Firstly, the spectacular use of technology, and, secondly, the expansion of markets. They are, indeed, related since labour saving and automatic machinery can only be employed effectively where the market is very large. The point to be appreciated is that the Americans made the market and did not find it there. The conspicuous example for this is that of Ford Motor Company in which Henry Ford raised the wages of his workers ahead of the market for cars. The use of technology in American sense has been quite different from European experience where methods have always been inhibited by the fear that the market was too small. The first step that we should study is the growth of the markets in the United States in relation to, say, a European market of the same commodity. One such obvious commodity is automobiles. Another is radios; the third might be refrigerators, followed by washing machines.

The second important point, namely that the exploitation of increasing returns is limited by the extent of markets, was first demonstrated by the American Economist, Leyon Young, who wrote in the Economic Journal in the twenties, on the point that the economists have over-simplified the benefits for increasing returns which could not improve so quickly the limitations of the markets which prevented the exploitation.

The Americans alone in the first half of the century made what was called the 'break-through' on both the technological and market fronts, partly because the Europeans were unable to make the break-through on the market front, and partly because their technology was also a little behind, although in some countries, notably Germany, comparatively efficient.

At the beginning of the century high maturity and mass consumption ran together. This was because the problems of technology and markets were simultaneously solved by American businessmen. For many years, indeed—perhaps for nearly a century—the leading West European countries remained in a stage of high maturity without entering the field of mass consumption. The mass consumption outlook has only overtaken the West in the post-war decade with, of course, a few exceptions such as soap. Indeed, in a few cases, where Europe made a break-through to the mass consumption market, it was primarily American experience which was the decisive because of new orientation.

The contention of the Eastern Economist is that we are markedly influenced by the European dilemma of the utilisation of modern technology because of the limitation of the size of the market and we have an even greater limitation in that we have an unemployment problem more obstinate than any that has faced the Europeans. Nevertheless, the fact remains that if we are to attain a mass consumption stage, it may be necessary to begin with a mass consumption outlook. That is very far from being the case in the Indian Union at the present time.

INDIA AND AMERICA: PROBLEMS OF TECHNOLOGY

It is obviously impossible for the Indian Union to measure itself against the United States in regard to the exploitation of either technology or the size of the markets. It is not impossible, however, for the Indian Union to measure itself against any European country or against Japan and to surpass them within a measurable time. For, in terms of industrial raw materials, the Indian Union is far more happily supplied than is any continental country or Japan. In the case of cotton, iron ore, coal reserves, etc., there is likely to be no major shortage. Significant shortages are likely to appear in respect of oil (still to be proved), coking coal (of which new deposits hold promise) and of metals particularly in the copper-lead zinc, tin group, where for industrial purposes, India will almost always be short. This gives special point to the exploitation of technology which has been, as stated previously, the source of American industrial strength. The President's Raw Material Policy Commission (The Paley Report) was conceived against what is described as "the threat of slowly fading supplies which, if not compensated, could produce a rise in cost to the point of arresting those increases in the standard of living which have hitherto constituted America's major contribution to the economies of a truly dynamic capitalism." India's problem is exactly similar in that our raw material situation hinders transition from the relative stagnant economy of the early fifties to the growing economy of the sixties and to measure up to the vision of economic development which has been set out in the earlier sections.

RAW MATERIALS PROBLEM

It is not generally recognised that the United States and the Indian Union have thus common problem of developing raw materials on a scale adequate enough to sustain continental systems. It is, however, clear that even in respect of a million tons of paper, (a basic consumer good) we have had to call in bagasse, a raw element not used in big paper making

in India's service

With a heritage of over a century we lay claim to a creditable record of service in promoting India's economic development. The watchword is one of endeavour in the service of the Nation

KILLICK INDUSTRIES LIMITED

KILLICK HOUSE, HOME STREET, BOMBAY 1

countries. Similarly, in regard to timbers, notwithstanding the fact India has got remarkable wealth in the Himalayan regions and the Central India, both soft woods and hard woods (such as sleepers) are in short supply. But the United States is developing over the years solutions to adjust such problems. And what might be described as the common technological challenge to India and the United States is largely to be found in the solution, by chemical and engineering research, to raw materials' problem and by production research to economise the use of those in short supply. More precisely, the Paley Commission described the demands which the raw materials problem placed upon technology under six main heads: "(1) To foster new techniques of discovery; (2) to bring into the stream of use materials which so far evade our efforts; (3) to apply the principle of recycling more and more broadly; (4) to learn how to deal with low concentrations of useful materials; (5) to lessen or eliminate the need for a scarce material by substituting one that exists in greater abundance; and (6) to develop and use more economically the resources that are renewable in nature."

These are also, it is true, the problems of whole world, but the current stage at which they are operating in India and in the United States make our problems more alike than elsewhere.

NEED FOR INCREASED COLLABORATION

This constitutes one of the major problems of co-operation between the two countries. Another is the question of means by which technical "know-how", where necessary by way of plant and machinery, can be obtained. Here historical development has been disappointing, as American business investment at Rs. 59.85 crores by the end of 1958, is regrettably small. But the current is flowing strongly at the present time, and collaboration agreements are beginning to take on both qualitatively and quantitatively a far more imaginative pattern. In particular, new process such as those for synthetic rubber and for various kinds of chemicals have entered India from America for the first time. Similar is the case with petro-chemicals which are to be developed at Visakhapatnam from the refinery. American methods of operation in the automobile industry are also being exploited in association with both the major units in the country. Union Carbide associates have brought in a whole range of chemical processes as well as their main line of "flash-lights and batteries".

INDUSTRIAL ORGANISATION

Not the least of America's achievement in the industrial field is connected with the pattern of her industrial organisation. In essence, this has been a supreme application of the principle of division of labour which is as old as Adam Smith and as common as every factory after the industrial revolution first dawned. But the American applications have been made possible by the vastness of the market and resulted in the extension of division of labour to limits, firstly, not actively sought and secondly not actively exploited in other countries. The most general illustration of this remarkable capacity of division of labour is to be found in the automobile industry where the great giants, the General Motors, Ford and Chrysler did not make in all their factories, more than 25 to 30 per cent of the total value of the product. This is also illustrated in the great public sector undertakings in the United States where single projects in the Navy or in the Army might have 2,500 to 3,000 contractors. Great techniques of co-ordination of production, sales and assembly are thus associated with every industrial factory. And not the least of the achievements of the United States is in the formulation of these techniques. One illustration of the capacity of management in the United States to adjust itself to these conditions which it has created, is the application of computers to a series of calculations which enable the optimum distribution of functions to be obtained under a very wide range of what is called "operation industrial management." Quite apart from the problem of breaking down an industrial problem into its theoretical and operational components, vast flow of academic research on these subjects is financed by industry directly so that universities and industrial units in the public and the private sectors have a flow of knowledge which is almost unique to the United States. A particular illustration which has recently received notice by imitation — as imitation is the sincerest form of flattery — is described as the "line of balance", i.e., a scientific technique worked out mathematically by the American Navy to co-ordinate all elements in a construction unit so as to provide, firstly, a continuous running check on the rate of progress, and secondly, a check on the pattern of expenditure. The line of balance fixes a point at which both should run for optimum utilisation of both factors. This technique has obvious applications in this country both in the public and the private sectors.

Industrial Growth: 1950-51 To 2000-01

"THE EASTERN ECONOMIST" in its Annual Number, 1956, made broad estimates of the pattern of growth of the industrial structure in terms of an all-India index of industrial production with base 1951=100. It was anticipated five years ago that industrial production during the Second Plan would rise by not more than 50 per cent. The index which stood at 130 at that time was anticipated to rise not beyond 194. Present estimates indicate a more optimistic picture. It is estimated by the Planning Commission that the level of the index is likely to rise to about 221 in 1966 as against 139 (revised) for the last year of the First Five-Year Plan. In view of this new dynamism which has been imparted to the industrial structure during the Second Plan and also because of the expanded industrial programmes during the Third and the Fourth Plans, the rate of progress is anticipated to be much higher. Recent progress has shown a rate of rise of more than 10 per cent per annum with spans of relative stagnation due to foreign exchange difficulties. In the table below are presented estimates of growth in the level of industrial production in terms of index numbers. In the earlier years, the rate of progress anticipated is a little more than 10 per cent per annum. As the structural base of the industrial economy broadens, it is anticipated—in line with the experience of other countries—that the rate of progress in percentage terms would definitely slow down. The index shows the multiplication of the present level of industrial production to eight times.

THE INDEX OF INDUSTRIAL PRODUCTION

1955-56—2000-01

(Base: 1951=100)

Year	Index
1955-56	139
1960-61	221
1965-66	362
1970-71	440
1975-76	650
1980-81	850
1990-91	1300
2000-01	1700

Steel Industry

THE UNITED STATES of America has been truly described as a giant amongst the producers and consumers of steel in the world. With a capacity of more than 145 million tons, it produces a little more than one-third of the total steel output of the world. It is true that during the period 1945-49, the United States produced more than half the total output of the world but it was due to the widespread destruction caused all over the world by World War II and the consequent fall in the share of the main producers in Europe. The European recovery brought down U.S.'s position only in percentage terms since there has been a steady increase in absolute terms. Between 1950 and 1960, the capacity of the U.S.A. in the steel industry registered a spectacular growth of 50 per cent from 100 million tons to nearly 150 million tons. The rate of growth of the U.S. steel industry, in fact, has been much superior to that of any other country including the U.S.S.R. with all its central planning and totalitarian control. The manner in which the U.S. gross national product has been growing till 1960 and is anticipated to grow in the future, the consumption of steel in the U.S.A. will certainly continue to rise.

What will be the total consumption of steel 40 years from now, in the world, in the United States of America and in India? The Economic Commission for Europe has attempted long-term trends of the European steel industry; since the steel industry of Europe could not be studied in isolation, the estimates were made by the Commission in regard to regional patterns of growth, country by country and continent by continent. The Commission has made projections upto the period 1972-75 only. The findings of the Commission are set out in the tables on page 114 and 117. It will be seen from the table that the total steel consumption in the world was estimated to rise from about 297 million tons in 1957 to 631 million tons in 1972-75. This shows that steel consumption in the world would more than double in 25 years, though the per capita consumption of steel would rise by only 80 per cent from 106 kilograms in 1957 to 189 kilograms in 1972-75. Per capita consumption in the U.S.A. is likely to be the highest.

Western Europe at the end of the next 25 years is likely to raise its consumption to a little more than half of the per capita consumption of steel in the United States of America. In the case of the Indian Union, it is estimated that the total consumption may be in the region of 28 million tons, which seems to be quite a realistic estimate. If this is achieved, it will take per capita consumption to 60 kilograms, only one-third of the average per capita consumption in the world. The total consumption of steel in the United States is estimated to rise not beyond 145 million tons in 1970-75. It means that the capacity of the U.S. steel industry will definitely cross the 200 million mark. Recent history of the steel industry in the U.S.A. has shown that there has been a large unutilised capacity in the United States. The forecast made by the United States seems to be influenced by this relationship between actual consumption of steel and the installed capacity.

The Indian Union had set before itself the target of 6 million tons steel (ingots) in 1960-61. It is now clear that because of the stresses and strains through which the Second Plan passed, there is likely to be a major shortfall in the production target of steel. Even though the capacity for 6 million tons has been set up, actual production will take some time to reach that target. In the year 1960-61, the total output of steel (ingots) is not likely to exceed 3 million tons. The Indian steel industry looks forward to the future with great hope. The draft outline of the Third Plan has placed the target for 1965-66 at 10.2 million tons of mild steel (ingots). If this target is realised there will be ample scope for expansion in the Fourth and the Fifth Plans to speed up expansion so as to reach the target of consumption at 28 million tons estimated by the United Nations. In the last 25 years of the present century, it will not be difficult to add another 25 million tons so as to take the total to 50 million tons. In other words, by the end of the century, per capita consumption of steel in the Indian Union will be about 100 kilograms—the same as the present per capita consumption in the world.

you have just opened A METAL BOX CLOSURE !

Soft drinks and concentrates are today being purchased in India in increasing quantities with their purity taken for granted. Processing by bottlers of repute is guaranteed to be under most hygienic conditions, and the contents are filled into sterilised bottles. Crown Corks and pilfer-proof Roll Seal (R.S.) Closures made by Metal Box—Crown Corks for carbonated or aerated drinks and R.S. Closures for syrups, fruit squashes and concentrates—put an efficient seal on these precautions. The wad or cap liner used as a sealing gasket is so constructed and fitted that it will not react with the contents nor, in the case of carbonated drinks, allow gas pressure to escape. Efficient packaging ensures that your drinks are served in excellent and, above all, hygienic condition.

The production of a wide range of scientifically designed packages is the business of Metal Box, leaders in the packaging field. R.S. Closures and Crown Corks are only two instances of the many ways in which they help to deliver first class consumer goods to you.

METAL BOX

Over 1000 manufacturers in India are being supplied by Metal Box with scientifically designed containers and closures that go to pack over Rs 100 crores worth of consumer goods every year.

OPEN TOP CANS for processed fruit, vegetables, fish and dairy products • GENERAL LINE CONTAINERS for confectionery, tea, biscuits, baby foods, edible oils, paints, insecticides, powders, etc. • COMPOSITE CONTAINERS of cardboard & metal • COLLAPSIBLE AND RIGID TUBES for toothpaste, ointments, adhesives and pills • CROWN CORKS for carbonated drinks • R. S. PILFER-PROOF AND OTHER CLOSURES for bottled products • COMPONENTS for radio, automobile and electrical industries • PUBLICITY MATERIAL including advertising tablets and calendars • PLASTIC PRODUCTS including Diethylene bags, foil laminate pockets and injection mouldings • HARDWARE including trays and table mats • MACHINERY Can Closing and Reforming and Bottle Sealing Equipment

Only in "MICHIGANS" do you get
Power trains—designed, built and
matched by one manufacturer—Clark

Michigan Tractor Shovels, Dozers, Scrapers, and Logging equipment—18 models and sizes—all use the efficient all-Clark power train.

Of all earthmoving machines now on the market, only Michigan gives you unquestioned efficiencies of a power train engineered and built by one manufacturer.

Designed specifically for earthmoving, Michigan power trains are produced entirely by Clark Equipment Company. This firm needs no introduction in the highly-technical business of designing and manufacturing heavy-duty power-transmissions and axles for heavy "working" vehicles...this has been Clark's specialty for over 50 years. Every Michigan power train represents this half-century of accumulated design and manufacturing experience. **You can't buy better experience anywhere.**

You can't buy a better testimonial of efficiency and durability than the one Michigan gives you. Since the introduction of the Michigan Tractor Shovel, over 12,000 units have been built and sold. Each has the same basic power train. Not a single major design change has been needed...dramatic proof that the power train was right from the start...
...and that it is right today.

Development of world crude-steel production (actual, moving five-year averages and theoretical values in millions of tons)

India's Energy Requirements

IN RECENT years, India has been becoming increasingly concerned about her energy supplies. Energy consumption has been mounting, and mounting steadily. Shortages have already been encountered. What, one might reasonably ask, are some of the underlying factors responsible for the upsurge in the demand for energy? Introduction of each new piece of equipment has augmented the demand for energy. This need for more fuel, in turn, has called still more machinery and equipment into play. The effect has been cumulative, and energy, the common ingredient of all these activities, has gone on compounding both as to supply and demand.

That there is a close relationship between energy consumption and economic growth has been known for a long time. In the north-eastern United States, it was the easily-won coal, accompanied in later years by an influx of oil and natural gas, which set the stage for the growth of the most complex, and at the same time the most dynamic, industrial heartland which the world has ever known. Recently, it has been shown that long-run changes in industrial output and fuel consumption are also closely related one to the other. There are strong grounds, therefore, for taking the statistics on energy consumption to be a quantitative measure of economic progress. A recent examination of the relationship between energy consumption and economic growth suggests that, for the world as a whole, each 2% increase in energy consumption has been accompanied by a 3% per annum rise in industrial output.

A good deal has been written in recent years about the extent of the demand for energy. The United Nations, in their publication "World Energy Requirements in 1975 and 2000", puts the historical rate of increase in the order of 3½% per year. We may reasonably expect that the world's energy requirements might go on increasing at a rate of around 3% per annum compounded. This is equivalent to a doubling demand every 25 years. A point of reference is often to be found in statistics pertaining to the United States. The best-known United States projection, that of the Paley Commission published in 1952, envisaged a 3% annual rate trending upward from 1950 to 1975. Based upon assumptions as to population growth and improvement in productivity which now appear to have been unduly conservative, it has had to be raised upward. The U.S. Department of the Interior has more recently come up with a slightly higher forecast of around 3.25%. Various individual and organisations reviewing recent trends have been inclined to go even higher. The Royal Commission on Canada's Economic Prospects consider an annual rate for Canada of 4% or even 4.5% a year reasonable. The rate of increase in energy requirements in individual cases depends upon (a) a greater emphasis on primary processing, (b) a relative decline in efficiency in use (such as accompanies a shift from hydro to thermal power), and (c) exceptional increases in population and labour productivity. In view of these considerations, an annual rate for India of 5% or even 6% does not appear to be unreasonable.

There is another way of forecasting energy requirements more or less directly from a projection of Gross National Product (G.N.P.). In earlier and less sophisticated studies the two were assumed to run in parallel. Thus, a 1% increase in G.N.P. resulted in a comparable rise in the demand for fuel and power. A closer examination of the facts reveals that usually energy inputs have lagged somewhat behind this all-inclusive measure of economic growth. In Western Europe, a 1% rise in G.N.P. has, over the past decade,

been accompanied by a 0.8% increase in energy demand. American analysts working in this field envisage 0.85 to 0.90 as being more relevant to the next two or three decades in the United States. The Canadian forecast, according to the Royal Commission on Canada's Economic Prospects, is for a ratio starting at 0.85 and rising progressively to 0.95 during the 20 year to 30 year period. On the average, over the next 25 years this is equivalent to a 0.92% rise in energy requirements for every 1% rise in Canadian G.N.P. For India, we may reasonably expect the Canadian rate to apply with a fair degree of accuracy.

It is interesting to note the relative importance of various sources from which India's energy requirements are met with at present; table I below attempts this.

TABLE I—Percentage consumption of Primary Energy by source of origin, 1950-56

Year	Coal	Hydro	Oil	Total
1950	82.96	6.34	10.70	100.00
1951	80.66	6.70	12.65	100.00
1952	81.91	6.09	12.00	100.00
1953	81.80	6.11	12.09	100.00
1954	81.60	6.23	12.17	100.00
1955	80.64	6.64	12.72	100.00
1956	79.55	7.16	13.29	100.00

It will be seen from the table that coal is the single source of energy that meets India's four-fifth of the total energy requirements and there has been no appreciable change in this position for a number of years in the recent past. It should, however, be apparent on closer scrutiny that the relative importance of coal in meeting our energy requirements has been declining in more recent years, and the relative importance of the other two sources of energy, namely, hydro-electric power and oil, are rising. And this trend is likely to persist in view of what India wants to achieve through her plans and because coal is being substituted by petroleum, a more readily transportable source of energy and one that can be utilised with greater ther-

USHA
SEWING MACHINE

We have developed an export market for our sewing machines and fans in the countries of South Asia, Australia, New Zealand, Ceylon, countries of the Middle-East, West and Central Africa. We are now even exporting to highly industrialised countries like Yugoslavia, U.K., U.S.A., Canada, Holland and Belgium.

WORLD WIDE

SALES AND SERVICE

USHA
Fans

- Highly efficient capacitor motor with low current consumption.
- High air distribution
- Unity power factor
- Sound construction
- Polychromatic Silver Grey with chromium Trimmings.

(GOVERNMENT OF MYSORE)

BHADRAVATI (MYSORE STATE)

mal efficiency than that normally attainable with coal. Moreover, extraction of coal becomes more difficult as the pits are made deeper, as coal faces recede from the shafts and as high temperature reduce output per worker.

This brief study may be concluded with a look at the supply position of India's energy resources. Table 2 attempts this.

It will be seen from the table that though expansion of energy supplies will, for some time more, be mainly in the direction of coal and coal-based fuels, there will be greater reliance on oil and hydro-electricity. Though hydro-electricity may provide a valuable contribution, it should not be over-estimated. The capital costs are very high for hydro-electric projects. Nuclear power stations are hardly a substitute for them. There are serious limitations to any grandiose plans for the production of atomic energy in view of barriers of capital costs and practical technology. All these point to the moral that it is in respect of oil that the country should place greater faith. There has been of late greater realisation on this score and efforts are being made to discover oil in the country. As an inducement, the Government have relaxed rules for oil exploration in the country and have made offers to foreign companies to come into the field, but much more tangible needs to be done.

TABLE II

* Gross production (including exports).

** Actual consumption (production plus imports).

† Figures prior to 1950 refer to undivided India.

Cotton Textiles

THE INDIAN cotton textile industry, in spite of various handicaps, has an important role to play in the economy. For instance, apart from feeding a huge home market, a considerable part of the output, about twenty per cent of the total, has to be exported to earn valuable foreign exchange. An industry with a history of 100 years, it has at present 516 mills, with a capacity to produce 1,750 million lbs. of yarn and about 5,500 million yards of cloth. The major problem faced by the industry is that of renovation. During the war years the industry had to bear the strain but hardly any replacements of machinery were available. New types of machinery too were not being installed. Even now, only 6 to 7 per cent of the total looms in India are automatic. In Japan, India's competitor in Asian market, about 67 per cent of the looms are automatic and in America almost hundred per cent of the looms are automatic. Consequently, the Textile Enquiry Committee recommended in 1958 that it was very necessary to increase the percentage of automatic looms as far as possible. As an experimental measure, it recommended the introduction of about 3,000 automatic looms. Besides this programme, it also recommended the replacement of the existing ones by 2,500 automatic looms. It may be observed that even the execution of these programmes will not take the industry any far. Table I below shows in this connection an interesting aspect. While the number of spindles has increased between 1953 and 1959 by about 17 lakhs, the number of looms has actually declined from 207,252 to 205,973. This important development can be explained only by the fact that the automatic looms that are being introduced or are replacing the present ones are creating greater needs of yarn. Another factor that can explain this development is that yarn forms an important raw material for weaving of cloth in the sectors beyond the mills — the powerlooms and handlooms. Besides, a large spindleage, about 25 per cent of the increase, has been added to the composite mills thereby making them independent of their requirements of yarn from spinning mills.

The growth pattern of American textile industry

has certain significant instances which throw some light on the probable course that the Indian textile industry may take during the next forty years. One broad feature of the American textiles has been that the monopoly of cotton textiles in the home as well as the export market was broken progressively by synthetic fibres during the last twenty years. In 1920, for instance, as against 2,828 million lbs. of cotton consumption by the textile industry, wool, rayon and silk consumption was 314 million lbs., 9 million lbs. and 29 million lbs. respectively. (Table II). By 1940, when cotton consumption had reached about 4,000 million lbs., man-made fibres had touched 500 million lbs. mark and had overtaken the consumption of wool which was about 400 million lbs. By 1950, when cotton consumption reached the 5,000 million lbs. mark, showing a 25 per cent increase during the decade, the man-made fibres consumption had reached about 1,500 million lbs., showing a 300 per cent increase. This trend continued in the following years. Another significant trend in the American textile industry was the popularity of ready-made garments which is a peculiarity of an industrialised society. A large number of clothing factories were established which could compete the best made-to-order types of clothing. Thus we can easily expect the textile industry to progressively introduce increasing number of automatic looms and comparatively larger consumption of man-made fibres. The use of ready-made garments is also likely to be popularised in the industrial centres in India.

AVAILABILITY IN 2001

The per capita consumption of cloth in the Indian Union has been slow in rising during the last 15 years. Till 1951, the level remained low at 12 yards per head because of a number of causes such as shortages of cotton crop, obsolescence of machinery etc. The era of shortages was eliminated from 1952 onwards and in 1960 per capita availability of cloth increased to 16 yards per head. It means that during this period, when incomes rose by 40 per cent, the per capita in-

crease has been of the order of not more than 4 yards. What will be the probable demand for cloth at the end of the century? It is estimated here that in relation to the overall rise in national income and per capita income, the level, forty years from now, may not exceed 35 yards per head. On that basis, estimates have been worked out on the probable production of the organised mill sector and handloom sector. The results of the analysis are presented in table III below.

TABLE I.
EQUIPMENT & PRODUCTION SINCE 1900

Year	No. of Mills.	No. of Spindles	No. of Looms	Production	
				Yarn (In Mil. Lbs.)	Cloth (In Mil. Yds.)

Jute Industry

OVER THE next four decades, the prospect for the jute manufacturing industry appears to be much brighter than what it is today in the global perspective. Today there is too much preoccupation with raw jute shortages and keen competition from newly emerging jute manufacturing countries like Pakistan, a number of countries in South-East Asia and elsewhere which have set up a very limited number of jute mills for their domestic requirements and, what is vital, the search for substitutes for jute as containers or packaging materials. In one sense, there is some justification for the present pre-occupation with the threat to the future expansion of the market for jute goods. But a little introspection would reveal that at least two valuable lessons will have been learnt by India since Independence.

Undoubtedly, the partition of the Indian sub-continent has completely transformed India's position before 1947 as the monopoly producer and supplier of jute to the world. Partition has transferred the cultivation of the golden fibre to Pakistan in a substantial

Thus, during the next forty years, the mill sector is likely to multiply its output three times.

The only threat to the growth of the cotton textile industry may come from synthetic fabrics which have already captured vast areas in the foreign markets. The experience of this country in regard to the synthetics is too limited to allow any forecasts to be made. All that can be said is that any reduction in the anticipated growth of the cotton textile industry will be caused by such synthetic fabrics as nylon, rayon, etc. The area of invasion cannot be precisely estimated.

TABLE II.

ed as an all-time danger. What the jute industry needs to do is to keep constant vigilance on capturing for itself a growing share of the world demand for containers and packaging materials in the future as well as evolve new uses for jute goods.

It would appear that the threat of substitutes has been, perhaps, exaggerated. Paper bags came into popular vogue in America and elsewhere as the price of burlap proved to be quite high. Similarly, cotton cloth was used on an increasing scale for storing flour. A few more substitutes were also found. But as soon as the price of jute manufactures returned to reasonable levels, the trend became evident that jute could not be ousted on a substantial scale. It is an encouraging sign for the future growth of the jute manufacturing industry that new uses are being found for jute in carpets, cables, twines, ropes, floor covering, in building requirements and so on. The case of fire and acid proof hessian, serving as a potential substitute to conventional walls of solid construction in factories and other industrial buildings, typically indicates new avenues for jute goods.

Cement Industry

THE GROWTH pattern of the cement industry during the last thirty years has shown a rate of rise of more than 8 per cent per annum. From less than one million tons in 1936-37, the capacity has risen to more than 8 million tons in 1959-60. The draft outline of the Third Plan has envisaged a rise in capacity to 15 million tons in 1965-66. One major factor which has conditioned the growth of the cement industry is the indigenous supply of machinery which has been slow in picking up. It is anticipated that some time during the middle

The production of jute increased at an encouraging rate since India launched the First Plan. From 3.3 million bales in 1950-51 it went up to 4.2 million bales in 1955-56 and at the end of the Second Plan it is estimated to reach 5.5 million bales. At the present time, in view of the difficulties of expanding home production of raw jute and of quality raw jute the target for the Third Plan has been fixed at 6.5 million bales. The jute manufacturing industry in this country has its own problems of redundancy of labour which it has to maintain at a high cost and looms have to be sealed as working to full capacity has not proved feasible.

Between now and 2,000 A.D. the world demand for jute may increase three-fold from 1 million tons to 3 million tons. This is after making allowance for the growth of substitutes, but on the assumption that the spectacular increase in the demand for jute goods, particularly in the developing countries, will give the momentum to the rising demand. Out of the increase of 2 million tons (equivalent to 12 million bales) of jute manufactures in the world market four decades hence, India should be able to retain a good share ranging between 70 and 75 per cent.

of the Third Plan, the indigenous supplies of machinery will increase and will make the modest target of 15 million tons of cement in 1965-66, a reality. It is estimated that at the end of the Fourth Plan, i.e., in 1970-71, the total capacity will be nearly 22 million tons and at the end of 1975-76, it may attain the target of 30 million tons. At the end of the century, the capacity of cement in the country is likely to range between 45 to 50 million tons. This pattern of future growth is commensurate with the

a BIRD'S-eye view of service to the economy

The Birds/Heilgers group of companies meet a substantial part of the country's demand for industrial raw materials like iron ore, coal, limestone, manganese ore, refractories... provide tubewells for tea estates and factories... manufacture plants for water treatment... supply paper for a variety of uses... make jute goods and steel castings and structurals...

Birds have today launched on a programme of expansion to increase their output and service facilities... And their laboratories are constantly at work exploring new uses for their products so that they may serve India's industries better.

A symbol of industrial leadership, Birds will continue to play a vital role in helping India attain industrial self-sufficiency.

WORLD ECONOMIC SURVEY, 1959

Comprehensive survey of world economic developments and stability. Special analysis of post-war trends in investment and the long-term significance for economic growth.—230 p. (Rs. 14.25).

PUBLIC INDUSTRIAL MANAGEMENT IN ASIA AND THE FAR EAST

An authoritative report on the management of public enterprises in Asia. It comprises a selection of material prepared for a UN seminar in New Delhi in 1959. 138 p. (Rs. 7.12).

PATTERNS OF INDUSTRIAL GROWTH, 1938-1958

Comprehensive world data on the mining, manufacturing, construction, and electricity and gas industries for the years 1938 and 1948 to 1958. 471 p. Cloth (Rs. 40.37).

WORLD ENERGY SUPPLIES, 1956-1959

Statistics on production, trade and consumption of commercial sources of energy—solid and liquid fuels, gas and electricity—for approximately 150 countries. About Feb. 1961. (Rs. 9.50).

Obtainable from:

Orient Longmans; Oxford Book & Stationery Co.; P. Varadachary & Co.;
or from the United Nations, Sales Section, New York and Geneva.

ECONOMIC SURVEY OF ASIA AND THE FAR EAST, 1959

Developments in the region as a whole, particularly with relation to production, effective demand and financial policies. Long-term review of foreign trade of the primary exporting countries in Asia. 178 p. (Rs. 14.25).

Annual subscription to the ECONOMIC SURVEY AND BULLETIN FOR ASIA AND THE FAR EAST

Three issues of the Bulletin and a copy of the Survey. (Rs. 19.00).

STATISTICAL YEARBOOK, 1959

Data for more than 250 countries covering a very wide range of economic and social subjects, including agriculture, production, mining, manufacturing, transport and trade. 624 p. Cloth (Rs. 47.50). Paper (Rs. 38.00).

MONTHLY BULLETIN OF STATISTICS

Extensive current data from 150 countries covering more than 60 subjects. Monthly figures for most recent 18 months; annual figures from 1951 to date. Ann. Subs. (including explanatory supplement. (Rs. 47.50).

HUME PIPES FOR EVERY REQUIREMENT

- i) Hume Pipes are ideal for Railway and Road Culverts, drainage, irrigation and water supply mains.
- ii) Humeogeneous pipes are better quality of Hume Pipes, where electrically welded Steel Cages and Drymixed concrete with minimum water is used to give better consistency and strength.
- iii) Prestressed Concrete Pipes are economical with ability to withstand high pressure.
- iv) Steel Pipes are best for waterworks where Test pressures of 400' head and above are required.

large-scale programmes envisaged in regard to multi-purpose projects, housing, construction of new industries, roads etc.

The level of cement consumption on per capita basis is considered as good an indicator of the level of industrial development in a country as per capita steel consumption. In the case of cement as well, the consumption level in India is significantly low. Present consumption standards show that in the United States per capita consumption runs at about 550 lbs. as against 30 lbs in the Indian Union. At the end of the present century, when production is likely to range between 45 to 50 million tons, per capita consumption will stand raised to not less than 60 lbs.

Chemical Industry

THE GROWTH of the chemical industry is fundamental to the growth of overall industry in any economy. Developing countries find themselves faced with the prospect of having to start practically from scratch in building up a sound structure of the chemical industry so essential for the orderly expansion of the industrial sector of their economies. In India, some of the chemicals were already taken up for indigenous production before Independence. But, by and large, the integrated growth of this crucial industry may be said to have got off to a real start after Independence and particularly after the era of planning started in 1950-51. Some of the basic chemicals included in the category of fertilizers are reviewed briefly elsewhere in this Section. Here attention is focused on some of the important chemicals which represent the character of the growth of the chemical industry of India in general.

Speaking broadly for the first decade after planning (to be precise, for the period 1951-59), it would be interesting to follow the progress of production of some of the major chemicals. The output of sulphuric acid increased between 1951 and 1959 from 106,900 tons to 269,000 tons showing an annual rate of increase of 13.37 per cent. Caustic soda showed a modest output of 14,700 tons in 1951 from where it rose fast to 66,000 tons in 1959. There was thus an impressive increase of 18.37 per cent in its production. Soda ash increased from 37,500 tons to 94,000 tons, recording an increase of 11.17 per cent. Bichromates had reached the relatively higher level of 3,276 tons in 1951 from where it was pushed to 4,320 tons in 1959 (with some setbacks even below the 1951 output in the intervening period). It had a rate of annual growth of 7.70 per cent. Paints and varnishes have a relatively longer history of growth. Their output increased from 33,500 tons in 1951 to 54,000 tons in 1959—marking a yearly increase of 5.35 per cent. Matches represent an instance of an older industry, dating to the early phase of the inter-war period and their output increased from 478,400 cases (50 gross boxes of 60 sticks each) in 1951 to 642,000 cases in 1959. The pace of expansion was low at

0.69 per cent per annum by reason of the fact that the year 1951 indicates a high base of output. Soap recorded an increase from 83,400 tons to 126,000 tons giving an annual rate of increase of 6.10 per cent. Rayon yarn (viscose) is a typical instance of a new industry, where spectacular growth was recorded by reason of the fact that the market was successfully tapped and the sales potential was vigorously exploited. From 2,040 tons of output in 1951 there was a spurt in production to 15,060 tons, recording a remarkable annual growth of 47.40 per cent. All these percentage increases have been calculated from year to year at the compound rate formula.

India's young chemical industry has given promise of accelerated growth in the first decade of planning. It would be interesting to venture some projections in the course of the next decade. Drugs and pharmaceuticals which have an ever-expanding market may be presumed to expand from a total output estimated to be of the value of Rs. 62.5 crores in 1960-61 to something like Rs. 185 crores in 1970-71. Paints and varnishes will be increased to 160,000 tons; sulphuric acid could be pushed up to anywhere around 3,000,000 tons, caustic soda to 550,000 tons, soda ash to 760,000 tons. To take other items, output of film products will be stepped up to Rs. 20 or 22 crores, that of dry cells may go up to 500 million units and sulphur, a strategic chemical, will attain the level of output of 190,000 tons.

In the last three decades of the present century, the rates of growth of individual chemicals cannot, of course, be maintained in the same proportion as during the coming decade 1961-70. There will be varying degrees of demand for the different chemicals and in response to them the rates of growth will in most cases rise and in some cases they may range lower. But it would appear that, taking the base 1955-56=100, the index of chemicals and chemical products, which will rise from 176 to 500 during the Third Plan, may be raised to 1,200 by 2,000 A.D. In this specific case, as in many others, estimates of growth can only be made in very broad terms.

Engineering Industries

WITH THE pronounced accent on the development of industry in the Second Plan, the trends in the expansion of the engineering industries, both in the light as well as heavy sectors, have given concrete proof that these industries are among the foremost pace-makers of progress. During roughly the first decade of planning, as much as 20 per cent of the rise in the General Index of Industrial Production was attributable to the impressive expansion of the engineering goods industries. As will be seen later, beginnings in taking up the manufacture of different items were made in different years and the domestic manufacture of some of the items is of very recent growth. This has one significant meaning, namely, that India's engineering industries have a promising future of accelerated growth.

Of equal importance is the fact that, in respect of many items of light engineering goods, India has made small but steady and very hopeful beginning of establishing export markets. Between 1957 and 1959 the total value of the exports of light engineering goods increased from Rs. 4.61 crores to Rs. 6.97 crores. The rate of expansion in exports is being maintained and it would be safe to estimate that by 1960-61 engineering goods exports will have easily touched the level of Rs. 10 crores. Among the important items of exports

are ceiling fans, textile, oil mill and sugar machinery, machinery and general appliances, sewing machines (household), aluminium household utensils, brass manufactures and, to mention important manufactures, bicycles, pumps and diesel engines. It is also interesting to note the growth in the exports of some of the other items of engineering industries in 1959, which is as follows: Motor vehicles (bodies, chassis etc.) Rs. 10.5 lakhs (1958) and cutlery other than knives Rs. 13 lakhs, primary dry cell batteries, Rs. 10.5 lakhs, lighting fixtures Rs. 10 lakhs, electric accessories Rs. 4 lakhs, and so on.

The growth of heavy engineering industries is remarkable for the reason that most of the items now produced in India are of recent origin—as recent as the year 1956. To this category belong steel tubes and pipes, sugar mill machinery, jute mill machinery, cement mill machinery, tea processing machinery, agricultural machinery, road rollers, chemical and pharmaceutical machinery, oil mill machinery weighing machinery, construction machinery, flour etc. mill machinery, mining machinery, vehicular diesel engines, and so forth. Items, such as, steel structurals, bolts nuts etc. machine tools, power driven pumps, welding electrodes, grinding wheels, coated abrasives, agricul-

'ENGLISH ELECTRIC'

HIGH RUPTURING CAPACITY HEAVY DUTY FUSEGEAR

H. R. C. CARTRIDGE FUSE-LINKS

Hermetically sealed construction—
Non-deteriorating—
ASTA certified for 35 MVA rupturing capacity—
Visible indication of operation—
Ratings up to 300 amps.

COMBINATION FUSE-SWITCHES

Ratings from 30 to 750 amps—
Rugged construction, fully shrouded and interlocked—
Type tested for 35 MVA rupturing capacity.

COMBINATION FUSE-SWITCHBOARDS

Incorporating Combination Fuse-Switches upto 750 amps—
Robust and compact construction—
Readily modified and extended—
Type tested for 35 MVA rupturing capacity.

DISTRIBUTION FUSE-BOARDS

Robust, dust and moisture proof construction—
Type tested for 35 MVA rupturing capacity—
Ratings from 15 to 100 amps.

Flexibility of power distribution—
Can be installed without disturbing existing layout or production—
Avoids chasing of floors for ducting—
Approved by Fire Insurance Authorities.

COIR BOARD-ERNAKULAM, Kerala State

tural implements and some others have an earlier historical growth. In the domain of light engineering industries, only a few items, such as, automobile ancillaries, air conditioners, typewriters, scooters, trailers, motor cycles, telephones have a recent origin dating to 1956. But the whole range of products extending from automobiles, bicycles, power transformers, dry cells, wood screws, winding wires, hurricane lanterns, sewing machines, radios, and so on have a much longer span of growth.

Taking the base 1957=100, it is instructive to note the rapid growth of some of the items in the year 1959: steel tubes and pipes 130, steel structurals 156, vehicular diesel engines 249, stationary diesel engines, 179; power driven pumps 154, jute mill machinery 168, agricultural machinery 272 and among the light engineering industries the following items: bicycles 135, electric fans 142, electric motors 126, automobile ancillaries 191, sewing machines 149, steel files 142, winding wires 285, telephones 173, and so on. Of course, in assessing these indexes of individual items, proper allowance ought to be made for the fact whe-

ther they are of recent origin with a low output in the base year or they are older items with large output in the base year.

No attempt will be made here to estimate even in broad terms the expansion of the heavy and light engineering goods industries. These industries are of relatively recent origin and India's steel industry which is basic to their growth has been put on a new basis of dynamic growth only in the Second Plan. At the present time India is relying very heavily on imports of capital goods and machinery, but as the take-off in the economy is completed and growth is put on a self-generating basis, it will be readily appreciated that the engineering goods industries of India will enter upon another vigorous phase of spectacular growth. Practically all the major items of machinery and equipment will be manufactured indigenously, dependence on imports being limited mostly to specialised varieties whose manufacture may not be worth while to undertake on an optimum scale. This gives a brief idea of the magnitude of the future growth of the engineering industries.

Sugar Industry

THE SUGAR industry—the second largest organised industry in the country—has had a spectacular growth after independence. In 1949-50, the total output of white sugar was less than 10 lakh tons, one-tenth of which was produced in the Southern States of Andhra Pradesh, Madras, Mysore and Kerala. The level of output took a sudden spurt from 1954-55 when production rose to nearly 16 lakh tons. By 1956-57 an all-time peak above 20 lakh tons of white sugar was reached. Then followed two years of stagnation when production ruled below 20 lakh tons, primarily due to heavy burden of taxation and control in ex-factory prices. The recent incentives in regard to the excise duty have once again imparted a dynamic touch to the industry and the total output for the last year of the Second Plan is anticipated to exceed the Plan target by a wide margin. Current estimates show that production would be around 27 lakh tons as against the target of 25 lakh tons.

The demand for white sugar is closely linked with the rise in the living standards of the people. Correlating the pattern of growth in income envisaged during the next forty years with the consumption of sugar on per capita basis, estimates have been made in regard to the level of likely demand and probable production of white sugar in the next forty years. The results are given in the table alongside. It will be seen that at the end of the Third Plan the target of 30 lakh tons of white sugar fixed by the Planning Commission will certainly be achieved. At the end of the century the total production will most likely touch the level of 75 lakh tons. A healthy feature of this growth is the diversion of pressure from the North Indian States of Uttar Pradesh and Bihar to South Indian States. A clear pattern of this is already available. Between 1949-50 and 1958-59 the four Southern States have trebled their output of sugar production. Whereas in 1949-50, the output of white sugar in the factories located in the Southern States was a little more than one lakh tons, it is anticipated to exceed three lakh tons in 1960-61. If this healthy trend is continued, the share of the South Indian States is likely to steadily increase and at the end of the century may contribute nearly one-third to the total volume of output. In that case the Southern zone will be able to feed itself from its own factories and will cease to depend on U.P. and Bihar.

PRODUCTION OF SUGAR

Year (November to October)	Production ('000 tons)
1949-50	979
1950-51	1,116
1951-52	1,497
1952-53	1,297
1953-54	1,000
1954-55	1,590
1955-56	1,862
1956-57	2,029
1957-58	1,978
1958-59	1,912
1959-60	2,400
1960-61	2,700

PROJECTIONS: 1965-66—2000-01

1965-66	3,000
1970-71	3,600
1975-76	4,300
1980-81	5,000
1990-91	6,200
2000-2001	7,500

Fertilizer Industry

THE FERTILIZER industry can look forward to a period of rapid development. The average consumption per hectare at 1.4 kilograms per annum indicates a very poor level of consumption in relation to such advanced countries as Japan and the United States, which have, by using fertilizers, increased their agricultural production at a very fast rate. The Indian Union has already chartered its path so far as the production and consumption of fertilizers in the next five years is concerned, and the Third Plan has set the target of one million tons (nitrogenous content.) The Kane Committee, however, recently went into the problem and has suggested a much more ambitious target of 1.5 million tons.

The production of fertilizers, specially ammonium sulphate, has taken a steep rise in recent years. The average rate of growth in the case of ammonium sulphate, which is one of the chief fertilizers being manufactured in the country, worked out to be over 23 per cent per annum. In the case of super-phosphates also, the rate of growth has been about 20 per cent per annum. These percentages do look impressive,

OUTPUT OF FERTILIZERS IN INDIA

(Thousand tons)

Year	Ammonium Sulphate	Superphosphates
1933	9.7	—
1934	14.0	—
1935	17.6	—
1936	16.0	—
1937	17.8	—
1938	14.5	—
1939	19.7	—
1940	25.4	—
1941	29.7	—
1942	27.3	—
1943	21.7	—
1944	23.5	—
1945	22.0	—
1946	22.5	4.5
1947	21.3	5.0
1948	35.2	21.5
1949	45.6	46.8
1950	46.8	52.8
1951	52.8	61.2
1952	220.8	46.3
1953	319.2	43.0
1954	340.8	105.6
1955	393.6	74.4
1956	368.8	81.6
1957	379.2	141.6
1958	384.2	226.3
1959	378.5	244.4

but it has to be conceded that the level from which production commenced was extremely low. In terms of the total volume, much ground still needs to be covered. The volume of ammonium sulphate produced in 1960 was less than 4 lakh tons; the output of super-phosphates was less than 3 lakh tons. The table in column 1 shows the trends in production in the case of both these fertilizers.

The fact that the pressure of demand is high can be gauged from the fact that during the last three years, the imports of fertilizers have been putting a heavy pressure on India's foreign exchange resources. Imports of fertilizers in 1959 cost more than Rs. 7 crores.

The awareness in regard to the utility of fertilizers amongst India's masses that has occurred through the Community Development Movement is likely to create a demand which may be truly described as "explosive". It is a pity that the fertilizers industry has been included in Schedule B of the Industrial Policy Resolution of 1956 which will tend to progressive State ownership, leaving very little latitude for the private sector. Recently, it seems there has been some relaxation and the Government of India is actively thinking of enlisting the support of the private sector for setting up new units in order to meet the ever-increasing demand.

Because of the "explosive" character of the growth of this industry, it is hazardous to try to forecast the probable demand at the end of the century. It is certain that the Indian Union, by the end of the century, will have attained self-sufficiency in food which will have come mostly through the "fertilizer revolution". It is anticipated that the total output of fertilizers in the Indian Union will at the end of the century exceed 10 million tons.

This expert has won the trust of millions in the label 'Sanforized'

Meet our American-trained expert who makes sure that any fabric marked 'Sanforized' won't shrink. Every day, all through the year, he tests fabrics bearing this international label; so that your clothes won't shrink out of fit—even after many, many washings!

This is how he does it:

Travelling from mill to mill, he advises and helps them with their technical problems; and makes on-the-spot tests that ensure value in the cloth you buy labelled 'Sanforized'.

Whenever he visits the mills, he takes at random several samples from their godowns as well as off the processing machine. These samples are first measured, and then given a standard wash test.

And then, the samples are re-measured. This is the first stage of ensuring quality. All fabric must meet the Company's strict anti-shrinkage specifications before it can use the label 'Sanforized'.

These tested samples are sent to the New York office for re-checking, and with them goes the expert's detailed report. These documents record the progress and prosperity of each individual mill.

The New York office checks thousands of samples from all over the world. This is your assurance that fabric labelled 'Sanforized' is of a uniformly high standard, and is welcomed everywhere in the world!

Look for

on the label

and your clothes will never shrink out of fit!

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay-2

OTTO battery of Rourkela Steelworks in operation

MORE STEEL MORE PROSPERITY FOR INDIA

Our activities include:
Coke ovens
Gas works ovens
Low temperature
carbonizing ovens
Lime kilns
Coal and coke
handling plants
Gas producer plants
By-product plants
Tar distillation plants
Chemical plants
Refractory products
Acidproof products
Civil Engineering

The prosperity of a nation can be shown by its steel consumption. The more steel that is produced and manufactured, the more you find the people possessing machines, motor-cars, refrigerators, sewing machines, tools, scientific apparatus and equipment of all kinds.

For more than 80 years OTTO coke ovens have been leading in the industry of the whole world.

Coke and gas produced in the Otto high capacity coke ovens are the basic necessities of the steel industry. Without coke no steel - without steel no technical progress - without technical progress no prosperity of a nation.

For the production of steel, coke is necessary. Further coke and gas is required in order to produce steel.

DURGAPUR COKE OVEN PLANT

the basis
for many
industries

Durgapur Coke Oven Plant installed by the Government of West Bengal, has gone into production from the month of March '59. Durgapur Coke Oven Plant is specially designed to produce good quality of coke of proper sizes for use in all big foundries and blast furnaces.

The coke is also very suitable for Ferro-Manganese Plants because special measures are taken for reducing the phosphorous content.

The quality of the coke is well above the specifications laid down by the Indian Standards Institute. The ash content is generally below 22.5% and the shatter index on 1½" is over 93%. Our coke is being regularly used by the Indian Railways and big foundries with satisfactory results. The project has selling agents in all parts of India. Large consumers are also served direct.

Our Products include:

1. Coal Tar
2. Benzol products of various specifications
3. Xylol
4. Solvent Naphtha

For further information please write to the Purchase & Sales Officer, Durgapur Project, New Secretariat Buildings, Block 'A' 1st. Floor, 1, Hastings Street, Calcutta-1.

The Durgapur Coke Oven Plant is an industry in itself and more it is the basis of many more industries to come.

Corporate Taxation: India, the U.K. and the U.S.A.

(Contributed by the Economic Intelligence Unit of the Indian Institute of Public Opinion)

CONSIDERABLE confusion exists in regard to the level of corporate taxation in the Indian Union as against that prevailing in other countries, particularly the United Kingdom and the United States. This is unfortunate because there has been a sudden growth of interest in private foreign investment in this country, and no clear indications are available as to the comparative merits of investment, whether in the form of an all-Indian company or a subsidiary or branch of a foreign company. It is, therefore, of topical interest that an attempt is made here to compare levels of corporate incentives in the three countries in the appropriate perspective.

The Government of India has foreseen the demand for information of this kind and has published a study described as "An Outline of Direct Taxes in India" which sets out several cases of particular interest. Unfortunately, the corresponding United States and the United Kingdom cases are not available in this publication. Broadly, however, it shows what needs to be

adequately realised, both at home and abroad, that the current (or standard) Indian rates of corporate taxation, of 45 per cent for an Indian company and 63 per cent for a foreign company, very seldom correspond with actuals in any year of operation of a company. This, indeed, is the case in the UK and the USA also, and nothing is so misleading as to suppose that, because the standard rates of tax are different in two countries, therefore, the overall incentives align themselves in proportion to these rates of taxation.

Two major elements operate in the Indian Union which greatly affect profitability of a new enterprise in the Indian Union, both for an Indian company and for a foreign company, in relation to the corresponding advantages in the UK and USA. These two elements are the development rebate covered by Section 10(2) (vi-b) of the Income-Tax Act and the "Tax Holiday" covered by Section 15C*. These two provisions are decisive in determining whether or not over the initial period of a company's life, an advantage is obtained in

locating it in the Indian Union as against the UK and the USA.

Apart from the general cases which have been referred to in the Ministry of Finance publication, two particular cases call for special examination. One of these is the case of a domestic company, (the tax rate on which is 45 per cent), which can avail itself of both the tax holiday and the development rebate, that is to say, a company which is engaged in an industry in which plant and machinery are of significant importance, attracting the operation of both sections. In respect of the period of operation, it might be appropriate to take the first fifteen years of a company's life and estimate whether over this period as a whole, it is advantageous to invest in the Indian Union as against the UK and USA. The results are set out in Tables I and II and in the graphs below which illustrate the point that there are in fact substantial advantages in locating in the Indian Union.

More precisely, one might argue that in the case of a domestic company, the profit after tax in the Indian Union moves in these fifteen years from 35.6 to 44.7 per cent, being at all levels above the corresponding figures in the USA. In the UK, on the other hand, there are particular years—namely, the first and second—when the profits after tax are similar, but in subsequent years they are lower than in the case of an Indian company.

In the case of a foreign subsidiary, the position is shown in Table II from which it will be seen that the tax paid rises from 16.9 per cent in the fourth year to 51.2 per cent in the fifteenth year. In the UK, the figure is higher at the beginning, but is lower at the end and in the USA, this is also the case with somewhat higher figures than in the UK for tax paid. When the average is struck over the whole of the fifteen years (as indeed it should be in order to determine on a given equity base what the average rate of tax is) India emerges mid-way between the UK and the USA. More concretely, the average rate of tax over fifteen years is 32.7 per cent of gross profits in the Indian Union and 30.8 per cent in the UK and 34.4 per cent in the USA.

Looked at somewhat differently, in the Indian Union after fifteen years, one would have in the form of profits after tax 144.7 per cent of the equity capital, whereas in the USA one would obtain 113.8 per cent and in the UK 126 per cent for a domestic company. In this case, therefore, the Indian system enjoys a substantial advantage over the USA and a somewhat smaller advantage over the UK, which might be measured by nearly a third of equity in the USA and about a fifth in the case of the UK. The position is somewhat different in regard to a subsidiary. Here the net profits after tax would be 11 per cent of equity over

fifteen years in the case of India, 104.9 per cent in the case of the USA and 118.2 per cent in the case of Britain. In other words, the American subsidiary in the USA would get back its capital plus 5 per cent in these fifteen years; the Indian subsidiary of a foreign parent would get back its capital plus 11 per cent; whereas a British subsidiary in the UK would get back 18 per cent additional equity capital.

The vital conclusion is reached that, so far as a fifteen years' study is concerned, no disadvantage pertains to investment in India as against the USA. This is because although the rate of tax rises after fifteen years, when the net advantage over these fifteen years is computed, the foreign investor could if necessary obtain his money back. This is illustrated in the cumulative graph of gains, which shows that the figure reaches the 100 per cent mark in the fourteenth year. This is primarily because of the advantage accruing to foreign parent company by the fact that when its subsidiary is taxed in the Indian Union, it has either to pay no tax—if it is covered by Double Taxation Avoidance Agreement—or get 100 per cent relief from the Indian Government in case it is taxed again at home on the remittances sent by the subsidiary.

Details of the assumptions on which the conclusions indicated above have been obtained are as follows:

A domestic company in India has to pay income-tax at 20 per cent and super-tax at 25 per cent on its earnings of taxable business profits. Hence, an Indian company pays 45 per cent of its earnings as corporate tax. In the case of a subsidiary company of a foreign parent, super-tax is payable at 43 per cent instead of 25 per cent. Thus, a subsidiary company of a foreign parent would pay corporate tax equal to 63 per cent of its earnings. But no tax is levied on the balance of 37 per cent of the earnings, even if the whole of it is distributed to the parent company. This concession is not enjoyed by a subsidiary of an Indian parent. For the balance of 37 per cent earnings, if taxed in the country of the foreign parent, the Government of India would provide double taxation relief equal to 100 per cent of the tax.

In the UK, a domestic company pays income-tax at 38½ per cent of its earnings or taxable business profits, irrespective of the amount. It has to pay a further sum of 10 per cent of the profits as Profits Tax. Earnings below £2,000 are exempted from Profits Tax and minor concessions are given if the profits are less than £12,000. Thus a domestic company in Britain would pay 48.75 per cent tax on its earnings subject to the exemption and concessions mentioned above. The parent company would pay tax on grossed-up dividends instead of net dividend from its subsidiary, but would get tax deduction equal to the difference of gross and net dividends.

PLANNED PROSPERITY

The Plan is not a dry document. It is a mighty movement effecting great changes in the life and living, outlook and attitude of the people. Thanks to the Plan, the lot of the peasant and the worker in Madras State is now vastly better than what it was a decade back.

Madras has achieved the Plan targets ahead of schedule. She leads the rest of India in the matter of rural electrification. All the rivers in the State have been harnessed to irrigate more lands, to produce more power. Her villages have been provided with good roads. The majority of them have protected water supply.

In the field of education, Madras has made history. Every village in the State with a population of 300 has a school. The School Improvement movement is a revolution that is convulsing the countryside of Madras State today.

Madras has made distinctive progress in all fields of life. This is as much due to careful planning and intelligent execution of Plan schemes as to the great co-operation of the people of the State.

The Ashoka Hotel AT NEW DELHI

LIGHTING BY PHILIPS

Occupying an area of 20 acres, the Ashoka Hotel—the largest project of its kind in India—stands out as another shining example of Philips specialised lighting.

The lighting is so essentially a part of the whole conception that it presents an architectural masterpiece which belies the fact that it is achieved by artificial means.

Philips exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy through maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience, research and development to meet the evergrowing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible plus of Philips' international experience and know-how.

PHILIPS quality lighting for ultimate economy

In the USA, domestic corporations pay under the Federal Code a normal tax at the flat rate of 30 per cent on the whole of their taxable income, and a super-tax of 22 per cent on the excess over 25,000 of taxable earnings. They are also taxed by most States, at a rate ranging from 1 per cent to 8 per cent. But under the Federal Code, the tax paid to the State is deducted before arriving at the figure for taxable earnings. Thus, in the US, a domestic company would pay between 30 to 52 per cent Federal Tax on its earnings, depending on its magnitude of profits. For simplification in computation, we have excluded taxes levied by the States. In the USA, a parent company pays normal tax and sur-tax only on 15 per cent of the dividends received from its subsidiary. Dividends are not grossed up and hence no tax deduction, as in the UK system.

The calculations are made for a new company with capital employed of Rs. 2 crores, out of which Rs. 1 crore is equity capital and the rest is borrowed capital. The capital cost of plant and machinery is assigned

Rs. 1 crore with other fixed assets Rs. 50 lakhs.

In Tables I and II, corporate tax and profits after tax are worked out for 15 years for a company with capital structure outlined above. The gross profits, obtained after deducting production costs, general and administrative costs and interest on borrowed capital from income from sales, are assumed to be Rs. 24 lakhs every year. Depreciation rates are different for different industries in these countries. Depreciation has been provided at 10 per cent of the net fixed assets in each of the three countries. Management's remuneration is also provided for at 5 per cent of the profits before tax or taxable earnings. Taxes are worked out after taking the various reliefs and rebates granted in each of these three countries. For the sake of comparability, figures for depreciation, management's remuneration, profits before tax, corporate tax and profits after tax are expressed as a percentage of the gross profits.

A Comparison of Personal Taxation in India, the U.K. and the U.S.A.

(Contributed by the Economic Intelligence Unit of the Indian Institute of Public Opinion)

IN the preceding article, an attempt was made to highlight the comparative incidence of corporate taxation on a company's profits in India, the USA and the UK. Though Indian rates of corporate taxation compared unfavourably with these countries, it was indicated therein that the cumulative effect of provisions, such as the Tax-holiday and Development Rebate of the Indian tax-system, tends to reduce the differentials in corporate earnings, and that investment in India by a foreign subsidiary was largely undeterred by corporate taxation as a whole. In this article, an attempt is made to present a comparative picture of personal taxation in India and other foreign countries. The main object of this piece is to assess the incidence of the rate of personal taxation as an element in profitability of foreign companies in India, consequent upon large charges on personnel of a foreign parent company operating in India.

In Table I are presented the corporate rates of taxation in India and other foreign countries in terms of incomes in £ sterling. It needs to be mentioned here before comparing these rates that the tax rates in all these cases apply only to earned incomes of married individuals with two children. In the case of the USA, the State Tax Levy on personal incomes is not included, as it varies from State to State.

At the income level of £2,000 per annum, the rate of taxation is the highest in the United Kingdom followed by India and the United States of America.

Unit of the Indian Institute of Public Opinion)

From £2,000 onwards, the Indian Union leads in taxation rates over every other countries, with the UK coming close second. Between £15,000 and 20,000, the

	Two	4,000	4,650	5,150	1,300	2,300
	Three	2,500	2,620	2,700	360	600
Total	..	—	—	—	4,160	8,900

United Kingdom supersedes India in the rate of taxation. In the highest income, i.e., £25,000 per annum, the UK is at the top with 72.3 per cent followed by India with 69.3 per cent, while the United States shows the rate of taxation of about 44.6 per cent. It is clear from the above analysis that the Indian Union's rates on personal income beyond £15,000 are not the highest. In particular, British management personnel with salaries above £15,000 are not affected when they accept employment in India. As a matter of fact, they will have slightly larger net incomes (after tax) available to them if they are offered the same remuneration that they are getting in the United Kingdom.

The fact that Indian tax rates on personal income below £15,000 are higher than those of all other countries considered in this article does, however, discourage foreign non-technical personnel from accepting employment in India, unless salaries significantly higher than their salaries at home are offered so that at least their net incomes after tax in India remain unaffected. The vital question is how under these circumstances the profitability of an Indian subsidiary (or a branch) of a foreign parent is affected if the top management is entrusted to their own personnel.

The character and size of the top management of a foreign company in India will depend on the size and the structure of the establishment. Consequently, profits will be affected accordingly. In the previous article, it was assumed that the equity capital of the company was Rs. one crore. After making provisions for direct costs of production and general and administrative expenses, gross profits were computed at Rs. 24 lakhs. Deducting depreciation and management's remuneration, a 15-year study of profits was presented. Taking into account the benefits of Development Rebate and Tax-holidays, it was computed that an Indian subsidiary of a foreign parent would recover 11 per cent more than its equity capital, i.e. Rs. 111 lakhs, in the first fifteen years of its operation. This compared favourably with that of a subsidiary with the same capital in the USA (Rs. 105 lakhs), though unfavour-

ably with the United Kingdom (Rs. 118 lakhs). If, because of higher tax rates in India, a larger charge has to be made for foreign managers and officers of an Indian subsidiary of a foreign parent, the figure of Rs. 111 lakhs will be affected; the degree of reduction will depend upon the salaries offered to the personnel. In Tables II and III are provided the figures of annual additional charges on a company under two different assumptions.

Statistics in Table II are worked out on the assumption that the salary which a manager or officer is offered in India remains the same as in his own country, after paying taxes. In view of the fact that the tax rates are different in the UK and the USA, it is shown in the table that a managing director getting a salary of £15,000 per annum in his own country, will have to be offered £16,750 in India, if he comes from the UK and £28,750*, if he comes from the USA. Thus, in India, considerably increased salaries will have to be offered to the personnel from the USA.

The incidence of this additional charge on a foreign company has been calculated for three sets of salaries of foreign top management in India. In each set, foreign management is supposed to consist of a general manager (or managing director), two assistant general managers and three other non-technical junior officers. In Tables II and III, salaries of these personnel are shown and for each case consequent additional annual charges on a foreign company is also calculated. For example, in case I of Table II the general manager, assistant general manager and non-technical officer are all assumed to have respectively an annual salary of £15,000, £10,000 and £5,000 in their parent company. The effect of offering them higher salaries in India—such that net income (after tax) remains unchanged—is an additional charge of £11,600 for the United Kingdom company and £38,750 for the United States company. The charge for a company will be correspondingly reduced and the probable reductions are indicated for cases II and III, when lower salaries are provided.

Table III sets out the results obtained on different

assumptions for the additional charge that a foreign company will have to bear. For each person, instead of assuming a gross income in his parent company, a net income (after tax) is assumed. For this net income, the corresponding figure of gross income is evaluated for each country. The difference between the gross income to be offered in India and that in the home country is a measure of the additional charge on the company. Thus, for case II of Table III, when a general manager, assistant manager and junior officer are provided £5,000, £3,000 and £2,000 respectively, the additional annual charge on the company is £4,900 for the UK company and £8,300 for the US company.

The effect of the additional charge on profits will vary with the magnitude of this charge. The figures of "profits before tax" and "profit after tax" for an Indian subsidiary of a foreign parent have to be consequently modified. The decline in "profits after tax" will not be in direct proportion to the additional charge. As a matter of fact, the fall in "profits after tax" will be about 37 per cent of the additional charge, because profits of a foreign company in India are taxable at a rate of 63 per cent.

As an exercise, the figures presented in the previous piece on comparative corporate taxation have been recalculated on the assumption that the additional charge for a US or UK company operating in India will be the same as obtained in the case of II of Table III. The results obtained thus are presented in Table IV.

If fifteen years' "profits after tax" are added together, it has been found that the US company operating in India will get back Rs. 103 lakhs (instead of Rs. 111 lakhs as estimated earlier) in its first fifteen years of operation. This still compares somewhat favourably with Rs. 104.9 lakhs for a US subsidiary in the USA. Since the additional charge in the case of the UK is lower than for the USA, the Indian subsidiary of a British parent will be affected. It will get back Rs. 106 lakhs. But the differences between India and the UK become greater, because a British subsidiary in Britain recovers about Rs. 118 lakhs in the first fifteen years of operation.

These findings suggest that some concessions on foreign personnel taxation may well operate in marginal cases to attract an enterprise in India.

Foreign Trade

THE legacy left by World War II in the sphere of international trade has given it a somewhat inflexible form and multilateral trade on a liberal basis remains a distant goal. Tariff barriers and bilateral agreements, or agreements between more than two countries, have contributed to this inflexibility. GATT has been a powerful instrument in lowering the tariff walls and imparting an increasing element of liberalisation to the trade of the member countries. But it would, perhaps, be too early to say that the goal of multilateral and relatively free trade will be achieved in the next few years.

The under-developed countries like India find that the significance which the import trade has acquired in their development programmes has also necessitated a drive for stepping up their exports to reduce the higher proportion of their import surplus. Trade deficit and overall balance of payments deficit is one of the necessary trials of their schemes of resources of development plans, and this has necessitated a greater reliance on bilateral agreements on their part than they would otherwise have accepted. Their present pre-occupation, rightly or wrongly—probably wrongly—is with intensifying their trade relations with countries from which they can import more and obtain greater investment in order to finance their development programmes. Until they complete the stage of take-off and attain self-sustaining growth, this pre-occupation

seems to remain a dominating factor in their trade policies.

REGIONAL BLOCS

But in the industrialised countries, particularly of Western Europe, the trend towards formation of regional trade blocs has become quite pronounced. Of course, it is argued in defence of these regional blocs that they are intended for, first, breaking narrow approach to policies in the trade of individual countries and, second, to give it a broader base of regional liberal trade as a step to global multilateral trade. The European Common Market professes this philosophy. All attempts to bring the entire West European continent within the orbit of the Common Market and thereby make it co-extensive with erstwhile OEEC, excluding Turkey, have failed. The consequence has been unfortunate and, for the immediate future at least, it threatens to raise, instead of demolishing, barriers between free trade. The emergence of the European Free Trade Association of the seven member countries, was an inevitable development as a counterpart of the European Common Market. To bring harmony and eventual merger of the two seems at present at least not easy, and the prospect is apprehended to be one of cleavage instead of continental trade unification.

The formation of the European Common Market has produced certain apprehensions in the minds of the

under-developed countries of South-East Asia, Latin America and the Middle East as regards some of their staple exports to the Common Market region. As a consequence, regionalism has also taken hold of their outlook on external trade policies. The advocacy of regional common markets for the under-developed continents is an expression of that outlook. Of course, the direction of their imports and exports and their reliance in an overwhelming degree beyond the continental regions make it difficult for them to give a concrete shape to their aspirations of regional trade arrangements as a defensive action.

CONTINENTAL ECONOMIES

America's emergence in the post-war period as a creditor to most countries on a grand scale has necessarily won for her a place of predominance in world trade. Trade between America and India has increased much faster and it has been based on a much wider coverage of commodities than ever before World War II. There is considerable similarity between the potential patterns of the foreign trade of America and India. This similarity arises from geographical factors. Both the USA and India can aptly be described as possessing continental economies in contra-distinction to island economies or small-sized economies. A continental economy, as it progressively achieves higher stages of growth, has inherent advantages which are not enjoyed by island economies. The continental expanse of the home market and the demand created at home by their large populations impart a very powerful element of stability to the trade of continental or sub-continental countries like the USA or India. A higher rate of progress in production is sustained in normal times by a rising domestic demand. The dependence on external trade—after a reasonable level of industrialisation at home is attained—does not make the economy highly susceptible to fluctuations in external trade. The capacity of the home market to sustain a relatively high level of production also creates the capacity to absorb the shocks imparted by the extreme swings in imports or exports.

This is, of course, not to argue that immunity from the repercussions of fluctuations in world trade can be

acquired by continental or sub-continental economies. This is impossible in the very nature of the growing interdependence of different countries in the sphere of trade as in other economic spheres. By contrast, an island economy, such as that of Britain, Japan or Ceylon, or of a small-sized country, such as that of the Netherlands, Switzerland, etc. is highly dependent upon the influences of export and import trade for its normal economic life. The size of the home market is modest and the greater share of national income contributed by trade has to be earned from external trade.

The percentage ratio of the foreign trade of a country to its national income, therefore, cannot necessarily be taken as an index of the high or low stage of development of that country. The foregoing paragraph underlines the conclusion that a highly developed continental economy, such as that of America, may have a low percentage ratio of its foreign trade to its national income, while an island country less developed may have a high ratio in this regard. This is amply borne out by Table TR-1 in this Section. In the year 1959, the percentage ratio of America's total foreign trade to her national income was 8.1, while non-continental economies had high ratios, such as, for instance, the UK 30.0, Norway, 65.2, Sweden 44.8, Denmark 66.3, the Netherlands 90.0, Switzerland 52.3, and Japan 25.2. From these high ratios of the countries other than the USA it cannot be suggested by any stretch of reasoning that a high degree of economic development is indicated merely by the fact of the share of its external trade in the national income. The ratio of India's foreign trade to her national income in 1959 was 12.0 per cent. It was 50 per cent higher (apart from the basic fact that the actual levels of the national income and foreign trade of the USA in absolute or aggregate terms stand very high) than that of the USA because the import requirements of India's development plans have given a sudden spurt to her total of external trade.

Looking from another angle, it would be an error to suppose that per capita foreign trade of a country

is a correct indicator of the high level of national income and, therefore, of the high level of economic development. One has only to glance at the comparative figures in this respect which are set out in Table TR-2 in this Section. It will be seen from this table that Switzerland, a small land-locked country with a modest population, has the highest per capita foreign trade of the order of \$680.4 among the countries incorporated in this table. Denmark, Norway, and the UK have per capita foreign trade respectively of \$659.3, \$599.2 and \$387.2. Their per capita foreign trade is high because of the modest size of their populations. Japan, an island economy otherwise similarly situated as these three countries, has per capita foreign trade of the order of only \$76.1, in spite of her high volume of external trade. The low ratio is explained by the high density of Japan's population. By contrast, the United States had in the year to which the table relates, namely, 1959, per capita foreign trade of only \$182.6. This is a telling instance of a highly developed continental economy which has a relatively low ratio of foreign trade to national income. India, an instance of a sub-continental economy, but representing typically the under-developed world, had per capita foreign trade

of merely \$7.9. It explains at once the low value of her foreign trade and her thick population. To take another typical example, Ceylon, an island economy with a high degree of reliance on export and import trade in her normal economic life, had per capita foreign trade of \$83.1 in 1959.

AMERICA IN WORLD TRADE

The historical growth of the USA's foreign trade is instructive, although it would, perhaps, be too much to assume that it can be said to set the pattern for India's foreign trade during the remaining four decades of the current century. America emerged as a creditor nation during World War I and, although her creditor status suffered some diminution during the inter-war period, there was a powerful resurgence in it during World War II and particularly in the post-war period. Not only that, but her relations as creditor, which were limited during World War I and inter-war period primarily to Western Europe, were diversified and extended to the continents of Latin America, Asia and the Middle East. International creditor-debtor relations involve a positive change in the direction of trade of

TABLE TR-2

PER CAPITA FOREIGN TRADE - 1959

2. Canada	5,746	5,365	11,111	17.44	637.1
3. United Kingdom	10,806	9,325	20,131	51.99	387.2
4. West Germany	3,478	9,805	18,283	52.79	346.3
5. France	5,086	5,614	10,700	45.10	237.3
6. Norway	1,323	810	2,133	3.56	599.2
7. Sweden	2,405	2,206	4,611	7.45	618.9
8. Netherlands	3,939	3,607	7,546	11.35	664.8
9. Switzerland	1,923	1,683	3,606	5.30	680.4
10. India	1,864	1,308	3,172	432.75	7.9
11. Pakistan	353	321	674	86.82	7.8
12. Australia	1,854	2,008	3,862	10.06	383.9
13. Japan	3,600	3,457	7,057	92.74	76.1
14. Denmark	1,602	1,398	3,000	4.55	659.3
15. Ceylon	4,21	368	789	9.50	83.1

the parties. The flow of credits and the repayment of debts has essentially to be channelled through capital goods equipment and manufactures, semi-manufactures,

raw materials and other merchandise goods. How the direction of America's trade has undergone a conspicuous change is summarised in the following table:

(To nearest 5 per cent)

Type of trade	Year	Europe	Canada	Southern North America	South America	Asia, Africa Australia
Imports	1910-1914	50	15	15	10	10
	1956	25	25	10	20	20
Exports	1910-1914	60	10	20	5	5
	1956	30	20	15	15	20

America's major creditor position in relation to Europe during World War I, World War II and the period of Europe's post-war reconstruction naturally gave a pronounced bias to the direction of her imports and exports towards Europe. The year 1956 marks the completion of Europe's post-war rehabilitation and a return to an improving balance of payments situation. It was inevitable therefore that Europe's exports and imports in relation to America should diminish relatively to the pre-1956 period. The above table shows that America's exports shrank from 60 per cent of the total to 30 per cent in the direction of Europe, while imports from Europe decreased from 50 per cent during 1910-1914 to 25 per cent in 1956. By contrast, the shares for the other regions in America's exports and imports increased in varying proportions. The shift explains the substantial fall in America's imports and exports in relation to Europe. The increasing share of the four regions in the table, excluding Europe, speaks for intensification of economic co-operation between the USA. on the one hand, and those regions, on the other.

There is no parallel between America's creditor

position acquired during World War I and World War II, on the one hand, and the creditor position to which India found herself to have risen during World War II, on the other. Between the end of World War II and the mid-period of India's First Five-Year Plan, the solid sterling balances of India, accumulated during the war, sustained a rising import surplus. But as the bias of development shifted from agriculture to industry towards the end of the First Plan, the sterling balances began to be depleted at a higher rate and India had to come back to the debtor position on a big scale, solely for the specific purpose of financing development by means of external aid. The difference between the creditor positions for two countries highlights the difference between the high degree of economic development in America and the start which India has made in her pursuit of economic expansion.

INDO - US TRADE

Elsewhere in this Annual Number, the development of America's massive role as a supplier of credits for India's development has been elaborated. As a

RATIO OF EXPORTS TO NATIONAL INCOME IN 1959

The breath of industry

Oxygen—feeding the flame that knifes through steel, welding enormous broken castings and bubbling through molten metal to make pure steel—the flow of Oxygen in modern industry never ceases. From tiny workshops to the great steel plants and shipyards, wherever there is metal to be worked, Oxygen is on the job.

corollary to this new and vital economic relationship between India and America, the trade between the two countries has naturally taken a new and expanding form. At the present time, the composition of India's exports to America is predominated by raw materials such as manganese ore, mica, hides and skins, secondly, by primary commodities like tea, pepper, cashew kernels, and manufactures like jute goods, mill-made cloth handloom cloth, which is acquiring rising importance, and so forth. India's imports from America are easily dominated by foodgrains of which wheat, constitutes the bulk and then in importance come maize, sorghums and rice. This is a reflection of India's post-partition vulnerability in the matter of foodgrain production. Raw cotton is a basic agricultural raw material for which India has come to rely in a substantial degree on America, partly because of her own shortages of domestic production, but primarily because of the great and liberal facilities available under PL 480. These PL 480 imports are a valuable interim phase in India's direction of imports. By the end of the Third Plan India will have achieved self-sufficiency in foodgrain production. From the long range view-point, the new trade relationship which has developed between India and America is demonstrated by our imports of capital goods and equipment from that country. In this important class of imports may be mentioned machinery, both non-electric and electric, transport equipment and chemicals, iron and steel, etc. Fertilizers represent an important development item and mention ought also to be made of medicinal and pharmaceutical products. Indo-US trade is now placed on a widening base which is bound to be sustained in the future patterns of the two countries.

What will be the changing pattern of India's foreign trade during the remaining four decades of the 20th

century? An answer to this question must be found with reference to the composition and direction of India's exports and imports. So far as the composition of the trade is concerned, no special effort at forecast is necessary. It goes without saying that, so long as the period of self-sustaining growth remains to be reached, capital goods and equipment, intermediates and industrial raw materials which are not domestically produced will predominate imports. Thereafter their importance will be substantially reduced. As India's industrialisation proceeds progressively with the fulfilment of the development programmes, the present lopsided reliance of our exports on raw or semi-processed materials and primary commodities will be rectified, giving place to manufactured products.

FUTURE DIRECTION OF INDIA'S EXPORTS

The most crucial question is about the direction of our external trade and particularly the direction of our export trade. If high import surplus is the pre-condition of our programmes of economic development, a concurrent responsibility is thrown on the export trade to expand to the maximum possible extent in order to reduce the magnitude of the import surplus. After the urgency for heavy imports is reduced, exports will acquire a strategic importance inasmuch as our primary function will be to repay the maturing credits which will fall due cumulatively after the next two decades or so. Of course, during the next two decades there is an obligation to repay, but these repayments are to be of a relatively small size.

The pattern of financial resources for our development plans in which foreign credits have a crucial place will impart some inflexibility to the direction of our export trade. India has opted for the policy of receiving

"He's not heavy, he is my brother!" says the five-year-old Champa to the farmer. He stands bemused at this strange logic. His eyes follow this little girl carrying her impatient two-year-old brother to the AMUL Free Milk Distribution Centre of the village. He thinks of this new generation—bold and independent. He thinks of the 16,000 other children, between the ages of one and six, who get six ounces of milk free every day. These children do not know, but he knows that this scheme is the result of an agreement between the UNICEF, the Kaira District Co-operative Milk Producers' Union Ltd., Anand, the Government of Bombay and the Government of India. His chest swells with pride as he walks on the pucca road he has helped build. Once it was a narrow pathway one stumbled along even in broad daylight! Now his village is no more a slumbering hamlet. Today, it has a school, a library and a dispensary. He recollects the day when electricity came to his hut... how afraid his wife was to touch the switch! And that water-tap in their hut... Yes, going, going are the days when she had to walk miles to fetch a pail of water, and when they had to retire at sunset. And he thinks of his own contribution. Of the 40,000 farmer members of the 138 Village Milk Producers' Co-operative Societies affiliated to the Union. Of their joint effort which is fostering a spirit of resurgence in the countryside. Of Champa, the symbol of the rising generation of Kaira, and of the day when she will lightly bear the responsibility of her community—the brotherhood of Kaira.

INDUSTRY

Simon-Carves, in India since 1935, accept contracts for designing and building plants for Sulphuric Acid and Oleum production, Roasting of pyrites and other sulphide ores, Saltcake and Hydrochloric acid, Electrolytic soda and Chlorine, Coal carbonisation and by-product recovery, Ammonia synthesis by the Ammonia Casale process and production of Nitrogenous, Phosphatic and complete fertilisers.

Simon-Carves are currently executing a contract from East India Distilleries & Sugar Factories Ltd., to build a complete compound fertiliser factory in Ennore near Madras. The factory will go into production about the middle of 1962. The contract includes the design and supply of the equipment, the civil engineering work and the erection and commissioning of the plant which will produce approximately 51,000 tons a year of compound fertilisers based on ammonium phosphate. The factory will include an ammonia synthesis plant, sulphuric and phosphoric acid plants and raw material and product storage and handling equipment.

ALUMINIUM FROM CANADA

One-fifth of the free world's supply comes from Canada, where wilderness watersheds provide the staggering amounts of electricity needed to smelt aluminium.

Hydro-power is one of Canada's great natural resources—and aluminium ingot is an ideal way to share it. That's why Canada smelts nearly 7 times the aluminium it needs at home—helping conserve electricity for power hungry factories in other countries.

Together with Alcan aluminium comes Alcan's programme of technical assistance and her team of engineers and scientists working to bring the most up-to-date knowledge and research right round the world to wherever that knowledge will be of benefit to users of aluminium.

external assistance from all friendly countries unhindered by ideological inhibitions. We have received, although in a modest size, credits from the USSR and other Communist countries. The essential principle underlying these credits is that they are accompanied by agreements of bilateral trade and, so far as it is practicable, these agreements are being evolved on the principle of bilateral balance. This may partake of the complexion of barter transactions, but the principle is that surpluses should be reduced to the minimum. Then another principle behind the credit agreements is repayment in rupees. As the credits are expanding in size, the volume of bilateral trade is also being expanded. The rupee balances acquired by the creditor countries are utilised, after a time, for buying goods in India which are required by those countries at home. Thus a novel feature of rupee exports, which is a counterpart of rupee repayable credits, is developing and it will have some significance in our export trade. These credits will undoubtedly serve to build up long-term trade relations between India and the Communist countries and they will bring to us the benefit of diversification of our export trade. What applies to the rupee repayment agreements of the Communist countries applies equally to similar agreements concluded by non-Communist countries with us.

The bulk of our foreign debt is acquired from the

countries of the West. These debts will need to be repayed in the form of exports. Since 1959 foreign credits from the Western countries, now including also the USA, are predominated by the principle of tie-up or utilisation of the credits for purchases in the credit-supplying countries themselves. The result that will occur is that a certain inflexibility will be imparted to our balance of trade. The absence of the choice to buy in the cheapest market will create larger trade deficits in respect of the aid-giving countries. At the present time, West Germany typifies the case of this class to an excessive point where our adverse balance of trade (which is virtually equivalent to our balance of payments) has reached a great dimension. The case is being strongly argued (and also being appreciated by the creditor countries) that aid ought to be accompanied by trade, that is to say, by a substantial off-take by the creditor countries of India's exports. If this view is accepted and the policy of aid plus trade is widely pursued, balance of trade and other severe stresses and strains will be reduced. In about two decades, the assumption behind our planning is that India ought to reach a stage of building up a significant export surplus. To the extent that aid and trade become the accepted pattern of the policy of the Western countries, the choice for India to diversify the direction of her trade will be more free than if tied credits, unaccompanied by a greater off-take of Indian exports, would leave us.

An asset to home and office

Steel Cabinets

Among the exclusive features of KHIRA Steel Cabinets are:

- perma finish of oven-baked enamel;
- the use throughout of mechanically-rolled and straightened sheets pre-treated against rust and corrosion;
- special 3-way locking device;
- shelves that easily adjust themselves to provide extra space when and where wanted.

Made from quality steel, KHIRA Steel Cabinets incorporate grace, strength and security

KHIRA Steel Cabinets come in three sizes:
The 'UTILITY' — 78"H x 36"W x 19"D
The 'POPULAR' — 65"H x 33"W x 19"D
The 'MIDGET' — 50"H x 30"W x 17"D

KHIRA Steel Cabinets come in attractive olive green or special gray, to fit in with your room colour scheme. Keep the things you value most, in a KHIRA Steel Cabinet.

Khira Steel Cabinets—combine elegance with utility

counts...

For the speedy production of machine parts to close size tolerance with good surface finishes, Grinding Wheels of high quality, efficiency and precision are essential. The picture above shows a Hardened Steel Machine Shaft being precision ground by Carborundum Universal Grinding Wheel on a Jones & Shipman Universal Cylindrical Grinder.

CARBORUNDUM UNIVERSAL manufacture a wide variety of Grinding Wheels and other Abrasive products of the highest quality for every industry. These products are helping top firms to make better products, to cut costs and to speed production. Whatever the Grinding operation, Bonded Abrasives by CARBORUNDUM UNIVERSAL cannot be beaten for high quality and economy.

We are now in a position to manufacture and supply large wheels upto 36 inches in diameter, thus offering our customers a complete range of Vitrified and Resinoid Grinding Wheels.

BONDED ABRASIVES:
Grinding Wheels, Segments, Rubbing Bricks, Slicks, Sharpening Stones, Valve Grinding Compound, etc.

Foreign Investment and Assistance

IN the context of the theme of the special number, the study of investment flows assumes special significance. The United States of America today is undoubtedly the most prosperous nation in the world and consequently it has the maximum capacity to export capital. India, having embarked upon a series of plans for economic growth, the magnitude of which is not equalled by the programmes of any other developing country in the free world, is in the greatest need of capital assistance. Her creditworthiness, tradition for sound administration and political stability make her safe for investment risks. Moreover, India is now launching her Third Five-Year Plan, which is adjudged to be of a reasonable size by foreign observers. Its requirements of foreign capital are much greater than those of the Second Plan and they are essential for the very success of the Plan. In the following pages, the role played by foreign investments in the growth of developing countries has been surveyed very briefly with special reference to the contributions made by America. In view of India's substantial needs of import of capital in the near future, the magnitude of investments from North America during the rest of the current century has been assessed in this section.

When a country sets about the task of developing its economy, with emphasis on the adoption of modern techniques which are practically alien to it, the import component rises not only in volume but in quality which has a direct bearing on value. As a corollary, the pressure on the country's balance of payments begins to increase and shortages of foreign exchange recur at intervals. This gap, in fact, keeps on widening due to the progressive demands created by investment outlays. Thus it is that every country in the process of growth has to depend on advanced and capital exporting countries for the supply of investment until it reaches the stage of self-generating growth.

PRIVATE CAPITAL INVESTMENTS

Foreign capital, up to the end of the last war, predominantly took the form of private investment in equity as well as in the form of loan issue. But in recent years loans at government to government level, loans to governments through the United Nations agencies like the World Bank or other international agencies and loans of a big order to private parties with the guarantee of the local government have increased in importance. This is because the number of countries which have acquired political sovereignty and therefore, undertaken immediate programmes of economic expansion is increasing progressively since the war and their cumulative demands for foreign capital are growing. To satisfy these demands is now more the responsibility of State Governments and specialized agencies than that of the private investor. Nevertheless, the private investor is bound to be relied upon as a vital source of capital assistance. In 1914, for instance, the value of global foreign investments were estimated at \$44,000 million. It remained almost unchanged during the inter-war period so that in 1944-45 it was around \$42,000 million. It ought to be stressed that the figure in 1944-45 was approximately equal to \$25,000 million if converted into 1914 prices. In terms of prices before the first World War, the total volume of foreign investments suffered a decline. This decline in overall foreign investments was primarily due to a rapid decrease in the proportion of export of European capital. However, the gap was being filled progressively by the USA. In fact, the foreign investments of the USA registered a marked increase during the inter-war period. The tables below show the accumulated long-term private investment of the USA in foreign countries.

ACCUMULATED LONG-TERM PRIVATE INVESTMENTS OF USA IN FOREIGN COUNTRIES

(In million \$)

	Total	Direct	Portfolio
1914	3,500	2,600	900
1930	15,200	8,000	7,200
1946	12,300	7,200	5,100
1957	33,600	25,300	8,300

U.S. PRIVATE FOREIGN INVESTMENTS, OTHER THAN DIRECT INVESTMENT, END OF 1958

(In million \$)

	Total	Foreign \$ Bonds	Other Foreign Securities	Other Long Term	Short Term
Canada	5,320	2,094	2,474	345	407
Latin America	2,403	139	40	860	1,364
All other countries	1,733	547	202	321	663
Int. Institutions	907	907	—	—	—
Total	13,749	3,931	3,690	2,640	3,488

RISING AMERICAN SHARE

Between 1914 and 1930 both direct as well as portfolio investments of the USA in foreign countries increased sharply and divided almost equally in the latter year. The second major rise was witnessed during the ten years between 1946 and 1957 when the total investment rose from \$12,300 million to \$33,600 million. The predominance of direct investment over portfolio investments became a characteristic of the investments during this period.

In most of the cases quite a substantial part of these funds represented reinvested profits. In fact, profits ploughed back constituted as high a proportion as 44 per cent of the total additional investments. Thus, nearly half of the private investment from the USA was not a fresh outflow but reinvestment of profits. This fact is revealed in a United Nations study on the pattern of foreign investments during the post-war years. The study says: "The growth of direct investments does not result principally from the transfer of fresh funds from the capital exporting countries, but from the reinvestment of a large proportion of the profits earned." Nevertheless, it is equally valuable because profits which in the ordinary course would have been repatriated home are ploughed back in the country of investment and retained there for much needed capital for future growth.

Private foreign investments from the USA were directed in the earlier phase, in an overwhelming measure, to Canada and Latin America. This was for the reason that, except for an artificial political boundary, there is considerable identity of interest in economic and political policies between the USA and Canada. Under-developed Latin America was considered a priority area for export of capital on the grounds of geographical proximity, affinity of outlook and safety in ventures like oil, mining and plantation industries. Furthermore, a sort of financial interlocking of interests came to be developed between the manufacturing interests in the USA and the raw material supplying interests in the USA and the Latin American countries. This pattern of flow is undoubtedly different from the pattern of investment of metropolitan countries in colonial countries but it has a common feature, namely, safety of investment. Out of the net flow of private long-term capital from the USA during 1952-58, totalling \$10,000 million, about 40 per cent went to Canada and 31 per cent to Latin America, while out of the residue of 29 per cent the last share was claimed by countries among which were Australia, the Philippines, Japan and Indonesia. The latter came to about \$30 to \$50 million by 1957. In that year American investments in India were of the small order of \$2 million.

Among the world's suppliers of private long-term capital, the USA now came to occupy a significant position. Out of the gross outflow of private long-term capital into under-developed countries as well as industrialised countries in 1957, more than two-thirds came from the USA. The UK was the next in order and it accounted for 13 per cent of the total. The USA's gross outflow of private long-term capital in 1957 rose to about \$4,000 million, while that of the UK came to \$760 million. The other shares according to

capital exporting countries were France \$460 million, West Germany \$195 million, and the remaining West European countries between \$100 million and \$150 million.

A significant change occurred in the last few years. Out of the total net outflow of private capital from the USA in the years 1957 and 1958, the larger part went to regions outside Canada and Western Europe. It was received by under-developed countries, but in this category the largest share equivalent to about \$1,100 million was directed to Latin America.

RISE IN STATE INVESTMENTS

Another noteworthy re-orientation in the pattern of foreign investments in recent years must now be explained. From investment on private account with profit as the mainspring, loans started flowing at the State level as part of the economic policies of the capital supplying countries. This orientation has been influenced by the fact that the magnitude of requirements of imports of capital is increasing so rapidly and almost with such a simultaneity that the needs can be satisfied in a substantial degree by export of capital at the State level. Furthermore, new international institutions like the IBRD were established to canalise capital to under-developed nations.

FOREIGN ASSISTANCE TO INDIA

American assistance to India has been growing and has been practically more than the combined total of the assistance received from all other countries. One reason why India did not feel the need to approach America for economic assistance earlier was the fact that, before and during the first phase of the First Five-Year Plan, the tempo of development was so moderate that capital imports could be carried out in significant quantities against the sterling balances. Most of the European nations and the UK were busy with their economic reconstruction and they could not spare surplus capital goods for export in significant quantities. The First Five-Year Plan which was largely oriented towards agriculture, did not require massive imports of capital equipment. The result was that against a plan of Rs. 2,000 crores, foreign assistance came to around Rs. 297 crores, which was 14 per cent of the Plan expenditure.

It was assumed that during the Second Plan period foreign assistance to the tune of Rs. 800 crores would be a realistic target. The foreign exchange crisis which emerged in 1957 brought home the realisation that dependence on foreign assistance would need to be larger than was envisaged in the Second Plan. The economic climate in the countries which could afford to export capital came to the rescue of the planners. By the end of the Second Five-Year Plan, it appears that as against Rs. 800 crores, foreign assistance materialised to the extent of Rs. 1150 crores. This was, indeed, a remarkable fulfilment. It ought to be stressed that but for the timely capital imports which were made available through various sources, India's Second Five-Year Plan would have fallen on the rocks.

It is interesting to observe that foreign assistance, which seemed to be a rather unimportant source of finance in the First Five-Year Plan and only partly an important source in the Second Plan, figures as a major base for the success of the Third Five-Year Plan. Not only foreign assistance forms a large percentage—32 as compared to 19 and 25 in the First and Second Plans respectively—but in absolute terms it is expected to be almost three times the amount received in the Second

SKODA'S SHARE TO THE COMMON STOCK FOR A COMMON END!

Skoda's contribution to the economic advancement of the nation is significant, considering that it has undertaken over a dozen projects in different parts of India, some of which have already been completed and some are under completion.

Five-Year Plan. In this context, the absolute quantum of aid is really relevant.

	Total Invest- ment (1)	Foreign Assistance (2)	(2) as per- centage of (1) (Rs. Crores)
First Plan ..	2,000	297	14
Second Plan ..	4,600	1,150	25
Third Plan ..	10,000	3,200	32

ASSISTANCE FOR THE THIRD PLAN

It is clear now that exports will not be able to finance more than a small portion of the Third Plan import requirements. Normal trade balance, which takes into account the normal exports and only maintenance imports is expected to show a deficit of Rs. 500 crores during the five years of the Third Plan. This is a weak spot in the foreign exchange resources for the Plan and it arises from the maturing repayments of foreign debts. Equipment for the Plan is expected to cost around Rs. 1,900 crores of foreign exchange. Another sum of Rs. 200 crores is earmarked for components and intermediate products which will have to be imported to increase the production of capital goods.

Apart from Rs. 2,600 crores, as indicated in the table below, it has been estimated that PL 480 assistance during the five years will be over Rs. 600 crores. This will make the country self-sufficient by providing 17

FOREIGN ASSISTANCE ALREADY PROMISED (Upto January 1, 1961)

Country	Total aid authorised		Credits already committed for Third Plan projects
	Loans	Grants	
World Bank ..	325	—	—
U.S.A. ..	628(2)	493(3)	24
U.K. ..	120	1	40
West Germany ..	122	2	28

Norway ..	—	2	—
Total(1) ..	1,626	620	374(4)

- Individual items in the above table may not add up to totals because of rounding.
- Includes Rs. 254 crores representing rupee loans out of P.L. 480 and P.L. 665 rupee counterpart funds.
- Includes Rs. 374 crores representing rupee grants out of counterpart funds.
- Of this sum, Rs. 246 crores is included in the Rs. 1,626 crores of total loan aid already authorized.

million tons of foodgrains. Thus the total assistance expected in the plan comes to Rs. 3,200 crores.

To cover the excess of payment over receipts	Rs. 500
Machinery and equipment for projects in the Plan	1900
Components, intermediate products, etc. for increasing the production of capital goods within the country	200
TOTAL	Rs. 2600

While India's needs of foreign capital are of such a high order, the immediate outlook of its availability is light. America's balance of payments problem and the hardening attitude of West European countries with great accent on tied loans, have altered the scene. American aid, too, is now to be tied to purchases in America. All in all, the foreign assistance component remains uncertain at the moment.

AMERICAN ASSISTANCE TO INDIAN PLANNING

The tables on pages 178 and 179 give the details of foreign assistance received during the First and the Second Plans also assurances of the credits for the Third Plan. It is quite apparent that the United States of America remains at the top. Of the total authorised assistance of Rs. 297.6 crores during the First Plan, the US share comes to Rs. 167.8 crores. Similarly, up to the end of March 1960, the US share of about Rs. 888 crores forms 54 per cent of the total. One peculiar feature of the US assistance has been that it was not for isolated products but flowed into sectors of the Plan where it was needed urgently. For instance, in the First Five-Year Plan, the biggest challenge was from agriculture. In 1951, USA, through various grants and loans came to India's aid with a wheat loan of \$359 million, made by the Export-Import Bank. The country was facing famine conditions.

PL 480 and DLF, two important agencies through which India has received a major volume of assistance are of recent origin. The first four PL 480 agreements were signed on August 29, 1956, June 23, 1958, September 1958 and November 13, 1959. Apart from 11 million tons of wheat and 625,000 bales of cotton, India has received modest quantities of rice, tobacco and dried milk powder. The total value of the commodities covered by the First four agreements amounts to \$967.5 million. The sale proceeds have been provided to be disposed as under:

	Dollars Millions	Rupee equivalent (Crores)
Grants to the Government of India for economic development	196.0	93.3
Loans to the Government of India for economic development ..	524.6	249.7
Loans to private enterprises under the Cooley amendment ..	92.1	43.8
Reserved for US government expenses in India	154.8	73.7
TOTAL	967.5	460.5

The fifth PL 480 agreement signed on May 4, 1960 and its two supplements concluded respectively on July 29 and September 23 cover commodities worth \$1,334.7

million (Rs. 635.3 crores). The apportionment of this amount is as follows:

	Dollars Millions	Rupee equivalent (Crores)
Grants to Indian Government for economic development	562.7	267.3
Loan to Indian Government for economic development	562.7	267.8
Loans to private enterprise under the Cooley amendment	66.8	31.8
US government uses	142.5	67.8
TOTAL	1,334.7	635.2

The fifth agreement covers the supply of the following agricultural commodities: 16 million tons of wheat, 1 million tons of rice, 100,000 tons of milo (grain: sorghum), 2 million pounds of tobacco, 134,000 tons of corn, 4,000 tons of soybean oil and 330,000 (US) bales of cotton. The wheat and rice shipment will be spread over a period of four years. The other commodities will arrive in India in the near future.

The Development Loan Fund provides dollars which are needed to procure technological goods and services. This aid was freely usable in the markets of the choice of the aid-receiving countries so that they could obtain maximum value of purchases in the competition markets. But the recent fundamental change of policy which makes it obligatory to spend the aid-funds in the American markets has brought it on a par with tied loans from the European countries. This is a source of restriction on the utilisation of the foreign exchange made available by way of loans. In special cases, repayment will be accepted in local currencies—rupee from India. Further, it has been expressed that the US does not intend to purchase export goods of the receiving country with local currency payments, preferring that they be used for internal development capital. This again is a feature that distinguishes US assistance from that extended by certain other countries.

India is the biggest recipient of loans from the Development Loan Fund. Until June 30, 1960 the Fund extended credits totalling \$269.2 million (Rs. 125.8 crores). During the last few months upto the end of November 1960, more loans totalling \$159.1 million (Rs. 75.5 crores) have been announced though agreements have not yet been formally signed.

A comparison of the US assistance in respect of its magnitude and the terms attached to it with assistance from the USSR is of fundamental importance to examine the oft-repeated Russian claim that its aid is more effective and cheaper than American aid. This comparison will also apply to other Communist countries. One very evident difference is that Communist assistance tends to be concentrated in a fairly narrow range of activities. The US assistance on the other

hand, is spread broadly over a wide sector of the economy. In this process it extends its benefits to India's population. If the interest rates charged on loans from Communist countries are low the corresponding factor cannot be ignored that in volume it is small. This is apart from the political motives behind low interest rates.

LOOKING FORWARD

It may be worth while to estimate the possible requirement of foreign capital during the next forty years. The Research Section of "The Eastern Economist" has built up sectorwise distribution of India's national income decade by decade from 1960-61 to 2000-2001. The results of this study are set out in a table on page 60. What will be the probable size of the next eight plans and foreign exchange needs in terms of these national income figures? An attempt has been made to forecast these estimates on the following assumptions:

Throughout this period an average capital output ratio of 3:1 is assumed to prevail. It is known that the expenditure of the Indian Union during the last plans has shown some variations ranging from 2.5 to 3.5 per cent. The figure of 3:1 is a very safe one for purposes of forecasting because it is not likely to disclose very wide deviations.

The foreign exchange requirements which are estimated to be 25 per cent of the total development during the Third Plan will continue to be at the same percentage level in the Fourth Plan as well. For the Fifth and Sixth Plans, the size of the foreign exchange requirement is estimated at 20 per cent of the total size of the respective plans. Similarly, for the last two decades the requirements of foreign exchange are estimated at 15 per cent and 10 per cent of the total development plans respectively.

The results of this analysis, based on these assumptions, are set out in table below. It will be seen that during the Third and Fourth Plans, the total requirements of foreign exchange will be Rs. 5,900 crores out of which a demand for the Third Plan will be Rs. 2,600 crores. In other words, the foreign exchange requirements of the Fourth Plan will be Rs. 3,300 crores. The volume of foreign exchange needed in the subsequent plans will steadily go on rising, but it does not mean that the Indian Union will not be able to earn this volume of foreign exchange from current export earnings; the rise in national income which averages above 5 per cent during the next four decades will certainly be instrumental in setting up export industries, detailed in the industrial sector, which can find a market abroad. It is on the basis of the possibility of marketing a progressive portion of India's increased production of goods that this whole plan for the four decades has been made. The net imports of foreign capital, would decline. Normal capital inflows would continue, but reliance on special foreign aid programmes will be steadily reduced and after a period of fifteen years, it will be modest or negligible.

(Rs. Crores)

	1960-61	1970-71	1980-81	1990-91	2000-2001

The Insurance of Bank Deposits: The American Experience

THE failure of the Palai Bank and the country-wide feeling of uneasiness it created have provoked some hard thinking on measures to vitalise the Indian banking system. Confidence in the basic soundness of the system has not been shaken, but a strong demand has been made in Parliament and outside to eradicate unhealthy banking practices and to redouble the faith of depositors in the system as it is being called upon to bear increasingly onerous responsibilities in financing development in the successive Five-Year Plans. One of the major remedies advocated for this purpose is insurance of bank deposits on the American pattern whose feasibility has been tested for about three decades now. In the light of this urgency, which the issue of deposit insurance has assumed, it is pertinent to examine in brief the American experiment.

During the wave of bank failures after 1929, a demand for deposit insurance under the sponsorship of the Federal Government gained momentum. The Banking Act of 1933 provided a temporary plan for the protection of bank creditors through insurance plans. It was superseded in 1935 by the permanent plan administered by the Federal Deposit Insurance Corporation.

The Act of 1935 was designed to strengthen the commercial banks, weaken the connection between speculation and banking, and give added powers to the Federal Reserve System. Specifically, it established FDIC, with a capital of \$289 million, \$150 million subscribed by the Treasury and the remainder representing one-half of the surplus of the Federal Reserve Banks.

The chief purpose of the corporation is to insure the deposits of all banks entitled to the benefits of deposits insurance. All banks which are members of the Federal Reserve System are insured. Non-member State banks may, at their option, secure this insurance if they can meet the FDIC standards, as may mutual savings banks. Conversely, a non-member bank may terminate its deposit insurance upon notice at any time, the insurance on the bank's deposits continuing for two years thereafter. The FDIC now covers most of the commercial banks in the United States.

The FDIC does not insure the total deposits of each bank; instead, it insures only the first \$5,000 of each depositor's claim against a bank, whether public or private deposits. Insurance extends to deposits of every limit, including regular commercial deposits, time and savings deposits, and trust funds. Each insured bank pays the FDIC an annual premium equal to 1/12 of 1 per cent of its total deposits. The assessment is payable in semi-annual instalments.

The procedure of the Corporation upon closing of an insured bank is to assume immediately the insured deposit liabilities of the closed bank and make available the funds needed to pay off the deposits.

The Corporation acts as a receiver for all suspended national banks, and may act as receiver for suspended State banks when so appointed by State authority. The Corporation may make loans to or purchase assets from insured banks to facilitate a merger or consolidation which would reduce probable loss to the Corporation. The decision to close an insured bank does not rest with the Corporation, as this power rests with the bank's directors or with the Federal or State authorities which chartered it. Also, the decision to

merge with another bank is made by the bank's stockholders, not the Corporation.

The Corporation does have, however, the power to terminate the insurance of a bank found to be financially unsound or of a bank whose management persists in following illegal or unsound practices. Its powers also include: (1) to examine periodically insured banks which are not members of the Federal Reserve System; also national banks, with the consent of the Comptroller of the Currency, and other member banks, with the consent of the Board of Governors of the Federal Reserve System; (2) to approve or disapprove any consolidation or merger of an insured bank with a non-insured bank, or the transfer of assets to a non-insured bank, or the transfer of assets to a non-insured bank in consideration of the latter's assumption of deposit liabilities; (3) to approve or disapprove any proposals to reduce the capital of insured banks not members of the Federal Reserve System; (4) to approve or disapprove proposals by insured banks, and members of the Federal Reserve System, to establish and operate new branches or remove established branches from one location to another; (5) to regulate the advertising which insured banks are required to use to inform the public that they are insured; (6) to prohibit the payment of interest on demand deposits of insured banks not members of the Federal Reserve System; (7) to limit rates of interest on time and savings deposits of insured banks not members of the Federal Reserve System, and to prescribe different rates for different types of time and savings deposits.

The usefulness of the FDIC is greatly underestimated if it is considered to be merely a passive insurance company that protects the depositors in failed banks. In the first place, it can decrease the failure rate through its examination and supervision of insured banks. It promises to be particularly useful in raising the standards of thousands of small state banks that are not members of the Federal Reserve System. In the second place, the presence of deposit insurance may prevent sporadic bank failures from generating an epidemic of runs on banks. And in the third place, the FDIC has greatly improved the handling of distressed and failed banks.

Deposit insurance as it has been in operation through the agency of the FDIC has been the subject of some severe criticism. One criticism is that, while the scheme of insurance has been in force, American banking has not been put to the acid test of crisis. For one thing, this scheme does not pretend to make banking failure-proof. For another, confidence generated by insurance is one of the contributory factors in the uninterrupted span of prosperity. Another major criticism is that it introduces a novel principle in insurance, namely, that of charging the rate or premium not according to the nature of the risk but according to ability to pay. In consequence, bigger and stronger banks have to bear the brunt of subscribing to the insurance fund. If this practice was not followed, rates of premia would have risen high for weaker banks and discouraged their participation, thus restricting the cover of insurance to the stronger units where it is least needed. Other criticism are frivolous. The scheme does not purport to be a substitute for sound banking practices, but to create a defence against the contagion of loss of confidence, generated by a few bad cases, spreading over the entire banking system.

Transport: India and America Railways

THE SEARCH FOR "BALANCE"

THE search for a right policy for the development of transport, as a strategic component of the infrastructure of the economy, is basically a search for "balanced" growth of the different modes of transport. To secure balanced growth is necessarily a continuous process. The forces of dynamism and the changing structure of the demand for transport require that there should be constant adjustment and readjustment in the policy which ought to take full cognizance of the changing trends in the progress of technology. This is by no means an easy task as initial capital investment and also subsequent development outlay create financial stakes of a very high magnitude. Nevertheless, any transport policy which fails to take adequate note of technological improvements is bound to prove a poor instrument of progress, no matter what shifts are made in the relative emphasis on different types of transport. It is from this long-term angle that policy for transport in India ought to be viewed. Happily, a beginning is already made in this direction since the economy of our country entered upon the crucial stage of take-off.

Railway transport unquestionably constitutes the most vital life-line in India's communications. It is also a rich heritage which Free India has acquired from the British rulers. But the fact that the pattern of railway development in India was very largely, moulded after the pattern of British railways may prove an important handicap to the over-all development of the transport system of this country. This has no reference to the State ownership and management of the Indian railways because it is now a settled principle of policy that railway transport in this country can function as a dynamic force essentially under State auspices. But the handicap is likely to arise from the fact that the pattern of transport in Britain cannot prove to be the right prototype for the future development of transport in India.

CORRECT PROTOTYPE

Geographic forces dictate this conclusion. Britain is a small island. Her land mass is quite limited in area and the problems of transport in Britain are characteristically those of an island economy. India, by contrast, is a sub-continent, with a vast land mass and except for the Himalayas to the North, her topography is pre-eminently suited for extensive surface transport. Inland waterways undoubtedly have their own significant place in India's transport system, but in the overall scale their importance is small. With the vital difference in the relative importance of inland waterways, geographically there is the maximum conceivable resemblance between India and North America from the view-point of the suitability of the pattern of transport. What the Indian transport policy of the future requires is to imbibe more and more of the basic characteristics of transport for continental or sub-continental countries. The correct prototype for an appropriate transport policy, which will satisfy the requirements of our sub-continental economy is, therefore, the system of transport as it is being evolved in America.

This is not to say that there is complete identity of problems of future transport development between India and America. There are vital differences. It would be well to recognise at the outset that the late discovery of America, the infinite scope which her discovery opened for the exploitation of her manifold virgin resources, the distribution of comparatively sparse population as well as the remarkable and swift progress which America made in industrialisation are

factors of contrast between America and India. The prototype of American transport will serve as the correct pattern for the future development of transport in India subject to these vital differences between the two countries.

The bias for inland water transport in the first phase of the development of American transport is easily explained by the fact that the early settlers in that continent, who inhabited the coastal territories, found in the rivers the natural lines of communication with the interior which they were progressively penetrating. The presence of great lakes in America was another vital factor which created a pronounced bias for waterways as the dominant mode of transport. Government assistance, in these circumstances, was influenced and directed towards the exploitation of waterways. In course of time, as waterway facilities and construction of canals demanded increasing outlay, the State was easily inclined to provide it. Private transport carriers were saved from basic as well as fixed investment outlays. This created an impression that waterways are the cheapest mode of transport as their operating costs are low. Now, in retrospect, this view is being more and more challenged. It is argued forcefully that State outlay on construction and maintenance of canals, whose burden is borne by the tax-payer, constitutes a subsidy to inland waterways. If the waterway user has to pay cheap rates, it is because of this undoubted element of subsidy. Waterways, however, had a limited span of dominance as more intensive development of the continent demanded extensive transport facilities on the land surface. Railways offered a solution to this pressing demand.

GROWTH OF AMERICAN RAILROADS

America was ahead of India in embarking on the Railway Age by about a quarter of a century. Within less than three years of the formation of the first railroad company, railway transport was introduced in America with a tiny beginning. In 1830, the first 13 miles of American railroads were opened for traffic. Our parallel was 23 miles from Bombay to Thana in 1853. For convenience the growth of America's railway system in terms of route mileage is tabulated below:

GROWTH OF RAILWAY ROUTE MILEAGE IN AMERICA

Year	Route Mileage	Year	Route Mileage
1830	.. 13	1890	.. 163,597
1834	.. 167	1900	.. 193,346
1840	.. 2,818	1910	.. 240,293
1850	.. 9,021	1916	.. 254,090
1860	.. 30,626	1930	.. 249,052
1870	.. 52,922	1940	.. 233,670
1880	.. 93,207	1945	.. 227,000

Ever since their inception in 1830, American railways have been developed under the initiative of private enterprise. This is a unique characteristic in rail transport which has no parallel elsewhere in the world. There was, however, a very brief span during the emergency of the World War I when the operation of the railways was taken over by the Federal Government. On December 28, 1917, President Woodrow Wilson's administration took charge of the manage-

ment of the railways and operated them for 26 months until February, 1920, when they were handed back to the rail-road companies. Guaranteed dividend was paid to stockholders and although Federal management of railways during this interlude entailed a loss of \$1.2 billion, it proved competent and effective to deal with emergency war operations. It is the characteristic of America's free enterprise economy that State control was terminated as soon as the emergency was over. It is not as if railway development in America had no share of the State's financial assistance. Subsidies were granted to some companies and grants of land for railroads were made for the construction of about 18,000 miles or about 8 per cent of the total route mileage. Excepting for this Government assistance, the growth of American railways is the product of private enterprise and investment.

The magnitude of this enterprise is very clearly reflected in the remarkable expansion of route mileage of American railways summarised in the table above. In this history of growth one fact stands out conspicuously. During the decade ending 1880, the growth of the route mileage was of the phenomenal order of 70,000 which was reckoned to be equivalent to the combined growth of the railway systems in Britain, France and Germany over half a century. When this fact is highlighted, it would be easily appreciated that a comparison between the expansion of the American railways and the Indian railways in route mileage is without any basis at all. The dynamic and rapidly expanding economy of America imperatively demanded a fast spreading network of railroads.

PATTERN OF GROWTH IN INDIA

In India this motive force behind expansion was lacking. Table T-1 in this Section sets out the major indicators of the growth of the Indian railways since their inception in 1953 to 1958-59. Indian railways have suffered a loss of route mileage on account of three causes—separation of the railways in Burma, partition and allocation of railways to Pakistan and dismantling of some segments of the railway lines during World War II out of which some were not restored. The route mileage of American railways reached its peak at 254,000 in 1916 after which until the close of the last war, as many as 27,000 miles of route were abandoned. The abandoned route mileage may make an interesting comparison with India's present total route mileage of 35,080.

More important than the length of the railways are the basic contrasts in the forces which stimulated the expansion of the railway systems in the two countries. This may be illustrated with a paradox which has a powerful element of irony. During the decade ended 1860 the expansion of American railways got its first spectacular impetus (as demonstrated by the increase of the route mileage by 21,600 miles) from the investment boom following the discovery of gold mines in California. In India the first spectacular impetus came from quite a different factor. During the decade ended 1890 the route mileage was stepped up by 7,250 miles mainly because the Famine Commission which reported in 1880 made a powerfully argued recommendation that nothing less than extension of railway route mileage by at least 5,000 miles would provide the minimum insurance against recurring famines.

This background has, however, receded into past history now. Extension of Indian railways in the current century has been stimulated by pressures of economic growth. Although this pressure was undoubtedly manifest after Independence in a more pronounced degree than before, extension of route mileage has been kept within very modest limits for reasons of the order

of priorities in the allocation of development resources. During the first two five-year plans construction of new railway lines proceeded at an annual average rate of 120 miles or approximately 1,200 miles during the decade. Doubling of track, however, was stepped up during this period at the average yearly rate of 130 miles.

FREIGHT TRAFFIC TRENDS

Table T-2 in this Section gives a comparative picture of the growth of railway traffic in terms of freight ton-kilometers and passenger-kilometers in America, Canada and India. One conclusion which is apparent on the face of this Table from the trends in freight ton kilometers corroborates the basic dictum of transport that railways are the most efficient, the cheapest and, therefore, the most convenient mode of land transport of goods in bulk over long hauls. On the American railways, freight ton-kilometers reached the peak of 1,081,237 million in 1944 under the stress of the emergency pressure of the war. The relative decline in ton kilometers after 1944 is to be attributed to the easing of this pressure and not so much to loss of ground to other modes of transport. It is significant that except for the year 1949 the trends in railway freight traffic in America show a sustained high level of activity. In Canada freight traffic shows a much more spectacular progress than in America as shown by the performance in ton-kilometers from 1928 onwards.

In India, freight traffic carried by the railways received a great impetus during World War II, but under planned development since 1951 its high level performance is conspicuous from the table. From 47,449 million ton-kilometers in 1951 to 73,414 million ton-kilometers in 1957 is a far cry. The gap between the volume of railway freight in Canada and India is quite marked, but the gap between America and India is phenomenal and it gives the measure of the differences in the strides made by the economies of the two countries.

The railways of all the three countries have had to bear the brunt of competition from highway traffic carried by motor transport during the inter-war period as well as after the end of the World War II. American railways were the worst sufferers from this competition among the three railway systems during the inter-war period. But management under free enterprise in America exhibited a remarkable degree of progressiveness and after the costly experience of World War I, it introduced a new powerful phase of technological improvements in railway equipment. Among these improvements may be mentioned the introduction of diesel-electric locomotives (which since their introduction in 1925 surpassed the strength of steam locomotives by 1952), centralised traffic control with main reliance on automatic signalling, introduction of freight cars of larger capacity, improved automatic couplers, and so on. After World War II, the emphasis in technological improvements shifted to rationalisation of the yards sidings, terminals and rolling stock in general. Indian railways too have entered upon the initial phase of introducing, in a small way, these improvements in their equipment. But they have to make up a great leeway before they can catch up with the technological aids which are to be seen in actual use on the railways in the West.

IMPACT OF HIGHWAY TRANSPORT

Table T-2 in this Section is important for tracing the impact of motor transport on railways in Canada and America. This is not to say that this impact made little impression on the Indian railways, but the diffe-

The Catcracker at the Burmah-Shell Refinery, Trombay

"No discussion of refinery expansion in India is complete without reference to what is known as the imbalance problem. Forward estimates still show an imbalance between a demand for individual products and the yields of existing and projected refineries resulting in a surplus, for example, of motor gasoline. Ways and means of minimizing these surpluses are engaging the Government's/Industry's close attention... I should like to make particular mention of one technological advance. Last year your Chairman reported that the yield of gasoline had been reduced between 1956 and 1958 from 23% to 16.5% while middle distillate production had been increased from 31.8% to 34.6%. Currently the Refinery is producing about 15.0% gasoline and 45.0% middle distillates, an outstanding achievement and a real milestone towards the objective of making refinery production conform to the product pattern requirement of India."

Extract from Statement by Mr. P. D. Tew, Chairman of Burmah-Shell Refineries Limited, at the Seventh Annual General Meeting held on 29th August 1960

rences are quite remarkable. This impact is to be seen in the trends in passenger-kilometers recorded by railways in America and Canada. It was inevitable that during and immediately after World War II, railway passenger traffic should be stepped up to new peaks on account of defence requirements. But, if this emergency phase is excluded, it will be seen that in America there has been an almost continuous and sharp decline in passenger-kilometers operated by the railways. In spite of the progressive and phenomenal growth in passenger travel in America, passenger kilometers on American railways reached the post-war low of 37,500 million in 1958. In Canada the decline is not as spectacular as in America, nevertheless over the three decades, instead of showing a steady increase, Canadian railways are carrying a lower volume of passenger traffic. The major explanation of the sharp setback to passenger traffic on Canadian and American railways is to be found in the aggressive and successful competition of highway transport. In India, as Table T-2 demonstrates, railways are gathering an ever-growing crop of passenger traffic and also of freight traffic. This is because the potential competition from motor transport could not have a proper play owing to numerous restraints which operated through the policy of regulation, taxation, import restrictions in recent years, and so on.

In America the intense rivalry between railway transport and highway or motor transport exhibited itself in its crude form during the inter-war period, as in most of the countries including India. But the impact of competition from highway transport on the even tenor of railway transport was probably profound because the automobile manufacturing industry made the speediest progress in that country. It did not take America long to carry her automobile manufacturing industry to the stage of mass production scale and the result was that there was at once a flood of road vehicles running a severe race with railroads. Development of highway transport did not proceed on any orderly basis in the initial stage in any country with the result that competition generated by it took a chaotic form. Although the American railways had displayed impressive capacity for responding to the rapid change in the market for transport they found the onslaught of highway transport rivalry an altogether new force to reckon with. It became evident in a matter of only 3-4 years that some sort of regulation to restore order in transport, and co-ordination if possible, was necessary. From this time onwards regulation of different modes of transport by legislation became a vital and integral part of transport policy. This marks a new phase in modern transport development.

ACCENT ON REGULATION

The Transportation Act, 1920, was the first important legislative measure undertaken by Congress to regulate the growth of transport. The genesis of this Act is to be traced to the chaos created by highway transport and its marked adverse consequences on railway transport. It is significant that this Act recognised the principle of the "natural monopoly" of railway transport in the economy. The purpose of the Act was to bolster the financial position of the railways and this is to be seen in the new trend incorporated in the Act of extending the protection of law to the transport operator, which was a departure from the earlier basic purpose of regulation to protect the transport user. The Inter-State Commerce Commission was armed with greater powers in the matter of regulation of rates and minimum rates were fixed in order to eliminate cut-throat competition. The finan-

cial purpose of the Act was to give relief to the marginal and weaker railroad operators. The controversial "recapture clause" stipulated that railroad profits in excess of 6 per cent per annum should not be freely disposable by the managements. Fifty per cent of the excess was allowed to be retained by the operators subject to the strict condition that it would be used for specified objects with the approval of the Inter-State Commerce Commission. The remaining 50 per cent of the excess was to be deposited with the Federal Government. The purpose of this deposit was to utilise it as a pool for supply of loan finance to the financially weak railroad units. The "recapture clause" raised protests, while the purpose of relief through loans was not achieved on any mentionable scale as the rate of interest was fixed high.

It was with the passage of the Motor Carriers Act, 1935, that highway transport was brought within the regulatory jurisdiction of the Inter-State Commerce Commission. The Emergency Railroad Transportation Act, 1933, which was intended to help railroads out of the stalemate created by the economic depression of the 1930's, proved practically a relief on paper. But with the regulation of highway transport some measure of co-ordination could be restored within these two systems of land transport. These trends in the growth of co-ordination through legislative regulation of transport in America have a remarkable resemblance to the persistent policy of Government of India in putting severe restraints on road transport in this country for the ostensible purpose of co-ordination, whose inevitable consequence in operation has been to extend protection to railway transport at the cost of road transport. In America the policy enunciated by the Transport Act of 1920 and Motor Carriers Act of 1935 did not produce the desired effects of minimum regulation for healthy co-ordination. The policy was, therefore, changed with the passage of the Transport Act of 1940.

The principle of the "natural monopoly" of railways endorsed by the earlier Transport Act of 1920 was abandoned as the guiding principle of transport policy. In its place was substituted the principle of equitable scope for the development of the different types of surface transport which would ensure free but fair competition and enable each to obtain adequate return on investment. Inland waterways were brought within the jurisdiction of the Inter-State Commerce Commission by the Transport Act of 1940. The "recapture clause" was vacated and the deposits were refunded. In the post-war period the striking change in the structure of market for transportation and the flow of investment in highway and inland waterway transport created a new set of problems. The Cabinet Commission on Transport, appointed by President Eisenhower in 1954, reported a year later on measures of co-ordination of the different modes of transport. But this report, by the consensus of opinion of transport operators, is unlikely to produce any tangible and effective remedies.

MODIFIED RESORT: THE MORAL

The situation at the present time is that railroad operators find their financial position losing the essential elements of vitality. The Transport Act of 1920 assumed a rate of return of 6 per cent as fair, but experience has shown that a rate of 3.5 per cent is what the more advanced and progressive of railroad operators are in a position to stabilise. Over the years, since co-ordination became a live issue, the multiplicity of railroad companies has been one of the important problems in American transport policy. Efforts to reduce the number of railroad units by merger, with the good offices of the Inter-State Commerce Commission but on the

OIL — lifeblood of industrial civilisation

Oil means easier life—for oil powers and lubricates machines, planes, ships, trains and trucks, easing the burden of man.

Oil means brighter evenings—for oil keeps giant electric turbines and generators running, and also feeds the lantern of the villager.

Oil means more food—for oil powers tractors which give more food from less land.

Oil means healthier life—for petroleum insecticides destroy germ-carrying insects, adding more years to man's life.

Oil means diffusion of knowledge—for oil lubricates printing presses and makes printing inks, making communication of ideas easier.

Oil means all this—and a great deal more!

Oil is playing a major part in India's march towards economic expansion. Through its major operations—refining, marketing and exploring for oil—Stanvac is participating in the country's efforts.

STANVAC — participating in India's progress

STANDARD VACUUM OIL COMPANY (Incorporated in the U.S.A. with Limited Liability)

PSSVOC-8A/60

declared principle that amalgamation must be voluntary, have left this intractable problem unresolved. At the present time one of the principal objects of rationalisation of rail transport in America is to merge the existing units into about a total of 20 units or so. By contrast, the problem of integration of Indian railways, whose multiplicity on the merger of the former princely States with the Union of India assumed grave dimensions, could be solved without any difficulty as the ownership of the railway systems vested in the State. Even so, it would appear that the zonal system of merger of Indian railways has not helped to achieve the much publicized benefits of economical and efficient financial management. The history of regulation of transport in America for the purpose of co-ordination highlights the inference that co-ordination is difficult to achieve in an ideal form and the appropriate objective of policy should be to keep legislative regulation to the reasonable minimum.

This is indisputably the basic moral for India in her search for a dynamic policy of transport that has become a crying need at the present time. As earlier in America, railways have been looked upon as entitled to the status of a natural monopoly in the transport system of our country. When this assumption was being challenged and disproved by the emergence of road transport, much less than due regard was paid by the Government to the new forces in the demand for transport and the capacity of the different agencies of transport to satisfy that demand. Even to this day the Railway Ministry is trying to defend the position of railways as a system legitimately entitled to inherent monopoly. This is not to argue that road transport is being excluded from competition for traffic. But the superior position of easy access to traffic, not quite justified on grounds of competitive efficiency, is being preserved for the railways. There is neither consistency nor logic in the position which the Railway Ministry takes from time to time and what is amazing is that the shifts are irreconcilable.

During the earlier phase of the Second Plan, when the rates on the railways were revised, steep rates were evolved for short hauls on the avowed principle that short distance traffic ought to be discouraged from the railways and diverted to road transport. Last year the Railway Ministry came with a disguised demand, behind which it arrayed all the powerful forces of pressure it can exert, that diversion of short distance but high-rated traffic to the motor transport was inflicting an injury on railway finances which must be repaired. In consequence of this demand a Transport Co-ordination Committee has been appointed and, while it would be improper to prejudge the final shape of policy which will be approved in pursuance of its recommendations, there is little doubt that the Railway Ministry will strain every nerve to secure a tightening up of restraints on motor transport at points which affect it adversely. The pertinent question which must be asked in the interest of a long-range policy for transport is: Should policy for transport co-ordination be allowed to be influenced by such sudden and seemingly wayward swings? The answer is clear — it is in the negative.

A crucial stage has now arrived in recognizing the position of railway transport vis-a-vis road transport in the light of the spectacular expansion which our transport system has to undergo in the next three or four decades. As observed at the outset, railway transport will continue to occupy the position of the major life-line of the country's network of communications. But this is only in a relative sense that railways will be the major carriers of long-distance bulk traffic, that they will need to be entitled to a fair share of high-rated traffic which is not covered by long haul

bulk traffic, but certainly not by putting deliberate and artificial restrictions on road transport or by making a vain effort to put off the inevitable emergence of the Age of Roads.

INDEX OF VITALITY

Development outlay expended on the railways in the first two Plans ought to be scrutinized for the benefits — or the lack of them — which it has brought. During the First Plan, what was really done for the railways was not development as such but their rehabilitation after the excessive war-time damage to equipment. The major backlog of rehabilitation was cleared in the First Plan. In the Second Plan it could be said with full justification that outlay was allocated for the modernisation and vitalisation of the railway system. During these ten years new construction of railway lines was very modest and it worked at an annual average of 120 miles. Doubling of track which involved much less outlay than new construction recorded an annual average rate of 130 miles. By and large, the outlay in the Second Plan on the railways was allocated and utilized for the rationalisation of equipment and introduction of certain new technological processes. When this bias in the outlay is taken into account, it is only reasonable to expect that productivity on the railways should demonstrate marked improvement and that this improvement, in turn, should be reflected in the results of financial working.

Tables T-3 and T-4 are of considerable help in making this assessment about improvement in financial operations. The real index of the vitality of the railway finances and the progressiveness or otherwise in their trends can be judged with reference to the rate of return on the capital provided for the railways. Although railways do retain in a partial degree their character as a public utility undertaking, they are by universal recognition a commercial enterprise and, for that matter, the largest State-owned commercial enterprise. With the expansion of the public sector of industry in our economy, an ever-increasing responsibility will devolve on State enterprises to earn larger net profits in order to contribute to the resources which the Exchequer will have to supply for the progressive requirements of the developing economy. The success or otherwise of the railways with respect to this crucial criterion has an important bearing on the justification of the expansion of the public sector in industry.

The financial classification adopted in the railway budget is in some important respects different from the conventional commercial accounting classification and it requires a brief word of explanation. Net revenue receipts—so-called—are computed after deducting working expenses and appropriation to depreciation, but they include interest charges. Dividend paid to the General Revenues comes out of the net receipts. In reality, to call this payment to the Exchequer as a dividend is a misnomer. It is out of this dividend that interest charges are paid by the Exchequer on the capital-at-charge obtained by public loans by the Exchequer for the railways. The real or net dividend received by the Exchequer is the balance left after payment of interest charges. This leaves a residue which is equivalent to profits retained by the railways. In technical parlance, they go under the description of the surplus or net gain. The real position comes to this that the net dividend received by the Exchequer and the surplus retained by the railways together constitute the net return on capital.

The estimates in Table T-3 and T-4 about net return are made on this basis. They do not take into

account some minor allowances or concessions made in respect of interest charges etc. The most conspicuous fact which emerges from Table T-3 is that the rate of return on capital of the Indian railways declined from roughly 2.02 per cent in 1955-56 to 1.67 per cent in 1960-61 — the period of the Second Plan. According to the Railway Board's forecast for the Third Plan, the rate of return as computed in Table T-4 will decrease to 0.56 per cent in 1961-62 and 1965-66, with still lower rates of return in between. In America although 6 per cent was assumed as a fair rate of return on the capital of railroad companies by the Transport Act of 1920, the efficient units have been able to earn on an average something around 3.50 per cent. American railroads pay heavy interest charges on loans and steep taxes on property as well as income. Indian railways are exempt from payment of taxes. The rate of 0.66 per cent envisaged for the Indian railways in the Third Plan makes a painful comparison with this rate of return in America.

It has become a commonplace with the Railway Ministry to plead the teething troubles of the phase of development as the root cause of the present trends in financial working. But, in view of the fact that the Second Plan was essentially a Plan for modernisation and a small measure of technological improvements, in railway equipment and operating techniques, and the volume of traffic offering is actually reaching a level at which constantly recurring bottlenecks arise on the railways for strategic commodities like coal and ores, this plea cannot be considered to hold water. It may sound harsh, but it is a bare inference warranted by facts, that the management of the Indian railways in the sphere of finance has failed to show progressive trends. While revenue is going up, expenditure is allowed to increase quite out of proportion. And in spite of this financial sub-standard performance, railways are giving clear proof that they will find it increasingly difficult to provide the transport capacity which the continuously mounting volume of traffic will require.

RELIEF TO RAILWAYS

Railways have to take in their stride, as the main-lifeline of communications, all categories of traffic, over short or long hauls as well as high or low rated. It is but fair that they should be enabled to obtain an equitable proportion of high-rated traffic which usually crosses medium distance. In America this objective is attained by allowing railroad companies to operate

motor carrier services where the regular highway operators do not provide them or provide them on an inadequate scale. This is usually done by means of subsidiary companies or arrangements of through traffic. Of course, participation in highway transport is allowed to railroad companies subject to the approval of the Inter-State Commerce Commission. The question about the desirability of allowing such participation is decided in open enquiries by the Commission. It would be a very useful plank of policy to encourage Indian railways to participate in road transport operations on analogous criteria.

Equally important with such type of extra-rail operations is the need for Indian railways to assimilate an important technological improvement practised for several years on American railways and to look forward to another revolutionary road-cum-rail transport technique which is being introduced on a commercial scale in Britain. The "piggy-back service" which is prevalent on some railroads in America consists of mounting truck-cum-trailer-loads on flat railway freight cars or wagons and unloading them at the rail destination for carriage by road in the form of trailers coupled to tractors. This involves considerable labour and expense in loading and unloading the truck-cum-trailer. The British "road-railer", which emerged only a few weeks back this year marks a significant technological advance on the "piggy-back" service. The road railor is a road-cum-rail vehicle which has fitted to it a simple extra equipment. This equipment consists of retractable road and rail wheels and special couplers. It can be straightaway put on the rails instead of being mounted on a open wagon and at the rail destination it can be straightaway put on road and carried with a tractor. It can complete the entire haul from the farm or factory to the final destination over road and rail without transshipment of goods etc.

Undoubtedly, the introduction of this improved equipment will demand strong surface roads, with considerable width, capable of permitting use by tractors along with trailers or semi-trailers. It is assumed that the future expansion of roads will make adequate allowance for this integrated vehicle. But in any case the growth of Indian railways ought to be stabilised, if not reduced, in terms of expansion in route mileage at the rate of about 120 miles per year in the decade since planning. Development of railways must be concentrated on rationalisation and technological improvement of equipment and operating techniques.

Roads

SUPPRESSED GROWTH

IT IS an indisputable fact that road development in India has throughout received a miserly deal. Perhaps it would not be wrong to say that the two Five-Year Plans devoted more attention to the expansion of roads in terms of more mileage than to the quality of surface and the strength of the road system. Tables T-5, T-6 and T-7 demonstrate the severe effects of tardy development of roads on the expansion of modernised motor transport. As Table T-5 shows, commercial vehicles in use in India were of the order of 192,000 in 1957 as against 1,041,000 in Canada and 11,225,000 in America in the same year. This is an index of the very small growth of commercial road traffic and of freight traffic in particular. Table T-6 explains the poor ratios of vehicles in relation to area and population. As against 112 vehicles per 100 sq. miles of area in Canada and 2,158 in America, India had a poor ratio of merely 29 vehicles in 1956. For 1 lakh of population, Canada had 26,886 vehicles, America had 38,777 in 1956, while India had only 95.

The area-wise and population-wise distribution of vehicles in India is further handicapped by the fact that motor vehicle taxation in India is among the highest in the world as disclosed by Table T-7. As against per vehicle taxation of Rs. 500 in America, India's rate of taxation is of the crippling order of Rs. 2,040. Motor transport to the extent that it has been enabled to develop in our country has been found to be a lucrative source of tax revenue. The short-sighted policy of taxing motor vehicles at a crushing rate has invited the nemesis of retarded growth of this category of transport. It is acknowledged on all hands that the policy of motor vehicle taxation in India requires a rehaul. Expert committees have put the weight of their opinion in this behalf, but the major hindrance to tax reduction seems to be the reasonable demand of the State Governments for compensatory or substitute sources of revenue for the loss of revenue from motor taxation. Sooner rather than later the Government of India will have to come to an urgent decision that the problem of relief to the State Governments must be solved and motor transport must be

Ballabgarh—

the home of GOODYEAR in India

21 miles from Delhi, in East Punjab, the little village of *Ballabgarh* has been unaffected by time and progress. Today, however, it is humming with Goodyear's constructional activity and a new industrial town is emerging.

Goodyear, the world's largest tyre company, is investing six crores of rupees in building the most modern tyre factory — including

the revolutionary 3-T unit, which is an exclusive method developed by Goodyear after five years of research and an investment of five million dollars.

This 59th factory is part of the programme of Goodyear to place before all its overseas organisations, the benefits of its experience, resources and technical skill, for which the name "GOODYEAR" stands.

GOODYEAR

WORLD'S LARGEST TYRE COMPANY

The Goodyear Tyre & Rubber Company of India Private Limited

That's from our own farm!

THERE ARE OVER 20,000 private and public carriers in South India alone with a carrying capacity of nearly 70,500 daily tonnage. They carry not only rice bags from distant farms, but haul different types of goods like furniture, bales of cloth, motors, etc.

Back in the twenties, when TVS started its Southern Roadways service they realised that South India needed a vast number of

transport organizations to meet the growing demand for road transport. To help these, they started several units to give expert and efficient service.

From supplying the chassis, building the bodies, providing the finance, right down to reconditioning of worn-out parts, these units meet the increasing demands of the automotive industry in all its aspects in South India.

allowed to rise in stature without which the requirements of land transport cannot be satisfied. The alternative to this is slowing down of agricultural and industrial production for lack of adequate surface transport.

On the basis of the projections of the growth of national income in the next four decades made elsewhere in this Annual Number, projections have been made in Table T-9 in regard to the progressive requirements of the country for different types of motor vehicles from decade to decade. They need to be taken as broad indicators of what the revolution in road transport will require.

THE AGE OF ROADS

If the development of India's economy in the industrial sector is to be based on the dispersal of large-scale manufacturing units at medium distances from the present areas of heavy concentration and if the decentralised sector of industry is to expand on a spectacular scale, this object can be fulfilled only if transport facilities for the movement of raw materials and finished goods are created on a commensurate scale. Furthermore, agricultural production in India is bound to be stepped up at a spectacular rate. The marketable surplus of farm produce will also cry aloud for transport facilities. In addition to that the impressive increase in per capita income projected elsewhere in the National Income Section of this Annual Number will radically change the pattern of consumption and the structure of the market demand. All these can be served if, and only if, an expanding system of transport is built up.

In the years to come this will be principally the function of road transport. This and no other is the central moral of the Age of Roads that has actually arrived. Table T-8 in this Section makes an attempt to estimate the required magnitude in the expansion of the road network. During the First and Second Plan, road development got parsimonious allocations of Rs. 155 crores and Rs. 250 crores respectively. The Third Plan must be considered to be more retrograde than the Second Plan in this respect. It makes an allocation for road development tentatively at Rs. 268 crores. If allowance is made for price increase, this will be lower than the allocation in the Second Plan and it will strive in vain to meet the pressing demand of road-borne traffic. This policy is not only unimaginative but blind to the supreme and over-riding claim of

adequate expansion of the infrastructure of the economy.

THE MODEST MASTER PLAN

The Chief Engineers of the State Governments have prepared a Master Plan for road expansion during the two decades, 1961-1981, which will cover the periods of the next four Five-Year Plans. The Master Plan is in no sense an ambitious Plan at all. It is a modest estimation of the minimum requirements of the economy. It involves a relatively high order of outlay for the simple reason that the neglect shown up to now in developing surface roads is to be compensated partially during the next two decades. During the First Plan unsurfaced roads were extended by 44,088 miles and during the Second Plan the extension was pushed up to 54,949 miles. The Master Plan envisages construction of 155,000 miles or 38,750 miles on an average per each of the next four Plan periods. Thus it is clear that it has deliberately fixed a target which is even below the target achieved in the First Plan.

To come to the strategic sector of roads, namely, surface roads, it will be seen from Table T-8 that in the First Plan construction of new surface roads was only 14,071 miles and during the Second Plan it was raised higher to 22,383 miles. The Master Plan stipulates a target of 108,000 miles during 20 years or 27,000 miles on an average per each of the next four Plan periods. This gives an excess of only 5,000 miles over the performance in the Second Plan. These comparisons are quite sufficient to repel the impression that the Master Plan sets out any ideal scheme of road expansion. The truth is that this ought to be taken as the irreducible minimum. The financial estimates made by the Chief Engineers disclose that total outlay for the Master Plan would be Rs. 6,550 crores out of which Rs. 5,200 crores will be for new construction and Rs. 1,350 crores will be for maintenance. Taking new construction in isolation, the outlay envisaged on an average for each of the next four Plans is Rs. 1,300 crores. As against this the allocation in the first five years of the Master Plan (coinciding with the Third Plan) is tentatively put at Rs. 268 crores.

This gap is eloquent. But its warning ought not to be missed. It is that India can ignore development of road transport in the future only at the cost of recurring and grave shortages of transport capacity, which are bound to stultify schemes of expansion in the different sectors of the economy.

Shipping

INDIA'S EXTENSIVE sea-board and her historical traditions as a maritime nation ought to prove as factors which should enable her to find her proper place in the domain of international shipping in a reasonable period of time. While this is so, progress since Independence in the expansion of shipping has not been encouraging. Here it ought to be pointed out that international comparisons are not necessary to emphasize the great leeway which India has to make up.

Nevertheless, Table T-10 in this Section should prove useful for post-war comparisons with Canada and America, both of which are almost similarly situated from the geographical point of view as India in the matter of shipping. Post-war trends disclosed in Table T-10 show that there has been a decline in the gross registered tonnage of Canada as well as America. From the high level of over 2 million G.R.T. Canada had a decline to 1.5 million G.R.T. America's decline has been much steeper than that to Canada from 32.4 million G.R.T. in 1947 to 25.6 million G.R.T. in 1958. America

cannot afford to allow this rate of decline because the responsibilities which have devolved upon her as the leading military power of the non-Communist world ordain that she must keep herself sufficiently strong in shipping. And merchant shipping is the second line of defence.

Shipbuilding in America has been sustained by liberal Congress appropriations of subsidies for construction (for instance, \$120 million in the fiscal year ended June 1958) solely on grounds of national security. But previous experience of the war-time accelerated expansion of shipping in America has shown that quality of ships is as important as the volume of the tonnage built. The Liberty ships built during the war with somewhat improvised arrangements had to be scrapped on an abnormal scale. India has made some progress in the shipbuilding industry. The shipbuilding yard at Visakhapatnam is progressing at a modest rate. If construction subsidy is granted by the Government in respect of ships built at Visakhapatnam,

it is only in keeping with the universally accepted policy. Production costs at this yard are high because its capacity is below optimum and productivity of labour is low. But far more important than these two causes is a potent factor which is not known widely enough. Contrary to the prevailing impression that ships constructed at Visakh contain a substantial indigenous component would come the revelation that the import component as represented by marine engines etc. of these ships is as high as 80 per cent. Correspondingly, the foreign exchange outlay on ships built at Visakh exceeds four-fifths of the total cost. While the foreign exchange shortage continues for overseas purchase of ships, the impression that we are making massive savings by indigenous construction is not correct. This is a serious drawback at Visakh on which attention ought to be focused.

In order to realise to what extent low allocations of resources are made for shipping, one has only to compare the tonnage targets so passionately recommended by the Shipping Policy Sub-Committee which reported in 1947 with the targets achieved or fixed for the first three Five-Year Plans. The Sub-Committee had emphasised that the minimum targets should be 9 lakh tons in 1950 and 20 lakh tons in 1955 or 1957 at least. By 1957, 50 per cent of the share in India's overseas trade was to be acquired for Indian tonnage.

Inland Waterways

INLAND WATERWAYS in India in the last 100 years have remained the most neglected sector of transport. In this respect, India offers a contrast to America. As discussed earlier, inland waterways were the initial pace-makers of surface transport in America and liberal government financial assistance flowed in order to spread their network. In America early settlement of European immigrants on the coast, the presence of numerous big rivers and the existence of the great lakes attracted priority in transport. With the inhabitation of the entire continent and the march of agriculture and industry, the emphasis shifted from inland waterways to railroads and thereafter to highways. Nevertheless, inland waterways will remain an important part of the American system of transport.

In India, the navigable rivers and canals have either fallen into disuse or been subject to grave neglect because railway transport was presumed to be

In contrast with this, the total tonnage at the end of the First Plan was 4.8 lakhs, at the end of the Second Plan it will be 9 lakhs and for the Third Plan it is set at 14.2 lakhs. During the Second Plan period, according to informed estimates, India was paying in terms of foreign exchange an average of Rs. 130 crores to foreign shipping companies for obtaining their services. As long as low allocations are made for the expansion of Indian shipping, the increasing volume of export and import business will involve, in the years to come, much larger outlay of foreign exchange than Rs. 130 crores per year on freight. This outlook in itself is sufficient to argue the case, if argument was required at all, for a realistic policy for shipping. Shipping, like roads, has received a raw deal so far.

Development of ports and harbours was directed in the first two Plans at increasing the capacity of the five major ports from 20 million tons in 1950-51 to a little below 40 million tons in 1960-61. The emphasis will now shift to improving and strengthening the port facilities in the Third Plan by introduction of technological improvements. Even so, the distant sea trades will over-strain the capacity of the major ports. In consequence, attention is being focused for the first time on the development of medium ports on which expert enquiries were made twice. Action, so far delayed, will now be taken in earnest.

entitled to an inherent monopoly of surface transport. Since independence a small beginning has been made to resuscitate the waterways which were once active lines of communication. The Ganga-Brahmaputra Board has undertaken some pilot projects for improvement of waterways within its jurisdiction and elsewhere navigable canals and inland ports are being repaired and strengthened. This year the Inland Water Transport Committee reported extensively on a long-term plan for the development of waterways. How far its recommendations have been accepted by the Government and to what extent commitments of outlay and priorities will be made in pursuance of them are matters little known outside the precincts of the Central Secretariat. The stagnation in inland waterways will certainly be broken in course of time, but it is a foregone conclusion that the present status of waterways in relation to railways and roads will not be changed materially.

Civil Aviation

NO SOVEREIGN STATE can afford to neglect aviation, whatever the pressures on its resources for economic development. During World War II the air arm emerged as a very powerful arm of defence. Civil aviation has been fostered for two reasons in the post-war world, namely, air travel and the build-up of the second line of defence in the air. Table T-11 in this section gives the main indicators of the progress of civil aviation in America, Canada and India. For a new sovereign state, India's progress since independence is a matter of encouragement. In 1947, American airlines operated 12,736 million passenger kilometers, while the corresponding figures for Canada and India were 416 million passenger-kilometers and 223 million passenger-kilometers respectively. Cargo ton-kilometers carried by American airways in that year were of the phenomenal order of 161 million. As against this Canada's 3 million and India's 2 million may look petty beginnings, but allowances are to be made for

the fact that American airlines are operating on a gigantic scale. In 1958 Canada showed the maximum rate of progress by operating 3,232 million passenger-kilometers. America achieved 50,692 million passenger-kilometers and India 864 million passenger-kilometers. Thus both these countries showed a smaller rate of expansion than in Canada, their rate being 300 per cent increase. But this percentage comparison would be misleading because it would ignore the high base at which American performance stood in 1947.

For the Third Five-Year Plan, India has made a provision of Rs. 55 crores tentatively for the expansion of civil aviation. About Rs. 25 crores will be earmarked for development and rationalisation of aerodromes and the balance for the two air companies — the Indian Airlines Corporation operating the domestic routes and Air-India International. The annual report of the Indian Airlines Corporation for 1959-60 has high-

"Ashok Leyland COMETS carry in 5 trips what others would need 7 to clear"

says The Engineering Construction Corporation Private Limited, Madras

"For the Madras Harbour Job we shall need upto 500 tons of blue metal a day. All this has to be moved from our Quarries at Pallavaram to the Madras Harbour 15 miles away. Since a lorry can make only a limited number of trips a day, the larger the load it can carry, the more economical it will be for us. That is why we are happy to have Ashok Leyland Comets in our fleet. They carry in 5 trips what others would need 7 to clear. We save on fuel, maintenance and overheads too. Breakdowns? No... None so far!"

Testimonials like this show why LEYLANDS are the most wanted vehicles in over 50 countries in the world. Every vehicle is built to exacting standards of precision and craftsmanship.

The Forward-Controlled Leyland Comet Chassis is designed specially to combine large body space with easy handling. The quick starting, long life Leyland Diesel engine, with its high torque output, combines pulling power with remarkably low fuel consumption. The Ashok Leyland Comet is the only 7½ ton payload chassis made in India.

adarts/60

lighted the fact that, given imaginative and thoroughly businesslike management, the sales potential can be effectively exploited. A point of saturation has been reached in the aircraft fleet capacity of this Corporation and the crying need of the present day is to strengthen the fleet with the addition of Viscounts.

Curiously enough, the draft Third Plan makes a provision for replacement of the small capacity Dakota aircraft only. If this mistake is not rectified in time, there is a real danger that the Corporation's finances which began to gain buoyancy last year may again sink into the pool of chronic deficits.

Pipelines

PIPELINES HAVE come to assume a strategic place in America's system of transport. In 1957, their length was 139,000 miles and they carried wet cargo of the order of 200 billion ton-miles. India is making her debut in pipeline communications with the construction of two short pipelines to carry crude oil from the Assam wells. If our explorations for oil resources yield material results, there can be no doubt that greater attention will be attracted by pipelines. A veritable revolution has been inaugurated now, as a result of technological advances, in America. The use of pipelines is

no longer restricted to the transport of oil and natural gas. In 1957 the world's first pipeline for the transport of coal was inaugurated by America from eastern Ohio to Lake Erie, 108 miles in length. It carries a mixture of coal particles and water ("slurry") for generating electricity. The rate of delivery per day is 3,400 tons of coal. American engineers are looking forward to the transport of iron ore, limestone, wood pulp etc. by pipelines. The possibility of developing pipelines, as the emerging new system of transport, needs to be kept constantly in view in India.

TABLE T-1

INDICATORS OF GROWTH OF INDIAN RAILWAYS FROM THEIR INCEPTION

Year	Total Mileage	Capital Outlay (Rs. '000)	Net Earnings (Rs. '000)	Percentage of Net Earnings on Capital Outlay	Net Ton Miles ('000)	Average Rate Charged per Ton per Mile (In pies)	Passenger Miles ('000)	Average Fare Charged per Passenger Per Mile (In pies)

SPECIAL FEATURES

- ★ TWO STAGE DESIGN
- ★ HIGH EFFICIENCY
- ★ CAPACITY CONTROL
- ★ EASY STARTING
- ★ PROTECTIVE FILTERS
- ★ HEAVY DUTY SERVICE

Alas! I am no longer needed!

India-built PHILLIPS and
HERCULES are proving the high
quality of Indian manufacture abroad!

Our exports do more than earn foreign exchange;
they help to foster confidence in foreign lands that
India can make goods comparable to the best
they're used to from the West.

Abiding Partnership: Such a favourable image is owed in no small measure to the abiding partnership between Murugappa & Sons and Tube Investments which has produced outstanding results. Our factory units producing FRW steel tubes, cycles and cycle components are being enlarged in capacity to serve both our growing internal and export needs.

There is in evidence today, as a measure of contribution to our national economy, a cycle made by T. I. Cycles in every five on the road. Our TRU-WEL tubes are helping to stabilise the indigenous manufacture of cycles at a high level. These tubes are further contributing to the building up of other light engineering industries which require steel tubing combining great strength with exceptional lightness.

We look back with pardonable pride on the role we have played in developing our national economy and are happy to have a continuing opportunity to share in the unlimited task ahead of building up a free and prosperous India.

TUBE INVESTMENTS OF INDIA LIMITED

TRANCO

VALVES

resist Burnouts!

One set of TRANCO VALVES lasts and lasts for tens of thousands of miles with no special maintenance and with normal fuelling and lubrication.

TRANCO VALVES have indeed the power to stand up to the special requirements of modern engines & fuels.

Manufactured in India by

ENGINE VALVES LTD.
(Manufacturers of Internal
Combustion Engines)
MADRAS-16.

THERE IS AN INCREASE ALL AROUND

The ST Parcels Service has acquired an evergrowing patronage because of its efficiency. ST means the finest and the most reliable in Parcels Service. You too must join the ranks of our satisfied patrons and enjoy the benefits of our swift and safe Parcels Transport Service.

Home delivery service in Bombay, Poona, Sholapur and Panvel.

For further details, contact your nearest ST office.

VISADEX

THE DASHBOARD OF BUSINESS

Work the VISADEX way to get the best out of your men, machines and materials.

VISADEX can tell you what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much... VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Our VISADEX Representative will be happy to show you, without obligation, how simple VISADEX is to operate—either with Card Pockets or Brass Card-holders—and how easily it can meet your specific requirements.

Write for descriptive illustrated folder. Our Offices at:
Bombay - Calcutta - Madras - Delhi - Kanpur - Hyderabad
Stockists all over India & abroad

Planning TOWARDS A BETTER PORT

As the life-line of Eastern India's trade and commerce, the Calcutta Port faces recurring problems every year. The emphasis on industrial progress in the Second Five-Year Plan period has considerably changed the type of cargo to be handled. Steel and mechanical equipment, heavy machinery and huge plant form a considerable bulk of the import. On the export front it is coal or ore.

To-day's well-equipped Port needs be made into a better Port to-morrow. But this is possible not by more equipments alone. The Calcutta Port needs most the whole-hearted co-operation from all fronts,—from those who use and also from those who serve it.

MEN & MACHINES MAKE
A BETTER PORT

CALCUTTA PORT COMMISSIONERS

Issued by the Commissioners for the Port of Calcutta

INDUSTRIAL FINANCE CORPORATION OF INDIA

[Incorporated under the Industrial Finance Corporation Act, 1948 (XV of 1948)]

HEAD OFFICE:

Reserve Bank Building, Parliament Street,
NEW DELHI.

BRANCH OFFICES:

Liberty Building, P-11, Mission Row 38, Whites Road,
8, Marine Lines, Extension, Royapettah,
BOMBAY. CALCUTTA. MADRAS.

AUTHORISED CAPITAL: Rs. 10,00,00,000
ISSUED AND PAID-UP CAPITAL: Rs. 5,00,00,000
TOTAL LOANS OUTSTANDING
(AS ON 30-6-1960) Rs. 39,33,38,442

AUTHORISED BUSINESS

- Granting of medium and long-term loans in Rupees as well as, by arrangement with the Development Loan Fund of the U.S.A. Govt., in foreign currency, to existing public limited companies or registered cooperative societies engaged in, or new ones proposing to engage in, the manufacture or processing of goods, or the generation or distribution of electricity or any other form of power, or mining, or shipping or hotel industry; also subscribing to debentures of such companies and cooperative societies;
- Guaranteeing of loans raised by aforesaid industrial concerns which are floated in the public market and are repayable within a period not exceeding twenty five years;
- Underwriting the issue of stock, shares, bonds or debentures by aforesaid industrial concerns;
- Guaranteeing of deferred payments to foreign suppliers in respect of import of capital goods by aforesaid industrial concerns;

PURPOSES FOR WHICH LOANS ARE SANCTIONED:

Purchase of new or second hand machinery, renovation or modernization or replacement of worn-out or obsolete machinery, purchase of land for factory site, and construction of factory buildings.

IMPORTANT TERMS AND CONDITIONS OF LOANS

- SECURITY:** First charge of all the fixed assets such as land, buildings, plant and machinery & fixtures. Raw materials, stock-in-process and finished goods will not be mortgaged and will, therefore, be available for raising working capital from elsewhere.

- MARGIN:** Generally 50% of the value of total assets including those to be acquired with the loan. This margin may be reduced to 40% in case of industrial concerns importing plant & machinery under the U.S. Export-Import Bank Loans or other foreign currency loans (tied credits) taken by Government from foreign governments or financial institutions abroad where the cost of imported plant and machinery is 60% or above of the total capital cost of the project. The margin may be further reduced to 35% in special cases.

- INTEREST:** 7% per annum with a rebate of 1% for punctual payment of instalments of principal and interest.

- REPAYMENT:** Will be spread over upto 25 years to suit borrower's convenience.

H. V. VENKATASUBBIAH
GENERAL MANAGER.

K. R. K. MENON
CHAIRMAN.

Rs. 6 CRORES
of foreign exchange
\$aved!

In the last ten years, Alind's contribution to a power-hungry nation has been something like 200,000 miles of conductor ... a contribution which has meant more industrial goods, greater agricultural output and better living in the home. But that is not all ... for this contribution represents a saving in foreign exchange of about Rs. 6 crores. And as now our Hirakud plant is also set for continuous operation ... will use indigenous metal ... Alind's annual foreign exchange saving bids fair to be at least Rs. 1.5 crores.

Our lines include: Electrical conductor-grade aluminium rods: ACSR and All-Aluminium conductors; Conductor accessories and tools; and Covered aluminium conductors for outdoor and indoor applications.

THE ALUMINIUM INDUSTRIES LIMITED

India's largest manufacturers of aluminium conductors and accessories

Registered Office: Kundara (Kerala)

Plant No. 1: Kundara Plant No. 2: Hirakud (Orissa)

Managing Agents: SESHASAYEE BROTHERS (TRAV.) PRIVATE LTD.

AL-661

Productivity: A Key to Prosperity

THE rapid growth of the Indian economy which is anticipated to take place during the next four decades described in the earlier sections is likely to receive a generous dividend from the latest technological changes, resulting in markedly higher output per man. The prosperity attained in the United States of America and other Western countries has been mostly due to the new productivity-conscious techniques, and if the Indian Union desires to attain the ambitious targets it has set before itself, there is no other way but to revolutionise both Indian agriculture and industry by the latest scientific methods.

PRODUCTIVITY IN THE UNITED STATES

The progress of the United States in terms of its increasing productivity at the rate of 3 per cent per annum is clearly demonstrated in the table below. It may be mentioned here that the increase in productivity in America has largely been brought about as a result of expansion in research and development activity. Between 1953 and 1957, for example, industry's research and development expenditures nearly doubled from \$3.7 billion to \$7.3 billion, and in 1959 they were running at a rate of about \$9 billion a year.

The table below also shows a projection of the anticipated rise in productivity till 1970, assuming that the American economy would continue its search for new methods to produce more goods and services through automatic machines. As productivity in over-all terms in the United States has risen at a constant rate, it does not necessarily imply that each and every factor responsible for this rise will be exhibiting the same rate of increase throughout. Evidence is available that the durables, in particular, have not maintained a uniform rate of output.

The graph shows the manner in which the output of consumer goods, durables and construction have risen

during the last 15 years. It will be seen that while the construction and consumer durables have maintained a slow and steady upward march, durables after an initial rise have fluctuated between a narrow limit. It means that whatever capital is locked up in the manufacture of durables after a certain stage does not give increasing returns as productivity lags very much behind due to slackness in the market. Something like that is anticipated in the Indian Union as well in so far as the durables are concerned.

THE INDIAN PICTURE

Past performance of Indian industry in regard to productivity has not been measured in a very precise manner, though some general indicators have been pressed into service in order to determine how far Indian industry in general has come under the pressure of productivity methods. This study has been made

LONG TERM PRODUCTIVITY GROWTH IN THE U.S. ECONOMY

(Output per man-hour 1947=100)

				1970 Proj	198.8

in terms of indices of industrial production and of employment. The results of this analysis are set out in the table TL—1 for the period 1939-1958. It will be seen that during the war period while employment steadily rose, the output was almost stagnant, mostly due to the reason that the machinery could not be renewed or replaced because of the peculiar conditions prevalent in those years. Immediately after the war, there was some revival. The index with 1939 base shows that a steady increase in productivity was registered in the period which followed after 1949. Within three years, productivity rose by more than 10 per cent. Then came the era of Five-Year Plans beginning with 1951. Increased productivity over a wide range of industries was witnessed, and while the total volume of employment was kept at a lower level, the volume of output started rising with the result that by the year 1955, overall productivity had shot up by 18 per cent in relation to the pre-war levels and considerably more in relation to the post-war year 1947. During the Second Plan there has been added considerable new capacity in almost all the old industries and many new industries, and there is bound to be a time-lag between the installation of capacity and actual production which inevitably results in lowering the general index of productivity in the short period. It is anticipated, however, that in future with increasing automation, the upward course in the field of productivity would be continued. By the end of the Second Plan, it is hoped that the production in terms of pre-war levels will have risen by not less than 25 per cent due to improved techniques alone.

There is need for educating Indian labour in regard to the increased benefits of productivity. The erroneous impression that automatic machinery and other gadgets which increase productivity, lower the volume of employment needs to be removed. The experience of the advanced countries is there to prove that increasing productivity is accompanied by rising earnings which in turn creates demand for new goods and services leading to higher output levels and higher employment. The Anglo-American Council on Productivity (AACP) Teams have emphasised in their reports that new methods and new machines can create new jobs. The Freight Handling Team for instance reported:

"In several instances it was found that the introduction of mechanical handling methods at depots had, by agreement with the Union, resulted in some initial redundancy of labour. In most cases, however, within a short time the turnover of the depot increased so greatly that not only were these workers re-absorbed but the additional labour was engaged."

The first AACP Team that visited America were struck by what appeared to them as the generally favourable attitude of American trade unions to improved techniques of production, the introduction of new methods and new machines, the problem of man-power displaced by them (redundancy), and so on. The very first report, for example, remarked that the Congress of Industrial Organisations offers no opposition to the inclusion or exclusion of specific duties from any man's performance, provided he is paid a rate of wages commensurate with his responsibilities, skill and effort. This is the lesson that the Indian Union has to learn from both Canada and the United States of America and the sooner Indian labour is able to change its attitude into the new line of thinking, the better it will be for them and the industry.

The Union Government on its part will have to reorient and streamline, with a vigorous productivity bias, the organisational set up of its agencies dealing with matters of industrial developments and take positive measures to ensure that the public sector enter-

prises develop into models of productivity-conscious administrations and demonstrate productivity techniques and benefits flowing from their introduction. While the coming into being of 40 local Productivity Councils, with a total membership of over 2,500 industrial units throughout the country is no doubt welcome, a great deal still for setting up joint consultative machinery will have to be done so that the management and the workers could go on together in a spirit of mutual trust and co-operation. The experiment of joint Management Councils, which had been introduced by the Ministry of Labour and Employment sometime ago is yet to demonstrate what could be achieved in the plants. Efforts will have to be intensified to extend the establishment of such machinery in the industries. An increase in Indian productivity will not occur without the maximum of joint, co-operative consultation between the management and organised labour. The National Productivity Council will have to come more effectively into being to demonstrate how appropriate incentive schemes can be introduced on the basis of scientific studies and work management.

TABLE TL—1
PRODUCTIVITY IN INDIAN INDUSTRY

(Index Numbers)

(Base: 1939=100)

		Index of Employment (E)	Index of Production (P)	Index of Productivity (P x 100) E

Health

THE ideology of welfare state has become an accepted philosophy of political life not only in the industrially advanced countries—whether committed to the system of private free enterprise or socialism or a mixed economy or communism—but also in the states which have newly acquired a sovereign status. In any welfare state public health standards inevitably occupy a very important place. In America today, health services and health standards have been carried to a high pitch because of the spectacular improvements in the national income, per capita income and the capacity of the state to raise revenue and earmark it on an impressive scale to finance welfare services. This fact gives the correct explanation of the great gap that is witnessed today between the level of health services in America and India.

As a country, which has achieved political independence only recently, and is therefore under the compulsion of a mass demand for improvements in different welfare services, India has first to make a complete break from the past and introduce a programme of great magnitudes to carry the benefits of health services in the country-side. Before Independence, health and hygiene programmes for the masses had practically no place in the real sense in the policies of the Government. Attention was forced to medical relief by the occurrence of epidemics which held out a threat of destruction on a large scale. Undoubtedly, the government in those days showed energy and promptitude in fighting the epidemics and restricting their incidence to the minimum. But apart from the compulsions of epidemics, the realisation that medical relief and medical services should be placed at the disposal of the people can hardly be said to have come about. One has only to glance through the pages of the report of Bhore Committee which was released in 1945 to get a real picture of the state of medical and health relief services. Hospital facilities provided in India were 0.24 beds per one thousand of population as against 10.48 beds in the USA or 7.14 beds in the UK. The accepted norm, according to the specifications of American experts, was 5 beds per one thousand of population. The gulf between the norm and the provision of 0.24 beds in India and the provision in America of nearly twice as much as the specified norm gives a telling measure of the vast difference in the health services provided in the two countries. To reach the level in regard to the basic provision of hospital beds attained by the USA in 1942 will take something like four decades for India. This again is problemetical. The progress in India's population and national income explain the magnitude of the task to be achieved.

HEALTH ADMINISTRATION

To construct a far-flung network of medical relief and health services on the desired scale requires the right type of public health administration as well as the right type of medical education in its diverse branches to turn out the supply of the necessary personnel. Furthermore, rising per capita income, when it has crossed the minimum point of what is necessary for satisfying the bare necessities of life, has an important bearing on health standards because the urge for better health services is created by a greater capacity to spend on medical relief. In a mixed economy such as that of India, the responsibility for spreading this network remains in some measure with private institutions, but acceptance of the welfare state makes it principally the function of the government. The type of administration for health services has, therefore, great importance.

In so far as the pattern of administration is concerned, there is considerable similarity between the types accepted by America and India. In America, the health service is organised at the level of the Federal Government somewhat on semi-military lines. The Surgeon-General at the top of the administration has a band of commissioned officers, a reserve corps and civil employees. It is the function of the Federal authority to provide technical and consultative assistance to the state and local governments' health organisations. But it must be underscored that legislatively and administratively there is complete autonomy enjoyed by the States under the Constitution in the medical sphere also. It is remarkable how the whole pattern of medical services from the top to the lowest point functions in America. It has been aptly described in a recent United Nations International Survey in the following terms:

"The scope and intensity of services provided by local health departments vary tremendously. Because of limitations in staff and budgetary resources, services in some areas are only fragmentary. The State health departments assist local health agencies largely through financial aid, loan of personnel, performance of technical service and supervision. Part of this assistance originates at the State level, and the Federal Government is the source of another portion. Federal assistance is made available to State and local health services because many public health problems cut across both State and local boundaries, or are beyond the normal public and private resources of individual States and communities. Thus, although the three levels of government represent distinct and separate entities, their interrelationship is such that they really constitute a partnership for the protection and promotion of human health."

Under the Constitution of India, as stipulated in the Seventh Schedule, which sets out the division of function and responsibilities between the Union and the States or the concurrent responsibility of both, public health and sanitation together with provision of hospitals and dispensaries is essentially a responsibility of the State Governments. The Union Government is the repository of the functions of laying the broad outline of policy and co-ordinating the activities in regard to medical and public health services as well as disseminating information collected from various sources. The supply of experts and technicians as well as of technical assistance has actually become the function of the Union Government. Such a great leeway has to be made up in regard to public health and sanitation that, in practice, as demonstrated by the experience of the last decade since the Constitution was inaugurated, co-ordination has become a term and function of ever-widening connotation. Some idea of how the vague responsibility for co-ordination has in practice transferred increasing responsibility on the Union Government can be gathered from the fact that programmes of nation-wide importance, like malaria control, filaria control, water supply and sanitation, family planning (which has now started in a small way), control of communicable diseases and ever-widening provision of training facilities are being planned and introduced at the initiative of the Union Government. This is not to imply that there is any tendency on the part of the State Governments to shirk their responsibility. But so much has to be done simultaneously and on a co-

ordinated basis, so as to do justice to the requirements of all the regions, that the Union Government has to assume increasing responsibility, of course, with the consultation and full co-operation of the State Governments.

The magnitude of the task which has to be performed in the rural areas, irrespective of the fact whether they pertain to the advanced states or the less developed states, is so vast that there would be little point in deferring action, in the name of a thoroughly scientific approach, until adequate numbers of medical personnel providing different types of services at different levels are trained. Thirteen years since Independence have shown that appeals to the new generation in the medical profession to move away from the urban centres to the country-side, where there is such a dire need, have not produced any tangible results. The medical profession is hardly to be blamed for this because a fair standard of income as well as standard of social and cultural life, to which its members are certainly entitled, will be available in the rural areas after a lapse of quite a long time. In the meantime, in order that action may not be delayed the National Extension Projects and Community Development Programmes are being used as the agencies under whose auspices medical and health services should be placed within the reach of the local population. Likewise, the Ayurvedic and Yunani systems of indigenous medicine are being given active encouragement and the movement is afoot to place them on a more scientific basis than now by encouraging research. A system of licensing of physicians—Ayurvedic, Yunani or Homoeopathic—is being introduced progressively over the entire country. This approach has a promising potential to produce concrete

results, if the brief experience of the last few years is any guide.

In any assessment of the quality and improvement in health services two important indicators usually accepted are the trends in the birth rate and the death rate. It is an axiom that, with improving standards of life, the birth rate generally tends to show a steady decline. Exceptions the other way do occur and are consistent with higher per capita income and living standards. But they do not affect this general proposition. If this criterion is applied it will be easily seen that Free India has made impressive progress in regard to the birth rate. The crude birth rate per thousand of population in India declined from 25.2 in 1948 to 17.9 in 1958. Likewise, improvement or decline in the death rate is another vital index of improving health standards. The death rate per thousand in India was reduced from 17.0 in 1948 to 8.8 in 1958. This improvement in the death rate within the course of a decade is impressive and encouraging. If the rate of net growth in population has tended to increase, in spite of a decline in the birth rate, the change is explained by the improving death rate. Of course, the population problem remains intractable and ought to be tackled far more energetically than heretofore at the point of birth.

COMPARATIVE PICTURE

There can hardly be a close parallel between the strength of medical and health service personnel between any two countries. Social habits and the way of life have a decisive influence on the requirements of medical personnel. Just as in an under-developed country there may be utter dearth of health manpower so a lopsided proclivity of excessive resort to medical attention may raise the requirements of health man-

EXTERNAL ASSISTANCE

AUTHORISED UPTO 1959-60

INDIA'S FOREIGN TRADE

power in an advanced country. Ignoring these extremes, it would be interesting to make a comparison between health manpower in America and India. Only a few crucial indicators should suffice for this comparison.

In 1959 in America the ratio between physicians and the population of the country was 1 physician to 752 of population, 1 nurse to 379 of population and 1 dentist to 2,041 of population. In India the standard of dental health is relatively satisfactory and, even assuming that dental treatment is not procured by patients unless the malady takes an acute form, it would be safe to assume that the requirements of dentists will remain comparatively low in the Indian set-up. But in so far as the availability of physicians and nurses is concerned, the contrasts between the two countries are quite substantial. This will be apparent from Table TH-1 in this Section. In 1960-61 the ratio is estimated to be 1 registered doctor for 5,117 of population in India and in the case of nurses it is estimated to be 1 nurse for 13,255 of population. The same table would show that projections made on the basis of the estimated national income growth would provide India in 2000 A.D. with one registered doctor for 1,355 of population and 1 nurse for 2,131 of population. These assumed ratios even in 2000 A.D. will be a far cry from the ratios obtaining in America at the present time. The secret of a solid structure of health manpower which America has built up is to be found in the training facilities which have been provided. Table TH-2 in this Section sets out the growth over the first six decades of the current century in respect of different categories of medical training institutions and the students and graduates benefiting from them. One observation which needs to be made is that, while the rate of growth in the training institutions may show no fast rate, the quality of teaching and the nature of the curricula make all the difference in so far as training of students is concerned.

Table TH-1 in this Section highlights one important fact. It relates to the decade 1950-51 to 1960-61. The fact is that during such a short span the number of different categories of medical manpower has registered a reassuring rise. For instance the number of registered doctors increased from 59,000 in 1950-51 to 84,000 in 1960-61, that of registered nurses rose from 17,000 in 1950-51 to 32,500 in 1960-61. There is a crying need for nurse-dais and dais in the countryside where maternity aid is in a deplorable condition. The number of this category of badly needed personnel has increased more than five-fold from 2,200 in 1950-51 to 12,000 in 1960-61. In the sphere of public sanitation, the strength of health assistants and sanitary inspectors has been doubled from 3,500 in 1950-51 to 7,000 in 1960-61. One qualification, however, needs to be entered in assessing this rapid progress. It may not be denied that the quality of training particularly at the level of mid-wives, nurse-dais and sanitary personnel has been given lesser attention than it is entitled to, partly because of the shortages of trained teachers of the requisite calibre and the equipment required for training in the institutions. But the main reason for this low priority is the urgency to expand the number of medical personnel and to eliminate their acute dearth, since these requirements do not brook delay. Improvement in quality is bound to command attention once the minimum manpower is built up.

The projections made in Table TH-1 in this Section should be compared for the actual state of affairs in 1960-61 and the assumed requirements in 2,000 A.D. It will be seen from this Table that the ratio of doctors per thousand of population is going to be more than doubled and that of nurses is going to be increased six-fold. Their demand will be drawn from the urban as well as rural areas. But the deliberate emphasis which has been placed on carrying medical and health services in the non-urban sector cannot be missed and

Polystyrene plastic packaging helps increase sales and profits

Opaque or transparent, containers of Polystyrene rigid plastic are hygienic and make the product doubly attractive. Polystyrene comes in the following varieties in several granulations and a wide range of colours:

Styron 666 * Styron 688
Styron 428 * Styron 777
Styron 475 * Medium heat-resistant Polystyrene 200

the most extensively used raw material in the plastics industry

SETA'S-PCH-14

man's faith

Faith that makes man aspire, strive ...
awakening him to tasks in the early-glow of dawn.
That melts rock, shapes granite; transforms
still waters to surging power.

A faith in the living future:
in a world that offers a little more—
a little less of the care, a little more of the joy.
Faith that gives meaning to life.

Today, as in the past, our products help to make homes
cleaner, healthier, happier. But today we are also working for ...
Tomorrow, when the evergrowing urge for better living
will demand still greater efforts. And we shall be
ready with wider service, new ideas, new products ...

Today and Tomorrow... Hindustan Lever serves the home

PR. 6-X52

is at once noticeable from the Table. The ratio of mid-wives to one thousand of population will be increased nearly ten-fold, that of nurse-dais and dais will be stepped up by nearly 32 times and that of sanitation personnel will be increased more than seven-fold.

W.H.O. ASSISTANCE

A survey of national health problems cannot be complete without a brief word of reference to the valuable part played by the World Health Organisation. In the post-war period international co-operation through various agencies has become a potential channel of distributing the benefits of science and research in the participating countries. To say that the role of WHO is basically advisory in character, that it has no executive powers and, therefore, it lacks the normal sanction is to totally mis-judge the valuable services rendered by it. It will undoubtedly be making a plain statement of facts to say that the advisory role of WHO is the very foundation of the massive and solid services it is rendering. The results of advances in scientific research are carried from one country to the other by WHO and this is reinforced by the distribution of benefits of actual experience gained by one country among other participating countries. WHO can advise

and encourage and in this way it can impress upon the national experts of the participating countries to shoulder the responsibility of executing health programmes, wherever necessary with the help of foreign technical experts. Since advice is the function of WHO and execution is the responsibility of the benefit-receiving countries, the latter fortify their own national manpower and institutions. Of course, considerable foreign financial assistance flows into the receiving countries with the activities of WHO.

The assistance which WHO has extended to India has proved of timely and of great value in training national health workers for carrying out programmes of malaria control, tuberculosis control, maternal and child health education, professional technical training, and so forth. We are still to receive WHO's assistance in other spheres where the beneficiaries at the present time are the countries of the West. This refers to mental health, occupational health, public health laboratories, communicable eye and other diseases, social health, and so on. In the order of priority, this type of assistance comes after the elementary and pressing requirements of assistance which we are now receiving are obtained on a sufficient scale.

Beginning with only a small machine shop in 1939, NSE expanded rapidly and today it operates three major engineering factories, each engaged in producing vital equipment, covering the gamut of the country's developmental needs. Through engineering skill and technical knowledge garnered over the past two decades, NSE has earned the confidence of the various industries it serves.

Education in India and North America

EMPHASIS on education in general and on provision of free and compulsory education at the elementary stage is an integral part of the national policy of both America and India. This is because education is regarded as a precondition of the exercise of democratic rights. The American counterpart of the Ministry of Education in India is the Office of Education. The Office of Education exercises in an indirect manner a great deal of influence on American educational policy and practice. In India, education is a State subject and the Union Government has no legal function in the field except to co-ordinate facilities and maintain standards in higher education and in technical education. The difference in the attitude of the Ministry of Education and the Office of Education may perhaps be expressed by saying that the Office of Education, even when it influences national policies, is continually taking the initiative in discussing problems, devising remedies, and framing policies which are then translated into action, by the State Governments and local educational authorities. Local autonomy is a basic fact in American education and the diffidence on the part of the Office of Education, and up to a point also of the State education authorities, is a measure of the devotion to the cult of local autonomy. The fact, however, cannot be ignored that in spite of great freedom in many matters, there are quite significant checks on local authorities. Ultimately, the inter-play of five agencies influence educational policies in the United States—the US Office of Education, the State Departments of Education, the Local Communities, the National Organisations and Associations and the Teacher Training Institutions.

NOTEWORTHY FEATURES

There are many noteworthy features of American education. It rests on a philosophy that stresses the worth and dignity of the individual and is opposed to authoritarianism or dogmatism and cannot accept restriction on knowledge. In methods consistent with this philosophy, American education stresses freedom to choose a programme balanced between the humanities and sciences. In the American system, a student is taught to make his own decisions. The goal is to make him what he wants to do, not what the State wants him to be. American education not only provides free and compulsory education to all its nationals up to the age of 17, but it is greatly diversified to meet the needs of boys and girls of various abilities and aptitudes. The new element in American education is that in it is the notion of equality of educational opportunity, regardless of race, religion, colour, national origin, sex, or financial resources. These features of American education are of direct interest to us. We, too, are aiming at diversified education to cater to the diversified needs and aptitudes of our boys and girls. Schemes have been evolved in this direction, but progress has been too slow. The inclusion of craft teaching has undoubtedly given a bias of diversification to elementary education.

The first consequence of the new philosophy in the United States is necessarily a great increase in the number of institutions of higher education, with all the attendant problems of staff, libraries, laboratories, dormitories, dining halls, medical services and the like. In 1958 there were in the United States some 1,450 colleges and universities, 1,950 if the two year junior or the community colleges are included. Precise information for the year 1958 is available in Table TE—1.

PROGRESS

Evidence of progress in education in America is found in the fact that in 1957-58, 43,135,000 persons or

about 1 out of every 4 in the population were attending public or private schools and colleges—an increase of more than 4 per cent over 1956-57. In 1900, less than 5 per cent of those of college age went to college; their numbers were only 2,30,000. By 1930, there were about one million students enrolled in colleges. In 1957, there were more than 2,500,000 in college. It is possible that before the end of the century one out of every two Americans will insist on going to college. So far as Canada is concerned a big bulge is passing through the elementary schools. It is estimated that by 1980, enrolment in secondary schools and universities will increase faster. Present-day enrolment in secondary schools is equivalent to just over 50 per cent of the population of 14 to 17 years of age, inclusive; by 1980, the proportion may be 70 per cent. Between 7 per cent and 8 per cent of persons 18 to 21 years of age are in university; perhaps by 1980, some 15 per cent of the same age group may be there.

TABLE TE—1

	Number	Enrolment
Universities	141	1,436,000
Liberal Art Colleges	789	909,000
Separately organised Profession Schools		
Teachers' Colleges	197	323,000
Technological Schools	46	97,000
Theological, religious and other professional	127	70,000
Junior Colleges	499	387,000
TOTAL	1,958	3,259,000

Progress made in India has also been encouraging though not as rapid as the needs of administration, business and various other sectors of public life require. Compulsory free education for all up to the age of 14 is still a goal to be achieved, though 1960 was set as the date-line for this purpose in the Constitution. The following table states briefly the enrolment of pupils expressed as percentage of children in the respective age-groups in the two five-year Plans and the estimates made by the Research Section of the Eastern Economist, up to 2000 A.D.

Period	6-11	11-14	14-17
1950-51	43.1	12.9	5.4
1955-56	51.0	16.3	8.1
1960-61	60.0	22.6	12.0
1965-66	80.0	30.0	15.0
1970-71	90.0	38.0	18.0
1980-81	100.0	54.0	25.0
1990-91	100.0	70.0	32.0
2000-2001	100.0	85.0	40.0

TECHNICAL EDUCATION

If American education places more emphasis upon technology—technicians, skills, practical things, the everyday business of life, in India, too, emphasis is being shifted in that direction with the planned economic development of the country. During the Second Plan considerable expansion has been achieved in technical education. The number of engineering col-

leges has increased from 65 to 97 and the annual intake from about 5,888 to 13,165. The number of polytechnics has risen from 114 to 197 and the annual intake from about 10,484 to about 24,020. Establishment of 7 Centrally sponsored regional engineering colleges and at least 5 States' sponsored ones, has now been decided upon as a result of discussions between the Planning Commission, State Governments representatives and the Union Ministry of Scientific Research and Cultural Affairs. The seven regional colleges will be located in States which have no such institutions, namely, Gujarat, Rajasthan, Punjab, Orissa, Assam, Madras and Kerala. With the establishment of these colleges, each of the 15 States will have 1 Centrally sponsored engineering college. The combined expenditure by the Centre and the States on these institutions and other schemes in technical education under Third Five-Year Plan is expected to total Rs. 157 crores, out of which the Centre's share will be Rs. 87 crores and that of the States Rs. 70 crores. States' schemes to promote technical education under the Third Five-Year Plan provide for the setting up of 46 new polytechnics and 70 junior schools, the latter for the 14 to 17 age group.

In the sphere of technical education, it takes five years to train graduates and three years to complete the training for the diploma course, the outturn of graduates has so far increased only from about 4,000 to about 8,300 per annum and for diploma holders from about 4,000 to about 12,000. As a result, however of the extension which has already taken place, by 1965, the annual outturn in existing engineering colleges will increase to 11,500 and of polytechnics to 18,400. Estimates of demand and supply of the Second, Third and Fourth Plans for the graduates and diploma holders are shown in the tables below. The estimates of supply for the Fourth Plan have been based on the increased provision of facilities in the Third Plan.

Category	Second Plan	
	1956-61	
	Demand	Supply
1. Graduates	28,000	26,000
2. Diploma holders	54,000	32,000
Category	Third Plan	
	1961-66	
	Demand	Supply
1. Graduates	45,000	51,000
2. Diploma holders	80,000	76,000
Category	Fourth Plan	
	1966-71	
	Demand	Supply
1. Graduates	75,000	75,275
2. Diploma holders	120,000	1,175,000

If the per capita expenditure on education in India, U.S.A. and Canada is assessed, it is found that it is as low as \$1.2 in India and as high as \$56 in Canada and

\$92 in the United States of America. The table below pertaining to this is self-revealing:

EXPENDITURE ON EDUCATION

	Year	Total Expenditure (million U.S. \$)	per-Capita (\$)	As a percent age of national income
1. U.S.A.	1957-58	15,700	92	4.3
2. Canada	1957	930	56	3.9
3. India*	1958-59	457	1.2	1.7

* Expenditure by Ministry of Education only.

The low per capita expenditure in India is understandable in view of its huge population.

The position in regard to female education has improved in this country and is bound to improve in future at a fast rate.

REFORM OF THE SYSTEM

Reform of the educational system is now under way and if the present system of examinations as the sole test of proficiency is modified and the American system is given a trial, in which each educational institution judges its own students on the basis of the work done by them throughout the session as well as of the final examination and then determines the grade to be awarded to them, the central weaknesses of the present system can be rectified. Since India like the United States is faced with improving the standards of education and the expansion of education, some of the experiments and practices followed in America could be tried in this country. The practice of providing teaching assistants to teachers, the role of audio-visual material—in particular television—with which our country will soon be provided, have definite advantages. While teaching assistants would be of help to the teachers in paying attention to the really creative aspects of teaching, audio-visual aids may be the only means by which a large number of pupils may be reached by them. The use of audio-visual aids will, of course, be only feasible when there is fullfledged television in this country. The provision of teaching assistants might also help relieve unemployment in this country. An attempt no doubt must be made to bring back into the teaching profession highly qualified men and to remove the shortage of teachers. This is basically the function of attractive emoluments to induce requisite talents in the teaching profession as well as of raising the status of the profession. Perhaps the employment of married women might help solve the problem of shortage of teachers of the appropriate calibre in a partial degree.

Our pre-occupation with priority for technical education is perfectly correct in the context of the gaping hiatus between actual needs and the supply of trained personnel. But the tendency of looking upon the humanities as superfluous or as being a luxury, which it threatens to create must be carefully safeguarded against. The humanities are as integral and vital part of the system of education as science and technology. The march of the economy will perforce accelerate the rate at which scientific and technical education will expand in response to the market demand. While this trend will be inevitable as well as salutary, the neglect into which the humanities may fall must be prevented. A rational equilibrium between the two is essential for a really healthy system of education. This is the moral to be drawn from the American parallel.

PART C

THE CULTURAL PICTURE

India and America: The Cultural Dialogue

TO what extent have the cultural systems of India and the United States intersected? Has the seed planted in recent years with the increasing association of Americans and Indians in the educational and business fields been fruitful in creating an appreciation of their cultural backgrounds? If so, does the future contain promise that there will arise, in some cultural fields, a fusion of the old and the new, the West and the East, the spiritual and the material, the fatalistic and the deterministic—as it were, polarised focal points in these cultures? These are questions on which at least some aspects of future Indo-American relations must depend.

THE OLD AND THE NEW

On the surface, the contrasts between the American and Indian cultural traditions seem deep and abiding. The United States is often described as a "young" culture, not bound by the iron rules of tradition or by the hard crust of custom. India, on the other hand, largely because it has been dominated by the Hindu way of life, which is enshrined in the laws of Manu and 4,000 years of custom, impressed deep on almost every feature, appears to have little room to manoeuvre. On the face of it, there is almost nothing which is to be found in the American tradition which runs on parallel lines, say, with the life of Gandhi who might in our century represent the apex of the Indian tradition. On deeper introspection there will be found to be more.

The first point that Indian leaders need to recognise is that, while American culture is often "new" in its expression, it rests against the age-old structure of European culture which possesses the grandeur that was Greece and the glory that was Rome. The great arts,—sculpture, music and even architecture—did not begin in the United States. For the better part, they are continuations of a powerful cultural tradition and the European way of life. Sometimes they reach remarkable heights of excellence in American hands. The Metropolitan Opera in the United States, and the great Philharmonic Orchestras of New York and Boston are second to none in the musical world. All these reside alongside the aggressive modern versions such as Radio City where the American form of the stage business (also now flowing back to Europe) has native roots. Forward and backward the tide flows; it is a combined Atlantic tradition now flowing with speed from, and to, both sides of the Atlantic.

Unfortunately, the Indian mind does not see the old secure base in what it believes to be current American art. Hollywood, and all that the movie business implies, and more recently, television, appear as the representation of a lower American taste. Similarly, we do not understand the light opera, or the musical comedies of which 'Oklahoma', 'Annie, Get Your Gun', and 'My Fair Lady' were fairly typical expressions. In point of fact, however, Oscar Hammerstein and before him, American composers like Gershwin and Cole Porter were already drawing from an old European spring. What, in fact, has happened is that, in its culture, America wears a new look on an old and enduring base. There is more on the surface that is new than old, but in truth, there is more that is old than is new in its internal structure.

THE ELEMENTS OF FUSION

This point, which Indians seldom realise, that to the extent that Americans have inherited the best European tradition, they are as old culturally as we are and that Hollywood, Jazz and the musical comedies are no bars to deep and profound comment on philosophy, morals, politics and religion, needs to be driven home. By contrast, the average American deals with modern India as though it was still a life circumscribed by high philosophy and Sanskrit, by the ancient temples of the glorious Gupta Age and by the Muslim architectural contributions of Akbar, Shah Jehan, and Aurangzeb. In point of fact, the India of today is already living away from the glorious architecture of two thousand years and is spreading what might be described a predominantly European approach in which utility is now rising superior to the traditional forms of Indian building. Indian music is still almost unaffected, but European and Indian music live side by side in a very amicable manner. So far as the political dialogue is concerned, with the coming of Western democracy in Indian hands, the dominant note is European. Here on the surface we are old, but in practice we are new. Reversing the point that has been made in respect of the United States on a superficial view, the sources of Indian culture today are ancient, but a deep scrutiny of the forward areas of expression of this culture will show that we are absorbing Western strains, at, what might seem to a traditionalist, an alarming rate. On the surface, India is old; in its areas of advance it is new.

RELIGION AND MATERIALISM

One more point of the current dialogue between India and America may be noted. The early Founding Fathers in the United States were deeply religious men, but they combined their passionate religious beliefs with a lively sense of material values. Whether Max Weber was right in his analysis of the Protestant ethic as the spring of capitalism in both Europe and America, undoubtedly, he was right in suggesting that there was no conflict between the introduction of modern technology and the old religious doctrines of Calvin, Wesley and Knox. In India, the deep religious base has not, for a long time, been compatible with an all-out pursuit of material ends. It may be that in this respect a kind of fatalistic philosophy (or Karma) still prevents the operation of a free enterprise way of life at its best. But here, too, the spiritual and material are losing their firm dichotomy. India is becoming more material every day. Perhaps one might even venture the point that in the United States great riches have not dried up great spiritual founts; it may be that the United States is, in fact, growing more spiritual in its general outlook. One at least of the reasons why Communism has not been able to attain much hold in the United States is its atheistic or agnostic outlook.

All in all, one might argue that the old and the new, the East and the West, the spiritual and the material are now on opposite sides of the world in a state of flux or perhaps fusion. Over the next century, undoubtedly, each cultural tradition will contain more of the other.

THE FUSION OF CULTURES IN ARCHITECTURE

Old & New: JAMI MASJID, AHMEDABAD

Although its inspiration is Muslim, this arrangement, as well as decoration, is purely Hindu.

West and East: THE AMERICAN EMBASSY, NEW DELHI

Hindu and Muslim : GOL GUMBAD, BIJAPUR

Economic Wants: A Guilty Conscience?

WHERE does the cultural approach to problems of living between India and America most differ? There are likely to be as many opinions as there are men, but one might venture, in our age and time, to illustrate the differences in relation "to the grand theme of economic progress". Both the American and the Indian peoples are committed to higher living standards. One might have expected in this a single-minded and similar approach. In point of fact, the traditions are markedly different. For one thing, the doctrine of the limitation of wants never formed part of the American political tradition. In Mahatma Gandhi's hands it was the central idea, effective so long as the political problem was not solved; it has, indeed, overflowed after independence and the form in which the Ambar Charkha and labour-intensive methods of production have been put forth, reflect as much the doctrine of limitation of wants as it does the urge to solve the unemployment problem. India has an easy conscience about ostentatious living and about the creation of wealth. The United States has had a vastly unequal society; but the fear of riches has never been a conspicuous component of popular feeling. It has been possible for rich men to hold high political office and currently a millionaire has been elected the President of the United States. Radicalism has not had anything like the range which it possesses in Indian minds.

This is not, in fact, a minor aberration. It is part of a deep conflict in the Indian mind which goes on with both religious and social motivations. Excessive competition in the economic sphere is decried as lacking decorum and the business community, as a consequence, has not enjoyed anything like the same approbation which it enjoys in the United States. As a consequence, the doctrine of free enterprise is unacceptable under that form; the implication is that when the career is open to the talents and good fortune to enterprise the unfortunate go to the dogs. There are too many have-nots and too many sentimentalists for a system of this kind to work. India desires economic progress ardently, but it desires economic progress (as do most countries in the twentieth century) with a qualification. This qualification expresses itself in attempts everywhere to eliminate inequality by cutting off large incomes rather than by speeding up the rise of those which are low. The American fiscal system is also biased against inequality, but never restrains an individual from earning as large an income as he can. There are no ceilings on income in the United States as there are effective ceilings in the Indian Union, particularly on top managements.

The consequences of the approach to income and riches are to be seen also in the structure of consumption. While the great majority of the Indian people like a "show", the new Indian intelligentsia has a guilty conscience about displaying prosperity in the current environment of poverty. The fear of "profits", and the charge that the profits are the result of exploitation, are widespread, and thus, both Indian production and Indian consumption are held back by the unwillingness to let economic forces yield the highest rewards to those who are their best practitioners.

NO CONSPICUOUS CONSUMPTION?

Indian social life is also coloured by this strong sense of austerity. Prohibition is not merely a Directive Principle of the Constitution, it is a living creed over the Congress Party shared, as surveys of the Indian Institute of Public Opinion have shown, by the great majority of the Indian people. The unwisdom of prohibition in an economic sense has almost nothing to do with the fact that drinking is widely believed to be a great social evil. Vegetarianism has not been deeply affected by the current advent of Western forms of thought, and thus there is ingrained in the Indian system of consumption a deep inhibition against what might be called Western habits of conduct in food, drink and other forms of conspicuous consumption. Whether a society so constituted will be able to throw up in adequate measure incentives for the task of industrialisation and the mobilisation of talent in sufficient quantities for the solution of the country's problems, is a question which needs to be answered. At present, the answer is probably in the negative. It may be that one of the results of the American association and the agreement that the foreigners in this country should not be bound by Indian austerity standards will be reflected in the cultural life of Indian managers in the first instance, and then spread into all ranks of the intelligentsia. Currently the approach of Indians and Americans to the creation of business opportunities for individuals is by no means similar.

There has been a fear of certain callings as well as an inclination to austerity. For many years, work on machines was looked down upon; clerical callings and the professions were extolled and a marked literary bias existed in higher studies. This is all in marked contrast to the United States. The cultural pattern—and now the high level of wages—makes work with the hands a highly respectable everyday necessity.

The Outlook of the Intelligentsia

UNDOUBTEDLY, the future of countries is made more by the intelligentsia than what may be described as the rank and file, for the reason that leadership has to be found in this class. Something has been said in the two previous articles in differences in outlook in regard to cultural patterns in the two countries. The future depends particularly on the young. Perhaps a case study, recently published by Dr. Hadley Cantril of the Institute of International Social Research, Princeton, might indicate the manner in which the structure of opinion in a representative section of students in the two countries stands in relation to one another. These results, based on representative surveys, will show how markedly outlook in the two countries resemble one another.

The only important difference seems to be in the point that while 50 per cent of Indian students mention the desire to lead a life of service to the people or the nation, only 20 per cent of the American students mention anything related to this concept. Hadley Cantril's remark on the table is that "the most frequently mentioned" concerns are strongly similar in the two different environments. Regarding national aspirations and fears Indian students expressed much greater concern about moral leadership, while Americans are dominated by a sense of war and fears of war. In this they are reflecting areas of opinion not substantially different in the country at large.

In the wave of the future, this relative similarity

in goals of the respective student population of the two countries augurs well for joint economic co-operation. Political hurdles are likely to remain, but there is no reason to suppose that their intensity will not decline, once major differences on the Cold War subside. One of the most important effects of the imaginative United States Educational Programme has been to accustom Indian students (previous to World War II more frequent visitors to the United Kingdom) in many cases to change their country for foreign study. Not all students returning from the United States have unblemished admiration for the Universities in which they have studied. The chip on the shoulder, even though colonialism is gone, is sometimes still a living fact. And the sight of the prosperity of the average American is not often received so much as recommendation for his system as a criticism of bigness and power, resented the more because it is not equally shared.

The problem of giving and receiving of foreign aid plays an intense psychological part in these differences. Whether or not they will be reduced in a more normal period of association remains a matter for speculation. If, however, it should happen, as has been confidently predicted in the economic section preceding that the Indian Union should 'take-off' in the sixties and become a self-generating economy by the seventies, the confidence of the Indian people in their own destiny will presumably change our current psychological attitude both to bigness and to the receipt of foreign aid. Thus we might hope that in the years to come the suspicions which now attach to the United States in its power politics manifestations will be somewhat diminished. It may also be that, with the rise of the People's Republic of China, we will also need to call in a new world to redress the balance of the old. On both grounds, the chances of closer educational, and even emotional, associations can be described as favourable.

TABLE I.
PERSONAL ASPIRATIONS AND FEARS (IN PERCENTAGES) OF INDIAN AND UNITED STATES STUDENTS

Indian Students	%	United States Students	%
Personal Aspirations			
Life of service: ability and opportunity to serve people, nations	51	Harmonious family life; happy marriage, love children	75
Congenial occupation: independence in choice of occupation; pleasant, interesting work; chance for advancement	41	Congenial occupation: independence in choice of occupation; pleasant, interesting work; chance for advancement	61
Harmonious family life: happy marriage, love children	30	Economic security: sufficient money to live decently; freedom from debt; no, or few financial worries	49
Perform outstanding work: contribute to my field	22	Acceptance by others: be liked and respected, not be lonely, active in community and civic life	23
Economic security: sufficient money to live decently; freedom from debt; no, or few financial worries	18	Vacations and leisure: travel, rest; freedom to pursue hobbies; art, literature, music; time to spend with family	22
Personal Fears			
Uncongenial occupation: lack of independence in choice of occupation, no chance for advancement	26	Less harmonious family life; unhappy marriage, no children, no marriage (self or children)	58
Not to be of service: to community, nation, world; a person without character; lose religious faith	21	Uncongenial occupation: lack of independence in the choice of occupation, no chance for advancement	30
Less harmonious family life: unhappy marriage, no children, no marriage (self or children)	20	Disablement and/or poor declining health, lingering illness of self or family member	24
Personally inadequate to achieve aspirations as to occupation, marriage, etc.; emotional insecurity	15	Personally inadequate to achieve aspirations as to occupation, marriage, etc.; emotional insecurity	20
Lead a life of disharmony; less congenial living conditions, "vegetate"	11	Lack of economic security: insufficient money to live decently, debt, financial worries	19

TABLE II.
NATIONAL ASPIRATIONS AND FEARS (IN PERCENTAGES) OF INDIAN AND UNITED STATES STUDENTS

Indian Students	%	United States Students	%
National Aspirations			
Social justice	33	Peace	38
Exert moral leadership	29	Integration: remove prejudice as to race, class, creed	31
Education: more and better schools, fight ignorance and delinquency	28	International co-operation: reduction of tensions, stronger UN, etc.	28
Sound internal economy: country self-sufficient	27	Social justice	24
Employment for everyone	24	Education: more and better schools, fight ignorance and delinquency	24
Be a prosperous power: proper use of mechanization, science; wealthy; rich	22		
National Fears			
Disunity: unrest, civil war, division	29	War: live in fear of war	38
Political instability: poor leaders, dishonest government	22	Devastation from war	24
Pakistan	20	Domination by a Communist or totalitarian power	23
Lack of morality: no sense of social responsibility, lack of spiritual values	19	Economic instability	17
Low subsistence for people	19	Lack of personal freedom	17

Conclusion

IT is possible now to bring together the main threads of the entire piece. It has been argued, firstly, that the structures of politics in the United States and the Indian Union have some superficial constitutional resemblances. Firstly, they both enshrine vast "popular" democracies and have written Constitutions with a federal structure. On the other hand, the actual operation of relations has been over time to produce a truly "federal" distribution of functions in the United States with much intrinsic power in the States. By contrast India, because she is still living in the Age of the Revolution and is dominated by a leading hero of the Revolution, tends currently to be monolithic. This, however, is by no means a permanent polarisation in the federal structure of the two countries. The predominant element is time, and India is likely to become as "federal" as the United States when more normal conditions establish themselves. Secondly, in international affairs, there is also a natural dichotomy between the Indian Union and the United States decreed by their very different current positions in the international world. Because India is at the moment absorbed in the problems of reconstruction and cannot pursue her democratic faith internationally, she is in a state of relative isolation that corresponds with the position of the United States until World War I. The great shift in United States policy is due to the fact that she has emerged as a leader of the Free World in a classic conflict with Communism; both her responsibilities and her policies flow from her world position which we cannot share. Thirdly, there arise differences in the purely practical expression of American interests such as in the Doctrine of Containment and use of military alliances for that purpose. Partly because India is neutral and partly because it is friendly to the Soviet Union, the Indian people do not associate themselves with these expressions. While these differences are substantial, they cannot be deemed to be

perpetual, and are largely a function of what is called the Cold War. Should the Cold War recede, one might expect Indo-American political relations to improve rapidly with the recession.

There are also more particular causes of disagreement the most prominent of which might be summarised by Pakistan with its sub-head of Kashmir, SEATO, Laos and the Congo. Here it is difficult to say to what extent the Cold War is primarily responsible, but one must reckon currently that a large measure of American policy in all these matters is dictated by Cold War considerations. To the extent this is so, one can count on the disappearance of these differences over time. Unhappily, however, politics, like economics, produces its vested interests, that is to say, built-in rigidities arising out of past association or of mutual current interest. The long association of the United States with countries which have taken an anti-Communist line will, for some time, prevent it from embarrassing those nations by a too-sudden change to neutrality. One must, therefore, count on an improvement on all these special questions in the course of time, but one must not expect results too rapidly. By the same token, India's association with countries which have taken an anti-Communist line will not necessarily change overnight. Again, our relations with Communist countries themselves may need, under separate circumstances, to be revised. One can be at peace with the Communist world generally, and yet have an acute cause of discomfort, as we currently have from the presence of the People's Republic of China on Indian soil.

THE ECONOMIC PARALLELS

While the political scene is thus likely to be conditioned by contingencies, of which little can be now known, economic factors decree a process of extended

co-operation, collaboration and, perhaps, intellectual exchange which imply not merely understanding but a new and enduring bond between these countries. The argument in the economic section has gone further to the point of suggesting that the Indian economic system, although now pitiful by comparison with the massive system of the United States, will, in time, become massive in its own right, provided that the instruments of economic transformation are created with foreign assistance in which the United States must play a special part. It has been argued that three components of the United States' industrial transformation were technology, a genius for salesmanship, and a dynamic productivity consciousness so that production and consumption have managed to interact with very beneficial effects on incomes and on welfare. India's emphasis on the socialist method of achieving similar results does not seem to be necessary beyond a certain stage, and it is argued that a relatively free—may be even a free—market economy in forty years from now can raise us in a manner very similar to that of the United States where the demand for durables and for leisure provided a new component of dynamic welfare of a kind relatively absent in our economy today.

FROM A STAGNANT TO AN AFFLUENT SOCIETY

In effect, this economic component will be the catalytic agent changing a stagnant into an affluent society. The Indian society of the year 2000 will not be as affluent as American society is today, but it may have had strong resemblances, and one hopes less of

the dread of inequality which sometimes still disturbs the Indian mind. A great flood of opportunities which has made the American society dynamic, and more vigorously so than any other society in the world, such dynamism may not find its counterpart in the Indian Union which is fearful of ravages of inequality and suspicious of the 'have-nots'. Undoubtedly, the pressures of public opinion and of national psychology will leave all austere strain still in Indian society, but the movement socially is away from inequality, class and caste isolation, and, perhaps, economic jealousy. One might argue that although there will be a gap between American freedom which is proverbial, and Indian freedom which is still restricted, it will be a constantly narrowing one. Thus Indo-American relations might be said to be built on continuous political compromise, closer economic association, and a gradually broadening of social purposes with similar objectives and goals which will make each country more acceptable to the other as time flows on.

Only a disruption in the economic programme might bring a reversal of these hopes. Because a reversal of these hopes affects the international security of the United States, it is extremely unlikely that current difficulties of the dollar with the United States will resile her from a programme of foreign assistance to the Indian Union on a scale sufficient for the major attainment of her plans. Thus Indo-American co-operation is invested with an imperative on both sides. Herein lies its strength. Both India and the United States can ignore one another only at their deepest peril.

This is only an announcement for information and not a prospectus and applications are invited on the basis of the prospectus copies whereof are available from the Company's Bankers and Brokers mentioned herein.

An application will be made to the Stock Exchange of Madras and Bombay for permission to deal in the shares now being offered and in due course for an official quotation.

PROSPECTUS OF THE TRAVANCORE ELECTRO-CHEMICAL INDUSTRIES LTD.

(Incorporated on 4th April, 1945, under the Travancore Companies Act IX, of 1114)

AUTHORISED CAPITAL :

1,00,000 Equity Shares of Rs. 100/- each	Rs. 100,00,000
--	-----------------------

PAID-UP CAPITAL :

13,288 Equity Shares Fully Paid-up at Rs. 100/- per Share	Rs. 13,28,800
1,912 Equity Shares previously forfeited but subsequently re-allotted at Rs. 100/- per Share and now partly paid at Rs. 25/- per Share	Rs. 47,800
	Rs. 13,76,600

NOTE :

By a Resolution passed on the 7th of December 1960 the Deferred Shareholders of the Company have given their consent to the conversion of the Deferred Shares issued by the Company into Equity Shares of the Company in the ratio of five Deferred Shares to one Ordinary Shares ranking pari passu with the existing Equity Shares.

CAPITAL NOW ISSUED FOR PUBLIC SUBSCRIPTION :

10,000 Equity Shares of Rs. 100/- each	Rs. 10,00,000
--	----------------------

AMOUNT PAYABLE IN RESPECT OF SHARES

The amount payable in respect of Equity Shares is as follows:

Rs. 25/- per Share on application.
Rs. 25/- per Share on allotment.

and the balance in two equal instalments provided that there shall be an interval of not less than three months each between calls and between the allotment and the first call.

APPLICATION FOR SHARES

Each application must be for a minimum of 5 Shares or in multiples thereof.

Where no allotment is made the Deposit will be returned in full and where a partial allotment is made, the unutilised balance will be adjusted against amount due on allotment.

The Share Certificates will be issued within six months of the date of allotment.

DIRECTORS

1. **Shri Murarji Jadavji Vaidya**, Industrialist, Chairman, Bombay.
2. **Shri S. Chattanatha Karayalar, M.P.**, Advocate, Trivandrum.
3. **Shri V. P. Varde**, Stock-broker, Bombay.
4. **Shri J. L. Mehta**, Businessman, Bombay.
5. **Shri Russi Jal Taraporevala**, Businessman, Bombay.
6. **Shri K. P. Vishwanathan Nair, I.A.S.**, (Nominated by Government of Kerala) Director of Industries, Trivandrum.
7. **Shri T. V. Krishnankutty Warriar**, (Nominated by Government of Kerala), Trivandrum.
8. **Shri Limjee K. Panday**, Stock-broker, Bombay.
9. **Shri P. E. Raman Menon**, Landlord, Parur, Kerala.
10. **Shri M. S. Bhandarkar**, Engineer, Bombay.

BANKERS

- (1) **The State Bank of Travancore Ltd.**, Trivandrum.
- (2) **United Bank of India Ltd.**, Bombay.
- (3) **The Indian Overseas Bank Ltd.**, Bombay.
- (4) **The Bank of India Ltd.**, Mahatma Gandhi Road, Bombay-1.
- (5) **The Central Bank of India Ltd.**, Mahatma Gandhi Road, Bombay 1.

AUDITORS

Messrs. Suri & Co., Chartered Accountants, Trivandrum, Kerala State.

MANAGING BROKERS

Messrs. Lewis & Jones,
Bank of Baroda Building, Apollo St., Fort, Bombay.

BROKERS TO THE ISSUE

1. **R. R. Nabar & Co.**, 35, Dalal Street, Fort, Bombay 1.
2. **A. B. Pandit & Co.**, 32, Apollo Street, Bombay 1.
3. **G. M. Pyne**, Allahabad Bank Building, 14, India Exchange Place, Calcutta.
4. **Kothari & Sons**, Oriental Buildings, Armenian Street, Madras.
5. **Paterson & Co.**, 42, Errabalu Chetty Street, Madras.
6. **M. Nanjappaiah Jahgirdar**, 18, Cavalry Road, Bangalore.
7. **Harbansingh Mehta & Co.**, 33, Regal Building, Parliament Street, New Delhi.

SOLICITORS

Messrs. **MATUBHAI JAMIETRAM & MADAN**, Lentin Chambers, Dalal Street, Fort, Bombay-1.

REGISTERED OFFICE

P.O. Chingavanam, Kottayam, Kerala State.

OBJECTS OF THE COMPANY

The Company was established to manufacture and deal in Calcium Carbide, Carbon and Graphite in various forms, all types of electro-chemical, electro-thermal and high temperature furnace products like Carbides, abrasives, metal alloys and refractories, and derivatives and bye-products of the above.

HISTORY OF THE COMPANY

Although the Company was registered in 1945 it started operating as late as in 1952 owing to late delivery of the electrical equipment. The Company's activities were then on a developmental or experimental stage as it had put up a pilot furnace with a capacity of Calcium Carbide up to 1000 tons per year only. The Company in its developmental stage, therefore, made small losses, particularly as the cost of production of Calcium Carbide in a small capacity furnace was high. The Company's experimental activities are of great importance in as much as it proved the advantages of using sea-shells for manufacturing Quick-lime—an important raw material, at very cheap rates and of prescribed purity. The Company in its development stage

also proved that it could produce Calcium Carbide of high purity meeting the requirement of the British Standard Specifications, as borne out by the Certificate in this respect of the Technical Development Establishment (M.E.)—Kirkee (Ministry of Defence). The purity of the Company's products has also been confirmed by the Tariff Commission report of 1956.

PROSPECTS OF THE COMPANY

Thanks to the developmental activities of the Company in the past, it is only now that the possibility of commercial production of Calcium Carbide appears to have come.

In 1956 the Company planned to expand its Capacity to 10,000 tons per year. The Company since then have secured the necessary Industrial and Import Licences from the Central Government for raising the production capacity to 10,000 tons per year. The Tariff Commission Report of 1956 commented on the proposed expansion project of the Company thus:—"The existing plant enjoys certain marked locational facilities for procurement of raw materials and electrical energy at economic rates, and expansion at the same spot should seem to afford them a reasonable assurance of success."

ASSISTANCE FROM KERALA GOVERNMENT

The Kerala Government has given the Company co-operation and assistance in this proposed expansion of the capacity of Calcium Carbide plant to 10,000 tons per year. The Government of Kerala have also invested Rs. 5 lakhs recently in the equity shares of the Company.

ELECTRIC POWER

The cost of Electric Power determines to a substantial extent the cost of production of Calcium Carbide. The Company has the advantage of having Electric power at cheap rates and on favourable terms from the Kerala Government.

TRANSPORT FACILITIES

The Company is located favourably so as to enjoy good transport facilities by rail as well as by water for the movement of its raw materials and finished products.

SCOPE AND PROSPECTS

Calcium Carbide is a basic chemical which is used in production of many important chemicals and materials such as P.V.C., Calcium Cyanamide, etc. It is also used in the manufacture of explosives, in which the Central Government may be interested. At present it is being mainly used in welding and cutting steel. But market for this product is very rapidly growing with

the development of steel and chemical industry in India. The statistics published by Government agencies indicate that in the year 1959 the production of Carbide was 4,074 long tons and import was 8,430 long tons. In the recently published **Outline of the Third Five-Year Plan**, the local production of Calcium Carbide in 1960-61 and in 1965-66 are estimated at 20,000 and 60,000 tons respectively. With growing demand, therefore, the Company's entire production of 10,000 tons per year will find a ready market within the country.

ESTIMATE OF PROFITS

The estimated cost of production of Calcium Carbide manufactured by the Company as accepted by the Tariff Commission is Rs. 462/- per ton, and the present ex-factory selling price fixed by the Tariff Commission is Rs. 865/- per ton. Even taking into account some adjustments and contingencies, there is still a good margin of profit in the manufacturing operations of the Company.

SUPPLY OF MACHINERY AND TECHNICAL KNOW-HOW

The Company has secured collaboration from Messrs. Deutscher Innen-Und Aussenhandel Invest Export of the German Democratic Republic. The Company has entered into two agreements with the above-named firm, one for supply of a complete Carbide Plant of 30 tons daily capacity and the other for supply of technical personnel and of project-true supervision of erection, function tests, trial run and putting into commercial operation the plant. The total purchase price of the plant inclusive of the necessary basic and execution projects, constructional documents, etc., amounts to about Rs. 17 lakhs. The machinery suppliers have further agreed to charge an interest of only 3% on the outstanding balances. The payment is to be made in Indian Currency. The Company has secured the necessary import licence and permission from the Reserve Bank of India to make the payments.

BROKERAGE

Brokerage at the rate of 1% on the nominal value of each Equity Share will be paid to registered Brokers on recognised Stock Exchanges and Banks on allotment being made in respect of applications bearing the stamp of such Brokers or Banks.

Messrs. Lewis and Jones have been appointed the Managing Brokers to this issue. They will in addition be entitled to a Brokerage of $\frac{1}{2}$ % on the face value of the shares subscribed by the public and a further sum of Rs. 5,000/- as incidental charges.

Subscription List will open at the Commencement of Banking hours on 4th January, 1961 and will close at the close of the Banking hours on 11th January, 1961.

Company Meeting

THE MYSORE KIRLOSKAR LIMITED

YANTRAPUR, P.O. HARIHAR

Extracts of the speech delivered by the Chairman of the Mysore Kirloskar Ltd., at Harihar at the time of the 19th Annual General Meeting.

"The management has been already following certain conventions and precedents in tune with the changing concepts of Company management and it is for this reason that I feel that the new amendments to the Company Law may not affect materially the working of your Company" said Dr. M. N. Mahadevan, I.A.S., Director and Chairman of the Mysore Kirloskar Ltd., Harihar at the time of the 19th Annual General Meeting of the Company held at Harihar on the 26th December, 1960.

He further said that so far as this Company was concerned an equitable consideration had been given to the various interests concerned all these years and he assured that the management would show the same equitable consideration in future also.

He referred to the tentative estimates of the Planning Commission in regard to the requirements of machine tools of all descriptions in the country which would be of the order of Rs. 60 crores per annum by 1965-66. He pointed out that there was tremendous scope for further expansion in the machine tool line because of the estimated target of production through the private sector to the extent of Rs. 17 crores per annum.

He again urged on the authorities concerned to continue the facilities of Initial and Additional depreciation atleast in the case of machine tool industry where the requirement of fixed capital is heavier than in other industries. In this connection he stated that

such facilities would not bring any loss to the Government but would only act as a temporary financial accommodation to the factories concerned.

He referred to the rise in Sales of Rs. 36 lakhs during the year ending 30th June, 1960, the total sales amounting to Rs. 1.41 crores as against Rs. 1.05 crores for the previous year ending 30th June, 1959.

He informed that the Company desired to issue fresh capital of Rs. 40 lakhs made up of Rs. 15 lakhs Equity capital and Rs. 25 lakhs Preference capital and that steps in issuing this capital would be taken in due course and requested the shareholders to co-operate substantially in subscribing to the said issue.

He also pointed out that the Company had already received a licence from the Government for substantial increase in its existing lines (almost doubling the existing production) and that the Company had also received the manufacturing licence for Grinding machines and Automatic lathes and Precision Measuring Instruments.

After comparing the percentage allocation of the various factors of production he pointed out that there had been some progress in the efficient working of the factory during the year 1959-60 when compared with the previous year.

N.B.: This is not a report of the proceedings at the above Annual General Meeting.

This is only an announcement — not a Prospectus

Consent of the Central Government has been obtained to this issue.

A licence has been obtained from the Central Government for the establishment of this new Industrial Undertaking.

A copy of the Prospectus, together with the documents specified therein, has been delivered for registration to the Registrar of Companies, Madras.

An application will be made in due course to the Bombay and Madras Stock Exchanges for a quotation for the shares of the Company and permission to deal in them.

The Subscription list will open at 10 A.M. on 9th January, 1961 and will close at 2 P.M. on 16th January, 1961 or earlier as soon as subscriptions approximating to the amount issued hereunder to the public have been received, but not earlier than 2 P.M. on 12th January, 1961.

THE MADRAS ALUMINIUM COMPANY LIMITED

(Incorporated under the Companies Act, 1956)

AUTHORISED CAPITAL :

2,50,000 Cumulative Preference Shares of Rs. 100 each	Rs. 2,50,00,000
7,50,000 Equity Shares of Rs. 100 each	„ 7,50,00,000
	Rs. 10,00,00,000

ISSUED CAPITAL :

1,50,000 Redeemable Cumulative Preference Shares of Rs. 100 each	Rs. 1,50,00,000
4,50,000 Equity Shares of Rs. 100 each	„ 4,50,00,000
	Rs. 6,00,00,000

RIGHTS OF PREFERENCE SHAREHOLDERS

The preference shareholders will be entitled to a fixed cumulative dividend of 9.3 per cent per annum (free of Company's Income-tax but subject to deduction of taxes at the prescribed rates), payable in priority to the ordinary Shares. This means the shareholders will get a dividend of 9.3 per cent less a deduction of tax under Section 18-3(D) of the Indian Income-tax Act, which at present is 30 per cent.

In the event of winding up, the preference shareholders will be entitled in priority to equity shareholders to repayment of the capital paid-up at par, plus all accrued dividends, whether earned or declared or not declared, and also declared but not paid.

The preference shares will all be redeemed at par, on 1st January, 1975, on giving three calendar months' notice, with the option to the Company to redeem the whole or part of the preference capital outstanding at any time, at par, after 1st January, 1972, on giving six calendar months' notice. The proposed method of redemption, whether from profits or by fresh issue of capital will be decided by the Directors at the time of giving the notice, taking the then circumstances of the company into consideration.

The voting rights of the preference shareholders will be as per Section 87 of the Companies Act, 1956.

The issued capital is payable as follows:

- (1) Along with application at Rs. 25 per share, whether Equity or Preference.
- (2) The balance of Rs. 75 per share, whether Equity or Preference, will be called up in three calls of Rs. 25 each, with an interval of at least one month between each call, and the first of such calls will not be earlier than three months from the date of allotment of the respective shares.

PREFERENTIAL ALLOTMENTS AND RESERVATION

- (1) The signatories to the Memorandum of Association have subscribed for 1,200 equity shares. The promoters, directors, and their friends, have subscribed for a total of 48,800 equity shares of Rs. 100 each.
- (2) The Government of Madras have agreed to the Madras Industrial Investment Corporation Ltd., Madras, underwriting and subscribing for 70,000 preference shares of Rs. 100 each and 80,000 equity shares of Rs. 100 each.

- (3) The Life Insurance Corporation of India, Bombay, have agreed to underwrite and apply for 10,000 equity shares of Rs. 100 each and 20,000 preference shares of Rs. 100 each and these will be allotted in full.
- (4) There is a specific arrangement with Messrs. Dalal and Co., Madras, for their tendering applications for 35,000 equity shares of Rs. 100 each and these will be allotted in full.
- (5) As per the agreement entered into with Messrs. Montecatini of Italy, 1,20,000 equity shares of Rs. 100 each will be reserved for allotment to them.
- (6) In accordance with the provisions in the underwriting agreement with the Underwriters and Brokers, 28,500 equity shares of Rs. 100 each have been reserved for firm allotment in respect of applications procured and marked for "firm allotment" by them.

PRESENT ISSUE

The balance that is now unconditionally offered for public subscription is as follows:

60,000 Preference Shares of Rs. 100 each.
1,26,500 Equity Shares of Rs. 100 each.

THE ENTIRE ISSUE OF 60,000 PREFERENCE SHARES AND 1,26,500 EQUITY SHARES HAVE BEEN UNDERWRITTEN BY THE INDUSTRIAL FINANCE CORPORATION OF INDIA, NEW DELHI, AND BY THE VARIOUS PARTIES, AS PER DETAILS HEREIN GIVEN.

DIRECTORS

OBJECTS

The Company was incorporated on 31st August, 1960, for the several purposes set forth in the Memorandum of Association, and in particular to undertake the manufacture of aluminium ingots and alloys, from the bauxite reserves in the Sheveroy Hills. The plant capacity will be 10,000 tons, of which 7,000 tons will be ingots and 3,000 tons alloys, as per the Licence No. L/1B(1)N-760, dated 6th May, 1960, granted to this Company by the Government of India.

The Company has also applied to the Government of India for a licence to erect a Rolling Mill, as an adjunct to the proposed factory, for the manufacture of A.C.S.R., and A.A.C. Cables, extrusion, rods, foils, etc., and the licence is awaited.

The rapid progress made by the aluminium industry can be gauged from the fact that world production of aluminium, which was a little over 7,00,000 tons in 1939, has increased to over 3 million tons at the present time.

The development of a large scale aluminium industry is of particular importance to our industrial economy. Aluminium is the only non-ferrous metal for manufacture of which, on a scale commensurate with out increasing requirements, adequate natural resources are available in the country. And as indicated above, it is a non-ferrous metal with properties which permit its use as a substitute for several purposes for other non-ferrous

metals like copper, lead, zinc, and tin, the indigenous production of which cannot be developed to the required extent because of the very limited resources of the necessary raw materials as far as is known at present. It is in this context that the development of aluminium industry assumes a special significance in our plans for industrial progress.

According to the draft outlines of the Third Five-Year Plan, the estimated capacity of the Aluminium Industry in 1960-61 has been placed at 17,500 tons and production at 17,000 tons, against the production of 7,300 tons in 1955-56. The 1965-66 targets are estimated at a capacity of 82,500 tons and production of 75,000 tons.

The per capita consumption of aluminium in India is very low at about 0.12 lb. compared to 19 lbs. in U.S.A., 12 lbs. in Canada and 10 lbs. in the United Kingdom. With the growing use of aluminium for industrial purposes, the demand for aluminium is bound to far exceed production for several years to come.

RAW MATERIALS

Bauxite is the basic raw material for the production of alumina, while electric power is also as vital a necessity as bauxite. Bauxite deposits of Sheveroy Hills are considered to be very suitable for the manufacture of aluminium, because it is so soft and easily soluble in caustic soda in the process for the manufacture of alumina. The deposits in Sheveroy Hills are estimated at about 7 million tons.

In view of the advantages of nearness of bauxite, power, water transport facilities etc., the factory will be located at Mettur on a plot of about 400 acres, reserved for this Company by the Government of Madras. The Madras State Electricity Board have assured adequate power supply at the rate of Rs. 155 Kw/y for the Alumina section and Rs. 120 Kw/y for the smelter section.

TECHNICAL COLLABORATION

The Company has been fortunate in having secured the technical collaboration with Messrs. Montecatini of Italy, who are associated with the Neyveli Project of the Government of India, and who are one of the world known names in the manufacture of aluminium products, designing, erection and successful working of aluminium plants. Under the terms of the collaboration, M.s. Montecatini are to supply technical know-how, designs and specifications, procure the required machinery for the Indian Company, attend to erection, to supply required technical personnel and also train Indian technical personnel in their factory. The Government of India have approved the technical collaboration terms under which M.s. Montecatini are to be paid Rs. 45 lakhs for technical know-how, Rs. 40 lakhs for engineering fees drawings, assistance in purchase of plant and other allied services, and Rs. 35 lakhs for cost of foreign experts, contractors and agencies for the construction, supervision and other services, charges etc., and these payments are to be satisfied by the issue of 1,20,000 equity shares of Rs. 100 each. No further technical know-how fees are payable either for expansion of the plant capacity upto 20,000 tons or the Rolling Section.

COST OF THE PROJECT

The cost of the project, as estimated by Messrs. Montecatini, for a plant capacity of 10,000 tons of aluminium, of which 7,000 tons will be ingots and 3,000 tons alloys, is approximately as follows:

Foreign Side:	Rs.	Rs.
Plant and Machinery (to be imported)	3,40,00,000	
Technical Know-how	45,00,000	

Fees for designing, specifications etc.	40,00,000	
For Technical Services	35,00,000	
		4,60,00,000
Indian Side:		
Land and Buildings	1,70,00,000	
Fabrication of Machinery	1,00,00,000	
Customs Duty, Freight and Insurance	75,00,000	
Erection and implementation expenses	40,00,000	
Pre-operating expenses (plant trial expenses including raw materials)	13,00,000	
Bank Guarantee Commission for 3 years for deferred payment	15,00,000	
Preliminary Expenses, Underwriting Commission, Brokerage and Share Issue Expenditure	18,00,000	
Working Capital	50,00,000	
Contingencies	19,00,000	
		5,00,00,000
Total		9,60,00,000

The estimated foreign loan requirements (less Montecatini's share participation) of about 5,000 million Italian lire, equivalent to about Rs. 3.30 crores would be financed by a long-term loan under deferred payment arrangements, by "Mediobanca" of Italy, for repayment in nine years commencing from 1st January, 1965 in which direction preliminary negotiations have been completed.

The Industrial Finance Corporation of India have agreed to give guarantee for the foreign loan plus interest on the terms and conditions specified by them, one of which is mortgaging all present and future fixed assets in favour of the said Corporation for the duration of guarantee commitment.

ESTIMATE OF PROFITS

Aluminium ingots are now imported to meet the needs of the Rolling Mills in India. Secondly, rolled metal fetches good prices. The Company intends to instal up-to-date machinery and equipment and utilise the latest methods in the manufacturing processes. Based on current market conditions, the Directors anticipate that the operation of the factory will yield a satisfactory return on the capital invested.

COMMENCEMENT OF BUSINESS

After incorporation of the Company on 31st August, 1960, in order to facilitate carrying of all the arrangements and entering into early contracts for going ahead with the project, the Company obtained the certificate of Commencement of Business on 26th December, 1960, from the Registrar of Companies, Madras, after filing the Statement in lieu of Prospectus.

MANAGING AGENTS

Messrs. Salcoe & Co., a partnership firm consisting of Sri R. Venkataswamy Naidu, Sri P. R. Ramakrishnan, Sri T. S. Narayanaswamy, and Sri V. Radhakrishnan as partners, are proposed to be appointed as the Managing Agents of the Company for a period of ten years, as per the terms and conditions laid down in the draft agreement, with such modifications as may be suggested by the Central Government, and approved by the Board at their meeting held on 20th September, 1960, based on which an application has been made to the Central Government for approval of the appointment of the said Messrs. Salcoe & Co., as the Managing Agents of the Company.

The Managing Agents will be entitled to a remuneration in accordance with the prescribed graded

scale of commission on the Company's annual profits to be computed and determined as provided by Sections 349, 350 and 351 of the Companies Act, 1956, subject to a minimum of Rs 50,000 per annum in the event of absence or inadequacy of profit in any year:

DIRECTORS

The number of Directors shall neither be less than four nor more than twenty-one.

The qualification of a Director, other than the Ex-officio Directors, Italian Directors, if and when appointed by virtue of Clause 135 of the Articles of Association, Corporation Director, Government Director, Debenture-holders' Director and Alternate Director shall be the holding of at least fifty Equity Shares of Rs. 100 each in the Company, of the total nominal value of Rs. 5,000.

PAYMENT TO PROMOTERS

No amount of benefit has been paid or given or is intended to be given to any Promoter or Director of the Company, apart from the sitting fees for the Directors and the Managing Agency commission to the three Directors, Sri R. Venkataswamy Naidu, Sri T. S. Narayanaswami and Sri P. R. Ramakrishnan, as part-

ners of the proposed Managing Agents, Messrs. Salcoe & Co.

UNDERWRITERS

The Industrial Finance Corporation by their Letter No. U.C. 12/60—20657 dated 25th December, 1960, have agreed to underwrite 60,000 equity shares of Rs. 100 each and 60,000 Redeemable Cumulative Preference Shares of Rs. 100 each, and these 60,000 equity shares and 60,000 cumulative preference shares are offered unconditionally for public subscription.

In addition to the specific underwriting arrangements with the Madras Industrial Investment Corporation Ltd., Life Insurance Corporation of India and Messrs. Dalal and Co., set out in the paragraph under "Preferential Allotments and Reservation" the Company, has entered into underwriting agreements with the following parties, who have agreed to underwrite the number of equity shares set out against each of their names. The number of shares for which they will be tendering applications for full allotment (marked for "firm allotment") has also been shown as a deduction from the number of shares underwritten, in order to give clearly the number of shares offered unconditionally for subscription by the public.

		Number of Shares Un- derwritten	Less Firm Allotment Promised	Balance Offer- ed Uncondi- tionally for Public Sub- scription
1. Messrs. Dalal & Co.,	MADRAS	12,500	3,750	8,750
2. Messrs. Kothari & Sons,	"	5,000	1,500	3,500
3. Messrs. Maconochie & Co.,	"	5,000	1,500	3,500
4. Messrs. Somayajulu & Co.,	"	3,000	900	2,100
5. Messrs Swastik & Co.,	"	3,000	900	2,100
6. The Investment Trust of India Ltd.,	"	5,000	1,500	3,500
7. Messrs Devkaran Nanjee & Co.,	BOMBAY	10,000	3,000	7,000
8. Messrs. Jamnadas Morarjee & Co.,	"	10,000	3,000	7,000
9. Messrs. Merwanjee Bomanjee Dalal,	"	5,000	1,500	3,500
10. Messrs. Harish Chandra Gutt & Co.,	"	10,000	3,000	7,000
11. Messrs. Ramanbhai Lalbhai Sheth	"	10,000	3,000	7,000
12. Messrs P. R. Subramanyam,	"	5,000	1,500	3,500
13. Messrs A. B. Pandit & Co.,	"	5,000	1,500	3,500
14. Messrs. G. M. Pyne	CALCUTTA	3,500	1,050	2,450
15. Messrs. M. Nanjappaiah Jahgirdar,	BANGALORE	3,000	900	2,100
Total		95,000	28,500	66,500

The Directors are of the opinion that the resources of the Underwriters are sufficient to discharge their respective underwriting obligations.

All the Underwriters will be paid an underwriting commission of 2½ per cent of the nominal value of shares underwritten by each of them.

BROKERAGE

Brokerage at the rate of 1 per cent will be paid on all allotments made in respect of applications bearing the stamp of any Bank or recognised Broker.

Brokerage on the same basis is payable to the

Underwriters, in addition to the underwriting commission, as mentioned in the preceding paragraph, on allotments in respect of shares allotted on applications made or procured by them and bearing their stamps.

APPLICATION FOR SHARES

Copies of the Prospectus and Application Forms can be had from the Registered Office of the Company, or from the Underwriters or Brokers or from the Bankers of the Company, or from the Branches of such Bankers, at Madras, Bombay, Calcutta, Delhi, Bangalore, Coimbatore or Ahmedabad.

PRAGA MARCHES ON

.....Praga, pioneers in the manufacture of machine tools and precision equipment, made its debut in 1943.

Born in dole drums, it had to overcome many a rough weather. In 1957, the Government of India stepped into its life, and subsequently, it became a unit in the Public Sector. Since then, the story of Pragas is one of continuous progress. Acclaimed as symbols of technical excellence, its products meet the ever-growing demands arising out of the nation's plans and projects. The Unit has enlarged its range; stepped up its output; increased its sales. The number of employees has grown to the level of 1,700 from a handful of men.

Now, as ever, Praga will pull its weight in the national endeavour.

The Praga Tools Corporation Ltd.,
Kavdiguda Road, Secunderabad (A.P.).

Medium Section Mill—Bloom reheating furnace and Mill run-in table

Construction and operation proceed side by side at Durgapur Steelworks

ISCON's Medium Section and Merchant Mills—the final unit of the Rolling Mills Plant—are now well on the way towards completion. Three Mills were commissioned earlier this year and are in operation.

The two new Mills will make a considerable addition to Durgapur's productive range.

How Big

is 49,000 tonnes of coffee

It may be more than a handful—may be it will touch the sky if bags are placed one upon another. The figure must be read in comparison to the past production records to appreciate how big really it is! In the year 1952-53 production was in the level of 23,943 tonnes. It steadily increased and in 1959-60 the production of coffee in India has exceeded 49,380 tonnes. Now, the trend of increase is such that even the conservative speculators think it quite possible to touch the figure of 81,285 tonnes within a period of next ten years.

This achievement was not due to any freak of nature. Tremendous efforts are continuously made to increase the overall production, yield per acre and to improve the quality of coffee. The Research Department of the Coffee Board is engaged in continuous scientific activities to improve the quality and increase the yield by employing modern techniques of cultivation. Free technical advice is provided to all planters regarding manures, plant protection and other cultural operations through a large network of Liaison Officers.

Both internal and export markets for Indian Coffee are rapidly expanding, keeping pace with the increasing trend in production. Consumption in India has increased from 8,500 tonnes in 1939 to 27,500 tonnes in 1959.

14,500 tonnes of Indian Coffee were exported in 1959 to various countries, mainly to West Germany, France, Italy, England, U.S.S.R., Middle Eastern countries, etc., earning foreign exchange worth nearly 6.08 crores.

The distinctive aroma of Indian Coffee is preferred by all connoisseurs. Apart from the natural advantage of high altitude, sunny slopes and rich soil, which is ideal for growing good quality coffee, great care and attention are devoted at all stages by the traditionally skilled people. The human touch in it makes Indian Coffee supreme.

COFFEE BOARD

JANUARY 13, 1961

The Punjab: Animated Suspense?

EVENTS have moved dramatically in the Punjab during the last seven days. As often, when events follow very quickly upon one another it is difficult to assess, until they settle down to what might be described as their equilibrium position, what they portend. Even the facts, as reported in the newspapers, are confusing enough. The only points which are clear are that Sant Fateh Singh ended his fast of twenty-two days on the morning of January 9, on a recommendation of Master Tara Singh that the Prime Minister's statement involved a fulfilment of the purpose for which the fast was undertaken. This has been hailed in official circles as a climb-down by the Akalis, and a suggestion has been made that the Akali leaders were all-too-ready for a symbolic gesture to change their minds. The mass release of Akalis detained and the Prime Minister's statement, equivocal and uncertain as it is, seems to have provided a welcome way out. If things could be left there, namely, that both sides have recognised that the agitation has fulfilled its main purpose and nothing more need be done, all would be well. Many observers have drawn this conclusion; but *The Eastern Economist* believes it is not warranted.

Two uncomfortable facts remain. In the first place, on Monday this week, Master Tara Singh announced that "the agitation would continue." While the Akali Morcha has been discontinued, something like a Gandhian demand is to be now made for the same end. While this displays moderation on the part of the leaders, the rank and file of the supporters is highly agitated. An attack was made on Master Tara Singh on January 11, when he was shouted down and had to be escorted to safety by armed Sevadars. So far as the temper of the rank and file can be gauged, it is still militant and by no means reconciled to the 'peaceful' proposals of its leaders. Since the rank and file will have a longer and more continuous influence on the making of policy than the leaders, there is no room for complacency.

This is not the first time that the volume of the Akali agitation has been misconstrued in Delhi. At the last Governors' Conference, the Governor of the Punjab, Mr. N. V. Gadgil, showed himself a very poor judge of its intensity. While

the Prime Minister has played his role with dignity and firmness, there is still no evidence that he is playing on firm and stable ground. Indeed, the vigour with which the agitation was pursued (notwithstanding the readiness with which it was withdrawn) seems to indicate that a settlement is not in sight. It is, therefore, right that one should consider whether or not a further concession to obtain a solution would, or would not, be historically expedient and administratively wise. The Central Government obviously has power with the Army—not the police—to defeat the Akalis. But is this expensive operation to be waged for no purpose beyond those the Prime Minister named?

In deciding whether or not a separate Sikh State should be conceded, one should not too narrowly conceive of "unity" in terms of a geographical area only. The essence of unity is the absence of tension between the inhabitants of the area. There is not much evidence in the Punjab that this obtains, and while the present position is certainly much better than it was a week ago, no one should underestimate the intensity of the feeling amongst the Sikhs in respect of their demands. The substance of the demand is that the Sikhs want a separate area to be run predominantly as a Sikh State. Equally there is a good deal to be said for a Hindu area covering Haryana in which the tension between Sikhs and Hindus will be reduced by placing a Hindu administration firmly in power. The division of the Punjab is not necessarily a reduction of all-India unity any more than the separation of Gujarat and Maharashtra previously refused on the same ground. It is sincerely to be hoped that, when talks are resumed, the Central Government will not take an unduly rigid stand. If it is true that the tension between the Hindus and the Sikhs makes working together impossible, the separation of two areas, both owing direct loyalty to the Centre would by no means be, on balance, an evil. The long-term solution, which has now been kept in animated suspense is one which should not be unduly delayed. And second thoughts on both sides suggest that the time to reach a compromise agreement is before disagreement hardens into an election battle, with the Sikh districts solidly in opposition.

Dandakaranya: The Tractor Scandal

THERE is much more in the scandal of the tractors acquired from the Defence Ministry for the Dandakaranya project than what was made out when this issue was raised in Parliament in the last Budget Session. Mr Sukumar Sen, Chairman of the Dandakaranya Development Authority, made the startling revelation at a Press conference in New Delhi on Monday this

week that not a single tractor out of the entire fleet of 58 was in working order. This certainly lays bare a very grave state of affairs. It was pointed out early in March last year in Parliament by Mr. M. C. Khanna, the Rehabilitation Minister, that certain defects were discovered in 16 tractors which were grounded on the advice of the collaborating Japanese manufacturer. It

is a matter for serious consideration that after the end of the monsoons, when the fleet of tractors was expected to be used in full swing to expedite the reclamation operations to rehabilitate refugees without any further delay, the entire fleet of 58 should be found fit only for being grounded. Mr. Sukumar Sen's forthright and categorical statement has not been contradicted. This is significant.

This statement takes the Dandakaranya tractor scandal a long step forward. In March last, when this issue was raised on a call-attention notice in the Lok Sabha, Mr. Khanna stated that out of the fleet of 53 tractors purchased from by his Ministry from the Ordnance Factories, 42 tractors of the D-120 type were in perfectly good working order and they were giving completely satisfactory service; it was only 16 tractors of the D-80 type which had to be put out of commission. They required mere minor adjustments which could be completed soon. What were then dismissed as minor defects in these tractors actually turned out to be so serious as to render them unserviceable.

The tractor scandal has now taken a grave turn by reason of Mr. Sen's disclosure that even the large sized 42 D-120's which, according to the Rehabilitation Minister's statement of March were quite sound, have also become unserviceable. The entire fleet is said to be rusting and lying in a corner like a scrap heap.

These tractors were manufactured by the Defence Ministry in the Ordnance Factories in collaboration with the Japanese firm of Komutsu Manufacturing Company. Immediately after the call-attention notice, this question was again raised in the Lok Sabha and the Defence Minister was called upon to explain the real state of affairs. Mr. Krishna Menon's explanation makes it crystal clear that responsibility for the tractor scandal ought to rest heavily on the shoulders of the Defence Ministry. The liability of the Rehabilitation Ministry may at best be confined to an error of judgment in seeking the agency of the Defence Ministry to acquire these tractors.

The Draft Election Manifesto

THE resolution on the draft of the election manifesto of the Congress Party for the ensuing general elections of 1962, which was adopted at the Bhavnagar Session, appears to be commendatory; but, in essence, it is directive in character. The text of the resolution sets out no less than twenty-two points, which are to be emphasized in the final election manifesto, as constituting the kernel of the politico-economic policies and the programmes of the Congress Party. This resolution has been over-weighted by economic issues and the attention which has been focused on domestic and international political problems has been kept within reasonable limits. This is undoubtedly a great virtue of the draft manifesto.

Achievement of food self-sufficiency by the end of the Third Plan is the acid test of the success or shortcomings in performance of the Third Plan. It is undoubtedly curious that definite programmes of intensive cultivation, which ought to be carried through in reaching food self-sufficiency, have been practically over-looked in the resolution or disposed of with mere exhortations. On the other hand, there has been so much high-sounding talk about the co-operative pattern of society and the setting up a country-wide network of farming co-operatives as well as service

But here again, the Defence Minister's ambition to make all manner of experiments in manufacture in the Ordnance Factories appears to have been the root of the whole trouble. Mr. Krishna Menon asserted in an over-confident tone that the report about the unserviceability of the 16 D-80's was nothing short of "a sensational story". He also asserted that the most eloquent testimony to the quality and efficiency of the type of tractors whose manufacture was taken in hand by the Ordnance Factories in collaboration with Komutsu was that the Rehabilitation Ministry had placed an order for a further supply of 125 tractors with his Ministry. One fails to understand how placing of the second order in such a short time without putting the first batch to a severe test for a sufficient time, amounts to a sound testimony. It is now alleged that the firm of Komutsu has little experience of manufacturing tractors of the types selected for the Ordnance Factories. If so, this fact raises still another fundamental issue.

On what evidence did the Defence Ministry come to the conclusion that Komutsu were the right manufacturers whose collaboration should be sought by it? The Defence Ministry ought to have taken the precaution in selecting the collaborator for manufacturing the tractors. Whatever the force behind the allegation about Komutsu, it is undoubtedly outrageous that the Dandakaranya project should have been singled out for this dubious experiment. In this case, Parliament ought to insist upon a thorough explanation about the facts collected and criteria applied by the Defence Ministry to satisfy itself about the suitability of Komutsu for collaboration. The stock plea of non-disclosure in the public interest cannot be maintained here. If the Chairman of the Dandakaranya Development Authority was constrained to declare that the entire fleet of 58 tractors has become absolutely unserviceable, this development calls for a parliamentary enquiry after the views of the Ministries of Defence and Rehabilitation have been presented.

co-operatives. Rural electrification for introducing technological improvements in agriculture and rural industries, on a progressive scale, has not escaped attention. A novel recommendation has been made that each State should earmark a definite proportion of the electricity generated by it for rural electrification. The Draft of the Third Plan exposes the hollowness of this novel approach. Taking a population of 5,000 as the norm for a village, only 3.4 per cent villages in India will have been electrified by the end of the Second Plan and the target for the Third Plan aims at pushing up this puny percentage to 6. The fundamental obstacles to carrying forward rural electrification programmes have been very frankly admitted in the Draft Third Plan. They are the wide distances separating the villages, the consequent difficulty of spreading the grid systems in the countryside and the sluggish response of effective demand, present as well as prospective. The resolution cannot but give the impression that the imperative instruments of food self-sufficiency have received scant attention.

Labour and employment constitute the Achilles heel of the first two Plans. Even in the non-agricultural sector of the economy, there has been a grave shortfall in the creation of addi-

tional jobs in the Second Plan, leaving a heavy load of carry-over of the unemployed to the Third Plan. The resolution hints at the possibility of exploiting the employment potential of the village industries as an immediate programme to fight unemployment. Comment on the assumption behind tapping this potential in the short run, in the light of the grave difficulties of organising these industries on modernised lines to generate self-sustaining capacity, is unnecessary. Emphasis has been placed on greater attention to welfare. Provision of training facilities has also been mentioned incidentally as a plank in labour policy. While improving standards of living and welfare are labour's due, their correlation to productivity, which alone can sustain them in the long run, has been totally ignored by a conspicuous omission. One wonders why, in the light of the grave challenge to industrial peace in both the sectors during the Second Plan, a rational link between wages and productivity has not been driven home.

Whether by inadvertence or otherwise, there is a reference to "socialisation" as a means, among

Guest Editorial

South Africa: Country of Minorities

By William Rees-Mogg

PARADOXICALLY the first impression of a visitor to South Africa is not of the state of tension but of the degree of stability. The events in the Congo, the Sharpeville shooting, and the policy of *apartheid* have created such a strong impression of crisis that there is bound to be some initial surprise at the solidity of the South African economy, and, for that matter, at the freedom of the South African Press.

Indeed one South African sympathetic to the Government asked me whether the violence of the opposition in the English-speaking press did not create a false impression of South Africa. I had to tell him that the vigour of the English language press criticism was one of the most encouraging points about South Africa; it both showed that a powerful element was absolutely opposed to *apartheid*, and that the censorship of the emergency period had not muzzled the press permanently.

There is certainly growing bitterness among English-speaking South Africans at being caught in the crossfire of the Nationalist Government's racial policies. Obviously these English businessmen do not all hold liberal views, but the general tone of their community is surprisingly progressive. The old idea that business and politics should be kept rigidly apart is now much less widely held; Sharpeville, and the crisis of confidence it created, showed that business cannot avoid the consequences of political action.

It does seem clear, however, that the long-term political future of South Africa depends upon a reconciliation of different races rather than on a simple transfer of power to the native majority. The latest figures of population show that in 1960 there were about 8 million native Africans, about 1½ million of mixed descent, about ½ million of Indian descent and about 3 million of European descent, more or less equally divided between the English-speaking and the Afrikaans-speaking communities.

The present Government is a tyranny of the Afrikaans people over everyone else. The English-speaking population benefits economically from

other priority measures, of the achievement of the socialist pattern of society. Socialisation or nationalisation has been definitely frozen, except in very urgent and indispensable cases, if the Industrial Policy Resolution of April, 1956, is to be interpreted in its correct connotation. There can be no frittering away of rupee resources for socialisation, scarce as they are. Perhaps this may be disregarded as a sop to the electorate. Nevertheless, it is gratifying to find that the central character of the pattern of the country's economy as a mixed economy has been emphasized and what is still more gratifying is that there has been a deliberate accent in quite unequivocal terms on the preservation of the worth and dignity of the individual in the accepted pattern of the economy. The draft manifesto, on a general view, attempts to clarify the attitude of the Party to the live issues before the nation, but the greatest flaw in it has been a serious lack of balance in emphasis. However, can any election manifesto have a true sense of proportion? Objective proportion, it seems, is not good for the people or at least their votes.

the advantages that are reserved for the European peoples, but it has been completely excluded from Government for twelve years, and expects to share the consequences of the eventual breakdown of the policy and much of the bitterness it has created. One South African—a supporter of the Progressive Party—said to me, "if it ever gets to the point of a shooting-match, I don't suppose that a white man will be asked 'do you speak English?' before he is shot at."

The Government itself seems to be completely without merit, but is not, I think, completely without sincerity. It leaves the impression of being an administration of dangerous fanatics but not an administration of dangerous criminals. Admittedly it is capable of some pretty sharp political practice, and its attitudes are far from liberal. I was impressed by the fact that no one while I was in South Africa mentioned the fact that their Prime Minister, Dr. Verwoerd, had been shot only a few months before. This was the ideal Reichstag fire incident on which to build a firmer dictatorship; yet the Afrikaans reaction to it had been entirely sane and level-headed. They knew it was the work of a lunatic and left it at that.

In economic terms *apartheid*—the complete separation of the races—is absurd and the consequences of attempting it have already been disastrous. The South African economy is the strongest and most prosperous in the whole of Africa, but it depends naturally upon the labour of all the people of South Africa. It never was reasonable to try to separate them into different economic units, and it is now far too late for the attempt to succeed.

At present the need to get away from *apartheid* dominates everyone's mind. Inevitably the bitterness the *apartheid* has created makes it difficult to work for any just alternative. A liberal South African told me that he wanted to get away from Verwoerdism without replacing it with Nkrumahism. That seems a fair way of expressing the dilemma of a country in which every one belongs to a minority and every minority needs protection.

A DELHI DIARY

MAN OF THE YEAR

IN the first Delhi Diary of this year I must create a new precedent and choose a man of the year just ended. Everyone keeps on telling me that 1960 has been a very bad year for every country except India, which has reached a new peak in agricultural and industrial production, rising at a rate, the statisticians tell me, never attained before. Amongst countries, I, therefore, choose India as the country of the year. Amongst individuals, I choose Jawaharlal Nehru. Not on the old argument which used to be repeated amongst schoolboys of a progressive selection on lines such as this: Asia is the most populous continent in the world; therefore, the most important. India is the most civilized country in Asia and, therefore, the most important; inside India the Central Government is the most powerful of all Governments, and, therefore, the schoolboys say, most important. The Head of the Central Government is Jawaharlal Nehru; therefore, he is the most important man in the world. Quod erat demonstrandum. I choose Jawaharlal Nehru not in terms of economics, or (let me be brutally frank!) in terms of his international achievements in 1960, which I reckon small, but in terms of the fine leadership he has given to the Indian people at what must have been one of their most critical years. It contains both Assam and the Punjab, and, more personally, Berubari and Dr. B. C. Roy. Over all of them is his fine sense of timing and, at the same time, his resilience, which compel admiration. Therefore, on his own account or what the Americans call 'on the record', I award the 'Argus Prize' for Leadership in 1960 to Jawaharlal Nehru.

It has become difficult, as the years go by, to reconcile ourselves with the point that Jawaharlal is a septuagenarian and, therefore, according to the Life Insurance Corporation's actuarial tables, has only a meagre expectation of life. No one need deny that he is looking increasingly tired and those who saw him at Bhavnagar, say that he showed great signs of strain. On this nobody should be surprised. He had more than one conversation with Master Tara Singh and 'intervened' on innumerable occasions in the A.I.C.C. meetings, apart from his marathon speeches which, it seems to me, keep his physical powers unnecessarily engaged at a time of strain. However, I have been told by a fellow-journalist that I lack understanding on these points. The question that is vital in assessing Jawaharlal Nehru is the manner of his method (or absence of method) of work. A very large number of people keep on repeating mechanically that he is a poor administrator, by which they mean that there is much overlapping, much absence of true delegation, much irritation and confusion in the apparatus which he heads. I accept none of these criticisms in exactly this form, though I admit that all these weaknesses exist when looked at from what might be called a completely orderly administration. But I think critics of the Prime Minister fail utterly to remember that the purpose of administration is to get things done. That (and not order) is both the acid test and justification of an administrator. When one looks upon the Prime Minister's achievements, particularly over the last two decades, which cover the two Plans, one is staggered by the volume of his positive accomplishments. We in India are querulous and often unimaginative people in terms of objective historical assessment. I venture to think that any historian of class, looking back on the achievements of the last ten years, would rank the Prime Minister as one of the world's great administrators. I, therefore, salute him today not merely as a man who has been able to break through the great mists in the minds of the

people of Assam and in the Punjab—though in both places the final chapter has not yet been closed—but as a man who has been able to move great new forces in the Indian social and economic system.

Whether this movement, which has taken place under what is called the socialist pattern of society or not, is directed in its best possible way is a different question. I see that 'The Eastern Economist' in its latest Annual Number has been propounding the doctrine that, if the American and Indian Revolutions are parallel, Jawaharlal Nehru is part Washington, part Hamilton, and will be overcome, in time, by the Jeffersonian spirit of individualism, more powerful States and even (horror of horrors!) free enterprise itself. I do not subscribe to this view, but I consider it is not entirely erroneous in its assumption that Jawaharlal Nehru's leadership, effective as it has been, has not been in the true line of the genius of the Indian people. The only question is to find India's Thomas Jefferson in order to influence policy in the next forty years to bring back individualism and private incentives. I presume he is already born. I often wonder whether it will not be good thing for us to institute search for divinely-sent leaders as in Tibet where they 'search' for the new Dalai Lama as soon as one departs. But I am reminded that the chances are that if a search had been made neither Mahatma Gandhi nor Jawaharlal Nehru would have been chosen. Let this not be any comment on more divinely inspired processes of selection, not vouchsafed to secular States!

MR. DUNCAN SANDYS

One of the great merits of the Prime Minister is that he finds time to see hundreds of people, not all of whom, to put it mildly, are interesting. This week, however, he really has had both an interesting and an important visitor in the form of Mr. Duncan Sandys, Secretary of State for Commonwealth Relations. Mr. Sandys met representatives of the Press on Wednesday and stood his grounds splendidly; Laos, on which he had conversation with the Prime Minister, naturally being in the ascendant. He made an eminently wise introductory speech stressing the broadening of the Commonwealth and the likelihood of the growth of its influence following the next Commonwealth Prime Ministers' Conference in March. He spoke hopefully on the new partnership symbolised in Durgapur, this had impressed him even more than the purely physical achievements which have also been striking. He skipped skilfully over the India House Library, smiling blandly when it was suggested this might be a gift from the Queen. He avoided Burma presumably as that would take him close to China and refused resolutely to be entangled with anything outside the Commonwealth except Laos. His comments were interesting in themselves, though I must confess I cannot work up in fever on Laos and am beginning to tire of international commissions, changing Governments, and anything connected therewith. I have ceased to remember names of the Prime Ministers of Laos as they come and go, or even—which is more important—its military commanders. What was really interesting on this occasion was Mr. Duncan Sandys himself. Some people tell me that he is a future Prime Minister of the United Kingdom. Would it be a terrible indiscretion if I admitted that the reason why I went to the Press Conference was that I thought it would be a good thing to form my own opinion on an astrological prediction. My own opinion is: Very Possible. But then how are Prime Ministers chosen?

ARGUS

STATE BANK OF INDIA'S

RUPEE TRAVELLERS

CHEQUES FOR CARE-FREE TRAVEL

You can travel anywhere in India and outside without having to carry a large amount of cash, without being in fear of theft or of running short of money.

The State Bank's travellers cheques, issued in denominations of Rs. 100/- and Rs. 50/-, represent the ideal travel funds. They are as safe as a bank draft and are encashable anywhere, anytime.

This is one more of the services the Bank has provided from January 1958. For complete information, please ask for a copy of our illustrated booklet from the branch nearest to you, or consult your travel agent.

SISTA'S-58-13

THE MADRAS ALUMINIUM CO., LTD.

(Registered Office: "Kamala Nilayam", Peelamedu, Coimbatore-4)

AUTHORISED CAPITAL:

2,50,000 Cumulative Preference Shares	
of Rs. 100/- each	Rs. 2,50,00,000
7,50,000 Equity Shares of Rs. 100/- each	7,50,00,000
	Rs. 10,00,00,000

ISSUED CAPITAL:

1,50,000 Redeemable Cumulative Preference Shares of Rs. 100/- each	Rs. 1,50,00,000
4,50,000 Equity Shares of Rs. 100/- each	4,50,00,000

The Subscription List will open at 10 A.M. on 9th January, 1961 and will close at 2 P.M. on 16th January, 1961 or earlier as soon as subscriptions approximating to the amount issued to the public have been received, but not earlier than 2 P.M. on 12th January, 1961.

With reference to the last paragraph under the heading TECHNICAL COLLABORATION (page 11 of the Prospectus) of the announcement published on 6th January, 1961 about the approval of the Government of India of the terms of the collaboration agreement with Messrs. Montecatini of Italy, we have to clarify that the Government of India have approved the said collaboration on the following terms:

- I. (a) Allotment of 45,000 shares of Rs. 100 each in the equity share capital of the Madras Aluminium Company Ltd., Coimbatore, to M/s. Montecatini of Italy in consideration of the transfer of the collaborators' technical know-how in the field of the mining of bauxite ores and production of alumina, aluminium ingots and aluminium alloys. It is noted that the collaborator would be agreeable not to charge any additional fees for the supply of technical know-how either in regard to further expansion upto 20,000 tons of aluminium smelter or in regard to manufacture of aluminium fabrications.
- (2) Payment to M/s. Montecatini of Italy of a sum not exceeding Rs. 40 lakhs in Italian lire towards engineering fees, drawings, assistance in purchase of plant and other allied services.
- (3) Payment to M/s. Montecatini of Italy of a sum not exceeding Rs. 35 lakhs in Italian lire for the cost of foreign expert's, contractors and agencies for the construction, supervision and other services, charges, etc. This amount of Rs. 35 lakhs represents the payments in foreign exchange to the technical personnel of Montecatini in India. The rupee expenditure on such personnel, it is understood, is estimated at Rs. 15 lakhs.
- II. It is noted that M/s. Montecatini will, apart from the equity shares to the extent of Rs. 45 lakhs issued to them for the know-how, would also invest a sum of Rs. 75 lakhs in equity capital of the company as and when this sum that is being paid to the Italian collaborator for engineering fees and personnel become due.

The reservation of 1,20,000 shares for allotment to Montecatini in page 2 of the prospectus is to meet the commitments stated above as and when they fall due.

THE WEEK'S NOTES

France

GENERAL DE GAULLE'S TRIUMPH

THE MASSIVE vote in favour of President de Gaulle on the Algerian referendum has demonstrated again the large personal equation in French politics. The final figures announced this week gave General de Gaulle, in Algeria, 1,747,529 'yes' votes against 782,056 'no' votes. It is true that under a suggestion of the leaders of the Algerian National Party, the referendum was boycotted by a large number of its members and the popular vote was, to some extent, vitiated thereby. It would not be an unwarranted assumption, however, to say that these abstentions are, in fact, no negative votes. If they were included in the counting even on a basis that half of them were willing to consider the de Gaulle proposals, one might say that in Algeria the vote is as favourable as in France. In Metropolitan France, there were three times as many 'yes' votes as 'no' votes. Thus one can argue that the President has received abundant authority from France and almost equal confidence in Algeria.

Whether the execution of his plan is aided merely by this recognition that large majorities in both areas are for the General, it is a different question; even a small minority, led by the determined Colons, will be difficult to extinguish, if it is based on violent opposition. Nevertheless, the General is now likely to shoot down opposition as much as to decrease it. The referendum strengthens his own personal position in terms of justification of such shooting as seems inevitable in Algerian politics.

What has been again demonstrated is that the personal equation in French politics, which ran at an all-time high with General de Gaulle's coming to power, has not been significantly diminished. Curiously, it is not so much in Algeria as in French politics that the referendum is interesting. The constant complaint that General de Gaulle has fallen from grace and the French people are restive under his decrees, does not seem to have any evidence in fact. He still rides on the crest of the wave.

Laos

RE-ACTIVISING THE SUPERVISORY COMMISSION

A RECENT Gallup Poll conducted in the USA on the eve of the latest crisis in Laos reveals that an increased number of Americans have come to believe that there is a growing danger of another World War. The percentage believing that there is "much danger" of war has risen from 38 in February 1960 to 50 in December 1960 and those confident that there is "not much danger" of war has dropped from 51 to 35 per cent. Compared to this, in Britain there is still the optimism that the chances of war breaking out are bleak. A similar survey conducted in Britain reveals that 18 per cent of the British people fear that there is "much danger" of war, while 65 per cent believe that there is "not much danger." These views apart, it, however, is clear that the situation in Laos is in a state of flux. With the turning down by Prince Souvanna Phouma, the former Premier of Laos, the invitation of Boun Oum's Government to return to Laos to resolve the crisis, the situation seems to have been worsened.

The only silver lining in the cloud that now appears to be is that Britain and India are agreed on the view that the International Supervisory Commission needs to be reconvened. It may be recalled that in the summer of 1959, Britain was not anxious to reconvene the Commission when the proposal was mooted by India. Boun Oum's Government now functioning in Vientiane is not prepared to admit the Commission until and unless it recognizes the present

Government. Russians on the other hand are putting forward the claim that Prince Souvanna Phouma's Government in exile has not yet resigned and should be regarded as the functioning Government for the purpose of the Commission and even otherwise. The present position is that India on her own cannot take action until there is a request from the two co-chairmen. This is because India cannot function independently of the procedures laid down in the Geneva Agreement even though she is a chairman of the Supervisory Commission.

Feelers continue to be thrown that the Commission may not deal with the Governments as such, but with the King who is the constitutional head. But is the King prepared to have the Commission back? Then again, while Britain, the USA and France are in favour of revival of the Commission, Russia continues to insist that there should be a preliminary meeting of the two co-chairmen to work out the details. In its anxiety to solve the present crisis, there has come a new move to convene a 14-nation conference including, among others, the signatories to the Geneva Agreement. The Soviet Union, France, North Vietnam and Cambodia are said to have committed themselves to the view that such a conference would be more fruitful than a re-activation of the Laos Commission. On the face of it, the convening of the 14-nation conference might appear to be well-meaning, but the fear is that it perhaps may not be so effective to induce the contending forces to cease fire and to stop foreign military intervention. The immediate need is to check fighting and under the circumstances, the revival of the Commission seems to be the only workable solution. All those interested in peace in South-East Asia must strive for its re-activation.

University Education

MR. S. R. DAS'S CONVOCATION ADDRESS

THE ADDRESS of Mr S. R. Das, Vice-Chancellor, Visva-Bharati University, Santiniketan, at the thirteenth convocation of Rajasthan University on Monday, the 9th January, 1961, is a happy departure from hackneyed and routine addresses that young graduates have to swallow against their will every year. Mr Das's address is not only useful to the university students, but also to people in all walks of life. Mr Das is not given to making frequent speeches. But in the few which he makes his magnificent and noble personality and his breadth of vision cannot be missed. One listening or going through his convocation address is amazed at the sincerity of feeling and a complete identification of his sentiments with the young graduates of the university. But what marks out Mr Das from most others is his depth of compassion and feeling, punctuated properly with the realism of life that only comes through living a useful and eventful life. When Mr Das advises the young graduates to lead a life of usefulness, one does not feel that one is listening to another of those tall talks in which many people have become habituated to indulge without really meaning what they are saying. And Mr Das explains to young students what he means by useful life in the context of India's rich heritage and of modern strains and stresses, both at home and abroad. He reminds the students that the Indian youth have forgotten the Fatherhood of God and the Brotherhood of Man, and the declaration of human dignity by the words 'Amritasaya Putraha' enunciated by our 'Rishis.'

Mr Das is pained to see that a large number of educated young men have been involved in linguistic quarrels; naked goondaism has replaced a logical argument of one's case with supporting reasons. The failure on the part of university students to live upto certain standards of moral, spiritual and intellectual

values has been ascribed to the failure of our universities to discharge their duties and functions properly. The main purpose of university education, according to Mr Das, should be to promote the study of the mind of man and research into the various cultures and civilisations of the world with a view to strengthening the fundamental conditions of world peace, through the establishment of free communication of ideas between the thinkers and scholars of both eastern and western countries, free from all antagonisms of race, nationality, creed or caste. And in order to attain those ideals, Mr Das gives the following practical pieces of advice to young students which are worthy of emulation by all. They are: Speak the truth. Practise righteousness. Deviate not from your duties. Be firm as a rock. Be sharp as an axe. Be worthy as gold.

MAHARASHTRA LAND CEILINGS BILL

Press Statement of Mr. F. Edwards, President of the Deccan Sugar Factories' Association, Bombay

The proposed Land Ceilings Bill of the Government of Maharashtra is a very risky and dangerous move! No right thinking businessman or industrialist could possibly support such a retrograde step. The very basis of the success of the Sugar Industry in Maharashtra is being undermined, and the benefit, experience and efficiency built up over a period of 40 years is being thrown to the winds. Maharashtra is the most successful sugar producing area in India and this success is only due to the pioneering work and perseverance put in by the old established joint stock companies. Their experience has proved that only by having the growth of its Sugar Cane under its own complete control can a factory produce quality sugar at low prices. The profits made by such factories are not due to high selling prices, or profiteering, because the selling rates are fixed by the State Government! They are due solely to lower costs of growing cane and manufacturing. Looking to the yields of cane per acre and quantity of sugar produced per acre of cane, it is completely beyond all comprehension why there should be State Government interference, when the Central Government are urging higher production, at lower costs, to enable the country to participate in world trading and earn valuable foreign exchange.

Maharashtra produces results equal to the averages in other well known Sugar producing countries of the world. Take Java, for example, and study the following figures:

	Yield of Cane in Tons per Acre	Average percentage recovery of Sugar from Cane
Java	56.20	11.49%
Maharashtra	53.25	11.80%
All India	14.70	9.84%

Compare Maharashtra's results with the averages throughout India, and ask yourselves the question "Why should the State Government attempt to disturb such progress in Maharashtra, when the rest of the country's Sugar industry is obviously so sick and ailing"? The answer cannot possibly be that it is in the interests of the Nation or even in the interests of the State. There are abundant facts to prove that. It is therefore astounding that the Central Government should allow such legislation to be brought forward. The only obvious answer to the question is that the move is entirely political and is an effort to attain some ideological goal

at any and all costs. The intention to apply Ceilings to Sugar Cane farms is all the more astonishing when one recalls the utterances of Ministers and the Planning Commission in recent times and the steps that have been taken in other States to exclude industrial undertakings from their Land Ceiling Bills. Surely it can't be that the Governments of Andhra, Kerala, Madras, etc. are more enlightened than that of Maharashtra! In the Madras Bill provision is made for the setting up of a Sugar Cane Board with a High Court Judge as Chairman to determine whether Sugar Cane farms shall continue to be run by the factories which have been cultivating them hitherto. This is fair enough as it is expected the decisions will depend on facts and merit but the Maharashtra Government has set itself up as the sole judge as to what it should do with the Surplus lands which become vested in it. And if any difficulties should arise in administering the bill when it is enacted, the Government has taken the power to make such adjustments or take such decisions as it may consider necessary to meet the case. This is a bad feature of the bill and should be opposed vigorously. Another possibility is that some of the Sugar factories in the country may find themselves deprived of their farms while others will not and this discriminatory treatment should not be allowed by the Central Government.

The whole Bill is another example of unnecessary political interference in industry and commerce and the effect, if the bill is enacted in its present form, must inevitably be detrimental to the progress of the Sugar industry in the Deccan. It is to be hoped that the Government even at this late stage will indulge in some re-thinking and come to the right conclusion that it would be infinitely wiser to exclude well run Sugar Cane farms attached to factories, from the provisions of the bill.

The World Abroad

CONTRASTS IN THE BRITISH AND GERMAN ECONOMIES

By

ODYSSEUS

IN his dispatch "After the German Miracle" (March 18, 1960), Our West European Correspondent explained why, although Germany's economic growth will no longer proceed at the spectacular pace that it was able to maintain as long as it was aided by the influx of refugee labour, the national product may be expected to continue to expand, albeit at a more "normal" pace, related to Germany's ability to raise productivity. After a three weeks' study tour of Germany, I offer, as a footnote to my colleague's carefully documented exposition, some points of contrast between the UK and German economies.

The labour shortage will, of course, enable the masses to secure a larger slice of the national cake. Most Germans with whom I talked believed that competition for votes between the parties would lead to rising "welfarization", but they thought, for reasons that I outline below, that for some time to come the term "Welfarism" is likely to have widely different meanings in the UK and in Germany.

Since the British Trade Union Congress and the German Federation of Workers (DGB) are important factors in their respective economies, a comparison of their different attitudes towards labour problems is enlightening. The TUC is staffed by intelligent men, who understand what makes for economic growth, but they cannot control the jealously independent craft unions that they loosely federate. The TUC realize the imperative need, if wealth is to grow, for labour-saving devices and new techniques. Recent events in the Wills cigarette factory illustrate their difficulties. Wills want to instal machines which will each do the work of five men. They guarantee that no present worker will be dismissed. But the Tobacco Workers Union struck because they realized that, over the years, the new machines would cause the membership of their union to contract. The plethora of unions in shipbuilding (rivetters, boiler makers, fitters, etc.) is another and even more notorious example of the way in which the craft unions impede (a) technical advance and (b) mobility and flexibility in the employment of workers.

DISCIPLINED GERMAN WORKERS

In Germany, most unions cover whole industries, not crafts, so that a new technique, in e.g. rivetting, need not contract membership of a union; men can be shifted to other jobs inside the industry. The DGB's centralized structure gives it control from top to bottom. The unofficial local strikes in defiance of union authority which plague UK industry are unknown in Germany. The DGB is strong enough to enforce a strike code. No strike can be launched until all the prescribed steps in negotiations have been taken. A union's local section cannot strike without the authorization of headquarters. Once authorization has been obtained, the local must hold a secret ballot amongst its members. A strike is illegal without a 75 per cent majority. Even then, a strike does not follow automatically because the union is required also to consider the circumstances as a whole, e.g., the state of the trade cycle and the possible repercussions on other enterprises and other branches of the economy.

The DGB's goal is not the abolition of capitalism but the greater participation of labour in its working.

Its attitude is empiric, not doctrinaire. Although, in practice, the DGB has close links with the Democratic Socialist party (SPD), it is not affiliated to it, as is the TUC with the Labour party. (Incidentally, two members of the DGB Council belong to Adenauer's party). The DGB therefore enjoys a certain freedom of action, whereas the TUC has always to think in terms of avoiding policies that might harm the Labour party and of pursuing policies that will help it. Although the DGB's natural affinities are with the SPD, it has a wider margin than the TUC in which it can assess any situation in terms of abiding economic realities rather than of the SPD's current political slogans. The DGB's attitude towards wage problems and rationalization is therefore more flexible than that of the TUC. I do not suggest that the DGB will not exploit the labour shortage to increase the workers' share of the cake. Of course, they will. But the DGB will be more alive than the TUC to the need (a) to increase the size of the cake and (b) to moderate demands in accordance with realities.

Few realize that the cost of social security in the UK and in Germany is about the same (about £3,000 million a year). The difference is in the systems of collection. In the UK, four-fifths is raised from general taxation. In Germany, social security is financed mainly by a charge per employee paid by the employer. The UK system means a low level of taxation on labour and a high level on capital, because the rate of tax on unearned or investment income is higher than that on income created by work, and also because profits are taxed. Because the social security charges are an important element in his labour costs, a German has a greater inducement than a British employer to use his workers economically and efficiently, and to substitute capital-intensive methods whenever possible.

DEFENCE, EXPORTS, AND OVERSEAS INVESTMENT

Since the war, the UK has made an immense and successful effort to modify the structure of its exports. The leading example is textiles, which have dropped from 19.4 per cent of total exports in 1938 to about 10 per cent today, while machinery, transport equipment, and chemicals have risen from 30.1 per cent in 1938 to 43.3 per cent in 1955. In 1938, only 74 per cent of UK imports were financed by exports; today the figure averages 100 per cent. This is remarkable evidence of post-war Britain's resilience. But when her obligations to maintain the reserves of the sterling area and to export capital are remembered, the balance of payments record shows that a still greater effort is required. One of the UK's handicaps has been the expenditure of 8.4 per cent of her gross national product on her share of defence in NATO and elsewhere. Moreover, the defence burden falls mainly on the metal and engineering industries, which today constitute 56 per cent of the UK's export earning capacity.

By contrast, Germany has hitherto spent only 4.3 per cent of her GNP on defence, and beside the UK's total post-war export of private capital (£3,000 million) and government aid (£800 million), the German totals of £208 million and £200 million respectively are puny. German defence expenditure is, however, likely henceforth to rise steadily. Will this effect the export earning capacity of her metal and engineering industries?

My German informants did not think so. They pointed to Germany's policy of buying defence equipment from France, Italy, and the USA, rather than of building up a domestic armaments industry.

Our West European Correspondent has explained that Germany will henceforth substantially increase her exports of capital and that the German economy should be able to bear the burden. Among contributory factors to this satisfactory prospect is the way in which state owned enterprises are managed in Germany. The Federal government alone (apart from the states and municipalities) has an interest in over 400 companies, sole control of over 220, and employs over 200,000 workers. Although efforts are being made to denationalize as many as possible, a vast sector of the economy is likely to remain state owned.

In Germany, each state owned enterprise competes for capital in the market. The terms on which it can borrow depend on the market's estimate of its profit earning capacity. This means that the prices charged for the commodities produced must be those of the market. It follows that Germany's state owned enterprises are (a) compelled to be as efficient as those of private enterprise and (b) that they do not distort the economy.

How does German "state ownership" compare with British "nationalization"? The products of UK nationalised industries have been sold at artificially low prices, because the politicians feared that to charge market prices would anger the electors. Investments have therefore had to be financed out of gilt-edged loans at low rates of interest. Even so, the industries have mostly failed to cover costs at the prices charged, so the yield on their investments has been about 5 per cent, compared with 15 to 20 per cent in the private sector. The government have at last begun to realise

that when these low prices compel them to finance investment programmes by issuing more and more government stock every year, a big hole is created through which inflation continues to pour. Artificially low prices have also stimulated wasteful use of nationalized products. Where, as in Germany, market prices are charged, the comparative costs and efficiency of, e.g., coal, coke, gas, electricity, and oil, as fuels, sort themselves out. A further distortion has occurred in the UK because charges to private consumers have been kept below charges to industry. This has stimulated wasteful private consumption, raised costs to industry, and has increased unnecessarily the huge investments needed in these industries, not in order to raise efficiency but merely to satisfy artificially stimulated demand. Productivity has decreased.

The management of UK nationalized industries in accordance with the Socialist doctrine of substituting the alleged "public interest" for the "selfish profit motive", and of allowing political motives precedence over economic principles, have been major factors in (a) keeping inflation alive, (b) the wasteful allocation and use of resources and capital, and (c) slowing the rate of the UK's economic growth. It is one of the outstanding strengths of Germany's economy that it is not plagued by these distortions.

We may conclude by noting that, in the past three years, the Socialist principles, taken for granted in the UK after the war, are being widely questioned. With a comfortable majority in hand, the Conservative Government is tackling these anomalies one by one.

On October 14, I debated here whether any man was worth Rs. 2 lakhs a year. I propose in the following article to reconsider this question in the light of my talks with some of Germany's post-war millionaires.

GERMANY'S 3,502 MILLIONAIRES

WHY did the German national income rise between 1950-59 by 6.5 per cent a year, compared with 2.7 per cent in the U.K.?

A glance at the economic organization of pre-1914 Europe provides part of the answer. Before 1914, the European masses enjoyed modest living standards. To all appearances they were reasonably contented. And any man of capacity at all above the average could ascend into the middle classes, for whom life offered standards beyond the dreams of the richest monarchs of other ages. Barriers to the flow of trade and capital were negligible. Some 300,000,000 lived inside the frontiers of Russia, Germany, and Austria-Hungary.

Pre-1914 Europe was organised to ensure the maximum growth of wealth. The living standards of the masses crept up slowly but steadily (real wages in the U.K. doubled between 1850 and 1904). But, of course, a great part of the increased income went to classes who consumed little of it. It is at any time only a tiny minority that indulges in conspicuously wasteful expenditure. The average pre-1914 middle class men preferred the power which investment gave to the pleasures of immediate consumption. It was the UNEQUAL distribution of wealth which made possible those vast accumulations of fixed capital — new harbours, bridges, railways, industrial plants, cable, and telephone systems — which distinguished that from all previous ages. Investment on that scale cannot occur when taxation redistributes surpluses. The railways of the pre-1914 world were built by workers who did not immediately consume a "fair" share of the result of their labour. The saving and investing middle classes were allowed

their "unfair" shares because they consumed only a small part of them in practice. "Saving became nine-tenths of virtue and the growth of the cake the object of true religion."

"UNFAIR" SHARES MULTIPLY WEALTH

Remember, however, that the cake was small in relation to the potential consumption of the millions. If it had been shared "fairly", the poor could not have risen above subsistence level because (a) in relation to their millions there was little of it and fairly shared slices would have been thin to the point of transparency, and (b) mass consumption of these extra slices, however thin, would simultaneously have consumed what the middle classes would otherwise have invested.

What ended the golden age was the splintering of the great economic units of Germany and Austria-Hungary into small, intensely nationalistic units; each with its own currency that, divorced from gold, was steadily depreciated; each with its rising protective tariffs, quotas, and exchange controls that diminished the volume of international trade, wasted capital in duplicating production of identical goods behind tariffs, and slowed down the growth of wealth throughout the world. Trade was also contracted by the withdrawal of the U.S.S.R. into isolation. Another factor was that, to the masses, the lesson of World War I seemed that governments could afford limitless expenditure on high explosives and on good living for millions of troops. If in war, why not in peace? They did not see that, in war, capital had been recklessly consumed and that, before living standards could be raised, new accumu-

lations were necessary. Nationalistic policies, seeking the illusion of economic self-sufficiency, helped to induce depression, which, in turn intensified protectionism. Since economists had not yet found the solution to depression, unemployment further undermined the confidence in free enterprise of masses and entrepreneurs alike. Germany went over to a state-controlled economy. After World War II, memory of the depression dominated thought in the U.K., and the ideology of "fair" shares held the field.

But post-war Germany listened to the great economist, Walter Eucken, who taught that the basis for the growth of wealth is a stable currency, who denounced the political serfdom of an economy in which the state is the chief employer, who upheld individual initiative, and explained that what multiplied wealth quickly was its unequal distribution. The result was that the index of industrial production (1936 = 100) rose from 89 in 1949 to 281 in 1960, i.e., over three times pre-war. I don't have comparable UK figures to hand, but with both Germany and the U.K. on 1950 = 100, free enterprise Germany had risen to 211 by 1958 and Welfare U.K. to a meagre 121.

This was because whereas the U.K. upheld (at any rate until recently) the "fair" shares ideology of reduction of inequality by punitive income taxes, which deadened incentives to invest and gave free rein to the masses immediately to consume as much as possible, Germany, on the other hand, granted tax exemption to anyone ready to work, save, invest, and produce. Germany's millions of refugees provided cheap labour? So what? If they had insisted on "fair" shares, Germany would be an under-developed country, with starving masses on the unfortunate Asian scale.

Since the war, 3,502 Germans have become millionaires. Their success demonstrates anew that all men are not born equal because after the war every German started equal — from nothing. Of the millionaires with whom I talked, Axel Springer, now worth Rs. 20 crores and owner of newspapers with a total circulation of ten crores a month, started in 1945, aged 33, in an old air raid shelter, with a packing case for a table, and a borrowed typewriter. Iwan Herstatt, now chairman of an influential private bank with a Rs. 78 lakhs balance sheet, was an obscure bank clerk. Friedrich Flender, now chairman of a power drive company, employing 2,000 workers with a wage bill of Rs. 1.20 crores, started with a heap of rubble. He collected 300 refugees and rebuilt it into a modern factory. Josef Neckermann, now head of a mail order business with a turnover of Rs. 5 crores, was controller of civilian clothing supplies under Hitler. As such, he was sentenced to a year's imprisonment by the Allied authorities, contracted tuberculosis in gaol, and went to a refugee camp to recover. At the age of 32, he started only with the clothes on his back.

Why have these men become millionaires? Each, of course, had business ability, but many have that without making fortunes. What each had, in addition, was the imagination to spot either an untapped market or to keep several jumps ahead of their competitors in an existing market.

I INTERVIEW FOUR MILLIONAIRES

Take Springer: Before Hitler, the German press only produced papers for serious readers. Circulations were small. Under Hitler, the censored press became monotonously uniform. Circulations fell steeply. Pre-war Germany never had a popular press. Springer had the vision of a newspaper adjusted in content and language to the average man. His newspapers approximate to the responsibly popular London "Daily

Mail". I confess that I rarely find anything to read in the popular press, but that only means that I'm a highbrow. It is a mistake to think that if you only allow "Manchester Guardians" to be produced, you will compel the masses to read them. They will read nothing at all. Why should the lowbrow be deprived of entertainment? And the Springer press, which includes "Kristal", a popular illustrated weekly devoted to science, provides entertainment of reasonable quality. (Incidentally, he also publishes the highbrow "Die Welt").

In his refugee camp, Josef Neckermann realized that millions with low incomes would want cheap household goods. In 1950, he borrowed Rs. 10,000 from a bank, and sent out a 12 page catalogue to 250,000 refugees picked from card indexes. He soon had a turnover of Rs. 1 crore. The secret of his success was to insist on high quality of manufactures and to cut prices by placing bulk orders. When an ordinary radio sold for Rs. 325, he offered an equally good set for Rs. 200. Retailers refused to repair his sets and threatened to boycott the manufacturers from whom he bought. Neckermann assembled imported spare parts, and inaugurated his own fleet of radio repair vans. Result: He brought the prices of radios down throughout Germany. Neckermann was also the first to realize that factory and office workers have little time for shopping, that traffic congestion makes travelling to and from shopping centres slow and time-wasting, and that milling peak hour throngs in stores make shopping fatiguing. Mail to their home a 400 page catalogue, plentifully illustrated with detailed specifications, offer low prices, guarantee quality, and money back on unsatisfactory goods, open instalment credit accounts, and satisfied customers will make you a millionaire. Out of your "grossly unfair" share you'll be able to re-invest ever increasing sums to start new lines and to bring down prices further over a widening range of goods. Is that unfair to the consumer?

As I know nothing of power drives, I took Friedrich Flender's word that it was constant experiment with new ideas that enabled him to race ahead. As for Iwan Herstatt, it is not easy to get onto paper the secret of success in private banking, beyond saying that it consists in the ability to judge the capacities of industrialists who want to borrow from you, and in the vision to risk investment to develop untried machines and ideas. It was not, in fact Herstatt who advanced Springer the initial credit which enabled him to make his start by producing a small paper listing radio programmes and reprinting broadcast talks, nor Neckermann the credit to buy his initial stocks, but it must have been someone with similar gifts.

In short, post-war Germany recreated the conditions of the pre-1914 era in which entrepreneur was supreme, in which his drive for profit thrust the economy forward. Whereas in "fair" shares Britain, punitive taxation slowed savings (or diverted them to inefficiently run nationalized industries), inhibited initiative, and encouraged indifference to the control of expenditure in industry, and all this, together with over-full employment, promoted inflation and uncompetitive sellers' market, in Germany, on the other hand, a buyers' market threatened entrepreneurs with bankruptcy if they did not discover new techniques. Because in the early post-war years, domestic buying power was limited, German entrepreneurs were driven into export markets to secure adequate profits. Low tariffs forced them to be competitive. The stable Mark helped to keep their prices cheap compared with those of inflating countries. Gradually rising exports multiplied internal wealth. Thus have unfair shares given all Germans bigger shares.

COMBINED OPERATION

The know-how and equipment of British technicians and British industry have combined with India's skill and labour to build an integrated Steelworks at Durgapur for the people of India.

THE COMMON MARKET CROSSES THE RUBICON

From Our Special West European Correspondent

PARIS, January 8.

IN the jargon of rocketry, the first-stage rocket of the Common Market got well off the ground this month and the big new satellite should go into orbit at the end of 1965. The two previous tariff reductions that took place in 1959 and 1960 were little more than the count-down, because the venture could not be held to have overcome the force of gravity until it had made internal tariff reductions that were not extended to outsiders, and until it had begun to set up its uniform external tariff. These things having been done this month, the enterprise is at last successfully launched. There remains one intermediate rocket that has yet to function satisfactorily: adoption of a joint agricultural policy. This is due to be fired this year and thereafter the engine will never fall back to earth, and might even gather momentum very rapidly.

Already, from this height, it is interesting to look back over the distance traversed since the Common Market came off the drawing board in Rome. It was then reckoned that the first phase—the period in which internal tariffs would be progressively reduced to zero—would last 12 years, from 1958 to 1970, but the French had demanded the inclusion of so many escape clauses that it could well have lasted 18 or even 20 years. Moreover, as 1958 approached it became clear that France was in no state to enter the path of duty reduction, even with all the safeguards she had invented; Paris served notice on her partners that the beginning of the venture would have to be postponed one year, to 1959. Then came the return of de Gaulle and the subsequent economic reform, which enabled the Six to start moving toward a customs union on the scheduled date. The first steps were so successful that there was soon a move to hasten duty disarmament. This was agreed to in principle in May last year, but now it was the West Germans (or more exactly, the party led by Dr. Erhard) that were seeking to delay matters.

Dr Erhard managed to get a decision on acceleration postponed from June 1960 till December 1960, and throughout those six months there were ample reasons to suspect that nothing would in fact be done. The hopes of the liberal free-traders both inside and outside the Common Market, whose ambition has always been to drown that venture in a vague free-trade area, were revived and led to a spate of rumours that London and Bonn had agreed on a plan to scuttle the Common Market in a customs union for all West European manufactures. Such uncertainty was reinforced by the evident political discord between Paris and Bonn, by Continental hostility to President de Gaulle's project for a confederation and by the fear that the successor Administration in Washington would not continue the Eisenhower regime's support of the Common Market. Scepticism about the Common Market's future was not limited to newspaper articles but had an immediate effect on the flow of investments; to quote a typical example, I know of a Franco-Swedish paper pulp combine that abandoned plans to build plant at Nantes, in France, and decided instead to build in Sweden because they felt sure that West Europe would end up in a vast free-trade area.

The tide turned when it was known that President-elect Kennedy had chosen only one eminent Republican to continue in high office in the Democrat Administration, and that was Mr. Douglas Dillon, who had been the main agent of US support for the Common Market. Assured of American backing, and thus protected from attack in the name of free trade, the Common Market was free to press ahead as fast as it could. There were numerous economic interests within the six-nation region opposed to acceleration (the farm lobbies and north German industry are the most vocal) and they were all set to delay matters at the crucial Brussels conference at the end of last month. Yet when the negotiation began, everyone realised that to abandon acceleration plans now would mean jeopardising the whole enterprise by reviving the responsibility of ruining a venture to which most Continentals are firmly attached, so that when it came to a showdown the special interests had to bow before diffuse but lively public opinion.

Thus it is not at all a question of six nations merging economically despite political differences. On the contrary, all the forces opposed to economic integration are sectional economic interests, whereas the main motor of progress is a firm political will to unification. Naturally, this political aspiration takes many forms, which often seem to conflict: one group wants a super-state to be built from the people upwards, others envisage a prior confederation of existing governments. Yet these are minor differences comparable to theological disputes within a religion; however much they interest the doctrinaires, the mass of the people is indifferent to them, as long as unification continues to progress by whatever means are, for the moment, most apt.

What, then, is the economic structure of the Common Market at the start of its fourth year? Firstly, what remained of the first phase of tariff disarmament—10 years, to 1970—has been neatly halved: internal duty reductions will be complete by 1965. Already duties have been cut by 30 per cent for manufactures traded within the six-nation area. That is, an article sent from Italy to Germany and which used to meet a customs duty of 20 per cent is now charged, since 1st January, only 14 per cent; this will fall to zero by the end of 1965. Next, all import quotas for manufactures will be abolished by the end of this year at the latest. But this is less important because the six nations are abolishing the quota system for imports from all countries except Japan and a few others.

For agricultural produce, tariff disarmament is slower. Duties are, since 1st January, 25 per cent lower against 30 per cent for manufactures. However, for trade in agricultural goods, import quotas and customs duties are much less significant because almost all primary produce prices are falsified by intricate systems of subsidies, open or disguised, controls, export incentives, preferential transport charges, and so on. Before farm produce can be traded freely, this jungle of supports and discriminations has to be sorted out in a common agricultural policy. This is not easy, since countries like Holland that have a

competitive agriculture and export heavily want the freest commerce possible whereas countries like West Germany that have a subsidised farming class and import much of their food from overseas want to continue protection and discrimination. On the one hand, West German farms would not survive an avalanche of cheap produce from France and Italy (which, they claim, is cheap in part because indirectly subsidised). On the other hand, West Germany wants to go on buying food from non-industrialised countries such as Denmark who, in return, buy her manufactures. No final solution has been found to this conflict, and this is the next task before the Common Market. It is, assuredly, soluble at the cost of some political courage; it is too late now for the impetus of economic integration to be broken on the resistance of a few farm lobbies.

For the outside world, the main novelty in the Common Market this month is the variation in external tariff, i.e. customs duties imposed, not on trade between the Six, but on goods coming from outside. These changes are so far minor, and are limited to manufactures; external tariffs on primary produce will be part of the uniform agricultural policy that has yet to be written. But the important thing is that they have occurred, for they mark the beginning of a process that should be complete by 1965. At that date, all the Six will have identical tariffs for imports from outside; the same article will pay the same duty whether it enters West Europe at Genoa, Le Havre, Antwerp, Rotterdam or Hamburg. What will that uniform tariff be? At first, the idea was that it should be the arithmetical average of the six national duties, but it is now agreed that it will be that average minus 20

per cent. It is toward that level — the average minus 20 per cent — that the national tariffs began to move this month, the high ones coming down and the low ones going up. In fact, there is much more coming down than going up; many Italian and French duties have fallen while very few West German duties have risen and when they have it is by a smaller percentage.

This first step toward a uniform external tariff is as important a date as 1st January, 1959, when the first internal duty cuts were made. On the earlier date, the Six announced their will to trade more freely among themselves; this month, they affirm their personality to the outer world. In so doing, they put an end to the long period of dispute between them and their neighbours grouped under British leadership in the Free Trade Association. The debate about whether West Europe should be economically "divided" is out of date, for the two groups now exist and their only problem is peaceful co-existence. Any difficulties that arise from their parallel development can be settled within the Organisation for Economic Co-operation and Development, with the Americans acting as umpire. The Outer Seven propose to meet in Geneva next month to see whether their customs union can be speeded up to keep pace with the faster integration of the Six. This competition between the two groups is, of course, welcome and does not constitute a "trade war". Quite the contrary, experience of tariff disarmament within a customs union will prepare Britain to face the problems of membership of the Common Market if ever the day comes when she decides to apply to join an enterprise that cannot now be stifled.

BOEING 707
Jet INTERCONTINENTAL

Lufthansa, German Airlines have pleasure in announcing the introduction of their big Jets to the Far-Eastern route and extension of this route to Hong Kong and Tokyo from 24th January.

The ultra modern Jet-liners coupled with Lufthansa's fabulous service on board will make the Far-Eastern route the last word in luxury and efficiency. Best food, choicest drinks, alert stewards and charming hostesses (both European and Oriental) will all add up to make your trip the most memorable ever!

Contact your travel agent to-day for further information.

Jute

secret of an industry's success

With a membership of 70 companies, comprising 100 manufacturing units, the IJMA represents almost 95% of the total jute loomage in India.

Providing employment to millions of farmers, traders and mill-workers... earning about Rs. 115 crores annually in foreign exchange... contributing large sums in taxes to the State and Central Exchequers—the Indian jute industry occupies a prominent place in the nation's economy.

Guarding the interests of this nationally important industry and guiding its destiny, is the Indian Jute Mills Association. Founded in 1884, the IJMA—representing almost 95% of India's total jute loomage—protects, forwards and defends the trade of its members. The Association

carries on research... to improve the quality of jute products and to develop new uses of this already versatile material. In the field of export promotion the Association has been active for well over a decade, undertaking publicity and promotional work which has helped make jute goods India's largest dollar-earner. Its labour welfare activities have set standards throughout industry.

The Indian Jute Mills Association looks forward to serving the Indian jute industry in ever-increasing measure in the years to come.

Economic Report from the U.S.

1961 ECONOMIC PROSPECTS

By GUY SIMS FITCH

WASHINGTON, Jan. 4.

ECONOMIC news from the United States can hardly be described as very cheerful as 1961 takes over from 1960. Yet, it would be a mistake to underestimate the forces which in all likelihood will be pushing the economy upward again before many months have passed. This is the case even though the statistical measurements are likely to be showing further deterioration in the months immediately ahead. The probability is that unemployment will rise, while retail sales, industrial production and other key barometers will fall. It will be very important, however, to keep this apparently gloomy picture in perspective. It is well to remember that as the winter season deepens, such declines in economic activity are quite normal. Actually there is much that is encouraging about the present economic situation in the United States. Economists, by and large, are sticking to their view that by mid-1961 the United States will again be shifting to a growth trend. There are a number of reasons for this anticipation. In the first place, this economic dip—or recession—has not burst forth with a sudden and devastating impact. It has been a rather mild slowdown—even milder, so far, than previous postwar recessions—and has been under way for many months now. Some experts trace its start all the way back to the spring of 1960, yet the Gross National Product (GNP)—the total output of goods and services—has slipped by less than one per cent. Secondly, in key sectors of the economy, such as housing, steel and some raw materials industries, the downturn has gone about as far as it can reasonably be expected to go.

Third, and very important, is the fact that the downturn has not "snow-balled"—has not fed on itself, so to speak. Despite the slippage in some sectors, over-all economic activity has remained high. Whatever unemployment there is—and at this writing, it still is less than 4.5 million out of a total civilian labour force of more than 71 million—has tended to be concentrated in a few industries and a few parts of the country. It has not spread geographically to any marked extent, nor has it noticeably affected service and commercial trades. This is reflected in the fact that the total personal incomes and expenditures of the American people have held up well. In fact, retail sales, despite stated misgivings by some of the experts, were strong enough at year's end to assure a new annual record for 1960, about two per cent above the previous record set in 1959. In assessing the 1961 economic prospects, it also is well to keep in mind that a number of anti-recessionary moves have already been started, and they are bound to have an impact on the economy. Partly as a result of market factors, but also because of deliberate U.S. Government policy, credit is now cheaper and more abundant than it was six months or a year ago. Government spending also is rising, and this too should help push money into the economy and thus stimulate business activity.

To these existing policy trends must be added the likelihood that the new Kennedy Administration, which takes office on January 20, will pursue anti-recessionary policies of its own. While no one can or should prejudge the course of public policy in the coming months, the incoming administration appears pledged to the idea of more public spending for such vital services as schools, housing, highways, and defence. Moreover, a special task force appointed by President-elect Kennedy and headed by Senator Paul Douglas of Illinois—a noted economist in his own right—already has proposed an ambitious programme for

dealing with the special problems of the so-called "depressed areas." These are the few "problem" areas of the United States—such as some coal mining and textile producing centres—where unemployment has been labelled as "chronic" and where business activity has tended to lag even in times of burgeoning prosperity for the nation as a whole. One can safely conclude, then, that the fundamental forces making for the expected 1961 upswing in U.S. economic activity are already at work, and they may well be abetted by whatever vigorous steps the incoming President, and the new Congress, may deem advisable. It is in this context that one should read and interpret what may be some rather dark economic statistics in the next few months. As the saying goes, it is always darkest before the dawn and the U.S. economy in 1961 undoubtedly will be reversing the 1960 pattern: it is starting on a downturn, but it will be ending on an upturn.

Kirloskar

Machine Tools

for Precision plus Production

IMPROVED MODEL 'RL' LATHES

SWINGS
OVER BED DIA
375 mm to 570 mm

These versatile Lathes possess the qualities of ruggedness and outstanding performance which distinguish all Mysore Kirloskar products.

The all-g geared headstock of these heavy duty, sliding, surfacing and screw cutting Lathes transmits maximum power throughout the spindle speeds. All the gears are made of specially selected alloy steel, hardened and ground to give long service. These high speed, precision Lathes have several other special features described in an illustrated literature. Please send for it today.

India

India's Foreign Trade in Merchandise in November 1960: The provisional figures of India's Foreign Trade in merchandise by all routes — sea, air and land — on private and Government accounts during November 1960, according to information available in the Department of Commercial Intelligence and Statistics, are given below:

Exports	Rs 60,76 lakhs
Re-exports	Rs 1,24 lakhs
Imports	Rs 68,71 lakhs
Balance of trade	Rs—6,71 lakhs

The figures exclude trade with Tibet, Sikkim and Bhutan, and the trade arising in the Andaman and Nicobar Islands and the Laccadive, Minicoy and Amin-dive Islands. In the case of Nepal, air borne trade alone is included. The figures are exclusive of the value of certain consignments of private merchandise under reference to the Customs for verification and of Government stores awaiting adjustment. Table I below brings together provisional figures for Nov. 1960, along with similar figures for October 1960, November 1959 and the revised figures for November 1959.

TABLE I
INDIA'S FOREIGN TRADE DURING NOVEMBER 1960,
OCTOBER 1960 AND NOVEMBER 1959:

Foreign trade in	(Lakhs of rupees)			
	November 1960	October 1960	November 1959	
			Prov.	Revised
Exports	60,76	55,65	61,26	59,36
Re-exports	1,24	39	50	1,12
Imports	68,71	72,91	69,99	77,93
Balance of trade in merchandise	—6,71	—16,87	—8,23	—17,45

The cumulative total for the eight months ended November 1960 are shown along with the corresponding figures for 1959 in Table II below:

TABLE II
INDIA'S FOREIGN TRADE DURING THE EIGHT MONTHS, APRIL-NOVEMBER, 1960 AND APRIL-NOVEMBER, 1959

Foreign trade in merchandise	(In lakhs of rupees)			
	1960	1959	Provisional	Revised
		April to November		
Exports	407,46	421,98	411,31	
Re-exports	7,73	2,96	5,43	
Imports	657,40	549,65	628,25	
Balance of trade in merchandise	—242,21	—124,71	—211,51	

Tractor Factory for Madras: The latest addition to M/s. Simpson Group of Companies in Madras is a Company known as Tractors and Farm Equipment Private Ltd. with an authorised capital of Rs. 2 crores for the manufacture of Massey Ferguson Tractors and allied equipment in India. The object of the company is to augment the mechanized cultivation of the farms and to achieve the target of Third Five-Year Plan for self-sufficiency in food. 51 per cent of the shares are held by M/s. Simpson Group of Companies and the remaining 49 per cent of the shares is provided by Massey Ferguson & Company. The factory will be located in Sebiun, near Perambur at the Simpson Industrial Estate and will be completed in 12 months' time. The licensed capacity of the new factory will be 7,000 tractors annually on a double shift basis at present.

Indian Transistor Set: An Indian transistor set is claimed to have been made by an Indian manufacturer. Its difference with the imported set lies in the fact that

though its parts are imported they are assembled on a layout pattern quite different from the printed design that comes from abroad. Its circuit system is also claimed to be different from the imported one and in fact follows from the different layout pattern for the parts. The improvements on the imported variety include a push button system for changing the wave-length, a small window to see that the battery cells are properly fitted, a safety device to prevent any harm to the transistor in the event of wrong battery cells being used, provision for attaching extension 'speakers' and the locally produced coil for sound reception.

U.S.A.

Detroit Firm Ships Giant Press to London: A 1100-ton capacity power press weighing 255 tons—so big that it reaches two stories above ground and one below—is on its way to England, consigned by a Detroit press dealer. Machine parts usually are created for overseas shipment, but this disassembled press went aboard the British motorship Beechmore uncrated. Max Wender, president of Wender Presses Inc., 1957 Glay, said that crating would have cost an additional \$10,000. He sold the big machine, which has a replacement value of \$250,000 for \$50,000 to the British firm E. H. Jones, Ltd., who will install it in their London factory. Most of the parts were loaded recently at the Detroit Marine Terminals on the Rouge River. But the Press bed—large enough to contain a whole auto—and what is known as the crown, were too heavy for the terminal cranes. So the Beechmore was shifted to the Great Lakes Engineering Works, where a giant "sheerlegs" derrick handled the job. The press stood in the one-storey plant of the former In'erlake Manufacturing Co., 13595 Helen, which went out of business. To get it out, Wender's men had to remove part of the plant roof because the towering machine had been encased in a cupola on the roof.

German Imports of Cotton Seed Oil from U.S.: German imports of cotton seed oil from the U.S. amounted in value to \$6 million in 1954. These imports doubled in each of the following 2 years and reached a peak of more than 1,18,000 metric tons or \$40 million in 1957. In competition with soybean oil which was gaining in popularity, and vegetables (coconut, peanut and palm) oil from other countries, U.S. cotton seed oil, sales to Germany fell in 1958, but were back upto \$26 million in 1959. As this oil has become one of the major ingredients in the production of first quality margarine, Germany will undoubtedly continue to provide the United States with a good market for it.

U.S.S.R.

Supply of Oil to Cuba: It is reported this year the Soviet Union will supply Cuba with 3.5 million tons of oil, 9,50,000 of oil products, and 2 lakh tons of mineral fertilizers. The Soviet Union will receive from Cuba in 1961, one million tons of sugar and several other traditional Cuban export goods.

Increased Soviet-Rumanian Trade in 1961: The protocol on reciprocal goods deliveries between the U.S.S.R. and Rumania in 1961, signed in Moscow, is another important step in the promotion of the economic co-operation between the two countries. In accordance with the protocol the volume of the goods exchanged will be 19 per cent above the 1960 level. It will amount to over 550,000,000 roubles (in new roubles put into circulation as of January 1, 1961). Substantial growth of reciprocal deliveries of machinery and equipment is a characteristic feature of the exchange his year. The total volume of Rumania's foreign trade in 1960 was 150 per cent above the 1950 figure.

United Kingdom

British Firm to Build Indian Chemical Factory: A contract worth about £1,300,000 for the design and construction of a chemical plant in India has been placed with Humphrey and Glasgow Ltd. of London, a firm of international contracting engineers. The plant is to be built at Bulsar, 120 miles from Bombay, as an extension to the existing chemical works of the Indian company Atul Products Ltd. British technicians will supervise the erection of the factory, and British experts will come to India to supervise the initial operations, remaining on to train Indian staff. Nearly 50 per cent of the equipment and material for the factory is expected to be Indian-made. The remainder will be supplied from Britain. Design work is now in progress and it is expected the factory will be operating in 1963. It will produce chemical products based on naphthalene for use in the preparation of dyestuffs. The manufacturing programme includes a range of 24 different products, but these can be extended to meet other demands.

Novel Atlas of British Plants: A plant atlas of the British Isles which will be without parallel anywhere in the world is being printed by new mechanical methods in Cambridge. More than 2,000 volunteer plant observers have helped to gather the material. The volume, which is being prepared by the Botanical Society of the British Isles under the direction of Dr. Franklyn H. Perring, of the Cambridge University Botanic Garden, will have about 500 pages. It will indicate the distribution of each of some 1,700 specimens on separate 'plant maps.' The atlas will be published in February, 1962, with the aid of an automatic tabular for transferring data direct to the maps.

France

Construction of an Oil Refinery in the Philippines: The Compaigne Industrielle et Agricole de Vente a L'Etranger (C.I.A.V.E.) signed in Manila with the Filoil Refinery Corporation a \$10,700,000 financing contract for the construction of an oil refinery capable of refining 10,000 barrels of oil a day. This contract also includes a contract for material to be supplied by the Constructions Metalliques de Provence and the Societe des Ateliers et Chantiers de la Sine-Maritime. Engineering will be carried out by the American Procon Company and its French affiliate Procofrace. A group of banks, presided over by MM Worms et Cie and the Banque de L'Indochine, will ensure the financing of the project. The construction of this refinery is the first large French activity in the Philippines and the first large scale business deal made by the Philippines since the end of the war.

Italy

New 500 Fiat Station Wagon: The 500 Fiat Station Wagon a tiny car which can be used for the carriage of passengers and goods is now available at 565,000 lire from Fiat Agencies throughout Italy. The car can seat four persons and carry additional luggage weight, or can be converted into a specious van with two front seats, and carry upto 200 kilos besides the driver.

Norway

Labour Management Pension Plan Approved: The Norwegian Employers Confederation and the Norwegian Federation of Trade Unions have voluntarily negotiated and approved a pace-setting pension plan geared to collective wage contracts. Due to go into force on January 1, 1962, the pension plan will initially cover some two 240,000 union workers employed by firms affiliated to the Employers Confederation. On certain conditions, membership in the pension plan may be extended to other groups of workers. Pension payments will start in January 1, 1964. At the end of 5 years the agreement may be revised.

Pakistan

Soviet Oil Offer: The Pakistan Government has been offered Russian oil at cut prices and Soviet assistance in developing its own oil resources. The Pakistan authorities have recently been pressing the Western oil companies further to reduce prices for their products, but they are reluctant to do so, because world markets are uncertain and further reductions might meet with resistance from the Governments of the oil-producing countries.

Canada

Solving Unemployment Problem: A new bid to solve the unemployment problem, particularly the high seasonal level in the winter months, is under consideration of the Canadian Government. At its summer peak unemployment was nearly 7 per cent and the winter figure is expected to be more than 10 per cent. Heavy investment in new primary resources may produce a temporary boom as it did in 1957, but does not seem to provide a stable basis for continuing prosperity; unemployment is further aggravated, by the virtual stagnation of many parts of industry.

Germany

Volkswagen Issue: The issue of "people's share" in volkswagen was announced in November, 1960. The subscription list will be opened for two months from January 16, 1961: DM 360 millions of the nominal capital of DM 600 millions will be offered for sale at a favourable price—DM 350 (£30) per DM 100 share—decided by the Cabinet. The maximum allocation will be DM 500 nominal value, so that the cost of a full quota will be DM 1,750 (£150), but the system of rebates can reduce this by 10-25 per cent depending upon the number of dependents the applicant has, and his salary. The offer may be fully taken up by investors qualifying for a rebate as they will receive first consideration and they can pay DM 100 down and the remainder in three or six instalments spread over a year. The share will be introduced on to the bourse next autumn.

Ceylon

Report on Steel Works: The report of the group of Soviet experts on the proposal to construct an iron and steel works in Ceylon has been completed. The report is said to state that the project would cost Rs. 150 millions of which 65 per cent could be provided by Russia under the agreement for economic and technical collaboration between the two countries concluded early in 1958.

Kuwait

A National Oil Company: A petroleum company has been set up with a capital of Rs 100 million, of which 51 per cent is being subscribed by the Government and the rest by Kuwait shareholders. Initially it will be engaged only in the distribution of oil products within Kuwait, but it is expected that later it will engage in drilling operations in collaboration with a foreign concern, possibly in the off-shore areas of Kuwait (tenders for the exploration of which were recently invited by the Government).

Ghana

Agreement on Smelter: Negotiations concerning the aluminium smelter part of Volta Dam scheme were completed in mid-November 1960, the Anglo-American Canadian consortium of Valco having undertaken to construct the smelter at an estimated initial cost of £57 millions subject to the conclusion of satisfactory financial arrangements.

NEWS IN BRIEF

INDIAN

It is reported a process on surface coatings from castor oil has been developed at Regional Research Laboratory, Hyderabad.

As against the current year's target of afforesting an area of 1,000 acres under the Bhakra Soil Conservation Programme, the Forest Department of Himachal Pradesh exceeded it by 287 acres at the end of November last.

The allocation of indigenous art silk yarn to art silk powerloom weaving units for January-March, 1961, will be made on the basis of the number of loom shifts worked by the units during July-September, 1960, says a Press Note issued by the Textile Commissioner.

It is reported the Forward Contracts (Regulation) Amendment Bill, 1960, has received the assent of the President.

Exports of rice bran, wheat bran and husk of pulses will now be allowed only from the ports of Calcutta, Vishakhapatnam, Madras and Bombay, during the period ending March, 1961.

The Planning Commission has agreed to the establishment of a fruit canning factory in the Union Territory of Himachal Pradesh during the Third Plan.

About 3,600 more factory workers have benefited by the Employees' State Insurance Scheme as a result of the extension of the Scheme to Dandeli in Mysore State and Hissar in Punjab, from the mid-night of Saturday, January 7, 1961.

The Central Board of Revenue has decided to grant concessions in respect of the overall alternative allowance admissible to the Expenditure-tax assesses under section 6(2) of the Expenditure Tax Act.

The production of automobiles in the country touched a new high in 1961, according to the figures for the complete year, recently made available. With the output of cars, commercial vehicles and jeeps totalling 5,073 in December, 1959, the year's production reached the peak level of 52,115 as against 36,923 in 1959 and 32,138 in the first year of the Second Plan.

A phased programme of development of rural higher education costing over Rs. 1.35 crores during the Third Plan period was discussed by the Standing Committee of the National Council for rural higher education, which met in Udaipur recently.

Among the subjects on which attention will be concentrated during the Third Plan is the question of utilising to the fullest extent the vast manpower in the country, particularly in the rural areas.

FOREIGN

Imperial Chemical Industries has signed an agreement giving American Cyanamid Company manufacturing rights in the U.S. for ICIs know-how on methyl methacrylate.

It is reported the General Electric Company's lamp division has started building a 15m, 125,000-square foot refractory metals plant on 11 acres at Cleveland Ohio.

October, 1960 world production of natural rubber at 170,000 tons was again higher than consumption according to the latest bulletin by the International Rubber Study Group. This figure shows an increase over September of 2,500 tons (a normal seasonal improvement) but is 11 per cent lower than the figure for October, 1959.

The official German share index climbed by 38 per cent during 1960, the Federal Statistics Office announced recently. It began the year at 516, climbed to an all-time peak of 322 at the end of August, then slumped to 710 at the end of 1960.

British insurance companies whose assets were taken over by the Egyptian Government at the time of Suez or subsequently no longer have to provide the Foreign compensation Commission with proof that their Egyptian assets were sold before they can obtain compensation from the Commission.

The U.S. Development Loan Fund recently approved three loans totalling 27.7m. for the economic development of Yugoslavia; one loan was made to extend the Kosovo power plant.

A group of underwriters, headed by Swiss merchant banks announced recently that it has underwritten a 60m. Swiss franc 4½ per cent loan to be raised by International Business Machine World Trade Corporation, an I.B.M. subsidiary.

Vauxhall Motors production of cars and trucks in 1960 topped 250,000 for the first time, with total output of 252,026 vehicles, 2.4 per cent higher than in 1959.

The sterling area's reserve of gold and convertible currencies rose by £23m. during December. For 1960 as a whole, it went up by £177m. to £1,154m.

According to Mr. Mackenzie, the Minister for Agriculture, a start will be made early this year on the Kenya Government settlement schemes for African farmers. The schemes will cost £8½m. over two and a half-years and two members of the Kenya Government will visit America next month for final discussions on a World Bank loan.

The Nuclear Power Group has won the contract to build Dungeness nuclear power station on the Kent Coast. Work on the site began in August last year, and the Dungeness station which will be Britain's sixth commercial nuclear power station, is due to be completed and handed over to the Central Electricity Generating Board in 1964.

Special Article

THE LINE OF BALANCE TECHNOLOGY†

THE Five-Year Plans of the Indian Union not naturally have a very high construction component. It has been estimated by the Committee on Plan projects that the construction element in the Second Plan was of the order of Rs 2,000 crores. With the anticipated increase in the size of the Third Plan, the construction element is likely to be more than Rs 3,000 crores. It is necessary, therefore, to evolve techniques whereby the execution of the Plan projects is laid out in a simple but scientific manner so as to know at various stages during the progress of the Plan if the projects were progressing according to the schedule and at below or above the scheduled costs. Happily, a simple technique called the "line of balance technology" has been suggested by the Committee on Plan Projects; it is drawn from practices developed in the US Navy. This technique, though elementary in concept, has wide applications. It seems that if this technique is pursued at every project site where construction is in progress, considerable time, labour and money could be saved by keeping a close check on the progress of work.

The utility of this technique will be explained here with reference to a particular example of building 50 pre-fabricated schools in Delhi during an interval of 12

months. The broad methodology of "the line of balance" technique is summarized in the three graphs below. The first graph relates to the objective to be achieved. There are three variables in this graph. The first variable relates to the time within which the schools are to be constructed and it is indicated by the number of months at the foot of the graph. The targets of the construction programme are indicated next by showing that at the end of the 6th month, 15 schools would be ready and at the end of the 9th month, 30 schools would be completed. At the end of the year, the objective graph indicates that all the 50 schools would be ready. The supervising executive is supposed to watch the progress of the project at various time intervals indicated as A, B, C, D, E, F, G—denoting the dates of study.

The programme of execution of a single school is set out in terms of the "time-lead" which is defined here as the minimum period which must elapse between the pre-acquisition-of-land stage and the completion of a school. This is denoted here, in the programme plan, as a period of 5 months. The process of constructing a school consists of 19 different components. It means that the proceedings for the first element, namely, land

SCHOOLS

19. End.

† Based on an official publication of the Committee on Plan Projects.

acquisition, should start at least 5 months before the target date and the process of acquisition itself should not take more than 6 weeks. Similarly, high tensile steel and mild steel should be obtained normally 5 months ahead of the date of completion of the school, and they would take nearly a month to procure. All the 19 components are thus set out. Flooring, for example, is not needed till two weeks before the completion date; that is why it comes at the end of the programme. This "programme graph," based on previous knowledge about the process of putting up a school sets out broadly the time taken by each component.

The progress of the construction of 50 schools is presented in the "progress chart" which is set out alongside the "objective graph." The two are on the same scale. Here, at any particular time when the progress is studied, the position of the schools in terms of the 19 components is given by the vertical pillars. The dates of study are indicated as A, B, C, D, E, F, G and they also indicate the lines of balance. Each line of balance is drawn with reference to each component by giving the proper lead. Let us have a look at one point of study, namely, the end of 7th month which is denoted by the line of balance D. This line shows that whereas land should have been acquired at the end of the 7th month for all the 50 schools, it had been actually acquired for only 46 schools; thus there was a failure on acquiring land for the remaining four schools. In the case of item No. 2, namely, high tensile steel, there seems to have been complete success, as the needed quantity had been obtained. Again, this diagram shows that there was failure on mild steel which was sufficient hardly for 35 to 36 schools while at the end of the 7th month, mild steel for all the 50 schools should have been

obtained. In this way, the line of balance shows the points where unnecessary stocks have been accumulated when the objective needed their procurement at a later date and the points at which shortages have occurred which are likely to hinder the progress of the construction of the units.

This simple technique has very wide applications and can be applied to a number of similar situations such as, the shipping of our exports, the construction of godowns as well as dams and bridges. The technique in itself is extremely simple, and provides a clear picture to top executives for taking vital decisions at the proper time. If it is found during the progress of the project that there has been some failure in achieving the targets laid down earlier, a revised target could be set out. This is shown in the graph as R.T. or the Revised Target. It is seen, for example, that by the end of the 8th month, only 10 schools were ready while according to the original objective, no less than 25 schools were proposed to be completed. In view of this later development, the target is revised so as to raise the number of schools to be completed between the end of the 8th month and the 12th month at 40. Similar modifications will need to be introduced in the progress chart.

This technique provides a co-ordinated picture of all the important factors needed for a critical evaluation of schemes and for having a correct proportion of the achievements as well as the setbacks. It has applications both in the public and the private sectors and it is hoped that it will be pressed into service in the Third Plan on a wide scale for economizing both on time and money.

THE BUSINESS WORLD

Politics in Land Ceilings

By CROESUS

THE Maharashtra Government has begun the New Year with a highly controversial piece of legislation and how far it will be able to pilot it successfully through the legislature, especially with the interests in Vidarbha and Marathwada reported to be stoutly opposed to it, is more than one can say at this stage. The Legislative Assembly Bill No. 1, 1961 entitled "A Bill to impose a maximum limit (or ceiling) on the holding of agricultural land in the State of Maharashtra; to provide for the acquisition and distribution of land held in excess of such ceiling; and for matters connected with the purposes aforesaid" has confirmed the worst fears of the sugar interests in the State. Contrary to the pious hopes of many, the Bill has not cared to exclude land belonging to industrial or commercial undertakings, notwithstanding the considered opinion to the contrary of the Planning Commission and several eminent authorities on agriculture. Thus the Maharashtra Agricultural Lands (Ceiling on Holdings) Bill empowers the Collector to call for returns of particulars of land held by every one, including industrial and commercial undertakings (these include sugar factories), to apply the ceiling proposed under the Bill, to declare the land in excess of such ceiling as surplus land and to acquire it on payment of compensation in the form of 3 per cent transferable bonds, a part of which is repayable over a period of 20 years by equated annual instalments of principal and interest, and a part in bonds redeemable at par at the end of 20 years from the date of issue. The Bill also outlines how the surplus land is proposed to be distributed. While no exemption has been given to land held by industrial or commercial undertakings, including sugar factories, a sop has been thrown to them in the form of a provision, that "in order to ensure efficient cultivation of lands acquired under the Bill from industrial or commercial undertakings (including sugar factories) and continued supply of raw materials from such land to the undertakings the Government would either manage such lands as State farm or farms or grant them to joint farming societies for cultivation. Whilst doing so, the Government adds, anticipating possible objections, it has taken powers to impose "conditions which are calculated to ensure the full and continued supply of raw material to the undertakings at a fair price."

All these assurances make it patent that, although the declared object of the Bill is "to provide for the more equitable distribution of land amongst the peasantry of the State," the Maharashtra Government has not hesitated to take advantage of the proposed land reforms legislation to force on the public of the State its ideological schemes of State farms, joint farming societies and co-operatives. One cannot escape the feeling that it is more this political motivation rather than the economic needs of the people, or the economic realities of the prevailing situation, which has determined the issue. Perhaps, in view of the forthcoming general elections, this is only to be expected.

A few statistics about the land in Maharashtra will better illustrate this point. The total culturable land in the whole of Maharashtra is some 50 million acres, consisting of about 4,30,000 holdings. Of these, only about 32,000 holdings are likely to be affected by the proposed ceiling law, and these also include 900 holdings above 500 acres and 350 holdings above 1,000

acres. It is only in Vidarbha and Marathwada that there are a few holdings extending beyond 10,000 acres. The total land held by private or company owned sugar factories is about 1,00,000 acres and the land actually owned by them is around 30,000 acres. This represents .006 per cent of the total culturable land in the State; even if all the land (both owned and leased) held by the sugar factories is taken into consideration, it will constitute no more than .002 per cent of the total area! And it is this negligible percentage of land which the Maharashtra Government seems so determined not to exempt from the purview of the Land Ceiling Bill. It almost seems to be regarded as a prestige issue by the Government, considering that the Chief Minister (as already indicated in an earlier dispatch on this subject in these columns) sought, and doubtless succeeded in getting, the Prime Minister of India to intervene and prevail upon the Planning Commission reportedly to permit a deviation from the norm prescribed by it earlier after mature deliberation.

It is not that either the Chief Minister of Maharashtra or the Planning Commission is unaware of the serious repercussions to the sugar industry that would follow from the non-exclusion of farm lands held by sugar factories from the purview of the proposed Bill. It cannot certainly be any deficiency on the part of the company-owned sugar factories that has provoked the proposed measure. Nor is it the certainty that the land that would become surplus as a result of the enforcement of the ceiling would be adequate to give land to all the landless in the State. What then is the compelling factor that has influenced the Maharashtra State Government not only to deviate from an accepted and healthy norm but to hustle through the Bill? According to informed sources, the decision is probably forced upon the Government by the henchmen of the party in the State who are out to placate the discontented elements among certain agricultural classes in the Deccan sugar factory region. Those who sold away their lands and those who entered into lease agreements decades ago have seen their land, which was once arid and uncultivable, transformed into flourishing fields of sugar-cane. They have also been witnessing the prosperity of their neighbours who have become members of co-operative sugar factories and are now seized with the desire to secure a reversal of their past transactions under colour of legislative sanction. In other words, they would like to, if they can—or are enabled to by an obliging Government—to be installed in positions of prosperity created by the hard labour, initiative and enterprise of others. And in this unholy—however understandable or human, it may seem to some—desire, they have been egged on and encouraged by those political busybodies that are ever ready to fish in troubled waters. But it is one thing to sympathise with the lot of people who long ago parted with their property for a very small consideration and it is another to take a realistic view of the position to-day. We must see what was the ruling value at the time. If the value of the property has increased several fold since, it is because of the efforts that have been put in by the new owners. In fact, it is the efforts of these people which have also raised the value of the property of those who still own and do not want to part with their lands as did their neigh-

hours. If it is unfair, as some allege, that those whose lands were sold or leased in the past received a very low price decades ago, it is equally unfair to deprive the present owners on the plea that they have already reaped a rich harvest several times the price paid by them and also using it as an excuse to whittle down the amount of compensation for the lands proposed to be acquired from them.

As regards lease holders, again, maybe the rents they receive per acre as per the old agreements are low, compared to the total value of the yield per acre today. But the point to consider here is whether the lease land would have yielded what it is yielding today, had it been left as it was and continued to be neglected as it was when in the possession of the lessors. To ignore the circumstance and the sacrifices which have led to the capital appreciation of the lands in question since the take over is to be blind to facts.

Then, again, another argument in favour of the proposed land ceiling legislation goes that the lease agreements were heavily weighted in favour of factory owners, as though to suggest that the lessors and the Government had no hand whatsoever in concluding these agreements. It is necessary to recall that it was the same Congress Government which is in power today in the State that appointed District Collectors to arbitrate and revise all old lease agreements with sugar factories and it is these awards that are in operation today.

Nor are the lessors as helpless as they are made out to be by interested parties, in case they want a revision in the terms of their lease agreements. Under the relevant awards, it is believed, they can invoke a clause to get a revision effected in the lease terms.

It may not be known to many that this is not the first time that company-managed sugar factories are being asked to give up their farm lands. In a small way, it seems, the thin end of the wedge was driven as early as in the year 1955 when, while giving their awards, some District Collectors decreed that the companies concerned should give to the landless, if any, in the reserved areas of their factories three acres of sugar cane land from out of the lands held by them. The feeble protest of the factory owners at the time that this amounted to a forcible reduction of their farm holdings was, of course, ignored. Elsewhere in this issue, after Week's Notes section, will be found the statement of the chairman of the Deccan Sugar Factories Association on the question of ceilings on sugar factories. It gives a complete idea of the objective situation and the harm which is bound to follow from the inclusion of sugar factories in this bill.

It is against this background that a dispassionate student of land reforms in the country should examine the proposed land ceilings legislation of the Maharashtra Government.

Business Notes

Foreign Trade

CANADA'S NEW CREDIT SCHEME

MR GERALD A. NEWMAN, Commercial Counsellor for Canada in Delhi, has just returned from an Export Trade Promotion Conference in Ottawa, where 110 Trade Commissioners had gathered from 63 posts in 49 countries along with representatives of 1,288 Canadian firms. One of the important achievements of the Conference, as Mr Newman indicated, has been the evolution of an export promotion policy for providing financing facilities through the Export Credit Insurance Corporation in Ottawa. In respect of medium credit upto 5 years for capital equipment, arrangements will be made by a new financing company to be established by the Canadian banks. The longer term credit to cover the export of Canadian capital goods will be made under government-to-government arrangements. The Canadian Government proposes to guarantee and subsequently buy foreign obligations issued to cover Canadian capital goods exports. Though the precise procedure has not yet been laid down, it is gathered that there will be two types of long-term credits. In the first case, trade promotion credits will be given on the basis of industrial and regional needs with the primary consideration of increasing exports. Secondly, political credits, which involve the purchase by the borrower of specified categories, will also be given. In the former case, the exporter would approach the Corporation for credit in the case of capital exports against which the exporting firm cannot make the sale on less than five year credit basis. Such requests will be referred to the Departments of the Trade and Commerce, the External Affairs, and the Finance for their consideration. If the Departments are satisfied and the foreign government requests for a credit the new financing company would act as an agent for the Export Credit Insurance Corporation. The exporters would be paid in domestic currency by the Corporation.

In the case of political credits, the Ambassador of a foreign country would approach either the External Affairs or the Trade and Commerce Departments with a request for a credit for a particular project. As long as the major portion of the requirement would be for capital goods and in sectors in which additional production and employment would be desirable, the

Canadian Government would be prepared to guarantee the foreign country's obligations.

This bold policy will be hailed in India, as in other developing countries. To India it would prove of valuable timely help, in view of the large foreign assistance component in the proposed Third Plan.

WOOL EXPORTS

AT THE 9th Annual Conference of the All-India Wool Trade Federation, Mr Jayantilal K. Anjaria, in his presidential address dwelt at length on various problems facing the wool industry. He succinctly clarified the features central of wool exports stating that, with the rise in wool prices, most of the countries increased their exports in 1959-60, India's share being 42.11 million lbs. which it should be noted, is a record, showing an increase of 20 per cent.

In 1958-59, India's exports of wool were 35.24 million lbs. Out of the 42.11 million lbs. exported in 1959-60, the United Kingdom took 13,618,000 lbs. Though it marks a decline of 4.52 million lbs. from the highest figure reached in 1952-53, it is satisfactory to note that it shows an increase of 64,000 lb. over the figure of 1958-59. It is, however, to be noted that exports of Indian wools during the first quarter of 1960 declined and amounted to 9,196,000 lbs. as against 9,440,000 lbs. during the same period last year. Perhaps, this is a result of the previous year's heavy off-take. So far as the raw wool export trade is concerned, the Common Market countries took 7,455,000 lb. of raw wool during 1959-60. If the country-wise figures are taken into consideration, it would be seen that Belgium, France and West Germany have exceeded their previous off-take. The relative short supply position possibly explains this performance.

Since raw wool is one of the items in the country's export trade which should be consolidated and expanded, the All India Wool Trade Federation has suggested that the following measures be adopted to encourage exports. The measures suggested by the Federation are appointment of a Raw Wool Export Board, in consultation with the Federation, with powers to recommend measures for export promotion; no restrictions on the export trade of raw wool; sending of a delegation of wool merchants to foreign countries both to study their requirements and explore possibilities of new markets; a publicity campaign and reduction in

Ease out of that profit squeeze...

Decentralisation and lower profit margins make the profit-and-loss statement the real measure of each plant's efficiency. That's why it is increasingly important for management to study methods to ease out of the profit squeeze. Planned Lubrication gives management such an opportunity for savings.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

The service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

PLANNED LUBRICATION—A VITAL FACTOR IN COST CONTROL

ocean freight on wools. It would be in the interests of the wool trade if levies such as Central and State Sales Tax and local octroi duties be paid back as a rebate in respect of exported quantities. The main advantage of this would be that it would place Indian wools on a better competitive basis than now in the market abroad.

Equity Investment

INTERESTING TRENDS

THE GROWING public interest lately in the stock market is evident from the sharp increase in the number of shareholders and the broadening of investment in shares. The rise in the number of shareholders points to the fact that the habit of investing in shares—and, therefore, of saving also—is spreading. This is the conclusion of a study made by the Economic Development Department of the Reserve Bank of India, based on the assessment dividend income as gleaned from the All-India Income-Tax Revenue Statistics, during the year 1955-56 to 1958-59.

According to the Study, both the number of shareholders and the dividend income earned by them increased from 112,471 and Rs. 50.50 crores, respectively, in 1955-56, to 141,189 and Rs. 75.00 crores during 1958-59, representing an increase of 25.5 per cent in respect of the former and 48.5 per cent in the case of the latter. The data on dividend income are based on the shareholders' report in their income-tax returns as well as the refunds claimed by them. While the total number of shareholders (exclusive of companies and other concerns assessable at the Company rate) in 1958-59 was 139,077, as compared to 110,605 in 1955-56, individual shareholders alone accounted for about 89 per cent, their number having increased from 99,948 in 1955-56 to 125,099 in 1958-59 i.e. by 25 per cent. It is significant that the expansion was higher under salary earners (39 per cent) than under non-salary earner individuals (21 per cent).

The income-wise trends also show an increase in the number of individual shareholders. The increase in the number of individual shareholders in 1958-59, as compared to that in 1955-56, was higher (about 40 per cent) in the income range Rs. 25,000 to 1,00,000. In the income bracket Rs. 0 to 25,000 the number of salary-earner individuals deriving income from dividend increased by 41 per cent, as against an increase of 19 per cent in the case of non-salary-earner individuals during 1955-56 and 1958-59. But the reverse was true in the income range Rs. 25,000—1,00,000. The increase in the case of non-salary earners has been much higher (48 per cent) than in the case of salary earners (28 per cent). However, the increase in the number of shareholders is more significant in respect of salary-earner individuals than non-salary earners in the income bracket below Rs. 1 lakh, the former having risen from 22,848 in 1955-56 to 31,791 in 1958-59 and the latter from 75,809 to 91,866.

The Study, however, has proved that the expansion in the number of people earning dividend income, particularly under the salary-earner individuals in the income range below Rs. 1 lakh, is quite in tune with the growth in the number of assessee deriving income from sources other than dividend. It would have been interesting to know from the same source the extent of disinvestment, especially since the recent sharp rise in prices began to impinge on savings generally and investment in particular.

Meanwhile, the prospects for a further sharp increase in the number of shareholders are, if anything, brighter today than ever before, what with authorities having decided to release to the public shares in public sector undertakings also. Generally speaking, the number of shareholders can be increased considerably if studied attempts as the setting up of "investment

clubs" as in the United States are made in our country. During the past five years, the number of investment clubs in that country is estimated to have jumped up from about 2000 to 25,000 with the number of stock holders as high as 13 million, which number, incidentally, is greater than that of factory workers in the United States. The investment club movement seems to be growing rapidly in several other countries as well. Thus, there are reported to be 6,000 clubs in Japan, 500 in the UK, about 50 each in the Netherlands and Australia, and 500 in Canada. Even Israel seems to have started one such club recently. Efforts should be made to explore the feasibility of starting similar investment clubs in our country also to educate more and more people to take an active and intelligent interest in the stock market and, stemming therefrom, company affairs.

Ships

PRICING AT VISAKH

JUDGING FROM any standard, the year 1959-60 will go down in the annals of Hindustan Shipyard Ltd. as the best on record so far, and it must have been with not a little satisfaction that Mr. G. L. Mehta, could relinquish his office as Chairman, after noting this. It was appropriate that he should have selected, as the theme of his valedictory presidential address, the present position of, and the future outlook for, the Shipyard. A gratifying improvement in the production of the yard, and this without any increase virtually in the overheads, the best performance in regard to delivery, a satisfactory record as regards the number of man-hours spent in processing a ton of steel on hull construction and a like quantity of other materials on the outfit and, to crown all, the acceptance of the order for a vessel with a penalty for delay in delivery, for the first time, are, indeed, a good augury for the future working of the shipyard. If, in addition the cost of production, which is admittedly high today, also is brought down, the outlook for this presently semi-Government, but prospectively wholly Government, undertaking should certainly be encouraging.

But all this is not to say that the Shipyard has turned the corner. On the other hand the position still is that the Shipyard is confronted with a serious situation because of lack of orders. Mr. Mehta, in fact, drew pointed attention to this when he mentioned that "if the order for a construction of the vessel, which has since been received, had been received earlier, the Shipyard could have avoided a hiatus in planning which has now become unavoidable." This situation can only be overcome if a reconciliation can be made between the need of the shipyard for orders and the requirements of the shipowners about prices and delivery dates.

Now on the question of pricing of ships, the shipowners have taken the view that they will be prepared to pay for maintaining the volume of work in the Shipyard, only if the Yard can supply the ships at the cheapest world price, but the question of determining the cheapest world price at any given period seems to bristle with difficulties which are not capable of solution, at any rate immediately. In the circumstances, as Mr. Mehta said, "a formula based on the percentage of the cost for fixing the prices," whatever that may mean, seems to merit serious consideration. According to Mr. Mehta himself, "the proposal has not been found acceptable on the ground that it does not provide the necessary incentive to the Yard to reduce its cost". He also conceded that "this contention has undoubtedly force." In other words, what Mr. Mehta suggested cannot be considered as a lasting solution, but only a stop-gap arrangement, which means that the problem continues to plague the yard and the shipping interests.

FROM THE CAPITAL'S CORRIDORS

PETRO-CHEMICAL INDUSTRY

A BEGINNING has been made to develop petro-chemical industry in India. Three licences, two to Duncan Brothers and one to P.J.B. Industries, were issued last week to set up chemical manufacturing units based on utilisation of natural gas from Assam Oilfields. Duncan Brothers will manufacture poleathene and synthetic rubber, while P.J.B. industries will go in for the production of carbon black. Duncan Brothers have entered into collaboration arrangements with Phillips, while P.J.B. Industries will secure technical know-how from Continental Carbon Company, of the United States.

A rough estimate puts the output of natural gas from Assam Oilfields at 60 to 80 million cubic feet a day, of which 40 million cubic feet a day have already been earmarked for utilisation by a fertilizer plant to be set up in the public sector. The requirements of Oil India Limited are not yet known. The left-over natural gas will be used by projects in the private sector.

As regards the setting up of the fertilizer plant, a Japanese firm is reported to be a strong competitor to the British tenderers. It is, however, anticipated, that a part of the credit which the British interests have promised to provide for the Third Plan projects will be used for financing this plant.

ASSAM PIPELINE

Meanwhile, construction of the 720-mile pipeline which will connect the Upper Assam Oilfields of Oil India Private Limited with the two public sector refineries one at Nummati (Assam) and the other at Barauni (Bihar), has commenced.

Oil India Private Limited, which will produce crude oil from its wells at Nahorkatiya and Moran and transport it to the Nunmati and Barauni refineries, has appointed the Burmah Oil Company (Pipelines) Limited as the construction agents for the project. Oil India Private Limited is a partnership firm of the Burmah Oil Company Limited (of which Assam Oil Company is a subsidiary) and the Government of India. It was incorporated as a rupee company on February 18, 1959, with an authorised capital of Rs. 50 crores. Its issued capital will be Rs. 28.25 crores, of which 62-2/3 per cent will be subscribed by the Burmah Oil Company and 33-1/3 per cent by the Government of India.

The pipeline has two sections: (a) Nahorkatiya-Nunmati section of 260 miles which will use about 32,900 tons of 16" diameter pipes; (b) Nunmati-Barauni section of 460 miles which will use 51,000 tons of 14" pipe. The capacity of the two sections is: (a) Nahorkatiya-Nunmati Section 2.75 million tons per annum but capable of expansion to 4 million tons per annum; (b) Nunmati-Barauni Section 2 million tons per annum but capable of expansion to 3.25 million tons per annum. The pipeline will be laid over three States—Assam, West Bengal and Bihar.

Messrs. Mannesmann A.G., of Dusseldorf, and Saipemm, of the E.N.I. Group of Italy, have formed the Mannesmann-Saipemm Pipeline Contractors Company to lay the pipeline under direct supervision of the Burmah Oil Company (Pipelines) Limited.

The main line pipes of 16" diameter have been supplied by Messrs Stewarts and Lloyds and the 14" pipes by Messrs Hindustan Steel.

The terrain over which the pipeline will be laid is subject to numerous climatic hazards. It will cross about 78 rivers, including the mighty Brahmaputra. A right-of-way of 40-60 feet width will have to be cleared for laying the pipeline. The State Governments con-

cerned are arranging to acquire most of the land from owners under Land Acquisition Act, 1894.

There will be eight pumping stations located at an average distance of 90 miles apart in addition to an injection station at Moran. The pumping plant will consist of reciprocating plunger pumps driven by Allen diesel engines. Natural gas will be used as fuel to drive these engines at Nahorkatiya and Moran, and other units will use crude oil ex-pipeline. At each pumping station there will be three main generating units.

The pipeline will be laid on a four-foot deep ditch which will be covered. To guard the pipes against corrosion, cathodic protection will be given i.e. electrical charging of the ground in which the pipe lies. Moreover, the pipes will be coated with plasticised coal-tar bitumen which will be reinforced by an inner wrap glass tissue. There will also be an outer protective wrap of fibre glass impregnated with coal-tar.

The cost of the entire project is estimated to be around Rs. 44 crores, of which the foreign exchange component will be nearly 43 per cent. The following are some of the major heads of expenditure: pipes 28.8 per cent of the total cost; main line construction and demarcation 19.0 per cent; pumping and generating plants, conditioning plants, etc. 17 per cent; river crossing 8.2 per cent; tele-communication/telemetering and cathodic protection 4.3 per cent.

MERCEDES-BENZ TRUCKS & WILLYS JEEPS

Tata Electric Locomotive and Engineering Company and Mahendra and Mahendra have plans to increase their production of Mercedes-Benz trucks and Willys jeeps from 12,000 to 24,000 and 458 to 833 units per annum respectively. Total outlay on TELCO's expansion programme is expected to be around Rs. 1,165 lakhs, out of which Rs. 700 lakhs will be in foreign exchange. The expansion programme of Mahendra and Mahendra is estimated to cost Rs. 65 lakhs, out of which Rs. 55 lakhs is the expenditure involving foreign exchange.

The Jha Committee, it may be recalled, has estimated that demand for commercial vehicles will rise to 60,000 units by 1966, while that for jeeps will increase to 10,000 units. These targets have been accepted by the Planning Commission. The present annual production of commercial vehicles and jeeps is around 27,000 and 6,288 units.

MOTOR-CYCLES, SCOOTERS AND MOPEDS

The demand for motor-cycles, scooters and mopeds during the Third Plan period is placed between 60,000 and 72,000 units per annum. The Government, it is understood, has decided that each State in the Indian Union should have at least one unit for the manufacture of motor-cycles, scooters and mopeds and that no new units should be set up in a State where one or more units are already in existence or have already been licensed to be established. The Government, it is learnt, does not favour creation of additional capacity for the manufacture of motor-cycles.

Twelve proposals, it is understood, have been received by the Government from the existing scooter manufacturing units for expansion of their capacity. The applicants are one firm from Delhi, four from Punjab, two each from Andhra Pradesh and Madras and one each from West Bengal, Bihar and Mysore. The foreign collaborators of these manufacturers are from West Germany, Japan, Great Britain, Austria, Poland and France.

Secunderabad.

Nine applications for setting up new scooter manufacturing units — three in Punjab, two in Calcutta and one each in Bihar, Bombay, Rajasthan and Madhya Pradesh — have also been received and are under consideration of the Government. The foreign collaborators of these firms are also a mixed bag composed of firms from the United Kingdom, Japan, Austria, Czechoslovakia, U.S.A., Italy and West Germany.

Another 21 proposals have been received from firms in Delhi, Punjab, Uttar Pradesh, West Bengal, Gujarat, Maharashtra, Hyderabad, Madras and Kerala for the manufacture of mopeds and scooters.

There appears to be every likelihood of the schemes of applicants from Mysore, Andhra Pradesh, Gujarat, West Bengal, Kerala, Rajasthan, Madhya Pradesh, Uttar Pradesh and Orissa getting preference as these States have not got any motor-cycles, scooters or mopeds manufacturing units.

TYRE-TUBE VALVES FOR AUTOMOBILES

Kamani Brothers, a Bombay firm, it is learnt, has entered into an agreement for technical collaboration with Messrs. Technoexport, Praha, Czechoslovakia, for the manufacture of six lakh pieces of tyre-tube valves for automobiles at a factory to be set up in Mysore State. The machinery for this factory will be supplied by the foreign collaborators on non-convertible rupee payment basis.

CAR RETARDER EQUIPMENT

Messrs. Saxby and Farmer (India) Ltd., have prepared plans to manufacture car retarder equipment in this country. The type of equipment proposed to be produced is the recognised one suitable for application on Indian railways.

The plans, to be executed in collaboration with their principals, Westdair, envisage a progressive increase in indigenous content from 55 per cent in the first stage to 98 per cent in the fourth stage. Each stage is proposed to be completed in a year. Thus, in the course of four years, India might be producing this highly specialised equipment almost fully from components manufactured indigenously.

PRODUCTION OF CAUSTIC SODA

The production capacity of the caustic soda industry is proposed to be raised to 4,00,000 tons per annum under the Third Plan. Licences for the creation of capacity to the extent of 2,97,000 tons has already been issued, leaving a gap of 1,03,000 tons. A number of applications have been received for installation of further capacity. These include proposals from the West Coast Paper Mills (to create 30 tons a day capacity for self-consumption at Dandeli, Mysore), the Titagarh Paper Mills (to expand their existing capacity by 5 tons a day to 15 tons a day), Orient Paper Mills (to increase their capacity from 10 tons to 20 tons a day), Travancore-Cochin Chemicals (to expand their capacity from 30 tons to 40 tons a day) and D.C.M. Chemicals Works (to raise their capacity by 9,900 tons per year).

X-RAY EQUIPMENT

Five schemes for the manufacture of X-ray equipment, with a total capacity of Rs. 150 lakhs worth of equipment per year, have so far been approved by the Government. The demand for X-ray equipment is expected to increase to about Rs. 200 lakhs worth of equipment per annum by 1965-66. Among the five schemes is a scheme of the West Bengal Government which envisages production of Rs. 30 lakhs worth of

equipment. The factory is proposed to be set up at Calcutta. The West Bengal Government will have 51 per cent share in this enterprise. Foreign collaboration has been secured from Pickers.

THIRD PLAN PRIVATE SECTOR TARGETS

Some details are now available of the Third Five-Year Plan targets for some of the important industries in the Private Sector. They are as under:

S.No.	Industry	Unit	1960-61 Estimated Capacity	Target for 1965-66 Capacity
(1)	(2)	(3)	(4)	(5)
1.	Aluminium	000 tons	17.5	82.5
2.	Copper (fire refined and electrolytic)	"	7.2	18.4
3.	Lead	"	6.0	8.5
4.	Zinc	"	Nil	15
5.	Industrial machines			
	(i) Cotton textile	Rs. crores	10.0	22.0
	(ii) Cement	"	1.1	4.5
	(iii) Sugar	"	10.5	11.0 to 12.0
	(iv) Paper	"	0.7	8.5
	(v) Dairy	"	0.25	2.5
	(vi) Industrial bolters	"	3.7	29.0
	(vii) Cranes	000 tons	2.5	60
6.	Automobile and Ancillary Industries			
	(i) Passenger cars	000 nos.	20	30
	(ii) Commercial vehicles	"	28	60
	(iii) Jeeps and station wagons	"	5.5	10
	(iv) Automobile ancillaries including trailers	"	0.7	2.5
	(v) Motor cycles and scooters	"	24	48 to 60
7.	Bicycles	mil. nos.	2.2	2.2
8.	Sewing machines	000 nos.	288	500
9.	Welding electrodes	mil. rft.	600	1,080
10.	Electric fans	mil. nos.	2.2	2.8

WIRE DRAWING INDUSTRY

The Government of India, it is learnt, has decided to encourage the establishment of wire drawing capacity in the country to the extent of 500,000 tons a year. The existing capacity of the industry is of the order of 400,000 tons per year.

A recent study has indicated that demand for wire of all types is likely to grow to about 470,000 tons per year by the last year of the Third Five-Year Plan. The Government has already licensed a number of units and a very large number of manufacturers have set up wire drawing plants on small scale under the relaxations announced in April last year.

The raw material for wire making—wire rods—was till now made by the Indian Steel and Wire Products, Jamshedpur. Wire rods are also now being made at Burnpur. The Government has also decided to grant permission to existing re-rollers to manufacture wire rods in coils within the existing billet allocations by allowing them to instal coilers and other connected equipment.

IMPORT OF FERTILIZERS

Fertilizers worth about Rs. 20 crores are expected to be imported during the current year—Rs. 8 crores worth from the "free world" and the balance from rupee payment account countries or through deals involving their exchange for sugar, iron ore and oil-cakes exports. Availability of fertilizers even after these imports, however, will not be enough to meet the full requirements of the country; only 60 per cent of the total requirements are likely to be met by the indigenous production and these imports.

Fertilizer requirements of the selected districts where package programme of intensive cultivation is being put through will be met by separate imports for which finances are being provided by the Ford Foundation.

COAL COMMITTEE'S MEETING

A meeting of the Industrial Committee on Coal will be held here on February 18. Among other things, it will consider revision of wage structure of colliery workers. It is contended by the colliery workers that coal production has gone up and the industry has been given in the recent past price increases which have not been reflected in their wages.

ZIGZAG SEWING MACHINES

Messrs. Jay Engineering Works propose to float a sister concern to manufacture three lakh zigzag sewing machines per annum on single shift basis. The product will be wholly exported for the first few years. The authorised capital of the new venture will be Rs. 2 crores.

COMPANY AFFAIRS

INDIAN AIRLINES CORPORATION

In sharp contrast to the results of some previous years, when the Corporation recorded losses, the year under review (ending March 31, 1960) has recorded a profit though fairly modest. This improvement has been the result of an increase in the available capacity to carry freight as well as passengers as compared to any previous year. While the fares remained unchanged the Corporation could bring down the cost to Rs 175 per available ton mile, the lowest since the Wage Awards of 1955. This reduction in cost was achieved largely by an increase in the capacity operation, brought about by improvements in the route pattern and higher utilisation of Viscounts and Skymaster aircraft. In part it was also the result of the economy measures introduced and better control of costs in general during the year. As the table below would indicate, the Corporation has registered a positive increase in the revenue per available ton-mile although the costs have fluctuated, and 1959-60 is the only year when the costs are lower than the revenue.

	Cost per available ton mile	Revenue per available ton-mile
1953-54	Rs. 1.69	Rs. 1.42
1954-55	Rs. 1.69	Rs. 1.49
1955-56	Rs. 1.80	Rs. 1.57
1956-57	Rs. 1.76	Rs. 1.56
1957-58	Rs. 1.81	Rs. 1.63
1958-59	Rs. 1.83	Rs. 1.69
1959-60	Rs. 1.75	Rs. 1.76

The Corporation is gradually reducing the number of dakota aircraft in use but even now the number of dakotas is quite large. At the commencement of the year, the operating fleet of aircraft consisted of 10 viscounts, 5 skymasters, three herons and 58 dakotas. During the course of the year one dakota was written off due to accident and one dakota and one hiper-dakota aircraft were sold.

There has been an increase in the utilization of skymaster along with further increase in field utilisation. The utilisation of dakotas too has been restricted. This trend seems to be quite healthy and it is hoped the Corporation will continue its policy of increasing the number of Viscounts which appear to give high efficiency in service as well as in costs.

The Corporation has placed orders for the purchase of 5 Fokker Friendship aircraft. These are scheduled for delivery towards the end of the financial year 1960-61 and should begin revenue-earning operations early in 1961-62. The Chairman is of the opinion that Wage Bill of the Corporation is likely to show a significant increase in the coming year but it seems that there is a reasonable chance of countering rising costs by creating more capacity. There has been witnessed a higher demand for air transport especially after the introduction of viscounts. This increased tempo will, it

appears, be intensified with increased tempo of economic activity in the Third Five-Year Plan.

INDIAN BANK LTD.

Subject to audit, the Net Profit of Indian Bank Ltd. for the year 1960, after providing for contingencies and meeting all expenses together with the sum carried from the previous year's account amounts to Rs. 41.03 lakhs as against Rs. 37.45 lakhs for the year 1959. An ad-interim dividend at the rate of 5% and a bonus of 2½% (subject to tax) has been paid. The Directors now propose to recommend to the annual General Meeting payment of a final dividend of 5% and a bonus of 2½% (subject to tax) for the year 1960 thereby making the dividend and bonus for the year amounting to 15%.

DENA BANK

The net profit of Devkaran Nanjee Banking Co. Ltd. for the year ended 31st December 1960 after providing Rs. 2.65 lakhs from for bonus to staff and including Rs. 5.60 brought forward from last year's account, amounts, subject to audit, to Rs. 29.24 lakhs.

An interim dividend was paid by the directors at the rate of Rs. 1.86 per share for the half year to June 30, 1960. A sum of Rs. 8 lakhs was transferred to reserve fund and Rs 9 lakhs for taxation. Now the directors have proposed the payment of a final dividend for half year to December 31, 1960 at the rate of Rs. 2.52 per share (making in all 8.76 per cent per annum subject to deduction of tax).

Company Meeting

THE CONSOLIDATED COFFEE ESTATES (1943) LTD.

CHAIRMAN'S SPEECH

At the Seventeenth Annual General Meeting of the Company held on the 30th December 1960.

Ladies & Gentlemen,

It is with great pleasure that I welcome you here today on the occasion of the Seventeenth Annual General Meeting of our Company. The Directors' Report and the Audited Accounts for the year ending 30th June, 1960 have been in your hands and with your permission I propose to take them as read.

There has been a sharp decline in the income of the Company and the revenue from Coffee at Rs. 71,99,953 is lower than that of last year by Rs. 18,49,420.

The coffee crop harvested amounted to 1,451 tonnes of Arabica and 998 tonnes of Robusta or a total of 2,449 tonnes against 1,793 tonnes of Arabica and 1,009 tonnes of Robusta or a total of 2,802 tonnes in the previous year. Though the crop for the year is the fourth highest in the history of the Company, the Arabica crop in comparison to the previous year was less by 342 tonnes the difference in Robusta being negligible. The points awarded in respect of Arabica for the year under review was consequently some 5,45,000 less than the previous year which with a valuation at Rs. 2.20 per point lead to a decline in coffee income by Rs. 18,49,420/- referred to earlier.

The crop of 1958/59 was valued in the accounts at Rs. 2.37 per point as against Rs. 2.20 per point for this season. At the same valuation this year's crop would have been worth Rs. 77,56,313/- or about Rs. 6,00,000/- higher than the valuation now made in the Profit and Loss Account.

Your Directors considered it wise to value this year's crop at only Rs. 2.20 per point in view of the sharp decline in export prices for Arabica and Robusta, those for the latter being considerably lower than the basic minimum return to the grower fixed by the Board. The valuation at Rs. 2.20 per point is the highest that could be made with safety and it is feared that surplus receipts over the present valuation of Rs. 2.20 may well prove negligible.

The income over valuation for 1958/59 received into this year's accounts is Rs. 3,67,344/- as against Rs. 9,45,863/- received in 1958/59 from the crop of 1957-58. An excess of only 8 nP. per point making up to a total of Rs. 2.45 per point was received.

It will be of interest to compare the valuation and final value per point for each of the last 5 years:—

	Valuation in accounts Rs.	Final value per point Rs.	Amount received from previous year Rs.
1954-55	2.12	2.37	6,88,290
1955-56	2.37	2.55	7,27,779
1956-57	2.50	2.81	13,43,214
1957-58	2.25	2.51	15,40,484
1958-59	2.37	2.45	9,45,863

It will be seen that the income of Rs. 3,67,344

from the previous year's coffee crop received during the year is the lowest since 1954.

The profit for the year under review after taxation was Rs. 13,08,089/- and is the lowest since 1949. The fall in profit is accounted for by the lower crop, lower valuation and lower realisations resulting in a very much lower income from previous year's coffee.

This makes somewhat dismal reading but a brief comment on the state of the crop itself is necessary. The Arabica crop averaged 6.16 cwts. per acre and Robusta 7.51 cwts. per acre. Apart from the year 1956-57 a phenomenal year when the production per acre of Arabica was 11.32 cwts. the present production of 6.16 cwts. per acre is the fourth highest on record. The production of Robusta at 7.51 cwts. per acre is the third highest since the formation of the company.

It is necessary to offer an explanation for the very marked divergence between our revised estimates of crop and actual crop harvested. The revised estimate in September 1959 of Arabica was 1,829 tonnes whereas the actual crop harvested was 1,451 tonnes, a reduction of 378 tonnes. Robusta was lower than estimate by 18 tonnes. The Company has had a fair record of estimating the crop and barring 1947, this is the only instance where there has been such a large fall in actual yield.

Mr. Paterson in his speech last year indicated that the unusual rains during November and December 1959 might lead to the estimates for Arabica not being realised.

This fall in actual realisation may not, I fear, be attributed solely to the untimely rains but may well have been due to the appearance of a malady particularly in Arabica coffee further reference to which will be made later on.

I will now refer briefly to our subsidiary crops.

Pepper: Pepper produced during the year was 59 tons as against 95 tons in the previous year.

About 20 tons have been sold at an average price of Rs. 310/- per cwt. whereas the highest price secured the previous year was Rs. 120/- per cwt. We still hold about 38 tons of pepper which we have not been able to dispose of due to a sudden decline in prices. Pepper is a highly speculative commodity but we hope it will be possible to obtain the conservative valuation made in the accounts.

Cardamom: The income from cardamoms at Rs. 82,468/- is the second highest since the inception of the company and is due to the higher prices obtained. The area under cardamoms is 158 acres and particular attention is paid to better cultivation and improved methods of preparing the cardamom for the market.

Oranges: The income of Rs. 1,23,469/- from oranges is also a record. The bulk of our oranges are mar-

keted through the Coorg Orange Growers' Co-operative Society and prices realised have been good. Oranges in Coorg have generally been on the decline but proper attention under the guidance and advice of the Research Station maintained by the Indian Council of Agricultural Research appears to be producing better results. This Station has also improved on techniques of grafting and improved Plant Material, and it is proposed to take advantage of these for extending our areas under Citrus crops.

Paddy and Straw: Ruling high prices coupled with the highest crop on record have enabled us to earn an income of Rs. 2,12,490/- as compared to Rs. 1,86,613/- in the previous year. Our income under this head would be higher but for the fact that the larger portion of our paddy is issued to our labour on a "no profit no loss" basis from September to December each year to counter prevailing high market rates during that period. Our acreage under this crop is 625 acres and it should be possible to increase our yield further.

It will be noticed from the accounts before you that our income from subsidiary crops such as pepper, paddy, cardamoms, oranges and minor produce amounted to Rs. 7,01,474/- or very nearly 7.2% of our total income. The income from these crops is not insubstantial and more attention will be paid to these subsidiary crops. They should prove a valuable stand by in the highly fluctuating coffee market.

Haarer in his "Modern Coffee Production" warned coffee producers that prices had reached their peak at the time of his writing (1955-56), and advised them strongly to prepare for falling prices and even for a slump. He recommended various measures to be taken in time to stave off disaster, for example International Agreements, improvement of quality, proper grading, increasing the demand by propaganda, producing instant coffee etc. He also suggested mixed planting. Most of the steps suggested by him have not been adopted and it seems that progress in that direction will be too slow if not late to be immediately effective as a remedy against what he foresaw.

Coffee production will, of course, remain our main occupation, but more attention will be paid to pepper, cardamom, oranges and arecanut and for their extension wherever possible. These are undoubtedly long term measures, but I fully believe that these will play a very substantial part in the coming years in the economy of your company. The possibility of growing other crops such as Nutmeg, Cloves, Cocoa, etc. is under study and will be taken up only on expert advice being favourable.

In the context of encouraging a mixed economy it will not be out of place to comment briefly on the contemplated extension of coffee planting in Andhra, Assam and Orissa States. The coffee Board is finding it difficult to market the existing production and it would appear to be wiser to encourage the cultivation of other crops in those areas.

There is considerable overproduction in the world and notwithstanding International Agreements the position is bound to deteriorate. We appear to be following countries like Costa Rica, Haiti, Ecuador and French Africa, which despite the threat of overproduction encouraged coffee growing by subsidies, loans and other forms of financial assistance, whereas it would be preferable and wiser to follow Brazil which is reported to be the only country with a scheme to assist farmers to move out of coffee growing.

Timber: The income from timber this year is Rs. 2,98,537/- as against Rs. 6,15,904/- last year. This is not

a regular source of income and sales will be made only as and when necessary.

The Kushalnagar Works has cured 3,709 tonnes which is the highest quantity cured since the start of the Works. The trading results have been better than in previous years.

It has not been possible to effect savings in the rate of expenditure except for the corresponding lower crop charges due to a smaller crop. These savings are limited to cost of gathering, pulping, transport to Works and curing. The question of effecting economies is under serious consideration, but it must be remembered that our expenditure has so far been geared to a high rate of production and a corresponding high return for our office.

Our Capital Expenditure during the year amounted to Rs. 7,74,902/- out of which Rs. 1,23,247/- was spent for extending drying ground space and Rs. 1,09,125/- for estate machinery. The balance accounts for New Clearings, buildings, etc. We have so far built 2,199 new quarters for labour and we still have to build about 200 houses. There will be built on a phased programme and will eventually cost at present rates some Rs. 3 lakhs.

It is necessary here to bring to your attention the fact that depreciation allowances under the Mysore Agricultural Income Tax Act are less than that allowed under the Central Act particularly in the case of Tractors, Motor vehicles, Machinery, spraying hose, etc. Under the old Coorg Act over and above the normal depreciation allowance a special allowance of 20% was allowed for a period of 5 years which allowed for the writing off of all buildings and machinery in a period of 4 to 5 years.

The fact that added to lower rates of depreciation no allowance is made for the capital value of an Estate results in the Agricultural Income Tax working out at a rate higher than that of Central Income Tax.

Expenses incurred in new planting and replanting up to the yielding stage are treated as Capital for which an allowance of only 10% is granted. In the case of replanting which is undertaken to replace a non-yielding or old and useless area no allowance is made for the loss of capital invested.

There is a very strong case of liberalisation in the matter of depreciation allowances and a memorandum on this subject first submitted when the Mysore Act came into force has not yet received consideration.

The dividend of 20% recommended by your Board is as liberal as possible in view of our lower earnings coupled with the necessity to allocate adequate funds to our Reserve. It was only possible to pay this dividend because of the refund of Agricultural Income Tax, amounting to Rs. 4,67,288/- received by the Company in respect of the tax paid for the year ending 30th June, 1956. Tax had been demanded and paid on the basis of the Mysore Agricultural Income Tax in respect of the year 1955-56 even though Coorg at that time was a separate State. A further appeal is pending in respect of the Agricultural Income Tax paid for the 4 months ending 31st October 1956—merger of Coorg into Mysore having taken place as from 1-11-1956. In the event of the appeal being successful a refund of about Rs. 2 lakhs may be expected.

The Preference Share Regulation of Dividend Bill has been passed by Parliament and the question of how it affects an Agricultural Company as yours is to be considered. It is only fair to say that the portion of

our profit subject to Indian Income Tax is negligible and only that portion will require to be grossed up. The resulting extra payment will be very small indeed but even without this, the Preference shareholders will not be losing as they will still have the benefit of Section 49 B of the Indian Income Tax Act.

The coffee crop that is now being harvested may be higher than our estimate of 3,099 tonnes specially in Robusta. Some of our Arabica estates have been particularly affected by the new disease and it is apprehended that this may effect the outturns and quality of the coffee. In the year under review it was found in some Arabica estates that the percentage of "A" sized beans was substantially lower than the average and that there was a similar remarkable increase in Peaberry and the "B" size. This naturally has an adverse effect on the quality of the coffee and results in a lower number of points being awarded. I hope that I am not being unnecessarily alarmist and will only be too glad if proved to be unduly pessimistic.

I am afraid it is rather early in the season to venture any opinion on the prospects of the 1961-62 crop and this should as usual wait until we have had our blossom showers.

I referred earlier to the prevalence of a new disease on coffee. This condition was first reported in 1957 but did not receive any attention as the condition reported appeared to be not unlike "Die Back" normally occurring in coffee. The disease appears to have spread since then and the condition of the coffee especially from January, 1960, onwards has given cause for alarm.

A Scientific Committee which was appointed by the Coffee Board to investigate the malady has submitted its report and has indicated that while there is no cause for alarm there is equally no room for any complacency. They go on to state that the problem is urgent and important and that the subject should be treated as a special project and studied in greater detail on a long term basis. They have made suggestions for setting up a special project to undertake certain studies and it is hoped that these will be given effect to as early as possible.

As the earliest diagnosis of this condition appears to be of the greatest importance, one wonders whether it would not be our best interest to invite a Scientific Officer from Kenya or other coffee growing areas to undertake a short tour. It may be that if such a condition has been noticed before that he would be in a position to identify it and much valuable time to be spent in diagnosis would be saved.

Due to this condition on coffee it is considered that it would be better not to open any new clearings in 1961. We have 727 acres of immature coffee and it would be wiser for our estate managers to be allowed to look after and bring up the immature areas instead of diverting their attention to opening new areas.

Our relations with labour have been generally cordial.

A Wage Agreement with the Unions was entered into effective from the 1st August 1960 under which the existing rates of wages were increased from Rs. 1.50 and Rs. 1.12 to Rs. 1.62 and Rs. 1.23 respectively for men and women labourers and correspondingly for adolescents and children. This represents an increase of 8 to 9% on the existing wage bill. This increase inclusive of Provident Fund and leave wages will cost the Company about 2½ lakhs extra for 1960-61.

The last increase in labour wages was in 1957. The present agreement lasts for two years, or until the

Wage Board which is to be appointed by the Central Government makes its award whether earlier or later. The increase in wages on plantations is inevitable and in an expanding economy essential.

One serious effect of the increase in wages is that absenteeism appears to increase in proportion. The absenteeism in your Company varies between 16 to 20% and added to the poor output of work, really imposes on us the burden of having to maintain a large number of unproductive labourers and to incur the corresponding increase in Capital outlay for providing labour quarters.

In the present state of falling prices and a return which is beginning to prove to be uneconomic labour must play its part in improving their output of work. Coffee plantations cannot be expected to face a situation where labour wages may be eventually doubled or trebled and still be expected to maintain the present rate of employment.

The production of coffee is a purely agricultural occupation, and there are generally very few agricultural activities which can be paid for on the basis of a fixed task. Unless there are incentives to work and earn more, it will be impossible to obtain a full day's work from a labourer. Incentives at present are possible only in the picking and estate curing of coffee. It is essential that a special study of this subject as applied to coffee plantations is undertaken, and we propose to take up this matter with our Planting Association. It is surely the duty of labour unions to advise their members to do a full day's useful work.

I must now refer to a thought uppermost in the minds of all those interested in coffee. For the first time since 1948 that which we feared for many years has happened. The world price of coffee has come down below the Minimum Release Price fixed for release in the internal market. In 1948 the Government of India withdrew the price control imposed on coffee. For almost 12 years thereafter world prices were very high and the Indian producer was not allowed to get the full benefit of these high prices. Exports were restricted and even where allowed a very heavy export tax of as large as Rs. 70/- per cwt. was imposed. In fact at one stage some 5,000 tonnes of coffee fit for export was not permitted to be exported though this could have been done easily without affecting the stock position in India. The selling price of coffee in India itself was kept low on the ground that the profits made on exports were to subsidise the internal market prices.

Recently, there has been a greater pressure to increase the exports of coffee and it is curious that this should come at a time when growers are faced with an adverse export market. We are now faced with the position of suffering a loss as coffee is to be exported on the basis of any price which it could fetch. There is no doubt that until now the grower has subsidised the consumer. It is extremely doubtful if it could be expected that the consumer is now to subsidise the grower.

The world production of coffee in 1959/60 amounted to 4.5 million metric tonnes, representing an increase of over 1 million metric tonnes. The increase in world imports from 2.2 million metric tonnes to 2.5 million metric tonnes was not commensurate with the rise in output. The stocks with producing countries enlarged from 1.6 million metric tonnes to nearly 3 million metric tonnes, which is equal to one year's world consumption.

In India itself the estimate for 1960-61 when realised will be a record. The estimate amounts to 52,290

metric tonnes made up of 30,885 metric tonnes of Arabica and 21,405 metric tonnes of Robusta, and it is possible that the Robusta crop may be substantially higher.

The trend of internal offtake of coffee is not in consonance with that of production. On the contrary the internal consumption during the 11 months of 1960 is slightly lower at 27,321 metric tonnes than in the corresponding period of 1959. As on the 1st January, 1961, the stock of old crop still to be marketed inclusive of carry forward will be about 7,200 tonnes.

The Food and Agricultural Organisation states as follows:

"Although world imports and domestic consumption of coffee will rise in coming years, it is unlikely that the annual increase will exceed 5 per cent, even at present reduced prices. The proposal has been advanced to extend the International Coffee Agreement for another year and consider, in the meantime, the conclusion of an export agreement for five years, to provide time for producing countries to enact and carry out measures of production control, at present still at the planning stage. Unless such measures are taken, stocks will continue to accumulate in producing countries and could reach twice their present size three to four years from now."

We have to consider our marketing policies against the background of what is stated above, viz., increasing production and the very large stocks of coffee held by producing countries.

The system of marketing of coffee in India for internal consumption is multi-channelled. Coffee is sold by Pool auctions for whatever price it may fetch above the Basic Minimum release prices; coffee is sold at local auctions thereby reducing the demand on pool auction buyers; and coffee is allotted to Co-operative Societies at the Basic Minimum release price. In addition in the name of propaganda, coffee is being issued to consumers again at Basic Minimum release prices. The return to the grower is thereby kept very nearly at the minimum. This system no doubt was a good system when stocks were short. The system was introduced in 1948 immediately after the removal of price control and when the production of coffee during that year was as low as under 14,000 tonnes. Prices were indeed very high and all these methods were devised by the Indian Coffee Board to keep prices down. With the doubling or even trebling of production as considered in relation to 1948 there seems little justification to continue, what were after all, expedients suited to a particular situation. Added to this is the fact that export prices have fallen to uneconomic levels. I make a strong plea that the entire marketing policy is overhauled and a more realistic one adopted.

The first requirement is that the Board adopts a more practical propaganda policy. There are I know mixed opinions as to the utility of what were known as India Coffee Houses, but there is no doubt that India Coffee Houses were largely instrumental in increasing the coffee drinking habit and that the internal consumption of coffee rose from some 8,000 tons to over 20,000 tons. For various reasons the Coffee Houses were closed down and the few that are running now are more in the nature of prestige houses and cater to a limited and favoured clientele. Propaganda is very necessary particularly for Robusta coffee if we are to sell our increasing production. The prices for Robusta on the world market are very much lower than our cost of production, and I am convinced that the best market for our Robusta is in India, as at its price it provides a cheaper drink to many of our people.

In particular I refer now to export marketing. We are in no position of course to hold back the huge stocks being received into the pool. With the increased production in 1961 we may well find ourselves at the end of that year with a stock of 10-12,000 tonnes if not a little more waiting to be marketed. We are now obliged to sell coffee at whatever the price that is offered. In these circumstances it is more than ever necessary to examine the export marketing activities of the Coffee Board in some detail. I would like to say at the very beginning that this is not an attempt to find fault with the Coffee Board's marketing policies. If the Coffee Industry is to exist there seems to be little doubt that the system of marketing should be completely overhauled and some bold decisions taken.

The method of marketing is briefly that of offering coffees for export and inviting bids by means of sealed tender. Inevitably this system has led to the concentration of the export business in the hands of only two or three large exporters, a position in which Jamaica found herself for the same reason. It is also significant that India at present is the only country which sells its coffee by this system.

In making up lots for sale, coffees of the same type and grade of equivalent quality are bulked together and offered as separate district growths. There is, however, no guarantee that each year any lot of a particular district offered is comprised of the coffee from the same two or three estates of the district. In any case, the importer in foreign countries knows only that he is being offered the bulk of a particular district growth, and is, therefore, not in a position to enter the market or interest himself on grounds of selective buying.

Before the advent of the Coffee Board, all coffees were sold on the basis of estate marks. The quality of coffee of each estate was well known in London, and these estates always obtained premium prices for their coffees. With the method of marketing adopted by the Coffee Board, and in fairness it must be said that at that time there was no alternative, estate marks disappeared from the London market. Recently the Coffee Board sent some coffees of about half a dozen well-known estates without disclosing the names of these estates, and it was a pleasant surprise to see that these coffees did fetch very good prices, evidently on grounds of quality.

It is relevant to consider the manner in which Kenya sells its coffee. Here they are sold strictly according to liquor tests, and the buyer knows that the coffee he purchases is the type that he requires for his own particular purposes. He also knows, and this is most important, that in the following year the same quality of coffee identifiable by him as similar to that bought by him previously will again be offered. This method ensures that an importer takes sustained interest in each type and grade of coffee and this should be our object also.

There has been a decline in world prices, but it is interesting to note the comparative prices fetched by Kenya coffee and our coffee. Tabulated below are comparative prices for Kenya and Indian coffee per cwt:

	Kenya		Indian
	Rs.	Rs.	Rs.
January	266	393	260
February	246	380	250
March	213	364	245
August	210	333	201
September	200	372	192
October	202	400	184
November	200	353	174

If we are to stay in the export market, there is no doubt that we can do so only on grounds of quality. There is no question of our driving Kenya coffee out of the market, for I fully believe that there is room for both our coffees considering the volume of production of these extremely popular coffees. At best India can export only 15,000 tons of first class plantation and in a quality conscious market, there is plenty of room for our coffees sharing in some of the rewards paid to high class coffees.

In respect of the effect that the European Economic Community market will have on our coffees I quote from "The Commonwealth and Europe" a study prepared by the Economist Intelligence Unit:

"Coffee has an infinite variety of flavours and established blends have a following faithful despite price changes. Kenya coffee, for example, is exceptionally popular in West Germany where importers willingly pay a premium to secure it; Jamaica's Blue Mountain coffee holds an enviable and almost unique position in many markets as do, though to a lesser extent, the high grade coffees of Southern India."

Consumption is also rising in the United Kingdom, and the same book goes on to state as follows:—

"So long as the small tariff preference is maintained in the U.K., or indeed even without it, Commonwealth producers can expect to take their full share of the growing British market, Kenya, India and Jamaica catering to the better end of the trade, other producers to the soluble coffee market."

The above quotations offer an authoritative reply to those who may doubt that Indian Coffees cannot compare in quality or compete on that basis.

I would, therefore, propose for the most earnest consideration of the authorities concerned the following measures:

- The appointment of a well-known Coffee Taster with his headquarters at Bangalore, say for a period of 3 years during which he will also train a number of assistants.
- All Arabica coffees produced in India to be liquor tested and the best coffees earmarked for export.
- The coffees offered for export should be from estates which have earned premium points.
- Such coffees should not be bulked with other coffees.
- Samples will be true to the particular outturn.
- The coffee offered should be in the name of the estate or by a distinguishing mark.
- Coffees offered in subsequent years will continue to bear the same distinguishing marks.
- The coffees should be sold in public auction and not by sealed tender.
- Auctions should be held at weekly intervals to enable importers to cover their requirements quickly if they fail to do so in a previous auction.
- The interval between sale and shipping of the coffee should be reduced.

Without going into detail, I am convinced that the methods I have advocated will be the only way of earning a little more in what is quite obviously a buyer's market. All this requires a bold decision and courage to sell coffee in a way different to ours, but which is common throughout all other exporting countries. If an early decision is taken it should be possible for us to start selling our coffee this year itself on basis of quality. Even if we sold 1,000 tons this year on this basis, we would be entering the export market on proper lines and we could expand this activity in coming years.

One further suggestion I would make is that the Coffee Board should open a prestige Coffee House in London and one in Hamburg. All our coffees should be displayed and sufficient publicity undertaken to revive an interest in Indian coffee. This will be expensive, but it should be money well spent.

Eventually the sale of coffee on the basis of cup tasting should also apply to internal sales and will ensure discriminative buying.

I have touched on a few controversial matters but I trust these will receive earnest and sympathetic consideration. Bold and urgent decisions are necessary. Coffee producers have an unhappy feeling that their fate is decided by a body not truly representative and not close to them or to their problems and it is only by the adoption of realistic attitudes that satisfaction can be given. It is regretted that no decisions have yet been taken on the Expert Committee's report though this was submitted some 18 months ago. Coffee producers and Associations feel that their problems are not dealt with, with any sense of urgency or realism and the failure on the part of the authorities to release the report to Associations confirms the feeling that the fate of producers is being decided without taking them into confidence.

I must refer here to the excellent services rendered to your company by my predecessor in office, Mr. R. C. Paterson. Your Company showed much progress during his term of office and I trust that his policies will continue to bear fruit in the coming years.

I must express my thanks to all our managers and members of our staff both at Head Office and on the estates and at the Kushalnagar Works for another year of hard and efficient work. They have a challenge to face in the coming years, occasioned by falling prices and overproduction and every effort will have to be made by them to run the estates as economically as possible.

I would refer in particular to Mr. E. R. W. Walker, your Field Manager and a fellow-Director for the devoted service of some 30 years he has given to your Company and its predecessors. He will be going into well-earned retirement from the end of June 1961 and I would on your behalf like to thank him for all he has done for the company.

His devotion to duty and capacity for unsparing hard work is worthy of emulation by all of us and he will be seriously missed.

Finally I must thank my fellow Directors for their wise guidance and help.

C. I. MACHIA,
Chairman.

Pollibetta,
30th December, 1960.

The Eastern Economist

JANUARY 20, 1961

The Economic Weather: January 1961

THE month of January is as good as any other for reading the economic signs; possibly better, because it opens a new calendar year. Not, indeed, that industrial fluctuations are any more related to the diurnal movements of the earth or to the far-fetched sun-spot theory of the ancient economic text-books. In India this particular January has been sanctified as a convenient date-line, because it has seen the finalisation of India's Draft Third Plan in a controversial National Development Council meeting and also a preview of the Aid-India Club meeting to be held in March. Mr. Joseph Rucinsky's helpful Press Conference on Tuesday and the indications that the Aid-India Club might give loans to cover some "maintenance" imports is at least in principle a departure large enough to cause optimism on the maintenance of organised production. The Press Conference was held at a time when the markets, for reasons not entirely clear, were displaying new signs of good cheer. Perhaps this is no more than what is called a technical correction, but the fact remains that, in spite of the fact that taxation was vigorously displayed in the meeting of the National Development Council, markets suddenly revived after the meeting and have stayed strong for five days.

Two major factors may explain current optimism. The first of these is the record of the economy in the last year, the best ever in India's economic history. It is now claimed that food-grains output will be in the region of 76 million tons, a million more than the first estimate, and optimism has carried over to the belief that performance being so good in the last year of the Second Five-Year Plan, the 100 million ton target at the end of the Third Plan is a clear probability. Secondly, the industrial sector under the stimulus of new steel, has displayed its highest rate of rise since Independence. Whether that rise is as high as 15 per cent or substantially less depends on which index one uses for this purpose. However, one need not deny that there have been spectacular rises in steel, paper, sugar and cement, all leading elements in strengthening the industrial picture. Not so happily there have been substantial bottlenecks in power, transport and coal, which hinder further advance. Nevertheless, any one who has looked at the record of the last year as a whole, as distinguished from the failure to work particular development programmes on schedule, must feel that the record has been remarkably good. It is as well that this is so, since the last year of the Plan has a strong psychological effect in regard to the measurement of performance of the Plan as a whole. Statistically, 1960-61 is just a year subject to variations of climate and accidental factors like any other, but observers abroad are optimistic in the view that the year 1960-61 has been a reflection of

India's planning effort. Judged by this standard, one might say that the Plan in its revised schedule has been fulfilled. Congratulations go to all those to whom this success is due.

What can be said on the outlook of the Third Five-Year Plan is very little, and is not assisted by the refined debate which took place in the National Development Council meetings on the 13th and 14th January on 'physical' and 'financial' targets of the Plan. The Government of India really seems to have two personalities, one of which is in strong sympathy with the States which insist that the 'physical' targets should not be cut down because of financial imperatives. The argument seems to be that, firstly the financial elements are unproved, and, to exclude a physical target on the ground that the finance is not currently available, may be in fact to prejudice what is intrinsically good and necessary. And nothing included in the Plan, including Calcutta (for which happily there is to be a project report prepared for inclusion in the first instance), has been cut down. The Finance Ministry has salved its conscience by the pretence (to rank it no more than that) that it has not lost ground because the resources figure of Rs. 7,500 crores for the public sector is not to be exceeded. In point of fact, once a project is under way, the financial element has to be underwritten whether it happens to be greater or less than the estimated figure. Therefore, the States have won and the financial pundits have lost in the first round of the debate. But the second round which is finding of resources will be a different matter, since neither the foreign exchange nor the rupee resources are currently available. A hard relentless master presides over both the Chief Ministers and the Finance Ministry. Again, in an election year neither is free to compel the production of resources from the sovereign master, the voter, who still is unable to recognise the inevitability of high taxation as a means of speedier development when prices are high.

All in all, one might argue that we still live in the best of all possible worlds. 1960-61 has been a year of remarkable success both in agriculture and in industry, notwithstanding the dramatic failures in transport and coal. Secondly, if one looks upon this year as the last year of the Second Plan, and a measure of its achievement in the revised form, one can proclaim success, notwithstanding the shortfall on steel. Thirdly, a fairly unanimous picture now emerges in regard to the obligations of the Third Five-Year Plan and the extent to which its priorities will decree progress. When resources are available, those priorities are for transport and fertilizers in the first instance, with steel, coal, and other "basic" industries following suit. Exactly where the social services come in the picture has

still to be determined. In this holiday mood, with the stock market registering optimism and the capital city displaying gaiety in anticipation of the visit of Queen Elizabeth, one might be dis-

posed to agree with the public and rest quietly content. It may be unsophisticated but who, knowing the tendencies of the dismal science to overweigh difficulties, will proclaim them wrong?

Eisenhower: The End of a Chapter

HOW does the Eisenhower Age, which came to a close yesterday, look in the eyes of the American people? The fact that Mr. Eisenhower was elected by large majorities to the presidency for two successive terms, the maximum permissible under the constitution, is in itself a reflection of the place the American people have given to his qualities of head and heart. It has been said, somewhat acidly, that he held the spotlight of popularity essentially by the qualities of heart. But the display of both always came in an ample measure when situations called for them. Mr. Eisenhower's eight years of presidency were, of course, not a phase of even popularity. It had its rising and declining curves, but the most outstanding fact about it was that, on the average, it always stood higher than the popularity of his two predecessors in office, President Truman and President Roosevelt. This is the outstanding conclusion which emerges from the three recent Gallup Polls on Mr. Eisenhower's eight years' record. President Roosevelt's average in the popularity poll ruled at 63 per cent, President Truman's at 46 per cent, but President Eisenhower's average rose above both these to reach 66 per cent.

It was undoubtedly the attraction of Mr. Eisenhower's personality, rather than the American public's switch-over in preference to the Republican Party, that a landslide victory in the presidential election of November 1952 swept him into power. During the eight years of his two terms, President Eisenhower maintained his popularity at a remarkable level never letting it dip below 49 per cent. The all-time low of 49 per cent was touched only once in April 1958. That was in the wake of America's first crisis of unemployment in twenty years. Barring this one occasion, Mr. Eisenhower's popularity index invariably showed that, even in weaker times, a minimum of more than half of his people acclaimed him as their popular President.

It would be well, first, to recount the low in President Eisenhower's popularity. As the first flush of enthusiasm over the elevation of the war hero to the highest executive office in the nation abated, reaction in the popular estimation showed itself by the downward curve in Mr. Eisenhower's popularity in the first year of his first term of

office. To add to this reaction came the first major post-war recession of 1954, which was reflected in a further loss of popularity. It touched the low point of 57 per cent. Something very much the same happened again soon after Mr. Eisenhower's election for a second term in November 1956. The first year of his second tenure — 1957 — saw the "battle of the budget" and the sharp differences in the Republican Party between Mr. Eisenhower and Mr. Taft. This cost the President a diminution in his popularity which again touched the low point of 57 per cent in that year. The lowest ever point of 49 per cent recorded in April 1958 on the score of unemployment has already been referred to. The major loss of popularity at the time is to be seen in the presidential election of November 1960, when it came down to 58 per cent.

The real index to Mr. Eisenhower's popularity is perhaps better seen in the peaks reached from time to time. In December 1953 his historic proposal to the United Nations for peaceful use of atomic energy suddenly carried the popularity curve to 68 per cent. In 1955, again at the Geneva Conference, Mr. Eisenhower's imaginative but dramatic proposal of 'open skies', to reduce international tensions, had a wonderful response in American opinion. His popularity, which, before Geneva, hovered around 69 per cent, shot up, after Geneva, to 79 per cent. That in itself was a very solid vote of confidence. This was paralleled by another record of 79 per cent immediately after the commencement of his second term of office in January 1957. The despatch of marines to Lebanon in the summer of 1958 raised the popularity index from 52 per cent to 58 per cent. There was yet another upswing in the President's popularity which came in the wake of his goodwill tour of 11 nations. It carried the curve to 70 per cent in January 1960.

It is characteristic of the frank nature of the American people that they do not allow judgment to be blurred by sentiment. While 20 per cent voted that he would go down in his ory as a "Great President", 25 per cent voted for his place as a "Fair President," but the majority of 45 per cent assessed him as a "Good President." As a "Good President" he leaves office with sincere good wishes for all the world.

Stringency and Interest Rates

THE Reserve Bank of India on January 12 decided to revoke its earlier directives regarding impounding of additional deposits. Not only were the deposits impounded with the Reserve Bank of India to be released but all further impounding of deposits was also abolished. This dramatic decision was virtually forced on the Reserve Bank because of the acute demand for funds in the current busy season which has been described as "busier" than the last year.

That the pressure of demand for credit was steadily growing was evident even in the month of December. In the second week of December, 1960, the volume of borrowings of the scheduled banks from the Reserve Bank of India at Rs. 20 crores was nearly three times the borrowings in the corresponding week a year ago. The latest

return, for the first week of January 1961, shows that the total borrowings of the scheduled banks from the Reserve Bank at Rs. 53.45 crores were more than double of the corresponding borrowings a year earlier. Another measure of stringency, namely, the ratio of bank credit to total deposits has also shown almost 10 per cent rise as compared to last year. In the first week of January, 1960, the ratio of bank credit to total aggregate deposits was 54.5 per cent as against the present level of 63.7 per cent. During the last twelve months, the total volume of credit has expanded by nearly 200 crores of rupees while deposits have risen by not more than 50 crores of rupees. Thus, all the main indicators of the banking system reveal that by the end of the last year, the pressure of demand on funds was such that the banks

were forced to borrow from the Reserve Bank even at the penal rate of interest of 6 per cent. There is also proof that this has happened in the case of about 10 crores of rupees borrowed by the scheduled banks from the Reserve Bank in recent weeks. If the banks are forced to borrow at 6 per cent, it is but natural that they should demand 6½ to 7 per cent from industry and trade which fact again is instrumental in encouraging the interest rates to rise—a situation which is hardly in the interest of the economy.

The Central Budget which is to be presented within the next six weeks, and the State Budgets which will all be presented within the next quarter, will have to rely upon market borrowings to a large extent in order to finance the capital expenditure. Will it be possible for the Centre as well as for States to borrow money at 4 or 4½ per cent when the scheduled banks are being forced to pay 6 per cent to the Reserve Bank? This dear money policy is likely to undermine the fiscal operations planned both for the revenue and the capital budgets. The latest move of revoking the

monetary restrictions will at best make available 15 crores of rupees to the banking system and will not be sufficient to meet the present pressure. What are the concrete steps which the Reserve Bank proposes to take in order to meet this stringency? If the inflated Third Five-Year Plan is to go through successfully and the first year of the Third Plan is to meet both its financial and physical targets, the Reserve Bank must take certain vital decisions quickly so as not to lose any time. At this moment the industry and trade cannot be starved of funds. If the new equipment and plants which have been installed are to operate to their full capacity and also, if the new floatations are not to be throttled before birth, the Reserve Bank must relax all its controls and restrictions and institute an easier money policy for encouraging expansion of the economy unhindered. Already there is evidence that the failure of a few banks in the past few months has shaken the confidence of the people in the banking system and the pace of rise in deposits has considerably slowed down in relation to the increases recorded in the three year period 1957-59.

Self-sufficiency in Oil?

TALKING about the economic progress that India is making, the Prime Minister sometimes works more on national, and nationalistic, psychology than on the facts. A case in point is his last week's address to the National Development Council in which he said that we would achieve near-self-sufficiency in oil by the beginning of the Fourth Five-Year Plan. He did not clarify whether he was referring to crude oil output or the production of petroleum products. But from whichever angle one views this problem, one can scarcely share his optimism, notwithstanding the fact that this country has made commendable progress in this field during the past few years.

Expert estimates put our demand for crude oil around 14 million tons by 1965-66. Of this, we produce at present only about 400,000 tons. The rich oilfields of Nahorkatiya-Hugrijan and Moran, in Assam—which, according to the latest estimates, have reserves to the tune of about 40 million tons of crude—are not expected to yield more than 2.75 million tons per annum during the Third Plan period. Even if exploitation of the oil reserves of this area is intensified, annual output is not expected to exceed 4 million tons which is the maximum capacity, after expansion, of the pipeline that is being laid to connect these oilfields with the proposed refineries at Nunmati and Barauni.

From where are the rest of the supplies — nearly 10 million tons of crude — to come? The Cambay and Ankleshwar oilfields, where prospecting so far has yielded very encouraging results, hold promise to supply good quantities of crude oil. But it is extremely unlikely that these two oilfields would be able to make good the entire balance of 10 million tons of crude per annum; the total reserves of these oilfields have yet to be estimated. Oil prospecting being a very uncertain business, it would be hazardous to base our calculations on mere possibilities of striking oil in areas like Sibsagar, Punjab, Kutch, Rajasthan, Bengal Basin, East and West Coasts, Andaman Islands and Ganga Valley which are supposed to contain "black gold" in their bowels. Even if oil is struck at any of these places in the near future — the possibility of this, however, cannot be rated high in view of the deficiency which we have in oil prospecting machinery — it is very unlikely that exploitation of the possible oil reserves in

these areas would be undertaken in the next five or six years. India, thus, can hardly be expected to become self-sufficient in crude oil by the end of the next Plan period. More so, if account is taken of the fact that growing realisation of further development of road transport will entail greater demand for oil.

If the physical and natural limitations will thwart our dreams of becoming self-sufficient in crude oil by the end of the next Plan, foreign exchange difficulties may stand in the way of our achieving self-sufficiency in petroleum products, even if manufactured from imported crude. The setting up of the two refineries at Nunmati and Barauni will increase our refining capacity to about 8 million tons. Another two million tons capacity might be available if the contemplated refineries at Cambay and in the South mature. This will leave a gap of nearly 3.5 million tons in capacity, presuming that about 5 per cent wastage is involved in refining of crude oil. One wonders why, in the circumstances, the existing refineries are not being allowed to expand their capacity?

Another aspect of the oil business which need be stressed is the manufacture of oil drilling and refinery machinery. We have yet to make a start in this respect, and unless we begin producing this equipment ourselves, in view of our foreign exchange limitations, we can hardly intensify our efforts in oil prospecting and refining. The need for intensification of efforts in this direction, of course, can be scarcely over-emphasized. Import of crude oil and petroleum products is a heavy drain on our foreign exchange resources and it will only grow with the increasing tempo of industrialisation. Mr. K. D. Malaviya has made a good beginning in exploration, but one wonders whether he is wise to underestimate the difficulties ahead and to lead the Prime Minister to do likewise. This is the time for imaginative partnership with all units which can assist us to promote the national interest. The national interest is not to be identified with a monopoly of the Oil and Natural Gas Commission or a Ministry of Fuel determined on aggrandisement of its particular role in India's oil development. When will there be a recognition that India's thinking here must be pragmatic, not ideological and wishful?

A DELHI DIARY

INDIA'S SPLIT PERSONALITY

I HAVE constantly heard in Delhi whispers that India has a split personality. "The Eastern Economist" would, perhaps, say that this is largely connected with the old and the new — the conflict between the hard crust of custom and the unknown frontier in technological development and economic progress which we are still exploring. But whether or not the "split" comes from these historical forces, its expression, at least in Delhi, appears currently to be unusual. I saw it in operation at the meetings of the National Development Council on the 13th and 14th January; I have kept asking myself the question whether or not there is not hidden in the womb of time a major source of difference between the States and the Centre at the moment plans are on the anvil. This is really a reflection of India's split personality. The States seem to have different interests at the present time from the Centre. I think one of the most interesting projects for both political and economic research is an analysis of the character of these differences. Since, however, it is the function of a journalist to anticipate research (and even the facts!) I might declare myself at once on the points at issue.

PHYSICAL OR FINANCIAL TARGETS?

In the first place, let me state the central difference. This is that the States' Chief Ministers were not in agreement with the Centre (Mr. Morarji Desai, this time) in regard to the cutting down of the Plan in order to meet the "limit" of financial resources. Everyone knows that a Plan is a Procrustean bed; one has either to extend the financial targets (always underestimated) in relation to jobs proposed, or one has to cut physical targets in order to meet a financial ceiling. During the Second Five-Year Plan we saw, by turn, both operations. At the beginning of the Plan the financial targets were raised to accommodate the physical targets; in the middle when the foreign exchange crisis arrived—it has stayed ever since—it was the opposite operation, cutting off what were believed to be frills, leaving what is known (not very respectfully) as "the hard core". Since in the Third Plan, we have started with a desperate foreign exchange crisis and the hard core is no longer fashionable, the debate has been resumed on the level of an agreement to disagree with no unpleasant references to hard cores. At least I have heard of no hard core—yet.

The substance of the agreement is to the effect that the Centre is not committed to accept more than Rs. 7,500 crores in the public sector, but the States are free to make physical targets which at present add up to Rs. 8,000 crores, and, if estimation is as bad as in the Second Plan, probably Rs. 9,000 crores. Instead of trying to argue the nice point as to how little capital can be used by using what is called work study — on which I shall say more in due course in these pages one day — the fact remains that nobody has any evidence as to how this particular difference will end. I am, therefore, cagily reserving opinion as to whether or not the States or the Centre is likely to prove right in its assumptions. As in the law of perjury all I need to say is one or other must be proved wrong. But the fact of the difference is significant. At no previous meeting of the National Development Council was there a tussle for seven hours to find a magic formula for an agreement between the States and the Centre. In no previous National Development Council meeting was a committee of four Chief Ministers — the emerging shadow Cabinet of the States? — set up to discuss how to obtain their point of view instead of dutifully signing on the Centre's dotted line. The beginning of the conflict between the Centre and the States (referred

to in "The Eastern Economist" Annual Number?) might possibly be seen in embryo in these proceedings.

I am at a loss to understand as to how this has suddenly come about. A sophisticated friend tells me, winking slyly that it is all the 1962 General Election in which the States are much more involved. Some of them — dare I say Dr. B. C. Roy, in particular, — are deeply concerned about winning the election on a bold and big plan for employment. The Centre is pretty secure because the Congress Party in the Lok Sabha, which is certain to arrive with a majority, has no major fear in the elections, although it pretends to operate under the compulsion of popular opinion. The Centre, on the other hand, has very important responsibilities in regard to financial matters such as the control of prices and the raising of both Central taxation and loans, which make it necessary for it to be "moderate" in regard to the financial resources which are to be extracted from the "system." There is, therefore, a nice debate between the forces of political expediency and economic moderation. In the result it would seem to me that political expediency has won the day because nobody — as I believe, was hinted after the National Development Council meeting was over — believes that, once projects are included, they will grind to a halt, half-finished. May I, therefore, draw a corollary to the effect that the Indian system is much more a political than an economic one, and that, if the science is still political economy, the emphasis is very much on its Christian name!

GENTLEMEN: THE QUEEN

I would not have believed it possible that Republican India could have worked itself up into so much excitement in preparation for the visit of the Queen tomorrow. The front pages of the newspapers are already telling a widely interested public about the grand memories it raises. For example, Shri Ibrahim Khan — if he will so permit me to address him — is very much in the news because fifty years ago, he served the Queen's grandfather, King George V, as a bearer during the Coronation. 'Bade Miyan' they say, is 76 years old, but has been strongly recommended for service tomorrow. Apparently he has to be given a personal interview, and all Delhi is waiting to see if he is to obtain his heart's desire.

Meanwhile, the traffic arrangements continue with a lavishness of personnel which is truly embarrassing to those who were told that simplicity is to be the keynote of the visit. I have seen rehearsals go on each morning and have noticed the distance between policeman and policeman becoming shorter each day; or am I mistaken? Have we not learnt the lesson that one of the ways of creating confusion is to have too many men on a job? Of course, one can have too few, as we found on Thursday when there was a traffic jam in Connaught Circus; we discovered that it was due not to the Delhi Police or even the military police — as it was on the famous occasion at Tilpat, five years ago—but to a failure of the traffic lights. An irreverent observation heard at the time was that Delhi's traffic lights have been able to do what was expected only from the Queen.

One thing is certain that the traffic jam tomorrow is going to be the greatest ever. So indeed, will be what is now described as the 'vast ocean' of humanity which is coming in for Republic Day. We have now graduated from crowds to 'seas' and from 'seas' to 'oceans'. An ocean, I might say, is currently represented by a figure of five million people!

ARGUS.

THE WEEK'S NOTES

Congo

CLAMOUR FOR MR. DAYAL'S RECALL

THE DEMAND, contained in a letter sent on 14th January, 1961, by President Kasavubu to Mr. Hammerskjöld, for the recall of Mr. Rajeshwar Dayal, the U.N. Secretary-General's Special Representative in the Congo, should be reviewed against the fact that Mr. Dayal was not accredited to the Congo Government, but was acting as a local executive to Mr. Hammerskjöld, who had been charged with the mandate by the Security Council and the U.N. General Assembly in accordance with Article 101 of the Charter. Further, Article 100 states that the Secretary-General should not seek or receive instructions from any Government, and members should not seek to influence him in the discharge of his responsibilities. And Mr. Hammerskjöld has rightly replied that Mr. Kasavubu had no locus standi to demand his recall. He rejected out of hand Mr. Kasavubu's allegation charging Mr. Dayal with partiality and partial responsibility for the U.N. failure to maintain law and order in Congo. Mr. Hammerskjöld made it clear that Mr. Dayal was not a diplomatic representative accredited to the Republic of the Congo and could not be subject to a declaration that he was persona non grata with the effect generally given to that term in diplomatic practice. In upholding Mr. Dayal's fearless role in Congo, Mr. Hammerskjöld also upheld the rights and dignity of the United Nations.

Mr. Dayal, who succeeded Dr. Bunche in the admittedly thankless job of supervising U.N. operations in the Congo, is certainly not, as some observers have suggested, a sinister figure plotting simply to bring Mr. Lumumba back to power. He is an able, conscientious civil servant and is doing his best to steer a neutral course between contending political factions and to preserve constitutional and legal proprieties in the quicksands of political instability, which are largely the creation of the leaders of Congo. He is firm and consistent in his advocacy of recalling the Congolese parliament so that a form of representative government is restored in Leopoldville. It was outside his mandate to take sides or intervene by disarming the "rebellious bands of Gizenga and Lundula," as suggested by Mr. Kasavubu, without fresh instructions from the Security Council. The only sane course for all concerned is to further strengthen the U.N. Supervisory Commission and to make the Congolese people see clearly what the U.N. is striving to achieve and how Mr. Dayal is pursuing his job to that end. The other nations should also try to see what the U.N. is trying to do in Congo and in what a delicate and difficult position Mr. Dayal has to function. Mr. Hammerskjöld had no course left open to himself but to take a serious view of Mr. Kasavubu's tactics in pressing for the recall of Mr. Dayal. The correspondence between the Congolese President and the Secretary-General has been the subject of considerable comment among political observers. The final effect of this unhappy episode cannot but be derogatory to the status of Mr. Kasavubu as President, but it will at least have served the purpose of vindicating the impartial role of the United Nations.

Sino-Indian Border

CHINA'S INTRANSIGENCE

THE CONCERN expressed in New Delhi over the reported agreements between the People's Republic of China and Pakistan on demarcation of Sino-Pakistan border would be widely shared by the Indian people. China has no common border with Pakistan except in occupied Kashmir. It is, therefore, intriguing indeed that having never before supported the claim of Pakistan over Kashmir, China should have come to an

understanding with her on demarcation of the border which actually belongs to us. The obvious intention of the Chinese Republic in coming to this understanding with Pakistan is to embarrass this country.

Pakistan on her part has come to an understanding with China apparently for the reason that she wants a de facto recognition of her claim over Kashmir. The Communist world as such, under the leadership of the Soviet Union, has not so far accorded to her the recognition she has been desiring to have in this matter. Pakistan's this overture to China incidentally reveals the true intentions why she joined the SEATO which professedly was formed to check the growth of Communist influence in the Far East. Pakistan's refusal to participate in the recent Manila Conference, sponsored by the Philippines to draw up a policy to meet the Chinese menace in South-East Asia, read in this context is quite meaningful. Have China and Pakistan come to some understanding to alienate India with which both have differences?

Prime Minister Nehru in his Press Conference on Wednesday asserted that the detailed examination of the Sino-Indian border issue at the recent Rangoon talks has upheld the correctness of our stand and that the more the Government of India thought of the dispute, the more it became firm in its conviction that the disputed territory belongs to this country. If China has refused to be convinced of this fact and has dragged on negotiations, is it not time that we should think of other measures to get the aggression vacated? The Congress Party at its Bhavnagar session has resolved that all steps will be taken to get back the Indian territory forcibly occupied by China. It is hoped this solemn promise of the party in power will be redeemed through solid action.

Political Tenures

TEN-YEAR LIMIT

MR. SANJIVA REDDY'S suggestion in his Presidential address to the 66th session of the Indian National Congress that those Congressmen who have held Governmental office for ten or more consecutive years should now retire has come as a red rag to the bull. The suggestion will be discussed by the new Congress Working Committee early in February this year. Since Mr. Reddy made this suggestion, Congressmen have tended not to discuss it publicly; but privately, they have been discussing little else. Though the rank and file has welcomed it, it has not proved popular among Congress leaders. They fear that the implementation of the suggestion would weaken the organisation, for its implementation would involve entry of "new and inexperienced people" in the entire Central Cabinet, except Mr. V. K. Krishna Menon, Mr. S. K. Patil and Mr. Asoke Sen. Mr. Reddy's suggestion has already emptied the Prime Minister. What view the Congress Working Committee will eventually take of his suggestion would only be known in due course of time, but all indications point to the possibility that the suggestion would not be implemented.

Whatever the fate of the Congress President's suggestion that the people in power for ten years or more should step down in favour of "fresh blood", the implications and the thoughts that went behind this suggestion are worthy of taking note. The power, prestige and patronage that go with office have assumed such proportions in the past ten years that it is only but natural for those kept out of the seats of power to seek removal of their occupants or acquire a share in the exercise of power their only occupation. By the same token, those who have got in are reluctant to give up office and power — and, it is only human. Mr. Reddy's suggestion amounts to giving up power and

office voluntarily so that Congressmen devote themselves to nation-building work while giving opportunities to younger men to run the Government. The idea is good and noble; but as with so many noble ideas, it is difficult, if not impossible, to implement without the master mind of a great leader like Mahatma Gandhi.

Textile Target

RESPONSIBILITY ABDICATED

IT IS A pity that the Cotton Textiles Consultative Board, which met in Bombay last week to consider the question of reallocation of targets for the different sectors of the textile industry in the Third Plan, did not arrive at any decision, especially as the National Development Council was stated to finalise the plan a few days later. The Board has, in a way, abdicated its responsibility. The excuse that a proper assessment of the need for early decision in regard to the one vital sector of the economy which must needs be relied upon most to counter the inflationary consequences of an ambitious Plan by producing more cloth. Surely, if the Board wanted to decide, there were a number of other factors, such as the probable increase in population during the Third Plan period, the non-availability of a wholly dependable trend in cloth consumption, and the likely extent of the general rise in prices following a large outlay, which could have been considered to enable it to take a workable decision. As it is, the total output in the country is only 7,500 million yards, made up of 5,000 million yards of mill cloth, about 2,000 million yards of handloom cloth and 500 million yards of Khadi and cloth produced by power-looms. According to the draft outline of the Third Plan, however, the target has been provisionally fixed at 9,300 million yards, while the Indian Cotton Mills' Federation has suggested a higher figure still of 9,600 million yards, after making due allowances for an export of the order of 800 million yards. Incidentally, this quantity falls woefully short of the minimum limit of production for export recently prescribed by the Union Minister for Commerce and Industry, who wants all industries to earmark atleast 25 per cent of their respective outputs for export.

Be that as it may, the problem bothering powers-that-be today does not seem to be one of augmenting production on a realistic basis as the situation demands, but of how to allocate the additional production of 1800 million yards, already assumed, among the various sectors of the industry on a preconceived pattern. Now, each sector has put forward its claim for additional quota on the basis of its performances in the past, actual in some cases, imaginary in some, and anticipated in yet others. But, taking only facts into consideration, there should be no difficulty in taking a dispassionate decision. In this connection, it will be remembered, the mill industry has all along been urging that its share should be at least 6,300 million yards, as against 5,800 million yards. The industry has the capacity successfully to undertake this expansion. The handloom interests, on the other hand, have been pointing out that not only should the output of mill cloth be pegged at 5,000 million yards but the powerloom sector also should not be allowed to expand any further, without, at the same time, giving any definite assurance, and certainly no indications so far, that it will be able to produce all that it claims for its share. It is, to say the least, the attitude of a dog in the manger.

Judging from the past performances of the mill sector as well as the decentralised sector, one is left with no choice other than that of allotting a much larger share to the mill sector and insisting on a definite increase in the efficiency of the handlooms. An unduly large quota out of the additional cloth output required to the handloom sector would result in a costlier cloth budget to the average consumer, whether he goes in for handloom cloth, by reason of its relative inefficiency, or mill-made cloth because the mill industry is likely to be asked to bear more duty in the years to come to find finances for the Plan and so its cost of production will rise in the process. If the State wants to afford protection to the handloom industry let it do so by all means, but not by handicapping the other sectors of the industry and holding the whole country to ransom. The State should assist these sectors in every possible way so as to ensure the fullest possible use of the installed capacity of each of them. Only the latter consideration could be the basis of any sensible and sound cloth policy for the Third Plan period.

Jute

— an industry on the march

Long regarded as the cheapest heavy-duty packaging material, jute is today claiming attention as a fabric with greater possibilities and wider applications.

Laminated with paper or plastic, jute fabrics provide moisture-proof containers for fine or high-grade products. Treated with chemicals, they offer protection against rot, mildew, corrosion and attack by rodents and insects. Scientific experiments have resulted in the production of a hessian membrane for water-proof roofing...hessian in combination with asphalt is finding increasing favour as a material for

canal-lining and a moisture barrier.

These and other discoveries which have dramatically widened the scope of jute usage, stem from the fundamental and applied research carried out at the Indian Jute Mills Association's Research Institute in Calcutta. Side by side, the Institute of Jute Technology—financed by the IJMA—provides facilities for training young men for important supervisory positions in jute mills.

Founded in 1884, the Indian Jute Mills Association seeks to serve India's vital jute industry in ever-increasing measure.

*opportunity
for those
that take it*

AN important feature of the educational facilities at Jamshedpur is the leisure-time training of employees. Instruction provided, after hours, helps steelmen like J. P. Pathak to acquire wider knowledge and new skills.

Pathak, who started his career in Tata Steel as an office boy in 1929, passed his matriculation examination from the Company night school in 1944. Pathak next took up an evening course in basic mechanical drawing at the Jamshedpur Technical Institute. In 1957, he was selected for overseas training, and went to Canada, the U.S.A., West Germany and Holland, to learn techniques of

operating a sinter plant. Today, Pathak is operator-in-charge of the sinter plant added under the two million ton expansion programme.

Notwithstanding initial handicaps, enterprising men like Pathak have the opportunity to better their prospects through further education and training at Jamshedpur, where industry is not merely a source of livelihood but a way of life.

RELIGION AND INDUSTRY

By

ODYSSEUS

THE INDIFFERENCE of ordinary men and women to religion in industrialized countries, and their increasing indifference in industrializing countries, is often deplored.

In my recent tour of Germany, I came across a group of religious leaders who, instead of deploring, were actively doing something about this indifference.

I was invited to take part in an Anglo-German conference on the problems of the relationships that ought to be established between the European Economic Community, the European Free Trade Association, and the rest of the world. It was organized by the Evangelical Academy at the village of Loccum, not far from Hanover. To understand how a conference of economists, businessmen, publicists, and financial journalists was held under the auspices of a church, one needs to recall that one of the reproaches made against the German churches, not only by the outside world, but by many Germans themselves, was that Hitler was able to establish his bloodstained dictatorship only because men of conscience weakly acquiesced. After Hitler's downfall, therefore, many German Christian leaders felt that their churches ought to play a full part in public and political life. They thought that while the Churches had fulfilled their mission in colouring the thoughts and actions of all men in the centuries of mediaeval Christianity, they had thereafter gradually retired into ivory towers, ever more out of touch with contemporary life. They felt that Christianity had shrunk to narrow circles in local parishes, and no longer influenced the consciences of men absorbed in industry, commerce, and politics.

GERMANY'S EVANGELICAL ACADEMIES

The leaders of the Evangelical Church therefore conceived the idea of Academies, or study centres, in each German province, at which different groups could discuss their vocational problems, and which would provide centres of contact for the churches with those people who had become indifferent to religion. They did not want clergymen to attempt the impossible task of briefing themselves on contemporary problems and then preaching sermons to professional groups. They wanted every kind of worker and professional man and woman to meet in groups to discuss their particular vocational problems freely between Christian and non-Christian speakers.

The first two conferences were wholly successful. Although a few trade union leaders turned up out of politeness, the conference participants were mostly active Christians who monopolized the discussions among themselves. This was because invitations to the conferences had been sent through the local parish churches. Those who accepted represented only a minority, traditional in outlook. They did not represent the average man or woman, who scarcely ever went to church, except to be baptized, married, or buried. Little beyond polite platitudes emerged from these conferences. The Evangelical leaders digested the lesson. Ever

since, they have organized their conferences with the help of non-religious bodies—associations of employers, teachers, doctors, industrialists, businessmen, trade unionists, and others, which have themselves chosen and invited the participants.

Postwar Germany has one of the world's lowest records in industrial disputes. Various factors have brought this about, including the moderate attitude of the trade unions and their strict control over strikes. But the eighteen Evangelical Academies can claim to have made their contribution, because they have made special efforts to bring employers and workers together in innumerable conferences to study human relationships in industry. Participants in these conferences are chosen by joint consultations of the unions and the managements of the industrial firms concerned. The invitations are sent by the unions. The managements meet the cost of the conference and pay full compensation to workers for wages lost while attending. In the course of the years the industrial conferences have become more and more diversified, covering workers from many industries and firms, apprentices, engineers, secretaries, and industrial leaders.

These conferences last three or four days. There is a morning, an afternoon, and sometimes an evening session. One or two authorities on the subject begin each session with a 15 or 20 minute lecture. Thereafter, the discussion is open to everyone. The Academies urge all to speak with complete frankness and discussions have, on occasion, become heated. If so, the Academies rejoice! Because what, above all, they seek to avoid is the exchange of compliments and innocuous views. Only by honest controversy can opposing attitudes be brought out into the open, constructive thinking be induced, social tensions relieved, and the truth emerge.

Out of these conferences, many new friendships have been formed. Participants go back to their factories, offices, schools, or other places of work, and many form permanent local groups to keep abreast of new developments.

WHERE DO SPIRITUAL VALUES COME IN?

But, you may object, admirable though all this may be, do these conferences not end as they began—mere assemblies of industrial or professional workers anxious to study material problems? Where do spiritual values come in?

Each conference day begins and ends with an hour's prayer and a short address by the Academy's pastor, in which he picks out the spiritual issues at stake in the material problems discussed. The Academies seek to link the practical problems of contemporary life to eternal verities. Their pastors have quitted the cloistered seclusion of their parish pulpits to listen to what contemporary men and women have to tell them. In these conferences, pastors and the minority of active

Christians, learn at first hand the frustrations, anxieties, doubts, and difficulties of ordinary men and women who are indifferent to religion. You can't answer back the preacher in his pulpit. Without interruption, he can sermonize along the lines that satisfy him. But in the Academy conferences, his faith and his values are challenged, and he is forced to apply them to the practical needs of the participants.

The extent to which the Christian leaders in the Academy conferences succeed in their aim is difficult to evaluate in objective terms. I can only report that I was impressed by the atmosphere—serious, sincere, frank, friendly—of the conference which I attended. The eighteen Academies hold 700 conferences a year, to which there come between 40,000 and 50,000 men and women. The difficulty of the organizers is not to fill up empty places but to squeeze in all who want to come. Attendance at the daily prayer meeting is voluntary but the overwhelming majority of participants turn up.

What happens to the participants when they leave? Do they become regular church goers? In the fifteen years since the Academies have been started, they have established new contacts with some 700,000 people previously indifferent to religion. In general, the Evangelical Church does not seek to persuade these people to attend their local church. The Church's existing congregations consist of faithful church members who have very different spiritual interests, and a much higher degree of religious education, than the average conference participant who is only beginning to have contact with the Church. The Academies believe that

it would be basically wrong to try to draw the newcomers into old established church circles immediately after the first contact has been made. Human beings only feel at home in groups whose spiritual climate resembles their own.

The Academies therefore try to create new groups which can slowly be led towards the already established church institutions. They do so, first, by following up a conference with study groups organized through the professional bodies, trade unions, or firms, which have attended it. The Protestant Action Committee for Workers' Questions tries to find suitable pastors to co-operate in these professionally organized groups. Secondly, an Academy may arrange for conferences with various professional groups inside a particular area or community. These conferences are initiated by full-time Academy workers, but as time goes on, the work is increasingly taken over by the pastors in the area. In this way, the Academies seek to develop a new form of parish work which is in constant touch with the professional and industrial worlds. The Church's long-term aim is to persuade as many parish pastors as possible to assume charge of local professional study groups in addition to their normal parish work. This, it is hoped, will promote increasingly close contacts between professional groups and parish churches.

Does Gokhale's Servants of India Society still exist? Has it ever thought of studying the problems of the jute mills of Bengal, the steel workers of Jamshedpur, the civil servants of New Delhi, or the minority linguistic communities? And doing something about them?

BELGIUM AND THE COLONIAL FALLACY

From Our Special West European Correspondent

PARIS, January 14.

THE month-long general strike in the French-speaking part of Belgium (in the Flemish-speaking part, only the port of Antwerp was affected) coincided with the climax of the debate in France about the future of Algeria, connected with the January referendum. This coincidence was the occasion for resuscitation of a Big Lie, a really big lie which we shall call the colonial fallacy. In its simplest form, this fallacy asserts that colonialism benefits all classes in the imperialist nation, including the working class and others who claim to have clean hands when imperialism is impeached; and therefore the loss of profitable colonies must inevitably be translated into a lowering of living standards for the whole of the nation. This dogma would be unimportant if it were put about only by those who have, in the present case in France, revived it with the Belgian "lesson" in view: namely, certain colonial interests who will resort to any argument to secure the help of other classes in the defence of their privileged position in colonial economies. In fact, it is also put about, in different terms, by very different interests such as the Communists, and it is accepted by many people in present or former European colonies.

The owners of colonial capital use the colonial fallacy to argue that if their working class wishes to preserve its current high living standards then it must co-operate in the preservation of the colonies. Thus (and this is the topical version of the case here) the French workers must help keep Algeria French and, above all, safeguard French hegemony over the Sahara which has been discovered to contain immense oil deposits. If it declines to "shoulder its national responsibilities" when imperialist interests are in jeopardy, then it must bow before "inevitable economic laws" such as are, it is alleged, now being verified in Belgium where the loss of the Congo was followed, as night follows day, by an austerity programme that drove the trade unions to revolt before the prospect of lower living standards.

The Communist presentation of the fallacy differs only in detail, invoking the highly dubious authority of Lenin. Colonialism consists, on this view, in the exploitation of one economy by another, and if it is a case of profitable colonialism then all the factors in the first economy benefit. That is, for example, British domination of the Indian economy not only produced the Nabob fortunes but was an important element in the growth of the whole British economy and, consequently, in the progress of the living standards of the British workers. Go a little further along this line and you reach the caricature of Marxism where one talks of "proletarian nations" and of imperialism as a "necessary stage" in the evolution of capitalism. Believers are, of course, immune to argument, such as the thoroughly documented work of British economists in recent years showing that imperialism caused an uneconomic diversion of capital which, invested at home, would have benefited all classes much more, and saved Britain from the obsolescence of her industry in relation to non-imperialist economies like Germany and the USA. At all events, the Communists agree with the colonialist interests that the liberation of colonies inevitably causes great damage to the whole imperialist economy, so much so that it might produce situations favourable to revolution. At the very least, the working class has to resort to violence, as lately in Belgium, to ensure that the inevitable losses are not passed off entirely on to its shoulders.

In general, I think that this argument, in any of its many variations, is worthless. Imperialism remains a subterfuge whereby certain interests (which are not only capitalist, but military and administrative) extort money and prestige from other interests in the same nation, in the name of imperial glory—and those other interests are not only proletarian, but other capitalists and specifically the most progressive and technologically-minded of them. Incidentally, colonial enterprise gravely disorganises the colonised economy, not so much by exploitation (which is rife in backward economies anyhow) as by completely destroying its balance and wiping out its traditional crafts. However, the general case is not in point here so much as the demonstration that the colonial fallacy can provide no explanation for the recent serious troubles in Belgium; specifically, the loss of the Congo has precious little to do with the Belgian crisis.

The demonstration can be quite succinct because the figures speak for themselves. The Congo represented about 5 per cent of the Belgian national income, 3 per cent of exports, 5 per cent of imports, directly employed about 1 per cent of the population and brought in certain hard currency earnings that were useful in the days of the dollar shortage. These figures are all quite small, considering that an annual increase of 5 per cent in national income would be perfectly normal in West Europe today where all national economies have done much better in one year or the other and sometimes year in and year out. Moreover, since the Common Market got under way increases of 5 per cent in foreign trade would be well below the average. In other words, if the Belgian economy were in phase with the tempo of expansion of her neighbours and partners, the consequences of total loss of the Congo could be wiped out in a year or two. And, in fact, the "austerity" law introduced by the Government and which touched off the strike was actually a plan to promote investments and plausibly forecast an expansion of 4 per cent in national revenue in the first year.

So the Congo fiasco would have had no other impact on a normally dynamic economy than to cause a temporarily awkward redeployment of resources even if (a) the economic bonds with the Congo had been severed totally and (b) the shock of this had been concentrated in one year. Neither of these was the case. The Congo today is in a fine mess, for which the Belgians themselves are in part responsible, but it has by no means cut adrift from the Belgian economy. Katanga, the insecure preserve of M. Tshombe, has always accounted for 70 per cent of the ex-colony's production and it is still closely connected with Belgian interests, thanks to the Angola railway. This situation might not endure, but it is clear that the full impact of the loss of the Congo (which would have the percentage results referred to above) has not yet been felt and may never be; so it could not explain developments in Belgium. Such loss as is suffered has been, and will be, spread out over a few years, thus becoming all the easier to bear. For example, the foreign exchange earnings of Congolese minerals ceased to go into Belgian trade accounts years ago when the territory got its own central bank with its own exchange reserves. The capital losses were being gradually written off by the Brussels Bourse for more than a year before independence. And so on. The story that Belgium suffered a cataclysmic loss that was concentrated into the last six months of 1960, and that this led to workers' revolt before the prospect of lower living standards, will not stand an instant's examination.

Belgium is indeed going through a critical stage of economic reorganization, in which, however, the role of colonial enterprise is entirely unimportant. The most that can be said is that the Congo imbroglio and the subsequent national humiliation have helped destroy the credit of the Government just when it most needed popular support to put through a reform that included (precisely as similar reforms in France, Spain and West Germany in recent years) some diversion of resources from consumption and welfare to investment.

The important figures about the Belgian economy have nothing to do with the Congo but are these: the country has the slowest growth rate in the Common Market (up to 30 per cent in 10 years compared with 100 per cent in France and 200 per cent in West Germany); the population is aging and its economically active proportion is only 60 per cent against 71 per cent in France; its traditional industries are coal and textiles, both threatened by world-wide excesses; investments are the lowest in West Europe whereas the national debt, per head, is the highest—i.e., fresh capital has been going into securities rather than into industrial ventures. In these unfavourable circumstances, highly centralised Belgian labour unions have worked hand in glove with even more highly centralised Belgian capital to build a cosily feathered welfare State that was not financed by taxes but by budget deficits covered by public borrowing.

This suicidal policy has been practised in the name of "social harmony," which means collusion between conservative socialists and indolent capitalists. A typical example has been mentioned on this page several times before: the Borinage coalfields which have no

business to be in production in an age of surplus energy but which were kept open with lavish subsidies because the employers could not offer alternative jobs. When the coal glut made this fools' paradise unworkable two years ago, the workers rioted savagely and the employers asked for bigger and bigger subsidies—they are now getting them from the European Coal and Steel Pool. To imagine the condition into which Belgium had complacently subsided, you must picture British capitalism as it was 100 years ago, based on coal and textiles, trying to support the British welfare State as it is today—and without anyone paying taxes in proportion. Obviously this could not last and the thing that would knock the bottom out of it fastest was the keener competition of the Common Market.

The Eyskens Government has been toying gingerly with an economic reform since 1958, i.e., before the independence of the Congo had been mentioned. It has held off both because of resistance from unenterprising capitalists, whose Liberal Party is necessary to the Christian Democrat coalition, and because of reluctance to accept the cost of welfare on the part of the trade unions. This plan has at last been produced, and in the event it turns out to be insufficiently severe, and much less severe than the 1958 reform in France. The divorce between bourgeois socialists and subsidised capitalists when asked to face the facts is all the more noisy because they have been working hand in hand for years past, at the expense of the State. In this picture, the place of the Congo is quite accessory. The reckless exploitation of Congo minerals was just part of the paternalistic rentier mentality that dominated in Belgium. The shock of the loss of the Congo is just part of Belgium's re-awakening to the 20th century.

SHAPING INDUSTRIAL PROGRESS

Cooper Engineering Limited has been making machine tools for over 20 years, keeping abreast of the rising need for more Machine Tools—Shaping, Slotting and Planing machines. Cooper has set up a complete new Division to devote itself to develop the manufacture of machine tools.

More and more machines through machines to shape India's industrial growth...

MACHINE TOOL DIVISION
at Chinchwad will be inaugurated
by His Excellency Shri Sri Prakasa,
Governor of Maharashtra,
on Saturday, the 21st January 1961.

On this auspicious occasion
the Governor will bless
Cooper's first Planing Machine
completed this very day.

Economic Report from the U.S.**BRIGHT EXPORT PICTURE**

By

GUY SIMS FITCH

WASHINGTON, January 11.

ENOUGH solid information is now available to substantiate the estimates of a spectacular export gain for the United States in 1960. What is more, most of the experts who have examined the current trends hold that the export surge is firmly based, and could well continue into 1961. On the basis of data for the first eleven months of 1960, it is clear that the year's final tabulation will show a commercial export total well in excess of \$19,500 million. Some experts are putting the total at \$19,750 million or more. This ends two successive years of export declines, and represents a gain of better than 20 per cent over the 1959 total of \$16,300 million. By way of comparison, the annual U.S. export expansion rate in recent years has averaged a little less than five per cent. The 1960 achievement also represents a new all-time U.S. commercial export high—a development which certainly exceeds even the fondest hopes. It beat out by a slim margin the nearly \$19,500 million total scored in 1957, a year when the demand for U.S. goods was boosted to an extraordinary degree by the dislocations engendered by the Suez crisis.

What is particularly encouraging about the 1960 record is that it was achieved without an abnormal stimulation comparable to the 1957 disruption of world trade patterns. Furthermore, the current export surge is more broadly based than was the 1957 rise, and therefore promises to be less vulnerable to any sudden shifts in foreign demand for U.S. goods. Pacing the glowing 1960 export picture were sales of semi-finished iron and steel. Also notable were increased shipments of such products as cotton, textiles, chemicals, machinery, automobiles and passenger aircraft. The only major product category to show an export dip in 1960 was that of coal and fuels. Contributing to the increased sales of U.S. merchandise abroad were the steps taken by many countries to relax their restrictions on dollar purchases, commensurate with the revitalization and expansion of their economies. The countries of Western Europe and Japan, for instance, imported more U.S. goods than ever—and they were by no means alone in this. For so did Pakistan, Malaya, Burma, the Philippines, Rhodesia, Australia, Iran and a number of other countries.

Looking ahead, the U.S. Department of Commerce foresees a continuation of the bright export picture into the first half of 1961, at least. The Department's experts base their view largely on the factors which made 1960 such an outstanding year. These would be the trend towards reducing trade barriers abroad, the generally sound base of the current U.S. export rise, and the likelihood that economic activity around the world will remain at a high level. It is possible, of course, that the rapid pace of economic expansion may slow down in some countries which enjoyed exceptionally buoyant growth rates last year, but few of the experts anticipate any serious let downs or general economic reversals that would substantially affect the demand for U.S. goods. Rather, the Commerce Department anticipates that the burgeoning consumer demand in many countries will

continue to outstrip production and thus help assure U.S. supplies of continued large markets. While conceding the possibility of 1961 declines in U.S. exports of steel, cotton, copper and perhaps airplanes, the Department's experts are reasonably confident in predicting U.S. export gains for such products as coal, rubber, aluminium, machinery and finished consumer goods.

At the world's greatest consuming nation, the United States also managed to maintain a high level of imports in 1960. While the slowdown in domestic U.S. economic activity could not help but affect the total U.S. demand for foreign goods, U.S. imports nevertheless approximated the \$15,000 million mark, a negligible dip from the record 1959 U.S. import total of \$15,200 million. During 1960, the United States increased its purchases of such items as paper, newsprint, iron and steel, nonferrous ores, and various types of metals and manufactures. On the other hand, purchases of such items as coffee, petroleum and related products tended to decline. On the import side, too, the 1961 prospects appear rather favourable. If U.S. imports held up as well as they did in 1960, when the economy was slowing down, it is reasonable to expect that they will be at least as well and perhaps better in 1961, in the light of the anticipated upturn in U.S. economic activity.

WANTED

A Secretary is urgently required by a well-known representative organisation in Calcutta. Ability to work without supervision is required and duties will also entail attendance at meetings and the preparation of reports and statistics. Applicants with either Chartered Accountant or Chartered Secretary qualification and also shipping experience are preferred. Attractive terms. Interested applicants to write to C/o The Eastern Economist, P. Box No. 34, New Delhi, giving full details of experience and indication of salary required.

Medium Section Mill—Bloom reheating furnace and Mill run-in table

Construction and operation proceed side by side at Durgapur Steelworks

ISCON's Medium Section and Merchant Mills—the final unit of the Rolling Mills Plant—are now well on the way towards completion. Three Mills were commissioned earlier this year and are in operation.

The two new Mills will make a considerable addition to Durgapur's productive range.

WORLDGRAM

India

Import Of Goods By Sailing Vessels: The position in respect of import of goods by sailing vessels has been revised, according to an Import Trade Control Public Notice. The import of fish and cuttle fish bones by sailing vessels will now be allowed from the countries formerly covered by the Open General Licence No. IXX. Cowries, shells (cheap and rough variety), coconuts in husk and mangrove poles will be allowed to be imported from the East African countries of Kenya, Tanganyika, Uganda, Nyasaland, Zanzibar and Pemba and Northern and Southern Rhodesia. The import of dates will be permitted from countries formerly covered by the Open General Licence No. IXX, Iran and Iranian Coastal areas of Persian Gulf. The concession will be available only for import by sailing vessels which satisfy certain conditions which have been laid down in the Public Notices. The goods which have arrived at the Indian ports between December 31, 1960 and January 12, 1961 will also be allowed to be cleared without an import licence. The policy in respect of import of dry fruits from Iran by sailing vessels will be announced later.

Machine Tools Output to be stepped up: The Minister of Industry, Mr Manubhai Shah, said recently that the country should aim at an annual production target of Rs. 45 crores worth machine tools in the Third Plan period. Mr Shah who was inaugurating a seminar on machine tool industry sponsored by the Development Wing in the Union Ministry of Commerce & Industry, said that of this target, Rs. 15 to 16 crores worth machine tools would be manufactured in the public sector and the rest in the private sector. The Minister pointed out that production of machine tools in 1960 had been estimated at about Rs. 10 crores, Rs. 6 to 7 crores in the large scale industry and about Rs. 3 to 4 crores in the small-scale sector. The production of Rs 10 crores in 1960 itself was a big rise compared with the production at the beginning of the First Plan period. Mr Shah referred to the record increase in industrial production last year and said that more than the quantitative rise the qualitative performance of the Indian industries had been highly remarkable. As compared with 1951, the industrial machinery sector had today registered the largest rise and in this sector, the output of machine tools had been the highest. With the 1951 production as the base, the manufacture of machine tools in the country had gone up by over 11 times.

Working of Employees Provident Fund Scheme: The number of subscribers to the Employees Provident Fund increased to 27 lakhs during 1959-60 from 25.44 lakhs in the previous year. The scheme framed under the Employees Provident Fund Act 1952, applied to 39 industries by the end of March 1960 as compared with 6 initially. According to the Annual Report on the working of the scheme during 1959-60, the total contributions to the Fund amounted to Rs. 16.36 crores as compared with Rs. 14.59 crores in 1958-59. The scope of the scheme was widened during the year to bring certain classes of workers within its ambit: employees working outside the precincts of a covered establishment in connection with its work and employees with emoluments exceeding Rs. 500 per month, if they apply for the membership of the Fund, with the consent of their employers. Also, the condition regarding the qualifying period for membership of the Fund was liberalised so that an employee, who actually

worked for not less than 240 days during the period of 12 months or less became eligible for the membership of the Fund. Previously, the qualifying period was one year's continuous service or actual work for not less than 240 days, during a period of 12 months. As a result of the amendment, a regular worker could become a member of the Fund without having to complete 12 months. The number of establishments covered under the Employees Provident Funds Act, on a voluntary basis, increased during the year from 53 to 95, which was an index of the growing popularity of the scheme among the employees also.

Central Revenue Collections For November 1960:

The revenue realised from items on which duties are levied and collected by the Central Government in the first eight months of the financial year 1960-61 amounted to Rs. 508.46 crores. Of this, Rs. 65.68 crores were collected during November, 1960. The corresponding figures for the first eight months of the financial year 1959-60 and for the month of November, 1959, were Rs. 442.28 crores and Rs. 55.65 crores, respectively.

Following are details of the revenue realised under various heads:

Revenue head	(In lakhs of Rupees)			
	November		April to Nov.	
	1960	1959	1960-61	1959-60
1. Customs	14,57	14,11	1,08,28	1,01,33
2. Union Excise				
Duties excluding Coal cess and Salt cess	36,85	28,85	2,63,38	2,27,56
3. Corporation Tax	4,19	3,26	53,36	31,60
4. Income Tax	8,96	6,65	68,12	66,22
5. Estate Duty	23	16	1,27	1,30
6. Taxes on Wealth	44 (P)	72	2,34 (P)	2,79
7. Expenditure Tax	14	10	35	29
8. Gift Tax	6	6	34	30
9. Railway Passengers fare Tax	N.A	1,01	8,05 (P)	8,29
10. Opium	24	73	2,79	2,60
Total	65,68	55,65	5,08,46	4,42,28

United States

7m. Loan For Indian Automobile Company: The United States Government has announced approval of a 7.2 m. (Rs. 3.4 crores) loan to Premier Automobiles, of Bombay, a private Indian firm. The loan, which will be channeled through the U.S. Development Loan Fund, will finance foreign exchange costs of importing machinery needed to produce sheet metal components for Dodge trucks and Fiat autos, and equipment needed to modernise and expand capacity of other portions to the Premier plant. All equipment will be purchased in the United States. Details of the loan agreement remain to be negotiated. Like all loans made by the U.S. D.L.F., the credit may be repaid in rupees. Repayment in India's currency does not involve expenditure of India's foreign exchange earnings. This credit brings the total U.S. aid to India to \$3,747m. (Rs. 1,783 crores). Premier Automobiles expansion project, which will be financed by the new loan, is expected to enable India to save more than \$2 m. per year in foreign exchange now spent in importing sheet metal components. The loan will support the Indian Gov-

ernment's plans to increase the locally produced content of motor vehicles from the present figure of 60 per cent to about 85 per cent. Premier's output will be increased from 12,000 trucks and cars per year to 21,000 units.

Bank of America: All-time highs in total resources, deposits and loans as well as record earnings for the past year were reported by Bank of America on December 31, 1960 in its statement of condition. "Our loans outstanding at the year-end totalled \$6,699,494,437, as compared with the previous high of \$6,599,668,231 at the close of 1959," said President S. Clark Beise in commenting on the report. "This is evident that business activity in California has continued at a generally high level," Beise declared. Total deposits on December 31 stood at \$10,805,891,450 as against \$10,624,958,182 a year ago. Total resources of the bank amounted to \$11,941,981,259 at year end, compared with \$11,669,404,346 on December 31, 1959. Investments in securities totalled \$2,702,508,087 whereas a year earlier they aggregated \$2,725,392,943.

U.S.S.R.

Big Advance Planned in Tajikistan's Textile Industry: The construction of the third section of the Stalinabad textile combine has begun. The section consists of three mills: 120,000-loom spinning mill; a weaving mill with 2,240 automatic looms and a finishing mill for processing all coarse fabrics. With the commissioning of these mills in 1963 the annual output of cotton fabrics in Tajikistan will reach 100m. metres, that is equal to the amount now produced in Pakistan, Afghanistan and Iraq put together. A significant advance in Tajikistan's textile industry is planned for this year. One of the Soviet Union's largest carpet mills, the Khodzhen combine, will increase its output four-fold this year as compared with 1960. A garment factory and a weaving mill will be commissioned this year in Northern Tajikistan. Construction of the second section of the Leninabad silk weaving complex has begun.

New sowing machines on Uzbek cotton fields: The Council of Ministers of Uzbekistan approved a programme for cotton sowing in 1961. The level of mechanisation of spring field work in state and collective farms will be substantially raised. Approximately 6,000 new sowing machines will sow cotton by the progressive square pocket method on an area of 1,050,000 hectares, i.e. 75 per cent of the total planted to this crop in the Republic. The ploughing is now nearing completion in the Republic, fertilizers are being accumulated and winter watering of the fields is in progress.

United Kingdom

Computer Export Sustained: Expansion in Britain and Overseas made 1960 a particularly active year for Standard Telephones and Cables Ltd., and its associates. Standard Telephones opened a new factory in South Africa which will, in five years, be making 95 per cent of that country's trunk telecommunication equipment. The total number of Stantee Zebras delivered reached 36. New Zealand's first broadband microwave radio system, brought into service in October, was supplied by the company. The system handles 600 simultaneous telephone calls and links Auckland with Wellington. In Sardinia, the first installation of the company's 300-circuit carrier telephone system, using buried transistors or repeaters along with a small diameter coaxial cable, was completed in the autumn. These 'hole-in-the-ground' repeaters are cheap to ins-

tall and require no building or external power supply: power is fed along the cable. During 1960, the company took part in 40 exhibitions at home and overseas. At the British Exhibition in New York, new PVT-2 automatic triangulation equipment for radio direction-finding was shown for the first time.

Switzerland

Switzerland produces heavy water: Coming after Norway and France, Switzerland has now become the third country in Western Europe to produce heavy water. The Ems Works Ltd., of Ems in the Grisons (Switzerland) have thus become suppliers of heavy water to Swiss Institutions for scientific research, to the Universities, to the Federal Technological Institute and to the European Centre for Nuclear Research (ECNR), at Meyrin, near Geneva. The heavy water is produced with the aid of machinery built in collaboration with the firm of Sulzer Brother Ltd., in Winterthur.

U.A.R.

More Trade Between U.A.R. And Burma: Ways and means of promoting trade exchanges between the U.A.R. and Burma were discussed at a meeting which El Sayed Hassan Abbas Zaky, Executive Minister of Economy held with the Burmese Military Mission visiting U.A.R. At the end of the meeting it was declared that yarn, cotton textiles, cement, tyres and plastic products could be exported to Burma and timber could be imported by the U.A.R. It was disclosed by the Minister that a Burmese Economic Delegation led by the Minister of Commerce, was expected to arrive in Cairo towards the end of February 1961, to negotiate a trade agreement between the two countries.

France

Installing A Coking Plant in Brazil: The Brazilian company Siderurgica Paulista (COSIPA) have given an important order to the Compagnie Generale de Construction de Fours for a coking plant having a metallurgical complex to be built at Piacaguera near Santos. This contract follows quotations requested from international manufacturers specialising in the construction of coke furnaces: British, German, Belgian and French. It is a question of supplying a complete coking plant for immediate possession, the assembly and starting to be assured by engineers and technicians belonging to the Compagnie Generale de Construction de Fours with the help of local labour. The annual production will be 350,000 tons of coke during the first stage; eventually the production could reach 500,000 tons, without any changes in the gas treatment installations as they are foreseen to handle this quantity; measures have been taken to double up the installations eventually. In the first stage there will be 62 coke furnaces divided into two batteries of 31. As far as their general conception is concerned and also by means of numerous ingenious details, these furnaces will integrate the most modern technical solutions realised from plans and patents belonging to the Compagnie Generale de Construction de Fours. For instance, the heating system is the patented type C.G.C.F. with twin flues having integral regulators which offer the advantages of easy operation together with precise regulation of the burners. Amongst other points may be mentioned the doors which have a patented system which permits unbolting and raising simultaneously by the door-puller, reversing boxes assuring reduced loss, etc. The contract also includes complete installations for gas treatment and the recuperation of by-products (tar distillation, manufacture of sulphate of ammoniac, recuperation and distillation of benzol, recuperation of phenol and naphthalene).

for adequate and economical wiring

ALIND Covered Aluminium Conductors

ALIND ALL-WEATHER Weatherproof Wire

Polythene insulated taped, braided and weatherproof - compounded aluminium conductor for outdoor weather-proof applications.

ALIND KER-AL-LITE Building Wire for indoor power and light wiring in place of conventional CTS and TRS wires

ALIND AL-VINYL All-purpose wire (an ideal alternative to conventional wire for conduit or casing-and-capping wiring)

Our lines include:
• Electrical conductor grade aluminium rods
• ACSR and all-aluminium conductors & conductor accessories.

NEWS IN BRIEF

INDIAN

A new Indo-German company in the name of Stumpp Schuelek and Somappa Private Limited has been floated for manufacturing high quality products for the automobile industry in Bangalore from June next. The plant will have an initial capital of Rs 10 lakhs and will employ about 100 workers in the first stage.

India's foreign exchange earnings from scrap exports during 1960 is estimated to be about Rs 6 crores. The scrap exports of 3.25 lakh tons last year surpassed the performance of all the previous years, except that of 1953, when the exports were 3.92 lakh tons.

Applications for essentiality certificates for the import of permissible items of machinery and spares required by the manufactures of hosiery goods are at present received by Textile Commissioner's office at Bombay.

It is reported the Rajasthan Government will launch a one-month State-wide rural insurance drive on January 26 in collaboration with the Life Insurance Corporation.

The revenue realised from items on which duties are levied and collected by the Central Government in the first eight months of the financial year 1960-61 amounted to Rs 508.46 crores. Of this Rs 65.08 crores were collected during November, 1960.

There was higher production of pig iron and steel at the Bhilai Steel Works during the month of December, 1960. The steel works produced 62,016 tons of pig iron during December, 1960, compared to 61,206 tons produced during the preceding month.

Aligarh district has been selected for the implementation of the intensive agricultural programme sponsored by the Ford Foundation. About Rs 7 crores has been earmarked for the scheme. The programme envisages immediate rise in food production and demonstration of effective ways of increasing farm yield.

Jet planes on rupee payment have been offered by the Soviet Union to India. Negotiations between the two countries in this respect had just been concluded in Moscow and the Government of India's reply was now being awaited.

The recently formed International Development Association will advance loans to India to the extent of \$50m. (about Rs 23.75 crores) during the Third Plan period. The main feature of I.D.A. assistance is that the loans can be repaid in rupees.

The Malabar Iron and Steel Works Ltd. proposes to enter the market for raising new capital amounting to Rs 50 lakhs on or about January 20. The company has been registered in Kerala with an authorised capital of Rs 1 crore.

FOREIGN

Fact-finding missions of leading British businessmen and industrialists are to be sent next month into nine European countries by the newly formed Export Council for Europe.

Australia has sold 20,000 tons of flour to China. The sale is the first to the Chinese mainland since 1939, when war stopped Australian flour sales there.

British exports to China in the first eleven months of 1960, at £30.12 million were 50 per cent up in 1959, the biggest percentage rise in any one market, the China Trade and Economic Newsletter states in its January issue.

A new company has been formed to supply "factoring" services for international and domestic trade, known as International Factors. It has been launched by the First National Bank of Boston (through a subsidiary), M. Samuel and Co., merchant-bankers, and Tozer Kemsley and Millbourn (Holdings), a well-known U.K. confirming house.

The first outline of the promised five-year-plan for Belgian industrial expansion was issued recently as a Parliamentary paper. The aim of the plan is to produce annually a 4 per cent average growth in the gross national product.

The Oberg Manufacturing Company has formed a partnership with a British firm for the production of carbide dyes at Dudley, near Birmingham.

World production of natural rubber this year is expected to be only 25,000 long tons greater than in 1960, according to estimates for both years published by the U.S. Natural Rubber Bureau. Total output this year is expected to reach 2,050,000 tons.

It is reported China will grant Burma an unconditional £30m. interest-free loan with repayment in ten equal yearly instalments beginning in 1971. The loan comes into effect next October, and is to be utilized by the end of September, 1967, but may be extended by mutual agreement.

The Societe de la Raffinerie de Strasbourg will build a 3.3m. tons per annum refinery in the Strasbourg region. Capital will be supplied equally by three groups—Compagnie Francaise de Raffinage, the Antar-Pechelbronn group and the French subsidiary of the British Petroleum Company, Francaise des Petrolas B.P. The refinery is expected to require an investment of 250m. to 350m. new francs.

Under a protocol signed recently, Russia will double trade with Sudan this year. Sudan will export cotton, hides and oilseeds, and obtain machinery, equipment, timber, wheat, sugar, cement and other goods from Russia.

Czechoslovakia is to give Poland a 112.5m. rouble loan under an agreement signed recently—the biggest such agreement ever made between the two countries.

THE BUSINESS WORLD

Criteria for Bonus Formula

BY CROESUS

IF the Government of India has become proficient in anything, it is certainly in the art of putting the cart before the horse. I have not kept count of the number of times this has happened in the past 13 years, but it must be innumerable, for it has now become a hardy habit with the powers-that-be. It is only this force of habit that can explain away the latest performance of our labour Archangel, Mr Gulzarilal Nanda, the Union Minister for Labour (and Planning?). Perhaps on the eve of the A.I.C.C. session at Sardarnagar, and when once again in his old and familiar field of activities—Ahmedabad—Mr Nanda, or rather the politician in him, could not resist the temptation to hit the headlines in the Press. So he came out with his hasty announcement of the appointment of the Bonus Commission and even its personnel. Little did he dream that he was thereby raising a hornet's nest around his ears. Not only the premature (I had almost said indecently hasty) announcement of the Commission but the highly controversial appointment of a presiding judge of an Industrial Tribunal as Chairman of the Commission have upset even the most sober elements among employers and so, I am afraid, the forthcoming meeting of the Standing Labour Committee where Mr. Nanda will have to face the spokesmen of these enraged elements, does not promise to be smooth sailing business. Apparently, the Union Labour Minister's belated declaration that the Standing Labour Committee will have an opportunity of finalizing the terms of reference of the Commission, and, if necessary, to enlarge its personnel, has not served to assuage the feelings of these elements. In the result, it is doubtful whether the main question, namely, that of linking productivity with the real income of the worker, will receive the considered attention it merits.

A good deal of difference of opinion, if not confusion, is prevalent on the purpose and import of bonus, which is a question of vital importance to the industry in the private sector. The Labour Appellate Tribunal (L.A.T.) formula on bonus was no doubt intended to serve as a guide, but, unfortunately, in the context of the varied and conflicting interpretations placed on that formula, the whole question still needs to be straightened out. It was because of this that even the Supreme Court suggested, in the course of its judgment in the Associated Cement Company's case in May, 1959, that "it may also be possible to have the question comprehensively considered by a high-powered commission which may be asked to examine the pros and cons of the problem in all its aspects by taking evidence from all industries and all bodies of workmen." I wonder whether the care and concern that inspired this suggestion have at all been respected by the Government of India in naming the present personnel.

Be that as it may, the recurring disputes over bonus constitute a major obstacle to the promotion of good industrial relations, wherefore certain basic facts require to be taken into account in considering the question dispassionately. These may be briefly indicated here. In the first place, many industries, especially the old established industries, are in dire need of rehabilitating and modernizing their productive equipment. It is

needless to say that new machines are as necessary as men to tend or mind them, if higher production at lower cost is to be achieved. The first and foremost charge on the earnings of any company should, therefore, be a provision for this purpose.

Secondly, there is the question of capital formation. There is no use blaming individual entrepreneurs for frittering away the resources of their enterprises when, by sanctioning payment of bonuses, some Industrial Tribunals themselves conveniently overlook the need for consideration of resources for purposes of consolidation and expansion.

Next, as regards the concept of the term "Bonus" itself, there is considerable confusion. It is sometimes referred to as a deferred wage, sometimes as a share in the profits; sometimes, they talk of profit bonus or annual bonus to fill the supposed gap between wages actually paid to workmen and the still vaguely defined "living wage." Then, again, what is equally intriguing is that bonus is awarded not only when a company makes huge profits, but even when it makes a modest profit or actually suffers a loss, and this is clearly an unfair deviation from the principles embodied in the L.A.T. formula, viz., that bonus is payable only when an industrial or business undertaking has made huge profits.

Furthermore, when the declared policy of the Government is to broaden the public sector and more and more industrial and commercial undertakings are being started in that sector, the limitation of the application of the L.A.T. bonus formula to undertakings in the private sector only cannot but be considered as an invidious discrimination. Either a separate formula applicable to undertakings in the public sector, if such is considered necessary to meet the special circumstances of these undertakings or, more preferably, a formula that would apply uniformly to private as well as public sector undertakings, it seems, cannot be long postponed.

The informed objection to the present system of bonus is that it does not act as an incentive either to better attendance or to higher production; instead, bonus is apt to be treated as a deferred wage, which it is definitely not. Ways must, therefore, be found in any new formula that may be evolved to link the bonus payment with the contribution that the worker makes to the production of the undertaking or with the attendance that he keeps or, perhaps, better still, with both. Incidentally, if such a formula is evolved, it will probably eliminate all controversies about whether bonus payments must be based on production only or on attendance only. In any case, the mere insistence on payment of bonus as a hardy annual, irrespective of all other considerations, must stop, and the sooner it is done, the better.

Then, there are such important questions as the distinction that has to be made between manufacturing concerns and trading concerns and provisions for what

are called "prior charges." As "prior charges" must be deducted from "gross profits" in order to determine the available surplus, it is perhaps necessary also to be clear about what "gross profits" precisely mean. Among "prior charges," both the relative importance and the exact size of the amounts to be set apart in each case—for items like depreciation, rehabilitation, reserves, return on capital, income-tax and other expenses—have to be clearly laid down. In certain industries, such as plantations, which, for obvious reasons, cannot claim rehabilitation allowances, some other provision, such as replantation allowances, a principle that has been accepted by the Tariff Commission, would have to be made. There may also be industries where, for special reasons, the capital may be quite modest, and no attempt must be made to force these also to toe the line with established enterprises with a large capital base in the matter of payment of bonuses. That would be both unfair and inequitable.

After providing for all these, there still remains the question of whether the balance left should work out to some reasonable amount so as to attract the obligation to pay bonus. And when once bonus is decided on these lines, the undertakings concerned should not be coerced into granting any other bonuses—customary, conventional or concessional.

Even as there is a need to decide a reasonable amount of balance, after meeting all charges, to attract the obligation to pay bonus, there is need to lay down a reasonable ceiling on the quantum of bonuses. This is necessary not only to avoid wide fluctuations from year to year but also as an anti-inflationary measure, especially in the era of austerity that we are asked to prepare ourselves for. For the same reason, there is need to limit bonuses up to a given amount, say, the monthly salary of any Minister in Congress Governments, or a given portion of the employees' own total emoluments in a year, whichever is lower, and, even here, the payment must be partly in cash and partly in Savings Certificates encashable only after a fixed number of years. There is no reason why this should not be done when the distribution of profits by way of dividends has been sought to be statutorily controlled in certain industries.

After having said all these, I must conclude with a note of caution, in order to avoid all complications in future, that, before any formula is enforced, it should be accepted by all the parties concerned and the latter must also establish a convention that all of them would resist any deviation from this mutually accepted formula at least for a given period.

E.N.I. In the Italian Economy

ENTE Nazionale Idrocarburi Group of Companies—dominated by the giant personality of Signor Enrico Mattei—engaged in oil exploration, extraction, processing and distribution is a unique example of a public sector institution shooting up the growth of an economy. Providing about 21 per cent of the total Italian energy consumption in 1959, the Group has made considerable contribution in accelerating Italy's industrial activity. As an instance of its leading position in the country may be cited an eloquent contrast. In 1959 E.N.I. group completed 153 oil wells whereas all the rest of the Italian and foreign companies operating in Italy completed only 62 oil wells. As a consequence between 1953 and 1959 total drilling operations in Italy increased by 51 per cent, natural gas output by 135 per cent and liquid and liquified hydro-carbons output by 176 per cent. Similarly, the length of natural gas pipelines increased by 74 per cent, fleet tonnage by 137 per cent and refining capacity by 20 per cent during the same period. A high proportion of this growth was contributed by E.N.I.

In fact the group has wider interests of Italian economy in view and has, therefore, concentrated its attention on the development of resources in the Southern districts which constitute a comparatively under-developed region. The capital invested by the E.N.I. in South Italy for mining has gradually been increased and today it represents over two-thirds of its total investment in Italy. The Corporation intends to increase this proportion in the coming years to three-fourths of the total in this sector, thus placing at the disposal of the region, which was at a comparative disadvantage, resources and raw materials which are an important prerequisite for industrial growth.

This State-owned Corporation is run on the basis of commercial success and continues to remain competitive in the face of other international groups engaged in similar activities. In fact, E.N.I. has extended its activities beyond the national boundaries of Italy. Signor Enrico Mattei was here last month, and his dynamism will probably soon be felt in India. Of the 68 companies which comprise the group, or are associated with it, 18 are registered abroad. E.N.I. has entered into agreements with "concessionary" coun-

tries like Iran, Libya, Morocco, Sudan, Egypt, etc., and has developed a wide range of contacts and interests over a vast area in Africa and the Middle East. The experience thus gained in drilling, pipeline transport, engineering and designing and erection of industrial plant has helped the group to attain the requisite amount of efficiency to become competitive contractors in foreign countries. It may be observed that the area covered by permits abroad for exploration doubled during 1959 alone. The table below shows that at the end of 1958, E.N.I. Group had an area of about 79,000 sq. kilometers which increased to about 153,000 sq. kilometers a year later. New areas have been acquired in Libya, Somalia and Sudan. Drilling operations in Iran and Morocco have shown quite interesting results and in Egypt a company of the Group has discovered a new area producing light oil.

E.N.I. Group Exploration Permits Abroad

	End 1958	End 1959
	(sq. kilometers)	
Iran	22,590	22,590
Libya	—	29,997
Morocco	35,150	35,150
Somalia	21,500	55,259
Sudan	—	8,545
Egypt	631	1,823
Total	79,871	153,364

Apart from major activities of the Corporation like exploration, drilling, refining and distribution of petroleum products, the Corporation has paid attention to minor products especially the petrochemicals. Fertilizers form one of the more important petrochemicals. Calcium nitrate produced by a subsidiary of the Corporation was put in the market in 1959 and received a fair response. Similarly synthetic rubber was also produced by the Corporation. Sulphuric acid, petroleum coke and other products like *supertrim*, *trimeca*, *lavatrix* and *trik* were also received well in the Italian market. The Corporation has also helped in nuclear power research and the exploration of radio-active materials.

The annual report indicates that the Group has been investing about 80 thousand million lire every

year during the last three years in exploration, transport, distribution, refining, manufacture of petrochemicals and nuclear industry. The group proposed to make capital investments of about 100 thousand million lire in 1960, mostly in mining and partly in petrochemicals and distribution. In fact, it has planned a schedule for

the years 1960-1963 which calls for an investment of about 500 thousand million lire in capital goods. The Corporation is, therefore, making significant contribution in making Italy, as far as possible, self-sufficient in energy resources and also in providing low-cost raw materials.

Business Notes

Sugar

THE PROBLEM OF SURPLUS

IT IS one of the few heartening features of our economy that there has lately been a distinct improvement in the supply position of sugar. While it has belied earlier apprehensions of sugar shortage it has also occasioned, in its wake, a new headache to the producers as well as to the consumers, let alone to the authorities. It was this point that Mr D. D. Puri, President of the Indian Sugar Mills' Association, found it necessary to underline in his address to the Federation of Andhra Pradesh Chambers of Commerce, in Hyderabad, last week. The country was in the throes of a crisis of sugar surplus as against a shortage last year, he said, and cited the convincing evidence of the concessional rate that the sugar industry is now in a position to offer to ancillary industries. The total sugar production in the country during 1959-60 was 24.22 lakh tons, as against only 19.9 lakh tons in 1958-59. If the present trend continues, the industry will be able to achieve a total production of 27 lakh tons or more during the 1960-61 season, it is estimated.

The President of the I.S.M.A. also drew attention to some of the new problems that the surfeit of sugar production in the country has given rise to. He said, for example, that the Association has had to urge the Reserve Bank to reduce margins in respect of advances against sugar stocks. How much the position could deteriorate if this was not done should be clear to any one from the fact that whereas the present season has begun with a stock of five lakh tons, next year, the carry-over could be at least a million tons!

The surplus sugar problem also highlights the urgency of augmenting our sugar exports. If no relief were afforded to the industry, by way of exports, as he said, at least the internal consumption should be increased to give some breathing time to the industry. Meanwhile, it is known that efforts are being made to export sugar to the USA. While the Government of India is keen on encouraging more sugar production and building up an export trade in sugar thus, it is unfortunate that some State Governments are indulging in ideological land laws which strike at the root of the most efficient sector of the sugar industry in the country.

While on this point, the ISMA Chairman pointed out that the industry could not, under the existing conditions, fully bear the loss sustained to our exports which may amount to about Rs. 150 per ton, even taking for granted that there would be a rebate of the entire excise duty and cane cess. Since both the Central and the State Governments derive considerable revenue through excise duties, cane cess and sales tax from this source, he argued, there was a case for asking them also to bear a part of the loss on exports. At the same time, he added, effective steps should be taken to reduce the cost of cultivation of cane, which constitutes 60 per cent of the cost of sugar, and thereby bring down sugar prices.

As one other possible measure of relief, Mr. Puri suggested to the Government that the excise duty should be levied only on individual consumption of sugar. He rightly made it clear that this concession should not extend to industries that use sugar as a

principal component in their industries. In other words, the benefit is sought to be extended to the people at large, who cannot pass on any increase in costs like the industries consuming sugar may, although even this is debatable in an era of steadily rising prices.

New Issue

MAHENDRA ELECTRICALS

THE MAHENDRA ELECTRICALS, LTD., will shortly be in the market with a public issue of Rs. 23 lakhs. The Authorised and Issued capital of the Company is Rs 2 crores and Rs. 60 lakhs (60,000 equity shares of Rs. 100 each), respectively. The Company was incorporated in November, 1960 for manufacturing VIR and PVC insulated wires and cables. Out of the issued capital of Rs. 60 lakhs, divided into 60,000 equity shares of Rs. 100/- each, the promoters, the directors and their friends have agreed to take up shares of the face value of Rs. 18.67 lakhs. The ICICI, which has also given a loan to the Company of an amount equivalent to the foreign exchange currency of Rs. 17.5 lakhs, has agreed to subscribe for shares of the face value of Rs. 5 lakhs. Further, shares of the face value of Rs. 13.33 lakhs have been reserved for allotment to Messrs. Johnson & Philips Limited, London, the technical collaborators for this new firm. The balance of 23,000 equity shares of the value of Rs. 23 lakhs are now being offered to the public. The extra issue has been underwritten by the United Commercial Bank, Ltd.

The Company proposes to manufacture two million core yards per month of rubber insulated cables and one million core yards per month of thermo plastic cables, based on two shifts per day. The Company's wire-drawing equipment is, in fact, large enough to meet four million core yards per month. The Government, it is understood, has also given a licence for the manufacture of 30,000 KVAR capacitors for power factor correction—the first of its kind in the private sector in Western India. Originally, it was the intention of the Government, it would appear, to restrict this line to the public sector only.

The subscription lists will open on 21st January and will close on 28th January, or earlier, but not earlier than 24th January. A sum of Rs. 25 per share is to be paid on application, Rs. 25 after three months of allotment, and the balance of Rs. 50 in instalments of Rs. 25 at intervals of three months after allotment, as and when called.

The factory will be situated at Kamlā, near Nadiad (Gujarat State), and is expected to go into production some time in the middle of 1962. Messrs. Jashbhai C. Patel & Company have been proposed as the Managing Agents of the Company, while the Indian organisation of Messrs. Johnson & Philips Ltd., London, are to be the sole selling Agents in India.

Mr Rasiklal J. Chirai is the Chairman, while Mr. Jashbhai C. Patel is the Promoter of the Company. It is noteworthy that the latter, an employee of Messrs. Johnson & Philips Ltd., has been permitted, nay actively encouraged, to start a new industry on his own thus. One hopes that this will be the precursor of many more such commendable gestures.

AIR-INDIA
IN ASSOCIATION WITH BOAC AND QANTAS

FROM THE CAPITAL'S CORRIDORS

N.D.C. MEETING

THE National Development Council met here last week to give to the Planning Commission its final directive on the size of Third Five-Year Plan. The Prime Minister, who was in the chair, in his opening speech made two important announcements. He contradicted press reports that the setting up of the public sector steel plant at Bokaro had been postponed to a date falling beyond the Third Plan period. The Prime Minister categorically stated that the Government was keen on going ahead with the Bokaro plant. India, he said, could not afford to have shortage of steel at the end of the Third Plan. If, in the meantime, there was any surplus of steel it could be exported.

The second important observation which the Prime Minister made was about oil. He struck an optimistic note when he said that India would achieve near-self-sufficiency in oil by the beginning of the Fourth Plan. The Prime Minister also felt confident that foreign oil companies would be coming out to help this country in oil exploration on Government terms.

PLEA FOR AUSTERITY

The Prime Minister made a passionate appeal for austerity and observed: "I would not wish to put great burdens on people in the shape of austerity. But one thing should be definitely frowned upon, that is flouting wealth, flouting expenditure, extravagance whether in one's life or in weddings; also as a consequence of this increase in wants. Again, I am not against increasing wants if the country can afford them. But when we are saving, we should not adopt policies which give new habits, new wants, which we can do without today, so instead of savings, money goes into increasing consumption of unnecessary articles." The Prime Minister's this exhortation is obviously wise and timely. But whether it will be followed by the general public or even by his colleagues in the Cabinet only time will show.

PHYSICAL AND FINANCIAL TARGETS

The deliberations of the Council gave an inkling into the various pulls that are exercised on the Planning Commission by some States against scaling down of their Third Plan outlays. 1961-62 being an election year, it could be expected that Chief Ministers of various States would be chary of seeing the plans of their States being cut down. To meet the demand of the States for bigger plans for them, the N.D.C. chose, as it were, the line of least resistance and resolved the

issue by differentiating between the physical targets which the country should aim at and the financial targets which in the light of the present known resources the Planning Commission should fix. In terms of physical targets, the Council envisaged that the 3rd Plan outlay might be of the order of Rs. 8,000 crores in the public sector (the share of States in this would be Rs. 3,847 crores) and Rs. 4,000 crores in the private sector. The financial targets suggested are Rs. 7,500 crores for the public sector and Rs. 4,000 crores for the private sector. Out of Rs. 7,500 crores public sector financial outlay, Rs. 3,725 crores would be available for State plans. "The position, however, would be kept under constant review and every effort would be made to mobilise nation's resources to the greatest extent possible and to provide for implementation of various programmes of the Centre and the States through annual plans." The financial target of Rs. 3,725 crores outlay on State plans corresponds to the Draft Outline target of Rs. 3,650 crores outlay.

RESOURCES AVAILABLE

The total financial resources available for the public sector (both belonging to the Centre and the States) under the Third Five-Year Plan have been revised, by the Planning Commission experts, upwards from Rs. 7,250 crores to about Rs. 7,500 crores. This has been the result of an analysis of actual revenue receipts over the first six months of the current fiscal year so far as the Centre is concerned; these receipts have shown considerable improvement over those for the corresponding period last year, which were taken as the basis when the Draft Outline was prepared. The eagerness shown by the State Governments to raise additional resources for their plans accounts for some upward revision of resources available for State plans.

RESOURCES FOR STATE PLANS

In the Draft Outline resources available for State plans were estimated around Rs. 1,200 crores. They were upgraded to Rs. 1,416 crores on the basis of the discussions which States had with the Planning Commission during the past four to five months. Now, these estimates have been scaled down again to around Rs. 1,346 crores. The following table gives the comparison of the estimates of resources available for State plans (i) as worked out for the Draft Outline of the Plan, (ii) as on the basis of discussions State Governments had with the Planning Commission and (iii) as they are taken now.

ESTIMATES OF STATES' RESOURCES FOR THE THIRD PLAN
(Comparison between the estimates as worked out earlier and as worked out now) Rs. crores)

Heads of Resources	(i) As in the Draft Outline	(ii) As on the basis of discussions	(iii) As worked out now	Difference

The downward revision of the estimates of resources available for State plans, it is understood, has been effected due to two factors: (i) interest liability of the States on fresh loans from the Centre in the Third Plan period (This is estimated to cost the States Rs. 46 crores) and (2) increased interest liability on account of borrowings from the public (This is expected to cost the States Rs. 24 crores). The revised estimates, however, do not take into consideration the following facts:

- 1) Some State Governments may have to find resources for increase in pay and emoluments of their employees — only seven States have so far made provision for this in the calculation of resources available for their programmes falling within the purview of the Third Five-Year Plan.
- 2) Both the loans and small savings targets are apparently high in relation to the collections effected during the Second Plan period.
- 3) The Third Plan target of Rs. 610 crores for additional taxation which is over 2½ times the Second Plan achievement of about Rs. 240 crores, may not be attained notwithstanding the fact that State Governments have promised to raise this sum from further taxation.

STEPPING UP OF OUTLAY ON STATE PLANS

How the total outlay (physical target) on the State plans has been increased consequent upon the discussions the States have had with the Planning Commission is shown in the alongside table.

In the Draft Outline, a provision of Rs. 3,700 crores was made for outlay in the States and Union Territories, the former accounting for Rs. 3,525 crores and the latter Rs. 175 crores. For financing State plans Rs. 1,200 crores were to be found by the States from

TOTAL OUTLAY — STATES, INCLUDING UNION TERRITORIES

(Rs. crores)

Heads of Expenditure	Before Discussion	After Discussion	Difference
Agriculture and community development	900	947	+ 47
Major and medium irrigation	645	651	+ 6
Power	800	938	+138
Village & small industries	130	136	+ 6
Industries & minerals	50	76	+ 26
Transport & communications	225	271	+ 46
Social services	950	918	- 32
Miscellaneous	—	81	+ 81
Total	3,700	4,018	+318

their own resources and Rs. 2,325 crores were to be provided by the Centre as assistance. In the course of their discussions with the Planning Commission, the States agreed to raise another Rs. 216 crores to match which the Central assistance was to be stepped up by Rs. 106 crores. For the development programmes of the Union Territories, the Planning Commission has allocated Rs. 171 crores as against Rs. 175 crores envisaged in the Draft Outline.

The latest appraisal of combined resources of the Centre and the States available for the public sector outlay under the Third Plan, year by year, is as follows:

RESOURCES FOR THE THIRD PLAN: CENTRE AND STATES

(Rs. crores)

Items	1961-62	1962-63	1963-64	1964-65	1965-66	Total for five years

8. Balance of miscellaneous capital receipts over non-plan disbursements	25	38	44	51	50	208
9. Total of 1 to 8	445	474	645	671	758	2,993
10. Deficit financing	..	..	..	..	..	550
11. Additional Taxation	..	..	..	..	..	1,710
12. External assistance	..	..	..	..	..	2,200
Total	..	..	..	..	..	7,453

ACTUAL AVAILABILITY OF RESOURCES

Will these resources be actually available for financing the Third Plan? The above estimates, it is learnt, are based on certain reservations which are as follows:

(i) There is first of all a certain limitation in respect of all estimates which are based on the assumption that production increases steadily at a certain rate from year to year and that these increases reflect themselves more or less proportionately in the estimates of receipts.

(ii) The estimate of the surplus from revenues provides for total defence outlay of Rs. 1,700 crores. Recent indications suggest that this figure might have to be revised upwards.

(iii) The estimate of the surpluses of public enterprises and of the steel equalisation fund is almost certain to suffer a reduction. The Planning Commission is consulting the Ministries in this regard.

(iv) The estimate of loans of Rs. 850 crores may turn out to be on the high side. The net absorption of loans by the public in 1960 has been minus Rs. 4 crores. The estimate of Rs. 850 crores contains, in other words, a certain element of deficit financing through contribution to or support of these loans by the Reserve Bank.

(v) The additional taxation target of Rs. 1,710 crores is also on the high side. It will call for very special and sustained effort throughout the Plan period both at the Centre and in the States.

(vi) The Plan postulates external assistance of a substantial order, and there is no cushion available by way of foreign exchange reserves to draw upon.

(vii) Prices have risen by 25 per cent over the Second Plan period. Any further significant rise in prices of essential commodities would be undesirable and has to be guarded against. Deficit financing has, therefore, to be kept down to the minimum and care has to be taken not to exceed the limits set by the growth in the real national product.

REVISED EXPENDITURE ESTIMATES

If the estimates of resources available for the Third Plan public sector outlay have been revised upward and there has been a demand for increase in outlay envisaged under the State plans, the estimates of expenditure required to be incurred on the Central schemes have also gone up. The assessment of the financial requirements of the Central projects included in the Third Plan falls short of the provisions made in the Draft Outline in the manner indicated below:

(i) **Industries and Minerals:** When the Draft Outline was prepared, the cost estimates available showed that projects in categories A, B and C called for a total investment during the Third Plan of Rs. 1,535 crores. Recently, for some projects revised cost estimates have been furnished. For projects in categories A, B and C, the investment needed now comes to Rs. 1,657 crores — an addition to the original estimates of Rs. 122 crores, which represents an excess of Rs. 207 crores above the provision of Rs. 1,450 crores.

(ii) **Transport and Communications:** For transport and communications, certain additional alloca-

tion are required at the Centre. These include provisions for a diesel loco factory, a railway line for the Haldia port and extension of the Deva-Panvel line, inter-State roads of economic importance, additional provision for ports and harbours (including the barrage at Farraka) and for tele-communication facilities required for the railway electrification programme, etc., amounting in all, to about Rs. 100 crores.

(iii) **Power:** For power development, the main addition to outlay is in the States. At the Centre, additional provision might have to be made in case it is decided to instal a nuclear power plant with a capacity of 150 MW for the Delhi-Punjab region. To meet the shortage of power that is anticipated in this area there is need for additional capacity of this order. If undertaken, the nuclear power plant would be in substitution of an additional thermal plant for which so far provision has not been made in the Plan.

(iv) **Irrigation:** There is need for raising the allotment for research, investigations etc. from Rs. 5 crores to about Rs. 8 crores.

(v) **Agriculture and Community Development:** The outlays proposed by the Ministries of Food and Agriculture and Community Development and Co-operation come to about Rs. 194 crores. The provision earlier indicated was Rs. 125 crores.

WORLD BANK AND IDA ASSISTANCE FOR THIRD PLAN

Mr. Joseph Rucinsky, leader of the World Bank Mission which has been having discussions with the Government of India on the Third Plan with a view to prepare a report for the coming meeting of the Aid-India Club and to select projects for which the World Bank and the International Development Association can extend aid to this country, told a press conference here on Tuesday that India could expect assistance from the World Bank during the next Plan period for development of railways, power (in the D.V.C. and Bombay areas) and Calcutta port (including the construction of a satellite port — Haldia — near it) and for raising coal and steel production in the private sector. The Industrial Credit and Investment Corporation of India might also be assisted by the Bank, he added.

The International Development Association, Mr. Rucinsky said, would provide assistance to India for projects concerned with the development of national and local highways, small irrigation schemes, land reclamation, drainage and rural electrification. I.D.A. loans, he added, would be available for a period much longer than the World Bank loans. They would not carry any interest on them; only a small administrative charge, which is yet to be fixed, will be required to be paid. The repayment of I.D.A. loans, however, will have to be in convertible currencies. Mr. Rucinsky said that I.D.A. would provide a percentage of the total costs of the projects approved by it for assistance; thus it may provide finance not only for meeting the foreign exchange component of a project but also a part of the cost in local currency.

India, Mr. Rucinsky opined, required long-term loans from foreign countries. The minimum period for repayment of these loans, taking into consideration this country's foreign exchange difficulties, has to be 15 years or more.

STEEL PRODUCTION SOARS BY 173% AT MUKAND

In 1940, Mukand employed 694 men; in June 1960—2,187. Over the past seven years, production figures have soared—18,234 tons in 1952/53; 49,787 tons in 1959/60. This increase is a reflection of a good management of finances:—

	1957/58	1958/59	1959/60	
	(Rs. in lacs)			
Capital	51	51	71	Mukand manufacture high-grade steel products—bars, rods and castings. Presently an expansion programme is under way. It will cope with the growing influx of big orders—like the one placed by the Railways with Mukand on 16th July 1960 for 4,035 sets of Centre Buffer Couplers valued at 84 lacs.
Depreciation provided to date	32	36	41	
Profits retained in business to date	25	35	45	
Profit for the year	19	30	32	
Dividend for the year	5	5	8	

Mukand provides India's new and growing industries with the quality steel components they must have.

MUKAND STEEL STRENGTHENS THE NATION

Mr. Rucinsky did not give any idea of the quantum of assistance that would be forthcoming from the World Bank and I.D.A. during the Third Plan period. That, he said, depended on the outcome of the consortium countries' meeting, which will be held in spring, and on the study of the individual projects proposed by the Government of India for securing assistance. Mr. Rucinsky disclosed that some more countries might soon be joining the Aid-India Club. He mentioned Italy, France and the Netherlands in this connection and added that Sweden and Switzerland had also been approached to join it.

Mr. Rucinsky said that at the Paris meeting of the friendly countries in September there was a general discussion on India's Third Plan. The meeting also discussed the question of giving assistance to India on a long-term basis. Besides, giving her loans repayable after 15 years, the meeting also considered giving of assistance by these countries for the import of raw materials and spare parts. Some countries felt that apart from loans for specific projects, untied loans should also be given to India.

He pointed out that the World Bank, which sponsored the Paris meeting, also took up with these friendly countries the question of their removing certain restrictions on the import of Indian goods so as to help her in step up her export earnings.

All these questions, he added, would be further discussed at the coming meeting of these countries, to be held at the end of March. The venue of the meeting would be either Washington or London.

TIN-PLATE INDUSTRY

The Government of India, it is understood, has under consideration instituting of an enquiry into the progress made by the tin-plate industry. The estimated requirements of tin-plates at the end of the Third Plan period are placed at 3,00,000 tons a year, against which capacity licenced so far is about 3,20,000 tons. Apparently, there is no room for creating further capacity in this industry. Further applications for augmenting the capacity would be considered only if the proposed enquiry discloses tardy progress made by the present licencees in their manufacturing programmes.

MANUFACTURE OF TAPE-RECORDERS

The Government, it is learnt, is favourably considering the application of Electronics Ltd., New Delhi, for the grant of a licence to manufacture 5,000 Gram Deck Tape-recorders. The scheme envisages the manufacture of 1,000 tape-recorders in the first year, 3,000 in the second year and 5,000 in the third year of going into production. One condition that may be attached if the licence is granted would be that the firm shall have to start manufacturing recording and playing magnetic heads during the second year of going into production.

SUPPLY OF RAW COAL AND MIDDINGS TO THERMAL POWER STATIONS

The Government has appointed a committee, under the chairmanship of Mr. M. R. Sachdev, Secretary, Union Ministry of Irrigation and Power, for detailed examination of the utilisation of raw coal and middlings from existing washeries and those proposed to be set up during the Third Plan period. The com-

mittee will assess the advocacy of protection envisaged against the requirements of raw coal and middlings for the power generation programme during the Third Plan period, and ensure that such middlings would be consumed in thermal power stations at or near the coal washeries. It will also draw up a time schedule for the establishment of new coal washeries.

The committee consists of eight members, including Mr. M. Hayath, Chairman, Central Water and Power Commission, Mr. Kirpal Singh, Member (Transport), Railway Board, Mr. N. S. Mani, Joint Secretary, Department of Mines and Fuel and representatives of the Planning Commission, the National Coal Development Corporation, Hindustan Steel, and Central Fuel Research Institute, Dhanbad, and Coal Controller, Calcutta.

The report of the Committee is expected to be submitted to the Government by the end of the current month.

It is estimated that about 20 million tons of inferior and low-grade coal will be required for power production by 1965. During the Third Plan period, 17 thermal power stations schemes will be continued from the Second Five-Year Plan. In addition, 26 new schemes are proposed for inclusion in the next Plan.

HOLDING ANNUAL MEETINGS OF COMPANIES

The Department of Company Law Administration has clarified that companies would be granted extension of time up to three months for holding their annual general meetings and presenting the accounts relating to a financial year ending prior to December 28, 1960, when the Companies (Amendment) Act came into force.

This step has been taken to avoid any undue hardship that may be caused to companies by a strict enforcement of the provision in the Amendment Act that the accounts to be laid in any annual general meeting held after December 28, 1960, should relate to a period, not earlier than six months. Companies, which find difficulty in complying with the amended provision in this respect have been advised to apply to the Registrar of Companies for extension of time.

The Department has also clarified that the balance sheets and the profit and loss accounts of companies for financial years ending on a date prior to December 28, 1960, may be drawn up in the old form. In respect of financial years ending on or after December 28, 1960, the accounts must, however, be in accordance with the amended schedule. Under the Amendment Act, private companies are required, in future, to file their profit and loss accounts, along with their balance sheets. The annual accounts filed by a private company after December 28, 1960, must accordingly include its audited profit and loss account. In order to ensure that only the balance sheet of a private company and, not the profit and loss accounts, is accessible to members of the public for inspection, private companies are required to file the profit and loss accounts separately from the balance sheets.

It has also been decided that companies which had failed to file their documents with the Registrar of Companies within the prescribed period, may now request the Registrar to accept these documents. The Registrars are being advised about the additional fee that would have to be paid for such late filing of documents.

COMPANY AFFAIRS

INDIAN OXYGEN

From the report for the year to September 30, 1960, it appears that Indian Oxygen Ltd., registered an increase in sales by over Rs. 91 lakhs over the previous year representing an increase of about 16 per cent. While practically all products contributed towards this rise, the rate of increase was particularly high in the cases of piped oxygen supplies to the steel works, liquid oxygen explosives used in open-cast mining operations and electrodes. The increase in electrode sales was primarily due to the higher level of production at the factory and the introduction of new ranges of special types during the year. The record of the sale of dissolved acetylene was slightly disappointing partly due to delays in orders received from consumers and partly because there was an increased competition and the use of alternative products. The Chairman, Sir John Douglas Keith Brown, has pointed out that calcium carbide, the principal raw material used in the production of dissolved acetylene is being produced in the country to an extent that we do not have to import it but he has observed that the high price of indigenously produced carbide and its lower gas yield are already having an adverse impact on the cost of production of dissolved acetylene.

During the year under review, the Company recorded a profit of Rs. 62.98 lakhs which compares well with a net profit for the previous year of Rs. 53.07 lakhs. These results are considered quite satisfactory by the Chairman. He has, however, added that this industry being a capital-intensive one, as the past experience has demonstrated, there always is the necessity of continuously ploughing back profits to provide for plant replacement at increased cost.

Indian Oxygen has plans for expansion during the Third Plan period and in this connection, the Planning Commission arranged a meeting of major producers and consumers to discuss the requirements of products produced by the company. In the case of industrial oxygen and dissolved acetylene the Company has made arrangements to estimate the possible requirements. In catering for additional oxygen requirements the Company has considered the alternatives of multiplication of plants of similar capacity and also of stepping up the size of each unit as a region progresses industrially. The Company is in a particularly favourable position to fulfil additional requirements of regional development and it can accomplish it by transferring oxygen producing plants from one region to another and installing plants of higher capacity and greater efficiency in regions which by reason of economic advancement require such plants. For instance, oxygen requirements in Calcutta and Jamshedpur regions have been growing apace and an additional oxygen plant was installed in each of the factories in the region.

EASTERN SHIPPING

The Chairman of the Eastern Shipping Corporation Limited has pointed out in his annual report that during the year to March 31, 1960, the Corporation registered an increase in the freight and passenger earnings. From Rs. 2.55 crores earned in 1957-58 the company earned Rs. 2.98 crores during 1958-59. During the year under review a further improvement has been recorded and this year's earnings come to Rs. 3.20

crores, thus, showing an improvement of 7.46 per cent over the previous year's earnings. The increase in freight earnings taken by itself are of the order of 10.17 per cent and has resulted from larger liftings of cargo. The passenger earnings have declined slightly during 1959-60. The Company also recorded a slight increase in the operating expenses; as against Rs. 2.50 crores in the previous year, the expenses registered an increase of about 10.43 per cent and came to about Rs. 2.77 crores. The increase is mainly due to higher wages, marine and light dues, stevedoring, victualling, insurance, commission, etc. There was an increase in depreciation too.

The working results of the Corporation, however, show a loss of Rs. 5.06 lakhs. This unfavourable result is to be attributed to the large number of voyages undertaken by the Corporation which increases the expenditure. Moreover, freight rates during the year under review remained the same and the Corporation was not able to get adequate high-freighted cargoes but had to depend mostly on ores and scrap which are comparatively low freighted.

COMMODITY NEWS AND NOTES

IRON ORE PRODUCTION IN INDIA

The production of iron ore during November, 1960, was 791,000 tonnes, according to the Indian Bureau of Mines.

This brings the total output during January-November, 1960 to 9,726,000 tonnes which was higher by 36 per cent when compared to the output of 7,160,000 tonnes during the corresponding period of the preceding year. Orissa was the chief producing state with an output of 246,000 tonnes followed by Bihar with 229,000 tonnes. Mysore and Madhya Pradesh recorded an output of 148,000 tonnes and 121,000 tonnes respectively while the output from Maharashtra was 27,000 tonnes. During the month despatches of iron ore for consumption in the iron and steel plants totalled 623,000 tonnes while the despatches for export were 232,000 tonnes.

TWO LAKH TONS OF SUGAR RELEASED

The Government of India has decided to release 2 lakh tons of sugar. There will be no release for free sale from the factories in Uttar Pradesh, Bihar and Punjab, except a small quantity which will be released to each factory for sale to its employees. Allotments of sugar to Madhya Pradesh, Rajasthan, Uttar Pradesh, Bihar, West Bengal, Orissa, Madras, Kerala, Maharashtra, Gujarat, Himachal Pradesh, Assam, Manipur and Tripura from factories in the controlled region will be made only to the nominees of the State Governments. In case of Punjab and Jammu & Kashmir, allotments will be made direct to the State Governments or to their nominees. Allotments to Delhi will continue to be made on the existing basis. Allotments will be made at prices fixed under Notification No. GSR 1112/Ess. Com/Sugar dated September 15, 1960 and GSR 1/Ess. Com/Sugar dated January 2, 1961. The controlled ex-factory price for U.P. and North Bihar factories is Rs 37.85 per maund and for factories in Punjab and South Bihar Rs. 38.35 per maund for ISS D-29 grade with the prescribed price differentials for other grades. The fixed f.o.r. destination prices in respect of allotments made to Kanpur and Calcutta will be Rs. 38.60 and Rs. 39.85 per maund respectively for sugar of ISS D-29 grade.

WOOLLEN YARN (PRODUCTION AND DISTRIBUTION CONTROL) ORDER

The Minister of Industry, Mr Manubhai Shah, made the following statement in the Lok Sabha on 13th December in response to a 'Calling Attention Notice' by Messrs. Badakumar Pratap Ganga Deb Barma, S.M. Banerjee and S. Ahmed Mehdi, regarding the difficulties faced by the woollen mills in Northern India consequent on the Government order under the Woollen Yarn (Production and Distribution Control) Order, 1960: "The different sectors of the woollen industry had been facing some difficulty in obtaining their requirements of various types of worsted yarns. The hosiery industry, in particular, was having considerable difficulty in this regard. The question of taking steps to ensure a balanced supply of the different varieties of yarn was considered at length by the Government. In order to ensure this, it was decided that there should be some control on the production of different types of yarn, so that no sector of the industry would be put to undue hardship caused by want of yarn. Therefore, after examining the pattern of production of different types of yarn in the preceding

years, and having regard to the requirements of the various sectors of the industry, it was decided that every manufacturer of worsted yarns should produce weaving, hosiery and knitting yarn in the proportion of 47.5 per cent, 32.5 per cent and 20 per cent, respectively. The Textile Commissioner issued an order under the Woollen Yarn (Production and Distribution Control) Order 1960, directing manufacturers of worsted yarns to follow this pattern of production from October, 1960. It is expected that this pattern of production will ensure a reasonable supply of each type of yarn required by the industry. Representations have been received from a section of the industry, particularly the Composite Mills, that this pattern of production will adversely affect their working, as all the mills may not be equipped with the types of machinery required for producing the different types of yarn and also because this pattern of production will cause difficulties to composite mills, which depend on their own production of yarn for working their weaving units and will create some imbalance in the different sections of the mills. While it may be true, that in some cases, there may be a real difficulty, it is also probable that some mills are averse to following the prescribed pattern of production, as this would stand in the way of their producing greater quantity of particular types of yarn which yield a larger profit. The Textile Commissioner has been asked to examine the case of each individual mill, and on the basis of the capacity of the mill and its requirements of yarn for its own weaving section, if any, to allow the mill to vary the pattern of production to the extent necessary. It is significant that a large section of the industry has welcomed the prescribed pattern of production, and has stated that, as a result of this pattern, the prices of yarn are going down."

PRODUCTION OF PIG IRON

There was more production of pig iron and steel at the Bhilai Steel Works during the month of December, 1960. The Steel Works produced 62,016 tons of pig iron during December 1960, compared to 61,206 tons produced during the preceding month. Production of steel during December 1960 amounted to 41,580 tons compared to 35,871 tons in the month of November. Despatches from Bhilai during December 1960 totalled 32,660 tons of pig iron and 33,096 tons of steel billets. The Steel Works also produced 988 tons of ammonium sulphate fertilizer and 2,670 tons of crude tar. Nearly 2,257 tons of crude tar and 917 tons of ammonium sulphate fertilizer were despatched from Bhilai to consumers during the month.

REVISION OF SUGAR PRICE FORMULA

The Tariff Commission has issued a questionnaire on the revision of the sugar price linking formula for determining the amount to be paid by the industry to the cane growers. The Government of India had referred the matter to the Tariff Commission in October last. The basic principle of the formula which has been in operation from 1958-59 on an all-India basis is that the growers supplying cane to a sugar factory, share with the factory owners the net sugar price realized by the latter during the year in the same ratio as the cost of cane bears to the factory's cost of production of sugar during that year, excluding taxes.

JANUARY 27, 1961

The Prime Minister

THE news first appearing in a report of the London correspondent of the *Daily Herald*, following an interview with the Prime Minister Jawaharlal Nehru, about his contemplated retirement, has naturally struck the headlines. For two days speculation was widespread, and it was only on the evening of January 24 that the Prime Minister issued a statement to the Press indicating that he had no "immediate" intention to retire. Unfortunately, the original report was so worded, and the subsequent denial so brief, without any adequate explanation as to why the original statement was made, that speculation continues. It is obvious that the Prime Minister is not withdrawing immediately, but the view is being held in Delhi that he cannot continue in office for any very long period, and many believe, to use his own words, that his retirement would be good both for himself and for the country. The only question now is: When?

On the issue of timing, there is much to be said for the Prime Minister's staying in office for the whole of the current year. In the first place, there is the problem of China; in the second, there is the finalisation of the Third Plan, with many problems of international relations connected therewith. With the new Democratic administration in the United States and the possibility for a new thaw in the cold-war, India obviously has some constructive role to play and this cannot be done without the international standing of Jawaharlal Nehru. Finally, and perhaps most important of all, domestic problems, which include the Punjab and Assam, and the Congress rifts in Uttar Pradesh and Mysore, require his intervention as from a seat of power and not in an advisory capacity. All in all, therefore, the balance of advantage seems to lie in the Prime Minister's not abandoning office before March 1962. On the other hand, deeply as he will be missed, it would not be an advantage if the Prime Minister remained in office for an indefinite time after 1962. For one thing, at his present age—*notwithstanding what he describes as his "distastefully healthy" physical condition*—the country must get used to the idea of transmission of power from those who are aged to those who are middle-aged. The process of continuity or "normalcy" in political life otherwise will never be established. There are already too many aged people in the Central Government. Rumour has been current in Delhi that Mr. Sanjiva Reddy's resignation, that high office should not be held by

Congressmen for more than ten years, has not been well received in the highest circles of the country, and it is even understood that there are some Members of Parliament who are canvassing a third term for the President. This is an error in the President's state of failing health. There are undertones and overtones both in respect of the President and the Prime Minister, but these will only grow greater if there should be any suspicion that either of them intends to stay on indefinitely in office, waiting only for death to end their active career. Both have an active role to play in an advisory capacity, while younger men are made to broaden their shoulders to the task, with the country getting used to a normal political life without the protection of the heroes of the Revolution.

An issue of principle thus overrides personal choice in this matter. It would be a misfortune if the Prime Minister of India were, for the second time, to create the impression that speculation is raised by him on his retirement only to demonstrate his "indispensability". India would be a poor country, indeed, if any man, however eminent in public life and howsoever central in its administration, were so regarded, for immortality has been granted to no man, however great his role in history. Many will view the departure of Jawaharlal Nehru, when it comes, as a major historical misfortune. This it will not be. Or if it is to be, then India is unworthy of the democratic process which is to find leaders equal to her tasks in every generation. The Prime Minister himself has already ruled India with almost exclusive power for an Indian generation of fifteen years. It is wholly proper that as a matter of principle, rule by one man should not, under any circumstances, be extended over so long a period. This is not because Jawaharlal Nehru has been corrupted by power. Indeed, there are few men in all history who have been less corrupted. But it is bad for the people of India, for such a long period, to let major decisions—good and bad—be made by one man, for the capacity of decision making grows upon by what it feeds upon, and is easily killed by a failure to tread the hard journey of trial and error. Even if Jawaharlal Nehru is not like a banyan tree—preventing the growth of talent of the highest calibre—the fact remains that the highest calibre has not been able to display itself yet amongst men of middle-age in the Congress Party. Equally, it is wholly wrong that particular members of the Cabinet should have

no constituency except the Prime Minister himself. Undoubtedly, the character of India's administration would be more "normal" in every way if the Cabinet were composed of men with their own followings and it was not dominated by personality as supreme in every way as that of Jawaharlal Nehru has been over the last decade.

All in all, therefore, while one should record with satisfaction that the transition is not to be immediate, one should observe that this is time for preparation for a change in the most important office in the Indian Union. In wishing for this change, no disrespect of any kind can be intended for Jawaharlal Nehru whose towering personality

and prestige have been amply demonstrated in the year which has ended. Equally, however, the country should not be belittled by the idea that one man alone keeps its affairs from disorganisation and ruin. It is good, as the Prime Minister has said in the interview to the correspondent of the *Daily Herald*, both for the country and himself that the office of the Prime Minister should, in a relatively short period, be transmitted to a man who will have the opportunity to show that leadership, like so much else, is not a monolithic gift of God, reserved only for heroes of a revolution. For that, surely, is the path to a revolution, without a hero and without design.

The Case for Road Development

IT is a pity that the case for a moderate programme of road development, which is so evident and so cogently argued on quite a number of appropriate occasions, should need to be re-stated. But pressures of political expediency, as demonstrated by the questionable concessions made to the State Governments in their clamour for ambitious outlays on their plans, threaten to distort the correct perspective in planning and put priority programmes like road development on the defensive. The loss of perspective is vividly reflected in the enlargement of the size of the Third Plan in disregard of the superior claims of the infra-structure of the economy. The reverse process of a downward revision of the allocation of outlays for roads ironically typifies this trend.

The Draft of the Third Plan makes the admission that the provision of Rs. 250 crores made for roads is inadequate. The least that was expected was to adhere to the parsimonious provision made in the Draft. But astonishingly enough, while the size of the total outlay has now been raised from Rs. 7,200 crores in the Draft to Rs. 7,500 crores, the allotment for road development is proposed to be cut by Rs. 20 crores to about Rs. 230 crores. This process of pumping larger allocations at favoured points and pruning them at strategic points is apparently unconcerned with the prospect of an ill-provided infra-structure throttling the progress of expansion programmes in other sectors.

It is by no means too late at this stage to heed the advice emanating from those whose technical competence to give it is not open to question. It is in this light that the address of Mr. H. P. Sinha, President of the Indian Roads Congress, and Consulting Engineer (Road Development) to the Government of India, at the recent annual session of the Congress, is to be interpreted. In stating the case for an adequate, but by no means ambitious, plan for road development, Mr. Sinha has taken the opportunity of expounding the rationale of the Master Plan for Roads (1961-1981) drawn up by the Chief Engineers of States. While this plan has won the approval of the Government—in principle—it seems as though it is being overlooked even before it could get off to a start.

Mr. Sinha's approach to the question of road development in the Third Plan is matter-of-fact, but forthright. He urges that planning for roads in the next five years need not await the formulation of a long-term policy for the development of overall transport. Inevitably it will take time. He views the case for road expansion at the ob-

jective level in the immediate context. The plain facts are that roads claim at the present time the movement of hardly 10 per cent of the country's goods traffic in terms of ton-miles, while its potential capacity is substantially higher. At the beginning of the Third Plan, railways will be unable to provide capacity for transporting 20 million tons of traffic with an average lead of 300 miles. This gap can be effectively covered by road transport and in any case it represents the existing scope for expansion of roads. The talk about road-rail co-ordination, particularly in respect of medium distance high-rated traffic, need not be brushed aside; but at the same time it ought not to be allowed to hold up provision of transport capacity which the railways are demonstrably not in a position to offer. Even the Master Plan (1961-1981) assumes that the distribution of freight traffic that should be allocated to railways and roads could be made in the ratio of 2:1. In view of this recognition of the primary importance of railways as the premier mode of transport, they would do well to shed their fear complex about the expansion and competition of road transport.

The outlay of Rs. 5,200 crores for development and Rs. 1,350 crores for maintenance proposed by the Chief Engineers over the period of twenty years is not to be apportioned in four equal amounts during the next four Five-Year Plans. But starting with Rs. 500 crores in the Third Five-Year Plan, it is to be raised with steeper progression in the subsequent Plans. From Rs. 250 crores in the Draft Plan (now proposed to be reduced to Rs. 230 crores) to Rs. 590 crores may seem a far cry. But finance for road development should not really pose an insuperable problem. Road development can be made largely self-sustaining.

During the last three years, expenditure on road development and maintenance was kept far below the revenue of the Centre and States from road transport. The respective figures for 1959-60 were Rs. 84.7 crores and Rs. 134.5 crores. This is not to say that the entire revenue should be spent on roads. For the Third Plan period, road revenue has been put, on a conservative estimate, at Rs. 900 crores. The outlay of Rs. 590 crores is to be considered in relation to the anticipated revenue of this magnitude. Of course, the assumption behind this estimate of revenue is that adequate fleets of vehicles will be put on the roads to exploit the traffic potential. This is by no means an unpractical assumption. What applies to railways ought to apply to roads. Railway expansion is never conceivable without adequate expansion of rolling stock. Likewise, it is absurd to envisage road development without adequate growth of motor transport services.

Guest Editorial

The Economic War Against Hunger

By William Rees-Mogg

ONE of the remarkable contrasts in the World at present is that the strength of both the Communist and the capitalist systems lies where one least expects it. Communism is supposed to appeal to underdeveloped countries as their way of making, under conditions of ruthless regimentation, a break through into modern industrial conditions. In fact, the only real example of this happening is Russia which already had a very high rate of industrial growth in the first years of this century. Nevertheless, the attraction of Communism is that it promises a break through of this kind.

On the other hand, capitalism is thought of as an admirable system for more advanced countries where the standard of living is so high that the problem of consumer choice is more important than production at any cost. It is also regarded as a preferable system for regulating the division of resources in a highly complex industrial system, where its emphasis on profitability creates a greater cost-consciousness.

No doubt there is something in this view, which is certainly a widely held assumption. Yet the most interesting point at present is that the Communist countries seem to have solved the problem of growth economics in an advanced economy, while the capitalist countries seem to have solved the problem of applying advanced technology to agriculture.

Certainly neither point is absolute. The Japanese record of economic growth is at least as good as that of any Communist country, and probably better than any. The industrial production of Japan is double that of 1955, which compares more than favourably with the 10 per cent increase in the United States. But even if Japan and Europe show capitalism producing growth economies able to match the Communist, the fact is that the largest capitalist power, with its immense reserve of investment capacity, has hardly produced any economic growth at all in recent years.

Equally, however, the Communist system has a deplorable record of agricultural failure. China has this year suffered from traditional calamities of climate, a disaster for which the Government can scarcely be blamed. Yet after twelve years of Communist rule China seems as vulnerable to famine as it was under the despised Kuomintang regime.

In Russia Mr. Khrushchev made a most important speech on January 20. He promised to raise living standards and to devote more resources to the production of consumer goods. This

no doubt can and will be done. He then went on to criticise the farm programme. The Ministry of Agriculture is being re-organised and the level and rate of growth of Soviet agricultural production is too low. He pointed to the need for "providing a more solid scientific foundation for the organisation of agricultural production." The failure of their farm policies has, of course, been a source of concern to Soviet economic planners for forty years, and was one cause of the brutally imposed famine under Stalin during the period of liquidation of the Kulaks.

The American position, and even the British, is entirely different. There the problem is that rapidly rising agricultural productivity tends to produce surpluses which cannot be disposed of without the disruption of markets. The granaries of America are full of an almost unlimited quantity of grain.

It is this which lends particular force to the speech that President Kennedy made at his inauguration. Important as new investment capacity is the provision of food is even more important. But for the agricultural productivity of the advanced capitalist countries the whole world would face recurrent and major famines. President Kennedy's struggle against "the common enemies of man: tyranny, poverty, disease and war itself", would be almost meaningless if the United States was not in such a strong position to lead the struggle against hunger.

There remains the important question why the capitalist countries should have such a remarkable agricultural record. It is undoubtedly based on productivity. About 12 per cent of Americans live on the farm, and about 45 per cent of Russians. The American farmers produce a massive surplus after providing a very high standard of feeding for their fellow countrymen. The Russians provide a small and fluctuating surplus after a considerably lower provision at home.

The best available hypothesis for the difference in productivity, which seems to be wider than that found in industry, is that Communism tends to keep farm workers on earnings which encourage the wasteful use of labour. If labour is wasted then paradoxically farm efficiency suffers; low productivity per man goes hand in hand with low productivity per acre. While the farm workers do still provide an immensely large labour reserve for Russian industry, the wastage of manpower on Russian farms stems almost inevitably from the neglect of costing, and the inability to assess true costs of an economy which divorces itself from the ordinary market measure of prices.

A DELHI DIARY

THE QUEEN IN DELHI

LET me—as becomes an honest journalist—confess at least to one of the errors of my ways. Last week I prophesied an all-time peak in traffic jams with the arrival of the Queen. As things turned out on Saturday, by some miracle, which no one has yet explained, there was no suggestion of a jam anywhere; and although the crowd has been estimated between one and two million people (depending on the newspaper you read!), there was never a feeling of rush or a stampede that the eye could see or the mind could inwardly discover. The procession (or motorcade) sailed on according to schedule up to Willingdon Crescent, and then ten minutes ahead of schedule so that the Queen and the Duke had a breathing-space before they were ushered into lunch. Rumour has it that the breathing space was used for a cup of tea—surely an unusual beverage immediately before lunch. But this is running true to a Royal tradition. I recall that when Queen Mary was involved in a car accident in her seventieth year, she emerged from the wreck and asked calmly "for a good cup of tea." Whether the appropriate response after an air journey from London to Delhi and an hour-long procession, including many handshakes and a very formal speech, is a cup of tea or not, I leave to leaders of etiquette and the makers of fashion, amongst others, in the beverage world. All I can say at the present time is that the Tea Board has a magnificent opportunity of cashing in on what seems to have happened at the hour of 1.00 p.m. on Saturday, January 21, 1961.

LORD ALTRINCHAM WRONG

The Queen was in good form all the way from Palam to Rashtrapati Bhavan. Her smile was natural; apparently, there were no regrets at her not being Empress of India. The Duke waved with a fortitude which recalled the vigour of his first official visit, and the crowds were obviously very nappy at seeing young people, both happy themselves, and genuinely happy at being so warmly welcomed. Some people have evolved a theory that this has been such a tremendous reception, largely because Queen Elizabeth is a young woman and has romance of her own, apart from being the most important monarch in our crumbling twentieth century world. They used to say many years ago in England that there were only two institutions which would see the country through all revolutionary changes. The first was the monarchy, and the second the Bank of England. I shall not express myself on the Bank of England, but the monarchy, it seems to me, is as safe as anything I know in that very conservative country, which now chooses a Lord to be Governor of the Bank of England as well as Foreign Secretary.

People have often said, and some of these whispers have reached India, that Buckingham Palace at this age and time was moulded too much in the Georgian tradition of remoteness from the people. Lord Altrincham, of English and Scottish Review fame, made himself very unpopular some years ago—and, incidentally, got a box on the nose in an outburst of personal temper—when he criticized the Queen's deportment and manner. My first impression is that Lord Altrincham is now completely out-of-date, if there was ever any force in his contention. The free and easy manner in which the Queen and the Duke have moved about in the two days in which I have seen them, shows a natural communion with people which cannot have been created merely for the Indian visit. Those of us who were at the Press Reception on Saturday evening

were much struck by the gracious naturalness with which they conversed with the members of the 'fourth estate' which had, inevitably, various degrees of sophistication. They were at home with all and the meeting conveyed, at least to my mind, a lasting impression that they have natural warmth with dignity. Perhaps, the British monarchy has stooped to conquer; but many of us in Delhi at least were conquered.

The essence of this particular meeting was the fact that it was not excessively organized. Great tributes have been paid to the Protocol Section of the Ministry of External Affairs; I do not wish here to strike a discordant note. But I do feel the more protocol enters into relationships—diplomatic or other—the less normal they become in a human sense, which is a straight equality between man and man, woman and man and (if possible!) woman and woman. I understand the need for formal introductions, but the support of Prince Philip and the Queen by the Minister of Information on the one hand and the High Commissioner for India on the other was, I think, not absolutely necessary for a meeting with members of the Press. It gave an impression, to me at least, of officiousness in what might otherwise have been a more relaxed and informal occasion. The Fourth Estate should not depend on any other.

May I say that on the whole, however, the occasion was markedly successful with some pressmen elated at the fact they were the first to be invited to a reception to the Queen. I hope, that the Queen and the Duke, finding a level of sophistication different from that of the Fleet Street Press that they ordinarily meet, have also become earthier by the contact. May I more daringly express the hope that protocol and officialdom over the rest of the tour will be subdued a little further to let them mix more intimately with the Indian people? Perhaps, I am unnecessarily in revolt with officialdom. But I have a good precedent. One of the reasons why I so admire the Prime Minister's approach to the people is that he refuses to be bound by officialdom, anxious to "protect" him from the Indian people. I understand there are risks involved, but they are there in any case. The intervention of official intermediaries, who are anxious to "organise" the people, is always a mistake in our age and time.

THE PROTOCOL TIGHTROPE

Talking about protocol, an interesting piece of tightrope walking was maintained at Jaipur where the Queen and the Duke were on Monday this week. To the protocol pundits it was obvious that the Queen could not, at Jaipur, stay with the Maharaja since she was the guest of the Government of India and Government House was in readiness for her reception. On the other hand, the Maharaja of Jaipur and the Queen and Duke were old friends and not to give the Maharaja the opportunity to offer hospitality would be a lapse of 'noblesse oblige.' The compromise reached was skilful in the extreme. The Governor received the Queen and the Duke at Sangener airport and (shades of viceregal protocol!) the Maharaja was a pace behind. Lunch was at Government House, but dinner was with the Maharaja. After the Queen and the Duke had got on to a special train, apparently protocol permitted them to be the exclusive guests of the Maharaja of Jaipur. Since the Sawai Madhopur forests are more or less a shooting preserve of the Maharaja, no more was heard of the Governor for some time, and thus, it seems, the uneasy partnership between the old and the new was maintained.

ARGUS

THE WEEK'S NOTES

Education

DR. SHRIMALI'S PLANS AND PROPOSALS

THE PRESIDENTIAL address of Dr K. L. Shrimali, the Union Education Minister, at the 28th meeting of the Central Advisory Board of Education held in New Delhi last week, reminds one of another long list of impressive figures that seeks to congratulate one's own self. He gives us an impressive record of what his Ministry achieved during his tenure of office. But one fails to understand why does he not go deeper into a problem and try to solve it. For example, he mentions that "by the end of the Third Plan, number of schools is expected to increase to four lakhs." This is impressive; but has India got sufficient number of trained teachers to man these schools? Of course, Dr Shrimali pats himself by saying that not only there has been expansion of educational institutions but there is also every indication to show that standards of education have risen. He claims that the remuneration of the primary teachers has risen considerably and their minimum qualifications have been raised. As regards considerable increase in the remuneration of primary teachers, is he sure that the increase in wages has matched the increase in cost of living? Is he aware that though minimum qualifications for recruitment of teachers have been revised upward in the statute books, very often teachers have to be recruited who do not satisfy these qualifications, specially in some of the educationally backward States? He also claims that the percentage of primary teachers, who are matriculates, has risen from 8 per cent in 1947-48 to 40 per cent in 1960; but often reports are available to the effect that these matriculates are no better than many middle-pass students of pre-war days.

Dr Shrimali gives us great hopes of improving the quality of education at all levels by research, experiments and by opening many institutions for the training of teachers with the active collaboration of State Governments. But no one knows how long it will take to arrive at a settlement between the Central and the State Governments and to implement the schemes. Past experience points to the possibility that it will be a couple of years before these things are sorted out and it would not be before the end of the Third Plan that results of research and trained teachers would be forthcoming. True to the spirit of a Minister, he is very hopeful about everything and sets his goals of physical achievements very high. But he does not try to weigh his goals with means available. It will indeed give one great pleasure to see his plans get through in practice. But at this stage one cannot help but being a bit sceptical about the whole affair.

One last thing need to be said about the fall in standards of education in recent times. Any such talk seems to annoy and disturb the Education Minister so much that he makes a feeble plea for not criticising the educational system. He says that "standards" meant mainly students' capacity to read, speak and write English under the British rule. But now the education system is to be gradually geared to meet the demands of the society, and he claims that our educational system is achieving this goal. How far our education system is training young minds to make them suitable for the growing needs of the society or the objective standard which Dr Shrimali has in mind while judging the efficacy of the education system is anyone's guess. But one thing is certain: the capacity of students at a certain level of education to read, write and speak not only English but even their mother-tongue is deteriorating. What spiritual and intellectual values are being acquired at the schools or universities are not known to us and Dr Shrimali does not enlighten us on this point. From the Education Minister one

would expect more of heart-searching, self-criticism and practical determination to overcome problems and face issues rather than trying to impress the voter by statistics and pious hopes of doing wonderful things at a future date.

Laos

CAMBODIA'S GESTURE

THE REPORTED withdrawal by Prince Norodom Sihanouk, the Cambodian Head of the State, of his proposal to call for a 14-nation conference to resolve the Laos tangle should pave the way for reconvening of the International Supervisory Commission for Laos as advocated by Prime Minister Nehru. Press reports suggest that Mr. Harold Macmillan, the British Prime Minister, is agreeable to follow Mr. Nehru's advice in this respect. Mr. Nikita S. Khrushchev, the Russian Prime Minister, would also be inclined to accept this proposition provided the issue of recognition of the Prime Minister of Laos on whose request the Commission would be reconvened is resolved. Mr. Khrushchev is reported to be of the view that the present Prime Minister of Laos, Mr. Boun Oum, has no locus standi as long as Prince Souvanna Phouma does not resign. But this tangle is proposed to be resolved through recognition of the legitimate authority of the King who is the Head of the State of Laos.

Whether the reactivation of the International Supervisory Commission will ultimately lead to an end of the Cold War that has engulfed Laos, it will obviously help in extinguishing the blaze that has broken out in this country. As the embers die during the truce period, second thoughts can be had whether Laos should follow a policy of neutrality between the two power blocs or should be pro-West as wanted by the present regime there. The continuation of the current hostilities between General Phoumi Nosvan's forces and those of the Pathet Lao will involve this country in a fratricidal war the consequences of which can be well imagined. In India, of course, there will be great sympathy for Laos being treated as a neutral country on the periphery of the Communist World in South-East Asia. This point was well recognised in the Geneva Conference, held in 1954 under the co-chairmanship of Britain and Russia, which brought peace to the troubled Indo-China States. It needs to be reiterated again. If neutrality of Austria, on the periphery of the Communist world in Europe, can be respected by both the Western Powers and the Communist Bloc, it passes one's comprehension why Laos should not be helped to maintain its neutrality in South-East Asia.

Algeria

NEGOTIATIONS POSSIBLE

THE DECLARATION of Mr Ferhat Abbas, head of the Algerian "Provisional Government," that his Government would be willing to open negotiations with the French Government over the future of Algeria is in direct contrast with the Algerian leader's attitude last year. This is a considered reaction to the recent referendum which gave President de Gaulle an overwhelming majority in favour of his peace and self-determination policy in Algeria. Though the Algerian liberation movement is now willing in principle to enter into peace talks, it is less certain that such talks, once started, will end the guerilla fighting in Algeria.

Meanwhile, the U.S. Charge d'Affaires, Mr Cecil Lyon, said in Paris that President de Gaulle was the man best placed to solve the Algeria problem and that the best way for him to do it was without American interference. The General, as soon as the results of the

referendum were out, stated that he would put into operation his plans for Algerian "self Government" and also enter into negotiations with the rebels as soon as Algeria had voted, in a second referendum, on self-determination. Mr Abbas and his "Government" rightly insist that the true feelings of the Algerians can be discovered only at a genuinely free referendum. This would be considered genuine only when the French Armed Forces have nothing to do with it. What is required in Algeria is an immediate cease-fire, so that further negotiations might continue in a suitable atmosphere. It is hoped that the present secret, somewhat tentative, negotiations will lead to a cease-fire and ultimately to self-determination in the troubled Algeria.

Export

WHY THIS TARDY RISE

ALTHOUGH INDIA'S exports registered a small rise of about Rs. 16 crores over last year, the rise during the past four years worked out to only a little over three per cent., in comparison to world export trade, which registered a rise of 37% during the same period. The value of world exports in 1959, in fact, registered an all time record of 103,000 million dollars, an increase of more than six per cent over the figure of 1957. What are the factors which have brought about this slow progress in our exports? An answer to this poser was provided by Mr Babubhai C. Shroff, President of the All India Exporters' Chamber, at the half-yearly general meeting of the Chamber last week, in Bombay.

There are many factors, internal as well as external, which are responsible for this stagnation in exports, he said. Among external factors, he listed the tendency to form regional economic groupings, such as the European Common Market of the six countries and the Free Trade Area commonly known as the Outer Seven. While the forming of these new groups was not very healthy for the free flow of trade generally, he observed, it posed a positive threat to the exports of developing countries like ours. Another equally disturbing symptom, Mr Shroff remarked, was the recent announcement made by Arab countries to start their own economic grouping. Since most of our natural markets are in Asia and Africa, such groupings are bound adversely to affect exports from India to these countries.

The other adverse factors mentioned by the A.I.E.C. President were (a) foreign competition, which was mainly coming from the industrially developed countries of the world against our products, (b) growth of new industries in South-East Asian and African countries which had embarked upon ambitious industrial programmes in collaboration with the highly industrialised countries, again resulting in reduced exports of some of our traditional items, and (c) import restrictions and tariffs placed by some countries.

Among the internal factors responsible for the poor showing on our export front, Mr Babubhai mentioned the vagaries of sales tax administration by different State Governments, the recent amalgamation of excise duty and sales tax (ostensibly to avoid duplicate work) and the delay involved in bureaucratic red tape.

One has yet to assess accurately the net advantage that has accrued to the country by way of foreign exchange earnings as a result of the so-called export incentives. But, in the meanwhile, the scheme has created enough heartburns, if not complications. For instance, Mr Babubhai complained that the export incentives were not equitably distributed as between the manufacturers and the exporters. While the manufacturers took away a major share, he alleged, the exporters who put in about ninety per cent of labour and took all the initiative were given only a negligible part of the benefit. This, he was afraid, would leave very little impetus to the exporters. Accordingly, he urged the Government to go into the matter, with a view to increasing substantially the extent of incentives to exporters. These exporters, he maintained, had been conducting their business against heavy odds and then too with only a meagre profit margin.

Another important point made by Mr. Babubhai was that the system of barter trade, which had not been thrown open to individual business men yet, should be extended to them atleast hereafter. According to him, private traders, with their vast experience of world markets and fluctuating prices, would be able to show better results than any State venture. While on this point, he also demanded that the functions and scope of the State Trading Corporation should be more clearly defined in order to remove all uncertainty in the minds of the private traders.

The World Abroad

JAWAHARLAL NEHRU IN SEARCH OF GOD

By ODYSSEUS

MR. R. K. KARANJIA has just published "The Mind of Mr. Nehru" (Allen & Unwin. 1960. Price 10sh. 6d.), ten tape-recorded, widely roving conversations with our Prime Minister. By so doing he has placed all students of Indian affairs in his debt. Mr. Karanjia throws more light on Mr. Nehru's personality, thought, and approach to contemporary problems than any of the eight biographies, all of which I have read, listed in the useful appendix. I commend this book to Mr. Nehru's admirers and critics alike, in India and abroad, because I think that many will find that they have been admiring, or criticising, him for beliefs that we attribute to him because he calls himself a Socialist, and this whether we are, or are not, Socialist, colours our own thinking about him.

Mr Karanjia has succeeded where so many others have failed, or at least not succeeded so well, because he is a convinced Marxist. Mr. Nehru's replies to Mr. Karanjia's courteous but unflinching cross-examination reveal that if ever he was a Marxist, he is certainly not one today. But since Mr. Nehru talks the same language, and is in ideological rapport with Mr. Karanjia, he feels free to speak his mind frankly, whereas the same questions put by a professing Capitalist would have put Mr. Nehru on his guard, suspicious that his replies would be misunderstood, misinterpreted, and exploited against him.

Mr. Karanjia comes to grips with basic issues when he tells Mr. Nehru that the problem for India is to mobilize the masses to support the Five-Year Plan. This, Mr Karanjia urges, makes imperative certain institutional changes, such as a new political leadership, new administrative machinery based on essentials like service co-operatives, and the mobilization of at least a million "cadres" (euphemism for party officials, bosses, natchaniks, stakhanovites, komsomols, partogs, N.K.V.D.'s etc.... See "My Friend Vassia" by Jean Rounault. Rupert Hart Davis. London. 1952), necessary for a vast country like India to get the masses to co-operate in development projects.

TOTALITARIANISM OR DEMOCRACY?

To this, Mr Nehru replies forthrightly that the alternatives are either (1) the authoritarian way, i.e., in which the government, or a group of persons having power in the country and representing the government, impose their wishes on the people, make them work harder than they normally would, in ways that they dislike, and under pressure. Or (2) the democratic way, which means inducing the people by appeal and persuasion to co-operate because they are brought to realize that they will benefit. It is not so difficult to build an industrial plant, but when you come to agriculture—basic to India—you can't get far by authoritarian impositions. You must make the people self-reliant. That is why, Mr Nehru explains, he attaches importance to the Gram Panchayats, Samitis, and Jillah Parishads, which decentralize and hand responsibilities over to the people. The real "cadres" are being built at the village, not the party, level.

Other institutional changes, Mr. Nehru explains, are also coming about at the top, though slowly, because the risk is that in bringing about major institutional changes quickly, you may stop the wheels working altogether.

Mr. Karanjia suggests that whereas the Chinese revolution was a break with the past, the peaceful transfer of power prevented India from abolishing an archaic governmental and social structure. Mr. Nehru

replies that the peaceful transfer of power influenced independent India for both good and bad. He feels that, on the whole, it was better that India had to take the good and bad along with her. Gandhiji promoted the revolution in terms of continuity, as opposed to a violent break. This was unique because most revolutions are conceived in terms of violence. "The peaceful transfer of power has been a great stabilizing factor....."

Urged to explain his views on Marxism, Mr. Nehru says that, although the Marxist analysis illuminated the past, it no longer applies today. Marxism was the outcome of the English Industrial Revolution, the special conditions of which have not been repeated elsewhere. Because he thought that there was no democracy in 19th century England (a belief apparently shared by Mr. Nehru), Marx concluded that the condition of the masses could not be improved without revolution.

Mr. Nehru concedes that if you do not allow for the march of political democracy and trades unionism, the Marxist analysis is correct "in vacuo". But history has proved Marx wrong. Political democracy and trade unions have made peaceful change possible. As a matter of fact (this is my comment, not Mr. Nehru's), Marx's analysis was already out of date when he published "Das Kapital" in 1873. The political Reforms Acts of 1832, 1866, and 1867 had been passed; the Corn Laws abolished in 1846; a series of Factory Acts controlled working conditions; the co-operative movement had been originated at Rochdale in 1844; trade unions, legal since 1824, got into full swing between 1850/72. However, without rubbing it in that Marxist ideology was already anachronistic when it swept the world, my guess is that Comrade Khrushchev would agree heartily with Mr. Nehru that in 1961 Marx's analysis is an historical curiosity. On the other hand, reading between the lines, I suspect that Mr. Karanjia would support Comrade Mao Tse-tung in disagreeing.

Mr. Karanjia suggests that since there are landless workers in India today earning only Rs. 5 a month, they should be mobilized on large state farms. Mr. Nehru realistically answers that there are more rural workers today than the land requires. It is this excess population which has been reducing India to poverty for over a century. If you mechanize Indian farms in the Soviet manner, you displace peasants, who then have no work, which creates social problems without increasing production. Mechanization works in the USSR because the USSR is underpopulated. India's agricultural policy is to promote co-operatives of small farmers, following the example of Japan which, with small farmers, enjoys one of the world's highest agricultural outputs.

Is Mr. Nehru a Socialist? "Basically", Mr. Nehru replies, "we have adopted a Socialist ideal upon a planned co-operative economy, not Socialist in any rigid or dogmatic meaning of the word, but in a sense that is flexible and pragmatic.....Modern thinking all over the world is increasingly becoming Socialist and only people who have lost touch with contemporary trends can think otherwise. At the same time, I refuse to accept any particular dogma of Socialism.....to be rigid about the formal pattern....." As to the means of attaining Socialism, "We have chosen Parliamentary democracy.....because it produces the best results in the long run....." Mr. Nehru rejects capitalism ("Although it is changing all the time"), because he

says, it sticks to its basic grab instinct and tends to monopolies and aggregation of economic power.

MR. NEHRU'S REALISM IN FOREIGN POLICY

Scattered throughout these fascinating 106 pages are repeated evidences of Mr. Nehru's realism. "Foreign policy," he says, "depends ultimately on internal conditions and developments. Internal solidarity and solvency are, therefore, necessary if we are to play any effective role in world affairs." And in another connexion he says: "The Bandung powers can meet, of course, and pass pious resolutions but will that bring any result? ... Some of the Bandung powers are pulling in a dozen different directions."

Mr. Karanjia asks Mr. Nehru about the Chinese allegation that India, having recognized Tibet as a province of China, had interfered in China's domestic affairs. Mr. Nehru replies that India has not interfered but merely tried to persuade the Chinese that it is impossible to make good Communists of Tibetans by force and that persuasion is better. "We agree with them that the rebellion, as such, must be crushed, but repression is another matter." It creates a crisis which sends refugees into India. The distinction between "crushing" and "repressing" is a nice one and I like Mr. Karanjia's follow-up question: What would you have done if you had been P.M. of China? Mr. Nehru's answer is significant. "I would forget Communism, slow down the pace of reform, and first of all try to create understanding."

As a good Marxist, Mr. Karanjia tells Mr. Nehru that fears are expressed in many (presumably leftist) quarters that India's link with the Commonwealth might obstruct our leadership of newly liberated Asia and Africa and blunt our protest against racial and

fascist developments. Mr. Nehru answers: "We do not suffer from any such obstructions. ... I have myself denounced S. African racialism from London itself. ... One important factor about the Commonwealth association is that it reverses the other process of military or economic blocking-together for the purposes of the cold war. It has a certain warmth of approach about it. ... Although individual Commonwealth members have different approaches, the overall Commonwealth approach to controversial problems is nevertheless a friendly one, which helps to tone down friction and difficulties. The Commonwealth link does not affect India's association with the resurgence of Asia and Africa, nor does it restrict this historical development: on the contrary, it helps it."

In the course of their talks, Mr. Nehru refers to spiritual solutions. Marxists do not believe in God, and Mr. Karanjia puts the question squarely: "Isn't that unlike the Jawaharlal of yesterday to talk in terms of ethical and spiritual solutions? What you say raises visions of Mr. Nehru in search of God in the evening of his life." Mr. Nehru replies ".... Yes, I have changed. The emphasis on ethical and spiritual solutions is not unconscious. ... I believe the human mind is hungry for something deeper in terms of moral and spiritual development, without which all the material advance may not be worthwhile. ... The old Hindu idea that there is a divine essence in the world, and every individual possesses something of it and can develop it, appeals to me. ... Mr. Nehru may care to be reminded that Pascal puts these words in the mouth of God: "Comfort yourself. You would not seek me if you had not found me."

Next week, I offer some comments on Mr. Nehru's concept of Socialism.

The European Scene

FREE TRADE AND EUROPEAN UNITY

From Our Special West European Correspondent

PARIS, Jan. 21.

INDIAN exporters do not need to be told that much of the talk about free trade heard in Europe in recent years is accompanied by tacit but very firm reservations. European countries are willing to trade more freely in certain articles but not in others, to trade more freely with certain countries but not with others, to trade more freely on certain conditions (e.g. "equality of the conditions of competition") but not on others. Specifically, their free-trade liberalism does not run to opening their frontiers to all foreign textiles and agricultural produce; nor to granting Japan free access to their markets; nor, in the case of the Continental Six, to trading freely with countries that refuse the social and fiscal obligations of the Common Market Treaty. So, although it is wrapped up in the rhetoric of 19th century free-trade liberalism, the new European trade philosophy includes some very substantial amendments to that dead doctrine. In particular, before accepting the statement that country A produces an article better and more cheaply than country B (and then jumping to the conclusion that B should stop making it and import from A), Europeans now ask why A manages to do this. If the answer is that A pays lower wages because its labour is content with lower living standards, or that it uses women to make the article and does not pay them equal wages with men, then the retort will probably be: let A and B first equalise the conditions of competition, and then we'll see who does the job better, and draw our conclusions about a division of labour thereafter.

When this report is addressed by a European country to India, it constitutes, of course, a blank refusal to trade freely because it means telling India to achieve European living standards without increasing her exports, whereas an increase in exports is a necessary condition of an improvement of living standards. It makes more sense when applied to neighbouring countries of comparable economic development, and indeed the Common Market consists in just such an application. West German electronic equipment is today cheaper than French, but it would be foolish to conclude that the French should wind up their electronics industry in favour of German imports without first seeing whether this would still be the case if the Germans paid women (who do most of the fine assembling of electronic parts) men's wages, as the French producers do. This is only one of the things that can cause an apparent advantage over a neighbouring industry; there are dozens of others, ranging from different social security payments, taxes and export incentives to different agricultural policies.

Naturally, it is utopian to imagine that all these factors could ever be exactly equalised—and there are so many of them that no one could ever say when, on balance, "conditions" were equal. And when they had been equalised as nearly as possible, it is sure that the law of comparative advantage would still apply. For example, in our illustration, it might well turn out in the end that the Germans were still making electronic equipment better and cheaper than the French, and so in a truly common market the French industry would have to go under. (More exactly, what would happen is that a unified Franco-German electronics industry would emerge, using French ideas, because these are more prolific in electronics than German ideas, and

German labour, etc.) That might happen, I say, but there is no warrant for assuming it has to happen merely on the basis of a comparison of current export prices. Classic free-trade doctrine made that assumption, which meant that it was accepting as unfathomable mysteries certain discrepancies in export prices, which in reality had quite simple explanations. What was behind that hasty and unquestioning acceptance of mysterious price differences was a conviction of national and racial superiority: the fact that British hardware prices happened to be low at one point in the 19th century "proved" that Britons had superior endowments in that department, which it would be impudent for foreigners to question by trying to make their own hardware.

Since an identical "proof" could be drawn from a comparison of most industrial prices 100 years ago, this conclusion was welcome to complacent Victorians. No one would revive that argument today, one hopes, firstly because it has been disproven a thousand times, and secondly because all—literally all—prices are today more or less faked, by taxes, subsidies, welfare, labour unions, customs duties, monopolies and a thousand and one other influences. So they can tell us nothing about comparative advantage. To assign the various nations their separate "duties", which is what the theory of the international division of labour presumed to do, on the basis of current false prices would mean solidifying the world in its present irrational economic condition, while forcing a levelling down of the social advantages won, to very different degrees, by the national labour movements. This will be accepted neither by the industrialising nations nor by the beneficiaries of the Western welfare states.

There is an even more important point, and one that takes us to the heart of the trade-bloc controversies in Europe today. Supposing that a division of labour between country A and country B is to take place when conditions have been equalised, this can only mean (otherwise it means just nothing) that B stops making something and draws its supplies from A. In political language, that means that B is henceforth dependent on A, at least for that article. Now before, in this dangerous 20th century world, one nation consents to be dependent on another, there are a lot of questions to answer. Who is A, where is it and what are its politics? Is it on our side in world affairs and is it likely to stay there in the event of war or grave crisis? Is it Japan, at the other end of the earth and liable to be cut off from us for any number of reasons? Is it Egypt, governed by a dictatorship that might choose to blackmail us tomorrow? Is it a developing country that just happens to have plenty of this article to export today, but might be so much richer in 20 years that it has none to spare for us, when our own industry is dead and its craft extinguished?

Questions like these are the staple of politico-economic controversy in Europe today. The reluctance of Britain and Germany to wind up their inefficient farms, the anxiety in Italy about dependence on Soviet oil, the unwillingness of the Continent to stake its energy future on supplies of Saharan crude, the refusal of Switzerland to surrender its neutrality by joining a trade bloc in which it would prosper, and the search for a way to keep the European textile industry alive in the face of Asian competition, all refer to political

India today is caught up in the feverish activity of industrial advancement. Projects are planned...dams are being built...all through the night we hear the ceaseless hum of men and machines at work. In the world of today, the economic development of a nation is gauged by her machines...and the STEEL consumed by them. In dams and bridges, in the railway and automobile industry, in the manufacture of the thousands of consumer goods, STEEL is necessary—absolutely necessary! And so steel has come to be indicative of the economic development of a country...indicative of what a country is worth in cold hard cash.

questions of that order. About all, this is the reason why efforts toward economic unification (such as the Common Market, the Free Trade Association or the OECD) all run up against the problem of political unity. It has been realised that any form of freer regional trade implies a division of labour among the participants, and that implies relations of dependence, and that raises the issue of political security. In fact, Europe's free-traders today can be divided into two classes: those under the illusion that trade can be liberalised and protection dismantled without closer political co-operation, and those who know otherwise.

Switzerland is condemned as belonging to the former class in a study just published by M. Iffland from the European Research Centre in Lausanne. M. Iffland recalls that Switzerland stayed out of the Common Market because of its evident political implications, properly judged to be incompatible with her neutrality and independence. But by joining the Free Trade Area, she is sapping the autarchy on which her independence was based, preparing the ruination of some of her essential national industries and receiving no guarantees about future supplies—because the FTA is politically empty and can guarantee nothing. For M. Iffland the choice is clear: either a country sticks to classic tariff protection in order to keep alive all the industries necessary to its political survival, or else it joins a political confederation that offers it the same, or greater security, while liberalising trade. The Indian Union, which is still in process of forming a truly common market out of scattered centres of economic activity, and the Russian empire offer this political security to the units called upon to trade freely. The Common Market is pledged to do so too, the only question being whether it will find political unity in the way favoured by Dr. Erhard and President de Gaulle, by inter-governmental agreement, or in the way favoured by Dr. Adenauer and the European socialists, through popular elections and

supra-national institutions. The FTA and the "Atlantic union" of the OECD do not offer any security in return for the dependence that must follow freer trade, and are thus dangerous ventures for their participants.

Realisation of the political implications of freer regional trade has a significant consequence for the overseas developing nations. It is not simply that each European country must guarantee its supplies from other European countries, but—once they have a common tariff and are all in the same economic boat—they must co-operate in guaranteeing their raw material supplies from abroad. Taken individually, they have not the weight to do this, as Russia and America have today. As a political confederation they would have. Being the main client and the main supplier of the developing nations, a Europe with some political unity would see clearly its interest in promoting development, stabilising commodity prices, maintaining the purchasing power of, and the flow of materials from, the backward economies. In other words, a common foreign trade policy and joint assistance programmes are as much the consequence of regional freer trade as political unity.

Asians have a right to some impatience when Europeans mouth Cobdenite phrases about free trade, because genuine international free trade is nowhere in question. But the regional freer trade that is taking shape could lead, if necessary consequence of political unification is drawn, to the appearance of more effective agencies capable of promoting trade and aid for developing economies. Dr. Ludwig Erhard, who is no more a 19th century free-trader than he is a 19th century liberal economist, imagines that the whole of the non-Communist West could be brought into the scope of a free-trading political unit. Few Europeans believe that, and those on the Continent prefer to hold tight to the one unit that has shown both economic and political promise, the six-nation Community.

Our West German Letter

GERMANY'S AID PROGRAMME PICKING UP

From Our West German Correspondent

BONN, January 15.

THE first Letter in the new year (and the last one of this correspondent who is packing his trunks for a six months' stay in India) deals mainly with "Entwicklungshilfe", i.e. aid for developing countries. It keeps not only ministries busy but also industrial associations, trade unions, church and charity organisations etc. We start with quoting a New Year's article by the President of the Federations of German Industries. Fritz Berg, in which he says: "Among our efforts to reach such goals (safeguarding full employment and the purchasing power of the Deutsche Mark, etc.), the DM 1,500 million development aid loan of German industry certainly holds a prominent place. It will be a most valuable contribution to the international standing of the Federal Republic. I am fully aware that quite a number of German firms will find it hard to find the money to subscribe the loan, but I am likewise convinced that the loan will testify both to the enlightened self-interest and the sense of responsibility of German business. By signing the loan we also meet an honorary obligation towards our allies. We shall never forget that the United States' Marshall Plan aid sparkplugged our economic recovery. We shall also never forget that we need the assistance of our allies all over the world to safeguard Berlin and to bring about the reunification of Germany. We have therefore to show the same spirit of sacrifice when it comes to solve the problems posed in common to the free world." These are certainly brave words but during the first days of this month it became known that by the closing date of this aid loan on 16th December, it was not fully subscribed. In fact, on 4th January, the amount came to one milliard DM only. But it is hoped that the balance will be subscribed shortly. At any rate the Government does not intend to issue a forced non-interest bearing loan.

The administrative organisation of the "Entwicklungshilfe" will be finalised when Parliament will grant, possibly this month, the means for a new department in the Foreign Office. The present German Ambassador in Cairo, Dr. Walter M. Weber, will probably be chosen as its leader with the rank of "Ministerialdirektor". One also learns from reliable sources that Botschaftsrat Rolf von Keiser, since more than five years the highly recognized head of the Economic Department of the German Embassy in New Delhi, will become Dr. Weber's deputy. The President of the Association of Chambers of Commerce and Industry, Alwin Muenchmeyer suggested in a radio talk that, according to the importance of these problems, a "Secretary of State" should co-ordinate all work connected with the aid for developing countries within the various departments of the Foreign Office, the Finance Ministry and the Ministry of Economics. Even now there is a committee composed of high officials of these ministries meeting regularly whose task is already more or less the same. At present a law is being drafted to change the "Kreditanstalt fuer Wiederaufbau" (Credit Bank for Reconstruction) into the "Entwicklungsbank", a newly coined word of the German language, meaning a bank exclusively concerned with the "Entwicklungshilfe". The capital of this bank would amount to one milliard DM.

The official daily Bulletin of the Central Government deals in a three page article with private investments in developing countries and refers therein to the importance of getting correct informations. The Ministry of Economics has a special office in Cologne

(Bundesstelle fuer Aussenhandelsinformation) which receives its reports not only from the economic departments of embassies, legations and consulates but also keeps its own staff of correspondents in Asian, African and Latin American states. This office is publishing a daily paper "Nachrichten fuer Aussenhandel" (News for the Foreign Trade). Its correspondent in India published recently therein a series of articles under the heading "Investieren oder indischen Markt verlieren" ("To invest or to lose the Indian Market"). Besides this official information institution there are the combined chambers of commerce, as the Indo-German Chamber of Commerce in Bombay with its branch in Frankfurt as well as quite a number of private associations, each concerned with one developing country only which either provides information for the German investor or vice versa for the entrepreneur in Asia or Africa who is looking for a partner from overseas.

We close the subject "Entwicklungshilfe" with quoting extensively from an article "Our future and the developing countries", written by Professor Dr. Fritz Baade, Director of the (famous) Institute for World Economy at the University of Kiel. Baade (who was sent out to Turkey with a delegation of the Food and Agricultural Organisation of the United Nations to study the economical situation there) starts his observations with the following statement. The conquest of illiteracy and the building up of educational institutions in developing countries is the basic condition under which these nations are able to develop. This would mean that they have to spend a much higher proportion of their gross national products for these purposes. The Western countries would have to help in this respect to a far greater extent than hitherto. Starting from the Turkish example where the agricultural production is rising at a slower speed than the increase of the population, he refers to India where, according to expert reports, she would have a deficit of about 28 million tons of agricultural products in 1966 if the production is not trebled. While the FAO report suggests for Turkey the mobilization of a compulsory organised labour service to step up the agricultural production, Baade points out that India is thinking of co-operative organisations aiming at the same goal. But this kind of organisation requires an extremely high figure of advisers and amongst the village people it will be hardly possible to find the sufficient number of the experts. India will, as Baade says, experiment with village co-operatives for some years. If this system fails she will be compelled to introduce more effective methods to mobilize unused labour to achieve the final aim.

He goes on by stating that industrialisation in developing countries will only partly be possible by bringing people from villages to new or already existing industrial centres. It is a very expensive procedure to transplant a man from the village to the industrial area because it means not only the procurement of a job but also of a living room as well as of a minimum of water and electricity supply, drainage etc. Therefore, it will be necessary to bring industries and improved trade to the village. As a successful example Prof. Baade quotes Japan although not belonging to developing countries. There are villages in which people together with their agricultural activities are manufacturing single parts of bicycles. This requires only a few machines and, of course, it requires a factory which organizes such a system in various villages. Optical and toy factories are organized in Japan in a

similar way. To make this kind of development possible, electrification has to be urged on by using local water-powers or coal deposits which would not necessitate the costly erecting of high-tension lines. The author comes finally to the conclusion that the Western powers would have to multiply their contributions of their planned aid.

About two months ago the Communist regime of the German Democratic Republic published the draft for a new Labour Code, heralded as a "document of true historical and national importance." It is expected to become law sometimes this year. The period before this 12,000 words draft is passed by a rubber stamp vote of the so-called parliament, should be used by the workers to "dis-uss" the new Code. But more and more reports reach the West confirming that the workers eye the 153 articles of the draft with utmost suspicion and apprehension. This is not surprising in view of its salient points. The right to strike still — on paper — guaranteed by the constitution is not mentioned at all in the draft. In future wages will be determined in such a way as to provide for a direct material interest of the worker in the highest possible increase of labour productivity, in the correct meeting of quality — and time-targets, in the most economical use of time, money and material. This, in plain words, paves the way for the much dreaded increase of work norms. This Code also envisages that whoever willfully and/or carelessly produces wastage and/or goods of insufficient quality will see his wage cut accordingly. The plant manager will have full discretion to decide what "willfully and/or carelessly" shall mean. The free movement of labour will be further restricted. For up to six months a year any worker can be ordered to accept another job within or outside the plant and even in another town! This measure is obviously designed to counteract the scarcity of labour in some key sectors. The draft keeps silent on the earlier promise of the Communist Government that the workers would enjoy the 42-hour week by 1962. On the contrary, it says that the workers will have one day off a week, which means that the five-day week is still a far dream. The Code also makes further cuts of the work week dependent upon corresponding increase of labour productivity by saying bluntly "the length of the work week is determined by the socialist state." In their efforts to overcome suspicion and apprehension among the workers the Communists are presently resorting to expedients sometimes bordering tragicomedy. A Dresden news-

paper compared the new Code with a German Labour Code for domestic servants and farm labourers enacted in 1909 and in good earnest said that the new Code compared favourably with the 1909 version. The new Code will in fact force the workers to work more and to work faster without fully getting what is due to them in terms of personal dignity and material rewards.

Spreading property as widely as possible is one of the proclaimed aims of the Federal Government which by various kinds of tax relief and premiums encourages workers and employees to save and invest part of their earnings. The sale of shares of denationalized industrial firms, such as the Preussag (Preussische Bergwerks — and Huetten A.G.) and the Volkswagen (People's Car) Factory, at preference prices to people of lower and middle income groups is another step in this direction. The Government intends to follow up this policy with a bill drawn up by the Ministry of Labour and intended to become law before the general elections in September. The principle of encouraging property-owning by the working population has the wholehearted support of the majority of employers. The first annual general meeting of the denationalized Volkswagen Factory will take place in two large halls of the Hanover Fair by using television transmitters which will enable thousands of the new shareholders to follow the proceedings. The Company will even pay the travelling expenses to them! In this particular case we arrive at almost astronomical figures. According to an official announcement, the number of shareholders will rise to about two millions. As Minister Wilhelmi pointed out: in an article, with 'his new development a new phase of social order in Germany has started. The production of the people's car has risen in 1960 to about 9 lakhs and will increase this year, as stated in full page advertisements in the dailies, weeklies etc., to 4,000 cars per day or 1 million the year!

Tail-piece: While the Chinese try or tried to have their little ironworks in the backyards, one of the leading German aircraft factories, the Dornier Works in Friedrichshafen on the Lake of Constance suggest to have "an aerodrome in the backyard". With this slogan the firm makes propaganda for its type "D 27" which, in fact, needs an extremely short runway. More and more industrial firms are now-a-days using their own planes in order to be independent from the conventional means of communication. Dornier exports this new type already to 18 foreign countries.

This expert has won the trust of millions in the label 'Sanforized'

Meet our American-trained expert who makes sure that any fabric marked 'Sanforized' won't shrink. Every day, all through the year, he tests fabrics bearing this international label; so that your clothes won't shrink out of fit — even after many, many washings!

This is how
he does it:

Travelling from mill to mill, he advises and helps them with their technical problems; and makes on-the-spot tests that ensure value in the cloth you buy labelled 'Sanforized'.

Whenever he visits the mills, he takes at random several samples from their godowns as well as off the processing machine. These samples are first measured, and then given a standard wash test.

And then, the samples are re-measured. This is the first stage of ensuring quality. All fabric must meet the Company's strict anti-shrinkage specifications before it can use the label 'Sanforized'.

These tested samples are sent to the New York office for re-checking, and with them goes the expert's detailed report. These documents record the progress and prosperity of each individual mill.

The New York office checks thousands of samples from all over the world. This is your assurance that fabric labelled 'Sanforized' is of a uniformly high standard, and is welcomed everywhere in the world!

Look for

on the label

and your clothes will never shrink out of fit!

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

Production Beyond Licensed Capacity to be Permitted: The Government of India have decided to permit increase in production in manufacturing units beyond the licensed capacity provided the additional production is achieved within their foreign exchange allotment. This step has been taken to further encourage industrial production in the country. When the increase in production beyond licensed capacity is achieved, this should be brought to the notice of the Ministry of Commerce and Industry and the Development Wing for purposes of regularisation and registration. It may be recalled that the Government had taken steps to simplify the licensing procedure and facilitate a higher level of industrial production. In February 1960, the Government announced a list of 49 industries in respect to which licences for setting up fresh capacity would be issued freely. Subsequently, in June 1960 it was decided that in cases where production could be increased without installing additional plant or machinery, except balancing equipment, the requisite licences should be granted without prior reference to the Licensing Committee.

*

A New Process for the Production of Ethyl Chloride: A process on ethyl chloride has been developed at Shri Ram Institute Delhi. Ethyl chloride can be manufactured commercially by three methods, viz., addition of hydrogen chloride to ethylene, chlorination of ethane and the reaction of ethyl alcohol with hydrogen chloride. For Indian conditions, however, the last method is most suited because of easy availability of ethyl alcohol. Based on ethyl alcohol as starting raw material, know-how for the manufacture of ethyl chloride has been developed using zinc chloride as a catalyst. Hydrogen chloride is fed 30 per cent in excess of the theoretically required quantity at about 130°C. No by-products are obtained. Alcohol with 90 to 95 per cent alcoholic content is used. Over 95 per cent of alcohol is converted to ethyl chloride and the process gives an efficiency of nearly 99 per cent. Another novel feature of the invention is an improved apparatus where optimum conditions can be maintained. Total capital outlay for a plant having a capacity of 300 tons of ethyl chloride per annum is estimated at Rs. 1.87 lakhs. The plant can be located at a place where raw material and market facilities for the finished goods are easily available. Parties interested in taking up the commercial development of the process are invited to correspond with the Secretary National Research Development Corporation of India, Mandi House, Lyton Road, New Delhi.

*

Storage of Ripe Arecanuts: Ripe arecanuts during storage by conventional methods (pit storage, water storage, etc.) undergo heavy microbial damage. An important process of storage has been developed at Central Food Technological Research Institute, Mysore, by which arecanuts in husk retain their original colour of skin, fruits, firmness, colour, structure, flavour and taste of edible kernel. The process consists in balancing and steeping arecanuts in low concentrations of mixed preservatives in sealed containers. Preliminary experiments have shown that nuts in husk, stored for 2-3 months, if hygienically packed in ploythene bags have a shelf life of over a month for purposes of transport and retailing. The edible kernel after six months of storage contains preservatives well below the per-

missible limits. As an extension work, conditions have been established for convenient and safe storage of ripe arecanuts in husk in earthenware pots. Consumer evaluation of the 6-month stored product is satisfactory.

United Kingdom

Oversea Trade in 1960: United Kingdom exports in December 1960 were valued at £302,700,000, imports at £382,500,000 and re-export at £12,100,000, it was announced by the Board of Trade in London on January 16. In 1960, total United Kingdom exports at £3,536 million (valued f.o.b. were 6 per cent greater than in 1959. Imports, at £4,559 million (valued c.i.f.) exceeded the 1959 figure by 14 per cent. Re-exports amounted to £142 million, compared with £131 million in 1959. It is pointed out that 1960 was a year of mixed performance by the British economy. Industrial production remained high but, particularly near the end of the year, it did not show the rise which might have been expected. The level of national consumption, so far as can be estimated, declined as the year went on; on the other hand, fixed investment, especially by manufacturing industry, rose very rapidly in the third quarter of the year, and looks like continuing to do so.

*

Steel Production: Total production of steel in the United Kingdom in 1960 amounted to 24,305,000 tons, the highest figure yet reached, according to figures recently issued by Iron and Steel Board, in London. This total represented an increase of 20 per cent over the figure for 1959, and was 12 per cent above the previous annual highest figure, reached in 1957. Production of steel in the U.K. in December was at an average rate of 4,51,000 tons a week, which was 4 per cent higher than the previous best December figure.

Germany

Leipzig Spring Fair: With a collective exhibition in a representative fair pavillion of its own, having a floor space of more than 10,700 sq. ft. on the area of the Technical Fair and a participation of numerous individual exhibitors in the various groups of the Fair, the Union of India at the forthcoming Leipzig Spring Fair of 1961 will be the largest foreign exhibitor from overseas. In G. D. R. public circles the Indian exhibition, which is anticipated with great interest, is not only regarded as a purely commercial affair, but also as proof of how the friendly relations between the Union of India and the G. D. R. became ever closer in the past few years. In this connection the goods lists for 1961 recently signed in Berlin, which envisage an increase of 35 per cent in the trade between the two states, represent a solid foundation for a promising participation in the Leipzig Fair of Indian firms. Besides the exhibiting firms, a large number of foreign trade experts, and officials and private buyers from India are likewise expected to come to Leipzig where they will meet exhibitors from about 50 countries of the world in the 55 fair trade groups of the Technical Fair and the Consumer Goods Fair, covering an overall exhibition area of about 3 1/2 million sq. ft.

Yugoslavia

New Trade Agreement with Sudan: A joint communique has been issued in Khurtoum following the

conclusion of a new agreement on trade and economic co-operation, a payments agreement and additional documents on deliveries of equipment and on scientific and technical co-operation between Yugoslavia and the Sudan. The communique says, realistic possibilities exist for an increase in the exchange of goods between the two countries as well as possibilities concerning the participation of Yugoslav enterprises in the development of the Sudanese industry and in the fulfilment of the programme of economic development.

U.A.R.

Trade Pact With Cuba: An Agreement has been signed for the export of cotton yarn and textiles to Cuba to the value of 8,600,000 dollars. This was announced early last month by Central Minister of Economy and Treasury who is the Chairman of the Board of Economic Development Organisation. He added that the consignment would be exported in the course of 1961.

No Change in Cotton Policy: Executive economy Minister Hussan Abbas Zaki following a meeting he had with leading cotton exporters in Cairo on December 18, declared that the Government would adopt this season the same cotton export policy as had been in force the year before. The Minister further revealed that discount would be maintained and that barter deals and tri-lateral transactions would continue to be banned. Mr. Zaki affirmed that the Government would be taking stringent measures against whoever would take part in cotton re-export activity.

Norway

Earnings of Merchant Fleet in Foreign Currency: The Norwegian merchant fleet increased by 413,000 gross tons during 1960 and totalled by the end of the year 11,209,000 gross tons. The increase can be expected to continue for still one year to come as another 3,400,000 tons have been contracted for future delivery, 1,270,000 tons to be taken over in 1961. Roughly one million tons is contracted from Norwegian yards and another million from Swedish builders. The Norwegian fleet is now 8.6 per cent of the total world tonnage. It earned for Norway £157,500,000 in foreign currency during 1960. The total number of people employed on board Norwegian ships is 60,000 (population 3,600,000).

Good Year for Norway's Foreign Economy: 1960 was a good year for Norway's foreign economy. Although the accounts show a £35 million deficit in the working balance, imports include nearly £75 million worth of ships. This means that this money has not been invested in consumer goods, but in commodities which will earn new foreign currency for years to come. Foreign currency reserves have been trebled during the last four years and although part of this is due to foreign loans, the situation is much more comfortable.

Australia

Australian Project by Big American Cannery: Announcement of details of a new £1 million cannery to be built by the Campbell Soup Company on a 137 acre site at Shepparton, Victoria is an important development in the Australian canned foods industry. The American company, which is one of the world's largest producers of canned and frozen soups, acquired the food division of a soundly established company, Kia-Ora Industries Ltd. The Shepparton District is one of the main vegetable producing areas in Australia, and

the cannery is planning to export canned foods to Asian and African countries, as well as supply the local markets. The American enterprise expects to employ 300 to 400 people and to enter into contracts with local market gardeners, and poultry farmers in order to ensure supplies. As an added incentive to the producers the company will make available expert advice and services, as well as provide the suppliers with an assured income.

Petro-Chemical Industry Takes Shape: It is reported that over £50 million is being spent in Australia in the establishment of a petro-chemical industry, mainly in the States of New South Wales and Victoria. Most of the plants expect to be producing next year. There are five centres where the industry is being developed. The two major ones are linked with the oil refineries of Vacuum at Altona, Victoria, and Shell at Clyde, New South Wales. The biggest of the projects is the Altona complex. Here, on a 527 acre site, two miles west of the Stanvac Refinery, five petro-chemical plants are being constructed which would be completed by the end of next year. They are estimated to cost £26,500,000. Construction of the plant of Australian Petro-chemicals (Pty.) Ltd., at Liccombe, New South Wales, is another of the plants under construction. It will produce styrene monomer, a raw material for various industrial products. The Monsanto Chemical group is associated with this project.

World Bank

Loan for Irrigation in Mexico: The World Bank has made a loan equivalent to \$15 million for the improvement of irrigation on 1,430,000 acres of farm land in Mexico. The loan will finance the foreign exchange costs of completing and rehabilitating four irrigation systems on Mexico's north-west coast. When the project is complete, the annual net income from crop production on the lands is expected to increase by the equivalent of about \$20 million. Six private banks are participating in the loan without the World Bank's guarantee, for a total of \$821,000 representing the first three maturities which fall due between July 1, 1964 and July 1, 1965. The participating banks are: Crocker-Anglo National Bank, San Francisco; the Northern Trust Company, Chicago; Chemical Bank New York Trust Company; Girard Trust Corn Exchange Bank, Philadelphia; the First National City Bank of New York; and Grace National Bank of New York.

The total cost of the public works to be undertaken is estimated at the equivalent of \$41 million. The bank loan is for a term of 20 years and bears interest of 5½ per cent annually including the 1 per cent commission which is allocated to the Bank's Special Reserve. Amortization will begin July 1, 1964. The loan is guaranteed by the United Mexican States.

Loan for Burma Railways: The World Bank has made a loan equivalent to \$14 million to the Union of Burma Railway Board for a rehabilitation and modernisation programme. The proceeds of the loan will be used to purchase diesel locomotives, rail cars, spare parts and workshop equipment. The new equipment is an essential part of the railway's programme to increase operating efficiency, reduce costs and provide additional carrying capacity for Burma's growing freight and passenger traffic. The loan is for a term of 16 years and bears interest of 5½ per cent annually including the 1 per cent commission which is allocated to the Bank's Special Reserve. Amortisation will begin March 1, 1964. The loan is guaranteed by the Union of Burma.

The 3½ per cent ten-year Treasury Savings Deposit Certificates will start maturing on February 1, 1961. In order to facilitate the reinvestment of these certificates after maturing the Government of India have decided that they may be accepted in payment for purchase of 4 per cent Treasury Savings Deposit Certificates if they are tendered for such investment duly discharged.

The Government of India have reconstituted the Technical Advisory Committee in the Department of Company Law Administration. The reconstituted committee will function for a two-year period.

The Centre has redistributed money set apart for the welfare of Backward classes so that there is no shortfall at the end of the Third Plan. About three months ago, the States had informed at a Conference held in Delhi that as much as Rs. 145.96 lakhs would remain unspent at the end of the Plan.

The Department of Company Law Administration has formulated rules under which companies may obtain exemption from the provision in the Companies (Amendment) Act regarding the audit of branch accounts of Companies.

The Government of India have after a careful examination of the objections raised by some State Governments in regard to the inclusion of mother-tongue as a subject matter of enumeration in the coming census, decided not to change the two questions on language to be asked by the census officials.

The Uttar Pradesh Electricity Board has received six diesel sets of 7,000 kv each from Czechoslovakia and these will be installed at Ghaziabad by March and commissioned by April or May next.

The Tariff Commission has issued a questionnaire on the revision of the sugar price linking formula for determining the amount to be paid by the industry to the cane growers.

The cotton textile mills production in December, 1960 is provisionally placed at 159 million lbs. of cotton yarn and 447 million yards of cotton cloth, according to a press note issued by the Textile Commissioner.

It is reported that about 20,000 tons out of the recently released export quota of 50,000 tons of sugar has already been shipped to various destinations. The remaining 30,000 tons would be shipped out before the end of February.

India's foreign exchange earning from scrap exports during 1960 is estimated at Rs. 6 crores. The scrap exports of 3.25 lakh tons last year surpassed the performance of all the previous years, except that of 1953 when the exports were 3.92 lakh tons.

The Oil and Natural Gas Commission has decided to undertake oil exploration in an area of 2,859 sq. miles in the country during this year. Cutch, Kutch, Saurashtra, Assam, and the Punjab are included.

In Bombay recently, Mr. T. N. Toiani, Director of Technical Education, Government of Maharashtra, inaugurated the Blue Star-Honeywell Instrumentation Centre. The Centre is jointly sponsored by Blue Star Engineering Co. (Bombay) Private Ltd. and their principals. Minneapolis — Honeywell Regulator Co., the world's largest manufacturer of instrumentation and automatic control.

FOREIGN

An agreement for £5 million loan from the U.K. to finance purchases by the Pakistan Government of U.K. equipment for projects under the Second Five-Year Plan was signed at Rawalpindi recently.

Sr. Frazo, Chairman of the Board of the International Coffee Agreement, confirmed that the 10 per cent reduction in export quotas which the I.C.A. established a few days ago would be transferred to member nations' normal quotas for the second half of the year beginning April 1, 1961.

The Minister for Oil speaking in the Indian Parliament about his recent discussions with Sr. Mattei, the head of E.N.I. declared recently that apart from proposals covering oil exploration, talks were held on the possibility of obtaining credits from E.N.I. on reasonable terms.

The U.S. Agriculture Department has announced that 824,299 short tons of sugar, normally purchased in Cuba, would be obtained from other countries. The Department has estimated sugar requirements for 1961 at 10 million tons.

It is reported the Soviet Council of Ministers decided recently that the system of planning the national economy should be improved so that Russia would have a "continuous five-year plan".

A U.K. Trade Commission has now been established in Nicosia in the office of the U.K. Representative to the Republic of Cyprus.

A new British-controlled oil distribution centre will be set up next year at Korsor, on the Island of Zealand, according to the newspaper Kristeligt.

A new Franco-Yugoslav trade agreement was announced recently. Its provisions are designed to cause a considerable increase in the trade between the two countries during 1961.

Spain's industrial production index in 1960 increased to 169.4 from 160.4 in 1959 (1953 = 100) according to National Economy Council figures published recently.

The Volkswagen Company will complete about 750,000 passenger cars and another 140,000 vans and baby buses this year — about 200,000 vehicles more than in 1959. Daily output has reached 4,000 vehicles and the company expects to produce 1 million Volkswagens in 1961.

A. O. Smith International S.A., subsidiary of A.O. Smith Corp., Milwaukee, has entered into a joint venture with Kobe Steel Works, Koba, Japan, for production of equipment for the petro-chemical and fertiliser industries, the company announced.

Special Article

INDIA AND THE COMMONWEALTH

A Study in Aid and Trade

THE Queen's visit to this country has been deemed as a landmark in the relationship between the Indian Union and the Commonwealth. It is interesting, to look into the manner in which India's trading relations with the Commonwealth have progressed during the last 13 years (since Independence) and the order of assistance received from the Commonwealth in relation to the total economic assistance obtained from abroad. This Special Article attempts to analyse the role that the Commonwealth has played in shaping the economy of this country with special reference to trade as well as aid. Tables I, II, III and IV summarise the statistical position.

The volume of India's foreign trade has risen by about 62 per cent since 1948-49. As against the total of imports and exports at Rs. 966.23 crores in 1948-49, the estimated figures for 1960 show that the total volume of trade (including exports, re-exports and imports) was of the order of Rs. 1,567.39 crores. This rise has been encouraging but unfortunately most of it has come from the non-Commonwealth countries. Our trade has particularly risen with the Communist countries, the United States of America and West Germany. In the case of the Commonwealth, there has been a steep decline in percentage terms. In 1948-49 India's trade with the Commonwealth countries was nearly half of the total — 48.3 per cent to be precise. It dropped to 37.8 per cent in 1959 and 38.8 per cent in 1960. Amongst the non-Commonwealth countries, West Germany captured a sizable portion of the Indian foreign trade. In 1948-49 India's trade with West Germany was not more than half a per cent of the total trade. By 1959, it had risen to 9.16 per cent. Similarly our trade with the Communist countries constituted nearly 2 per cent of the total trade in 1948-49, while presently they account for 6 per cent of the foreign trade of India. The United States of America had also slightly improved its position. Thus, it is clear that the Commonwealth, in so far as India's foreign trade is concerned, has lost its dominant position.

India's imports from the Commonwealth countries have not exhibited that order of increase which the overall figures of imports depict. Here, the Commonwealth has registered a rise of only about Rs. 33 crores between 1948-49 and 1959 while the total rise in imports is of the order of Rs. 344 crores. The Communist bloc's share in India's imports has risen from less than Rs. 7 crores in 1948-49 to 37 crores of rupees in 1959. Our imports from West Germany have risen in a spectacular manner from Rs. 2.25 crores in 1948-49 to Rs. 18.72 crores. Thus, the Commonwealth as a trading partner has not fared exceedingly well. The only countries which have registered some marginal gains are the United Kingdom, Canada and some of the African countries. Our imports from Australia and Pakistan have been on the decline.

India's exports have not risen in the manner they should have as anticipated in the Five-Year Plans, but there has been a considerable rise in exports in relation to the base year 1948-49. Here the increase of about Rs. 200 crores is shared by the Commonwealth countries, the Communist bloc, the United States of America and West Germany. The Commonwealth countries have increased their exports from India by Rs. 70 crores. Between 1950-51 and 1959, India's exports to the Commonwealth countries have suffered minor deviations around the level of Rs. 290 crores.

The United Kingdom continues to be the biggest buyer of our goods in the Commonwealth. The countries which have shown greater interest in our exports are Canada, some African countries and Ceylon.

The dependence of the Indian Union in selling some of its major exports such as tea, jute manufactures etc. continues on the United Kingdom, the leading member of the Commonwealth. But it is a pity that in overall growth of India's foreign trade, the Commonwealth is not playing as important a role as it should have, in view of the dynamic manner in which the Indian economy has been growing.

TABLE I
EXTERNAL ASSISTANCE TO INDIA

Country	(Up to December 31, 1960)		
	Total Aid Authorised Loans	Credits already committed for Grants Third Plan Projects	(Rs. crores)
A. Commonwealth Countries			
United Kingdom	115.99	0.47	46.67
Canada	15.71	90.57	—
Australia	—	12.27	—
New Zealand	—	3.43	—
Total of (A)	131.70	106.74	46.67
B. Non-Commonwealth Countries			
U.S.A.	974.64**	505.68**	—
West Germany	122.24	2.09	28.34
Japan	27.61	—	—
U.S.S.R.	145.30	1.15	238.11
Czechoslovakia	23.10	—	23.10*
Yugoslavia	19.05	—	19.05*
Rumania	5.23	—	5.23*
Poland	—	—	14.30
Norway	—	2.19	—
World Bank	315.28	—	—
Ford Foundation	—	14.20	—
U.N. Special Fund	—	4.16	—
Total of (B)	1632.45	529.47	328.13
C. Total Foreign Assistance (A+B)	1764.15	636.21	374.80
D. Share of Commonwealth in total foreign aid (Ratio of A to C)			
	7.47	16.78	12.45

* Fully unutilised aid; hence the entire amount is available for the Third Plan.

** Includes the rupee loans and grants out of the counterpart funds of PL. 480 signed on May 4, 1960, and its two supplements concluded respectively on July 29 and September 23, covering commodities worth \$1,334.7 million (Rs. 635.2 crores). Out of this amount Rs. 267.3 crores will be as loans and an equal amount (Rs. 267.3 crores) as grants. Sizeable portion of this amount is available for the Third Plan.

In the sphere of foreign assistance for financing India's Five-Year Plans, the United States of America overshadows all other countries which have held out a helping hand to India. The latest figures upto January 1, 1961, indicate that the Commonwealth has given by way of aid to the Indian Union not more than 7.5 per cent as loans and 16.8 per cent as grants. The share of the United States, was 55.2 per cent for loans and 79.5 per cent for grants.

Thus, since the independence of this country, the non-Commonwealth countries, particularly the United States of America, West Germany and the Communist bloc countries have played a more dynamic role, both in the matter of aid and trade. While the Indian Union continues to depend on the United Kingdom for its traditional exports, it is necessary that fresh efforts should be made to widen the area of India's co-operation with the Commonwealth.

* I.N.S. AJAY—Constructed by Garden Reach Workshops, launched September, 1960

Well-known for shipbuilding and complete ship repairs for several decades, Garden Reach Workshops won new laurels when INS Ajay, a Seaward Defence Boat, was launched in September, 1960. This boat is a vessel of high manoeuvrability and has a displacement of 150 tons: it is powered by twin turbo-charged diesel engines and has a speed of 17 knots. Despite its diminutive size the Seaward Defence Boat packs a powerful punch in its surface armament and anti-submarine equipment.

Thus, to Garden Reach Workshops, went the honour of building the first defence vessel in India since Independence.

Complete facilities exist at Garden Reach Workshops for the construction of a variety of vessels such as Naval Craft, Harbour Tugs, Launches, Water Boats, Barges, Dredgers and Pontoons.

The Workshops are fully equipped to handle major and minor repairs to vessels in the River Hooghly, in the stream and wet docks, dry docks and lay-up berths allotted by Calcutta Port authorities.

THE BUSINESS WORLD

Costs, Wages and Work-Loads

BY CROESUS

WHEN a seasoned business man complains that, notwithstanding a dividend of 12 per cent, subject to deduction of tax—now all dividends are under a like disability—and despite higher profits, the results in a given year are disappointing, many may wonder how this could be. And when they are further told that this remark applies to last year's (year ended July 31, 1960) performance of the Associated Cement Companies, Ltd., they may wonder still more. But truth, as the old adage goes, is stranger than fiction, and, for unbelievers, if any, even after this assurance, I would advise a careful study of the speech of Mr Dharamsey M. Khatau, Chairman of the A.C.C. at the Company's twenty-fifth annual meeting. Without fully weighing the debit and the credit sides of the picture, he would never have gone on record, which he did last week, as saying that, as regards the future outlook for the Company, he was as much at sea as the shareholders. This is a depressing matter not only for the A.C.C. or the cement industry, but for the corporate sector generally. It was with this thought weighing in my mind that I emerged from the first important annual general meeting of the new year. I also decided simultaneously to devote this week's despatch to an enumeration, if not a detailed examination, of the several factors that must have combined to make the customarily genial chairman of the A.C.C. so cussed as he seemed to me at the meeting this year. Perhaps that also explains some of the most outspoken observations I have heard these days from any company chairman, least of all from Mr Khatau.

The first of such factors is undoubtedly the frustration that overtakes an industry when, even with an adequate installed capacity and no dearth of demand, it is not enabled to take full advantage of the improved demand. This has happened to the cement industry generally and to A.C.C. in particular. The reason? Shortage of railway wagons leading to acute shortage of transport for coal ("a number of our works were obliged to curtail production for want of coal supplies towards the end of the year under review") inwards and of cement outwards. According to Mr Khatau, "the transport situation still continues to be grave," although the authorities are doing all they can and the A.C.C. itself has appreciably increased its despatches of cement by road.

The second factor is the "future increase in the cost of various materials, enhanced railway freight, a further rise in the cost of coal and power, higher incidence of labour costs, etc. The incidence of depreciation was also higher on account of the high capital cost of expansion and rehabilitation projects. This, by itself, is understandable, if not bearable, but the fact is that "the major increase in costs which have been respon-

sible for the progressive reduction of profits from year to year over the past few years have been due to factors entirely beyond the control of the Company." They are, in Mr Khatau's own words, again, "the direct consequence of Government's own fiscal, monetary, labour and welfare policies, in an attempt, on the one hand, to implement the second Five-Year Plan (which many of us regarded as extravagant) and, on the other, to move nearer to the goal of a socialistic pattern of society (which, at this juncture, most of us consider impracticable)."

The third factor is that, when the Government itself has recognized that the increases in cost thus are beyond the control of the company or the industry concerned, and even undertakes to provide for them in determining the price, it fails to fulfil this assurance or do so only partially, for reasons best known to itself. In computing the incidence of the labour cost per ton of cement (consequent on the implementation of the recommendations of the Cement Wage Board), for instance, the installed "rated" capacity has been taken as the base, instead of the actual production which was considerably lower. Similarly, while compelling the industry to use second hand jute bags for packing cement, the Government has conceived (as an average price for packing in new bags and used bags) a price so low that "it makes the whole scheme both impossible of performance and grossly expropriatory."

Again, it is one thing if the increases in costs to be taken for the purpose of fixing prices are arbitrarily supplied by the industry concerned but quite another if these are meticulously worked out after minute study by a statutory body such as the Tariff Commission. Normally one would expect the authorities to accept the findings and also implement the recommendations, of such an impartial agency. Had this been done, no occasion would have arisen for Mr Khatau to say that "the Government's failure to implement the last Tariff Commission's recommendations concerning the retrospective operation of the enhanced retention price fixed in 1958 and the need to alter that price with every change in the cost of coal" is "reprehensible." No less reprehensible is the practice of taking decisions affecting the prices of any commodity after once the Tariff Commission is seized of the question.

These are merely by way of illustration, which is all I can do within the limitations of space and time at my disposal, but the list can be enlarged further. What I have catalogued, however, are serious enough to have driven the A.C.C. Chairman to declare ".....I feel bound to say, with all the emphasis at my command and with a full sense of responsibility, that the recent policies of

Government affecting this major industry are fraught with grave consequences to its future and to the early satisfaction of the country's urgent need for cement."

I must now turn to two other important points of general interest to the entire corporate sector made by Mr Khatau—the concept of a "fair net distributable return" as distinct from "a fair return" and the real significance of the Wage Board approach to a solution of the problems of wage fixation. These, again, involve broad questions of policy applicable to every industry.

At the outset alone, Mr Khatau indicated in his speech that the dividend recommended by the A.C.C. Board was "by no means a fair return on shareholders' capital." Accordingly, the Company proposes to urge before the Tariff Commission that the "fair return" on the capital employed in the cement industry should be conceived as a "fair net distributable return," after meeting all items of cost. It may not be known to many that, in the so-called "fair return," to the cement industry today, such items as full charges for packing, commission payable to stockists, bonus and accruing gratuity to employees, remuneration payable to managing agents, development rebate reserve and company taxation are excluded from the overall "cost" of cement. "To admit, on the one hand, that the industry is entitled to a fair return on capital employed, but to insist, at the same time, that, from this return itself, the industry should, in effect, meet the cost of the items to which I have just referred is, as the A.C.C. Chairman rightly described, "a contradiction in terms." That apart, it results in the industry being left with a net distributable return as in the case of the cement industry, which can be hardly described as fair. How far the Tariff Commission will persuade itself to accept this view is more than I can say, but I have no doubt whatsoever that the view requires to be carefully examined in the interests of this country's industrial development. No industry, least of all a basic industry like the cement industry, should be allowed to nurse feeling that it is possibly being singled out for harsh treatment, or that there is no clear understanding of its problems by the Government, or that there is some other motive influencing the Government's attitude towards it.

Business Notes

Power

LIGHT ON KOYNA

ALTHOUGH THE State of Maharashtra — the third biggest State in the Indian Union, both in area and in population—is predominantly agricultural, the State is bound to rank quite high industrially also, what with a number of important industries, such as engineering, sugar, cotton textiles, chemicals and a host of others, being already there, and many more industries still expected to be started. Fortunately for the industries, the generation and consumption of electrical energy—an important index of economic growth—is fairly high. Thus, the per capita power generation in the State of Maharashtra is about 71.1 kw., as against the all India figure of only 27.1 k.w. The position is expected to improve further, thanks to new State projects like the Koyna Project.

Addressing the first meeting of the Bombay Chapter of the Society for International Development last week, Mr S. G. Barve, Secretary, Maharashtra State Irrigation and Power Department, chose this project — one of the largest hydro-electrical projects under execution in the country — as the theme of his inaugural talk. The Koyna

As regards Wage Boards, now that these boards have come to stay, it is just as well that some one like Mr Khatau thought of the real significance of this approach to resolve the complex problem of wage fixation and also looked into the vital question of whether all wage boards have been scrupulously following the Central Government's terms of reference to them. From what the A.C.C. Chief said, it seems doubtful whether the latter is being done. Indeed, his charge was: "It seems to me that the Wage Board has, for all practical purposes, ignored the importance of fair work loads as an essential element in any fair wage fixation." Although he did not say so in as many words, Mr Khatau must be feeling whether it was at all prudent on the part of the A.C.C. to have gone ahead with the implementation of the Cement Wage Board's recommendations at most of the Company's works, "without waiting either for the actual realization of the revised retention price or the assessment of proper work-loads." On both the counts, it is unfortunate, the A.C.C.'s fine gesture has not been reciprocated.

Now, for reasons best known to itself, although the Government has accepted it in principle, it does not seem to be very keen on making the assessment of proper work-loads a precondition to the enforcement of wage board awards. Besides being contrary to the specific stipulation to this effect made by the Fair Wages Committee, it is an invitation to other industries, on whom wage boards may be imposed by the Government in future, to insist on proper work-loads being worked out before they agreed to abide by the decisions of any Wage Boards. It is not clear why the Government has chosen to relegate work-load studies to a secondary stage of importance thus, when it has itself (not to speak of the Planning Commission) proclaimed ere now that "higher productivity is the only sure basis of prosperity and well-being of the workers." One thought everybody had realized by now that the productivity of Indian workers is very much lower than that of workers in other industrialized countries. In any case, it is high time that the authorities at least realized that raising the wages of workers, unaccompanied by a corresponding assessment of fair work-loads or a rise in productivity, is "a dubious and somewhat self-defeating device," especially in a developing economy.

Project has certain outstanding features from the technical and engineering point of view, Mr Barve said: "It is the only project in the country and one of the two in the whole world where the entire works, apart from the storage, that is to say the head race, pressure shafts, power house, tail race and other elements, are all underground. Also in the construction of the dam wall of the project rubble concrete is being used for the first time in the country, thereby effecting a substantial economy." The project, which is designed to have an installed capacity of 650,000 kw. (approx.) will be executed in three stages. The first stage of the project, which is estimated to cost Rs. 38 crores, will be completed by the end of 1961, with an installed capacity of 240,000 kw. The second stage of the project is to be taken up in continuation of the first, making available an installed capacity of an additional 300,000 kw. by the end of the Third Plan period. The balance of 100,000 kw. is to be undertaken from tail race utilization of the Koyna storage. After completion of the entire project, Mr Barve said, the Koyna power would probably meet the requirements of the mounting demand in the Bombay-Poona area for over perhaps the next 6 or 7 years.

Briefly, the project consists of a gravity type dam across Koyna, where a storage of 73,000 M.Cft. would be

created. 56,000 M.Cft. are designed for power generation requirements and 16,000 M.Cft. for irrigation. For hydro power generation, the water will be diverted through a head race tunnel $2\frac{1}{2}$ miles long and 21 feet in diameter. Four steel lined pressure shafts 2,100 feet long each and about 10 feet in diameter at an angle of 45° will carry the water to the turbines in an underground power house 650 feet long with three caverns to house the valve House, Machine Hall and a Transformer and Control Hall. The tail race tunnel is a mile and a half long and 27 feet wide. Mr Barve also disclosed that the Maharashtra Government would, in all probability, initiate steps shortly for securing a loan of 10 million (Rs. 4.75 crores) from the World Bank for the second stage of the Koyna hydro-electric project. This is in addition to the loan of \$25 million already advanced by the World Bank in 1959.

From his experience of the Koyna project, Mr Barve said that hydro power projects have generally a long period of gestation. It is, therefore, necessary to settle the pattern of planning for power generation in a long-term perspective. Mr Barve further stated: "With the completion of the easier, the more obvious and the inter-state projects for water utilisation, we are now coming up on the harder core of projects involving the balancing of alternative and inter-regional interests. One has to weigh the interests of different regions, the economics of alternative uses and the master-plan for the optimum overall utilisation of the water resources with due regard to phasing of execution." In this connection, he also envisaged the building up of a trans-continental grid for electrical power linking the South with the North.

Indian Oxygen

STEADY PROGRESS

THAT THE Indian Oxygen Limited is well set on the road to progress is evident from the statement of Sir J. D. K. Brown, Chairman of the Company, issued to the shareholders, together with the Director's Report and Accounts for the year ended 30th September, 1960. The profit made for the year, after providing Rs. 37,10,806 for depreciation and Rs. 38,85,900 for taxation, amounted to Rs. 62,98,449. In the previous year, the net profit was Rs. 53,07,450. The increase in sales over the previous year has been of the order of 16 per cent. While the rate of increase has been particularly high in the case of piped oxygen supplies to the steel works, liquid oxygen explosives used in the open-cast mining operations and electrodes, it has been disappointing in regard to solved acetylene. Production has increased at Ahmedabad and Madras as a result of transfer of plants and now it is proposed to increase the capacity of the Bombay factory by importing new plant and equipment. The significant development has been that argon purification and high production facilities have been installed at the Burnpur factory and the Khardah factory, near Calcutta, has been equipped for bigger production of special electrodes.

In view of the expansion plans that may cost Rs. 3.85 crores, it is proposed to increase the ordinary share capital. It has been decided to make a rights issue of 600,000 ordinary shares of Rs. 10 each at a premium of Rs. 8 per share. Although the British Oxygen Company Limited is entitled to 70% of the shares, it has agreed to take only 60% thereby enabling the Indian public to have more shares, i.e., 40%. The contribution of the British Company will help Indian Oxygen to obtain the foreign exchange necessary for the expansion project. As for the future outlook of the Company, it is needless to say that with the continued expansion of the economy, Indian Oxygen's products will continue to have an expanding market.

Coffee

NEED FOR PLANNING

MR. C. I. MACHIA, Chairman of the Consolidated Coffee Estates (1943) Ltd., made a pointed reference to Haarer's "Modern Coffee Production" wherein the latter had warned that prices of coffee had already reached the peak (1955-56) and a decline was bound to be observed. The Chairman, therefore, warned the producers of coffee to take timely action to improve the economics of their estates. One step which could help the coffee producers was the introduction of mixed planting. In line with this policy the Consolidated Coffee Estates have decided to pay attention to pepper, cardamom, oranges, and arecanut, although primarily they remain the producers of Coffee. This certainly is going to help the estates to add to their earnings.

The Chairman also stressed the advisability of a thorough examination of the export procedure adopted by the Coffee Board. He was especially critical of the mixing of the coffee obtained from various estates by the exporters, because it made the grading less perfect. He cited the example of Kenya where coffee was sold according to liquor tests so that the buyer was sure of the quality he bought. It seems to be a more modern method of standardisation. The Coffee Board should consider this suggestion in view of the fact that Kenya coffee has sold at higher prices than those of Indian coffee.

Madras Cement

NEW ISSUE

THE FIRST stage of the construction programme of Madras Cement Ltd. which has its factory in Tulu-kkappatti in Ramanthapuram District has been completed and its production is expected to commence shortly. The initial capacity will be between 200 and 250 tons a day. As the company has been able to make satisfactory arrangements for the import of plant and machinery from Czechoslovakia on a rupee payment basis it has decided to go ahead with the second stage of the programme which will take the capacity up to 600 tons a day. The expansion scheme is proposed to be taken up immediately and completed as early as possible so that the new plant can commence production by the end of 1962.

The total cost of the second stage is estimated at Rs. 1.20 crores. The company proposes to find part of this sum by issuing additional capital for Rs. 70 lakhs in the form of equity shares worth Rs. 50 lakhs and preference shares worth Rs. 20 lakhs. Arrangements have been made to secure the balance of Rs. 50 lakhs as a loan from the Industrial Finance Corporation. The new shares were offered in the first instance to the existing shareholders. The balance left over is to be placed on the market for subscription details for which are available in an announcement in this issue.

The company has been successful in securing firm subscription from leading institutions. The whole of the issue of Rs. 70 lakhs has been underwritten. Madras Industrial Investment Corporation alone are taking up shares for Rs. 35 lakhs and the L.I.C. for Rs. 2.50 lakhs. The balance of Rs. 24.27 lakhs is to be raised from the open market. Even here, the L.I.C. will be sending an open application for equity shares of the value of Rs. 7.50 lakhs so that comparatively small amount is open for the public. The new issue is, therefore, likely to receive a ready response in the market. The investors will have the advantage of subscribing to new shares which may yield an income right from the beginning as these rank equally with the existing shares for dividend purposes.

FROM THE CAPITAL'S CORRIDORS

FERTILIZERS IN THE THIRD PLAN

THE latest estimates prepared by the Union Food and Agriculture Ministry put the requirements of nitrogenous fertilizers in 1961-62, the first year of the Third Plan, at two million tons out of which not more than about 8½ lakh tons will be available from indigenous sources. The Ministry, it is understood, is therefore pressing for additional allocation of foreign exchange for the import of nearly 11½ lakh tons of nitrogenous fertilizers. Originally it was expected that an import of one million tons of ammonium sulphate would meet the requirements.

The Third Five-Year Plan envisages raising of foodgrains output to 100 million tons from the present level of about 75 million tons. Substantial increases are also envisaged in the output of other agricultural products. This increase in agricultural production is to be mainly achieved through massive application of chemical fertilisers, extension of irrigation facilities, greater use of improved seeds and implements and through the package programme of intensive cultivation in selected districts. Primary emphasis will, of course, be on increasing the use of chemical fertilizers. Consequently, the Third Plan target of fertilizers output has been put at one million tons of nitrogen, four lakh tons of phosphatic fertilizers and about one lakh tons of potash fertilizers.

EXISTING CAPACITY OF NITROGENOUS FERTILIZERS

The existing capacity for the production of nitrogenous fertilizers is as follows:

1. Sindri Fertilizers Factory (after expansion just completed)	117,000 tons
2. Mysore Chemicals and Fertilizers	1,300 tons
3. Fertilizers and Chemicals Travancore Limited	30,000 tons
4. Five by-product ammonium sulphate units at Coke ovens, including those of steel plants	10,000 tons
5. By-product ammonium chloride at Varanasi Soda Ash Factory	10,000 tons
TOTAL	168,300 tons

Three more fertilizer projects — one at Nangal, another at Neyveli and the third one at Rourkela — have been recently taken up for execution. These factories will have a capacity of 80,000 tons, 70,000 tons and 80,000 tons of fixed nitrogen respectively. The Nangal factory was expected to start production by the end of the last year, but could not do so due to paucity of electricity; it is now expected to go into production sometime during the current year. The Neyveli and Rourkela factories are expected to start production by the end of 1962. Besides these, a fertilizer factory, with a capacity of 90,000 tons of fixed nitrogen, has been sanctioned to be set up at Trombay. Negotiations are in progress with the United States to arrange foreign exchange resources for this project. Preliminary work has been taken in hand. The total capacity already installed or under installation, thus, is as given in the table on top of next column.

Name of Unit	Capacity in Tons of Nitrogen
1. F.A.C.T.	30,000
2. Sindri	1,17,000
3. Nangal	80,000
4. Rourkela	80,000
5. Neyveli	70,000
6. Parry & Co. (Madras)	8,250
7. Mysore	1,300
8. Trombay	90,000
9. Steel Plants (by-product)	26,000
10. Ammonium Chloride (by-product)	10,000
TOTAL	5,12,550

PRIVATE SECTOR AND MANUFACTURE OF FERTILIZERS

Manufacture of fertilizers in the Third Plan has also been thrown open to the private sector which is expected to yield about 2 lakh tons of nitrogen per year by 1965-66.

To suggest suitable sites for setting up new fertilizer manufacturing units, both in the private and the public sectors, the Government of India last year instituted a technical committee under the chairmanship of Dr. G. P. Kane, Senior Industrial Adviser (Chemicals), Ministry of Commerce and Industry. This Committee has submitted its reports on the fertilizer factories to be set up in Andhra Pradesh, Assam, Rajasthan, Madhya Pradesh, Uttar Pradesh, Mysore and West Bengal. The capacity to be installed in these States, as suggested by the Kane Committee, is as follows:

Location	Capacity in Tons of Nitrogen
1. Andhra — Kothagudam	80,000
2. Assam — Nahorkatiya region	32,500
3. Rajasthan — Hanumangarh	50,000 (or 80,000)
4. Madhya Pradesh — Katni or Itarsi	50,000
5. Uttar Pradesh	30,000
6. Mysore	50,000
7. West Bengal — Durgapur	58,000
TOTAL	400,000

The Committee is examining the cases of setting up fertilizer factories in the remaining States which have no big fertilizer factories at present. Its reports about these States will be available in course of time.

The fertilizer factory at Kothagudam, in Andhra Pradesh, is proposed to be set up by the State Government. Preliminary work on this project has already been started. The factory at Nahorkatiya, in Assam, is proposed to be set up by the Central Government. The execution of this project has been entrusted to Messrs. Hindustan Chemicals and Fertilizers Ltd., Nangal. The Durgapur factory is proposed to be set up by the West Bengal Government which is having negotiations with a Japanese firm for technical and financial collaboration.

Three parties have submitted applications for the grant of the licence for putting up the fertilizer factory at Hanumangarh, in Rajasthan. The applicants are Mr. Dharamsey Mulraj Khatau, Mr. S. P. Jain and Mr.

VITAL NEWS

for every businessman

The management of the Times of India group of publications has decided to change the name of the proposed daily financial newspaper from 'The Financial Times of India' to 'The Economic Times'.

The change is designed to meet certain technical requirements, but the management is happy that the new title, with its wider significance accords better with the newspaper's main field of coverage — the economic development of the country.

The newspaper which will consist of eight pages will be published on all days of the week and will be priced 20 nP. per issue.

The *Economic Times* will contain information vital to every businessman, business house, investor, banker and student of economic affairs. With its comprehensive and objective coverage of economic developments in India and the world over, *The Economic Times* promises to keep its reader better informed than ever before.

"THE ECONOMIC TIMES" WILL CONTAIN:

- Economic news and comment of world-wide and Indian interest
- Complete coverage of all six Indian stock exchanges and those in London and New York
- Spot news on planning and development from regional economic bureaux and news about aid and collaboration, from foreign correspondents
- Extensive reports on the hundreds of commodity markets in India; statistics, tables and graphs on economic trends
- Periodic economic newsletters from State capitals
- Exclusive information from India and abroad for the import and export trade
- Investment guidance by experts; critical analysis of company balance sheets
- Articles on current topics by well-known economists; informed leading articles

The *Economic Times* will be a newspaper that no businessman can afford to go without.

THE ECONOMIC TIMES

SUBSCRIPTION RATES:

Local and through authorised agents: Yearly Rs. 73.00, Half-yearly Rs. 36.50, Quarterly Rs. 18.25.
By post in India, Pakistan & Ceylon: Yearly Rs. 80.50, Half-yearly Rs. 40.25, Quarterly Rs. 20.25.
By post to Aden, Burma and other countries: Yearly Rs. 102.25, Half-yearly Rs. 51.25, Quarterly Rs. 25.50

THE ECONOMIC TIMES, The Times of India Building, Dr. Dadabhai Naoroji Road, Bombay 1

Fabrications to specifications

Under licences
from Messrs Fives-Lille-Cail,
France, who built the largest sugar and cement
plants in the world and have supplied Soviet Russia
in 1959 a five thousand ton daily capacity cement plant, we
manufacture machinery and equip complete sugar and cement plants.

We also manufacture and supply complete sulphuric acid and super
phosphate plants. We have secured orders for five complete sugar
plants, of one thousand tons daily sugar cane crushing capacity.

Consult us with confidence

THE K.C.P. LTD.

Regd. office: 38, MOUNT ROAD, MADRAS-6
Phone: 84442 (3 Lines) Telegrams: KECEPE

KCP-9-SA

B. L. Jalan. All of them have based their proposals fundamentally on the recommendations made by the Kane Committee.

Messrs. Khandelwal Bros. Private Ltd., New Delhi, and Krishna Distributors, Indore, are interested in setting up the fertilizer factory at Itarsi or Katni, in Madhya Pradesh. The production patterns proposed by these two parties also conform to the recommendations of the Kane Committee which are as follows:

- | | |
|---|---|
| (1) Total capacity in terms of nitrogen | 55,000 tons |
| (2) Ammonia | 66,800 tons per year of which 6,000 tons would be sold as such for industrial purposes. |
| (3) Urea | 101,300 tons |

The Kane Committee has recommended production of methanol in the fertilizer factory to be set up in Madhya Pradesh. Messrs. Khandelwal Bros. have not included the manufacture of this in their scheme, while Messrs. Krishna Distributors have done so. There are five applicants for the grant of the licence for setting up the Visakhapatnam fertilizer factory. Among them are Birla Brothers, Parry and Company and Seshasayee Brothers. This factory is expected to cost over Rs. 20 crores.

It is understood the Government decision on the grant of licences for setting up these three factories in the private sector will be made known in the next few days.

BUILDING PROGRAMME UNDER THE THIRD PLAN

The Draft Outline of the Third Five-Year Plan had left out the following four items of expenditure: (1) building programme of the Ministry of Works; (2) expansion of printing capacity; (3) statistics and research; and (4) plan publicity. The revised estimates, increasing the outlay for the Centre by Rs. 817 crores, have included Rs. 53 crores for "Other Schemes" which shall cover these four items.

A provision of Rs. 6 crores is being made in the Third Plan for the expansion of printing capacity covering the following schemes:

- (1) Establishment of Government of India presses at Coimbatore, in Madras State, and Koratti, in Kerala State.
- (2) Resetting of the Government of India Press, Calcutta, and the construction of staff quarters at Santaragachi.
- (3) Construction of quarters for the staff of the Government of India Forms Press, Aligarh.
- (4) Setting up of a new Government of India Press in New Delhi (Najafgarh Industrial Area).
- (5) Addition of a Photo-Litho and Photography Wing to the Government of India Press, Calcutta, after it has been resited at Santaragachi.

A proposal is under discussion here to allocate Rs. 35 crores for the building programme of the Union Ministry of Works. This includes the expenditure to be incurred on the Second Plan spill-over projects.

An outlay of Rs. 12 crores is suggested for statistics and research and Plan publicity purposes.

THIRD PLAN PROVISION FOR DEVELOPMENT OF ROADS

A total outlay of Rs. 230.5 crores is now proposed for development of roads in the States and the Union Territories during the Third Plan period, as against an outlay of Rs. 234.6 crores recommended by the Planning Commission's Working Group on Transport Development and Rs. 350.5 crores initially proposed

ed by the States and the Union Territories. The outlay on road transport is similarly proposed to be cut down to Rs. 26.3 crores from Rs. 27.3 crores as recommended by the Working Group and Rs. 52.9 crores as suggested initially by the States and the Union Territories. Some further reduction in these outlays is not ruled out if the resources to the extent of Rs. 7,500 crores for public sector outlay during the Third Plan period, as envisaged now, are not available.

The following table sets out a comparison of the outlay on transport and communications in the Third Five-Year Plans of the States and the Union Territories proposed after their discussions with the Planning Commission, as recommended by the Working Group and as suggested initially by the States and the Union Territories.

	(Rs. crores)		
	Outlay initially proposed	Outlay recommended by the working Group	Outlay proposed after discussions
Roads	350.5	234.6	230.5
Road transport	52.9	27.3	26.3
Ports and harbours	13.2	3.5	5.1
Inland water transport and other transport	9.5	4.9	5.8
Tourism	8.1	3.0	3.5
Total	434.2	273.3	271.2

Besides the Rs. 230.5 crores outlay proposed for the development of roads in the States and the Union Territories during the Third Plan period, the Centre will be making an allocation for the development of national highways and inter-State roads of economic importance. The contemplated expenditure in this respect will be made known in the near future.

PROVISION FOR SOCIAL SERVICES

Provision for social services in the Third Plan in its revised form is also likely to be lower around Rs. 1,200 crores—Rs. 900 crores to be included in the plans of the States and the Union Territories and Rs. 300 crores in the Central Plan—as against Rs. 1,250 crores in the Draft Outline. The allocations now proposed for social services in the plans of the States and the Union Territories, compared with those recommended by the Planning Commission's Working Groups on Social Services and those originally suggested by the States and the Union Territories in their draft plans, are as follows:

	(Rs. crores)		
	Outlay proposed in Draft Plans	Outlay recommended by Working Groups	Outlay proposed after discussions
General education (including cultural programmes)	427.3	346.1	328.4
Technical education	124.4	73.5	70.3
Health	430.3	315.2	293.5
Housing	202.5	128.9	116.8
Welfare of backward classes	120.5	63.5	73.5
Social welfare	25.6	8.9	9.0
Labour and labour welfare	49.3	26.0	26.1
Total	1379.9	962.1	917.6

Outlays proposed by the States and the Union Territories for various stages of education during the Third Plan period, compared with the expected expenditure incurred under the Second Plan, are as follows:

(Rs. crores)

	Expected Outlay in 2nd Plan	Outlay Proposed for 3rd Plan
Elementary education ..	88	199
Secondary education ..	47	75
University education ..	23	37
Other educational programmes	16	15
Cultural programmes ..	1	3
Technical education ..	27	69
TOTAL ..	202	398

The States, as also the Centre, in their plans have endeavoured to provide for increased facilities for imparting technical education. This is evident from the following table which gives the number of additional seats to be provided for degree and diploma courses during the next five years, along with the growth that has taken place during the Second Plan period.

TECHNICAL EDUCATION

(Increase in Institutions and Number of Seats)

	Institutions	Intake	Outturn
Degree Courses			
1955-56 ..	64	5,937	4,017
1960-61 ..	97	13,531	8,300
1965-66 ..	117	19,400	12,000
Diploma Courses			
1955-56 ..	102	9,397	4,072
1960-61 ..	208	26,069	12,850
1965-66 ..	273	39,918	19,000

COMPANY LAW TECHNICAL ADVISORY COMMITTEE

The Government of India has reconstituted the Technical Advisory Committee in the Department of Company Law Administration. This Committee had been set up towards the end of 1958 under the chairmanship of Mr. D. L. Mazumdar, Secretary, Department of Company Law Administration, to advise the Govern-

ment on all major policy issues relating to legal and accounting aspects of the administration of the Companies Act. The scope of the Committee's work is similar to that of the Technical Advisory Committee associated with the Companies and Insurance Department of the Board of Trade in the United Kingdom.

The reconstituted Committee will function for a period of two years. Besides Mr. D. L. Mazumdar, who will continue to be its chairman, the Committee will consist of Messrs. N. R. Mody, S. P. Chopra, G. Basu, J. D. K. Brown, C. C. Shah, C. C. Choksi, J. M. Lall and P. L. Tandor.

Simultaneously, the Government has reconstituted the Research Programme Committee attached to the Department of Company Law Administration. This Committee's function is to advise the Department on the most fruitful lines along which statistics and other data on companies, now available, can be processed and analysed to serve as a basis for formulation of policy. During the last two years, this Committee has sponsored several research publications on different aspects of company management and finance. Besides the Secretary of the Department of Company Law Administration, who will act as its chairman, the members of this Committee will be some leading chartered accountants, economists and the Director of Statistical Research, Reserve Bank of India.

UTILISATION OF RURAL MANPOWER

Thirty-two pilot projects on utilisation of manpower in rural areas have been approved by the Planning Commission and the Government of India for execution by March 31, 1962. They will cover all the States and the Union Territories of Himachal Pradesh and Tripura.

The programme involves undertaking of some works concerning minor irrigation, drainage, communications, drinking water-wells, contour bunding, building of earth embankments, manufacture of building materials, development of Panchayat lands, afforestation and soil conservation. The projects included in this programme will be besides those included in the State plans, and will have high employment potential. On a rough basis, an outlay of Rs. 2 lakhs has been suggested for each of these projects. The programme envisages payment of wages to those engaged on its execution at rates prevailing in the country side at the time when the work is undertaken.

The object of these pilot projects is to gain experience in organizing in rural areas a works programme which will make a marked impact on the problem of unemployment and under-employment, especially during the slack agricultural seasons. On the basis of the first year's experience, it is hoped to extend this programme to many other areas in which there is widespread under-employment.

INDIA'S TRADE WITH ITALY

A 22-member economic mission, sponsored by the Italian Government, will arrive in New Delhi on February 1 to explore the possibilities of further expansion of trade between India and Italy.

During its 24-day stay in this country, the mission will hold talks with the Government of India and representatives of trade and industry for making arrangements for export of Italian machines and machine tools to India and for import, on a larger scale, of industrial raw materials from here.

COMMODITY NEWS AND NOTES

ALL-INDIA FINAL ESTIMATE OF POTATO, 1959-60 MANUFACTURE OF FREE-FLOWING TABLE SALT

The All-India Final Estimate of Potato, 1959-60 puts that year's area and production at 885,000 acres and 2,719,000 tons as compared to the Partially Revised Estimates of 858,000 acres and 2,327,000 tons for 1958-59, according to the Directorate of Economics & Statistics, Ministry of Food and Agriculture. This shows an increase of 27,000 acres or 3.1% in area and 392,000 tons or 16.8% in production in 1959-60 over 1958-59. The increase in area during the year 1959-60 has been shared mainly by Uttar Pradesh and West Bengal and has been attributed generally to favourable climatic conditions at the time of sowing. This increase has, however, been off-set to some extent by the decrease registered in Bihar State on account of unfavourable weather at the sowing time. The increase in production has occurred mainly in West Bengal, Bihar, Uttar Pradesh and Punjab States. The increase in production is due partly to increase in area and partly to increased yield per acre this year as compared to last year, as a result of favourable climatic conditions during the growing period of the crop and also due to adoption of improved methods of cultivation reported from Bihar and Punjab.

Central Salt Research Institute, Bhavnagar. The process involves purification of salt with lime and soda-ash and crystallisation under controlled conditions so as to produce grains of size and shape conducive to the free-flowing quality. Cost estimates indicate that a one-ton per day plant would give a 21.5 per cent return on investment. Ordinary common salt contains certain hygroscopic impurities. Thus, even when powdered to the requisite grain size, it is not free-flowing particularly in humid weather. Even when freed from impurity, the salt absorbs moisture when the humidity goes beyond a certain limit. It is therefore necessary to incorporate small quantities of certain chemicals (driers) to form a protective coating on the grains so as to preserve the free-flowing quality under varying atmospheric conditions. The free-flowing property is further improved by providing a very thin coat of a non-offensive paraffin wax in addition to small quantities of the usual driers.

RAISINGS AND DESPATCHES OF COAL

The raisings and despatches of coal during November 1960, from all fields in India, were 4,635,733 and 4,141,243 tonnes respectively. The corresponding figures for the month of October 1960 were 4,338,723 and 4,134,405 tonnes respectively. The daily average loading for the month of December 1960 from the West Bengal and Bihar fields was 4629 wagons as against 4897 wagons in the previous month. The highest loading on any day during December 1960 was 5452 wagons as against 5394 wagons in November. A daily average of 162 wagons was allotted for shipment traffic during December 1960 as compared to 180 in the preceding month. A daily average allotment of 152.70 wagons was made to Pakistan during December 1960. About 104,148 tonnes of coal were despatched to that country during the month.

CURCUMIN AS COLOURING AGENT FOR VANASPATI

Investigation in progress at the Central Food Technological Research Institute, Mysore, suggest the suitability of curcumin derived from turmeric as a colouring agent for hydrogenated vegetable oil. When powdered turmeric is extracted with alcohol, curcumin is obtained as a crude extract (7-8 per cent of the dry powder), mixed with the oil of turmeric. Addition of the extract (0.04 per cent on the weight of the fat) to hydrogenated vegetable oil imparts to it a pleasant acceptable colour. When added (even at 10 per cent level) to ghee, the colour is clearly visible and responds to the lime test. Taking the present market price of turmeric in bulk at Rs. 48 per maund (80 lb.) and reckoning the yield of crude curcumin at 8 per cent, the cost of colourization per pound of vanaspati inclusive of the extraction process comes to less than 1 nP. On the basis of average production of vanaspati in the country at 4 lakh tons, the country will need 2000 tons of turmeric which represents about 1 per cent of the total production of turmeric in the country. The addition of turmeric colour (at 0.04 per cent level of the extract) may serve as a deterrent for the adulteration of ghee with vanaspati because it acts both as a visible and as a latent colour. It is considered desirable that the addition of sesame oil should also be continued as it will serve as an additional check.

Optimum conditions have been worked out for preparing free-flowing table-salt from marine salt at the

THE INDIAN OVERSEAS BANK LTD.

has introduced

A RECURRING DEPOSIT SCHEME

to suit the requirements of all classes of people.

Deposits are accepted in multiples of Rs. 5/- with a minimum of Rs. 5/- & a maximum of Rs. 500/-.

Monthly Deposit of

Rs. 5 Rs. 10 Rs. 50 Rs. 100
will grow to

In 34 months Rs. 180 Rs. 360 Rs. 1,800 Rs. 3,600

In 46 months Rs. 250 Rs. 500 Rs. 2,500 Rs. 5,000

In 86 months Rs. 500 Rs. 1,000 Rs. 5,000 Rs. 10,000

Please call for full particulars from any of our branches.

COMPANY AFFAIRS

TITAGHUR PAPER: LARGER SALES

During the year to March 31, 1960 the Titaghur Paper Mills Company Ltd. registered an improvement in production although coal shortage was felt in one of the Mills of the Company. During the year under review paper sales proceeds of the Company were registered at Rs. 9.86 crores against previous year's sales of Rs. 9.42 crores. This was in spite of the fact that a reduction in the selling price of many qualities of paper and paper board took place on 1st January, 1960, as a result of the recommendations of the Tariff Commission. This has had an adverse effect on the results of the Company for the year under review and will have a still greater effect when the lower prices are in force for a full financial year. The Board of Directors have therefore decided to take certain steps to improve the earning capacity of the Company which has been affected by the reduction in selling prices and rising costs of production caused mainly by higher costs of materials, coal and rail freight. The ninth stage of renovation will be mainly at one of the Mills and it is proposed to improve the Soda Recovery and Boiler Plants and to build an Electrolytic Bleach Plant all of which will effect substantial economies.

The profit during the year under review after making provisions for depreciation and taxation comes to Rs. 55.42 lakhs which is higher than the previous year's Rs. 46.01 lakhs. A sum of Rs. 24.9 lakhs was transferred to statutory development reserve. An interim dividend on A and B ordinary shares at Rs. 1.20 nP. per share absorbed Rs. 13.45 lakhs. Now final dividend of the year has been paid on these shares at the rate of Rs. 1.30 nP per share absorbing another sum of Rs. 14.57 lakhs. In view of the Preference Shares (Regulation of Dividends) Bill, 1960, recently introduced in the Lok Sabha, the Directors have decided that Dividends on the Preference and Preferred Ordinary Shares be recommended for payment in the manner stated above in respect of the financial year ended 31st March, 1960, as a result of which Dividends will be paid at the rates specified in the Articles of Association of the Company. The Directors have added that as soon as practicable after the said Preference Shares (Regulation of Dividends) Bill has been enacted, steps will be taken for declaration of such additional Dividends, if any, on the Preference and Preferred Ordinary Shares in respect of the said year as may be necessary to comply with the provisions thereof.

THE PUNJAB NATIONAL BANK LTD.

The working of the Punjab National Bank Ltd., for the year ended 31st December, 1960, has been satisfactory.

Subject to audit, the profit of the Bank for the year 1960, after making payment of Rs. 12.77 lakhs to Employees' Gratuity Fund Trust and providing for Contingencies, amounts to Rs. 121.18 lakhs including Rs. 3.19 lakhs brought in from the previous year's account as against Rs. 88.69 lakhs for 1959 including Rs. 4.49 lakhs brought forward from previous year's account. A sum of Rs. 12.50 lakhs has already been utilised towards payment of ad-interim dividend at Re. 1/- per share subject to tax, thus leaving a balance of Rs. 108.68 lakhs for further appropriations.

The Directors have decided to make the following appropriations:

Provision for Income-tax, ...	Rs. 53 lakhs
Transfer to Reserve Fund, ...	Rs. 11 lakhs

Transfer to Bonus to Staff Account, ...	Rs. 27 lakhs
Transfer to Charity Account, ...	Rs. 1 lakh

The Directors have further recommended to the shareholders that out of the balance of Rs. 16.68 lakhs a sum of Rs. 12.50 lakhs be paid as final dividend at the rate of Re. 1/- per share subject to tax, making a total distribution of 20% per annum subject to tax. Balance of Rs. 4.18 lakhs is proposed to be carried forward to the next year.

The Bank had 408 offices in India, Burma and Pakistan as on 31-12-1960 as against 383 offices as on 31-12-1959 and offers all types of banking and foreign exchange facilities.

KOTHARI SUGARS AND CHEMICALS LTD.

Out of the public issue of 4,00,000 shares, the Kothari Sugars and Chemicals Ltd. has received application for 7,70,350 shares. The Board of Directors of this Company have made allotments in respect of the public issue of shares. The shares have been allotted on the following basis:

1. In respect of applications for 100 shares allotment has been made in full.
2. In respect of applications for over 100 and upto 500 shares, 50% of the shares applied for have been allotted but subject to a minimum of 100 shares, to be rounded off to the nearest 50.
3. In respect of applications for over 500 shares 40% of the shares applied for have been allotted subject to a minimum of 250 shares, to be rounded off to the nearest 50.

CHAIRMAN'S STATEMENT

INDIAN OXYGEN LIMITED

INDUSTRIAL GASES AND ELECTRODES PLAY INCREASINGLY IMPORTANT PART IN THE
INDUSTRIALISATION OF THE COUNTRY

PROPOSED RIGHTS ISSUE TO FINANCE LARGE EXPANSION PROGRAMME

The following is a statement by Sir John Douglas Keith Brown, Chairman, Indian Oxygen Limited, issued to the shareholders, together with the Directors' Report and Accounts for the year ended 30th September, 1960 and the Notice of the Company's 26th Annual General Meeting which is to be held on 14th February 1961.

The Directors' Report and Accounts for the year ended 30th September last are being circulated with this statement. In keeping with the trend in these matters, your directors have felt that the statement which is normally made by the Chairman at the Annual General Meeting, which is attended by only a very small proportion of the shareholders, should be circulated in advance to all members and that this opportunity might be taken to deal at some greater length than previously with the company's trading experience in the year under review, its financial position and its development plans with particular reference to its position in the expanding economy of India.

PROFITS, TAXATION AND DIVIDEND

The profit for the year, after providing Rs. 37,10,806 for depreciation and Rs. 38,85,900 for taxation, amounted to Rs. 62,98,449. This compares with a net profit for the previous year of Rs. 53,07,450 which was arrived at after charging depreciation of Rs. 31,69,459 and taxation of Rs. 34,62,755. As stated in the report of the directors, the profit may be considered satisfactory. Ours is, however, a capital-intensive industry and past experience has demonstrated the necessity continuously to plough back profits to provide for plant replacements at increased cost and for expansion which, as an industry serving other industries, we must always be prepared to carry out in anticipation of demand. I shall refer later in this statement to the expansion which we visualise over the next few years and to the arrangements which are contemplated to finance it. Suffice it to say at this juncture that, for so long as can be foreseen, there will always be the necessity to plough back substantial sums of money each year and it is in these circumstances that your directors have felt it appropriate, notwithstanding the increase in profits, to recommend the same rate of dividend as was paid in respect of the previous year.

SALES

From the accounts for the year you will observe that the value of sales exceeded that in the previous year by over Rs. 91 lacs, representing an overall increase of just over 16 per cent. While practically all products contributed towards this rise, the rate of increase was particularly high in the cases of piped oxygen supplies to the steel works, liquid oxygen explosives used in open-cast mining operations and electrodes. The increase in electrode sales was primarily due to the higher level of production at the factory and the introduction of new ranges of special types during the year. The rate of increase in sales of dissolved acetylene was disappointing and while partly due to delays in the completion of customers' own development programmes, was also accounted for by increased competition and

the use of alternative products. The principal raw material used in the production of dissolved acetylene is calcium carbide and towards the close of the year, with the commissioning of a plant in South India to supplement the output of another plant which had been functioning for some time in Calcutta, the country is now approaching self-sufficiency in this item. While this development is particularly welcomed by us as ensuring supplies of one of our main raw materials without our having to concern ourselves with the problem of foreign exchange, I have to observe that the high price of indigenously produced carbide and its lower gas yield are already having an adverse impact on the cost of production of dissolved acetylene.

DEVELOPMENT AND EXPANSION

Industrial gases and electrodes, which are your company's main products, play an increasingly important part in the industrialisation of the country, and this was appropriately recognised during the year when the Planning Commission called a meeting of the major producers and consumers to discuss the requirements of these products in the Third Five-Year Plan period. The outcome has been the inclusion of our industry's overall requirements in the draft outline of the Plan published a few months ago.

While the Planning Commission has indicated the country's overall requirements of our major products during the next few years and while this is extremely useful as a basis for planning our own production facilities, these requirements have to be broken down to assess the needs of each region. This is particularly important in the case of industrial oxygen and dissolved acetylene, where extremely high distribution costs limit the frontiers of the market. The whole country, therefore, has to be divided into several regions to be served by carefully sited producing and supply points. Again, each production point has to be of a capacity geared to the needs of the region it serves, and as the state and pace of development varies from region to region, it is obvious that the capacity and size of the various plant units will also vary. In catering for additional oxygen requirements, therefore, we have to consider the alternatives on the one hand of multiplication of plants of similar capacity, and on the other of stepping up the size of each unit as a region progresses industrially, so that benefit may be derived from the economies of larger scale production. Your company is in a particularly favourable position to fulfil this requirement of regional development, and this is accomplished by transferring oxygen producing plants from one region to another, and installing plants of higher capacity and greater efficiency in regions which, by reason of economic advancement, require such plants. This incidentally results in a significant saving of foreign exchange as the import of one additional plant may, through a number of consequential transfers, help to increase available capacity in more than one region. Thus, during the past year we have succeeded in stepping up oxygen production at Ahmedabad and Madras by transferring plants from Bombay to Madras and from Madras to Ahmedabad. This leaves the oxygen plant capacity at

Bombay to be augmented, and we are hopeful that the necessary licence under the Industries (Development & Regulation) Act will be forthcoming in the near future, to enable us to import a plant with adequate capacity against foreign exchange procured by the company.

Oxygen requirements in the Calcutta and Jamshedpur region have been growing apace and an additional 400 M3 oxygen plant was installed in each of the Calcutta and Jamshedpur factories during the year.

Another significant development took place at Burnpur, where we installed argon purification and high purity nitrogen production facilities, which were successfully commissioned during the year with the help of technical assistance received from The British Oxygen Company Limited. In our Burnpur factory we are now equipped to produce and compress argon, high purity nitrogen and argon/nitrogen and argon/oxygen mixtures. The production of these gases for the first time in India will lead to substantial savings in foreign exchange which had hitherto been expended on importing them and the cylinders which contained them. Argon, high purity nitrogen and their mixtures will provide electric lamp manufacturers with an indigenous source of supply, while argon will help in welding and fabricating stainless steel and aluminium and aluminium alloys, which are to be produced in the country in growing quantities in the years to come, and will also fulfil the large requirements of the Government Alloy Steel Plant to be set up at Durgapur.

The present oxygen producing plant in Bombay also produces liquid nitrogen which is essential for the operation of India's atomic reactors. The additional oxygen plant we hope to install there will further augment our supply of this gas, the demand for which is increasing and will continue to increase as India progresses in the field of atomic power generation.

Through the pioneering efforts of your company, liquid oxygen is being more and more used with loxite cartridges as an effective and economical explosive in open-cast mining for coal, iron ore, limestone and manganese. In developing the use of this explosive, we have been closely associated with the National Coal Development Corporation, the Tata Iron & Steel Co. Ltd., and the Indian Iron & Steel Co. Ltd. The loxite cartridge manufacturing plant which was established at Burnpur in May 1959 is producing the additional cartridges required to match developing sales.

The draft outline of the Third Five-Year Plan envisages rapidly increasing requirements of electrodes and our new factory at Khardah, Calcutta, is being equipped to meet the greater demands. The level of production at this factory improved during the year and new types of special electrodes were developed and introduced into the market. Our equipment factory at Calcutta, which two years ago undertook a phased programme of indigenous manufacture of gas-user equipment, is now on 100% local manufacture of the components required. Here again, plans are afoot to raise the level of production in the near future.

At Bangalore construction of a new oxygen and dissolved acetylene factory is progressing on schedule and operations should commence within the current financial year. When complete, this will afford increased production of dissolved acetylene in that growing industrial area.

At Gauhati, we have installed an oxygen plant within the premises of Indian Refineries Ltd., and I think we can claim that we have contributed in no small measure to the progress of erection at the refinery by coming forward with timely supplies of oxygen.

Nitrous oxide, which is an anaesthetic widely used by the medical profession in India and which is also exported, is now produced in our Calcutta factory. A

licence for setting up a second producing plant for nitrous oxide at Bombay has recently been obtained and when this plant is in operation, it is hoped to increase substantially both sales generally and in particular exports to the Near and Far East.

With regard to welding rods, miscellaneous gas-user and medical equipment and electric welding plant, it has been our policy to encourage their manufacture through feeder industries, thus reducing our reliance on imports. I am glad to say that in very many cases these feeder industries have been nursed and encouraged to undertake manufacture of these items, not only through the orders we place with them, but with the technical help we render them by drawing on our collaboration arrangements with The British Oxygen Company Limited.

It is obvious that with the increasing pace of industrialisation in the country and in particular having regard to the greatly increased quantities of steel which will become available for fabrication and machine building during the next Five-Year Plan period, the consumption of your company's products must continue to rise. What may not, however, be so widely appreciated is that based on the experience of the industrially developed countries, the rate of expansion of the industrial gases industry is likely to exceed the rate of expansion in the output of steel. Even today, in the United States of America, the consumption of oxygen per ton of steel produced is still increasing and this is a factor which I believe will have to be borne in mind in considering the scale of development required in India if shortages and deficiencies are not going to handicap the steel-using industries in the highly competitive years which lie ahead of us.

COMPETITION

Government's policy towards competition, especially with regard to industrial oxygen, has been indicated by the Planning Commission as follows:—

"... it was agreed that while recent entrants into this field and newcomers might be given some weightage in the interest of preventing over-concentration of growth, there could be no question of freezing the capacity of leading producers at current levels and that taking all relevant factors into consideration, an appropriate share of the expansion should be allowed to them also."

We accept this position which is in line with the declared economic and social objectives of planning in this country. I feel, however, that I should make one comment in this connection and it stems from what I have stated before, namely that by the very nature of its business, oxygen production facilities have to be sited at multiple points each serving a certain optimum area. If, therefore, the country is to reap the benefits of increased production each one of these production points should be allowed to grow to be able to achieve the economies of scale which in this industry are very considerable; indeed, spectacular. A careful eye should, therefore, be kept on this aspect of the problem so that wasteful competition is not allowed to lead merely to unnecessarily high prices to the detriment of our customers and therefore of the nation as a whole through failure to achieve economic cost levels.

FINANCE

The considerable expansion in our production facilities which has already taken place as well as the further expansion which is now visualised, necessarily involves financial commitments which cannot be completely met from cash retentions in the business. Apart from the quantum of the finance required, the necessity at this stage to import plants gives rise to a demand

for foreign exchange, and this is being met in various ways. The biggest single item in the past year has been for oxygen and dissolved acetylene cylinders and for this purpose accommodation was arranged through the United States Export-Import Bank. As a counter-part of this arrangement, the rupee equivalent of the U.S. Dollar cost which could not be met from internal resources was secured by way of additional facilities from our Bankers in Calcutta.

Our capital expenditure in the three years ending 30th September, 1963, is presently estimated at a figure of Rs. 3,85,00,000. Your directors have carefully considered the methods of financing this large expansion programme and in view of the steadily increasing investment in fixed assets have come to the conclusion that the Ordinary Share capital should now be increased. By virtue of The British Oxygen Company Limited's holding in our equity capital this will also yield foreign exchange in our hands through the parent company's subscription towards the new Ordinary Shares to be allotted to them. The consent of the Controller of Capital Issues has, therefore, been sought and obtained, and it is now proposed to make a rights issue of 6,00,000 Ordinary Shares of Rs. 10/- each at a premium of Rs. 8/- per share. You will notice that various matters arising out of this issue of share capital are proposed to be dealt with at the meeting to which this statement is to be submitted and full information is contained in the explanatory statement attached to the notice convening the meeting. I would particularly point out that although on the basis of its current holding of Ordinary Shares, The British Oxygen Company Limited, is entitled to 70% of the rights issue, they have agreed that they should take up only 60% thereof, thus enabling 40% to be offered to members other than The British Oxygen Company Limited, being very largely members of the Indian public.

MANAGEMENT AND PERSONNEL

In an expanding organisation such as ours which by the nature of its production is necessarily widely dispersed throughout the country, the need to provide for the development of senior executives is a continually increasing one. We have taken advantage of the facilities afforded to us by The British Oxygen Company Limited, to send a number of our officers to the United Kingdom for specialised training while nominees of the company have also attended the Administrative Staff College at Hyderabad as well as other specialised courses in sales and administration which have been available in India. We were particularly proud that our Secretary, Mr. A. K. Basak, was selected by the National Productivity Council to lead a Productivity Study Team on stores and inventory control to Japan, the United States of America and West Germany, while we are also pleased that one of our officers has been chosen for inclusion in a Productivity Team on welding which is to go abroad in 1961. The burden on our senior executives is a heavy one and I assure you that we have been well served by them. Our particular gratitude is due to our Managing Director, Mr. A. K. Sen, who has been untiring in his devotion to the company's interests. To him and to the other senior executives as well as to the staffs and work-people at our installations throughout the country I offer on your behalf our grateful thanks.

TECHNICAL COLLABORATION

It would be inappropriate to close this statement without a special mention of the help and assistance which we continue to receive from our parent company, The British Oxygen Company Limited. With the increasing tempo of development in India the contact between the personnel of the two companies has continued to grow at all levels and we were particularly pleased to welcome just a few weeks ago Mr. J. S.

Hutchison, the Chairman of The British Oxygen Company Limited, who in a crowded programme visited Jamshedpur, Calcutta, Delhi and Bombay. On your behalf I extend to The British Oxygen Company Limited and to its Chairman our appreciation of their valued assistance and of the very real interest which I can assure you they continue to take in our progress.

PROSPECTS

The Company is now embarked on a further expansion programme, the scale of which is substantial even on the basis of its already widespread activities. We are, however, building on a sound foundation and from what I have already stated, shareholders will appreciate that I have no doubts regarding the future demand for our products. Expansion of the steel-using industries constitutes a basic feature of the Third Five-Year Plan just as increased steel production was the central theme of the Second Plan. In these circumstances it is clear that our industry must forge ahead. At the same time I must point out that we have already shouldered substantial liabilities in the shape of foreign exchange loans and the likelihood is that the demands of Indian industry will compel us to consider before long a further stage of expansion, involving fresh financing problems. Having regard to all these considerations it may, I fear, be necessary for shareholders to be prepared to exercise a degree of patience in regard to the expectation of increased returns by way of dividend; but from what I have stated it is only reasonable that you should be able to look forward to a steady growth in the value of your investment in an industry which is vital to the continuing growth of the Indian economy. I have no doubt that, given a steady supply of the necessary raw materials, all industries in this country will bend themselves to the task of achieving what is expected of them under the Third Five-Year Plan and in serving them Indian Oxygen will play its full part.

THIS IS ONLY AN ANNOUNCEMENT—NOT A PROSPECTUS

A copy of the Prospectus has been duly filed with the Registrar of Companies, Madras State, for registration together with the documents specified in the Prospectus, as required by Section 60 of the Companies Act, 1956.

Consent of the Central Government has been obtained to this issue by an order of which a complete copy is open to the public for inspection at the Registered Office of the Company at Rajapalayam. It must be distinctly understood that, in giving the consent, the Central Government, do not take any responsibility for the financial soundness of any scheme or for the correctness of any statements made or opinions expressed with regard to them.

A Licence has been obtained from the Central Government for the establishment of this new industrial undertaking of which a copy is open to the public for inspection at the Registered Office of the Company. It must be distinctly understood that in granting the licence, the Government of India do not take any responsibility for financial soundness of the undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

The existing Equity and Preference shares of the Company are officially listed on the Madras Stock Exchange Limited, Madras. Application will be made in due course to the Madras Stock Exchange Limited for permission to deal in the Equity and Preference shares now offered.

The Subscription list will open at 10 A.M. on Friday, the 27th January, 1961 and will close at 10 A.M. on Saturday, the 4th February, 1961 or earlier as soon as subscriptions approximating to the amount issued hereunder to the public have been received, but not earlier than 10 A.M. on Wednesday, the 1st February, 1961.

MADRAS CEMENTS LIMITED

(Incorporated under the Companies Act, 1956)

SHARE CAPITAL

AUTHORISED CAPITAL:

1,50,000 Equity Shares of Rs. 100 each	Rs. 1,50,00,000
40,000 Redeemable Cumulative Preference shares of Rs. 100 each carrying a dividend of 9.3% free of Company's tax but subject to deduction of tax at source at prescribed rates.	40,00,000
10,000 Cumulative Preference shares of Rs. 100 each carrying a dividend of 6½% net after deduction of income tax at the prescribed rates.	10,00,000
Total	Rs. 2,00,00,000

ISSUED AND SUBSCRIBED CAPITAL:

40,000 Equity Shares of Rs. 100 each	Rs. 40,00,000
10,000 6½ per cent tax-free Cumulative Preference Shares of Rs. 100 each	10,00,000
Total	Rs. 50,00,000

PRESENT ISSUE:

50,000 Equity Shares of Rs. 100 each	Rs. 50,00,000
20,000 9.3 per cent Redeemable Cumulative Preference Shares of Rs. 100 each.	20,00,000
Total	Rs. 70,00,000

RIGHTS OF PREFERENCE SHARES

The holders of Preference shares shall be entitled to be paid out of profits which the Board of Directors shall determine to distribute by way of dividends, a fixed cumulative preferential dividend at the rate which after deduction of such amount of tax as may be prescribed from time to time under Section 18(3D) of the Indian Income-tax Act, 1922, would entitle the holder of such share to a net dividend of 6½% per annum on the capital paid-up for the time being on such shares

in respect of 10,000—6½% Tax-free Cumulative Preference shares of Rs. 100 each and at the rate of 9.3% per annum free of Company's tax but subject to deduction of tax at the prescribed rate as required under Section 18(3D) of the Indian Income-tax Act, 1922, on the capital paid up for the time being on such shares in respect of 40,000 Redeemable Cumulative Preference Shares of Rs. 100 each from the date of allotment and to a right on winding up to be paid all arrears of preferential dividends, whether earned or declared or not down to the commencement of the winding up and also to be repaid the amount of capital paid-up or credited as paid-up on the Preference Shares held by them respectively in priority to any payment in respect of Equity Shares, but shall not be entitled to any other rights in the profits or assets of the Company; subject as aforesaid and to the rights of the holders of any other shares entitled by the terms of the issue to preferential repayment over the Equity Shares in the event of winding up of the Company, the holders of Equity Shares shall be entitled to be repaid the amount of capital paid-up or credited as paid-up on such shares and all surplus assets thereafter shall belong to Equity shares in proportion to the amount paid-up or credited as paid-up on such Equity shares, respectively, at the commencement of the winding up. The holders of Preference shares that have already been issued and that may hereafter be issued shall, unless restricted by the terms of the issue of such shares, rank pari passu in the matter of payment of dividends and return of capital.

Any further issue of Redeemable Preference Shares over and above the present issue of 20,000 Redeemable Cumulative Preference Shares of Rs. 100 each ranking in all respects pari passu with the existing 10,000—6½% tax-free Cumulative Preference Shares of Rs. 100 each and 20,000 Redeemable Cumulative Preference Shares of Rs. 100 each now being issued under this Prospectus will be made only with the consent of holders of not less than three-fourths of the Preference Shares.

TERMS FOR REDEMPTION OF PREFERENCE SHARES

The shares will be redeemed at par after 10 years and before 15 years from the date of issue of shares.

Durgapur Thermal Power Station

Prestressed Concrete Plank Roofing was adopted for the Durgapur Thermal Power Station because of its lightness thus reducing the cost of the foundation and superstructure. It also made rapid construction possible.

A conventional cast-in-situ roof was ruled

out because of the unusual height between roof and floor.

The roof area covered was 50,000 sq. ft. The job was completed in about twelve months.

An additional feature is thermal insulation with foam concrete blocks.

SHALIMAR TAR PRODUCTS (1935) LIMITED

CALCUTTA • NEW DELHI • BOMBAY • LUCKNOW • CHANDIGARH

Agents: The Bombay Co. Private Ltd., Madras-1 R. C. Abrol & Co. (Private) Ltd., New Delhi-1

The Company may, at their option, start redeeming the Preference Shares at par, after six years from the date of issue of such shares. The Redeemable Cumulative Preference Shares, if any, subscribed for and held by the Industrial Finance Corporation of India, New Delhi, shall be redeemed in the first instance without draw of lots.

The Preference Shares may be redeemed all at a time or in instalments. The Preference shares to be redeemed on each occasion shall be determined by the drawing of lots.

RIGHTS OF THE EQUITY SHARES

The new Equity shares for all purposes shall rank pari passu with the existing Equity shares of the Company.

ALLOTMENTS TO SHAREHOLDERS AND FINANCIAL INSTITUTIONS

Pursuant to Section 81 of the Companies Act, 1956, and as per resolution passed by the Company in General Meeting on 1-10-1960, authorising the offer of the present issue to the holders of both Equity and Preference shares of the Company, all the shares under the present issue were offered in the first instance to the existing shareholders of both Equity and Preference shares of the Company, whose names appeared on the Register of Members of the Company as on 3rd December, 1960, on the basis of one Equity share of Rs. 100 each for every Equity or Preference share of Rs. 100 each held by them and two Redeemable Cumulative Preference shares of Rs. 100 each for every Five Equity or Preference shares or a combination of both held by them.

The shareholders of the Company have subscribed for 5,289 Equity shares and 2,941 Redeemable Cumulative Preference shares having a total nominal value of Rs. 8,23,000 leaving a balance of 44,711 Equity Shares of Rs. 100 each and 17,059 Redeemable Cumulative Preference shares of Rs. 100 each having a value of Rs. 61,77,000.

Out of the above, the Madras Industrial Investment Corporation Ltd., have subscribed for 27,500 Equity Shares of Rs. 100 each and 7,500 Redeemable Cumulative Preference shares of Rs. 100 each and they have been allotted these shares in full.

The Life Insurance Corporation of India have also underwritten and subscribed for 2,500 Redeemable Cumulative Preference shares of Rs. 100 each and these shares have been allotted in full.

THE ENTIRE ISSUE OF RS. 70 LAKHS IS UNDERWRITTEN

The following underwriting arrangements have been made with the institutions mentioned below in respect of the quantities and classes of shares mentioned against each.

Name of Underwriter	Redeemable Equity Cumulative shares	Total value Rs.
Madras Industrial Investment Corporation Ltd.	7,500	27,500
Industrial Finance Corporation of India, New Delhi.	10,000	10,00,000
Life Insurance Corporation of India, Bombay.	2,500	7,500
Indian Overseas Bank Ltd., Madras.	...	7,500

Brokers: Jointly

1) M. s. Chitra & Co., Madras)			
2) „ Maconochie & Co. „)			
3) „ Somayajulu & Co. „)	7,500	7,50,000	
4) „ Paterson & Co. „)			
5) „ P. R. Subramanyam,) Bombay.)			
Total	20,000	50,000	70,00,000

In the opinion of the Directors, the resources of the said underwriters are sufficient to discharge their underwriting obligations.

OFFER TO THE PUBLIC

The balance of the issued capital, namely, Rs. 24,27,000 consisting of 17,211 Equity shares of Rs. 100 each and 7,059 Redeemable Cumulative Preference shares of Rs. 100 each is offered at par for publication subscription in terms of the Prospectus and is payable as follows:—

On application	Rs. 50 per share
On allotment	Rs. Nil.

The balance of Rs. 50 per share will be called up at the discretion of the Directors not earlier than six months from the date of allotment.

No shares are issued for consideration other than cash.

The Life Insurance Corporation of India have also agreed to send us an open application for Equity shares to the value of Rs. 7,50,000 which will rank for allotment on a par with other applications received from the public.

CONSENT

The consent in writing of the abovenamed Bankers, Brokers and Auditors of the Company to act in the respective capacities have been obtained and have been filed with the Registrar of Companies, Madras, and have not been withdrawn.

HISTORY OF THE PROJECT

The Company was incorporated on the 3rd July, 1957, for the several purposes set forth in the Memorandum of Association and in particular to undertake the manufacture of Portland Cement and other allied products. A factory has been established for this purpose at Tulukkappatti, Ramanathapuram District. An industrial licence has been obtained from the Central Government for erecting a factory with a capacity of 600 tons of Portland Cement per day to be executed in two stages.

Large reserves of suitable limestone are available from quarries within a few miles from the factory. Suitable clay and gypsum are also available in and around the area. Extensive lands for the factory and residential buildings, both for existing and expansion scheme, have been acquired by the Company. Plenty of water is available from Arjuna River nearby. Necessary pipe lines have already been laid from the river bed to the factory site. The supply will be sufficient both for the first and the second stage of the project. The State Electricity Board have sanctioned necessary electric power to meet the requirement of the first stage of the factory and they have already made the power available. They have also assured the sanction in time of the required electric power for the second stage. The factory is located on the Madras—Cape Comorin National Highway and is well served by rail and road transport facilities. Besides, it is very near to the Tuticorin Port.

The Certificate of Commencement of Business was obtained on 31st July, 1957. The licensed capacity of 600 tons per day is to be executed in two stages, namely, the first stage having a capacity of 200-250 tons per day and the second stage having an installed capacity of 350-400 tons per day, making the total of 600 tons per day.

In accordance with the above phased programme, to finance the outlay of the First Stage, a capital issue of Rs. 50 lakhs was made. The original issue of Rs. 50 lakhs was in the form of Rs. 10 lakhs of Preference and Rs. 40 lakhs of Equity shares both of the denomination

of Rs. 100. The entire Preference capital of Rs. 10 lakhs and Rs. 30 lakhs of Equity shares out of Rs. 40 lakhs were placed before the investing public without resort to the publication of a Prospectus, using the personal influence of the Chief Promoter, Shri P. A. C. Ramasamy Raja, the well-known Mill Magnate of Rajapalayam and the Managing Agents of Rajapalayam Mills Ltd., Rajapalayam, the Ramaraju Surgical Cotton Mills Ltd., and Javaram Mills Ltd., Rajapalayam. The balance of Rs. 10 lakhs of Equity shares was taken up by the Madras Government to signify their confidence in the project. Further, a long term loan of Rs. 40 lakhs was obtained from Industrial Finance Corporation of India, New Delhi, to secure the balance of requirements.

The Company has now completed the first stage of the construction of the 200-250 ton factory. The plant and machinery were supplied by the internationally well-known firm of Messrs. Skodas of Czechoslovakia and they were erected under the supervision of their experts. The Directors are glad to state that the first stage of the project is about to be commissioned and the cement produced by the factory will be placed on the market shortly.

EXPANSION SCHEME

The Company is now issuing additional capital to find the required finance for the second stage of the project. The supply and erection of plant and machinery for the second stage are also in the hands of Skoda, who have made all arrangements for delivery by the end of 1961 and erection of the machinery according to our present schedule.

The Import Licence for the plant and machinery for the expansion scheme has already been granted by the Government of India under Rupee payment terms and it is in accordance with the terms of this licence that we have placed firm orders with Messrs. Skodas.

PLANT AND MACHINERY

The Company has entered into an agreement on 9-12-1959 with Messrs. Skoda (India) Private Ltd., Bombay, Agents of Messrs Technoexport of Czechoslovakia, for supply of the expansion plant of 350-400 tons day capacity. The entire plant and machinery including electrical drives are to be supplied by the renowned manufacturers in Czechoslovakia, Messrs. Skodas. These manufacturers of cement-making and other machinery, enjoy a world wide reputation, particularly in the Cement and Sugar lines. They have undertaken the erection and the successful commissioning of the extension plant. The plant and machinery supplied by the above mentioned firm, Skodas, is for the wet process.

CAPITAL REQUIREMENTS

The total cost of the second stage of the project is estimated as under:

Plant and Machinery	Rs. 76.25 lakhs
Civil Construction	" 27.00 "
Other Assets	" 9.25 "
Contingencies	" 3.50 "
Expenses for issue of shares	" 4.00 "
TOTAL	Rs. 120.00 "

The requirements of working capital for the Second Stage will be about Rs. 20 lakhs.

SOURCE OF FUNDS

The total sum will be provided as under:	
By the present issue of share capital	Rs. 70 lakhs
Additional long-term loan from the Industrial Finance Corporation of India, New Delhi (already sanctioned)	" 50 "
TOTAL	Rs. 120 lakhs

The requirements of working capital, namely, Rs. 20 lakhs for the Second Stage will be met out of the earnings of the first stage and borrowings from banks.

PROSPECTS

It is well-known that the cement industry in India has not only seen phenomenal growth in the last twelve years but is looking forward to a period of increasing consumption of cement in the next decade. Apart from a quadrupling of capacity in a little over a decade, the industry has been allotted a target of 14 million tons during the Third Plan period. The capacity of the industry at the end of 1960 was estimated at about 9 million tons. Thus, it is safe to expect that the target will be more than achieved during the Third Plan period, though it is expected that, by this time, consumption of cement by the house building industry will, apart from the needs of the large projects of the Third Plan, have very considerably increased. Actually, it is expected that, by the first year of the Third Plan, cement consumption will receive a new stimulus with the availability of larger quantities of steel, with the completion and coming into operation of the three steel units in the public sector. The Company's expansion scheme, is therefore, timely.

PROFITS

The Directors are of opinion that in the absence of any unforeseen circumstances, the Company will earn sufficient profits as to enable the declaration of a reasonable dividend within one year from the date the second plant goes into production.

FINANCIAL INFORMATION

The Auditors' Report dated 10-1-1961 in accordance with the provisions of the Companies Act, 1956, has been appended to the Prospectus. The Auditors have given and have not withdrawn their written consent to the inclusion of their reports in the form and context in which it appears.

EXPENSES OF THE ISSUE

The expenses of the issue, including underwriting — commission and brokerage, are estimated not to exceed Rs. 4 lakhs and are payable by the Company.

UNDERWRITING COMMISSION

Underwriting Commission at the rate of 2½ per cent on the nominal value of both Equity and Preference shares underwritten will be paid to the underwriters.

BROKERAGE

Brokerage at the rate of 1% will be paid to the Bankers of the Company and recognised Brokers on all allotments made in respect of applications for Preference and Equity shares bearing the stamp of such Banks or Brokers. Brokerage on the same basis is payable to underwriters in addition to the underwriting commission, on allotments in respect of applications made or procured by them and bearing their respective

stamps. However, no brokerage is payable on shares subscribed by the existing shareholders under Section 81 of the Companies Act, 1956, or by the Directors or by the Managing Agents or their associates and by the Madras Industrial Investment Corporation Limited.

DIRECTORS

The Articles of Association of the Company provide that the number of Directors shall not be less than three and until otherwise determined by the General Meeting, not more than fifteen, including Ex-Officio Directors. The maximum number of Directors not liable for retirement by rotation shall not exceed one-third of the total strength of the Board. The qualification of every Director, other than the first Directors, Ex-Officio Directors, and alternate Directors, Madras State Government Director, and Industrial Finance Corporation of India Director shall be his holding shares in the capital of the Company of the face value of Rs. 5,000/- and it shall be his duty to comply with the provisions of Section 270 and 271 of the Act.

Every Director is entitled to receive a sitting fee of Rs. 100/- for every meeting of the Directors or of any Committee of the Directors attended by him and all reasonable travelling, hotel and other expenses incurred within India for attending and returning from meetings of the Board or a Committee thereof or in connection with the business of the Company.

BORROWING POWERS

The Directors may at their discretion raise or borrow or secure the payment of any sum or sums of money for the purposes of the Company provided that the moneys to be borrowed together with the moneys already borrowed by the Company (apart from temporary loans obtained from the Company's bankers in the ordinary course of business) shall not at any time, except with the consent of the Company in General Meeting, exceed the aggregate of the paid-up capital of the Company and its free reserves.

INTEREST OF DIRECTORS

Messrs. P. A. C. Ramasamy Raja and P. R. Ramasubramania Raja, Directors of the Company, are the partners of Messrs. P. A. C. Ramasamy Raja & Co., the Managing Agents of the Company and each of them is interested in the remuneration payable to the Managing Agents in the following proportion:

1. Shri P. A. C. Ramasamy Raja	51%
2. Shri P. R. Ramasubramania Raja	49%

Each of the Directors is interested to the extent of shares subscribed, allotted or to be allotted to him in the Company and in the sitting fee receivable by him for attending the meeting of the Board of Directors.

MANAGING AGENTS

Messrs. P. A. C. Ramasamy Raja & Co., have been appointed with the approval of the Central Government accorded in their letter No. 41 (914)-GMN/57 dated 4th October, 1957, as the Managing Agents of the Company, for a period of 15 years from 30-1-1958 on a remuneration of 10% of the annual net profits of the Company. For this purpose, the net profits are to be computed in accordance with Section 349 and 350 of the Companies Act, 1956. In the event of inadequacy or absence of profits, the Managing Agents will be paid, as minimum remuneration for every such financial year of the Company, such sum payable in such manner, as the Central Government may hereinafter fix in this behalf.

In the event of any compensation becoming due and payable to the Managing Agents for loss of office, such compensation shall be determined in accordance with Section 366 of the Companies Act, 1956.

The partners of the Managing Agents are well-known industrialists and they are associated with several successful enterprises.

Subject to the provisions of the Companies Act, 1956, and to the supervision and control of the Board of Directors, the Managing Agents shall have the Management of the whole affairs of the Company. The Managing Agents have a right of appointing not more than two Directors where the total number of Directors of the Company exceeds five and one Director, where the total number does not exceed five. Such appointees will be known as Ex-Officio Directors.

VARIATION OF RIGHTS

The rights attached to any class of shares may be varied by complying with provisions of Sections 106 and 107 of the Companies Act, 1956.

INSPECTION

Copies of Memorandum and Articles of Association of the Company, Audited Balance Sheet and Profit and Loss Account for the last three financial years and the Auditors' Report referred to hereinabove, the original consent order of the Controller of Capital Issues, Licence issued by the Government of India for establishment of new industrial undertaking and copies of other contracts, agreements and documents mentioned in the Prospectus can be inspected at any time during the usual office hours of the Company at the Registered Office of the Company for a period of 14 days from the date of publication of the Prospectus or until the Subscription List closes whichever is earlier.

APPLICATION AND ALLOTMENT

Applications for Equity and Preference shares must be for a minimum of 5 shares.

All applications must be made on the forms accompanying the Prospectus which can be had from the Registered Office of the Company, the Company's Underwriters, Brokers and Bankers. In respect of Bankers, arrangements have been made with the following offices for receiving applications and remittances.

State Bank of India, Rajapalayam, Madras and Bombay; Indian Bank Ltd., Madras, all their branches in Madras State, Bombay, Calcutta and New Delhi; Indian Overseas Bank Ltd., Madras, all their branches in Madras State, Bombay, Calcutta, and New Delhi; Central Bank of India Ltd., Rajapalayam, Madras and Bombay, and Rajapalayam Commercial Bank Private Ltd., Rajapalayam.

The form of application accompanied by the necessary remittance of Rs. 50/- per Equity or Preference share applied for, should be delivered to the Registered Office of the Company, Company's Underwriters, Brokers and Bankers mentioned in the Prospectus on or before the date of closing of the subscription list.

Cheques or drafts drawn on banks at places other than those mentioned above must include bank charges at 1/8% with a minimum of 75 nP. Cheques or drafts should be made payable to 'Madras Cements Limited' and should be crossed. A separate cheque or draft should accompany each application.

Company Meeting

THE ASSOCIATED CEMENT COMPANIES, LIMITED

Twenty-fourth Annual General Meeting of the Company

Speech by the Chairman, Shri Dharamsey M. Khatau

PROFITS AND DIVIDEND

Speaking at the 24th Annual General Meeting of the Associated Cement Companies Limited held in Bombay on Friday, 20th January 1961, the Chairman, Shri Dharamsey M. Khatau said: "After the steady and continuous deterioration in profits over the preceding four years, there has at last occurred some slight improvement in gross profits and net profits. Encouraged by this, and by the prospect, or at least the hope, that the Tariff Commission now examining our current and future costs will recommend a fair price and that the benefits accruing hereafter from the increase in installed capacity will not be wholly neutralised by further increases in costs, your Directors have decided to recommend a Dividend at Rs. 12 per share (subject to deduction of tax). This has been done in an endeavour to reach what we consider to be the **minimum rate of dividend** to which the shareholders are entitled. Your Directors realise that this is by no means yet a fair return on shareholders' capital, having regard particularly to the fact that the shareholders have also contributed a very substantial amount of further capital by way of Premium on Shares paid in cash. But it is not possible to go any further in that direction just at present, because even the modest dividend now recommended as well as the rate at which it is proposed to pay Bonus to our employees this year, have necessitated the heavy withdrawal of Rs. 84.50 lakhs from General Reserve.

PRODUCTION AND COSTS

"Despite the slight improvement in profits the results of last year's working have been disappointing. In keeping with the Second Plan, the installed capacity of your Company's factories in India rose from 34.42 lakh tons to 37.30 lakh tons, but despatches improved only from 31.47 lakh tons last year to 33.68 lakh tons. This was not due to any lack of demand for cement. On the contrary, the demand improved strongly since the beginning of 1960. But the shortage of railway wagons, especially since the end of May 1960, prevented us from taking full advantage of the improved demand. Moreover, your Company along with many other industrial concerns was adversely affected by the acute shortage of transport for coal, with the result that a number of our Works were obliged to curtail production for want of coal supplies towards the end of the year under review. The transport situation continues to be grave, though the authorities concerned are doing all they can to ensure for our cement plants at least their minimum requirements of coal and adequate supply of wagons for despatching cement. We are also endeavouring to increase despatches by road transport.

"Apart from these, the increase in gross earnings has been largely offset by further increases in the cost of various materials, enhanced railway freight, a further rise in the cost of coal and power, higher incidence of labour costs etc. The incidence of depreciation was also

higher on account of the high capital cost of expansion and rehabilitation projects.

"The implementation of the recommendations of the Cement Wage Board would have increased the labour costs still further but for the Government's acceptance of the Wage Board's finding that the cement industry was incapable of bearing this additional burden, and that consequently there was need to neutralise it by an appropriate increase in the retention price. Unfortunately, in the process of computing this higher labour cost per ton of cement, the installed 'rated' capacity has been taken as the base instead of the actual production which was considerably lower.

"The major increases in costs which have been responsible for the progressive reduction of profits have been due to factors entirely beyond the control of the Company. They have in fact been the direct consequence of Government's own fiscal, monetary, labour and welfare policies in an attempt, on the one hand, to implement the Second Five-Year Plan which many of us regarded as extravagant and, on the other, to move nearer to the goal of a socialistic pattern of society which, at this juncture, most of us consider impracticable."

TARIFF COMMISSION

"In view of continually rising costs," the Chairman continued, "your Company was constrained to approach the Government repeatedly since 1959 for some enhancement of the retention price. It was pointed out that the continued decline in the earning capacity of the Company, despite the substantially higher production and increased capital employed, which is amply borne out by our published accounts since 1956, was the direct outcome of increasing costs and the uneconomic retention price. The Government was well aware that your Company has always co-operated in the plans and policies of Government by readily assuming responsibility for its share in the expansion of the country's cement output, and by carrying out expansions and technical improvements with a view to keeping down production costs. Your Company has also participated in establishing a major Heavy Engineering project in the country in collaboration with two leading British Concerns, involving very considerable investment of resources in men and money. In view of all this, one cannot but deprecate the irresponsible attitude of Government in deliberately ignoring the difficulties and needs of this basic controlled industry, and in refusing to re-fix the retention price at a level which would yield a reasonable margin of profit, and also leave something over for ploughing back into the business. Even more reprehensible was the Government's failure to implement the last Tariff Commission's recommendations concerning the retrospective operation of the enhanced retention price fixed in 1958 and the need to alter that price from time to time with every change in the cost of coal.

"In these circumstances, the decision of the Government to refer the whole question once again to the

Tariff Commission for a fresh investigation is welcome, though the decision was taken after nearly two years of inaction. In effect, this means that the Cement Industry will have to continue to suffer, without any redress, not only the entire rise in costs which has already occurred since January 1958, but also the further rise which will undoubtedly occur until a new retention price becomes operative.

"Meanwhile, almost exactly a month ago, even before the Tariff Commission could make a start with its formidable task, came an extraordinary edict from Government. They decided, by a stroke of the pen, to compel the industry to use second hand bags for packing cement; and this at a price so low, conceived as an **average price** for packing in New Bags and Used Bags, that it makes the whole scheme both impossible of performance and grossly expropriatory.

"I have often wondered,—lately with some anxiety,—what could be the reasons for singling out the Cement Industry for such unsympathetic, if not indeed harsh, treatment. Can it be that, even after all these years, there is as yet no understanding in Government circles of the real needs, or the elementary "economics" of this major, basic, capital-intensive industry? Do they not want a Cement Industry that is buoyant and can grow with freedom and vigour to a point when shortage of cement will be a thing of the past? Or is it, quite simply, that State Trading in cement, though initially highly lucrative, has lately become such an unprofitable adventure, that a desperate attempt is now being made to minimise the liability by passing back the losses in State Trading to the producers? I suspect that this last point is nearest the mark; but whatever may be the true answer, I feel bound to say, with all the emphasis at my command and with a full sense of responsibility, that the recent policies of Government affecting this major industry are fraught with grave consequences to its future and to the early satisfaction of the country's urgent need for cement. I must also add that 'holding the price line' is impossible, with **planned inflation** on the one hand, and with so many variable factors (of Government's own making) tending towards rising costs, on the other. In such circumstances a rise in the price of cement is an unavoidable necessity if a further increase in cement production is not to be throttled.

"It is with this background that we propose to urge before the Tariff Commission that the 'fair return' on the capital employed in the Cement Industry should be conceived as a 'fair **net distributable** return' after meeting all items of cost. In particular we shall urge that there can be no justification—legal or equitable—for excluding from the over-all 'cost' of cement either such items of **direct cost** as the full charge for packing, whether in New or Used Bags, and the commission payable to stockists, or such large and specific items of **overhead costs** as Bonus and accruing Gratuity to employees, the remuneration payable to Managing Agents, the statutory Development Rebate Reserve and Company Taxation. To admit, on the one hand, that the industry is entitled to a fair return on capital employed, but to insist, at the same time, that from this return itself the industry should in effect meet the cost of the items to which I have just referred is a contradiction in terms. It certainly results in our being left with a net distributable return which can hardly be described as fair."

EXPANSION AND REHABILITATION

The Chairman reported that the Company's various expansion and rehabilitation projects have made satisfactory progress. Giving details, Shri Khatau mentioned the extensions to the Shahabad Works which raised

its capacity from 4.00 lakh tons to 5.65 lakh tons per annum; the modernisation and extension of the Kymore Works as a result of which the capacity of the factory has been raised from 3.60 to 5.73 lakh tons per annum; the installation of the floatation plant for the beneficiation of low-grade limestone and the slag-cement plant at Chaibasa; and the slag-granulation plant at Jamshedpur. The Chairman expressed his fears that it may not be possible to commission the recently completed second dry-process kiln at Mancherla immediately due to the inability of the Andhra Government to supply the full requirements of additional power.

NEW CEMENT WORKS AT DURG

Shri Khatau also announced that the Company had decided to start immediately on the building of a Cement Works at Durg in Madhya Pradesh which was held in abeyance due to the glut in the cement market and the shortage of foreign exchange etc. The Government of India has now agreed to give high priority to this project so far as foreign exchange is concerned. This new Cement Works will have an initial capacity of 1.65 lakh tons of cement per annum, and in due course, will produce slag-cement using blast-furnace slag from the Bhilai Steel Plant.

FIREBRICKS AND WHITE CEMENT

The capacity of the refractories factory at Katni was being raised from 17,640 tons to 30,000 tons per annum in view of the adequate demand for this product. The Company also marketed nearly 8,000 metric tonnes of Silvicrete white cement produced at the old Porbandar Works. Since demand continued to be fairly steady despite competition from imported and local white cement, and was likely to increase in the coming years, the Company has planned to install a new 25,000 ton capacity white cement plant at Kymore.

COLLIERIES

Shri Khatau also said that the Company's Nowrozaabad and Kotma Collieries met a good portion of coal requirements at some of the cement works and the modern coal-washing plant at Nowrozabad to improve the quality of the coal produced there, is supplying enriched washed coal to the Kymore Cement Works replacing the more expensive Bengal coal to a large extent.

MACHINERY MANUFACTURE

Continuing, the Chairman stated that in line with the Government policy of encouraging the setting up of a heavy-machinery industry in India, the Company has decided to establish a well-equipped engineering works at Shahabad for the manufacture of machinery required for cement, paper and pulp, chemical industries etc. Meanwhile, the Company continues to manufacture cement machinery for its own requirements at the existing Central Workshops at Shahabad.

ACC-VICKERS-BABCOCK LTD.

The work on the construction of the Heavy Engineering Works at Durgapur in collaboration with Messrs Vickers Ltd. and Messrs. Babcock & Wilcox Ltd. is proceeding according to schedule. The new Company is expected to go into production by the end of 1961. ACC-Vickers-Babcock Ltd. have up to now issued 3,00,000 shares of Rs. 100 each and the ACC's share, which is 49.8% of the shares so issued, amounts to Rs. 1,49,40,000/-.

PAKISTAN

The Chairman reported that the Company's factories in Pakistan continued to function satisfactorily. Remittance to India of profits earned in Pakistan continued to be banned, but the Company was allowed to remit to India the due proportion of the management and administrative charges incurred at the Head Office. The demand for cement in Pakistan was steadily growing and naturally, the Government of Pakistan were eager to meet this growing demand by increased production within the country. "They therefore approached us to expand the capacity of our two plants in Pakistan; but we expressed our inability to do this for want of the substantial foreign exchange resources required for the purpose."

The Chairman continued: "As the need for expanding the cement production in Pakistan was undoubted, we have been in negotiation with certain foreign interests—at first British, and now American—to transfer our factories to them on terms mutually agreeable and subject, before completion, to the approval of the Government of Pakistan and the Government of India. The pre-requisites of any such transaction must be that we get a price which is fair, having due regard to all the circumstances, and that the entire sale proceeds together with our cash balances should be received by us in Indian Rupees or in convertible foreign exchange. From the point of view of the Government of Pakistan, such an arrangement would be of great value because it would ensure considerable expansion of production capacity without any burden on the foreign exchange resources of the country either for the acquisition of our factories, or for their further expansion. To the Government of India also the transaction should be welcome as it would enable the release of our resources in Pakistan for investment in further expansion in India. Negotiations are proceeding satisfactorily and before they are finalised the shareholders will be approached for their approval."

BONUS SHARES, MANAGING AGENCY ETC.

The Chairman stated that the Directors "have been reluctantly compelled to drop the idea of issuing Bonus Shares until such time as Government may deem fit to withdraw this entirely unjust imposition" (of a 30 per cent tax) "the incidence of which your Company cannot bear." Shri Khatau hoped that the Government (in the Company Law Administration Department) will sanction the extension of the duration of the Managing Agency Agreement to ten years and to enhance the terms as to remuneration above the "standard scale".

LABOUR-MANAGEMENT RELATIONS

Commenting on labour-management relations Shri Khatau observed: "Among the outstanding events of the year under review was the publication of the Report of the Central Wage Board for the Cement Industry."

He said that its main recommendations had been approved by Government and had been voluntarily accepted by us. The Wage Board must be complimented on the competence with which it has worked out a clear, need-based, fair wage pattern for this Industry.

Continuing, Shri Khatau said: "For this very reason your Company, without waiting either for the actual realisation of the revised retention price or the assessment of proper work-loads, went ahead with the imple-

mentation of the Wage Board's recommendations at most of our Works and has already paid the new fair wage in consultation with the Unions at those Works. I am confident that, very soon, with the co-operation of the Unions concerned, we shall be in a position to implement the new wage scales at the remaining Works also.

"There are, however, certain aspects of this question to which, I feel, I must draw the pointed attention of the authorities. The Wage Board has for all practical purposes ignored the importance of fair work-loads as an essential element in any fair wage fixation. This was contrary to the positive stipulation of the Fair Wages Committee, the principles of which the Central Government desired the Wage Board to follow by making a specific provision to that effect in the Terms of Reference.

"I imagine that, by now, we have all come to realise that the productivity of our workers is very much lower than in other industrialised countries. For reasons beyond our control we have to engage a much larger manpower force than is the case elsewhere, even in plants of equal capacity, with identical equipment and the same degree of mechanisation. Raising the wages of workers in this context, unaccompanied by a corresponding assessment of fair work-loads or a rise in productivity, becomes a dubious and somewhat self-defeating device because, in our developing economy, its inflationary result detracts from the workers' real income on which alone their standard of living can depend.

"The relegation by Government of work-load studies to a stage of secondary importance is all the more difficult to understand when the Planning Commission as well as the Government have repeatedly made it clear that higher productivity is the only sure basis of prosperity and well-being of the workers.

"However, it is at least some gain that the need for undertaking work-load studies has been accepted in principle. And although we did not succeed in persuading the Central Government to entrust the task of scientific work-load assessment to expert independent agencies having specialised knowledge of this particular type of work, Government has asked the Chief Adviser (Factories) to initiate pilot projects for intensive studies in two or three units in this Industry. We are giving the fullest assistance and co-operation to this team to facilitate and expedite their work."

APPRECIATION

Despite the low level of profits the Chairman said the Directors have decided to maintain the rate of bonus to all the Company's employees at the same level as last year, and the large majority of the employees in the lower scales of pay would receive substantially higher amounts of bonus this year in view of the increase in their basic wages due to the implementation of the recommendations of the Central Wage Board for the Cement Industry.

Shri Khatau concluded with an expression of warm appreciation of the sustained hard work and whole-hearted co-operation of all the Company's employees.

NOTE: This does not purport to be a report of the proceedings of the annual general meeting which will be sent separately to shareholders on request.

India and the Queen

THE Queen's visit has gone according to the plan and the first leg of the tour has been successfully concluded with both political and social success—the Duke bagged his tiger in the Sawai Madhopur forests and there has been an ease of access which has taken some United Kingdom residents by surprise. Protocol has not always been easy, but the Queen and the Duke have given the impression that they were not bound by the rigid codes of Buckingham Palace. One of the immediate consequences of the visit has been, in fact, to create the feeling that the Queen and the Duke have been responsive to the growing mood for social equality which has been one of the most enduring marks of the Indian Revolution. Hopes have been expressed that some of this freedom of access might influence thinking in the United Kingdom where social barriers, inherited largely from the nineteenth century, are still in undue force.

This particular point, namely, that the Commonwealth is now changing more by the pressures of its new members than because of the initiative and the hard crust of tradition of the parent country, is significant, and, slowly, but surely, will make itself felt. The new countries of Africa which have joined the Commonwealth are one with India, and, perhaps, Ceylon in wishing the Commonwealth to be much more a family of equal societies than a family of hierarchies. It is doubtful if a better demonstration could have been found of the substance of this feeling of

equality anywhere else than in the two At-Homes of the President for which 14,000 invitations were issued and to which some very considerable number of persons, who had not previously been at Rashtrapati Bhavan, were admitted. There were criticisms in regard to some failures, but the spirit of the change, which was to demonstrate the absence of the old rules of privilege, was abundantly seen. It is difficult to conceive of a better occasion for this demonstration that the Indian Union is now a very different society from the one we inherited in 1947.

It is views such as these which should engage scholars of the changing Commonwealth. But there is also a possibility of official research to be conducted into changes in organisation which will enable the pattern of friendship between Commonwealth countries to be more fully exploited. At present there is an anomaly in that while the External Affairs Ministry has a Commonwealth Secretary, he does not function such: he does little forward-thinking on relations between India and the Commonwealth. An immediate suggestion made is that the Commonwealth External Affairs Ministry should be a Minister of State who should be what like a Secretary of State for Commonwealth Relations. Perhaps one of the results of the Queen's visit should be that the Commonwealth Department dedicate the fund of goodwill that it

Agriculture: Crossing the Hump

THERE is every likelihood of our foodgrains production this year going up to 77 million tons—an all-time peak. It will be an achievement to be justly proud of and an event the significance of which cannot be ignored. Grudging critics may deride this performance by invoking the theory of the quinquennial circle in Indian agriculture under which output every fifth year is expected to be a near-bumper one. They may also exaggerate the fact that there have been short-falls in respect of jute and cotton production. But this year can by no standard be described as an exceptionally good one; there was drought in the last monsoon season in Andhra Pradesh, while Orissa, West Bengal and Uttar Pradesh witnessed unprecedented floods in the wake of heavy downpour. To cap it all, the winter rains have also come late. But if in spite of all these setbacks, we are able to reap a record harvest, it should be a clear indication that our agrarian economy, under the impact of massive

investment in the first two Plans, has gained a measure of stability. A special article elsewhere in this issue examines this question of statistical analysis.

Indian agriculture, as the Prime Minister stated on the eve of the Republic Day, has crossed the hump. It augurs well for the next Plan which envisages raising of food grains output to over 100 million tons. Sceptics have all along voiced the opinion that this target, though only a modest one if viewed against the background of consumption standards obtaining in this country today, is not likely to be achieved. But the determination shown and the success achieved by the small man behind the plough during the past one decade should evoke optimism in his capacity of rising equal to the task; there can be little room for scepticism, much less for pessimism.

The programme drawn up for accomplishment by the agricultural sector of our economy

under the Third Five-Year Plan—it is envisaged to achieve by 1965-66 an annual output of 100 to 105 million tons of foodgrains, 9.2 to 9.5 million tons of oilseeds, 9.0 to 9.2 million tons of sugarcane (in terms of gur), 7.2 million bales of cotton and 6.5 million bales of jute, to mention only some of the major targets—is ambitious indeed, but it is by no means beyond our grasp, if we set about doing things in right earnest and plan our strategy boldly. The potential created in our agrarian economy by the massive investment under the first two Plans has yet to yield full results which may be forthcoming during the next five years in a spectacular manner.

The various factors that help to raise agricultural output are too well-known to be recounted. It is only a question of according them proper priorities in our developmental programmes. Doubting Thomases would do well to divert their energies to the solution of this crucial problem rather than washing them in a search of failings that have occurred intermittently.

The top priority in our short-term programme of agricultural development obviously must go to increasing the use of chemical fertilizers whose input-output ratio is unity. Stepping up of the use of improved seeds and farm implements comes next, followed by extension of irrigation facilities. Much useful results can be obtained by increasing the use of pesticides and insecticides and by

establishing more farms on the Suratgarh model. Irrigation has to occupy the third place in our order of priorities for the simple reason that the potential created during the Second Plan has not yet been fully utilized. Until the time this potential is exploited to the full, better results can be achieved by diverting resources for the supply of fertilizers, improved seeds and farm implements, for which there is great unsatisfied demand. As the package programme of intensive cultivation gathers momentum, the demand for them will grow at a much faster rate than the demand for water supplies, because the fifteen districts to be covered by this scheme are ideally placed in regard to rainfall and irrigation facilities. Any extension of irrigation facilities during the Third Plan should come from minor irrigation works which are easy to construct and would yield quick results.

It is a matter of gratification that an all-out effort is being made to increase indigenous output of chemical fertilisers. But the rate at which consumption of these fertilizers is going up warrants a reappraisal of the Third Plan target fixed for them. There is also need to expedite setting up of the fertilizer plants, both in the public and the private sectors. Side by side, of course, soil testing has to be carried out on an extensive scale to avoid their misapplication and consequent adverse repercussions.

Moratoria for Amalgamation

PROOF of the foresight with which Parliament acted in incorporating in the Banking Companies (Second Amendment) Act, 1960, direct powers for the Reserve Bank to obtain from the Union Government permission to place certain banks under moratoria, not exceeding six months in any one case, for the express purpose of bringing about reconstruction or amalgamation, has come to the fore in a short time. At present, 9 banks have been put under moratoria for a period of six months, but in one case the period is five months from the initial date of the moratoria intended for the bank. Five, or more than five, months are from Kerala, and the question is from Kerala, an element of some controversy as to the advisability of reconstruction. The very object of the amalgamation is indirectly being called into question.

In Kerala, the Pradesh Congress Committee has appointed a special committee to inquire into the situation created in that State by the moratoria to five banks, among others. It has been suggested that the action taken by the Reserve Bank has been rather drastic and somewhat in ignorance of the sensitive structure of banking in Kerala State, which has been evolved with a distinct personality of its own, with a pronounced bias to render intensive local service especially to the small trader. The existing mood in Kerala vis-à-vis the relatively large number of banks under moratoria is the result of inconvenience and hardship that are being caused, for the time being, to the depositor and the small trader.

The Banking Companies (Second Amendment) Act, 1960, does not introduce a novel principle as regards moratorium for a bank. Prior to the Amendment, a bank could obtain moratorium by approach to the High Court, which referred the applicant, in the first instance, to the

Reserve Bank for its technical opinion. This dilatory procedure has been cut short by vesting in the Reserve Bank the authority to take the initiative. Whether before or after the Amendment, it is the technical assessment made by the Reserve Bank which has a decisive influence on determining the propriety of moratorium. But some urgency appears to have been added to the Reserve Bank's vigilance to scrutinize whether schemes of reconstruction or amalgamation would be necessary in the interest of the banks, their depositors and clientele, and the banking system of the country at large. The failure of the Palai Central Bank is obviously responsible for a greater degree of vigilance which is evidenced by the application of moratoria to 9 banks.

The Reserve Bank has given proof that it is conscious that the powers which it can exercise in restraining erring banks are to be used with sympathy and drastic powers are to be used as a last resort. The Palai Bank crash conclusively shows that the Reserve Bank has been over-cautious and too conservative in making use of its authority and that it gave a long rope to the Palai Bank before it applied to the Kerala High Court for its compulsory liquidation. That tradition of caution and accommodation, along with continuous use of persuasion, is being adhered to. When passions ran high in the wake of the Palai crash and the Reserve Bank was under fire for acting tardily, Mr. Morarji Desai explained that the Reserve Bank's powers are not to be used as an instrument for bringing about the closure of banks following unsound policies and practices. A lease was to be granted to such banks to mend their ways. In the light of this sparing use of powers of intervention, it would be too much to infer that it has taken premature or hasty measures in applying moratoria to the nine banks.

The Eastern Economist has vigorously advocated the institution of a scheme of insurance

of bank deposits ever since the Palai Bank failure focused attention on some weak spots in a section of the banking system and brought to the fore the urgency of safeguarding the interests of depositors—the main providers of the resources of banks. But this is a matter in which bank managements will need to supply the motive force. Two factors which seem to be responsible for the absence of a prompt and enthusiastic response from them are that the large as well as the major among the medium banks do not feel a sense of urgency about the scheme and they will have to bear the brunt of raising the insurance fund. Insurance of bank deposits requires a radical departure from the universal principle of charging the rate of premium according to the nature of the risk. In America, where the Federal Deposit Insurance Corporation has given successful proof of the scheme, the premia are charged at a uniform rate of 1/12th of 1 per cent of the total deposits of the insured banks. The rate of premia is thus fixed according to capacity to pay

and not on the basis of risk which is normally high in the case of small banks. The element of time that will be required in evolving a sound scheme of insurance should not be underestimated.

It would appear that there has been much pre-occupation with the immediate repercussions of the moratoria. Even assuming that the powers of amalgamation or reconstruction are delegated to the Deposit Insurance Corporation, it will need to act very much in the manner in which the Reserve Bank is acting. In any situation, immediate hardship, anxiety and suspense would be unavoidable. The ideal course would be for banks, likely to benefit from amalgamation or reconstruction, to take the initiative in the matter. But, failing that, where a third agency is required to intervene, its assignment takes a different character and raises additional problems. The forthright action taken by the Reserve Bank demands rational appreciation.

Technical Education

ONE of the achievements of the Second Five-Year Plan, which has received inadequate attention, although it is of long-range importance, is that the country has crossed the hump in creating facilities for technical education. There was keen awareness of the great pressure which would be generated by the development of the economy in diverse directions on the demand for technical manpower. But progress in providing these facilities was slow until after the start of the present Plan. A survey of technical education and manpower requirements, recently brought out by the Ministry of Scientific Research, draws up a balance sheet of performance and shortfalls in this sphere. Credit, however, ought to be given for the manner in which the backlog is being cleared.

At the beginning of the Second Plan, the nature of the requirements of training institutions for degree and diploma courses appears to have been seriously under-estimated under the garb of tentative targets. The requirements of additional engineering colleges for degree courses were placed at 9 and those of polytechnics for diploma courses were placed at 21. But with the publication of the report of the Engineering Personnel Committee in May 1956, the gravity of the gap between the requirements and likely supply of manpower was forcefully brought home. This Committee estimated a supply of 26,500 engineering graduates in 1960-61, leaving a shortage of 1,800, and a supply of 50,000 diploma-holders, leaving a gap of 8,000, in spite of the establishment of additional institutions that would be necessary in excess of the original programme. The Committee undoubtedly served the purpose of creating a new sense of urgency in this specific sphere. There were radical revisions in the provision of institutional facilities and, by 1960, 32 additional engineering colleges and 83 additional polytechnics were established during the period of the current Plan. The scheme of the chain of four higher technological institutes which came to a halt after the opening of the Institute at Kharagpur in 1951 was vigorously pursued and the remaining three Institutes were established at Bombay in 1958, at Madras in 1959 and at Kanpur in 1960. Each of the four Institutes has been designed with a capacity to train 1,500 undergraduate students and 500 post-graduate research scholars.

This impressive start which was made in the Second Plan gives confidence that no serious shortages of technical personnel will arise in the Third Plan. Nevertheless, it is clear that expansion of these facilities suffers from a lack of balance. At the end of the Third Plan, the supply of degree holders in civil engineering will rise to 16,700, creating a grave redundancy of 33.5 per cent; the supply of degree-holders in mechanical engineering will be 13,000, giving a redundancy of 13 per cent and that of electrical engineers will be stepped up to 12,700, showing a surplus of over 15 per cent. This redundancy may be due partly to the compulsions of long-range planning; but, even so, the sin of turning out surplus technical graduates on such a high scale without any prospect of jobs is difficult to condone. The only course left open now that matters are beyond remedy is that further expansion of institutions in these courses should be suspended until there is a definite and reasonable assurance that the Fourth Plan really requires that expansion and a potential would be created to absorb them.

The imbalance is to be noted also in the reverse direction in the shortages of degree holders in technological courses which are of strategic importance. For instance, there will be a shortage of 9 per cent in metallurgical engineering personnel and of 17 per cent for mining engineers at the end of the Third Plan. These shortages cannot be brushed aside as "marginal", as the Draft of the Third Plan has done with an obvious sense of complacency. The disequilibrium is further vividly brought out by the shortages which will occur at all levels of diploma-holders except in the case of civil engineering and chemical technology personnel.

One school of thought has strongly advocated the view that the emphasis should be shifted on priority for diploma courses of medium duration. The need to create a strong force to man technical posts at the supervisory and the foreman level, it is argued, requires this shift. The anticipated shortfalls in the supply of technicians at the level of diploma-holders strengthens the case for this shift. Future expansion of facilities for technical education will need to take into careful consideration these disequilibria to prevent shortages of technical personnel in some spheres and their oppressive redundancy in others.

THE WEEK'S NOTES

Cold War

THE FRESH THAW

THE SOVIET UNION'S gesture to the new President of the United States expressed in terms of the release of the two survivors of the American RB-47 aircraft, shot down over the Barents Sea in July last, and President Kennedy's assurance that there are to be no more U-2 flights over the Russian territory are perhaps signs of the new wind that might create a thaw in the cold war. Not indeed that these two acts in themselves are of great consequence; U-2 flights have all along been suspended since the crash of the Summit meet and Russia has not been able to justify her action in shooting down the RB-47 aircraft over the high seas. But their significance lies in the fact that they evince a desire on the part of both the United States and the Soviet Union to reduce tension.

President Kennedy's first Press Conference after assuming office and his "State of the Union Message" give enough inkling into his mind and the means he intends to adopt to lessen tension in the world. Though he has asked his Defence Secretary to reappraise the entire defence strategy of the U.S.A. and to take prompt action to step up Polaris submarine and missiles production programme, he has repeatedly stated that his fight against Communism would be waged on the economic front and not on any battle-field. To counteract Communist influence in the under-developed countries, he is asking for larger appropriations from Congress for economic aid. This new emphasis on assistance to under-developed countries from the United States and other prosperous nations will be widely welcomed.

Of course, Mr. Kennedy cannot take chances with the security of his country and, in the larger context, of the free world. His directive to the Defence Secretary to strengthen the defence system is born out of plain strategy. But he has uttered no investive even when referring to China which poses the greatest threat to peace in South-East Asia. His call to all the nations of the world to support the U.N. with a view to ending the cold war is timely and deserves response, especially from the Soviet Union whom he invites to join the United States in a programme of application of science for peaceful purposes and not for the manufacture of weapons of destruction. One hopes this will prove a prelude to an agreement on disarmament which would release resources for building a better world.

Portugal

SANTA MARIA AND SALAZAR

LAST WEEK Portuguese revolutionaries, under the leadership of Captain Henrique Malta Galvao, seized the 20,900 tons liner "Santa Maria" — "in the name", they said, "of the International Junta of Liberals presided over by General Humberto Delgado, the President-elect of the Portuguese Republic, fraudulently deprived of his rights by the Salazar Government."

In Sao Paulo, Brazil, General Delgado, Dr. Salazar's unsuccessful opponent in the Portuguese presidential

election of 1958, said that he had personally given the order for the takeover of the ship. The seizure of the Santa Maria has given the opposition movement in Portugal the most needed publicity abroad and with spectacular effect. Captain Galvao maintains that the first objective of the Portuguese Opposition would be to overthrow Dr. Salazar's administration, which, he argues, is strangling Portuguese life and expression. The ship's wireless vociferously exchanging messages with the world press, has called General Delgado "Portugal's President-elect". What Captain Galvao does with the Santa Maria in the end, nobody knows. But it appears that he has some further revolutionary action in mind, perhaps starting in a Portuguese territory in, or off, Africa. Or, he may proclaim the establishment of a provisional Government in exile abroad the Santa Maria and may seek recognition of his Government by friendly countries like Brazil, Cuba, and the Soviet Union.

In the meantime, a storm is raging in the international scene whether the seizure of Santa Maria by force amounts to "piracy". The word "pirates" can only be applied to this remarkable Portuguese eccentric and his political friends if the purpose of the seizure was "private gains". Captain Galvao and his political friends are no pirates out for gain, but honest men seeking to establish the existence of Portuguese Opposition, that cannot, in Portugal, express itself in regular ways.

Just how the American and British Governments, whose ships have been searching for the Santa Maria in the Caribbean and the Atlantic in response to a request from the Portuguese Government to help find the ship and restore her and her crew to the rightful owners, should act in such a case is difficult for them to decide. Naval powers are policemen on the high seas and they cannot be expected to approve of violent and arbitrary actions (including the killing of a ship's officer) there. The question is: Would the Navy be equally at the disposal of the Russian or Hungarian Governments if one of their crews made a "dash for liberty"? The Navy had been too quick to act. The Governments concerned should have taken a long, cool look at Portuguese internal politics before sending off American and British ships to hunt for the Santa Maria. The U.S. and British action has raised the question of political asylum and an assurance is called for that there would be no question of handing over these Portuguese citizens to Dr. Salazar's Government. If the United States and Britain accede to Dr. Salazar's request in toto, they would create a tradition of arresting those who are seeking to escape from a dictatorial regime. Dr. Salazar is not wholly blameless for the fact that his political opponents have no other alternative but to behave in this manner.

Poona Seminar

PATH OF ECONOMIC GROWTH

THE INTERNATIONAL SEMINAR on "Paths to Economic Growth" inaugurated on January 21 by the Chief Minister of Maharashtra, Mr. Y. B. Chavan, in Poona, concluded its deliberations on January 28. The Seminar, sponsored by the Congress for Cultural Freedom, Paris, and the Gokhale Institute of Politics and

Economics, Poona, was attended by 25 experts from Asia, Africa and Europe.

The central theme to which the members of the Seminar devoted their attention was how best the traditional society might be transformed to make possible the desired economic growth without, at the same time, disrupting the traditional values that are worth preserving. This was not only an economic problem but one that had sociological implications. Thus, the members of the Seminar agreed that the neutrality of the economist towards moral values was not a healthy development. Even the economic discourses of Adam Smith and Karl Marx had a moral purpose. Some of the formulations of Samuel Smiles may be derided today, but they embodied the spirit of a Victorian Age that was keen about values. The economists of today similarly cannot consider the so-called purely economic phenomena irrespective of social and moral values.

The introduction of a competitive psychology into Indian society, according to Prof. D. R. Gadgil, would be disastrous. He argued that while competition may work satisfactorily in a country with rich resources and an open frontier, it would lead to disaster in a country like India that was "poor, over-populated and burdened with a stratified society." While toning down of competition to some extent for the sake of social justice may be understandable, the outright denunciation of free enterprise and competition would deprive the free entrepreneur class from contributing their share towards India's economic development. In the industrialisation of all advanced countries of Europe and America, private enterprise and free competition played a major role in bringing about material pros-

perity and development. And there are reasons to believe that private enterprise has still to play some role in India's future economic development for some time.

Mr. Jai Prakash Narayan strongly advocated the view that redistribution of land through the Bhoodan Movement would go a long way to solve many of India's problems of growth. It is admitted that nothing would be better than Gramdan if it could be workable; but its practicability had never been put to proper trial, because of lack of disinclination to undertake the necessary organisational effort. Similarly, Mr. Narayan's Sarvodaya formulation suffered from the limitation that the notion of "Dan" and trusteeship adumbrated by self-constituted trustees were not easily acceptable by others. Prof. Gadgil advocated the philosophy of the co-operative system. He argued that if there was a discipline that was prescribed for the "Sadhu", there could also be discipline for the layman that called for a lower level of imposition of self-restraint on his wants and desires. The basic framework of Indian society, according to Prof. Gadgil, should comprise of a decentralised, dispersed units in which the small independent rural dweller feels that he is able to order his own affairs. It will be obvious from what Prof. Gadgil said that he was advocating some amount of competition and free enterprise; but he wanted all this within the framework of co-operatives. Prof. Gadgil, however, did not bring out the practical difficulties of setting up co-operative institutions at India's present stage of growth. The thing that is needed is avoiding dogmatic approach in dealing with problems of growth. What is required is a discerning understanding of the process of growth involved in individual cases, and a considerate treatment of the sufferers in the process.

The World Abroad

IS MR. NEHRU A SOCIALIST?

By ODYSSEUS

IS Mr. Nehru a Socialist? In reply to this question, put to him by Mr. R. K. Karanjia ("The Mind of Mr. Nehru". Allen & Unwin, London, 1960. Price 10sh. 6d.), Mr. Nehru says: "I have believed in Socialism for the past fifty years and until somebody convinces me to the contrary, I shall continue to believe in and work for Socialism..... Modern thinking all over the world is increasingly becoming Socialist and only people who have lost touch completely with contemporary trends can think otherwise." Well, that seems clear enough. So it next behoves us to ask what Socialism is. The thinkers who first thought it up should be able to supply the most authoritative answer: Saint-Simon, Fourier, Rober Owen, Karl Marx, and Friedrich Engels. To them, Socialism means the ownership and control of the means of production, capital, land, property, etc. by the state, and the distribution, exchange and administration of wealth by the state in the interests of all citizens.

But it is clear, not only from Mr. Nehru's talks with Mr. Karanjia, but from what goes on in India today that Mr. Nehru does not accept all this. India is a mixed economy, in which, although the public sector is allotted the "commanding heights," the private sector is left in possession of the greater part of the economy. The 1956 Industrial Policy Resolution laid down that only industries of basic and strategic importance, public utility services, and those which require investment on a scale which only the state can provide, are reserved to the state. What is more, while the private sector was barely tolerated in 1947, the passage of time and events has led the government to recognise that to discourage private enterprise is to slow down the development of the greater part of the economy. The anxiety of Mr. Nehru, and even of the leader of the Praja Socialist Party, to encourage the habit of investment among low income groups suggests that they both believe that a mixed economy cannot progress without constantly increasing private investment.

Mr. Nehru himself, while insisting that he is a Socialist, said to Mr. Karanjia: "At the same time, I refuse to accept any particular dogma of Socialism..... to be rigid about the form or pattern....."

I find it difficult to reconcile the facts (a) of a mixed economy in India, in which the greater part is controlled by private enterprise, and (b) of Mr. Nehru's rejection of any particular dogma, with the classical definition of Socialism.

Nor can I reconcile Mr. Nehru's statement that modern thinking all over the world is becoming increasingly Socialist, because in those parts of the Western world in which Socialism originated, and which have had actual experience of Socialist governments, it is in full retreat. Look at the German and the British Socialist parties—the prototypes of all other Socialist parties. On December 16 last, I quoted here a lengthy extract from the official German Socialist manifesto, which included the following:

"The free choice of a place to work, free initiative for employers are decisive foundations, and free competition an important element, of a free economic policy. The autonomy of employee and employer associations in the conclusion of wage contracts is an important part of the free order. Totalitarian control of the economy destroys freedom. The Social Democratic Party therefore favours a free market, wherever free competition really exists. Where markets come under the domi-

nation of individuals or groups, however, manifold measures are necessary to preserve the freedom of the economy. As much competition as possible—as much as necessary." When I commented to a German Socialist leader that this implied that the SPD believed in planning after all, he replied: "Not as an end in itself, but backed by all the qualifications we've previously mentioned, the answer is Yes." As for the "Socialism" of the British Labour party, it would be kinder to draw a veil over its present disarray.

R. H. S. CROSSMAN'S "SOCIALISM"

Let me, however, offer one quotation from "Socialism and the New Despotism", a Fabian pamphlet by Mr. R. H. S. Crossman, the leader of the orthodox Left: "More and more serious minded people are having second thoughts about what once seemed to them the obvious advantages of central planning and the extension of State ownership." He goes on to explain that "the discovery that the Labour government's 'Socialism' meant the establishment of vast bureaucratic corporations," of "a vast centralized State bureaucracy which constitutes a grave potential threat to democracy" had created a situation in which "the main task of Socialists today is to convince the nation that its liberties are threatened by this new feudalism..." Surely an extraordinary task to fall to the lot of Socialists!

Mr. Nehru told Mr. Karanjia that he rejects Capitalism ("although it is changing all the time"), because "it sticks to its basic grab instinct and tends to monopolies and aggregation of economic power." Yet it is the Socialist Mr. Crossman, who finds it necessary to attack state-ownership and bureaucracy for aggregating economic power into a new feudalism! Certainly the concentration of economic power in private hands is dangerous, but the problem of power is not solved by concentrating it under one all-embracing power—the state. The problem of power is solved when the state ensures (1) a stable currency, and (2) the fullest play of competition—the grab instinct—between individuals, firms, and industries. But, objects the Socialist, mass production requires huge combines. Not so, modern technology, with its constant new discoveries and techniques, proliferates ever wider and keener competition. Why is it that Imperial Chemical Industries, the biggest single industrial unit in the UK, is always seeking to cut production costs and reduce prices? Because its directors are alive to its vulnerability to competition from substitutes. Then, again, that the existence of assembly lines does not kill the small firm is spectacularly demonstrated in the USA—home of giant mass producers—where some 4,000,000 (repeat: four million) small firms, employing less than 100 persons each, do not merely survive but flourish, constituting 96 per cent of all US firms.

It is significant that, although their language may differ, both Mr. Crossman and Mr. Nehru, whose bona fides as Socialist leaders and democratic parliamentarians are beyond question, join in rejecting (a) "Socialism" as defined in the dictionary, and (b) totalitarianism. Both insist on the need to preserve individual freedom, and ethical and spiritual values.

THE KEY TO THE RIDDLE

I believe the key to the riddle is that whereas, on the one hand, being intelligent, clear-thinking, and devoted democrats, they perceive the evils that follow from 'doctrinaire' Socialism, and are seeking means to avoid them, on the other hand, they are the prisoners

of their intellectual inheritance and cannot get away from the terminology that they absorbed in their student days. The fact is that if "Socialism" means anything, neither are Socialists. The more that they insist that they are Socialists the more am I reminded of the famous passage in Lewis Carol's "Alice Through the Looking Glass":

"There's glory for you!" "I don't know what you mean by 'glory'", Alice said. "I meant, 'there's a nice knock-down argument for you!'" "But 'glory' doesn't mean 'a nice knock-down argument'", Alice objected. "When I use a word," Humpty Dumpty said, in a rather scornful tone, "it means just what I choose it to mean—neither more nor less....The question is which is to be master—that's all."

I have a profound admiration for Mr. Nehru as (what he calls) a "pragmatic Socialist", because this means (from my side of Alice's looking glass) that he is no Socialist but that rare person, an honest man who does not flinch from following the argument to whatever logical conclusion it leads, irrespective of the position from which he started. But I suggest that it would be a great help to final clarification of thought, if he dropped the title "Pragmatic Socialist" and called himself a democratic Liberal.

I suppose that in the light of all that I have written up to this point, I will arouse a gale of Homeric laughter when I go on to say that in the circumstances of a developing economy, like India, private enterprise alone is insufficiently advanced to shoulder the task of boosting India into Rostov's "take-off" phase within a reasonably short period, and that a Central Planning Commission, and substantial state economic initiative and enterprise are essential.

But on this point, I take my stand with Dr. Raja J. Chelliah (See this column for November 11 and 18, 1960), who, in effect, pleads that the public and private sectors of the economy should be treated not as enemies or rivals but as friends, fulfilling complementary roles, in a great national crusade. Because private investment is low, the inferences too often drawn hitherto by official spokesmen are that (a) public investment must be stepped up, even at the expense of private investment, and (b) compulsory savings and public investment are needed to reduce inequalities of income. But the fundamental need is to raise the rate of saving. If you put the cart of compulsory collective savings before the horse of raising the savings rate, you risk replacing private by public investment, whereas the need is to raise the total of BOTH. Public investment itself cannot hope to reach the very high level necessary if private investment is not actively encouraged. I refer you to Dr. Chelliah's excellent little book "Fiscal Policy in Underdeveloped Countries" for an authoritative elaboration of this theme.

My conclusion is that Mr. Nehru, Mr. Crossman, and I, as good Liberals, humanitarians, and democrats, are all in broad agreement. Where we disagree is in the words that we use to describe what we want. This difference in vocabularies is, however, unfortunate because it means that we waste a lot of energy in disputing with each other, which could be better employed in promoting understanding and co-operation between the public and private sectors.

In a final article next week, I will offer some reflections of Mr. Nehru's political and philosophical (as opposed to economic) views, as reported by Mr. Karanjia.

The European Scene

SOME ANOMALIES OF PRIVATE INVESTMENT

From Our Special West European Correspondent

PARIS, January 28.

ATTACHMENT to a cause which one believes to be, on the whole, a good one should not detract attention from its vices and limitations, for even the best cause has its faults and even the wisest policy produces unexpected and unwelcome consequences. Current events in West Europe and the USA invite us to apply this generality to the case of foreign private investment, which the present writer, like probably every financial journalist in the non-Communist world, has long regarded as one of the most important ways of stimulating development and boosting international trade. Naturally, few people outside Washington shared the view that Republican experts put into the mouth of President Eisenhower, that private investment was the one and only way of assisting foreign economies. Just as few would share the opinion of some US labour leaders at this moment, that private investment abroad is a disgraceful swindle whereby American employers ensure an unemployment pool at home of six million men. Any review of the results of foreign investment by private firms over the last 15 years would show that it has had, on balance, welcome consequences for all concerned; and one could conclude that there is not too much such investment but too little even now.

Yet the same review would reveal that foreign private investment, particularly as practised by US capital, has had many absurd and even harmful consequences—and that these are not accidental, but connected with the very fact that it is private investment. Some attention to the negative side of the account would suggest ways of controlling the flow of private capital overseas so as to increase its usefulness. Closer study would reveal (I believe, though I have not the space to establish it here) that the ideal form of private foreign investment is that which now flows from Britain to India, for reasons that are to the credit of both the Indians and the British, private investors as well as governments in each case. Alternatively, one could say that the best use of private investment will be found in international co-operation between several lending countries and one or more receiving countries, where the object is to combine the virtues of purely private programmes such as are implemented by US firms with the virtues of one-sided public aid programmes, such as constitute most French aid to Africa. The ideal suggested by either comparison is the same: a movement of private capital accompanied by public aid toward a country where the use of both is determined by a rational plan in which local private enterprise co-operates with its government, both having in view—not the import needs or cost-cutting of the investing country, but—the development of the receiving economy and the reward of the risk-taking investor.

Today, when the new US Government is rethinking its policy on foreign investment and when West European industry is becoming anxious about some forms of US enterprise abroad, is a suitable time to recall certain striking facts about private overseas investment since the war. Where has most of it gone? There is no difficulty about answering that because far and away the bulk of it has come from Western oil firms and it has gone to developing oilfields around the world. Yet the situation today is that the main lending country, the USA, has banned the import of oil from abroad; there is a world oil glut; prices of crude and incidentally of oil

shares have fallen without notable benefit to petrol consumers; and all the oil-producing countries are bitterly discontent, are as underdeveloped as ever they were and as politically unstable, and feel that they are being exploited by Western Government. They are too, in the sense that they receive only a fraction of what the ultimate consumer pays for petrol, the lion's share being confiscated by Western Governments in tax. If "exploitation" has any meaning at all, it must describe the situation where an idle intermediary claims most of the selling price for himself; and that is what is happening with petrol. One can well understand the impatience of the oil-producing governments who have just held a conference in Caracas when they are told demand for oil is behind supply—naturally demand for anything will fall below supply if taxes raise prices too far.

The private oil investors deplore that as much as anyone, but they would have to admit ruefully that much of their capital outlay in recent years has been, commercially, a poor investment. It was so partly for reasons beyond their control (Russian exports) or beyond their foreseeing (the coal glut); but also partly because of their own anarchic competition, especially the guerilla war between the big cartels and the "independents", and because of rivalry between supposedly allied governments (Italy, France, Canada and others). No one may be to blame, but the fact stands that most foreign private investment has gone to an industry where there has been no effort to co-ordinate energy policies, and where nationalist rivalries and short-sighted competition have annulled many of the benefits of that investment. As for the gains that the receiving countries have drawn from this investment, it makes a lot of noughts on paper but is hard to find in solid economic advance. The multiplier effect of oil investment has been virtually zero, and one of the main recipients, Venezuela, is not only as poor as ever but is enforcing exchange controls while its first democratic government struggles against subversion by Fidelists and Communists.

Oil, I will be told, is a special case and foreign private investment in general cannot be judged on the disappointing results of that one curious industry. Leave oil aside then (whereupon the total of such investment becomes much less impressive) and you will still find that much the same situation obtains in the mining industry, which has been the second biggest claimant of foreign capital. Vast sums were sunk in mines in developing countries with the objectives set out in the Paley Report: to guarantee U.S. supplies of strategic minerals rather than to develop those backward economies. Today there is a surplus of almost all minerals, prices are at their lowest in years, mining shares are out of favour, the producing countries have received precious little economic stimulation from the activity of their mines (which is anyhow being cut back now to combat the slump) and they feel that they are at the mercy of variations in Western industrial activity more than in the past. Oil and minerals have exploded the theory of the multiplier effect of foreign investment in export industries, and taken us back to what John Stuart Mill said a century ago: such industries are branches of the economy of the mother country, not of the developing country.

Turn now to U.S. investment in manufacturing industry. This has gone, not to the industrialising countries, but to those already fully industrialised, and its preference for the latter is increasing yearly: private U.S. capital outlays in the Common Market region will this year be \$355 million, well over double of the \$157 million of 1959, and about a quarter of total investments abroad this year. Since U.S. investment in other West European countries this year will be \$295 million, Europe will get just half of the American capital going abroad. This choice is economically rational on the part of U.S. investors, because West Europe is the most promising economic unit in the world today. But it looks less rational on other than commercial considerations: developing countries will point out that Europe has no capital shortage as they have, and U.S. labour will remind us that many of the goods produced by American enterprise over here will be re-exported to the U.S.A. or at least replace U.S. exports to Europe. Thus there is little or no net contribution to development or world trade.

U.S. unions are calling for a boycott of American movies made in Italy, where Hollywood is spending up to \$30 million a year for reasons that an accountant can easily justify but an economist less easily; and they are whipping up a nationalist campaign against foreign motor cars and against U.S. typewriters, outboard motors, electronic machines etc. that are made with "cheap European labour." Whether or not this sort of thing is responsible for the six million unemployed in the U.S.A., one understands why Washington has just withdrawn the incentives offered to American firms investing in West Europe.

The rush of American capital to West Europe looks even odder when we ask what it is going to produce there—because the answer often is, something that West Europe is already producing enough of: such as motor cars, or something of which there is an existing or prospective surplus such as synthetic rubber, or things that restrict the market for raw materials exported by developing countries, such as synthetics in general. To note

these facts does not entail concluding that competition should be curtailed or that technological progress should be restrained—but it does make us question the dogma that foreign private investment is the best way to promote development and world trade. In the case of the automobile industry, those ends might be better encompassed by specialising production between West Europe and the U.S.A., whereas the present crazy competition between producers on each side of the Atlantic makes no sense, and is highly dangerous to boot. Europe is already producing more cars than it can use and is faced with a period of acute competition as the Common Market is built—and yet Detroit has decided (a) to make the same sort of cars as the Europeans, and (b) to invest vast sums in Europe itself: \$500 million in three years for General Motors and \$358 million for Ford. Motor cars are only the most striking instance: there are numerous other industries where one could show that the main result of vast foreign private investment will be to transfer profits from one firm to another without any net expansion of total output.

Meantime developing countries, hungry for capital, are neglected. Sometimes private enterprise shirks investment responsibilities there that are clearly its concern. Last year, for example, Tunisia got governmental loan to build an international airport at Tunis when it is plain that, if Mr. Bourguiba really had to have a superb aerodrome in his poor country, then it should have been financed, not by the U.S. taxpayer, but by the international airline companies that will use it. One could multiply examples of such anomalies. It is better to hasten to our conclusion which is this. The doctrine of free private enterprise, as understood in the Western neo-liberal welfare economies, is easily defensible inside one national economy, but when applied to the task of promoting development of foreign countries it leads to absurd and wasteful results if not supplemented three times over: by public aid from advanced countries, by national planning in the developing country and by international co-ordination among all Western Governments and investors.

*Economic Report from the U.S.***REPORT ON FOREIGN TRADE**

By GUY SIMS FITCH

WASHINGTON, Jan. 25.

THE United States Senate's Committee on inter-State and foreign commerce has issued recently one of the most forceful trade documents Washington has seen in a long time. Prepared by the Committee's Foreign Commerce Study Staff, it was made public by Committee Chairman Warren G. Magnuson at the express request of President John F. Kennedy. The document, a 3,000-word summary of a longer and more detailed report which has not yet been published, represents a vigorous affirmation of strong and enlightened policies at home and abroad, recognizing the inter-relationship between foreign and domestic economic programmes. Beyond that—and this is where its chief significance may well lie—it recommends important advances to strengthen further the already liberal base of US foreign trade policy. The essence of the report may be found in this succinct paragraph: "We believe our national trade policy should reflect our confidence in the power, the resiliency, the ingenuity and creative capacity of the American economy. It should leave no doubt that our own confidence in the dollar is unshaken. It should assert that we fear honest competition from no quarter on earth. It should serve notice that we intend to use all means at our command to expand world markets for our products, and that we intend to keep our own market open to all who want to do business with us on a fair and reciprocal basis". Within this context, the report argues in favour of "continuing effort to lower or remove barriers to the exchange of goods and services among the nations of the world".

In the process, the report sets forth a number of far-reaching recommendations. Many of them are admittedly controversial, but all are keyed to the "liberal trade" approach. One, for instance, would add a new dimension to US foreign trade policy, looking to ways other than import protection to assist industries hampered by foreign trade competition. "The resources of government should be brought into play", the report says, "to assist an affected industry to improve productivity, move into new and more competitive lines, or otherwise adapt to the competitive situation without undue hardship". Other recommendations involve such matters as broadened tariff-cutting authority for the President, modification of "buy American" procedures,

and strengthening of the multi-national General Agreement on Tariffs and Trade (GATT). Even in the matter of safeguarding national defence interests, the report urges that import curbs "be the last rather than the first remedy available". No one can say how many or which of the dozens of recommendations in the report will be adopted officially by the Kennedy Administration, nor can anyone say how many or which of those that do win official endorsement will find favour with the Congress. The circumstances surrounding publication of the Committee document are not being overlooked. However, the fact that it was issued at the request of the President seems to suggest, if nothing else, the new Administration's concern with forward-looking programmes, and its willingness to explore new ground in meeting international economic problems—including the vexing problem of the US balance of payments.

C. Douglas Dillon, who is the new Secretary of the Treasury and was the old Under-Secretary of State, has already indicated in Congressional testimony that the United States will be examining new approaches to its balance of payments difficulties. Some of those being mentioned—unofficially, it should be stressed—fall in line with the tenor of the Senate Commerce Committee's report. They include a liberal trade policy, a fair sharing of international aid responsibilities with Western Europe, and an attempt to achieve closer conformity among the domestic policies of the industrial nations. Underlying all these, of course, is the evident Kennedy determination to expand US economic activity, so that higher productivity and increased technology can further strengthen the US balance of payments. Among these lines, Mr. Kennedy, Mr. Dillon and other members of the new Administration have consistently ruled out any increase in the price the United States pays for gold. Indeed, most experts take a dim view of such a suggested increase, viewing it as not only unnecessary and fruitless, but as potentially disruptive to the entire fabric of international commerce. The broader and more constructive approach of the Kennedy Administration seems to be a multi-pronged effort that would set in motion increased growth for the US economy, expand the opportunities for world trade, and develop new and meaningful forms of international co-operation.

WORLDGRAM

India

The Enfield India Ltd.: The Enfield India Ltd. came into being late in 1955. A licence under the Industries (Development and Regulation) Act was originally given to the Madras Motor Private Ltd. who entered into a technical collaboration agreement with the Enfield Cycle Company Ltd., U.K., the world famous organisation manufacturing Royal Enfield Motor Cycles. Later, the Madras Motor Private Ltd. transferred this technical collaboration agreement and licence to the newly formed Enfield India Ltd. The licence granted by the Government of India under the Industries (Development and Regulation) Act was for a phased programme of 5 years during which the indigenous content was to increase gradually, ultimately reaching 75 to 80 per cent. Though, strictly speaking, this phased programme commenced only by the end of 1956, roughly in about four years' time, an indigenous content of about 80 per cent has been reached.

The company has also been licenced for the production of 6,000 scooters per year and also Villiers engines. The industry is at present licenced to produce 5,000 motor cycles per annum. The scooter project for which the Villiers 173 c.c. engine will be used is in collaboration with M/s. Phellon and Moore, who are making the "Panther" scooter for which also the Villiers engine is used. The trade-name will be "Royal Enfield". Their collaborators' design has been developed further by them to suit the conditions obtaining in India. The scooter will be introduced into the market during the second half of 1961. The price of the scooter will be around the price of any other scooter available in India today. M/s. Villiers Engineering Co. Ltd., Wolverhampton, U.K., are the manufacturers of the world famous Villiers engines. Their engines are used by a number of manufacturers of motor cycles and scooters in U.K. They also manufacture engines for industrial and agricultural applications and will be taking up these things for manufacture shortly. There are innumerable usages for these engines. They are used as prime movers in pumping sets, domestic illuminating generators, concrete vibrators, agricultural tractors, fork lifts, inboard and outboard motors, compressors, insecticide spraying equipments, railway trolleys and any other application which needs a compact and efficient power unit developing upto-5 h.p.

Process on Para-Aminophenol and 2:4 Diaminophenol: A process on para-aminophenol and 2:4 diaminophenol has been developed at Central Electro-Chemical Research Institute Karaikudi. The electrolytical reduction of nitrobenzene and m-dinitrobenzene gives corresponding aminophenol directly and is thus more advantageous than ordinary chemical methods. Working in these lines know-how for the electrolytic production of p-aminophenol and 2:4-diaminophenol from nitrobenzene and m-dinitrobenzene respectively has been developed. The process consists in reducing a suspension of the corresponding nitrobenzene in dilute sulphuric acid in an electrolytic cell. The same cell can be used for the manufacture of both aminophenols. In one cell amalgamated copper or monel rotating cathodes and perforated lead sheets anodes with porous pot diaphragms are used.

For the manufacture of p-aminophenol, cell voltage is maintained at 3.8 — 4.6 volts, bath temperature

at 80-85° C and current density at 20 amp./dm². Under these conditions yields of 65-73 per cent are possible. Optimum conditions for 2:4 diaminophenol are current density of 30 amp./dm², cell voltage of 3.8-4.8 volts and bath temperature of 100° C. Yields of 50-58 per cent can be obtained.

*

Interim Relief for Workers in Jute Industry: The Government of India has accepted the unanimous recommendation of the Central Wage Board for the Jute Industry regarding the grant of interim relief for workers. They have accordingly decided to request the jute mills to implement the recommendation as soon as possible. The following is the recommendation of the Jute Wage Board. Every worker — whether permanent, temporary or badli—shall be paid interim relief at the rate of Rs. 2.85 per month from 1-10-60 to 31-12-60 and at the rate of Rs. 3.42 from 1-1-1961. The arrears of interim relief from 1-10-60 to 31-12-60 will be paid to the respective workers on or before 15-2-1961. The amount of interim relief from 1-1-1961 onwards will be paid each month in one lump sum on the first pay day of the next month. In case of workers who did not or do not work for the entire month, or for calculating wages due for any broken part of a month e.g., by going on leave or sick leave etc., the amount of interim relief payable to them will be worked out on the same principles as govern dearness allowance. The amount of interim relief shall be paid as a separate item till the final award of the Wage Board and would be adjusted according to that award. The above recommendations apply to all jute mills in all parts of India, except that the Katihar Jute Mill will pay interim relief at the rate of Rs. 3.42 with effect from 1-9-1961.

United Kingdom

Manufacture of British Tool Grinder in India: Under an agreement signed between Praga Tools Corporation Ltd. of Hyderabad and A. Jones and Shipman Ltd., of Leicester, England, Praga is to manufacture in India one of Jones and Shipman range of precision grinding machines. The machine to be manufactured in India is a cutter and tool grinder — a versatile model which has been installed in factories in most parts of the world. A compactly designed machine having universal operating positions, it has a rising and falling swivelling wheelhead which enables all types of milling cutters to be ground in the shortest possible time. The accuracy and efficiency to which these are ground ensures that the machine tools on which they are used give maximum performance. Numerous attachments are available to cover a wide range of cutter and tool grinding operations. The licensed agreement allows Praga to manufacture the machine for sale in India and other territories. British made models of the machine have been sold in India for a number of years.

United States

Loan for an Indian Firm: The United States Government has announced the authorisation of a loan of \$18.5 million (Rs. 9 crores) to the Orient Paper Mills Ltd. a private firm, with its Head Office in Calcutta. The loan, channeled through the U.S. Export-Import Bank, will be utilized for the purchase of pulp and

paper making machinery for a big paper mill to be built at Amlai in Madhya Pradesh. Using bamboo as raw material, the mill will produce over 50,000 tons of paper annually. India's needs for paper have greatly increased in recent years. Beloit Iron Works of Beloit, Wisconsin, a well-known American firm, will manufacture or procure the machinery and equipment for the mill. The Eastern Engineering Company of Atlanta, Georgia, another prominent American Company, will provide technical and engineering services for the overall project. The loan is repayable over a period of 10 years, with the first payment due in 1964. The new loan brings the total of U.S. financial assistance to India to \$3,765 million (Rs. 1,792 crores).

Norway

Britain Still Norway's Largest Export Market: Norway's export to EFTA countries has considerably increased recently. While the increase in value of the total export during January-October last year amounted to 7.7 per cent over the previous year, the export to the EFTA area went up by 22 per cent. During the first 10 months of 1959 EFTA countries received 39.1 per cent of Norway's export, whereas in 1960 this figure rose to 44.2 per cent. Export to "The Six" went up by 5.8 per cent which is less than the average increase, and there was a drop in export to America by as much as 29 per cent. Statistics show that Britain was further consolidated as Norway's most important export market, and export went up by over £10,500,000 to £58,330,000 which is a 22 per cent increase. There was also a remarkable increase in export to Sweden by as much as 33 per cent to a total value of £28,855,000.

Yugoslavia

Investments According to the Five-Year Plan: The new Five-Year Plan of Yugoslavia calls for a vigorous rate of investments in the economy. The distribution of investments between the individual spheres and sectors of production should assure the optimum and harmonious development of the economy as a whole. Due attention will be given to assure the most adequate investments into expanded production and capital formation, thus enabling the investments to yield the best possible results with regard to the growth of production and national income at the end of the five-year period. The faster development of the productive forces will be based primarily on the growth of productivity in all spheres of the economy. As distinct from the previous years, productivity will become more important factor than employment in the increase of production and national income, this being one of the essential characteristics of the new Five-Year Plan. Total gross investments in fixed and working assets for the entire five-year period planned will amount to 8,015 billion dinars or an average 1,600 billion annually.

Holland

Projects for A-ships: Along with a number of other European countries Holland has submitted to the Uratum commission a project for nuclear reaction for ship propulsion. The project originates from the Reactor Centrum Nederland (RCN) and ship builders co-operated. The Dutch Project concerns an advanced boiling-water reactor. It is one of the most specific plans.

U.A.R.

Foreign Loans Exempted from Taxes to Encourage Investments: With a view to open up wide vistas for foreign investments in UAR economic plans, all government foreign loans will be exempted from payment of taxes, declared the Executive Treasury Minister in a statement to the Press. He said such loans, credit facilities and current credit accounts have such a great importance that taxation burdens should not be allowed to constitute a bar to their importation since they are so essential for the financing of the country's development plans. On the other hand, current accounts between the Egyptian Region and other countries are aimed at the activation and diversification of our exports, the opening up of further foreign markets for goods, the provision of abundant supplies of essential commodities, and the import of more capital equipment and raw materials for development plans.

U.S.S.R.

Industrial Production: Industrial Production in the USSR has risen by 10 per cent in 1960 (the planned increase was 8.1 per cent) over the 1959 level. The output of means of production (Group A) increased by close to 11 per cent, according to preliminary estimates (the planned figure was 8.8 per cent) and that of consumer goods (Group B) by more than 7 per cent (the planned increase was 6.4 per cent). The Central Board of Statistics published a report on the results of the fulfilment of the 1960 plans of economic development of the USSR which says that the programme of the second year of the Seven-Year Plan (1959-1965) has been fulfilled ahead of time both with regard to gross output and with regard to the production of pig iron, steel, rolled sections, most important non-ferrous metals, electricity, oil, coal, textiles and other products. 6.6 billion roubles worth of manufactured goods were produced over and above the target figures of the Seven-Year Plan (all figures were given in new rouble).

Colombia

IMF Credits to Colombia: The International Monetary Fund granted Colombia recently a credit for \$75 million for a period of one year. During the past 12 months Colombia could have availed of an IMF line of credit amounting to 41.25 million dollars but did not find it necessary to do so. Further, the country gave 47 million dollars on short-term debts without reducing its international reserve level. Colombia is endeavouring to continue its policy of achieving a balance of payments surplus without recourse to import restrictions.

France

Automobile Industry in 1960: A new production record was established in 1960 by the French automobile industry. A figure of 1,360,000 vehicles is estimated for 1960 compared with 1,283,000 vehicles in 1959. However, it is noted that the increase in production which had been 15 per cent between 1958 and 1959 will be only approximately 6 per cent between 1959 and 1960. Automobile production has undergone a slack period since July 1960. Two producers, Renault and Simca which were foremost French producers because of an increase in their production and their export were the first to slow their production rate. A decline in the exports to the United States is the principal factor in this production decrease.

NEWS IN BRIEF

INDIAN

One thousand three hundred and ninety-nine tons of ingot steel was produced in the L. D. Steel melting shop at Rourkela Steel Plant on January 29, which is the maximum production on a single day so far.

The Textile Commissioner recently assured the weaving industry that the supply of worsted woollen yarn would not be affected by the withdrawal of the order fixing a flat pattern of production for weaving, hosiery and knitting yarns for all the worsted spinning mills in the country.

The Tariff Commission has issued a questionnaire on the revision of the sugar price linking formula for determining the amount to be paid by the industry to the cane growers. The Government of India had referred the matter to the Tariff Commission in October last.

Farmers' schools are being set up in Jammu and Kashmir to give practical training in farming and to inculcate enthusiasm for agriculture among the children of farmers.

The output of cotton textile mills in December, 1960, is provisionally placed at 150 million lbs. of cotton yarn and 447 million yards of cotton cloth, according to a Press Note issued by the Textile Commissioner.

According to preliminary estimates based on house-listing figures, 18 to 20 per cent increase in India's population was expected in the next census.

The Rajasthan main canal will have double-tile lining on sides and the bed in those reaches where the soil conditions are bad or the embankments are such as to allow seepage of water due to high filling.

The Government of India have authorised the State Governments to relax the provision of rule 11(2) of the Minerals Concession Rules, 1960, for renewal of the prospecting licenses.

Afsons Industrial Corporation Private Ltd., which has been promoted by Abdulabbai Fidaali and Co. of Bombay, is being converted into a public limited company with an authorised capital of Rs. 1 crore. The public company will establish a paper and board mill at Khopoli.

It is reported the Rajasthan Government proposes to set up industrial estates at Tonk, Beawar, Bundi, Dungarpur, Sikar and Churu, in 1961-62.

Of the eleven countries which provided training facilities to their Colombo Plan partners in 1959-60, India comes fifth after the United States, United Kingdom, Canada and Australia. India's contribution under the Colombo Plan has been in both capital aid and technical assistance. During the year 1959-60, she offered capital aid of the value of Rs. 180 million to Nepal.

FOREIGN

Shell Oil Company is completing a programme increasing its benzene producing capacity. At the same time Pure Oil Company and Atlantic Refining Company announced plans to construct facilities for producing benzene, toluene and xylene.

It is reported in the Manyoni district of Tanganyika 82 peasant farmers will plant a total of 20 acres of Turkish tobacco in the 1960-61 season following a successful experiment carried out by the Agriculture Department during the 1959-60 season.

A record number 3,300,000 jobless Americans claimed unemployment benefits in the first week of 1961. This was an increase of 225,000 during the seven-day period, and represents 8.1 per cent of those covered by unemployment insurance.

One of the biggest trade export promotion ventures undertaken for Australian industry will leave for a four-month tour of South-East Asia in May. The motor vessel *Strait Banker* is being converted to carry a floating mission which will display every aspect of primary and secondary industry.

Some of the individual projects included in the £130 million five-year expansion programme to be launched by 34 Mexican companies have now been announced. They include a project by Telefonos de Mexico to double its capacity at a cost of about £43 million, a £16 million expansion programme to be undertaken by a consortium of three leading steel companies, and a project for a new zinc mine, expected to cost £8.6 million.

Pechiney announces that it is negotiating with the Argentine Government with a view to the possible construction in Argentina of an aluminium plant with a capacity of 25,000 tons per year. Kaiser Aluminium is also taking part in the negotiations.

The economic upswing in Switzerland is reflected in her foreign trade figures for 1960, both exports and imports showing a marked increase. Imports rose 15.7 per cent to Swiss Frs. 9,648 million and exports 20.5 per cent to Swiss Frs. 8,131 million resulting in a deficit of Swiss Frs. 1,517 million.

Signor Mattei, Chairman of Italian Oil Company E.N.I. which is to build a £9m. refinery in Ghana stated recently that he hoped E.N.I. would be able to supply all the necessary crude. Work on the refinery would start at once.

In spite of efforts by the authorities to rectify the imbalance, in the destinations of Egyptians cotton, 69 per cent of exports this season have so far gone to Communist countries against only 37 per cent to Western countries, USA, India and Japan. To UK only 2,704 bales had been exported by January 4, against 13,523 bales for the same period last year.

A detailed report prepared by Russian experts on the Rs. 41 million rubber tyre and tube factory proposed to be established by the Ceylon Government with Soviet aid has been handed to the Minister of Industries. After the Ceylon Government has approved the report an agreement will be signed and work on the factory will commence.

Special Article

PLANNING AND AGRICULTURAL PRODUCTION

PRELIMINARY estimates of foodgrains production in the Indian Union for the year 1960-61 indicate an all-time peak at 77 million tons as against 65.8 million tons in 1955-56 (last year of the First Plan) and 54.0 million tons in 1949-50. The First Plan agricultural targets were based in relation to the actual production in 1949-50, which was a moderately good year and not in relation to 1950-51, which, for technical reasons, ought to have been the real base of the First Plan, but in the agricultural sphere it was a lean year. These figures demonstrate a rise of 23 million tons in foodgrains output over a decade or an average rise of about 4.3 per cent per year. The performance in the agricultural sector is encouraging, though it has become a fashion with

the commentators to attempt to discount these encouraging results as a gamble of the monsoons. It goes without saying that not all the increase which has occurred is through fortuitous circumstances. During the last decade, systematic efforts have been made in various fields in order to raise the production of foodgrains. It is the purpose of this Special Article to analyse the factors on the credit side of the national balance sheet in so far as agricultural production is concerned.

In order to impart stability to the agricultural sector, attempts have been made to increase the size of irrigated area. Table I below sets out, since 1947-48, a balance sheet of the gross as well as the net

TABLE I
BALANCE SHEET OF GROSS IRRIGATED AREA

(In million acres)

Period	Area Irrigated Under						Gross Irrigated Area	Net Irrigated Area
	Foodgrains	Sugarcane	Other Food Crops	Total Food Crops	Cotton	Other non-Food Crops		
1947-48	40.7	2.9	2.4	46.0	0.7	3.4	50.1	46.6
1948-49	41.0	2.6	2.1	45.7	0.7	3.6	50.0	46.9
1949-50	44.2	2.5	2.4	49.1	1.0	3.6	53.7	49.8
1950-51	45.4	2.9	2.2	50.5	1.1	4.2	55.8	51.5
1951-52	45.9	3.4	2.6	51.9	1.4	4.0	57.3	52.0
1952-53	46.9	2.9	2.6	52.4	1.3	3.7	57.4	52.1
1953-54	49.3	2.4	2.9	54.6	1.5	4.0	60.1	53.8
1954-55	49.4	2.8	2.9	55.1	1.9	4.3	61.3	54.3
1955-56	50.9	3.1	2.9	56.9	2.1	4.3	63.3	56.2
1960-61	63.0	3.4	3.6	70.0	2.5	5.5	78.0	70.0
(Anticipated)								
1965-66 (Target)	89.0	3.9	4.6	97.5	4.6	7.9	110.0	90.0

area under irrigation. It will be seen that between 1950-51 and 1960-61, the area irrigated under foodgrains has shown hopeful signs of a steady increase from 45 million acres to about 63 million acres. For all the agricultural crops, the increase in net irrigated area is of the same order, from 51.5 million acres in 1950-51 to 70.0 million acres in 1960-61. This is a significant achievement and it has imparted stability to the agricultural economy, thus reducing the monsoon-gamble-element considerably. These figures also indicate that the rise in irrigated area has been much faster in the Second Plan than in the First Plan. The Third Plan contemplates a much faster rate of rise in irrigation, and in fact attempts to increase the area under irrigation in five years by as much as what was accomplished during the last decade.

Table II alongside, shows the relative share of major and minor irrigation schemes in extending the total area under irrigation. It is seen that the increase in minor irrigation is slightly greater than the increase registered under major and medium irrigation schemes. The current line of thought is in favour of minor irrigation, because of the speed with which the results can be attained. Major irrigation projects have an honourable place in Indian agricultural planning, but the experience of the two Plans has shown that they are slow

in yielding results and demand large resources. In the Third and the subsequent Plans attention is to be directed much more on minor irrigation schemes so as to accelerate the supply of agricultural crops.

The consumption of chemical fertilizers also has shown a spectacular rise during the last decade. The total consumption of fertilizers in 1950-51 was less than 70,000 tons. By 1960-61, it is likely to reach somewhere

TABLE II

(In million acres)

	Major and Medium Irrigation	Minor Irrigation and other Sources	Area Irrigated (Net Total)
1950-51	22.0	29.5	51.5
1955-56	24.9	31.3	56.2
1960-61	31.0	39.0	70.0

* Irrigation projects costing more than Rs. 5 crores are classed as major schemes and those costing between Rs. 10 lakhs and Rs. 5 crores as medium schemes.

near 5,00,000 tons, showing a rise of about 600 per cent in ten years or roughly 60 per cent per year. How could such a voluminous investment in the shape of chemical fertilizers fail to yield fruits? In fact, this particular factor has been instrumental to a large degree in raising agricultural production in this country. The need for expanding the supply of fertilisers through indigenous sources has already been underlined, and it is certain that the contribution of chemical fertilizers will continue to rise. The pattern of consumption of chemical fertilizers during the last decade and the target of consumption for 1965-66 (which is about four times the estimated consumption in 1960-61) are set out in the Table below.

TABLE III
CONSUMPTION OF CHEMICAL FERTILIZERS
('000 tons)

Period	Nitrogenous Fertilizers (In terms of N)	Phosphatic Fertilizers (In terms of P ₂ O ₅)	Potash Fertilizers (In terms of K ₂ O)
1951-52	57.9	6.9	7.7
1952-53	56.7	4.6	3.1
1953-54	67.2	8.1	8.5
1954-55	94.7	14.8	14.2
1955-56	105.6	12.8	10.8
1956-57	131.3	15.6	10.9
1958-59	164.0	27.2	16.5
1959-60	231.0	38.9	29.0
1960-61	360.0	67.0	N.A.
(Anticipated)			
1965-66	1,000.0	500.0	200.0
(Target)			

The total cropped area has also steadily increased since Independence and has also been a major factor in imparting confidence to the agricultural sector. On the eve of Independence, the total cropped area was hardly 278 million acres and showed a rise of 50 million acres before the commencement of the First Plan. The first two Plans show an increase of about 60 million acres in the cropped area and within the Third Plan period another increase of 30 million acres is envisaged, thus rising the total of additional cropped area to 90 million acres in the three Plans.

TABLE IV
MULTIPLE CROPPING

(In million acres)

Period	Net Area Sown	Area Sown more than Once	Total Cropped Area
1947-48	245.5	32.6	278.2
1948-49	243.2	33.4	276.6
1949-50	283.2	38.1	321.3
1950-51	293.4	32.5	325.9
1951-52	295.0	34.6	329.2
1952-53	304.9	35.1	340.0
1953-54	313.3	38.7	352.0
1954-55	315.8	40.1	355.9
1955-56	318.2	44.3	362.6
1960-61	323.0	62.0	385.0
(Anticipated)			
1965-66	327.0	88.0	415.0
(Target)			

The increase of 23 million tons of foodgrains in the last decade is equally distributed between the first two Plans. A factorial analysis of the sources of this increase in food production is set out in the Table V. It shows that out of a rise of about 11.2 million tons in the Second Plan, fertilisers (both organic and non-

organic) were responsible for about 4.6 million tons. Major and minor irrigation was also responsible for nearly three million tons, while double cropping, im-

TABLE V
COMPARISON OF THE BREAK-UP OF ADDITIONAL PRODUCTION IN SECOND AND THIRD PLANS
(Million tons)

Schemes	End of Second Plan	End of Third Plan
1. Major Irrigation	1.52	4.25
2. Minor Irrigation	1.54	3.00
3. Double Cropping	1.08	2.50
4. Improved Seeds	1.50	4.50
5. By application of		
(a) Nitrogenous Fertilizers	3.30	5.00
(b) Phosphatic Fertilizers	0.60	1.20
(c) Organic manures and green manuring	0.70	4.00
6. Land reclamation, improved practices and Plant Protection	1.00	3.77
Total	11.24	28.22

proved seeds, land reclamation and other improved practices yielded more than 1 million tons under each category. Thus, the contribution of chemical fertilizers in giving a healthy tone to the increase in food production is a basic factor in India's agricultural scene. In the Third Plan also, the fertilizers (both organic and non-organic) promise to yield nearly 40 per cent of the total increment of about 28 million tons in food. The irrigation projects are likely to occupy a second place, followed by improved seeds, land reclamation and other improved practices, and double cropping.

The picture of Indian agricultural growth during the last decade as shown by the index of agricultural production is really encouraging (Vide Table VI) and one of which any country can be proud of. A rise of nearly 40 per cent in ten years confirms the picture already indicated above on the basis of the trend in

TABLE VI
INDEX OF AGRICULTURAL PRODUCTION
(Base: 1949-50 = 100)

Period	General Index	Food Crops	Other Crops
1950-51	95.6	90.5	105.9
1951-52	97.5	91.1	110.5
1952-53	102.0	101.1	103.8
1953-54	114.3	119.1	104.7
1954-55	117.0	115.0	120.9
1955-56	116.8	115.3	119.9
1956-57	124.0	120.5	130.6
1957-58	114.6	107.9	128.1
1958-59	132.3	130.1	136.7
1959-60	127.2	124.3	133.1
1960-61	135.0	131.0	143.0

food production. The critics, it seems, have been extremely severe and sometimes unjust in painting a gloomy picture of agricultural growth in the country under the two Plans. There are positive optimistic signs on the credit side of the balance sheet which should not be ignored. The problem, no doubt, is immense and also pressing, due to the fast rise in population. Because we have had a major failure in not taking up the family planning programme in earnest and we failed to keep our rise in population according to the estimates made in the Plans, it does not follow that this failure should be twisted to discount the achievements in the agricultural sector under the two Plans.

THE BUSINESS WORLD

The Gold and Silver Ferment

By PAUL BAREAU

THE London bullion market continues to be exceptionally active. The interest, which until recently was largely centred on gold, has now spread to silver the turnover in which has in recent weeks assumed large proportions.

The flurry in gold has failed to maintain the heights of excitement and activity that became apparent last October and November. On one recent day, however, the Friday which preceded President Kennedy's inauguration, the turnover of gold in the London market is estimated to have exceeded 15 tons which would make it the second largest day's business in recent years. That sudden spasm of excitement was caused by rumours that during the ensuing weekend the US authorities would take special measures to prevent further outflow of gold designed to feed what they regard as speculative demand in the London market.

These rumours proved unfounded and the temperature of the market has since fallen. There is, however, continuing concern about the next chapters in US economic policies and about the manner in which the "pump priming" experiments of the new administration will in the long run affect the US balance of payments and, therefore, the dollar.

Some substance was given to this concern by the surprising final move of the departing Eisenhower administration in the realm of gold policy. This was the order banning United States citizens and companies buying and holding gold outside the United States and, furthermore, requesting them to repatriate by the 1st June any gold so held. There is some logic in this move since citizens of the United States have been debarred from buying and holding gold in their own country since 1933. Its timing and psychology must, however, be open to grave question.

In the first place it must be regarded as an admission of concern about the recent loss of gold by the US Treasury, and more particularly about the extent to which the Americans themselves have contributed to it. It is a move that has behind it considerable powers of moral suasion, but little effective means of enforcement. The United States have not, and have never had, any exchange control. Any American citizen can, therefore, transfer dollars abroad. Once there these dollars can vanish into anonymous strong boxes containing gold or bearer gold certificates, which will be quite outside the machinery of supervision available to the authorities. It is significant that very little gold has been resold on American account since this order went forth. There has even been evidence that the Canadian markets, where much of the American buying has occurred, have been net buyers of gold in the last few weeks.

The amount of American gold held on private account outside the United States has been estimated at \$200 million, which is a mere trifle in relation to the gold which the United States have lost recently. It is also insignificant in relation to the amount of dollars deposited in the United States on foreign account and which could be induced by this kind of move to seek greater safety in gold.

If, therefore, this step toward physical controls in the United States and towards further restriction on the free convertibility of the dollar is to be made fully effective, it may have to be followed up by similar measures. One set of controls tends to beget another.

The new administration have given all the necessary assurances that there will be no tampering with the dollar, and indeed the majority of informed opinion not only believes them but is convinced that they have the means to enforce this decision. This, however, can only apply to the immediate and medium term future. In the long run the reflation which the United States are about to attempt, and its impact on the rest of the world, must take us a step nearer the perhaps distant objective of a readjustment of all currencies in terms of gold, and incidentally towards a correction of some of the disparities and distortions which now mark the structure of international exchange rates.

It is not only gold that the US Treasury has been losing. Its stocks of available silver, not required as backing for silver certificates, fell during 1960 from 175,100,000 ounces to 123,500,000 ounces. This is, despite some receipts of silver from foreign countries, including the return of silver that was made available to India and others, by way of lend-lease during the war.

For some years past the demand for silver has considerably exceeded the supplies of newly mined metal. A number of countries are still faithful to silver for their token coinage, and recently France when introducing its new franc has decided to give it the dignity of a high grade silver content. The coinage demand for silver in the London market remains high and consistent.

The industrial demand for silver is also increasing. The photographic industry is still its main customer, but some new ores are appearing. These include the electrical and electronics industries whose appetites are growing fast. The gap between supply and demand has been covered by sales from the US reserve whose silver is being made available in the United States on the basis of a price of 91½ cents per ounce. That reserve of available silver is, however, dwindling fast. The other major source of supply has been the demo-

netised coin which has been laboriously refined in the U.K. and has been sold by the Bank of England, but recently in steadily dwindling quantities.

There is one large unknown and available stock of silver, namely the reserves of the metal that lie hidden in Asia and particularly in China which from time immemorial has been a veritable sink for the metal. The Chinese Communist authorities have secured part of these hoards and will no doubt obtain much of what is still left in private hands. The serious crop failures in China are compelling the Chinese authorities to buy foodstuffs in the world markets and the wherewithal to pay may well lead to substantially

larger exports of silver from China than have recently appeared on the world's markets.

In all these circumstances buyers of silver, whether they be governments or private industry, are beginning to indulge in some stock-piling which could rapidly exhaust what is left of the freely available reserves at the disposal of the US Treasury. Long before the point of exhaustion is reached, the United States will presumably stop their sales at the present fixed price, and the result will be a sharp bound in the world price of the metal. President Kennedy's inheritance of monetary problems may, therefore, be said to have a bi-metallic character.

Intransigence on Electricity Rates

By

CROESUS

IF the Federation of Electricity Undertakings of India had bargained for a change in the attitude of the Government towards the electric supply industry, especially the private-sector in the power sector, by wanting the Union Minister for Irrigation and Power, Mr. Hafiz Mohammed Ibrahim, himself to be present at its annual meeting — and this it has been trying for the past two years — I must say, it was sorely disappointed. For, on none of the three important questions raised by Mr. S. M. Zubair, Chairman of the Federation, the Minister had anything encouraging to say. On the other hand, notwithstanding his laborious efforts to convince Mr. Hafiz Mohammed, it seemed to me the latter simply refused to be convinced. Not only that, he went so far as to suggest, in case any unit of the private enterprise sector experienced difficulties, such as limited resources and others, it might as well integrate with the system of the Electricity Board in the area concerned. The point now, therefore, is whether the industry should give up its stand or continue to agitate, in order that its reasonable stand might be appreciated and acted upon, sooner than later, if only by reason of the ambitious power target fixed under the Third Five-Year Plan.

Let me refer to the three points made out by Mr. Zubair and the relevant replies of the Union Minister. The first demand of the Federation of Electricity Undertakings Chairman was that "the level of return now obtaining in the electric supply industry (official Bank Rate at 4 per cent plus 2 per cent) is grossly inadequate, and, if it remains unaltered any longer, it would tend to erode the capital invested in the industry". The reply to this of Mr. Hafiz Mohammed was categorical. He said: "I cannot agree with the view that the rates for power obtaining at present in most of the power systems are below cost and that there should be no reluctance in permitting an increase therein to enable the industry to earn a higher return." Of course, he added all those familiar clichés about electricity being "a basic industry," "a primary tool of production" and almost "a necessity, of present day life" and so on, and stressed the need for keeping a careful watch over power rates. He also raised the usual consumer canard when he maintained that the interests of the consumer required to be safeguarded.

Now, what passes my comprehension is how, with this attitude, the authorities propose to help the licensees to improve their financial operations to attract larger investments. In this connection, it is interesting to quote the considered opinion of a well-known house of share and stock brokers in Bombay — Messrs. Harkisondass Lakhmidoss. In their seventh annual report released recently, they say: "The situ-

ation in company-owned electricity industry became worse when the Finance Act of 1959 prevented grossing up of dividends as hitherto and, in addition, shareholders had to suffer a deduction of tax at the rate of 30 per cent from dividends paid to them. It has become difficult for the industry to expand, as the investment in electricity shares has become unattractive."

It is precisely this point that Mr. Zubair wanted to drive home, when he spoke of "investor confidence", inasmuch as investment is a pre-requisite to promote and sustain development. "The prime test," he said, "is the level of return necessary to attract investment and this is a focal point on which all problems of the industry converge." "That the level of return obtaining at present is insufficient," he went on to say, "is best witnessed in the price of equity shares in the electric supply industry. These shares were, at one stage, regarded as 'gilt-edged', but we now see the spectacle of such 'blue chips' being quoted at discount! The net result has been that expanding undertakings are unable to raise resources, as electric supply shares as media of investment have come to the suspect; indeed, there is large-scale disinvestment in the industry."

Other things remaining equal, as that accepted qualification for all economic laws goes, the electric supply industry would not have experienced much difficulty in raising finance. But, as in all other lines where we are blessed with parallel ownership of industries, in this industry also, the private sector has to contend with the pampered public sector units. When comparing the two in the electric supply industry, in particular, there is a tendency to ignore that the State Electricity Boards command decided advantages. Thus, they obtain finance from the State Governments at a privileged rate in interest, which means that the problem of financing for them has no relation whatsoever to the competitive tests of money or capital market. Secondly, whereas statutory corporations like the D.V.C. and the State Electricity Boards are specifically enjoined not to conduct their operations at a loss the reward of the licensees in the private sector is strictly limited to the so-called "reasonable return", which is anything but reasonable. What amounts to adding insult to injury in these circumstances is that, forgetting the definite advantages that they thus enjoy, the public sector projects should subject the private sector units of the industry to the odium of having to sustain a tempo of expansion without the means to draw resources from a competitive capital market. It is not conceivable why, when the public sector elec-

tric supply undertakings, on the one hand, and the other industries which benefit from the basic service provided by the private sector units of the electric supply industry, on the other, are allowed to operate at handsome profits, the private sector units of the electric supply industry alone should be indefinitely made to suffer from an inadequacy of return forced on it by the authorities, knowingly or unknowingly.

The second suggestion of the F.E.U. Chairman was that the new approach commended by the Federation for the consideration of the Central Board of Revenue "for licensees being exempt, at the time of the acquisition of their undertakings, from tax on that portion of the purchase price which could be related to unprovided deferred tax liability when individual licensees go out of business", should receive favourable consideration. And, thirdly, Mr. Zubair referred to the desirability of making a few changes in the existing electricity law with a view to making the profits of the electric supply licensees entirely independent of the tax pattern. Both of these suggestions were answered thus, briefly, if not curtly: "The Federation has already submitted to the Government detailed memoranda on these points. These and numerous other proposed amendments to the Act are being examined and whatever is found to be fair from the point of view of the licensees, as well as the consumers, will be done."

Of wider and more general interest, however, were the observations made by the Union Minister, and the words of caution uttered by the FEU Chairman, on the subject of power development in the Third Five-Year Plan. These are particularly appropriate, coming as they do on the eve of the conclusion of the Second Five-Year Plan and the commencement of the Third Five-Year Plan. As the Union Minister said, by the end of the Second Plan period, the generating capacity would rise to about 5.7 million KW (the Draft Outline of the Third Five-Year Plan had estimated this at 5.8 Million KW). In this connection, the FEU Chairman said that, "although development received sufficient priority in the Second Plan, a measure of setback had resulted in the power capacity actually commissioned during the period," and also added that "the pace of development in the economy has been such that time lag in sectors which are particularly capital-intensive (such as power projects) are inevitable." Mr. Hafiz Mohammed too admitted that the development programmes in the power sector in the Second Plan were "inhibited mainly by foreign exchange shortage, in-

adequacy of experience and trained technicians, and non-availability of plant and equipment". But, in the face of these difficulties, he claimed what has been achieved to be "quite substantial".

It is against this background and with the knowledge that most of these handicaps still continue that we must examine the proposed target in the Third Plan of 13.3 million KW (this is actually higher than the original estimate of 11.8 million KW). In absolute terms, the increase during the First Five-Year Plan amounted to 1.1 million KW, while that under the Second Plan is expected to be 2.3 or 2.4 million KW. But it is proposed to add, during the Third Five-Year Plan, about 7.6 million KW. In other words, between 1961 and 1966, it is proposed to more than treble the achievement during the Second Plan period. It is true, as the Planning Commission has opined, that, even with this addition, some parts of the country are bound to continue to suffer from paucity of power. Maybe, the country has also gained considerable experience during the two Plan periods which should go a long way towards facilitating the implementation of the power projects during the Third Plan period. Account could also be taken of the broader base on which the proposed expansion has been projected. Moreover, the country cannot but benefit from the proposed Power Research Institute in Bangalore, the Switchgear Testing Station in Bhopal and the specialised organisation for planning, designing and constructing large hydro and thermal stations, as also the increasing attention to be given to inter-connection of power grids. Even after making due allowances for all these, the authorities cannot afford to ignore the note of caution sounded by Mr. Zubair that, "in planning for accelerated power development, due regard should be given to all round co-ordination, so that, from the blue print stage to the pressing of the button commissioning plant capacity, there is awareness that even the smallest details receive as much attention as the grand concept reflected in the doubling (sic) of power capacity during the Third Five-Year Plan." Only if this is done is there reason to hope that at least the actual benefit to be derived during the Third Plan according to the draft outline, namely, 3.6 million KW from new schemes in the Third Plan, would materialise. Certainly the setting up of the proposed special high-powered division in the Central Water and Power Commission, as suggested by the Bangalore seminar, should help eliminate administrative bottlenecks and further facilitate the fulfilment of the Third Plan target.

Business Notes

Automobiles

ANCILLARY OR APPENDAGE ?

IT WOULD not be correct to think that the rather broad term "ancillary industry", which has followed in the wake of the advent of the automobile industry in this country, is just an appendage of the automobile industry and that it serves only the limited function of jobbing for automobile manufacturers or servicing old vehicles on the road. On the other hand, the scope of the ancillary industry encompasses the requirements of various other items of machinery, such as agricultural tractors, earth-moving machinery, road rollers, and stationary diesel engines, including those of automotive vehicles. While addressing the first annual general meeting of the All-India Automobile and Ancillary Industries' Association, in Bombay, last week, Mr. Manubhai Shah, Union Minister for Industry, did well, therefore, in debunking this wrong notion and underlining the vital importance of the ancillary industry

in the context of our steadily expanding commercial road transport.

The ancillary industry, the Minister said, had a dual role to play: first, to assist the main manufacturers to enable them to put more vehicles on the road by reducing their foreign exchange element for the imported components that could be supplied from the ancillary industry, and, secondly, to meet the demand for the service and maintenance of the growing fleet of vehicles on the roads. With the increase in the production of automobiles in the country (the total production in 1960, as given by Mr. Shah himself, was 52,115, as against 36,903 in 1959), the role of the ancillary industry assumes all the greater significance. It is heartening to note that the All-India Automobile and Ancillary Industries' Association, which has been in existence for only the past 14 months, is not only aware of this responsible role but is getting fully equipped to take on that role. That this has followed the more broad-based character of the Association's membership is just as well and quite encouraging too. In the year

1958, the Association had only about 45 units, accounting for a total output valued at Rs. five crores, but, since then, 45 more units have been licensed to produce additional items like starters, dynamos, electrical accessories, wheels and rims, dash board instruments, etc. The total value of production for the year 1959 and 1960 accordingly improved to Rs. 7.5 crores and Rs. 9 crores, respectively, (without taking into account the production of units producing batteries, tyres, tubes, and ball bearings). If the output in the small-scale sector is also taken into account, it is estimated that, last year, the entire ancillary industry accounted for a production worth some Rs. 13 to 14 crores. Mr. Manubhai Shah was apparently not content with this, so much so that he suggested a target of production for the ancillary industry of at least Rs. 20 crores per annum in the next two years. This should be possible, he thought, because of the increase in the allocation of the foreign exchange to the ancillary industry from Rs. 1.8 crores in 1959 to Rs. 2.8 crores in 1960. Conceding this to be a substantial improvement no doubt, the industry feels that even this higher allocation is not sufficient in the context of the steadily rising level of automobile production.

Earlier, Mr. Pranlal Patel, President of the All-India Automobile and Ancillary Industries' Association, had pleaded for a broad demarcation and bifurcation of functions as between the vehicle manufacturers and the ancillary producers. Such a demarcation, Mr. Patel felt, would do away with the uncertainties of the present situation by clearly defining the field available for specialisation by the ancillary manufacturers. He also complained that the automobile industry had so far developed on a vertical basis, in that each manufacturer was himself trying to produce all the components needed, including those which were normally expected to and could profitably be bought from the ancillary industry. Bifurcation of functions, he argued, would enable the ancillary manufacturers to enter the field with confidence and take up the manufacture of those items which, they could feel assured, were their own and legitimate responsibility to develop.

Mr. Manubhai Shah did not say whether he agreed with this view or not, but he discreetly advised the ancillary interests that it was a matter for mutual discussion and understanding as to what components the automobile manufacturers should produce and what components the ancillary industries should turn out. There is sense in this suggestion, and no one who has any experience of the differences and misunderstandings that have followed the demarcation of the respective lines of manufacture as between the handlooms and the mills will seriously put forward such a suggestion.

Scrap Export

GLOOMY OUTLOOK

THE ANNOUNCEMENT of the ferrous scrap export policy for the January-June 1961 period has not resulted in any significant improvement in the trade as was expected earlier. As a matter of fact, the trade view is that the current policy has not served to mitigate any of the long-standing grievances of the exporters with regard to the export of surplus scrap. Despite the Mysore Iron and Steel Works communicating to the Union Government its "no objection" for the unrestricted export of No. 1 bundles, which appeared to be the hurdle all along, the scrap interests point out, the new policy has not cared to remove the export ban on No. 1 bundles. While, on the one hand, the authorities have thus not done anything to mitigate the

already prevailing scrap surplus situation, on the other hand, they have, thanks to their policy of making mild steel sheets more freely available to the engineering units, contributed to augment this surplus. Their action in continuing the ban on export of No. 1 bundles is also bound to result in large-scale misuse of this surplus.

Another gloomy feature about scrap exports is the performance in respect of No. 2, 2a and 3 bundles permitted to be exported. Owing to the high incidence of the export levy, the export of these bundles also during the past few years has been distressingly disappointing. Thus, as against average annual exports in the three-year period 1957-60 of 75,000 tons, the average annual uncollected waste over the same period was of the order of 1.5 lakh tons. Since the burdensome export levy is still there, the trade does not expect any improvement in exports in 1961, although the raisings in these grades might aggregate as much as three lakh tons.

This apart, the other factors which might adversely affect the outlook for straight exports in 1961 are, according to the trade, low foreign market prices, high freight rate, severe competition from the US scrap exporters and growing dependence of the US scrap industry on exports owing to dearth of demand for scrap from domestic consumers. Notwithstanding all these adverse elements in the situation, there could still be a silver lining to the cloud, observes the trade, and that, it adds, lies in the immediate announcement of barter. Without even this gesture, it is convinced, the export trade in scrap cannot be kept going.

Watches

INDIA'S FIRST PROJECT

MR. MANUBHAI SHAH laid recently the foundation-stone of India's first watch factory at Jalahalli. It will be in the public sector and will function under the aegis of the Hindustan Machine Tools. The factory is being started in collaboration with a leading Japanese firm, Messrs. Citizens Watch Co. Ltd. This Rs. 2.5-crore project envisages the establishment of a watch manufacturing plant with a capacity of 2.4 lakh watches per annum — both 'ladies' and 'gents' — in a single shift. The selling price, though not yet estimated, is expected to be around Rs. 100 a piece. Construction of the factory building with necessary facilities will take sometime and it is expected that actual production will start by the end of 1962.

Speaking on the occasion Mr. Manubhai Shah referred to the working of the public sector industries and pointed out that he looked upon the watch project not merely as one to produce commercial items, but as a project of "high social content" which would develop the precision skill of the men of this country. One would not differ with Mr. Manubhai Shah if he wanted us to believe that the project was in line with the Government of India's policy to expand the public sector in whatever way it suited it. But there is little in the claim that it is only in the public sector that precision skill has been developed. The private sector is much ahead in this regard and that apart, the priority given to the establishment of the watch factory is yet another telling instance of the unprincipled manner in which limited resources are being looked up in non-essential items. In view of the serious shortage of resources — both in rupees as well as foreign exchange terms — there is no justification for the State sector to take up the production of a luxury consumer good. Since there will be greatest need to conserve financial resources in the years to come, this practice of wayward allocations ought to be stopped with a firm hand.

FROM THE CAPITAL'S CORRIDORS

FERTILIZERS FACTORY IN MYSORE STATE

THE Kane Committee has selected Mangalore as the site for locating a fertilizer factory in Mysore State. "Mangalore", the Committee thinks, "is not only the most suitable, but also the only location worthy of serious consideration for a fertilizer factory in this State."

This conclusion of the Committee, however, is contingent on the development of a deep water all-weather port at Mangalore, extension of the metre-gauge railway system from Hassan to Mangalore and availability of adequate power supply. The Committee recommends that the setting up of this factory should go on simultaneously with the development of the port.

The capacity proposed for this factory, on the basis of 330 production days in a year, is as follows:

(i) Total capacity of the factory in terms of final products indicated as N/Year, including requirements of ammonia for industrial purposes ..	70,000 tons.
(ii) Ammonia	85,000 tons per annum (Equivalent to 70,000 tons N) (78,540 tons for the production of fertilisers and 6,460 tons for outside consumers).
(iii) Urea (complete re-cycle process) ..	32,500 tons per annum (Equivalent to 37,950 tons N)
(iv) Ammonium Phosphate (16 N: O2P2 O5)	132,000 tons per annum (Equivalent to 21,120 tons N)

RAW MATERIALS TO BE USED

The raw materials proposed to be used at this factory are indigenous petroleum naptha (for the production of ammonia), sulphur pyrites from Ingaldahl (for production of sulphuric acid) and rock phosphate (to be imported from abroad). The Committee recommends the installation of an oil terminal at this place in the port development programme.

The overall cost of the project is estimated at Rs. 22 crores, including a foreign exchange component of nearly Rs. 10 crores. This estimate is, however, exclusive of financing and interest charges for the import of plant and equipment on deferred payment basis.

ELECTROLYTIC HYDROGEN TOO EXPENSIVE

The Committee has examined the State Government's proposal that ammonia production at a fertilizer factory to be set up in Mysore should be based on electrolytic hydrogen and has found the proposition unfeasible in the present situation of acute shortage of power in the country in general and the Mysore State in particular. The Committee feels that it would not be prudent to utilize electricity for this purpose, especially when satisfactory and cheaper alternative processes are available for the production of hydrogen. The Committee opines that if electricity is to be competitive for the production of ammonia, it must be

available at a price not exceeding Rs. 22.20 per kilowatt year. This rate is substantially lower than the estimated cost of electricity generation at Jog or at any other power project in the country. Even if a fertilizer factory can be set up near the Jog generating station — at Talaguppa as suggested by the Mysore State Government — calculations show that cost of production of ammonia would be about Rs. 557 per ton, of which electricity cost would be Rs. 130 per kilowatt year. The corresponding figure based on oil gasification process using naptha as feed stock at a port site would be Rs. 370 per ton. The production of ammonia from electrolytic hydrogen, the Committee says, would also require higher investment on plant and equipment without any compensating advantage of lower cost of production. Further, when hydrogen is produced from naptha, large quantities of carbon dioxide gas are available as a by-product which can be utilised for the manufacture of urea. On these considerations, the Committee has ruled out Gersoppa, Bidare, Talaguppa and Bhadravati as possible sites for setting up a fertilizer manufacturing unit in Mysore State.

NAPTHA SUPPLIES FROM TROMBAY REFINERIES

Since there are no deposits of coal in Mysore and a fertilizer factory based on electrolytic hydrogen would not be an economic proposition, the Committee has suggested that the Mangalore factory should be based on petroleum naptha to be supplied by West Coast refineries. This consideration makes Mangalore an obvious choice for the site of this fertilizer manufacturing unit as it would facilitate easy transport of one of the most essential raw materials from Trombay refineries. A factory at the port would also be desirable as rock phosphate supplies are also to be obtained from abroad. Transport of the end-products of this factory to the coastal destinations would also be facilitated.

Ammonium sulphate at this factory will be produced by neutralising ammonia with phosphoric acid made by reacting imported rock phosphate with sulphuric acid. Sulphuric acid will have to be made either from imported sulphur or indigenous pyrites. The Committee points out that geological investigations carried out till now have proved the existence of nearly 1.5 million tons of these pyrites with a sulphur content of 25 to 30 per cent. There are indications that the deposits are more extensive. The Committee, therefore, has suggested extension of the programme of prospecting and providing pyrites deposits in various parts of the State on a top priority basis. It has also recommended finding out of whether it would be desirable to beneficiate these pyrites. This, it opines, may be done in the next two years by bulk trials of roasting the pyrites.

FOUR ZONES

The Kane Committee has divided India into four zones for the purpose of planning fertilizers production during the Third Plan period. In the first zone are included Punjab, North Rajasthan, Uttar Pradesh, Jammu and Kashmir, Delhi and Himachal Pradesh. The second zone includes Andhra Pradesh (Telangana area), Bombay, Madhya Pradesh, Mysore (Karnataka areas of former Hyderabad and Bombay States) and South Rajasthan. Orissa, Bihar, West Bengal, Assam, Manipur and Tirpura will form the third zone. In the fourth zone are included Andhra Pradesh (excluding Telangana area), Madras, Kerala and Mysore (excluding the areas included in zone II).

The total estimated demand for nitrogenous fertilizers by 1965-66, the production capacity already plan-

ned and the capacity to be planned in each of the four zones are as follows:

ZONE I		
Estimated demand	278,800 tons per year	
Production planned	90,000	-do-
Deficit	188,800	-do-
Production to be planned:		
Ammonium Sulphate	96,000	-do-
Ammonium Sulphate Nitrate	92,800	-do-
Total	188,800	-do-

ZONE II		
Estimated demand	246,000	-do-
Production planned	Nil	
Deficit	246,000	-do-
Production to be planned:		
Urea	90,000	-do-
Ammonium Sulphate Nitrate	82,000	-do-
Complex Fertilizer	74,000	-do-
Total	246,000	-do-

ZONE III		
Estimated demand	230,100 tons per year	
Production planned	213,000	-do-
Deficit	17,100	-do-
Production to be planned:		
Ammonium Sulphate	15,000	-do-
Urea	35,000	-do-
Total	50,000	-do-

The surplus of 32,900 tons is to be adjusted against requirements of Zone IV.

ZONE IV		
Estimated demand	256,400 tons per year	
Production planned	92,000	-do-
Deficit	164,400	-do-
Production to be planned:		
Ammonium Chloride	40,000	-do-
Diammonium Phosphate	62,000	-do-
Total	102,000	-do-

With 32,900 tons surplus available from Zone III, the deficit of this zone will be reduced to 29,500 tons. To meet this deficit possibilities will be explored to manufacture ammonium sulphate by setting up fertilizer factories adjacent to steel plants.

IRON ORE EXPORTS

West Germany, Italy and Yugoslavia, it is understood, are interested in entering into long-term agreements for import of iron ore from India. Jointly or severally they might extend aid to this country for the development of Mangalore port (through which these exports will be effected) and transport facilities linking this port with iron ore deposit areas on the West Coast and for the mining of the ore itself. As already reported in this column, an economic mission from Italy is expected here shortly. This mission is likely to discuss with the Union Government the prospects of iron ore exports to Italy. A similar mission from Yugoslavia is also expected here in the near future.

The Government of India is anxious to develop new sources of iron ore with a view to step up exports. Large deposits of iron ore have been located in the Tumkur and Chitaldurg districts of Mysore State. These deposits, estimated to be around 276 million tons, are believed to contain ore equal in quality, and in some cases even superior, to the iron ore deposits of Bellary-

Hospet region. Large deposits of low-grade iron ore, suitable for blast furnaces, are also known to be available in Babubudun area. These deposits will provide sufficient traffic through the port of Mangalore if Hassan-Mangalore rail link is established. The length of this railway line will be 122.6 miles to lay which nearly Rs. 10.24 crores would be required. Another Rs. 7 to 8 crores will be needed for the improvement of the capacity of the existing lines in the region and for providing rolling stock for handling a traffic of about 2 million tons of iron ore.

COAL OUTPUT

The public sector collieries, it is learnt, will shortly achieve an annual production rate of 12 million tons. In December, they attained an annual production rate of 8 million tons. In November, they produced 616,473 tons of coal, as against 560,154 tons in October. The annual production rate reached in November was 7.3 million tons.

Though the production of coal in the public sector has shown some improvement in the past three months, it is still appreciably below the revised monthly targets fixed in September last. This is evident from the following table:

		(In tons)		
Colliery		Production Target for November, 1960.	Actual Production in November, 1960.	Actual Production in October, 1960.
(A) New Collieries				
Katnara

underground	40,000	27,408	26,169	
Kurasia				
opencast	75,000	66,045	61,548	
underground	24,000	16,050	17,731	
(C) Old Collieries (other than Bhurkunda and Kurasia)				
	262,000	239,179	224,803	
Total	1,024,000	616,473	560,154	

In December, production at the old collieries handled by National Coal Development Council is understood to have improved appreciably. In Kargali colliery, for instance, production increased from 57,183 tons in November to 60,127 tons in December. In Bokaro colliery, it went up from 85,040 tons to 100,690 tons. Non-availability of adequate number of railway wagons for transport of coal from these collieries to consuming areas is said to have been acting as a drag on production.

In the private sector, coal output has been more or less stationary during the months of October, Novem-

Over 888 Offices and Enlarged Service

Perhaps you would like to know how rapidly the State Bank of India is expanding. On 1st July 1955, when the Imperial Bank of India was re-constituted into the State Bank of India, the Bank had only 243 branches. By August 1959, it had 555 fullfledged branches in urban and semi-urban areas. The rate of growth is now about 100 branches a year. The Bank has also 238 sub-offices.

With a net-work of over 888 offices spread all over the country and many more to follow, the State Bank is particularly suited to handle your remittance and collection business.

Thousands of account holders have benefited by the wide range of services offered by the Bank. You too can take advantage of the Bank's services.

Why not contact the nearest Agent of the Bank to talk things over?

ber and December. In October, production amounted to 3.50 million tons. In November, it increased slightly to 3.74 million tons. In December, there was again a set-back and production declined to about 3.54 million tons. Compared to the corresponding months of previous year, output in November was higher by about 5.4 lakh tons, while in December it was lower by one lakh tons. Coking coal production figures for November and December are not yet available. In October, the private sector collieries produced 1.08 million tons of coking coal.

TECHNICAL EDUCATION

An inquiry conducted by the Union Ministry of Scientific Research into provision of facilities for education and research reveals that great progress can be achieved in this field by integration of the study of fundamental and applied sciences with engineering studies in technical institutions. Separate institutions for individual fields of studies are not only wasteful, but they also restrict their development. The move now is, therefore, to have composite institutions as far as possible, or to diversify and develop the activities of the existing institutions.

The Central Government in the recent past has taken steps to establish four higher technological institutes, one in each region of the country—East, West, North and South. The Indian Institute of Technology at Kharagpur, established in 1951, is the first of the series. The other three institutes are being set up at Bombay, Madras and Kanpur. The Bombay Institute started functioning in 1958 and the Madras Institute in 1959, when admissions were made in first degree courses. The Kanpur Institute started work this year. All these institutes are planned on the same comprehensive scale as the Kharagpur Institute and, when completed, will provide technical education on an appreciable scale. Each institute will provide facilities for the training of about 1,500 students in the under-graduate courses and 500 students in the post-graduate courses and research.

FOREIGN ASSISTANCE

The Bombay Institute is being assisted by the Soviet Union and the Madras Institute by West Germany. The assistance given by these countries consists of scientific and technical equipment, services of expert personnel for a period of 5 years and facilities for the training of Indian teachers at Universities and institutions in the Soviet Union and West Germany. The Kanpur Institute is expected to receive assistance from the United States.

The targets of imparting technical education have had to be revised thrice in the course of the Second Plan period. The original targets were creation of annual admission capacity by 1961 to the tune of 7,390 students for degree courses and 13,080 students for diploma courses. The finally revised targets are 13,500 students for degree courses and 27,000 for diploma courses. In 1960, the admission capacity available at various technical institutes reached 13,500 students for degree courses and 25,290 students for diploma courses.

ROLE OF PRIVATE AGENCIES

An important feature of technical education in India is the role played by private enterprise. Of the 275 institutions in the country at present for first degree and diploma courses, 158 have been established by the Central and the State Governments, 29 by universities and 88 by private agencies. Thus, technical institutions established by private agencies account for nearly 35 per cent of the total number. Private agencies established 9 engineering colleges and 25 polytechnics during the Second Plan period, as against 9 colleges and 45 polytechnics established by State Governments and universities.

AID FROM CANADA

Of the 25 million dollars aid available from Canada under the Colombo Plan during the current financial

year, 11.7 million dollars are meant for import of non-ferrous metals, 7 million dollars for the import of wheat, 3.5 million dollars for the Kundah Power Project and 600,000 dollars for the India-Canada Atomic Reactor. Negotiations are in progress for utilization of the remaining portion of the aid.

INTERIM RELIEF FOR JUTE WORKERS

The Government of India has accepted the unanimous recommendation of the Central Wage Board for Jute Industry regarding the grant of interim relief for workers. It has asked the jute mills to implement the recommendation as soon as possible.

The Board has recommended that (1) every worker—whether permanent, temporary or badli—shall be paid interim relief at the rate of Rs. 2.85 per month from 1.10.60 to 31.12.60, and at the rate of Rs. 3.42 from 1.1.1961; (2) the arrears of interim relief from 1.10.60 to 31.12.60 will be paid to the respective workers on or before 15.2.1961; (3) the amount of interim relief from 1.1.1961 onwards will be paid each month in one lump sum on the first pay day of the next month; (4) in case of workers who did not or do not work for the entire month, or for calculating wages due for any broken part of a month e.g., by going on leave or sick leave etc., the amount of interim relief payable to them will be worked out on the same principles as govern dearness allowance; (5) the amount of interim relief shall be paid as a separate item till the final award of the Wage Board and would be adjusted according to that award; (6) these recommendations apply to all jute mills in all parts of India, except that the Katihar Jute Mill will pay interim relief at the rate of Rs. 3.42 with effect from 1.9.1961.

JUTE INDUSTRY CAUSES ANXIETY

The future of jute industry is causing a great deal of anxiety here. The issue is a simple one. It is whether the industry should take advantage of the existing shortage of raw jute and push up prices of jute manufactures or to adjust the prices in a manner which would win the goodwill of the foreign buyer. As matters stand, the foreigner is at India's mercy and can be made to pay through his nose. It may, however, be added that India is not the only supplier of jute manufactures. Pakistan is India's next door competitor. It is true that there is shortage of raw jute even in Pakistan. But any wrong step by India may be to Pakistan's advantage. Then again, the monopoly in jute manufactures is losing its ground. The consumer countries have already developed substitutes and India's "make the foreign pay" drive may accentuate this process. Lastly, any undue increase in the price of jute manufactures will affect Indian trade and industry. In other words, over a long-term period, India should have a stable price policy for the marketing of jute. This aspect of the problem was emphasised by the U.S. buyers, when the trade delegation of Indian Jute Mills Association visited that country.

Raw jute trade, as it is well-known, has peculiarities of its own. Raw jute prices, unlike those of cotton, have neither a floor nor a ceiling. To make matters worse, some jute mills, according to New Delhi sources, have entered the speculation market.

The Jute Mills Association has a voluntary quota system. This system works as long as the members of the Association honour their self-imposed commitments. The Jute Mills Association has also sealed seventeen per cent of the looms to conserve the supply of raw jute and thereby maintain employment at a steady level. Side by side, the Forward Markets Commission has banned forward dealings in jute. These steps have had steadying effect on prices. The Government is carefully watching the situation and may take such action as is considered necessary in the interests of jute industry.

BOOK REVIEWS

THE POPULATION EXPLOSION

Three Essays on Population: By Thomas Malthus, Julian Huxley and Frederick Osborn: Published by New American Library of World Literature Inc., 501. Madison Avenue, New York 22, N.Y.: Available in India from India Book House, Bombay: Pp. 144: Price 50 cents.

MORE than a century ago Malthus drew the attention of the world to the fast rate of rise in population as compared to the slow rate of growth of food, and made the gloomy forecast that soon vast numbers in the world would be subjected to miserably low standards of living. He popularised the famous concept of "geometric progression" in population versus "arithmetic progression" in food production. Julian Huxley and Frederick Osborn both agree with Malthus in the sense that the excessive rate of rise in population continues to undermine the 20th century standards of living but there is no cause for pessimism. They have offered constructive suggestions for checking the fast increasing numbers, family planning has to be encouraged if the demon of "over-population" in the world is to be kept under control. A strong plea has been put in by Julian Huxley for intensifying the search for "what the laymen (much to the annoyance and distress of the experts) persist in calling "the pill" — cheap and harmless substance taken by mouth which would temporarily prevent conception, either by preventing evolution or by rendering the egg unfertilizable."

All the three essays make very provocative reading and focus attention on one of the burning problems of the day. They will be read with interest in the Indian Union because here also the latest estimates of rise in population have shown a steep up-turn, though they are still to be confirmed by the census which is scheduled to be started throughout the Indian Union on February 10, 1961.

MEN WITHOUT WORK

Unemployment, Full Employment and India: By Mr. Nabagopal Das: Published by Asia Publishing House, Bombay: Pp. 94: Price Rs. 8.

IN the brief compass of 94 pages, Dr. N. Das has presented a penetrating analysis of the unemployment problem in India. This is not his first attempt at this ticklish subject. In fact, he wrote a pamphlet for "The Eastern Economist" about eight years ago under the title "Men Without Work." In the present publication, he has carried the story of India's employment and unemployment a little further and has come out with a constructive programme for the future which needs to be actively considered by the Government of India.

The burden of Dr. Das's argument is that, according to the estimates made by the Planning Commission, the backlog of the unemployed at the end of the Second Plan is likely to be higher than the backlog of the unemployed at the beginning of the Second Plan. Similarly, according to the present indications, the backlog of the unemployed at the end of the Third Plan is likely to be higher than that at the beginning of the Third Plan despite the fact that the number of jobs created in the Plans continue to rise.

He has suggested that unemployment in the country should not be viewed as a "residual" problem but should be tackled as a "primary" problem. According to Dr. Das, "All the economic and social policies of Government, whether they are price policy, wage policy, trade policy or taxation policy, should have one main guiding principle, viz., whether they would create

the conditions necessary for an increase in employment". He has cited the example of Japan where this policy has already borne fruitful results. He is of the opinion that much of the money which is currently being wasted on table-talks and seminars could be profitably utilised on intensive work in the villages and research laboratories.

Dr. Das's provocative booklet has, however, ignored one vital aspect of the problem which relates to the pattern of unemployment at the regional or State level. All-India estimates of unemployment tend to cancel out pressures of employment and unemployment at the State level. This needs to be explained. If in zone 'A' the supply for a particular type of labour is short while in zone 'B' there is excess of labour skilled in another trade or industry, over-all estimates of the Indian Union tend to cancel out the harmful impact of these uneven pressures. This is a problem which has been brought into sharp focus in recent papers of the Planning Commission and it will be worthwhile for Dr. Das to introduce a separate chapter on this particular aspect in the next edition of this booklet.

LABOUR IN AFRICA

Labour Survey of North Africa: International Labour Office, Geneva, 1960: Price \$4.

EVER since the publication of "The Economic Survey of Africa" in 1950, there has been a general desire to know more of economic and social conditions in the African countries, particularly North Africa. Happily, Labour Survey of North Africa, issued by the International Labour Office fulfils that need to a great extent. It not only makes a comprehensive survey of labour conditions in that region, but also gives a clear idea of the social and economic conditions in that part of the world. The region covered by the survey includes all the countries and territories which border the Southern coast of the Mediterranean: Morocco, Algeria, Tunisia, Libya and the Southern Province of the U.A.R. Like many other surveys, its first chapter deals with the essential physical features of the region and the basic economic pattern, but in the second chapter a general account has been given of the natural conditions in which agriculture, the main stay of life in the area, is carried on, together with its organisational features, the problems of land tenure, of population pressure, and of living and working conditions of the various categories of agricultural workers. Chapters three to twelve cover successfully the following subjects: manpower and employment, technical and vocational training; freedom of association and industrial relations; wages and wage trends; conditions of work, social security; co-operation; handicrafts; labour administration and inspection; and the application of international labour standards.

The analysis of the extent of the application of the international labour standards in each of the countries given in the survey is quite interesting. For instance, it is to be noted that Libya has not so far ratified any International Labour Convention at all, which goes to show the social backwardness of this country.

The chief merit of this survey is that it provides a most up-to-date picture and a balanced view of labour conditions in the countries of North Africa. There are also provided three appendices which contain a reference list of the principal labour legislation, a list of additional tables and a short bibliography, all of which are highly useful. For students of international labour problems, the study of this survey is a "must".

LINKED IN LEADERSHIP

Two major firms stretch halfway across the world to collaborate in a gigantic venture, to give a boost to India's tyre and tube industry.

The Madras Rubber Factory—India's largest manufacturer of tread rubber compound—and the Mansfield Tyre and Rubber Company, Ohio—one of the oldest, and sixth largest manufacturer of tyres, in terms of units produced, in the United States—join hands to manufacture Mansfield truck and car tyres and tubes at Madras.

When in full production, the new factory will be producing over 3,00,000 tyres and tubes per annum.

A part of this production will be exported overseas.

COMPANY AFFAIRS

THE CHAMPADY JUTE

The Directors of the company have reported that during the year to March 31, 1960, the trading conditions remained generally satisfactory. Owing to uncertainties about the availability in adequate quantities of raw jute during the current year, and having regard to the ever increasing competition from Pakistan mills, the outlook seemed obscure. The Directors had placed orders for machinery required to manufacture wide carpet backing and although there were certain difficulties in obtaining the necessary Import Licences the Directors hope that the plant will be in operation in about a year.

The profit for the year under review came to Rs. 8.18 lakhs which is lower than the previous year's Rs. 10.52 lakhs. This was essentially due to the fact that the sale proceeds during the year were lower at Rs. 2.65 crores against Rs. 3.05 crores last year. The Directors declared an interim dividend at the rate of Rs. 4 per share subject to taxation absorbing Rs. 2.37 lakhs. Now the Directors have recommended the payment of a final dividend at the rate of Rs. 6 per share subject to tax absorbing Rs. 3.55 lakhs.

THE CANARA BANKING

For the year 1960 the Canara Industrial and Banking Syndicate Ltd. has recorded a net profit of Rs. 25.54 lakhs inclusive of a sum of Rs. 29,000 brought forward from in previous year's account, as against Rs. 20.14 lakhs in 1959. Out of this, the Directors propose to transfer Rs. 7.50 lakhs to the Reserve Fund, bringing the total reserves inclusive of Share Premium of Rs. 1 lakh to Rs. 42.50 lakh. The balance of Rs. 18.04 lakhs is proposed to be appropriated as under:

Provision for dividend Rs. 6.36 lakhs
(Dividend maintained at the last year's level of 14 per cent tax-free net)

Provision for taxation Rs. 9.64 lakhs

Bonus to staff Rs. 1.75 lakhs

The total deposits of the Bank have increased to Rs. 18.80 crores during the year, as against Rs. 17.08 crores last year showing an increase of Rs. 1.72 crores.

THE INDIAN OVERSEAS BANK LIMITED

The net profit of the Indian Overseas Bank Ltd., subject to audit, for the year ended 31st December 1960, after providing for contingencies and expenses amounts to Rs. 45.92 lakhs including the sum of Rs. 1.26 lakhs brought forward from the previous year's account as against Rs. 35.64 lakhs for the year 1959.

Allocations for various items during 1960 as compared with the previous year are given below:

	1959	1960
Provision for taxation	Rs. 12.50 lakhs	Rs. 18.50 lakhs
Transfer to Reserves	Rs. 7.50 lakhs	Rs. 9.50 lakhs

Provision for bonus to staff Rs. 5.00 lakhs .. Rs. 5.50 lakhs

The Directors propose to recommend to the share-holders at the next General Meeting payment of dividend of 14% subject to tax some as last year .. Rs. 9.38 lakhs .. Rs. 10.50 lakhs

Carry forward Rs. 1.26 lakhs .. Rs. 1.92 lakhs
Rs. 35.64 lakhs .. Rs. 45.92 lakhs

THE INDIAN OVERSEAS BANK LTD.

has introduced

A RECURRING DEPOSIT SCHEME

to suit the requirements of all classes of people.

Deposits are accepted in multiples of Rs. 5/- with a minimum of Rs. 5/- & a maximum of Rs. 500/-.

COMMODITY NEWS AND NOTES

PRODUCTION OF COPPER ORE IN INDIA

The production of copper ore during January-November 1960 was 407,854 tonnes, according to the Indian Bureau of Mines. This represents an increase of about 9 per cent as compared to the output of 373,078 tonnes in the corresponding period of the preceding year. The entire production was reported from Singhbhum district of Bihar State. The production of copper metal during January-November 1960 was 8,161 tonnes as compared to 7,303 tonnes in the corresponding period of 1959.

SUGAR PRODUCTION AND STOCKS

According to the Indian Sugar Mills' Association the sugar production during the month of December, 1960 was 4,78,000 tons as against 4,27,000 tons produced during the corresponding period last season. This brings the total production for the season 1960-61 up to 31-12-60 to 7,66,000 tons as against 6,42,000 tons produced last season by this date. The off-take of sugar from factories during the month of December, 1960, was 1,63,000 tons as against 1,71,000 tons during the corresponding period last season. The total despatches upto 31st December, 1960 was 3,14,000 tons as against 3,02,000 tons by the same date last season. The total closing stocks of sugar with factories on the 31st December, 1960, was 9,94,000 tons as against 4,82,000 tons on the same date last season.

EXPORT OF H.P.S. GROUNDNUTS

The Government of India have decided to release a further quota of 20,000 tons of H.P.S. groundnut for export in 1961. It has also been decided to release a quota of 20,000 tons of groundnut cake (expeller variety) for export in the half year, January-June, 1961. Export would be allowed by all shippers (including established shippers) on production of firm sale contracts in the form of cable offer and cable acceptance on first-come first-served basis. In order to ensure execution of contracts, the shippers would be required to furnish Bank guarantee equal to 10 per cent of the f.o.b. value in the case of H.P.S. groundnut and 5 per cent of the f.o.b. value in the case of groundnut expeller cake. An individual ceiling of 500 tons has also been fixed in the case of groundnut expeller cake exports. A quota of 20,000 tons of H.P.S. groundnut kernels had been released last month for export.

PRICES OF RAW WOOL

Despite unfavourable rates offered by most foreign buyers the prices of raw wool in the Indian markets remained steady last year. This was due to a sustained buying interest shown by the indigenous industry and a marked increase in Russian purchases. Position of Indian wool in the foreign market, however, has not been good. A steady rise in carpet exports through Government efforts in the past few years has led to a greater use of indigenous wools by the industry. Although figures of sales within the country are not available, the rising standard of living indicates that people are spending more on home furnishing — including carpets — than ever before. The handloom industry is also using more wool now. The introduction of a subsidy to the weavers and a rebate to buyers has helped to increase sales of hand-made woollens. The capacity of the wool-growers to hold their stocks

is another factor which has helped to maintain the price level. They have been selling most of their stocks in outlying markets to the cottage weavers. As a result exports up to September were 20 per cent less than a year earlier. Indian wools in the Liverpool market have not fared very well. Although the year opened with a brisk demand, the imposition of hire purchase restrictions followed by the increase of the Bank Rate to 6 per cent disturbed the optimistic tone of the market. Buying most part of the year was therefore confined to maintaining stocks at minimum levels.

A noticeable feature was the high price of Indian wools throughout the year as compared with wool from Pakistan. As a result the U.K. mills concentrated only on the best quality Indian wool and bought the bulk of their needs from Pakistan. Indian wools also have had to meet considerable competition from other sources, including China, Spain, Portugal, Syria, Morocco and North Africa generally, all of whose wools were relatively more attractively priced and often of excellent shade and quality. The New Year has now opened with a note of greater optimism and although the new business from foreign markets is generally quiet for the moment this is not unusual because at this time yellow wool season is on the turn to close whilst white wool arrivals are awaited. With wool prices on previous year's level and with the rate of carpet wool consumption increasing in several countries there is a general feeling of confidence that better conditions are on the way and the wool industry is poised for a forward move during 1961.

TRADE PROMOTION

... is our business

Australia, New Zealand, and Fiji offer opportunities to exporters and importers and the International Division of the Bank of New South Wales can help those interested.

The Bank's complete banking service includes such specialized facilities as trade and industrial enquiries, economic and trade information, and a complete travel service. The Bank, through more than 1,000 branches and agencies, is closely and constantly in touch with industry, business, and agriculture in the areas it serves.

Enquiries may be made through your own bankers or direct to

The Eastern Economist

FEBRUARY 10, 1961.

The State of the National Exchequer

THE month of February in every year contains two 'D-Days', on which the Railway and Central Budgets are introduced. In the current year their significance has been much enhanced by the fact that the budgets are for the first year of the Third Plan, which have so raised the sights of the nation in terms of the financial expenditure—some times erroneously described as investment—that it is inevitable that excursions and alarms, before the dates of illumination, should run high. It is natural that some substantial arithmetic should be done on three factors which will help to cushion the blows that are certain to fall. The first of these has been the relatively happy yield of taxes on the major items of revenue, particularly Union excise duties, corporation taxes and income taxes for the year 1960-61 as compared to the previous year. Preliminary figures suggest that for the period from April to October 1961 revenue is running at a rate of Rs. 50 crores more than the previous year as against about half that sum expected. In other words, there might apparently appear to be a windfall of Rs. 25 crores in a half year and possibly between Rs. 30 to Rs. 40 crores in a full year on tax account.

As far as can be determined, the loan position is, by no means, as happy. While substantial loan floatations apparently according to plan have taken place, it is clear from the Reserve Bank of India's statements that a good deal of new loans have been taken up by the Reserve Bank which has, in the year, increased its investments from Rs. 1377 crores to Rs. 1562 crores—a matter of Rs. 185 crores. A good deal of this has been reflected in inflationary finance with the corresponding issue of notes in circulation which have risen by about Rs. 150 crores during the year. If, therefore, tax receipts suggest an abundance of new money in Government hands, the heavy loan liabilities of the Government of India to the Reserve Bank suggest a difficult 'ways and means' position. When one looks at the deposits of the Central Bank which are virtually stationary at Rs. 50 crores, one recognises that the ways and means position of the Government of India as a whole has by no means been solved by tax windfalls. In other words, expenditure has mounted up to absorb all the additional taxation receipts.

It is clear that there is nothing in this situation to warrant the belief which seems to have been

widely created that the Third Five-Year Plan can somehow or other be financed by good fortune overflowing from the last year of the Second. Undoubtedly, it is true that the pace of Indian industrial production is now much faster and with the rise in the national income in the year 1960-61, by possibly an average of 9 per cent over 1959-60, the country is in a better position to bear substantial excises. But this is quite a different thing from saying that, at this critical stage of development, taxation can somehow be bypassed with the investment and expenditure figure left unaffected. Indeed, with banking deposits declining in the month of January from Rs. 1,760 crores on December 30 to Rs. 1,738 crores on January 27, one might wonder whether a larger defensive operation is not necessary on another front. Institutional investment, far from gathering force, for reasons which are not entirely clear, is losing its buoyancy. Stringency in the banking system is intense as indicated by the fact that the ratio of advances and bills discounted to deposits is now nearly 67 per cent and will undoubtedly pass the 70 per cent mark before this busy season is over. The capacity of the Government of India, therefore, to force loans out of hard-pressed banking system will be much more limited in 1961-62 than in 1960-61.

Again, in spite of the fact that it is constantly claimed that we have reached a peak of agricultural production in the current year with food-grains production at 77 million tons, no wide deflationary factor is visible on the price front; apart from the marginal drop the upward trend is not merely to be sustained but would become dangerously sensitive to deficit financing. In other words, the volume of deficit financing, which the Finance Minister can maintain, cannot be as large as last year and should be significantly below—perhaps not more than Rs. 100 crores, or a little less than one-fifth of Rs. 550 crores included in the Third Five-Year Plan period as a whole. Thus the Finance Minister is on the horns of a dilemma both because the subscription for loans will not be supported to the same extent by institutional sources and, secondly, because deficit financing has to be considerably less than last year. Any relief given by increased yields in taxes will not offset

the fact that on both accounts he may have to make good a figure of about Rs. 150 crores on loans and deficit financing.

In the face of these factors there must be a massive taxation effort in the current year. Taxation must be conceived in a manner in which the revenue can be increased as far as possible without disorganising production. But it is doubtful if any scheme of taxation which the Railway Minister and the Finance Minister can jointly conceive can fail to have serious repercussions on industry. In the Leading Article which follows, it is suggested that the magnitude of increases in freights and fares over the Plan period should be about Rs. 275 crores. In spite of this effort, the Finance Minister will need attempt to reach in the current year a tax effort of Rs. 100 crores. If one allows for the inevitable paralysis of a year before the elections, one nevertheless arrives at a figure between Rs. 50 and Rs. 75 crores.

How much of this taxation will be direct and how much indirect? The view that the whole of this can be indirect is wishful. It is not likely that the rate of corporate taxation at 45 per cent, even though this was higher than the rate prevailing which it was deemed to replace on a neutral basis, will remain unaffected. If the rate of corporate taxation should be raised by 5 per centage points, the increased yield would be of the order of about Rs. 10 crores in a full year. The question is to be asked, however, whether this is absolutely necessary. The answer to this question depends very largely on the character of indirect taxation.

Railway Freights and Fares

WITH hardly a week left for the Railway Budget for the first year of the Third Five-Year Plan to be presented to the Lok Sabha, Press speculation has tended to be concentrated on the budget proposals in relation to freight rates and passenger fares. The trends in railway traffic during the first eight months of the current financial year show an increase of Rs. 21 crores above the same period in the preceding year. Considering the fact that at least 6 out of these 8 months were covered by the slack season, this increase is reassuring. During the rest of the financial year, which coincides with the busy season, gross earnings will have made a spectacular stride, surpassing the Budget Estimates of gross earnings of the order of Rs. 466 crores.

From this upward trend there has been a temptation to argue that increases in freights and fares, if levied, should be marginal. This view is totally erroneous and it appears to have been entertained in disregard of the hard straits in which railway finances are going to be caught up during the Third Plan. A bold and realistic policy of imparting minimum flexibility to railway finances is essential. The traditional resistance to increases in freight rates and fares has now become obsolete in our rapidly developing economy.

Elsewhere in the Statistical Section in this issue is reproduced in full a table, setting out the Railway Board's forecast of the financial working of the railways during the Third Five-Year Plan. It is the startling disclosures made in this forecast and not some marginal increases that are likely to be revealed in the Revised Estimates for the current year that ought to determine whether

Can we raise between Rs. 50 and Rs. 60 crores additional?

If one assumed that the growth factor in excises is the same as in the year between 1959-60 and 1960-61, Union excises might rise by Rs. 20 crores on their own account that is, without a change in rates. This would, however, still leave us with a need of 30 to 40 crores of rupees of indirect taxation. It would be impossible to impose a figure as large as Rs. 40 crores without impinging on items of necessity such as cloth, rayon, and perhaps paper and there is a good case (notwithstanding the political implications involved) of imposing a duty on salt and kerosene. All in all, one might argue that the issue is not whether or not Rs. 50 to 60 crores can be raised by indirect taxes; they certainly can be, but whether the Government of India will have the courage, in order to save the production system from disorganisation, of placing a good deal of burden on the consumer directly such as in the case of salt and kerosene. Salt and kerosene between them could produce Rs. 30 crores. But the chances are that this will not be done under current auspices. If so, it would seem tobacco, matches cannot, in spite of numerous levies in the past, be entirely excluded.

The general outlook on the situation presented by these comments cannot be anything but bearish. But it is well for this country to recognise that the economic development which it has spaciouly planned cannot be achieved with wishful thinking, and calls for real and immediate sacrifices.

railways should raise freight rates and fares. In terms of the new Railway Convention, to be operative during the Third Plan period, the net dividend to be received by the Central Exchequer from the railways will be reduced substantially from 0.83 per cent per annum on the capital-charge as at present to 0.67 per cent. Even so, the net surplus which the railways will have earned during the entire period of the Third Plan will be of the nominal order of Rs. 11.44 crores. This surplus will be all that the railway revenues will be able to earmark for allocation to the Development Fund, leaving the Revenue Reserve Fund high and dry as during the current plan period. This is not the only index of the gravity of the situation which railway finances will have to confront. Allocations to the Depreciation Reserve Fund (which has been reduced to the rock bottom of Rs. 17.75 crores now) will be at an annual average rate of Rs. 70 crores. This is on the assumption that the cost of replacements, as now estimated, will be Rs. 350 crores. In case prices of replaced assets go up, which is highly probable, the Depreciation Fund may prove unequal to the task of meeting the costs of replacements.

Yet another index of acute financial stringency is to be found in the critical condition of the Development Fund. This fund now owes a liability of the order of Rs. 33.46 crores by way of loans taken from the General Revenues. This liability is to be transferred partly by charge to capital and partly by debit to the Revenue Reserve Fund to enable the Development Fund to make a clean start. In spite of this device, it has a grim prospect to face in the Third Plan. Accretions to the fund during the Plan period cannot exceed Rs. 15

crores on a liberal estimate. In order to provide internal resources on a fractional scale for the Railway Development Plan, it will be required to raise loans of the order of something like Rs. 100 crores from Central Exchequer. The last four dollar loans of the railways raised from the World Bank will also fall due for repayment in semi-annual instalments in the Third Plan period. But it has not been feasible to build an amortization fund.

The official forecast of the trends of railway finances in the Third Plan is apparently based on conservative estimates to err on the safe side. The actual trends may show excesses practically under all the heads. In the result, the net surplus may increase marginally. But the overall position is unlikely to be changed appreciably inasmuch as control over expenses has always proved ineffective.

It is obvious that the status quo in rates and fares cannot be maintained. It is now a matter of common knowledge that several categories of goods which are transported by railways in bulk over long hauls do not bear rates sufficient to cover the actual cost of transport. They are pitched low for various social and economic considerations. Similarly, many other classes of goods are charged low rates relatively to those on foreign

railways. Now, when development finance is required on an unprecedented scale, the general outlook on railway freight rates and passenger fares ought to be reorientated. Refusal to face this plain obligation will only result in increasing the community's tax burden. There is no justification why the burden should be shifted from the transport user to the general tax-payer. Public sector undertakings, although some of them may partake of the partial character of public utilities, cannot escape their liability to find modest internal resources for expansion in an under-developed economy.

On a conservative estimate freights and fares ought to be increased during the Third Plan period so as to give railway finances a net surplus of about Rs. 275 crores. This would mean an aggregate increase of 10 per cent over the Railway Board's estimate of total gross earnings. But increases for individual freight rates in particular will need judicious assessment. The increase cannot be at a flat rate. This is undoubtedly an inflationary factor, but so is indirect taxation. If, as is argued, in the previous article, large doses of indirect taxation are inescapable, there is no reason why alarm should be taken at a rise in consumer costs and, therefore, producer prices. This is part of the price the country needs to pay for the spaciousness of the Third Plan.

Guest Editorial

Minding Other People's Business

By Andrew Boyd

GENERALLY speaking, "intervention" is a rude word in world politics. In part, this is just a reflection of a basic human attitude. Familiar maxims about minding one's own business, and pejorative words in common usage, such as busy-body and bully, reveal the normal—and healthy—antipathy to meddling in any form. In relations between sovereign States, moreover, there is also the legacy of dark suspicion left behind by many centuries during which strong nations have built up empires by skilfully taking a hand in the affairs of weaker ones.

Unfortunately, "hands off" is not by itself an adequate formula for international relations. If the scrupulous are content simply to apply this formula, they leave the way open for the unscrupulous to get their fingers well and truly into the pie. The British, for example, still remember the bitter failure of the attempt to apply "non-intervention" during the Spanish civil war; the effect was to give a free hand to Hitler, Mussolini and Stalin, and thus the democratic elements in Spain were the only ones that did not receive substantial aid from abroad.

If, on the other hand, every foreign intervention is met by an equal and opposite counter-intervention, what began as a small-scale local conflict may spread and become a very perilous threat to world peace. Laos has lately provided a warning example. Russia and China on one side, America on the other, have supplied and supported the warring contestants, each in turn accusing the other of assisting rebels against lawful authority, and defending its own actions with the argument that they were a necessary counter to intervention

from the other side. This is what the theorists of war and peace call the danger of "escalation"—a situation in which the great powers can become progressively more and more directly involved in a conflict that was originally local and limited.

International intervention is clearly not only better than individual foreign intervention—because it is disinterested—but also, in many cases, the best means of preventing or ending individual intervention. The right kind of meddling can, in fact, avert the wrong kind. That has been the theory behind the proposals for Laos. It was also theory behind the formation of a United Nations force in response to the Congo's appeal for aid last July. But the painful experience in the Congo since then has shown how difficult it can be to translate an apparently simple theory into successful practice. And failure in the Congo could mean that the kind of intervention attempted there by the United Nations will never be attempted again.

Accurate understanding of the Congo problem from the viewpoint of the world community is, therefore, essential, if the lessons are to be rightly learnt. While it may be too late to undo what has gone wrong in the Congo, it is not too late to avoid the ultimate failure—failure to learn from this first bold experiment, and to resolve to do better next time.

The Congo has presented the international community with a much more complex problem than Laos, an infinitely more complex one than did the Suez-Sinai conflict of 1956. The task for

the United Nations has not been the relatively simple one of manning an international frontier so as to interpose a shock-absorber between hostile armies or to prevent the introduction of foreign troops or military supplies. The mutiny of the infant republic's troops in July caused an immediate breakdown in administration. Secessionist movements developed in Katanga and elsewhere. In September the central government lost even the semblance of constitutional authority; a few days later the army seized power in the capital; by January there was a visible division of such effective authority as could be identified between no less than four self-proclaimed governments. But not one of these developments in itself provided a basis for United Nations intervention.

The basis for UN intervention in the Congo was provided by Belgium's action in sending troops there after the mutiny to rescue and protect Belgian citizens who had been attacked or threatened by the mutineers. The attacks and the threats were real enough, and the panic flight of Belgians that followed them intensified the Congo's difficulties. President Kasavubu and Prime Minister Lumumba appealed to the United Nations for aid the primary object of which was to get the Belgian troops out again. This aim was quickly achieved. As the UN force came in, the Belgian troops left.

But the United Nations had also been asked, and had undertaken, to provide temporary apparatus of internal security until the Congo's own forces could take over the duty again. This was an unprecedented task for the international organisation. The impressive unanimity among the member nations in favour of taking it on rested on the general belief that domestic chaos in the Congo would lead to further foreign intervention and involvement. Mr. Hammarskjöld's contention that the UN operation in the Congo ought to be mainly carried out by the African nations was also generally accepted.

If all member nations had loyally sustained this UN enterprise, it might have successfully survived even the subsequent more serious breakdown of constitutional government in the Congo. But the familiar temptations of separate intervention asserted themselves. Instead of co-operating with the United Nations in its efforts to restore peace and economic life in the Congo, the contending factions there, led by Mr. Lumumba, President Kasavubu, Colonel Mobutu, Mr. Tshombe and Mr. Kalonji, harassed its representatives with both physical and political attacks. Their respective champions in other countries followed suit. Mr. Khrushchev launched his campaign of abuse against the Secretary-General and his officials, blandly ignoring the fact that they were similarly being criticised by the very people, in Belgium and other western countries, whose "lackeys" he dubbed them. Mr. Eisenhower's Administration, after showing praiseworthy initial restraint, was eventually drawn into the partisan game, espousing Mr. Kasavubu's cause against Mr. Lumumba's. The rot spread to nations actually contributing to the UN force, with the well-known result: the decisions to withdraw their contingents taken by half a dozen of the contributing governments. Their presumably sincere belief that the UN intervention is doing more harm than good must be weighed against the argument, implicit in a co-operative enterprise of this kind, that individual states ought to accept the general will as prevailing over their private opinions.

But the point that surely needs emphasising is that, in the Congo, the whole great concept of co-operative international intervention as a means of protecting a "vacuum" area against the perils of individual interventions has been put to its first harsh test. If this experiment is to founder, not only will the Congo be left wide open to those perils, but there is unlikely to be much chance of using the world community's organisation to avert similar perils elsewhere. Or will the sombre lesson of the Congo in the end be learnt? One can only hope that it will.

A DELHI DIARY

ABSENCE BY DESIGN

BY a concatenation of circumstances—otherwise called historical chance—I was omitted from last week's issue, and I have been greatly flattered by two kind friends who have assured me that I was missed. In point of fact, a Delhi Diary which should have dealt with the Republic Day, Beating the Retreat, the Queen and, of course, the people—how can great events be presented without a massive popular stage these days?—was one which I might have anticipated would have been sought after. The fact of the matter was that I was in Calcutta on a "study tour." Convinced as I am now that Dr. B. C. Roy's great Calcutta expansion scheme is one of the most important projects ever to be conceived in the Indian Union, I had at least to visit its holy ground. I should say it is spacious and imaginative and, therefore, should attract a journalist on its own account. But it also has a powerful strategic component with political and economic consequences far in excess of any thing which inhabitants of Delhi, at whatever level of influence, have yet realised. Having visited Calcutta and looked over the area on which the scheme is to operate, I wonder how it encountered so many obstacles before it was agreed to in principle in the National Development Council meeting in January. It has now been accepted in principle, but I have no doubt that it is very far from being accepted as a top priority for India's Third Five-Year Plan. Rumour tells me that "The Eastern Economist" has now suddenly convinced itself that its destiny is linked up with the propagation of the Greater Calcutta Project and, not very far from now in time, a whole Blue Supplement is to be committed to its explanation. If so, I can well reserve my comment on the project for another issue and concentrate upon its main architect.

BHARAT RATNA B.C. ROY

A nice debate has been going on in Calcutta as to how Dr. B. C. Roy should be addressed after he received in the Republic Day honours the title of Bharat Ratna. Some people think he should be addressed as Bharat Ratna B. C. Roy; others say that he should be called B. C. Roy Bharat Ratna and some others opine that he should be just Dr. B. C. Roy with Bharat Ratna nowhere in the picture. I cannot see that Indian decorations of any order have been used in forms of address. Neither the Prime Minister nor Pandit Pant uses his Bharat Ratna, and I cannot see why this nice debate should have arisen only in Calcutta. Perhaps as in the French Assembly, it was important that there should be an issue for discussion, not, of course, that every discussion should be necessary. In any case, doubts have been set at rest by Dr. Roy himself who has indicated that he does not propose to use the title or advertise it in any way. Indeed, I might say, having seen Dr. B. C. Roy last week, that the title, while giving satisfaction to his followers, has not changed one bit of his down-to-earthiness in any way. The remarkable quality of the Chief Minister of West Bengal is that he is so intensely absorbed in his ruling passion, which is the solution of the problems of West Bengal, that he cannot be distracted by anything like an honour from outside or even by great popularity or unpopularity race. He stays at his post from early in the morning to late in the evening whilst the shafts fall thickly about him; he seems, as far as I can determine, to be almost unaffected by the virulence of the language used. Even in the West Bengal Assembly where decorum is not a habit, he wears a gay and cheerful demeanour—the result of

much assurance in himself and a wonderful protection of philosophy from the outside world. I need only add for those who think that Dr. B. C. Roy is tired at 78 (and that the Prime Minister also is aging rapidly) that they are talking through their non-existent hats. Talking to Dr. B. C. Roy, one is amazed at his command of detail about particular projects and his capacity to find time to explain in an unhurried way his great Calcutta scheme, the conception of which has been, in my opinion, one of his great contributions to the life of West Bengal. Greatly daring, I prophesy that he will, within a very short time, receive the Rs. 70 crores needed as a revolving fund to finance expenditure of about Rs. 220 crores in all, most of which will be forthcoming with the sale of reclaimed land; West Bengal might even cash in a profit of Rs. 20 crores. All of it shows that reclamation, rehabilitation, and realignment—the new three R's—are unlike the old ones productive in the relatively short period.

... AND P. D. TANDON

It is a natural transition from one Bharat Ratna to another. I cannot myself discover the basis on which Mr P. D. Tandon has received an honour equal to that of Dr. B. C. Roy. There has been some fairly querulous comment in Delhi and the assumption seems to be that when an eminent son of India from a non-Hindi area is honoured, it would be somewhat infradig for the hard core of both Hindi and Hindi civilisation if an equal honour were not conferred on someone from that central political citadel in the country. In the spirit of our age, Mr Tandon is somewhat ill at ease and unless we wish, in the new age, to have a throwback to ancient scholarship with ancient ways of life, the honour granted to him this year would appear to be an anomaly. Nevertheless, those who have respected Mr Tandon's independence of character and his great tradition of public service and integrity rejoice that he has been honoured on the advice of the Prime Minister with whom his relations have not always been cordial. One can record this display of cordiality without becoming enthusiastic about its substance. I am reminded of the old comment on the Anglo-French Alliance: Entente mais ne pas cordiale. I do not think the Prime Minister's relations with Mr Tandon have now entered into a phase of what may be called bi-partnership as distinguished from the non-biped variety.

Has Mr Tandon any role to play in the new difficulties of Uttar Pradesh? Can he be rewarded—as in British political practice—with a peerage for political service? I cannot find any evidence of this. Nor does it seem to me from the events of this week that the squabbles of Uttar Pradesh have been solved. Binar, indeed, has a Chief Minister unanimously elected, if not unanimously desired. If Mr. C. B. Gupta was unanimously elected by invoking the Prime Minister's prestige, events this week have shown that the election was not intended to seal an enduring agreement. Here again people are asking how long the pretence of a united Congress in the Uttar Pradesh, behind the High Command's directives, can be maintained. The question is being asked anxiously in Delhi and at the moment no reply has been received. In any case, the next move is not in Lucknow, but with the High Command which has been very much at it throughout the week. Next week something is to happen. What?

ARGUS.

THE WEEK'S NOTES

U.P. Congress

FIRM ACTION NEEDED

THE UTTAR PRADESH Legislative Assembly this week witnessed an unprecedented scene. Boycott of Governor's address to a State Legislature by the Opposition parties, though deplorable, has not been an uncommon occurrence in this country in the recent past. Never before, however, had members of the ruling party deliberately abstained from attending the House and refrained from hearing the Governor's inaugural address. When the daily press reported on the eve of the Budget Session of the U.P. Legislature that the dissident group under the leadership of the ex-Chief Minister of the State, Dr. Sampurnanand, would stay out of the inaugural proceedings of the Legislature, it was not apprehended that the matters would come to such a pass, especially when agreement had been reached between the two groups on the election of Mr. J. S. Negi as the new party chief in the State. But these expectations have been belied; as many as 144 Congress M.L.A.'s abstained from attending the House, along with the Opposition members, which reduced the number of those present to only 180 in a House of 431 members.

Whatever the grievances of Dr. Sampurnanand and his followers about the foisting of Mr. C. B. Gupta as the Chief Minister of the State, they have indeed adopted a highly questionable way of ventilating their differences with the ruling group. The proper forum for airing such grievances is the party meetings. The dissidents, instead of adopting this course, presumably due to the fact that the followers of Mr. C. B. Gupta outnumber them, have chosen to wash the dirty linen in the public. This is most reprehensible.

The Opposition cannot be blamed if it exploits rift in the U.P. Congress Legislative Party. It may table a no-confidence motion against Mr. Gupta's Ministry. It is time the Congress High Command takes energetic action to set matters right. The dissidents have made a mockery of party discipline; their conduct has to be seriously dealt with lest it gives free handle to recalcitrant elements in the legislative parties of other States. Party decisions can be challenged inside the party machinery. But once issues are settled, compliance with party discipline is absolutely necessary. Any soft-paddling at the present juncture will only spell disaster for the U.P. Congress at the next General Elections.

Police

POLICE IN WELFARE STATE

THE DECISION to appoint a high level commission with a former Chief Justice of the Supreme Court, Mr. Mehar Chand Mahajan, as Chairman, to make recommendations to the Punjab Government for making the Police force more suited to the present democratic set-up is welcome. This is specially so in view of the public criticism in recent times against various excesses by the police. The state of respect for the rule of law and self discipline in general has not been such as to reduce the strain on the police. Rather, the police is sometimes put into a delicate position vis-a-vis the people. With the change of country's political set-up some change in the operational techniques of the police in using lathis, tear-gas, firearms, etc., is called for. But what those changes will be can only be decided after a thorough examination of people's changed attitude towards Government on the one hand, and the increasing need for controlling the people by the police on the other. In this connection, the Commission's term of reference whether improvements are needed or can be made in the general supervision exercis-

ed by the Magistracy over the police, specially in view of the separation of the judiciary from the executive, and the supervision exercised by senior police officers themselves, is relevant.

The Commission has also been asked to consider possible steps for improving public co-operation with the police in preventing and investigating crime, "keeping in view the rule of law, the free exercise of civil liberties and political rights and public aspirations in the light of the directive principles of the Constitution." Connected with the new role of the police force is the question of organization, training and strength of the different ranks of the police force. Much of the oft-recurring mob violence and defiance of law can be averted by tactful handling of the situation by the police officials. This emphasises the need for training.

Atomic Energy

A PROPER CASE STUDY NEEDED

INDIA IS embarking upon an atomic energy programme at considerable cost. No one disagrees with the fact that atomic energy can go a long way in bridging the gap between India's future demand and supply of electric power. It is estimated that total energy requirements (installed capacity) of the country in 1986 will be somewhere between 50 to 60 million kwts. Out of this, the hydro capacity is likely to supply 25 million kwts. and thermal (coal) capacity another 15 million kwts. The balance of 10 to 20 million kwts. of electric supply may very usefully be contributed by non-conventional sources, such as the atomic power. Thus, India has decided to construct the first atomic power station at Tarapur, about 60 miles north of Bombay with an installed capacity of 300,000 kwts.

The Government of India has shown foresight and courage to introduce nuclear power in the country quite early, but the economic considerations behind undertaking such costly projects at the present juncture should be clearly brought out. The question that needs to be seriously considered refers to the precise estimates of relative costs of power from conventional and nuclear stations. Some estimates are being attempted; but such estimates of relative costs are beset with a number of ticklish problems. For example, a realistic rate of interest should be used in evaluating the economic performance of nuclear power stations, for capital costs of nuclear power stations are very high and can, therefore, make substantial difference in the estimates of relative costs. Secondly, forward estimates of availability of materials and resources as well as of the course of prices are notoriously unreliable. In the third place, it is equally difficult at the initial stages to assess the performance of a nuclear power station, and any statement on the future cost of this type of power involves a complicated judgment of the out-turn. And, lastly, other estimates, which affect the valuation of the cost of power, are the course of fuel prices and inflationary influences. There may also be important technical assumptions about the performance of a power station, for example, the thermal efficiency of a coal-fired station, or the fuel burn-up achieved in a nuclear station. Further, note has to be taken of the load factor and the life of the station. There is no doubt that a great deal of uncertainty and hazard lie in estimating the cost of power from a nuclear power station in India; still any sane policy of developing nuclear power should be based on realistic calculations of definite benefit-cost analysis. The fundamental principle of allocating scarce resources to the best possible use can never be ignored, if the maximum benefit is to be achieved for the nation.

The Ashoka Hotel

AT NEW DELHI

LIGHTING BY PHILIPS

Occupying an area of 20 acres, the Ashoka Hotel—the largest project of its kind in India—stands out as another shining example of Philips specialised lighting.

The lighting is so essentially a part of the whole conception that it presents an architectural masterpiece which belies the fact that it is achieved by artificial means.

Philips exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy through maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is

the result of experience, research and development to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible *plus* of Philips' international experience and know-how.

FREE: For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau

MR. NEHRU IS UNREASONABLE

BY ODYSSEUS

AMONG THE CHARACTERISTICS whereby you can recognize whether a man is a genuine Marxist is his substitution of material for spiritual values, his rejection of God, and his conviction that no progress is possible unless the existing "archaic" structures of a society are overthrown by violent revolution. Constitutional evolution is scorned as crypto-Capitalism.

It clearly emerges from that excellent little book "The Mind of Mr. Nehru" (Allen & Unwin, London, 1960), containing the text of tape-recorded talks that Mr. R. K. Karanjia had with Mr. Nehru, that our Prime Minister is no Marxist, because he unhesitatingly proclaims his faith in spiritual values and rejects violent revolution.

When Mr. Karanjia challenges Mr. Nehru's references to spiritual solutions with the remark "What you say raises visions of Mr. Nehru in search of God in the evening of his life!" (the exclamation mark is Mr. Karanjia's) Mr. Nehru replies "... Yes... the human mind is hungry for something deeper in terms of moral and spiritual development, without which all the material advance may not be worth while... The old Hindu idea that there is a divine essence in the world, and every individual possesses something of it and can develop it, appeals to me... I do not happen to be a religious man, but I do believe in something—call it religion or anything you like, which raises man above his normal level and gives the human personality a new dimension of spiritual quality and moral depth. Now whatever helps to raise a man above himself, be it some god or even a stone image, is good... and must not be discouraged..." There are other similar passages, which show that Mr. Nehru, whether conscious of it or not, is abreast of contemporary philosophical thought, but what is striking is that there seems to lurk in Mr. Nehru (unless I misread him) the feeling that Mr. Karanjia's exclamation mark, denoting the materialist viewpoint, is rational, and that his own belief in a divine essence is an eccentricity which needs to be defensively justified. But contemporary philosophers have left far behind the crude 19th century "cause and effect" materialism, which ignored the evidence, and indeed often the very existence, of feeling and intuition. Today the onus is on the Marxists to justify their values rather than on Mr. Nehru to justify his. This is not a minor academic point but is of practical, contemporary, political importance, because all who cherish individual liberty and true democracy should be at one with Mr. Nehru in defence of the spiritual, anti-rational viewpoint.

The development of a theory of liberty began in 18th century England (which enjoyed individual liberty) and France (which did not). That is why, as Professor F. A. Hayek points out in "The Constitution of Liberty" (Routledge & Kegan Paul, London 1960. Price 45 sh.), we have two traditions of liberty: (1) the English empirical, unsystematic, based on the interpretations of customs and institutions which had grown up spontaneously and were imperfectly understood; (2) the French speculative, rationalistic, critical of existing institutions, and aiming at the construction of an ideal system—a utopia, often tried, never successful. Nevertheless, it has been the rationalistic, and (apparently) logical French tradition, with its flattering assumption that the powers of human reason are unlimited, that has gained influence, and the pragmatic, English tradition which has, until the last ten years, lost ground. The French tradition leads to totalitarian "democracy," which sacrifices the individual to the good of society, as conceived by a ruling group; the English to liberal democracy, which respects the individual as an end

in himself, not to be sacrificed to the whims of a ruling group or a passing majority.

FRANCE'S EIGHT REVOLUTIONS

The French think that liberty can be found in the government, the English that that is the last place to find it. The consequence of the French view is to regard civilization as something imposed by organization, i.e., in unlimited interference by public authority. The French decide whether this interference is despotism or liberty solely by asking WHO interferes, for the benefit of what CLASS. The English consider that interference is always despotism. That French liberty expects everything from an ideal organization is one reason why between 1789 and 1871, there were eight revolutions accompanied by varying degrees of bloodshed in France, while before, during, and after the same 82 years, liberty in England broadened from precedent to precedent, retaining the form of ancient institutions but continuously modifying their content. That is why there has been, broadly, so little improvement and expansion of institutions in France and so many abolitions and new departures.

Any institution has good and bad elements. Improvements occur by attacking the bad, not turning out the good with the bad. Mr. J. L. Talmon, in his "Origins of Totalitarian Democracy" (London, 1952) says that the main contrast in the results of the English empiricist, and the French rationalist, traditions has been that the English finds freedom in spontaneity and the absence of coercion, the French in pursuing an absolute collective purpose; the English stands for organic, slow, half-conscious growth; the French for doctrinaire deliberateness; the English for trial and error; the French for an enforced, solely valid pattern, from which totalitarian "democracy" originates. Professor Hayek recalls that the Scottish philosophers, Adam Smith, David Hume, and Adam Ferguson, developed a body of social theory that showed how institutions (like parliaments, law courts, trade unions, etc.) grew up, not planned by individuals but aggregated from successive separate improvements of many men, out of whose individual contributions there grew an ever increasing cultural heritage. These contributions were fruitful because they assumed the moral value of the individual human personality. Without this, their tinkering with not wholly understood institutions would have ended in tyranny or anarchy. The organic growth of institutions corresponded to an organic growth in the human individual.

The revolutionary rationalists, like Rousseau and Karl Marx, flatter human pride by assuming that man's reason enables him to mould civilisation deliberately. The evolutionary empiricists (all the way from Adam Smith to Gandhiji and Jawaharlal Nehru) have shown that civilization is the accumulated, hard-earned result of trial and error, the sum of experience in part handed down from generation to generation but to a larger extent embodied in institutions, whose worth has been proved by their very survival, and which are capable of continuous adaptation by the constant chiseling of new generations of individuals.

THE VALUE OF CONTINUITY

For the revolutionary rationalist, freedom means chaos. For the evolutionary empiricist, the value of freedom lies in the opportunity for the growth of the undesigned. The fruitful working of a free society depends on maintaining spontaneously evolving institutions.

Mr. Karanjia quotes Professor Dumont (signifi-

cantly, in this connexion, a Frenchman) as saying that India cannot achieve a real social revolution, abolishing castes etc., without Communist methods. How profoundly right Mr. Nehru is to reply: "Tradition and customs here condition and limit one's activity, and slow progress. We don't want to destroy their past or uproot them from their social fabric. We have to balance the forces of continuity with those of change. It all takes time." Mr. Nehru points out that modifications in the caste system are going on all the time, and that the big landlord system has been abolished. "We try to do all this democratically and peacefully, by eliminating rather than aggravating the conflicts of caste and class..." Authoritarian and violent methods "might lead to disruption and violence." Mr. Nehru's methods help to unify India. As one who has lived for ten years in France, has visited it repeatedly throughout his life, and has made some study of French history, I can testify now profoundly France's eight violent revolutions have weakened her by setting Frenchman against Frenchman. The attitudes of innumerable Frenchmen are conditioned by conscious or unconscious memories of bloodshed, injustice, and resentment. Has there ever been any successful free society which has not revered its grown institutions and "all those securities of liberty which arise from regulation of long prescription and ancient ways"? And, to quote Professor Hayek again, "paradoxical as it may appear, it is probably true that a successful free society will always be a tradition-bound society."

It is this submission to undesigned institutions, this reverence for tradition, that exasperates the ra-

tionalist, who wants to sweep them all away — leaving what? An imperfectly planned new design, commanding no reverence, and standing alone in a spiritual void. The rationalist condemns religious observances as "superstition". But what is, or is not, "superstition" is not determined by any one group of rationalists, however intelligent, but by the clash of many reasoning minds in the sifting of argument and debating. "That we ought not to believe anything which has been shown to be false does not mean that we ought to believe only what has been demonstrated to be true." Human beings who were protected from microbes by being brought up in sterilized rooms, would perish as soon as they went outside, and human beings, who lived in a world of ideas, sterilized of all beliefs which could not be demonstrated to be true, would be helpless against vigorous neighbours who braved the challenge of all ideas as they came.

I am not arguing against reason. It is reason which distinguishes man from beast. I only suggest that reason is not all-powerful, that it cannot work safely, or at all, except in the cut and thrust of a free society, and that the spheres of feeling and intuition, which escape reason, are as important, and are ignored at man's peril.

Orthodox Socialists, who think that science has disproved religion, and reject God as "superstition" because contrary to "reason", are as quaintly archaic in their outlook as the American sect which insists that the earth is flat.

(This is the final article on Mr. Karanjia's "Mind of Mr. Nehru". — ED.)

GLAXO NOW MANUFACTURE VITAMIN A WHOLLY IN INDIA

FOR THE FIRST TIME IN INDIA, in Glaxo's new factory at Thana, near Bombay, all the stages of Vitamin A manufacture are now in operation.

Designed by Glaxo chemists and engineers in the U.K. and erected with their help by Indian colleagues, the factory can provide all India's requirements of Vitamin A — a vitamin essential to the pharmaceutical and processed food industries.

A feature of the factory is the manufacture of Beta-ionone, the basic starting material in Vitamin A manufacture. It is being produced from Indian lemongrass oil. Thus, Glaxo India is making use of India's natural resources.

Not only will this chemical plant save foreign exchange, but earn it. For, high-grade Beta-ionone, so far made only abroad, will now be exported. So India will earn much more foreign exchange than by the export of lemongrass oil alone.

Vitamin A is just the first product of Glaxo's new Fine Chemical project at Thana. Soon cortisone, hydrocortisone, prednisone and prednisolone (already made by Glaxo from intermediates) will be completely synthesised there. Other products will certainly follow — all of them being a significant contribution to India's development in the Fine Chemical field.

WEST EUROPE'S 1961 BOOM

From Our Special West European Correspondent

PARIS, February 2.

THE Common Market continues to be an oasis of expansion in a non-Communist world that is in recession (as in the USA), or stagnating (as in Britain) or expanding with a painful slowness (as in the developing countries). The EEC Commission has, therefore, just warned the Six that this situation cannot continue indefinitely and that, although their near-term prospect is excellent, they must give more aid to developing nations and timely help to the USA, in order to ensure that demand for European goods will sustain their expansion in six or 12 months' time. The warning will be heeded only by those who look well beyond tomorrow, because at present the Six are managing very nicely without the stimulation of growing demand for their exports. The motor of their current boom is internal demand and this is expected to go on increasing, though at a slightly slower rate, through most of 1961.

The relative independence of the Common Market boom of external conditions is reflected in their trade figures for 1960. The internal trade of the region increased over the year by 28 per cent, their imports from outside increased by 23 per cent, while their exports rose by only 15 per cent. That latter figure disguises the slowdown in exports that took place in 1960: at the start of the year, exports overseas were running 31 per cent above a year before, and at the end of the year only 9 per cent. In other words, the region imported much more than it exported and its 1959 trade surplus gave way to a substantial trade deficit. It was internal demand that was supporting the boom (shown in the increase in imports and in internal trade), whereas export demand slowed down because less prosperous overseas countries could not keep expanding their imports from West Europe at an equivalent rate.

The big trade deficit mitigated the effects of the discrepancy between the growth rates of the Common Market and of its trading partners; by buying much more from them than it sold them, the region contributed to maintaining activity abroad. But not nearly to the extent it could have afforded—because despite the trade deficit, the region scored another immense payments surplus and entered the new year with gold and currency reserves bigger than ever before. The inflow of capital, which more than compensated for the trade deficit, was due to speculative movements of short-term money, to differences in interest rates between Europe and the USA, to repatriation of colonial capital from insecure or newly independent areas, and finally to substantial private investment in Common Market industries by American, Canadian and Swiss lenders. With all this cash in their coffers, the Six can well afford to go on running up trade deficits, to repay their loans to the USA and buy more US imports, and give more assistance to developing nations. If, by these means, they contribute to maintaining the level of activity abroad, prevent the US recession from hitting the raw-material exporters too hard, and give Washington a hand in restoring confidence in the dollar, then they will find later on—when their internal demand slows down or has to be slowed down deliberately—that demand for their exports will take up the slack.

They are in a better position to do this than Britain, who has felt the effects of the US recession more sharply and has not been able to compensate for them either with sufficiently bigger exports to regions that are still expanding (such as the Common Market), or with increased internal activity. True, British trade losses have been partly annulled in the payments account by an influx of short-term capital due to higher money rates in London compared with New York. Yet, given the stagnation of the British economy, these speculative investments are much more insecure: London has already had to reduce bank rate twice, partly in order to stimulate home demand, thus reducing the attractiveness of the British market to foreign funds. On the Continent, no such monetary-rate stimulation of domestic demand has been necessary. Interest rates are indeed falling gently here, because of the excessive liquidities resulting from the payments surplus; also because, in several countries, the boom has so far increased government tax revenues that the State has not had to borrow in the capital market. To the extent that lower money rates make Continental centres less attractive to purely "hot" money, the reasons for those lower rates—the industrial boom, healthy finances and a strong currency—make them more attractive to more permanent funds and to genuine investors.

The constituents of the internal demand that is carrying the Common Market boom are important, because they indicate which imports will be in demand in the months ahead. The reliance on this internal demand will become even more marked in 1961 because the prospect for European exports is not encouraging and only a slow rate of increase can be expected until the American economy recovers its vigour. At present, the major element in internal demand is fixed capital investment by industry. Industrial outlays were already high last year, but they are currently being further increased despite the uncertain outlook for exports. The order books of manufacturers of producer-goods are full for months ahead, and the applications for building permits for factories, offices and shops are much more numerous than a year ago. There are two main reasons: the acceleration of progress with the Common Market customs union, and the labour shortage.

Both these factors act in the same way: they stimulate efforts to increase productivity, both to save labour and to cut costs in a more competitive market. The need to save labour is felt most urgently in West Germany and Holland, where the supply of manpower has been strained to the limit. The need to cut costs is most urgently felt in the formerly high-tariff countries, France, and Italy, which must now renovate their protected industries in order to face the increasing competition of the Germans. In all countries, the prospect of a wider market as duties fall encourages manufacturers who hope to gain from it to reconvert, expand and modernise. Sustained industrial outlays will continue to be a positive factor throughout 1961. Even Belgium, the one member-country that has not (for evident reasons) been in an expansionist mood lately, will have to undertake extensive reconversion of her industrial plant in the near future.

The accumulation of stocks played a big role during 1960 in the level of demand; in fact off-take was so fast that many intermediaries could not stock all the steel and manufactures they would have liked. However, it is expected that a more cautious stock-building policy will be followed in the months ahead. The main interest will be in stocking manufactures, because, as will be mentioned later, an increase in private consumption is foreseen. There will be less concern to accumulate stocks of raw materials and semi-manufactures, because prices are still weak and there is no reason not to wait. Producers and intermediaries are left with big enough stocks of most raw materials, in the shape of large carry-forwards to the new season, so there is no call for industrial consumers to compete. Finally, the excellent 1960 harvests have left plentiful supplies of many agricultural products in West Europe itself. In sum, purchases abroad of commodities and semi-manufactures will be kept in line with the actual movement of industrial demand.

Public demand (purchases and investments by the State and public authorities) has been a supporting factor in West Germany, Italy and France in recent months, and to judge from current budgets it will increase in those same countries in 1961. Private consumption has been even more important: private revenues have increased with over-full employment in West Germany and Holland plus some competitive bidding for labour from employers, and with a gentler tendency to higher wages in France and Italy. Higher profits have everywhere contributed to increased personal expenditures, too. This trend will be accentuated between now and the summer. Sharp rises in wages, salaries, distributed profits and welfare payments are scheduled in West Germany, to the point where some price-inflation is inevitable. Rigid wage-pegging in Holland will perhaps avoid that sequence, while the trend to higher personal revenues will be less dan-

gerous but still marked in France and Italy. Given last year's excellent harvests and the present food surpluses, the pressure on prices from this development will be felt only in manufactures and tourism. The French and Italians expect to boost their sales of manufactures in West Germany as German prices rise, but substantial imports of manufactures from outside the region are also foreseen: the USA and the Free Trade Area will be the beneficiaries. It is notable that Common Market imports of US goods have been running 66 per cent above 1959 in recent months, and with further removal of restrictions on dollar purchases by Continental countries that expect to need more foreign manufactures, it is plain that the Americans do not have to worry their trade balance (whatever may be true of their payments balance).

On the contrary, imports from developing countries have been running only 10 per cent above 1959; the extra European demand has been for wood and minerals mainly, among the goods exported by those countries. Since, as has been shown, the motor of present European expansion is investment in capital goods, and since its principal result is increased demand for finished manufactures, the hope of greater European imports of food and raw materials from developing countries is not great. Such increase will be, in any case, less than the increase in industrial production. It must not be forgotten that much of the industrial investment is directed at technological progress, which not only cuts costs and saves labour but economises use of raw materials. This brings us back to where we started: to the EEC Commission's warning that the Common Market will have to increase its assistance to developing countries if their export earnings are not to fall so far behind West Europe's expansion that they will not be able to buy more European goods in late 1961 or 1962, when internal demand may no longer be sufficient to support the European boom.

Economic Report from the U.S.

STATE OF THE UNION MESSAGE

By GUY SIMS FITCH

WASHINGTON, Feb. 1.

IF there is one conclusion to be drawn from the message President Kennedy has presented to Congress on the "State of the Union"—that is, on the position of the United States at home and abroad—it is his abiding and unshaken confidence in the capacity of the US economy to meet whatever challenges may lie ahead. The address, delivered in person to the Congress this week, was firm and to the point. It spread few illusions in its realistic portrayal of the nation's economic shortcomings, as the President sees them. Yet running through it was the conviction, both explicit and implicit, that the economy is essentially sound and that conditions can and will improve.

More than mere pious platitudes, Mr. Kennedy has offered specific proposals to promote the advances of both the domestic and foreign policies of the United States. These advances encompass virtually every aspect of the nation's socio-economic life, and are keyed not just to overcoming present difficulties, but also to fostering long-term progress at home and in US relations with the rest of the world. What is more, Mr. Kennedy sees domestic and foreign requirements as inextricably intertwined. Domestically, he wants to see the economy expanding again and accelerating its growth rates as soon and as rapidly as possible, within the limits of sound and prudent programmes. Involved in this are proposed steps both to counter the current recession and to lay a healthy foundation for continued gains. To these ends, he has recommended improvements in the nation's unemployment compensation system, tax incentives for sound plant investment by business, more relief for the unemployed and needy, moves to stimulating housing and construction, revamping of the Federal minimum-wage legislation to raise its wage "floor" and broaden its coverage, expanded development of natural resources, help for areas subject to chronic unemployment, stepped-up activities by US agencies which help the unemployed find new jobs.

To these essentially quantitative approaches to economic progress, Mr. Kennedy has added his concern with the qualitative criteria of American life. His State of the Union message, for instance, proposed a number of expanded Federal programmes in the general field of health and welfare. Among them were a new national housing programme, an expanded programme of Federal aid to education, a medical programme for the aged, financial help for hospitals and the training of doctors and dentists, a stepped-up programme to combat the threat of water pollution. In meeting these domestic problems, the US economy also would be enhancing its capacity to meet the challenges of the outside world. These include, as the President noted in his message, the need to maintain a strong defence, to enlarge the meaningful programme of economic assistance to developing lands, to support the constructive efforts of the United Nations, and generally to proceed along the path to international peace, freedom and economic well-being.

A particularly vexing problem that currently is affecting US relations with other lands is the continuing deficit in the nation's international balance of payments, despite the strong export trade position it currently enjoys. This problem, too, is seen by Mr. Kennedy as soluble over the long-run within the con-

text of a growing and productive US economy. Such an economy will not only be able to compete even more effectively in world markets, but can be counted on as a source of firm, continued and enduring confidence around the world in the economic and financial potential of the United States. Meanwhile, in his Congressional message, Mr. Kennedy has proposed some measures that can be undertaken now to protect the US balance of payments and stem the outflow of gold and dollars. First and foremost, he again has pledged no distortion in the value of the dollar, behind which there still stands the substantial sum of \$22,000 million in actual or potential gold reserves. Beyond that, the President spoke of efforts to attract more foreign investment and travel to the United States, to promote US exports at stable prices, to curb tax and custom loopholes that encourage undue spending of private dollars abroad, and to have other nations finance a larger share of the economic and technical aid for developing lands. There is no indication here of any US retreat from its international obligations. The contrary, in fact, is the case. Pre-occupation with the current recession in domestic economic activity clearly has not promoted the Kennedy administration to turn its attention inward. Rather, the administration obviously is prepared to have the United States assume a full measure of international responsibility, even while stressing the need for other countries to do the same. This is particularly evident in several specific recommendations Mr. Kennedy has advanced in the field of economic co-operation and assistance. For one thing, he strongly urged in his message that Congress quickly appropriate the \$500 million which has already been authorized for the new economic and social development programme in Latin America, so that the programme can go forward speedily and effectively. Along these lines, he indicated he was setting up a new inter-departmental "task force" in the US government to co-ordinate programmes for helping Latin America.

In addition, Mr. Kennedy recommended speedy Congressional approval of US participation in the Organization for Economic Co-operation and Development (OECD)—the new organization of Western European Nations, Canada and the United States, aimed at spurring world economic growth through enlarged aid and trade efforts. He also proposed that Congress make it easier for the President to extend aid to east European countries. Moreover, Mr. Kennedy spoke of expanding the food for peace programme, involving the use of US reserve farm stocks to help needy nations, and indicated his interest in a national peace corps of skilled young Americans—men and women both—to work in developing lands. Many of these Presidential proposals and legislative recommendations may be spelled out in greater detail in promised special messages to the Congress. Current estimates on the number of these messages range from about ten to twenty. At this writing, it appears that the first two will be coming up shortly—both of them deeply concerned with economic matters. One, on measures to stimulate the domestic economy, is scheduled for later this week, and another, on the balance of payments, is due early next week. In any case, the basic Kennedy approaches to national and international economic affairs have now been laid out. They envision a strong and sound United States, with its economy flourishing and contributing in full measure to the advancement and well-being of mankind.

KENNEDY'S ECONOMIC MESSAGE

WASHINGTON, Feb. 2.

THE new administration of President John F. Kennedy has come out with a vigorous programme to stimulate the recovery and growth of the American economy. As revealed in the special economic message the President has sent to Congress, the scope of the programme is broad and its intent is clear: not merely to halt the present recession in business activity; but to set in motion a renewed upturn that will build a sound foundation for fuller use of the nation's resources and a more rapid rate of economic growth than has been evident in recent years. Behind a programme of this kind is the obvious conviction that the performance of the recent past has not been entirely satisfactory, even during periods of rising economic activity, and that the US economy has the resources, the strength and the resiliency to realize the great potential the Kennedy administration visualizes for it. That potential, the President notes in his message, is constantly expanding. Given the current annual rises in productivity and labour force, it is the view of the President and his advisers that the US economy could normally be expected to expand at a rate of about 3.5 per cent a year. But the economy has not maintained this rate in recent years. And even this rate is not high enough, in the President's view. With expanded investment in physical and human resources and the full use of the nation's productive facilities, the growth rate, he says, can and should be increased.

Along these lines, the message indicates clearly that the administration would not be satisfied merely with an upturn sometime during 1961, as is being widely predicted. It wants to see that upturn start as soon as possible, and move as rapidly as possible to meet the Kennedy criteria of a satisfactory economic growth situation. Just a cursory run down of only a relatively few of the President's proposals aimed at achieving these ends offers a revealing picture of the breadth of this economic message. It is concerned with a variety of recommendations in a dozen broad categories of governmental activity, from monetary policy to minimum wages, from housing to social security. For example, to stimulate residential construction, which has been lagging, the President suggests, among other proposals, reductions in interest rates on home mortgages and a speed-up of urban renewal projects. In other fields, the President proposes a temporary extension of benefits to the jobless under the nation's unemployment insurance system, distribution of surplus fund to needy areas of the country, special assistance to the dependent children of unemployed persons, improvements in the nation's social security system, increases in the minimum wage and expansion in its coverage, acceleration of government construction projects, and special assistance for those "distressed areas" of the country where economic growth has lagged and unemployment has been a chronic problem. Among the important problems governments face during a time of economic recession is in the field of monetary policy and debt management. Action in this field is made peculiarly difficult for the US at the present time because of the nation's balance of payments deficit, which has been aggravated by the outflow of short-term funds, partly in response to higher interests rates abroad. Thus, Mr. Kennedy and his advisers are faced with the twin tasks of keeping short-term rates from falling too far, while at the same time stimulating credit so as to bolster economic activity

at home. As a general principle, the administration is following a policy of letting long-term interest rates fall, while keeping a closer rein on short-term rates. This is a matter which may receive a fuller airing when the President sends his special balance of payments message to Congress early next week.

Proposals of the kind outlined can be categorized, for the most part, as anti-recessionist. But they still constitute only one element in President Kennedy's programme for the nation. The other element, which goes well beyond the anti-recession category, is dedicated to the long-term restoration of the US economy to its full potential and the acceleration of economic growth. To expand and modernize the nation's productive plant as an essential stimulant to long-term economic growth, the President is considering important reforms in the nation's tax system. These are income incentives for business investment in plant and equipment, measures to remove unwarranted special tax benefits, and steps to improve tax compliance and administration. In this way, it is believed, it should be possible to stimulate economic growth without reducing revenues and without violating the basic principle of fairness in taxation methods. These tax proposals will be the subjects of special recommendations of a later date. In addition, the President urges what he calls investment in human and natural resources. The human element, he notes, will be stressed in programmes to strengthen education, health, research and training. In the field of natural resources, the message talks of such moves as a new national minerals policy, improvement of forest and of water facilities, the accelerated development of energy sources. Finally, the President has indicated his intention to establish in the near future an advisory committee on labour management policy. It will examine the whole range of questions relating to such developments as price and wage policies, collective bargaining, automation, productivity and price stability. Its membership will be drawn from the ranks of labour, management, and the public, with the thinking now that two of the public members will be high-ranking government officials—the Secretary of Labour and the Secretary of Commerce. The committee's main emphasis would be on the actions labour management and other private groups could take to spur productivity and growth, rather than on governmental activities.

In retrospect, this Presidential economic message is essentially a takeoff from the State of the Union message, which Mr. Kennedy delivered to Congress earlier this week. Many of the points the President made then appear here in greater detail and with specific emphasis. And many of the proposals appearing in this economic message will, in turn, take on more concrete form in future legislative recommendations. Thus, bit by bit the Kennedy economic programme is taking shape. Perhaps the best summation of that programme's direction is found in this concluding section of the economic message: "I have sought in this message to propose a programme to restore momentum to the American economy. I have recommended measures designed to set US firmly on the road to full recovery and sustained growth." Furthermore, as Mr. Kennedy himself points out, he is prepared to submit further proposals to Congress "within the next 75 days" if the measures outlined in this economic message prove inadequate to the task. "We will do what needs to be done to fulfill the high promise of the American economy."

WORLDGRAM

India

Small Car: Standard Herald will be the Indian version of the already popular Triumph Herald of U.K. that will be put on the Indian market by the Standard Motor Products of India Ltd., Madras, by early May, 1961. For the time being Standard Motor Products will be giving the choice of the new model as well as the current four door model to the Indian buyer. Its main features are its very elegantly stream-lined look and it will be the first small car in the Indian market which will have independent suspension on all its four wheels. Because of this it can do a complete turn round in 25' diameter circle, which no other car can do today.

Export Risks Insurance Corporation Ltd: The Export Risks Insurance Corporation which commenced operations in October, 1957, closed its third accounting period on 31st December, 1960 and Directors Report to the members was finalised and the Revenue Account and Balance Sheet were signed by the Directors on 31st January 1961, i.e. within one month of the close of the year. In the third year of its working the Corporation issued 324 policies with a maximum liability of Rs. 8.14 crores as against 243 policies with a maximum liability of Rs. 7.87 crores in the year 1959. 40 per cent of the policies issued were those for which maximum liability was Rs. 50,000 or less. Shipments, contracts and credits insured during this year amounted to 6.96 crores as against 5.88 crores in 1959. Insured exports were of 69 commodities to 109 countries and amounted to about 1.1 per cent of total exports in 1959 and 3.48 per cent of the estimated insurable exports. In the case of 18 countries insured exports ranged from about 5 to 25 per cent of the total exports to those countries. Policies issued by the Corporation are treated as additional security by the banks. 94 policy holders obtained finance facilities in respect of shipments of the value of Rs. 2.37 crores by authorising the Corporation to pay in the event of a claim to the financing bank, as against Rs. 1.95 crores in 1959. The Corporation paid claims for Rs. 3,76,394 and made provision for Rs. 1,03,680 for meeting claims which may arise out of reported protracted defaults. Payments of a claim by a credit insurer is not its loss. When a claim is paid the insurer takes over the debt of the insured; loss is only to the extent a debt cannot be recovered. 64 insured exporters increased their exports after insurance. Of these 21 exporters increased their exports from 25 to 100%, 10 from 101 to 399% and 20 from 400 to over 1000%. The Corporation has decided to cover risks involved in packing credits given by banks to exporters to purchase and/or manufacture goods for exports.

Technical Assistance from France: Letters were exchanged recently between the Economic Counsellor of the French Embassy and the Joint Secretary of the Department of Economic Affairs, Ministry of Finance, to facilitate continued technical assistance from France. This programme which started in 1958 has already helped the training of 100 Indians in France in various technical fields and has also provided the services of about 50 French experts for development projects in India. It was also agreed that the programme will be subject to annual review so that the maximum benefit can be secured.

United States

Ford Foundation adds \$5 million to Overseas Grants: The Ford Foundation will increase by \$5 mil-

lion its 1961 appropriation for aid to less developed countries. The funds will support programmes, help meet needs for more skilled manpower and better education in Asia, the Near East, Africa and Latin America. The new appropriations announced recently, brings the total allotted to overseas development in 1961 to \$20 million. The Foundation also announced a series of grants and projects authorised from appropriations for its overseas development programme. Eleven countries received assistance, and regional grants were made for consultants to African countries and for studies of small industry and Latin American monetary problems. Among countries receiving Foundation grants were India, Pakistan, Iraq, Lebanon, Congo, Nigeria, Kenya, and Israel. Following are grants and projects for India: Carnegie Institute of Technology—\$181,000 grant, to continue a programme for training Indian engineers in management and production methods in the United States steel industry; \$30,000 to provide the services of a consultant for the development of a national science-talent search in India.

U.S.S.R.

164 projects to be built in 1961: Among the projects which are to be built or reconstructed in the Soviet Union in 1961 are 38 metallurgical plants, 68 enterprises of chemical industry, 26 installations in gas and oil industry and 32 factories of light industry. It is pointed out in a leading article in Pravda that the capital investments in iron and steel, chemical, oil and gas, engineering and power industries have increased by 28 per cent in comparison with the last year. Hundreds of major industrial enterprises, power stations, pits and mines will be built in the U.S.S.R.; over 6,500 kilometres of oil and gas pipelines will be laid and 96,200,000 sq. metres of living floor space will be provided in cities and workers estates. The builders of railroads will have to build 1,266 kilometres of new lines and electrify over 2,000 kilometres of railways.

Progressive methods of cotton growing in Uzbekistan: A programme has been outlined in Uzbekistan for increased application of progressive methods of cotton growing—the principal branch of agriculture in the Republic, which produces 2/3rds of the total Soviet cotton output. As early as 1961, one million 60 thousand hectares of the total area of one million 300 thousand hectares will be cultivated exclusively by machinery. Special machines, designed in Tashkent will do the chopping of the cotton plant for the first time on an area of 80,000 hectares. Sprinkling facilities and spongy pipelines will be tested on large tracts. Six hundred thousand tons of cotton are to be picked by machinery or 20 per cent more than last year.

United Kingdom

Further Rise in Sterling Area Reserves: The central gold and convertible currency reserves of the sterling area rose by £5 million in January and stood at £1,159 m. at the end of the month, the Treasury announced on February 2 in London. It is pointed out that there was a special payment during January of £4 m. in respect of European Payments Union bilateral debts, so that the true rise in the reserves was £9m. The reserves have been rising steadily since January 1960, and have now reached their highest point since September 1959. Although the rise in January was in

itself a modest one. It is a quite favourable result in view of various official commitments which generally have to be met at this time of the year.

British Yard to Build 8000-ton Cable-laying Ship:

An 8,000-ton (gross), Diesel-electric cable-laying ship costing £1,900,000 is to be built for Cable & Wireless Ltd. by the British firm of Cammell Laird & Co. (Shipbuilders & Engineers) Ltd. It will be the first British cable-laying ship originally designed to lay and handle modern deep-sea communications cables with repeaters, including the kind to be used in the 28,000-mile Commonwealth round-the-world telephone cable.

The new ship, with a maximum speed of 16 knots, a steaming range of 8,000 miles, and a sea endurance of 60 days, will have a carrying capacity of 1,200 miles of lightweight telephone cable with repeaters, or 1,500 miles of conventional telegraph cable. A distinctive feature will be two funnels abreast, needed to allow the extensive cable working spaces to run through the superstructure without obstruction, so that cable work can be carried out at either bow or stern. The vessel will be fully airconditioned for work in tropical waters as well as in colder climates.

Yugoslavia

Delivery of 40,000 tons of Rails to India: The Zenica Steel Works will deliver 40,000 tons of rails to India by April 1961. The contract was concluded recently by the techno-promet foreign trade enterprise of Beograd. The first shipment of 2,000 tons of rails was forwarded to India sometime back via the Ploce Port. The Technopromet enterprise is currently negotiating with the Indian Railway Board on the delivery of another 15,000 tons of rails valued at over 1.5 million dollars. The rails would again be supplied by Zenica. Agreement in principle has already been reached on the subject, only the terms of delivery remain to be fixed. The manufacture of rails for India will assure the far better utilisation of the heavy rolling mills in Zenica. This plant can roll about 70,000 tons of rails annually. The expansion of capacity of the heavy rolling mills which is currently underway will raise the capacity of the Zenica works to over 1,40,000 tons of rails annually, thus also increasing the export possibility appreciably. The Zenica steel works delivered 30,000 tons of rails to India through Technopromet in the course of 1957-58.

Exports of Furniture to the U.S.A.: The U.S. Department of Trade has announced that Yugoslavia has replaced Denmark as the foremost exporter of furniture to the U.S.A. U.S. furniture imports from Yugoslavia during June-January, 1960 were valued at 2.3 million dollars, 2.1 million dollars worth were imported from Chile, Denmark and Hongkong, 1.7 million dollars worth from Italy and Japan and 800,000 dollars worth from Sweden.

Norway

Norwegian Furniture Export Surging Ahead: Norwegian furniture export went up by leaps and bounds last year. Final figures are not yet out, but by the end of November, 1960, \$1 million worth of furniture had been exported which was twice as much as the total for 1959. Best customers were Germany, U.S.A., Sweden, Britain, France, Italy and the Netherlands, but Norwegian design is being exported as far as Australia. Producers are bustling with optimism as more than hundred of them are preparing for the great Furniture Fair in Stavanger, May 26 to 30, 1961 which buyers and design experts from many countries have given notice of attendance.

Japan

Personal consumption and fiscal 1961 forecast: The Economic Planning Agency reportedly forecasts that personal consumption will continue to rise in the coming fiscal year 1961 (April 1961 to March 1962). It puts personal consumption in fiscal 1961 at ten per cent above the fiscal 1960 level, or 9.5 per cent up, should consumer prices advance by 0.7 per cent during the year. As the new Ikeda administration aims at expanding the gross national product by 9 per cent in fiscal 1961, extension of the rising trend in personal consumption is now a feature of as great importance to the economy as a continued high level of business plant and equipment investment activity. In fact, personal consumption, which in fiscal 1959 increased by 8.6 per cent over the fiscal 1958 rate to provide a significant expansive influence on the economy, is estimated to grow 10.2 per cent in fiscal 1960 and, in the manner of the characteristic feature mentioned above, is playing as important a role as plant and equipment investment in sustaining the steady expansion of the country's gross national product.

Germany

German Funds for World Bank: The Federal Republic of Germany, through its Central Bank has agreed to provide additional funds for the lending activities of the World Bank. An amount of \$196 million has been made available, at 3½ per cent a year, for an average period of three years and four months. West Germany's Central Bank has so far lent a total of 591 million in dollars and Deutsche Mark to the World Bank. This is about a quarter of the Bank's outstanding indebtedness. World Bank President Eugene R. Black hailed the recent transaction as a further indication of co-operation between the Federal Republic of Germany and the Bundesbank. In return for the \$196 million loan from West Germany, the World Bank will issue notes totalling 148 million in United States dollars and 200 million in Deutsche Mark. These notes will replace an equal amount of World Bank borrowings from the Bundesbank, which are due to mature during the next twelve months.

Libya

Tripoli International Fair: The Tripoli International Fair will be opened from the 20th February to the 20th March, 1962. The Fair terrain is situated in the centre of the town and can easily be reached from any part of Tripoli. It consists of open air spaces, halls and pavilions, the latter being rebuilt according to the most modern methods, surrounded by meridional gardens. This will be the first national Libyan exhibition but it already has a history; From 1929 to 1939 the Tripoli International Fair used to be a very well-known and important annual manifestation, governing the commerce in the African area, and now after the war this fair will be newly established as a meeting place between African commerce and the world trade. So far 16 nations have officially participated, not speaking of course, of the single companies and private participants from all parts of the world.

World Bank

Refunding of Notes Held by Deutsche Bundesbank: The World Bank has arranged to refund in advance of maturity notes totalling the equivalent of about \$158 million held by the Deutsche Bundesbank (the Central Bank of Germany). Involved are World Bank note issues aggregating U.S. \$110 million and D.M. 200m. (about \$48 million), which were due to mature over the 18 months beginning June 20, 1962.

**INDIA IS
ONE OF THE
WORLD'S GREAT
SUGAR-BOWLS**

SUGAR IS THE NATION'S SECOND LARGEST INDUSTRY

Sugar-cane and its products have been known to India from 5,000 B.C. Sugar production flourished in the country centuries ago. The Chinese Emperor Tai Tsung (627-650 A.D.) was so enamoured with the Indian product that he sent his men to this country to study it.

Today the industry is closely knit in the fabric of our national life and is the second largest industry in the country. To 1,90,000 factory workers and two million cultivators, it is the daily bread. To the nation, it is a "Kamadhenu" yielding the highest excise duty for any commodity—revenue for 1958-59 being Rs. 52.27 crores, Rs. 70.49 crores for 1959-60 and expected Rs. 78 crores for 1960-61.

Maharashtra Sugar Industry has no mean share.

Pioneers in twenties and early thirties founded this agro-industry with commendable foresight and effort. Its composite factory-farms revolutionised cane agriculture in Maharashtra and established suitable varieties and cultural practices. Today the industry is justifiably proud of its outstanding achievements on farms which hold their own with world figures. Average sugar-cane yield on these factory-farms is 53.5 tons/acre against all-India average of 14.5 tons/acre and against published world standards set by Java and Hawaii States respectively at 56.20 and 62.05. Maharashtra Sugar Mills and Godavari plantations are prouder still with their respective yields at 62.5 tons and 64.1 tons per acre this season. Yield of sugar per acre in Godavari Sugar Mills Farms 7.36 and Maharashtra Sugar Mills farms 7.80.

For the sake of agricultural productivity

NEWS IN BRIEF

INDIAN

It is reported the question of further streamlining the arrangements for adequate supply of raw materials like steel and non-ferrous metals for the small-scale industries will be considered at a two-day meeting of the Small Scale Industries Board to be held at Trivandrum on February 9 and 10 under the Chairmanship of Mr. Manubhai Shah, Union Minister of Industry.

The Central Board of Revenue has clarified that the newly introduced simplified procedure for determining the income-tax payable by persons who derive small incomes from business is applicable also to persons deriving income from a profession or vocation.

Recent mapping, structural interpretation and drilling work carried out by the Geological Survey of India have revealed the extension of two important coal seams in new areas of the Raniganj coalfield as potential sources of metallurgical coal.

With the total production of more than 10,35,000 tons of coal in January 1961 from the collieries under the National Coal Development Corporation, the rate of production has now exceeded 12.4 million tons per year.

The share capital of South India Viscose Ltd., is to be increased by the issue of rights shares. The existing shareholders of the company are offered two new shares at a premium of Rs. 5 per share for every five shares held.

The World Bank is likely to extend credits totalling 30 million dollars for the port development programme during the Third Plan. The programme embraces development and modernisation of the Calcutta and Bomhay ports and the establishment of a new port at Haldia as a subsidiary of Calcutta.

Austria has agreed to contribute credit worth nearly 28 million dollars to a World Bank consortium assisting India in the achievement of its Third Five-Year Plan.

The Union Government has extended the term of the Uppal Committee for the survey and reclamation of cultural wastelands in the country by three months till the end of March, 1961.

India-made clocks will be marketed for the first time in the country in March. Each clock will cost between Rs. 25 and Rs. 35. The factory has been set up by a Delhi firm in collaboration with a Japanese manufacturer at a place between Shahdara and Ghaziabad at a cost of Rs. 14 lakhs.

The Punjab Education Minister disclosed recently that after the introduction of free and compulsory education in the State (except Lahaul and Spiti) in April, the number of primary schools would increase from 12,000 to over 14,000 in five years. Six lakh children in the 6-11 age group would go to school and 12,600 more teachers would be employed during the Third Plan period.

The West Bengal Government's Rs. 25 crore Fertilizers Factory in Durgapore will be erected and initially operated in collaboration with a consortium of several U.S. firms, which will hold 51 per cent of the shares in the undertaking.

FOREIGN

It is reported Avro Aircraft, a subsidiary of A. V. Roe, Canada which, in turn, is controlled by the Hawker Siddeley Group, is entering a new industrial field — that of manufacturing automatic vending machines.

Philips' Incandescent Lamp Works of Eindhoven, is to issue a Sw. Frs. 50 million, 4½ per cent Bond Loan at par in Switzerland soon. Sole object is to pave the way into the Swiss capital market in case Philips needs to borrow a more substantial sum there later.

The Bundesbank is providing credits to the World Bank totalling \$158 million which would have fallen due in the 18 months beginning June 20, 1962.

The Krupp concern has arranged to borrow DM 30 million by the issue of notes at 99 per cent to a Cologne private bank, Sa. Oppenheim Jr. & Co. The loan will carry interest at 6½ per cent and redemption is to be complete in 15 years.

Canada has handed over to Pakistan a \$70 million multi-purpose hydro-electric project completed by it under the Colombo Plan. Canada has so far contributed \$98 million through the programme of which \$42.5 million have been spent on the completion of three power projects.

With an expected 1,327,000 tons of oil production this year, Yugoslavia will be able to meet current domestic requirements, says the Yugoslav news Agency, Tanjug. In 1960, output was 943,000 tons, 80 per cent up over 1959.

Practically all imports except essential foods and duty-free goods are affected by the heavier duties announced by the Ceylon Government. The minimum increase is 5 per cent ad valorem, but in some cases it is very much greater.

A project by Fiat to establish an assembly plant in Egypt to produce about 2,500 cars annually has been submitted to the State Council. The cars would have 1,100 and 1,400 c.c. engine capacity.

According to the Mines Department of Kuala Lumpur, the tin metal content of ore stocks in the Federation of Malaya fell from 7,866 tons to 2,378 tons in 1960.

Britain's home sales of cycles and motor cycles dropped last year, but exports of the two industries increased. Bicycle exports increased by 16 per cent, motorcycles and scooters by 3 per cent. Exporters had been most successful in the dollar markets.

The West German Government is quickly coming around to the view that it must commit itself to a regular annual contribution towards the Western effort for the poorer countries. An annual sum in the region of DM 2,500 million to DM 3,000 million for credits and grants is envisaged which would be somewhere around one per cent of the gross national product.

Special Article

THE "PERSONAL" DEMAND FOR SMALL CARS: 1960-65

(Contributed by the Economic Intelligence Unit of The Indian Institute of Public Opinion)

THE most recent issue of 'Monthly Public Opinion Surveys' of the Indian Institute of Public Opinion contains an exercise in what is described as the "associated" demand of some products in relation to the "defined" market for radio receivers. The value of the exercise lies in the fact that the market for radio receivers is precise since receivers are completely licensed. It is, therefore, of value in determining the extent to which those who possess radio receivers are in the market for other electrical goods. What is not so evident is the relation between those possessing radio receivers and small cars and here, admittedly, there has been merely an addendum to a questionnaire to see to what extent a floor can be built into the assessment of the small car market by association with the motivation, assets, and income capacity of radio receiver owners.

Provided one looks upon the exercise as a limited attempt to define one particular component of the demand for small cars and not an answer to the question of total demand (which must be largely "corporate" as well as "personal") the result might be deemed to throw some light on matters of interest to those who have joined in the small car controversy. In the first place, it is interesting to observe that in this all-India random urban sample on which 1267 responded, about 25.1 per cent said that they intended to buy a small car costing about Rs. 8,000 in all, inclusive of taxes, 60.2 per cent answered in the negative and 14.7 were undecided. As it is natural to be expected, most of this demand, in fact 98 per cent, is to be found in income groups above Rs. 400 per month. About 50 per cent of those interviewed in the "upper class" wish to buy a car. But 5 per cent of the "working class" people and about 13 per cent in the "lower middle class", with incomes below Rs. 250 per month said they would like to buy a car mostly on a hire-purchase basis. There is also interest in the distribution of the desire to buy a car. Of

those wanting to buy a car only one-fourth wish to buy it within a year, 13.2 per cent wish to buy it in two years, 11.6 per cent in three years and so on. Of the 318 persons, out of a sample of 1267, who wish to buy cars, 54.7 per cent think they can save and finance the amount from their own bank accounts while 25.2 per cent will need to raise a loan. One is agreeably surprised by the fact that proposed sales of other property or insurance to finance this operation are small. In other words, one need not expect substantial paid-up insurance policies to follow on the decision to purchase a car. Again, motivations in respect of various factors which make the demand for the small car operative are of special interest. 27.9 per cent of those desiring to buy a car consider it will improve their "income," 18.6 per cent their "efficiency", 16.4 per cent their "social contacts", 14.8 per cent, their "social status" in their community, 8.8 per cent think it will improve their "career prospects", though not their income currently, and about 5 per cent wanted a car for no reason except for additional "domestic comfort." However, "domestic comfort" on a second rating receives a high place amongst all those responding.

There is a powerful social element in the small car and it is quite clear that the new class of "potential" buyers is ready to make adjustments in social life and in economies of operation to obtain its heart's desire. Thus, about half of those who wish to buy a car would gladly allow the ladies in the house to drive it. Self-driving is already marked. As a matter of fact, out of 112 who already possess a small car about 37 per cent drive themselves. The average expenditure on the maintenance of a car is estimated at Rs. 182, distributed somewhat unevenly between income groups. So far as "potential" buyers are concerned, the average expenditure per intending buyer is much less, namely Rs. 95. Practically all of them intend to do without chauffeurs, but those who wish to have a chauffeur are

THE ESTIMATED DEMAND FOR SMALL CARS IN DIFFERENT INCOME GROUPS:
ALL INDIA (URBAN): 1960 & 1965-66

Monthly Household Income Range (Rs.)	1960		1965-66		Deviations in 1965-66 from 1960	
	Actual Users ('000 Households)	Percentage Distribution	Actual Users ('000 Households)	Percentage Distribution	(4)-(2) ('000 Households)	(5)-(3) Percentage
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1 — 100	—	—	—	—	—	—
101 — 200	—	—	—	—	—	—
201 — 300	—	—	—	—	—	—
301 — 400	22.3	1.8	26.3	1.7	4.0	-0.1
401 — 500	86.6	7.2	105.2	7.0	18.6	-0.2
501 — 600	87.3	7.2	95.9	6.3	8.6	-0.9
601 — 800	226.3	18.7	269.3	17.8	43.0	-0.9
Above 800	786.4	65.1	1,015.2	67.2	228.8	+2.1
Total	1,208.9	100.0	1,511.9	100.0	303.0	—

prepared to pay on an average only about Rs. 70 per month. It would appear, broadly there is an indication that the maintenance figure must have a ceiling of Rs. 100.

The Economic Intelligence Unit of the Indian Institute of Public Opinion working on the distribution of incomes, connected with previous studies, presents a current estimate of small cars in use at 1,20,000, a little less than half the total number of cars in use; 65 per cent are in use in households with an income above Rs. 800 per month. This last figure would go up slightly by 2 per cent in 1965-66 when the "personal" market for the small car is believed to rise to 1,50,000 providing additional demand, apart from replacement, of only 6,000 per year.

This figure is disappointingly low. If we assume replacement demand at 14,000 small cars a year and new cars at 6,000 perhaps the small car "personal" demand market might be only 20,000 a year. How large the corporate sector demand would be? The guess has been hazarded in this report that it will not be less than the "personal" sector as the temptation to use cars for official and business purposes is rapidly expanding. If so, the total demand for small cars might be of the order of 40,000 per year by 1965-66. That indeed would be a confirmation devoutly to be wished. The table and the graph, give the structure of the "personal" demand and the changes in income pattern likely to arise as a result of movements in income in the next five years. They are presented here for scrutiny. They seem to make the case for a new small car unit much more dubious than expected.

THE BUSINESS WORLD

The Precarious Pattern of World Trade

By WILLIAM REES-MOGG

LAST year saw British trade with India more nearly in balance than for many years past. The English customs figures for 1960 show that British imports from India amounted to £149.3 million, while British exports to India were £150.2 million, an apparent trade gap of a mere £900,000 compared with the gap of £22.3 million in 1959, or £21.9 million in 1958.

Of course this achievement is not quite as good as it looks. Both imports and exports are valued at British ports, which means that the value of the imports is increased by freight and insurance, both of which would largely have been in British hands, while the Indian exports from Britain would also have had to meet these charges after leaving Britain. The comparable Indian returns will inevitably show a less favourable position.

From the Indian point of view this approach to a bilateral balance in trade with Britain is obviously a matter for self congratulation. In a period of considerable scarcity of foreign exchange Indian exports to Britain have been increased by £6.5 million, while British exports to India have been cut by nearly £21 million. Nor is it such a bad bargain from Britain's point of view; if the trade gap had been larger Britain would have been under a correspondingly greater pressure to cover the gap by loans.

This is, however, a rather disturbing reminder that the process of industrialisation tends in an early stage to reduce the value of any country as a trading partner. Before a country stands to industrialise itself the familiar pattern of exports of raw materials and food balanced by imports, in industrial goods can be carried on. When industrialisation has reached an advanced stage there is a much greater interchange of much more advanced products.

It does not follow, however, that the movement from the first stage to the second will be at all smooth. It is much more likely that there will be periods when the development programme itself calls for a drastic revision in imports. This can be tolerated with any one country or at any one time, but they could impose a considerable strain on world trade if they became the common form of all developing countries at the same time.

The risk of this is all the worse because world trade is already so far fragmented. In Africa trade has been dislocated by flights of capital, or, as in the Congo, by the breakdown of order. Trade between Communist and other countries is always precarious and is much smaller than it would be if political divisions did not exist. Many of the South American countries suffer from acute balance of payments problems and unstable currencies. If one adds the other developing countries to this list then the expansion of world export trade must depend very largely on Europe, North America and Japan.

Last year it was indeed the movement of the American economy which put the British balance of trade into jeopardy. Of the total decline in Britain's balance of trade in 1960, as against the previous year, the decline in trade with the United States accounted for two-thirds. If British trade with America had held up there would still have been a comfortable balance of payments surplus. The deterioration was partly the result of the introduction of the compact American car, partly of the recession in the American economy, and partly of the liberalisation of American exports to Britain.

The British economy is certainly not alone in its dependence on the expansion of trade by the United States. After the war there was too much anxiety, though it seemed very well justified at the time, about the prospect of a permanent dollar shortage. With the dollar now itself under pressure that no longer concerns people. It is, however, still broadly true that the American economy can provide a dynamic force to expand world trade which cannot be provided by anyone else.

With the Kennedy administration's evident determination to expand the American economy one can hope that the United States will in fact provide this impetus. A combination of the European expansion combined with a big revival in the United States would provide a splendid prospect for world trade as a whole. There will, however, remain a serious problem of the sound-barrier of expansion for the developing countries. It will be when the large developing countries are past that stage, which may take a generation, that the really enormous expansion in world trade can begin.

Kerala Calling

By CROESUS

A CORDIAL invitation to entrepreneurs, both within the State and outside, to exploit the vast potential resources of Kerala which await to be tapped was extended by Mr. V. V. Giri, the State Governor, when he inaugurated the Kerala Development Conference in Bombay, last week. It is a proof of his earnestness and his profound faith in the particular mission that notwithstanding the limitations of his position as a

constitutional Governor, he came down all the way from Trivandrum for this purpose. Not only he, but some State Ministers—though not all of them, including the Chief Minister and the Deputy Chief Minister, who were also scheduled to come—and the State's energetic and enthusiastic Industries Secretary—Mr. Abdus Salam—were present, doubtless to impress the industrialists of Bombay with their earnestness. Those

present could not possibly help contrasting this keen earnestness of the Kerala State with the seeming callousness of the Maharashtra State as evidenced in its Land Ceiling Bill which has sent joint-stock company sugar interests scampering around. The Keralites also seem to have shown a better sense of realism than the U.P. people did some time ago, when, led by Dr. Sampurnanand, the erstwhile Chief Minister of the State, they wanted to establish a high-powered U.P. Lobby in Delhi to ensure that their State's case for economic development did not go by default. Evidently Kerala believes in itself paving the way for the economic development of the State, rather than bring pressure to bear on the Centre to allot more industries to the State. This desire to stand on its own feet and the undiluted preference presumably for private enterprise from a State generally believed to be the central cell of the Communists in the country should carry a moral to other States.

The economic situation in Kerala, as the Kerala Governor said, is characterised by the paradox of unemployment and under-employment of manpower, on the one hand, and the unutilised natural resources, on the other. The problem of developing any such economy is primarily one of harnessing the unexploited resources available more effectively than has been possible so far. Accordingly, touching upon the broad opportunities that exist in the State for private industrialists, Mr. Giri particularly stressed two points which should interest every 'entrepreneur', namely, (i) the natural resources in the form of valuable and varied raw materials, mineral forest produce, and (ii) the abundant supply of electric power. Perhaps Kerala is among the few States which have a larger installed capacity of hydro-electric power than the present demand or potential load (as things stand today) seem to warrant.

On the specific question of assistance to private industrialists willing to set up industries in Kerala, Mr. Giri went on to recall how even the erstwhile State of Travancore had followed a progressive policy in the matter of development of large-scale industries by holding out incentives to stimulate capital formation and even participating liberally in the share capital structure of the concerns established. In some cases, he pointed out, the Government had not only provided a major portion of the share capital but also made power available at cheap rates, besides placing at the disposal of the concern large areas of reserve forest. But this is past history, it may be argued. So, turning to the industrial policy of the present Government, the Kerala Governor said: "The Industrial Policy Statement of the Government of Kerala dated 3-6-1960 is an important landmark. It underlines the two basic principles which inform the Industrial Policy of the State which are: maximum aid to industrialists and a fair deal to labour. The Policy Statement reiterates that the private sector has necessarily to play a vital role in the industrialisation of the State." Assistance to industries in a number of ways, such as acquisition of land, supply of cheap power, grant of industrial licence, provision of factory accommodation at concessional

rates in industrial estates, help in obtaining supply of machinery and marketing facilities, etc., has been offered by the Government of Kerala to prospective industrialists, who want to set up new industries in the State. Incidentally, the Kerala Government has proposed an outlay of Rs. 500 lakhs for share capital participation during the Third Plan period. In keeping with the policy of encouraging industries in the State, Mr. Giri disclosed that the State Government has been giving substantial concessions to products of indigenous industries in the matter of its store purchase. One such important concession specifically mentioned by him was the maximum rate of price preference allowable to local products over products from outside the State on a given scale, other things like quality, terms of delivery, etc. being equal: (a) 15 per cent, for the products of small-scale and cottage industries in which Government have taken shares; (b) 10 per cent for the production of other small-scale and cottage industries; and (c) 5 per cent for the products of medium and large-scale industries.

Being a veteran trade unionists himself, Mr. Giri did not forget to touch on the subject of labour situation in the State. Alluding to the understandable existence of considerable misapprehension about the labour situation in Kerala, he remarked that it looked as though the hackneyed proverb "give the dog a bad name and hang it" was being utilized to condemn labour in the State. In order to remove this impression, the Kerala Governor assured his Bombay audience that, unlike in some other parts of India, labour in Kerala was both organised and educated, and added that, as such, the workers were fully alive to their rights and responsibilities and looked to their unions invariably for the redress of their grievances. Lest this should be interpreted as anything in the nature of an unenviable prospect of endless wrangle between industry and labour, he hastened to quote what he described as "a spirited offer" of one of the foremost trade union leaders of the State made at a recent conference: "Truce is transient and smacks as though a perpetual war between labour and management is going on. What we want is peace, peace that can bring prosperity for the workers, profit for the employers, price-reduction for the consumer and the general welfare of all". Mr. Giri also quoted from a resolution of the Industrial Relations Board, adopted at about the same time at Travandrum, to give a correct picture of the prevailing climate, which many in the audience actually seemed to demand.

After listening to Mr. Giri and several other speakers who addressed the Conference, in particular the encouraging message of Mr. G. D. Birla in the course of which he disclosed that he undertook to do his best to contribute to providing employment to the people of Kerala—he had already embarked on a Rs. 7-crore project, he disclosed—many an industrialist must have left the Conference Hall seriously to consider if he should not respond to this stirring "Come to Kerala" call. Well done Keralites!

Business Notes

Agro-Industry

WHITHER MAHARASHTRA?

"THE GOVERNMENT'S aim is to transform the present agricultural economy into a dynamic agro-industrial economy resulting in more production, dispersal of industries against their present concentration in a few cities, more employment to the rural people and better living conditions and amenities for them." Thus reads

a passage in the address of the Governor of Maharashtra, Mr. Sri Prakasa, to the joint session of the Maharashtra State Legislature in Bombay, last week. Also among other things, Mr. Sri Prakasa said: "In agriculture, apart from improving agricultural wages and technique of providing irrigation facilities, Government will tackle the subject of land reforms, affecting, as it does, the lives and fortunes of millions of our peasants, both from the human and economic aspects." This is commendable in so far as it goes, but when, in

this connection, the Governor proceeded to refer to the Government's Land Ceiling Bill, claimed that it was aimed at securing economic and social justice and removing the disparities in land holdings and went on to add that a noticeable feature of the Bill was that no exception would be made in the case of large industrial undertakings, e.g. sugar factories, both he and his Government apparently failed to realise that, consciously or unconsciously, they are aiming at a course of action that will inflict irretrievable harm to the pride of the Maharashtra State, the Sugar Industry, the typical agro-industry of our country today. It is possible—although even this is doubtful—that uninterrupted supplies of agricultural raw material (sugar-cane) may be arranged—but not ensured—by the Government so as not to affect sugar output, but producing a certain quantity of any kind of sugar is one thing, while turning out sugar of the best quality as the joint-stock sugar companies in the Deccan have been doing is another. It is doubtful, if, in the distribution of surplus land, consequent on the proposed bill, co-operative farming societies and landless labourers are to be allotted priority, on the ground that co-operation needs to play a very important role in the economic development of the State in the process of change-over from a "rural" to an "agro-industrial" economy, the results would be as anticipated by the Government. Maybe, the integrated co-operative credit structure, thanks to the seemingly inexhaustible funds that the Reserve Bank is prepared to plough into the movement without necessarily satisfying any scientific criterion that used to be insisted upon all along, is today in a position to undertake the financing of agricultural production and industrial activities to a larger extent. But, then, has the available record of the co-operativised industrial sector been such as to justify this tall claim? Only future events should establish it.

Among various other points covered by the Governor in his 20-page address was a notable reference to the controversy over the distribution of waters of the Krishna and the Godavari rivers. The Governor said he was very glad that, in its last session, the Legislature had given its unanimous support to Government in its effort to get the 1951 agreement with Andhra revised. As he rightly observed, this is no question of narrow interests or prestige as between one State and another, but of making the best possible use of the available supplies of water in the interests of the people who need them.

Foreign Trade

INDIA'S TRADE WITH THE U.K. & WEST EUROPE

THE WORLD TRADE DEPARTMENT of the Indian Chamber of Commerce, Calcutta, has brought out recently a study on India's export trade with the U.K. and West Europe. The analysis of trade with these countries is quite timely particularly when India is trying to diversify her export and has a pressing necessity to reduce her trade deficit with these countries. In particular, her deficit with West Germany is posing a serious question mark. The suggestions for improving the trade relate mainly to the quality of the commodities and "research" so that India may be in a position to capture the markets abroad. Publicity which is very important has been stressed time and again. Although the suggestions have been repeated quite often, they need to be reiterated to ensure that they are implemented with speed and efficiency.

The adverse balance of trade has been the greatest with West Germany, because of our large purchases of plant, machinery and industrial raw materials from that

country and West Germany's lack of response in increasing her intake of Indian exports. India's exports to West Germany in 1959 amounted only to Rs. 19 crores as compared with her imports of Rs. 119 crores from that country. This gives a spectacular deficit of Rs. 100 crores in a single year. The study also points out that although the formation of trade blocs might affect our export trade, the position is not altogether serious.

The scope for increasing our export trade with countries of this region like France, Italy, Switzerland, Denmark, Holland, Belgium, Austria and Sweden is exhaustively dealt with in this study and the conclusion is drawn that there exists a demand for some of India's goods in view of the rapid expansion of industry going on in those countries. The goods that could be exported in large quantities, are raw materials, vegetable oils, hides and skins, spices, tobacco, coffee etc. Apart from these traditional items scope also exists for other commodities like handicrafts, coir-mats, carpets and floor-covering, cashewnuts and walnuts, preserved fruits, sheep casings as well as engineering goods like sewing machines etc. India's export promotion drive needs a fresh acceleration if only as a defensive action to reduce her deficits with this region.

ENROLMENT OF EXPORTERS

A SCHEME of enrolment of exporters as an export promotion measure has been finalised by the Government of India. While the scheme envisages the enforcement of certain minimum standards for the conduct of business on the part of exporters, they would be entitled to certain facilities and advantages. The Export Promotion Councils and the Commodity Boards will be the enrolling authorities in respect of commodities in their charge. For other commodities, the Director-General of Commercial Intelligence and Statistics, Calcutta, will be the enrolling authority.

To be eligible for registration the exporters will have to undertake to use standard contract forms for export; submit consignments for pre-shipment inspection as may be required; abide by the decision of the enrolling authority in the case of disputes in the matter of export contracts; follow the standards of quality and packing; follow the Code of Conduct when enrolled for the general guidance of exporters and manufacturers and abide by the provisions of any scheme evolved by the enrolling authorities for regulating the utilisation of shipping space for export purposes. For the benefit of the enrolled exporters, their names will be supplied to the Trade Commissioners and Commercial Secretaries abroad for being introduced to the local importers and will be included in the Directory of Exporters published by the Director-General of Commercial Intelligence. Other facilities which they will enjoy are grants of import licences for raw materials entitled under the export promotion schemes, priority for movement by rail and allocation of freight space, drawback and rebate of import and excise duties, etc.

The Directorate of Export Promotion has been wise in seeking the association of the Federation of Indian Chambers of Commerce and Industry and Associated Chambers of Commerce while examining the appeals. The whole scheme appears to have been conceived on a sound basis and it is likely to step up Indian exports considerably. The foreign markets will develop more confidence in Indian goods which, in certain cases at least, they lacked till recently. It is, however, very necessary that the procedural delays are not allowed to neutralise the positive advantages of the scheme.

Calcutta.**FROM THE CAPITAL'S CORRIDORS****NEOGY COMMITTEE'S REPORT ON ROAD-RAIL CO-ORDINATION**

The preliminary report submitted by the Committee on Transport Policy and Co-ordination sets out careful thoughts on various questions which are relevant in formulating a long-term transport policy. The Committee has refrained from making any recommendations at this stage, because it feels that any rational scheme of co-ordination between road transport and railways can only be put forward as part of a sound long-term policy. The Committee acknowledges the inadequacy of data available, particularly in respect of means of transport other than the railways. One of the most useful studies done by the committee is in respect of the factual sample surveys on six selected routes in the country to make an assessment of the nature of quantum of traffic moving by road. An enquiry into the cost of operation of a few selected road transport undertakings has also been undertaken.

The Committee bases its deliberations on the conclusion that the recent expansion of transportation demand has been at a substantially faster rate than the increase in national income or the growth of production in any sector of the economy. This indicates that these trends will continue for the next 10 or 15 years. Thus, there is enough scope for development of both railways and road transport, having regard to the requirements of the growing economy. The volume of traffic moved by the Indian Railways, particularly since the commencement of the First Five-Year Plan, has increased from about 92 million tons in 1950-51 to about 156 million tons in 1960-61, that is, an increase of 59 per cent. In terms of ton-miles, the traffic on the railways during this period shows an increase of about 100 per cent. There has been a similar expansion in the field of road transport. The number of goods vehicles on the road has almost doubled, from 73,000 to 145,000 between 1948-49 and 1958-59. The number of buses during the same period has increased from 27,275 to 44,744, that is, by 64 per cent. In addition, the average capacity of the vehicles over the period has increased substantially due to replacement of patrol vehicles by heavier diesel vehicles.

PREFERENCE FOR ROAD TRANSPORT

The Committee finds that use of road transport for movement of goods is being increasingly resorted to by a large number of commercial undertakings. Firms prefer road transport for long distance haulage in respect of several types of traffic for a number of reasons. The share of rail transport in the movement of goods has accordingly declined. Commodities which have to bear comparatively higher freight rates on the railways are being increasingly diverted to road transport. On the other hand, the share of comparatively low-rated commodities in the total freight traffic carried by railways has had a tendency to increase, and is likely to increase further in the coming years, since the freight rate for low-rated commodities like coal, ores, food-grains and salt falls sharply with increase in the distance of haulage. The Committee has shown that in respect of a number of low-rated commodities, the railways have to incur a loss both on broad gauge and meter gauge lines. There are a number of other commodities like sugar, cement, tea, fresh fruits and vegetables in respect of which railways lose on the meter gauge system only. If the share of low-rated commodities in the total railway freight traffic is to increase in future, it is bound to affect the financial position of the railways adversely. A review of the recent trend in the railway finances shows that the

increase in railway earnings during the recent years has not been commensurate with the increase in the capital-at-charge of the railways. In the last few years, withdrawals from the Railway Development Fund have been of a much higher order than appropriations to the Fund, so that the railway have had to resort to loans from the General Revenue. Withdrawals from the Depreciation Reserve Fund have also been of a higher order than appropriations to the Fund, and this has been made possible by means of drawing on the previous balances in the Fund. While the railways might be expected to meet their short-term financial commitments by increases in fares and freight, it may be impossible to avoid major modifications in the railway rating structure in the long run, in view of changing pattern of railway traffic and the capacity of the railways to compete with other means of transport.

CHANGES REQUIRED IN RATE STRUCTURE OF RAILWAYS

An important question posed in the Report of the Committee is what are the changes required in the railway rating structure to enable them to meet their financial obligations and what will be the repercussions of these changes on the economy of the country. The railways rating structure is much less based on the cost of the service provided by the railways than on "the value of service," or what is commonly known as the principle of "charging what the traffic will bear." Thus, rates of certain basic commodities like coal, food-grains, ores, etc., are kept specially low in keeping with the requirements of the economy. The Committee has said that it is difficult to work out the financial implications of the differential rating structure which the railways have been called upon to adopt from time to time in the public interest. It has been pointed out, however, that if coal were charged at the same rate as iron ore and other ores, the railways would earn an additional income of Rs. 23 crores per annum. Thus, the railways are at a comparative disadvantage vis-a-vis roads in respect of basic commodities mentioned above, even though the average cost of haulage by road is substantially higher than the cost of haulage by rail.

There are a number of other important social obligations which the railways have to shoulder by virtue of their role as a public utility undertaking. The total value of some important concessions given by the railways to students, Bharat Scouts, and girl guides, blind persons, etc., during 1958-59 is estimated to be about Rs. 3.6 crores, which includes Rs. 1.8 crores for military traffic, Rs. 0.3 crores for the Posts and Telegraphs department, and Rs. 1.5 crores for the other concessions given to the travelling public. In addition, the railways have to run uneconomic branch lines or sections, issue cheap season tickets, and to operate suburban or what are known as commuter services in large cities.

RAILWAY ADMINISTRATIVE ORGANISATION

The dual role of the railways as a commercial concern and also as a public utility undertaking brings the Committee to discuss the administrative set up of the railways and their relationship with the Government. A statutory body, according to the Committee, should manage the railways without the day-to-day interference of the Government. As regards management of nationalised passenger road transport undertakings, the Committee has expressed itself in favour of corporations being constituted with the participation of railways. The most important consideration

in favour of the corporation form of management is the need to achieve, by mutual agreement, co-ordination between two public undertakings, namely, transport undertakings on the one hand and railways on the other.

As regards the present state of organisation of the private road transport industry, the Committee poses the question: whether the industry could be made to follow any code of conduct or discipline, such as might be necessary in the interest of road-rail co-ordination. The basic question to consider, it says, is: whether the road transport industry could be so organised that it could be depended upon to undertake public service obligations similar to those which are placed on the railways. The investigations of the Committee reveal that the road transport industry in the private sector, particularly in freight services, is owned at present, by a large number of small operators, a majority of whom own just one vehicle each. A comparatively recent development is the growth of the so-called booking agencies who are intermediaries to the industry undertaking booking of business on behalf of the operators on a commission basis. In the absence of any regulation they indulge in bargaining with individual operators, who, due to various reasons, find themselves at their mercy. The Committee's attention has also been drawn to several malpractices prevalent in the industry, such as overloading, evasion of taxes, and circumvention of regulatory measures imposed under the law. The Government of India's attempt to form viable units in the industry and to operate road transport services according to law, the Committee thinks, have met with little success.

METHODS OF CO-ORDINATION OF RAIL-ROAD TRANSPORT

Experience of foreign countries indicates that there are broadly three ways of securing co-ordinated development of roads and rail transport on equal terms. Firstly, there is the possibility of allowing free unrestricted competition between different forms of transport. Secondly, the necessary co-ordination may be achieved through appropriate Government regulation. The third alternative is for the road and rail services to be integrated into one single unit, responsible for the joint management of all forms of transport, so that the problem of co-ordination will be not from outside but from within the authority. It may, at first sight, seem that "in Indian conditions only the second of the three alternatives mentioned above has any relevance, at any rate in the immediate future." The Committee, however, adds that it would be wrong to dismiss summarily the first and third alternatives, particularly because it cannot be claimed that the second has met with complete success in the other countries. The Committee desires elicitation of public opinion on each of these three alternatives. The Committee feels that it would not be right to rely on regulatory measures to be devised ad hoc as and when any signs of unhealthy competition between rail and road transport appear.

Recently a view has been expressed at an international expert level that in India "road transport should be equipped to handle more of the traffic which is usually carried by road in other countries—marketing of agricultural produce, distribution of factory products, local bus services, and so forth. . . . There may be loss of revenue to the railways, but this can be met by raising freights for bulk commodities." A detailed study of the implications of these suggestions, in all their aspects, has yet to be made.

The Committee is of the opinion that nationalisation of the entire road transport system will itself

raise many problems, though it may be achieved by suitable stages.

LICENSING OF NEW INDUSTRIAL UNITS

The Government of India has revised the lists of industries in respect of which applications for licences under the Industries (Development and Regulation) Act would ordinarily be approved or rejected without reference to the Licensing Committee. These lists will remain in force up to September 30, 1961, after which they will be scrutinised again in the light of the installed capacity reached by then.

In the list of industries in respect of which applications for setting up new units will ordinarily be approved without reference to the Licensing Committee are included 23 engineering industries and 21 non-engineering industries. The engineering industries included in this list are: Boilers and steam generating plants, i.e., all items falling under serial No. 3 of the First Schedule to the Industries (Development and Regulation) Act; Conveyors-chain, belt and screws; Construction machinery; Electrical switchgear; Fabricated structurals (Heavy); Garage equipment and garage tools; Hosiery and knitting machinery; Industrial machinery, i.e., all items falling under serial No. 8 (A to C) of the First Schedule to the Industries (Development and Regulation) Act, except air compressors; Instruments of all types such as meters, measuring instruments, drawing and surveying instruments, scientific and optical instruments; Ice making machinery; Machine tools; Malleable Castings and C.I. Castings; Machinery for milk and dairy industry; Precision industrial instruments i.e., all items falling under item No. 13 & 16 of the First Schedule to the Industries (Development and Regulation) Act; Radio components (excluding valves and transistors); Small Tools such as cutters, cutting tools; Sluice gates; Steel forgings; Structural ropeways, Twist drills; Transmission towers; Tungsten Carbides brazing of tips; Winches.

The non-engineering industries included in this list are: Abrasives grains; Bicycle tyres and tubes; Basic refractories; Camel Back (tyre retreading material); Crystal glass; Collieries in the public sector for production of coal; Finished leathers; Glass shells; Glass-lined equipment; Hollow building blocks; Laboratory glassware; Plate glass; Rubber/Canvas footwear; Rubber Prophylactics; Sintered magnesite; Special firebricks for steel and glass industry; Solvent extraction from cotton seed and cake (provided the State Governments concerned certify the availability of oilseeds and cakes in the area); S.W. Pipes; Table and pressedware of heat resisting glass; Technical gelatine, edible gelatine, Photographic gelatine; V and Fan Belts.

NO LICENCES TO BE GRANTED

The list of industries in respect of which applications for setting up new units will ordinarily be rejected without reference to the Licensing Committee includes 40 engineering industries and 45 non-engineering industries.

The engineering industries included in this list are: A.C.S.R. and all aluminium conductors; Air compressors; Automobile instruments; Aluminium foils; Bare copper conductors; Bearings—thin walled; Bifurcated rivets; Bicycle and bicycle parts and accessories other than rims, saddles, B.B. fittings, fork-head fittings and freewheels; Circles, sheets, rods and utensils of non-ferrous metals and stainless steel; Conduit pipes; Copper wire for non-electrical purposes; Collapsible tubes and rigid containers; Domestic refrigerators;

From India's past

A PLEDGE
FOR
INDIA'S
FUTURE

'ABUNDANCE of virtue, adaptability to the disease under treatment, capacity of being used in diverse ways, and undeterioration . . . ' so in his wisdom Charaka defined the properties of a Drug, in his great medical treatise compiled eighteen hundred years ago. Echoing down the centuries, the words of Charaka, of Vāgbhatta and Suśruta, who together formed the Triad of the Ancients of Indian medicine, remind us that the science of healing is ageless and universal.

On the occasion of the Official inauguration of their new factory at Kolshet, near Thana, in the distinguished presence of Dr. S. Radhakrishnan, Vice-President of India, SANDOZ pay tribute to the genius of the Ancients of Indian medicine . . . have adopted, for the commemorative seal, the words of Charaka which describe so well the qualities of the Drugs modern India needs.

SANDOZ PRODUCTS PRIVATE LIMITED

saving the city's water supply

On 1st October 1959, as rain and cyclone lashed Jamshedpur, a small group of Tata Steel workers hurried to a reservoir adjoining the Subarnarekha to save the city of Jamshedpur from a major disaster.

A raft, cut adrift by storm, stood poised on the very brink of a dam separating the reservoir and the river... threatening to hurtle down with the swelling current any moment and smash the water main running along a bridge over the river.

As catastrophe seemed imminent, 27-year old Shamsuddin Khan jumped into the swirling water. Fighting his way to the raft, he managed to pull it away. His colleagues gave him a hero's welcome and Tata Steel gave a reward of Rs. 500 and a permanent job to this brave son of an ex-employee.

Risking life from a sense of duty is a tradition that worker heroes like Shamsuddin are setting up in Jamshedpur, where industry is not merely a source of livelihood but a way of life.

JAMSHEDPUR THE STEEL CITY

JTN 4006

The Tata Iron and Steel Company Limited

Drums and barrels and tin containers (excepting those where the manufacture is for meeting the applicant's own requirements); Expanded metals; Earth moving machines; Flash light and torch containers; Ferro-manganese; General lighting lamps; Hurricane lanterns (except on a small-scale); wood screws, ordinary types, as indicated in part 1/54(b) of I.T.C. Schedule; Paper cones and tubing bobbins; Piston assemblies; Radio receivers except components; Room air-conditioners; Road rollers except expansions; Railway wagons; steel pipes and tubes (below 6" diameter); Spark plugs; Steel doors and windows (unless made from indigenous steel); Stranded wire (unless drawn from wire manufactured by applicant); Tungsten carbide tips from powder or ore; VIR and PVC cables; Welding electrodes; Wheels and rims; Wire ropes; Welded wire mesh (unless drawn from wire manufactured by applicant); Wire nails (unless from wire manufactured by applicant); Zinc strips; Radiators.

The non-engineering industries for which no licences will be issued during the period to September 30, 1961, are: Asbestos cement sheets or ordinary pipes, i.e. non-pressure pipes; Activated bleaching earth; Acetic acid except for captive consumption; Antibiotics viz., Penicillin, Streptomycin, Tetracyclines; Bismuth salts; Chloral hydrate; Calcium carbide; Calcium carbonate (precipitated); Cigarettes; Cotton mesh fabrics; Dyestuffs based on imported intermediates; Derivatives of 8-Hydroxyguanine viz., 8-7 Di-Iodo and 5-Choloro, 7-Iodo; East India Tanned (Semi-tanned) kips and skins; Fireworks and paper caps; Glass and mineral wool; Hollow-ware, including table and pressedware made on semi-automatic machines; Hydrogen peroxide; Liquid glucose; Match industry; Myrobalan extract; Oxalic, citric and formic acids; Photographic raw film and paper; Potassium chlorate; Phenol formaldehyde moulding powder; Soaps; Superphosphate; Sulpha drugs; Synthetic hormones; Surgeon's requisites viz., catgut sutures, adhesive tapes, plaster of Paris bandages; Salicylic acid, sodium salicylate, acetyl, salicylic acid; Sodium sulphite and by-sulphite; Sodium thiosulphate; Sulphur dioxide; Sodium aluminate; Sheet glass (including wire and figured glass); Textiles made of artificial silk; Urea formaldehyde resins; Urea formaldehyde moulding powder; Vegetable Oils (other than cottonseed oils); Vitamin 'A'; Vitamin 'C'; Vacuum brake hoses; Vanaspati; Waterproof fabrics; Zinc oxide.

COTTON SPINDLES & LOOMS

Applications for diversion of existing cotton spindles and looms to work on art silk will be ordinarily rejected, without reference to the Licensing Committee. Similarly, applications for licences to carry on the business of existing undertakings for the manufacture of copper and brass sheets, circles and rods from units which were not in existence on October 1, 1953, or which had not taken effective steps to set up their undertakings on or before that date, will not be considered. In the case of copper and brass utensils, applications for licences for taking over the business of existing undertakings from units, which had not been in existence on March 1, 1957, or which had not taken effective steps to set up their undertakings before that date, will also ordinarily be rejected without reference to the Licensing Committee.

INDUSTRIAL PRODUCTION

The latest estimates of 1960-61 industrial production, prepared by the Planning Commission, reveal that manufacture of road rollers, power-driven pumps and diesel engines is expected to exceed the output estimated at the time when the Third Plan Draft Outline was prepared. The output of caustic soda, cal-

cium carbide, plastics, synthetic detergents, power and industrial alcohol and acetylene gas, on the other hand, is anticipated to be somewhat lower. Production estimates of cotton yarn, jute goods, woollen and worsted yarn and woollen cloth have been substantially revised downwards, due probably to restricted imports of the raw materials required by these industries.

The following table gives at a glance the production estimates for these industries as included in the Third Plan Draft Outline and the current estimates:

Industry	Production in 1960-61		
	Estimated in the Draft Outline of the Third Plan	Latest Estimate	Difference Rise(+)/Fall(-)
1. Earth Moving Equipment			
Road Rollers (Nos.)	350	400	+50
2. Agricultural implements and machinery			
Power Driven Pumps ('000 Nos.)	86	90	+4
Diesel Engines ('000 Nos.)	33	40	+7
3. Heavy Chemicals			
Caustic Soda ('000 tons)	125	100	-25
Calcium Carbide ('000 tons)	20	12	-8
4. Drugs and Pharmaceuticals			
Plastics (polythylene P.V.C. polyesterene and others) ('000 tons)	11.5	11.0	-0.5
Synthetic detergents ('000 tons)	2.0	1.5	-0.5
5. Textiles			
Cotton Yarn (mil. lbs.)	1900	1800	-100
Jute Goods ('000 tons)	1100	1050	-50
Woollen and Worsted Yarn (mil. lbs.)	34	27	-7
Woollen cloth (mil. yds.)	23	15	-8
6. Miscellaneous			
Power and industrial alcohol (mil. gallons)	25	19	-6
Acetylene Gas (mil. c.ft)	105	80	-15

THIRD PLAN TARGETS REVISED

The Planning Commission has now fixed higher targets for accomplishment under the Third Five-Year Plan in respect of alloy, tool and special steels, aluminium, synthetic detergents and sugar. The following

table gives the new targets, compared to the ones included in the Draft Outline:

TARGETS FOR 1965-66

Industry	As set out in Draft Outline		Revised Targets	
	Capacity	Production	Capacity	Production
1. Alloy, tool and special steels (finished) ('000 tons)	200.0	200.0	250.0	250.0
2. Aluminium ('000 tons)	82.5	75.0	87.5	80.0
3. Synthetic Detergents ('000 tons)	12.5	10.0	20.0	20.0
4. Sugar (million tons)	3.0	3.0	3.5	3.5

TWO ORDINANCES ISSUED

The President has issued two ordinances this week. The first one, the Banking Companies Amendment Ordinance, promulgated on Saturday last, seeks to enable amalgamation of smaller banks with the State Bank of India. As the State Bank is not governed by the Banking Companies Act but by a special statute, the amalgamation of smaller banks with it could not be effected without the amendment brought about in the Banking Companies Act by this Ordinance. The Ordinance lays down that the banks taking over the assets and liabilities of the smaller banks will also have to take over all their employees. For three years the emoluments and terms and conditions of service of these employees will remain the same as prior to amalgamation. Meanwhile, no future Bank Award will be applicable to them. After the three-year period, these employees will be placed in the appropriate pay scales prevailing in the transferee banks at that time. Any dispute about fixation of pay scales will be referred to the Reserve Bank whose decision will be final.

The second Ordinance, issued on Monday, seeks to validate the collection of cess on sugarcane by the U.P. Government. The Uttar Pradesh Government under three of its Acts—The United Provinces Sugar Factories Control Act, 1938, the U.P. Sugarcane Regulation of Supply and Purchase Act, 1953, and the U.P. Sugarcane Cess Act, 1956—has collected Rs. 45 crores during the past 10 years. These Acts were held invalid by the Supreme Court recently. This Ordinance came into force with effect from February 3, the day on which the U.P. Government issued another Ordinance renaming the cess as purchase tax under item 54 of the State List in the Constitution.

UTILISATION OF RUSSIAN CREDIT

A team of economic experts from Russia has arrived here to discuss the projects to be financed with the 500 million roubles credit announced by the Soviet Union recently.

The Government of India, it is understood, wants this credit to be earmarked for the following projects: oil exploration (Rs. 10 crores); setting up of a refinery in Gujarat State (Rs. 15 crores); establishment of power plants (Rs. 25 crores); setting up a heavy compressors

and pump plant (Rs 15 crores); putting up of a ball and roller bearing plant (Rs 8 crores); manufacture of instruments (Rs. 5 crores).

TRADE DELEGATION FROM YUGOSLAVIA

A trade delegation from Yugoslavia, headed by Mr. J. Drausnik, of the Associated Manufacturers of Power and Industrial Equipment, arrived in New Delhi on February 8. The delegation includes representatives of Yugoslavia's ship-building and food processing industries and of firms connected with the manufacture of locomotives, chemicals, steam turbines, diesel motors, electrical engineering goods, water turbines, steam boilers, ventilating, thermal, milling and silo equipment. Six representatives of Yugoslavia's importers' organisations are also there in this delegation.

The delegation will, in consultation with the Government of India, finalise the projects to be financed with the 40 million dollars credit made available to this country by Yugoslavia sometime ago. Tentative discussions held so far envisage the utilisation of this credit for the purchase of four cargo ships, equipment for thermal and hydro-electric power stations, cement factories, food processing plants etc.

Yugoslavia recently sold one cargo ship to Ra'na Shipping Lines. Negotiations for the sale of another such ship to this company are said to be going on.

INDO-ITALIAN TRADE TALKS

The Italian Economic Mission, which is here these days, has started discussions with the Government of India on Indo-Italian trade matters. The Mission, among others, consists of Mr. Emilio Battista, Vice-President of the Commission for Industry and Commerce of the Senate of the Republic (Leader); Dr. Felice Di Falco, Director-General in the Ministry of Foreign Trade; Dr. Paolo Cavalli, Director of Messrs. FIAT, Torino; Dr. Marcello Merlo, Export Manager of Messrs. Finsider; and Mr. Giovanni Corbellari, Vice-President of General Confederation of Handicrafts.

Italy, as already reported in this column, is interested in entering into a long-term agreement on import of iron ore from this country.

DURGAPUR STEEL PLANT

According to the latest information available here, the expansion of the Durgapur Steel Plant to 1.6 million tons capacity can be achieved simply by better utilisation or preparation of raw materials rather than by any large-scale additions to the equipment itself. The new additions to the equipment called for are one blast furnace and one open hearth furnace for steel making.

COAL OUTPUT IN PUBLIC SECTOR

The public sector collieries attained an annual production rate of 12.4 million tons last month, according to a statement issued by the Union Ministry of Steel, Mines and Fuel. The production rate achieved in December, as reported in this column last week, was 8 million tons per annum. Most of the increase in output in January, it is understood, has been from the collieries located in Karanpura area.

BRIEFS

Of the one lakh tons of sugar released for export, contracts for the sale of 60,000 tons to foreign buyers are understood to have been entered into. The quantity shipped so far is about 30,000 tons.

The next meeting of the Import Advisory Council will be held on March 6. The Export Promotion Advisory Council will meet on the following day.

A PASSENGER FROM CALCUTTA WRITES:

... Just a line to thank you and KLM for looking after us so well prior to our departure from Dum Dum, and during the flight to London. The service on the plane was excellent and the hostesses charming ...

This extract is from an unsolicited letter: a photocopy can be obtained from KLM, Calcutta.

For that extra personalised service, there's nothing like flying KLM. Next time you visit EUROPE fly there

by **KLM's DC-8 JET**

DEPARTURE: New Delhi Saturday 22.35 hrs.

Excellent Prop-Jet connections from Amsterdam to the U.K.

ARRIVAL: London Sunday 13.50 hrs.

Sincerely yours

KLC-30

His costs will go up this month...

Because he has had a machine breakdown and has had to replace costly parts which were ruined by faulty lubrication. This didn't have to happen—a Caltex Lubrication Survey could have spotted the trouble—solved the problem.

Machinery shutdown means loss in production, time and money. Correct lubrication is therefore essential to ensure the protection and efficient operation of costly machinery. Planned lubrication is vital for increased production at lower costs.

This service is yours for the asking—call in your Caltex Lubrication Engineer—arrange for a correct lubrication programme for your plant. Let us help you in conserving parts and money.

PLANNED LUBRICATION—A VITAL FACTOR IN COST CONTROL

CALTEX (INDIA) LIMITED Bombay • New Delhi • Calcutta • Madras

COMPANY AFFAIRS

NEW INDIA SUGAR

In their report for the year to June 30, 1960, the Directors of the New India Sugar Mills Ltd. have observed that the Government of India announced certain incentives to the sugar factories to encourage increased production of sugar. The incentives were in the shape of a concession of 31 mP. per maund of cane crushed up to November 21, 1959 if crushing was started on or before November 10, 1959 and a rebate of 50 per cent. of the basic excise duty on production during the season 1959-60 in excess of the average production of the seasons 1957-58 and 1958-59. The excess production in the case of the Company, amounted to about 43,278 maunds. Direct allotment by the Government in respect of sugar released for internal consumption as also control on distribution and price of sugar are continuing. In October 1960 the Government of India allotted an export quota of 299.49 tons of sugar from the production of the season 1959-60 to the mills of the company against a quota of 77.37 tons from the production of season 1958-59.

During the year under review the factory worked for 148 days and crushed 42,70,529 maunds of sugar cane against 112 days and crushing of 32,88,397 maunds in the previous year. The recovery was lower at 9.16% against 9.8% in the previous year. The lower recovery which was in common with the other sugar mills in North Bihar was due to the cane crop having been affected by drought and red rot disease. During the current season a crushing of about 55 lakh maunds of cane is expected.

During the year under review the profit recorded was to the extent of Rs. 12.47 lakhs. After providing for depreciation and development rebate there was a balance of Rs. 8.97 lakhs. A sum of Rs. 4.45 lakhs was transferred towards taxation. The Directors recommended the payment of dividend subject to reduction of tax under income-tax act on ordinary shares of Rs. 10 each at the rate of Rs. 3.65 per share which absorbed Rs. 2.88 lakhs. In view of the recent changes brought about by the Finance Acts 1959 and 1960 in the matter of deduction of tax on dividends, the Company declared and paid dividend for the year ended 30th June 1959 on 486 7½% tax-free participating Preference Shares at a rate which after deduction of tax at 30 per cent amounted to 9 per cent. As regards 10,000 5½ per cent taxable Preference Shares, the dividend was declared and paid at the rate of 5½ per cent without deduction of tax paid by the company on its profits. Since then, the Preference Shares (Regulation of Dividend) Act 1960 has been passed. The Directors, however, feel and recommend that the rights attached to 486 tax free participating Preference Shares should be so modified as to confer on them a right to a dividend at the rate of 10.71 per cent subject to deduction of tax under the Income-tax Act instead of 7½ per cent tax free and with right to participate for additional dividend up to a limit of 1.5 per cent subject to deduction of tax as aforesaid if the ordinary shareholders are paid dividend of 10.71 per cent. As regards 10,000 Preference Shares the Directors recommended that their rights be modified so as to entitle them to a dividend at the rate of 5½ per cent without deduction of tax at rates prescribed under the Income-tax Act. The requisite circular is being separately issued convening class meetings for sanction of the different classes of shareholders.

BHARAT STARCH & CHEMICALS

Although the Government banned the use of indigenous maize in Starch Factories, it allowed import of American maize under P.L. 480 to meet the requirements of Starch Industry. During the year to January 31, 1960 Starch Section of the Bharat Starch & Chemicals Ltd. worked for 331 days. 10,532 metric tons of maize were crushed and about 6,700 metric tons of starch were manufactured. To fill the gap in the requirements of the factories it received about 1,900 tons of maize through R.D.F., Bombay. The sales of starch were carried out according to the starch manufacturers agreement. And total sale of starch and derivatives by the company came to around 6,400 metric tons against 6,000 metric tons during the last year. After providing Rs. 2.48 lakhs towards interest and Rs. 2.82 lakhs towards depreciation, there was a profit of Rs. 65,500, which is carried forward.

ANDHRA BANK

It is reported that the net profit of the Andhra Bank Ltd. for the year 1960 after payment of one month's pay as bonus to staff and before making necessary provisions amounted to Rs. 12,00,759/- (subject to audit) as against a net profit of Rs. 9,63,595/- for the year 1959.

COMMODITY NEWS AND NOTES

PRODUCTION OF LEAD ZINC ORES IN INDIA

The production of lead-zinc ores in India during January-November 1960 was 139,000 tonnes as compared to 147,000 tonnes in the corresponding period of the preceding year, according to the Indian Bureau of Mines. The entire output was reported from the Zawar mines in Udaipur district. The recovery of lead and zinc concentrates amounted to 5,622 tonnes and 8,953 tonnes as compared to 5,855 tonnes and 8,909 tonnes, respectively, in the corresponding period of the preceding year. Lead concentrates are sent to the lessee's smelter at Tandoo in Bihar State for extraction of lead and silver while zinc concentrates are shipped to Japan for smelting of zinc, as there is no zinc smelter in India at present. The production of lead metal during January-November 1960 was 3,342 tonnes as compared to 3,648 tonnes in the corresponding period of 1959.

SELLING PRICES OF CAUSTIC SODA REVISED

The Government of India have revised the ex-factory prices for different kinds of caustic soda. The revised prices, which will remain in force for one year from February 1, 1961, will be as follows:

Name of article	Revised prices (per cwt.)
Caustic soda flakes	Rs. 41.50 (on ISI basis)
Solid	Rs. 36.50 (on ISI basis)
Caustic Liquid	Rs. 31.50 (on 100% basis)

There will be no change in the prices of dry gas chlorine, liquid chlorine and hydrochloric acid.

The prices of fused caustic soda, caustic lye, caustic soda flakes, dry gas chlorine, liquid chlorine and hydrochloric acid had been announced after consultation with the Tariff Commission on October 27, 1959. These prices were to remain in force till December 31, 1960. Pending the completion of the review of these prices, they continued to remain in force till January 31, 1961. The review has now been completed, taking into account the representations that were received from the industry.

REVISED SELLING PRICES OF BLEACHING POWDER ANNOUNCED

The Government of India have revised the fair ex-works ceiling prices for different bulk packings of bleaching powder entering the wholesale trade. These prices will remain in force for a period of six months from February 1, 1961.

The revised prices will be:

Size of packing Kgs.	Revised ex-works ceiling prices Rs.
100	57.10
55	32.55
25	16.10
12.5	9.25
3.0	3.00
1.5	1.70
0.5	0.85
0.25	0.75

The prices of bleaching powder in various sizes of packing had been announced after consultation with the Tariff Commission on May 31, 1960. Since then, various representations had been received from the manufacturers of bleaching powder for a revision of the prices.

IMPORT OF RAW WOOL AND WOOL TOPS

In the case of wool-tops, licences are being issued on an annual basis during the last two years, in order to enable the spinning mills to make their purchases at the most favourable prices. The question of what should be the basis of allocation of wool-tops to the spinning mills has been under consideration for some time and the industry itself has been divided in its views. A section of the industry has been pressing that licences should be issued on the basis of past consumption, while another section had been equally insistent that it should be on the basis of spindleage. In view of this extreme divergence of views, the Government have had to examine the question in some detail, so that a rational view could be adopted. As there was likely to be some delay in finalising this, 50% of the value of licences issued last year was released to meet the immediate requirements, and this was done in the second or third week of October. Licences were issued to mills within three or four days of receipt of applications and in a few cases, licences were issued even without application. There is, therefore, absolutely no ground for the reports which have appeared in some newspapers regarding the delay, particularly so when licences were issued this year very much earlier than in the previous years. Even if licences for the annual requirements had been issued, only 50% of the value could have been utilised within the half year. Instructions have since been issued regarding the issue of supplementary licences to the mills to cover the entire year's requirements and these licences are under issue. Having regard to the difficult foreign exchange position, the woollen industry has been treated very favourably and there is absolutely no justification for some of the mills to close down.

RAILWAY'S THIRD FIVE YEAR PLAN

(FINANCIAL FORECAST)

(Rs. Crores)

Heads	1960-61 Budget Estimate	1961-62	1962-63	1963-64	1964-65	1965-66	Total
I Capital at charge at the end of each year	1563	1660	1841	2033	2186	2313	
II Gross Traffic Receipts							
Passengers	125.20	128.95	132.81	136.79	140.89	145.12	684.56
Other Coaching	24.95	25.32	25.45	25.70	26.08	26.47	129.02
Goods	304.35	320.28	340.84	361.77	383.82	429.13	1835.84
Sundry	10.00	10.10	10.20	10.30	10.40	10.50	51.50
Total	464.50	484.65	509.30	534.56	561.19	611.22	2700.92
III Working Expenses—							
Payment to worked lines and net miscellaneous expenditure	329.80	339.00	356.04	374.84	394.54	428.37	1892.79
IV Open Line Works—Revenue	14.00	12.00	12.00	12.00	12.00	12.00	60.00
V Net Revenue	120.70	133.65	141.26	147.72	154.65	170.85	748.13
VI Dividend payable to General Revenues At 4½ per cent.		64.63	69.94	77.59	84.50	90.03	386.69
VII Gross Surplus from which is met Appropriation to Depreciation Reserve Fund at 4½ per cent		69.02	71.32	70.13	70.15	80.82	361.44
VIII Appropriation to Depreciation Reserve Fund	45.00	65.00	67.00	70.00	73.00	75.00	350.00
IX Net Surplus At 4½ per cent		4.02	4.32	0.13	—2.85	5.82	11.44
X Average annual contribution that would be necessary to make from the final net surplus to the Development Fund in order to fulfil Third Plan Objectives		23*	23*	23*	23*	23*	115.00†

- Notes: * † (a) Includes Rs. 13 crores on the average annually—or Rs. 65 crores in five-year period as a whole—to meet the cost of users' amenities and Labour Welfare works only.
- (b) The Dividend is calculated on an assured pattern of year-wise increase in the Capital-at-charge—with reference to the Capital-at-charge at the end of each year after making adjustments therein for the element of over capitalisation etc. as per the 1954 Railway Convention Committee's Report.
- (c) The figures of earnings and expenses as in the Budget Estimates for 1960-61 have been shown as a basis for comparison, even though these would be affected substantially by various post-budget developments namely the general strike, unprecedented and widespread floods, further increase in coal price from 1.4.1960 and the Government's decision to give effect to the Pay Commission's essential recommendations in regard to pay and allowances in full from 1.7.1959 (instead of from 1.11.1959) which affects the arrears payable to staff in 1960-61 in respect of 1959-60.
- (d) The stepping up of the annual contribution to Depreciation Reserve Fund from Rs. 45 crores in 1960-61 to Rs. 65 crores in 1961-62 has led to the net surplus for 1961-62 dwindling to a very small figure. The real net surplus for 1960-61 in the Budget Estimates as pertaining strictly to that year would have been Rs. 26.43 crores if the arrear payments made in 1960-61 but pertaining to 1959-60 resulting from Pay Commissions recommendations is allowed for, and this surplus is more or less absorbed in 1961-62 by the additional appropriation of Rs. 20 crores to the Depreciation Reserve Fund.

Patrice Lumumba

THE news that Mr. Patrice Lumumba has been brutally murdered in the Katanga Province of the Congo has come as a rude shock to leaders in practically every country in the world. No one believed that his political enemies, with the spotlight of the world opinion so strongly centred on the Congo, could have stooped to vulgar political assassination as an instrument in the ruthless struggle for power which has gone on ever since the Congo attained independence. In the Indian Union, rightly or wrongly, the view is entertained that those in power in Katanga have been implicated in this foul deed. Rightly or wrongly, there is a feeling that murder has been abetted, in the Prime Minister's words, "in high places"; there is deep dismay that this should have happened under United Nations jurisdiction. The feeling that some action—unhappily undefined—should be taken against those responsible is widespread. The question now is whether the United Nations, bereft of all authority, is capable of giving any concrete form to the world's resentment.

The tragedy of the situation is not merely that a man of the people should have ended a courageous life in this manner. Opinions may well differ on the capacity that Mr. Lumumba had for leading his people out of the current chaos into an orderly parliamentary system. In the Indian Union, his capacity has been probably exaggerated. Nevertheless, there is no equal figure capable of uniting the people of the Congo and, at least, beginning the experiment of parliamentary democracy. His departure leaves the way open not merely for dictatorship and reaction, but also for deeper division and even more foreign criticism of the United Nations, its representatives in the Congo and all those who, because they are assisting to keep the Communists out, have tend-

ed to receive the support of the anti-Communist world. A central figure in the solution of the problem has departed leaving no man of any status capable of riding the storm.

It is necessary for us in India to take earnest thought for ourselves in the situation which has now arisen. Mr. Rajeshwar Dayal is not an officer of the Indian Union, but of the United Nations; but it is extremely unlikely that he will be reckoned as operating except in line with the views of the Indian Government. This suspicion has no doubt, dogged his footsteps from the beginning. While he has carried himself with superb courage and impartiality, the time has come for him to be withdrawn both because he will be increasingly ineffective, and because his motives which are of the highest, will not receive fair assessment. In his own statement, Mr. Dayal has talked about the question of "responsibility." It will be for him to enforce responsibility; has he the military power as well as the prestige in the Congo to enforce discipline in the highest places? One might doubt whether in the circumstances he can operate effectively.

This is the moment for the Indian Union, recognising how deeply involved the current situation is, to ask for Mr. Dayal's withdrawal and for someone less involved in current events to take his place. This is no censure on an officer who has performed, under conditions of incredible difficulty, an almost impossible task. It is merely a recognition of the hard fact that the nations of the world have not been able to give to the United Nations, whose representative he is, the power and the military strength wherewith he can perform his allotted task. Slowly, perhaps with all the staleness of history, the tragedies of Africa must unfold so that out of an old order there will come, through trial and tribulation, the birth of a new order.

a new. Mr. Patrice Lumumba might well be considered a forerunner of a new society. As the leader of that new society he has paid the supreme price. His death has been caused as much by his courage and daring against the forces of political backwardness as it is the expression of anti-

colonialism in the African scene. What has overcome him today is not Colonialism but the old order of African society. Perhaps if the new order can be better built on his supreme sacrifice, his tragic death, deeply mourned by thousands in many countries, will not have been in vain.

Railway Finances

THE Railway Budget for 1961-62 makes the disconcerting revelation that neither the lesson of the Second Five-Year Plan nor the challenge of an onerous assignment thrown up by the Third Five-Year Plan has produced the needed impact on the management of railway finances. Mr. Jagjivan Ram has taken care to stress that during the budget year there would be no revision of passenger fares and also of freight rates in general. The minor changes made in the surcharge on "smalls" and the adjustment made in the minimum distance charged for coal are intended as mild deterrents to divert uneconomic traffic away from the railways. In case the diversion does not materialise, they will make no mentionable impression on railway revenue. The inability of the railways to maintain bare equilibrium between revenue and expenditure to discharge their modest obligation to meet a fraction of the outlay on development in the Third Plan out of their internal resources is being overlooked. In maintaining the status quo in freight rates and fares, and thereby giving a further lease to stringency in railway finances, extraneous considerations seem to have weighed. But the status quo has come as a surprise even in an election year.

Mr. Jagjivan Ram entertains no doubts whatsoever on the extent to which fares and freight rates are out of tune with the rapid increase in the cost of transport. He has highlighted the fact that the present freight rates are uneconomic, particularly for long hauls and these are the categories which preponderate freight traffic carried by railways. It is difficult to see what readjustment the Neogy Committee can suggest beyond recommending a larger share of short and medium distance high-rated traffic for the railways. Specific recommendations regarding changes in the railway freight rate structure are beyond its competence. This is a reform which the Railway Minister ought to face squarely. He is clear in his mind about its magnitude. He has underscored the fact that the prices of materials and stores consumed by the railways have risen since 1938-39 by 350 per cent and the average annual cost per employee has gone up by 200 per cent., for which the increase of 70 per cent in passenger fares and of 100 per cent in freight rates is an utterly inadequate recompense.

But the case for higher revenue for the railways by means of higher fares and freight rates has acquired a new urgency by reason of the pre-swelling size of the development outlay. The present technique of financing railway development moves in a vicious circle. More loaned capital from the Central Exchequer directly goes to inflate the liability of the railways to pay the gross dividend to the Exchequer mainly to meet the interest charges. It is certainly not suggested that there is a total alternative to this mode of financing. But overcapitalisation can certainly be mitigated by raising railway earnings and providing greater room to draw at a higher rate from current revenues and the net surplus. In shirking this straightforward responsibility, the burden is being shifted from the transport user to the general taxpayer.

The financial performance of the railways in the current year, according to the revised estimates, does not argue for their efficiency. There has been a substantial decline of Rs. 15.4 crores in freight earnings. The partial strike of July 1960 which caused a loss of 3 million tons of traffic and large floods in some areas cannot wholly explain the shortfall of 8 million tons in the freight target. On the contrary, failure to make it good subsequently, when ample traffic was offering, demonstrates certain inflexibility in railway operations. The net surplus of the railways has fallen by Rs. 4.4 crores and the operating rate has worsened by 1 per cent to 81.1 per cent as compared to the budget estimate.

Against this background, it would be dogmatic to assert that the railways will be able to carry additional 15 million tons of traffic in the budget year. It is on this assumption that freight earnings are placed next year at Rs. 315 crores—an increase of Rs. 26.4 crores above the revised estimate for 1960-61. The net surplus will be Rs. 8.6 crores as against Rs. 14 crores for the current year. The gross dividend payable to the General Revenues will no doubt rise by Rs. 9 crores to Rs. 65.3 crores. This will be partly the price for acquiring additional capital-at-charge from the Exchequer to the extent of Rs. 181 crores and it will partly arise from the higher rate of dividend now fixed at 4.25 per cent—an increase of 0.25 per cent. But it cannot be overlooked that actually the net dividend received by the Exchequer will be reduced from 0.83 per cent to 0.67 per cent owing to the higher incidence of interest on the capital raised by means of loans.

As the railways embark on the Third Plan, they face the prospect of a marginal position for their reserve funds. This is very largely a legacy handed down by the financial management during the Second Plan. In the Second Plan the rate of appropriations to the Depreciation Reserve Fund was inadequate at Rs. 45 crores per annum. In the result, the depletion of the Fund had to be made at a very heavy rate. This Fund started with an opening balance of Rs. 103.5 crores at the beginning of the Second Plan, but the closing balance left in the Fund was only Rs. 14 crores. This balance, in fact, will be virtually the margin that will be available to meet any expenditure on replacement in excess of Rs. 350 crores in the Third Plan as envisaged and, in case the assumed order of prices changes upwards, the Fund will be driven to the extraordinary contingency of having to borrow from the Exchequer. In the budget year the allocations to the Fund will be Rs. 65 crores.

The Revenue Reserve Fund will get no appropriations during the Third Plan as the net surplus will be nominal. On the contrary, Rs. 8.6 crores are to be withdrawn from the Revenue Reserve Fund to discharge partially the liability of the Development Fund in respect of 'temporary loans' drawn from the Exchequer in the Second Plan. The Development Fund will get the allocation of the entire surplus of Rs. 8.6 crores in the budget

year. But it will need to borrow from the Exchequer Rs. 14.8 crores. This procedure of borrowing will go on without interruption in the Third Plan. Something like Rs. 100 crores will be found by the railways out of the Development Fund as their "own resources" for contribution to the outlay on development in this manner. This technique of "temporary loans" can be no substitute for raising internal resources.

The Transport Bottleneck

THE preliminary report of the Committee on Transport Policy and Coordination released recently stands in a class by itself. Normally, preliminary or interim reports are intended for the purpose of making positive recommendations for immediate decision and action until the final report is tendered. In this case the Neogy Committee has taken as much pains as would ordinarily be required for a full-fledged report, but it has modestly used the data as base material only to pose the issues which arise for determination in formulating a long-term policy for transport. The Committee has framed precise issues to elicit the views of a wide cross-section of the public.

One term of reference calls upon the Committee to define the role of the various means of transport during the periods of the Third and the Fourth Five-Year Plans. This term, however, is not altogether unqualified as it should have been, but it is circumscribed with the condition that the short-term policy for the next ten years should be indicated against the background of the long-term policy for transport which constitutes the bedrock of the Committee's assignment. This qualification renders any recommendations on the short-term policy impracticable unless the long-term policy is first defined. The Neogy Committee is hardly to be blamed if it is unable to indicate a positive transport policy for the Third Plan at this crucial stage when it is about to be finalised.

There is, nevertheless, overwhelming evidence in the report of the Committee which ought to be taken as a warning of the bottleneck in transport which threatens to be hardened in the Third Plan, particularly in the freight sector. To take one typical indicator, the outstandings of registrations of indents for wagons, computed in terms of days worth of loadings, are mounting up in the last two years on the broad-gauge, while the position on the metre-gauge is worse. But accumulations of registrations do not give the least idea of the crises produced at crucial times in industry after industry.

The Draft of the Third Plan estimates an increase of 81.5 million originating tons of traffic, including the requirements of the fourth public sector steel plant at Bokaro, for the railways. This is equivalent to an increase of 50 per cent over the traffic carried in the Second Plan. As much as 75 per cent of this increase, or 61.5 million tons, is allocated to steel and raw materials, coal and cement, while the provision for other categories of additional traffic is to be accommodated within the remaining 25 per cent. The estimates of the bulk traffic equivalent to 75 per cent are based on assumptions which are patently untenable. Thus, provision for steel traffic assumes its volume to be equivalent to the output at the plants and totally ignores multiple movements

The picture of railway finances at the start of the Third Plan demands an answer to inescapable question: Can the increase in fares and freight rates be postponed beyond the budget year? If the Railway Minister is so clear in his mind about the urgency of bringing fares and freights in alignment with actual cost of transport, why should there be any hesitation to face the choice?

involved from the plants to the wholesale stockists, to the fabricators, to the wholesalers and to the consuming centres. Miscellaneous traffic reckoned at 25 per cent is presumed to rise only at 6 per cent per annum as against the annual rate of 5 per cent in the Second Plan. This assumption is completely unrelated to the targets fixed for different industries. This broad magnitude of provision of rail capacity for additional traffic is the clearest indication of lack of correlation between its volume and rail capacity.

To minimize the magnitude of transport shortages in the Third Plan, resulting from the inability of the railways to move it, is the function principally of road transport. The potential capacity of motor transport to carry freight over long distance has been effectively demonstrated in recent years. The length of haulage on the roads has been pushed to limits ranging between 500 miles and 1,300 miles for a variety of goods—textiles, rubber tyres, footwear, machinery, and so forth. The provision made for its development in the Third Plan is, however, parsimonious. The allocation of outlay for road transport development has been cut down from Rs. 250 crores to Rs. 230 crores, in sharp contrast with the minimum outlay of Rs. 500 crores envisaged for the period by the Chief Engineers in their perspective plan.

The caution which the Neogy Committee seems to pronounce against a switch-over to long distance motor transport need not be disregarded. But the case for road transport does not at all rest on a plea for freedom to compete with the railways over long hauls, their proved potential notwithstanding. That case essentially rests on liberation of road transport from unfair restrictions currently imposed in the name of coordination and withholding the available scope for its expansion at a time when the economy is running desperately short of transport. The Committee's concern over the paucity of resources for development suffers from a lack of perspective when expressed in relation to road transport alone. Undoubtedly, all developmental programmes must be fitted into the available pool of resources and they cannot be planned on a greater scale than what the resources can afford.

Elsewhere it quotes, with obvious approval, the dictum emphasised by the ECAFE Working Party on Coordination of Transport to the effect that expansion of transport in an underdeveloped economy must be planned on a bigger scale than the expansion of the other sectors. This is to stress first priority in the allocation of resources to the infra-structure of the economy of which transport is a major component. Rather, it is an urgent plea to advocate provision of transport and other facilities in advance of the development of other sectors of the economy. The least that must be done is to plan their adequate expansion concurrently with other sectors. Even this minimum is being woefully ignored.

A DELHI DIARY

PIN-POINTED EXPERIENCE

THE week has been heavily clouded by the news of the murder of Patrice Lumumba; in Delhi there has been deep unhappiness that we have been so helpless in affording protection to someone who—for us in India at any rate—was a shining leader of parliamentary democracy in the African continent. The Prime Minister's dignified statement in Parliament, shortly after its opening, was meant for international consumption. His first (private) reaction with a reference to "murder in high places" reflects much more the Indian public's mood of anger and frustration. However, a leading article in "The Eastern Economist" deals with Mr. Lumumba and I am forbidden to tread on this dangerous ground. For the same reason—since a Business World piece deals with the new Indian Investment Centre, inaugurated by the Finance Minister at Sapru House on Thursday morning—I have been warned off the economic field. With politics and economics thus excluded by editorial decree from my purview, I am falling back on culture. Spiritually, I suppose, it is an ascent. The splendid pageant 'And There was Light' enacted in St. Thomas's School for Girls has given me what is sometimes described as "uplift"; it has done for me what politics and economics (and much improving literature) could not do. I have been, more literally, elevated this week by a flight in a Pilatus Porter aircraft which was demonstrated last Sunday at Safdarjung Airport. This holds out promise of landing me on the eternal snows one day, as did the Swiss expedition to Dhaulagiri. I, therefore, give myself over to two personal "uplifting" experiences this week instead of describing the muddy, and mundane, course of politics and economics.

AND THERE WAS LIGHT

I had no idea when I was invited to a Silver Jubilee Pageant at St. Thomas's School for Girls at Reading Road that I would encounter a Gandhian legend told with imagination and moving depth such as has never been seen in Delhi before. There happens to be a strictly local element in the picture. This is that Mahatma Gandhi actually passed and repassed on the grounds of St. Thomas's School in the days when he used to stay in the neighbouring Bhangi Colony. A bronze bust of Gandhiji was, therefore, a very suitable monument to a great leader. It was sculpted—is there such a word?—by Kewal Soni and unveiled by Professor Humayun Kabir, Minister for Cultural Affairs, shortly before the Cultural Pageant was staged on Friday. These might be described as the prologue and epilogue to a reliving of the Gandhian Age which (alas, like the Revolution itself!) is tending rapidly to recede from our memories.

The Pageant employed a clever flash-back method; it moved backwards instead of forwards, starting with the assassination of Mahatma Gandhi in 1948, with all the marks of martyrdom, through the panorama of Independence in 1947, the Quit India Movement in August, 1942, the first arrival of the Congress power in 1937, the march to Dandi in February, 1930, following the Lahore Congress Resolution on January 26, 1930. Meanwhile, the continuous intangible thread was the growing power of the nation to dedicate itself to the ideals and the pledge of constructive work Mahatma's ideals and the pledge of constructive work and service in the national revolution, in the campaign against untouchability, for adult literacy, and religious harmony. Out of this revolution there has come, it suggests, the fairly matter-of-fact working woman of India today. Whether or not she is as desirable as her parents, she is the result of the flow of Gandhian concepts of mass emancipation.

The script, as is appropriate, is better heard than read, but it makes good reading. This is because it is

drawn largely from Gandhiji's own writings which still ring down the years as though they have lost none of their original relevance. Who will, for example, claim that Gandhiji's great frontal attack against intellectuals on their attitude to the villages has lost its force? "I must hark back again to the village, and tell you what I need.... I want you to go to villages, feel the pulse of the people, examine their needs and supply what they want. Do not say that your intellects would lose their freshness in villages by being choked in their closed atmosphere. I will say that it is not the closed atmosphere, it is your closed intellect with which you have gone there. If you go there with your eyes and ears and intellects open, they will be all the fresher for a live contact with the virgin air." The accusing finger in the Pageant speaks and, having spoken, moves on.

How, I keep on asking myself, do the children fall so readily into the deep pathos and triumphs of the Gandhian Age unless the spirit of that Age is alive and can be imbibed from the air we breathe? We are beginning to have our actors and actresses who can imbibe this spirit and it is good that we have senior writers who understand the limitations of words. In this case, the script writers, Mina Swaminathan and Muriel Wasi, worked with the minimum of their own language, wisely using quotations from Gandhiji, Jawaharlal Nehru and Tagore to present almost the entire piece.

A FLYING MACHINE

On Sunday I was taken back forty years to a song of my misguided youth in which the words were: "Come Josephine in my flying machine, a little bit higher, a little bit higher." I have no recollection of who Josephine was, but certainly the experience of higher altitudes in her company seemed to be exhilarating to the singer who became shriller and shriller as he ascended in the flying machine. The Pilatus Porter is truly a flying machine capable of doing the most wonderful things. It can land and take off in a 110 yards, as I have found by personal experience. It can land on snow. It made 25 landings at 25,000 ft. and 16 landings at 19,000 ft. for the Swiss Dhaulagiri expedition. It can land, they say, at 29,000 feet. Why, it is being asked, if one can have an eight-seater aircraft of this remarkable kind, should one depend so much on helicopters? The helicopter can ascend vertically. But if 110 yards is no problem and one can land on Dhaulagiri, why should one make so much fuss about finding suitable high altitude helicopters when there are much more versatile Stol aircraft, particularly the Pilatus Porter? I look forward eagerly to the day when joy rides, like the one we had last Sunday, will take us on to the sides of a mountain for a weekend. Running costs are about a fourth or fifth of a helicopter and I am encouraged to believe, that even "The Eastern Economist" might be able to afford a trip.

Do I see signs that a major revolution in hill transport is under way? An exciting observer and passenger on Sunday was the Prime Minister of Bhutan. He came more than once to inspect the aircraft. Posing daringly, I predict that Sikkim and Bhutan will have at least one Pilatus Porter each very soon. Is it two lakhs of rupees payable in rupees only? If so, may I request all good men and true to tell me Porter wherewith to free myself from the tentacles of the Press Club of India think of providing an escape overwork in New Delhi in 1961?

ARGUS.

THE WEEK'S NOTES

Coal Shortages

WHO IS TO BLAME?

IN SPITE OF the fact that output of coal has shown an upward trend during the past three months, reports about coal shortage continue to pour in from various parts of the country. The growth of the industry, particularly in the regions situated far away from the principal coal producing areas, has been arrested to not an inconsiderable extent due to non-availability of adequate quantities of this vital energy producing material. Obviously, there is something wrong with the transport of coal from the collieries to the consuming areas. The Chairman of the Railway Board, Mr. Karnail Singh, waxed eloquently at a hurriedly called Press Conference on February 9 and asserted that, despite loss of movement capacity due to the Central Government employees' strike and unprecedented floods in some States, the Railways had attained their Second Plan target of coal movement and, if shortages were still being experienced, it must be due to reasons for which the railways could not be held responsible.

It is indeed a matter of gratification that the railways have achieved their Second Plan target of coal movement; according to Mr. Karnail Singh, they are at present moving coal, outside the steel sector, at the rate of 42 million tons per annum, as against the target of 41 million tons. This extra one million tons of coal movement outside the steel sector, he explained, had been achieved partly by diversion of the movement capacity released by the shortfall in coal requirements of the steel plants due to delay in their completion.

This plea may apparently absolve the Railway Ministry of the blame for the bottleneck experienced in the movement of coal. Where then lies the snag? Presumably, there has been committed a grievous mistake in co-ordinating coal movement and production plans. The blunder probably was committed in 1958 when the Ministry of Fuel started talking of 56 million tons target for coal production, instead of the 60 million tons target provided in the Second Plan. The Railway Ministry, it is understood, than cut back its development plans for coal movement, presumably in consultation with the Planning Commission, to suffice for a movement corresponding to 56 million tons production. The Planning Commission owes it to the nation to explain why it did not ask the Railway Ministry to restore its development programme, if, at a later stage, it was decided to stick to 60 million tons coal production target.

The Railway Ministry, however, cannot escape entire responsibility for the present-day coal muddle. Its development plans obviously have to be drawn up to provide for some surplus capacity to meet unforeseen exigencies and seasonal pressures. At present its operations have little flexibility; only a modest increase in traffic, consequent upon higher food output this year and some increase in import of foodgrains under P.L. 480, have strained its resources to the point that not only the capacity released by the shortfall in various industrial sectors has been completely used up, but difficulties are being experienced in moving industrial raw materials and finished products. Then, again, who is responsible for not making available to the collieries open wagons which quicken the movement of coal?

Labour Commissions

SELECTION OF CHAIRMEN

HAVING APPOINTED Mr. M. R. Meher, President, Industrial Court, Bombay, as the Chairman of the Bonus Commission, the Government of India, it could be expected, would not have retraced its step, even though the employers had raised serious objection to his appointment. This was not because the employers' objections had got no force in them, but because the Government was not to surrender its prerogative to appoint the chairman of a labour tribunal or a commission according to its own judgment. This prerogative of the authorities, however, does not obviate the necessity of choosing a chairman judiciously and after going into all the pros and cons of his appointment. In this particular case, the Government appears to have thrown all these considerations to the wind. Not meaning any offence to Mr. Meher, who has had a distinguished career at the Industrial Court of Bombay and who has got a wide experience of industrial disputes, not excluding bonus disputes, it must be said that he being an officer whose some of the judgments on bonus matters have been set aside by the Supreme Court, could hardly have been the best choice to head the Bonus Commission.

The criteria for evolving a bonus formula are many. In its issue of January 20, 1961, "The Eastern Economist" published an article on the subject by its columnist "Croesus." The article set out the various considerations which have to be taken into account in framing a bonus formula. Mr. Meher has already given his verdict on some of these considerations in his judgments as President of the Bombay Industrial Court and his rulings have not been always upheld by a higher judicial authority. Nevertheless, employers' apprehensions, apparently reasonable, to the effect that it is difficult for a person placed in this situation to keep an open mind can be dispelled. It is re-assuring that the Government has given an assurance to the employers that only the unanimous recommendations of this Commission would be binding on the authorities.

Though the controversy about Mr. Meher's appointment appears to have been settled at the last meeting of the Standing Labour Committee, it has a moral to convey which the Government will do well to take note of for the future. No doubt, it is the prerogative of the Government to appoint the chairman of a commission or a tribunal. But this prerogative is to be circumscribed by the caution which the Government has to exercise in such appointments. The persons selected for these jobs are to be such whose choice should inspire confidence in both the parties to the dispute; what is more important is that they should not have shown any pronounced leanings towards either the employers or the employees. Is it not possible to sound the parties to the dispute before an independent chairman of a tribunal or a commission is selected by the Government? It may be difficult to find such persons always and the Government may have to nominate a person on its own. But that should be done after full deliberations and not in a hasty manner as appears to have been the case in the selection of the Chairman of the Bonus Commission.

Bastar

RULER DEPOSED

THE GOVERNMENT'S withdrawal of recognition from the 31-year-old Maharaja Pravin Chandra Bhanj Deo, as the ruler of Bastar, has been long overdue. As early as 1952, Pravin Chandra's father, Maharaja Prafulla Chandra Bhanj Deo, an Opposition Member of the Rajya Sabha then, wrote to the Prime Minister requesting him to advise the President of India to withdraw recognition from his eldest son, Pravin Chandra, and confer the "gaddi" on his younger son, Yuvraj Vijaya Chandra, as the ruler of Bastar. The request was made by Pravin Chandra's father consequent upon his son's activities. His father then wrote: "All efforts to bring my eldest son back to reason and normal ways of life have been exhausted and I, as his father, have been most assiduous in my efforts in this direction."

Since the execution of the covenant of merger of the Bastar State with the Indian Union in January 1948, it appeared that Pravin Chandra had not reconciled himself to the merger of his State and reports have been pouring in that the Maharaja was leading a "life of depravity and indulging in very objectionable activities." It was also alleged that he was distributing money and appealing to the people in the Bastar district for their assistance in recovering his "gaddi." His estate was placed under the management of the Madhya Pradesh Court of Wards in June 1953, because Pravin Chandra was behaving in an "erratic and irresponsible manner" and was squandering his resources. Till the arrest of Pravin Chandra recently, the Government of India have been just tolerating his provocations and hoping for sanity to return to him ultimately. But tolerance on the part of the Government of India only made Pravin Chandra more and more audacious and indulge in highly objectionable statements and gestures. He went to the extent of saying in a series of press statements that he would raise the standard of rebellion if his State was not released from the Court of Wards and his so-called grievances not redressed. He also said that he would "consider the treaty of accession as a scrap of paper" and become the "arbitrary ruler of Bastar." No wonder that the Government had no other alternative but to take such a drastic step.

British Press

ODHAMS DEAL AND THE ROYAL COMMISSION

THE ANNOUNCEMENT of Mr. Macmillan, the British Prime Minister, following the proposed merger of the Odhams Press with Thompson Newspapers and the subsequent offer of Daily "Mirror" Newspapers for examination of the economic and financial factors affecting the production and sale of newspapers, magazines and other periodicals and to consider whether these factors tend to diminish the diversity of ownership and control is welcome. The public were shocked to learn that a national daily newspaper (the "News Chronicle") with a circulation exceeding a million, could not pay its way. This implies that the medium circulation newspapers are finding it hard to survive and it would be very difficult, if not impossible, for newcomers to enter the industry without heavy financial implications. And this hard reality is a matter of concern to everyone who believes in the freedom of information and opinion as a fundamental obligation of democracy. If the Odhams deal goes through, Mr. King would hold sway over the largest aggregation of press assets in the United King-

dom. The deal would have the effect of creating a situation approaching monopoly in the field of magazines and trade and technical journals.

The "Economist" rightly contends that the "King and Thompson bids are symptoms of the present state of press economics, of the relation that has developed between soaring costs and prices, between cut-price circulations and massive advertisement revenues, between restrictive (even Luddite) practices throughout the business and the built-in bias towards bigness as the only surety of survival." And the report of the Royal Commission, when ready, would be illuminating.

It may, however, be contended why the British Government did not intervene immediately and in a more direct manner to stop this deal. It is clear that the Government had no power to intervene in an individual transaction which is, in itself, legal. The Government could have avoided being a silent spectator to all this grand empire building, if it had a policy for mergers and monopolies and a policy for the press. It is hoped that the British Government would lay down definite policies regarding mergers and monopolies and a policy for the press, in light of the findings of the Royal Commission.

But something need to be done immediately to prevent building empires, whether for power, profit or sheer virtuosity. The "Economist's" suggestion that there ought to be a "round-table conference of newspaper proprietors, writers, journalists, printing workers and professional advertisers—all of them now in the same boat or pillory—with an independent chairman and the public represented perhaps by politicians" is a move in the right direction. If something comes out of it, well and good; if not, the whole issue will revert itself to Parliament and, perhaps, to the Court.

The World Abroad

THE ATTACK ON WORLD POVERTY

By ODYSSEUS

ANDREW SHONFIELD has, in "The Attack on World Poverty" (Chatto and Windus. London. 1960. 21s.), written a book of outstanding importance. In less than 250 pages, he achieves at least three feats, any one of which would have justified a book to itself. First, he assembles the facts of the diverse problems facing the developing countries of Asia, Africa, Central and South America, and discusses ways in which they could be helped to help themselves. Secondly, he outlines the problems of international investment, basing his exposition on a reasoned critique of the methods of the World Bank. Thirdly, he offers an analysis, magisterial in its clarity, of the functions and mutual relations of 19 leading United Nations bodies, which, directly or indirectly, are concerned with aid to the developing countries, namely, the UN General Assembly, the Economic and Social Council (ECOSOC), the Department of Economic and Social Affairs, the Technical Assistance Committee (TAC), the Technical Assistance Board (TAB), the Special Fund Proposed for Economic Development (SUNFED), the Food and Agricultural Office (FAO), the International Labour Office (ILO), the World Health Organisation (WHO), the UN Educational, Scientific and Cultural Organisation (UNESCO), the UN Technical Assistance Office (UNTAO), and the lending agencies, the International Bank for Reconstruction and Development (IBRD)—popularly known as the World Bank), the International Development Association (IDA), the International Finance Corporation (IFC), and the International Monetary Fund (IMF).

Mr. Shonfield realistically points out that there are countries in which effective use of foreign aid on a large scale is not feasible because of political obstacles. For example, those Latin American countries in which the budget is overloaded with the cost of masses of officials who owe their jobs to political patronage. When President Frondizi in the Argentine decided courageously to tackle the superfluity of civil servants in 1959, he ordered that all should be at their desks by 9 a.m. Chaos reigned. The several different holders of the same jobs all turned up to use simultaneously the desks at which they had been sitting in shifts. This revealed the magnitude of a problem common throughout Latin America. Again, most of these countries have to cope with a powerful military class. A government which defies the officers will end up by having to fight them or mobilise its own group to cow them.

On the other hand, Mr. Shonfield short-lists India, Mexico, and Brazil, as countries ready to use foreign aid on a scale that would speed up their rate of growth in the short term and achieve their complete economic independence in the longer.

TRADE AMONG THE UNDERDEVELOPED

After pointing out various difficulties that prevent an exporter of raw materials and primary products, like India, from substantially raising the volume of its exports to the West, Mr. Shonfield suggests that the developing countries could help their balances of payments by trading more among themselves. Much more food would be grown in the surplus agricultural area of S.-E. Asia if there were an assured market for it. But it only needs one good rice harvest for Burma to be faced with surplus stocks. With inadequate godowns, the rice rots, the price falls, and next season the peasant

grows less. India does not buy Burma's surplus because New Delhi is not ready to allocate its dwindling foreign exchange for additional rice imports. Mr. Shonfield urges that the solution is to encourage barter trade, where necessary. This offends the multilateral doctrines of the IMF, but Mr. Shonfield argues that these were intended to provide fair play rules for commercial contests between developed industrial countries. Should they be used to prevent the level of output and consumption in the developing countries from rising?

The export trades of Asia and Africa, originally developed by Europeans, are largely directed outwards by sea to Europe and America, where the markets for raw materials existed. Now, however, with the new Asian and African effort to diversify output, including the whole range of advanced industrial products in which the developing countries are bound to be at competitive disadvantage for some time, the need is to start trade moving in new directions. On grounds of economy alone, regional trading groups ought to appeal to the Western donors of aid. It would be cheaper to finance industrialisation if the new countries were, from the start, planned to reach the most efficient size by looking beyond their national markets. Apart from the waste of resources which goes on now because these nations do not exchange their surpluses with each other, there is the vast waste of setting up new high-cost industries in markets too small for them to pay their way. It is tragic to see Burma, for example, putting up a new steel plant which cannot be economic for years to come. The Burmese could concentrate their scanty resources on more urgent needs if they struck a bilateral bargain with India to barter steel for rice.

Mr. Shonfield concedes the danger that a series of competitive trade agreements reached between pairs of underdeveloped countries would produce more political quarrels than useful business. That is why the UN regional organisations, like ECLA and ECAFE, are important as expert co-ordinating bodies, and to provide a forum where inevitable trade wrangles can be sorted out with factual information. GATT has demonstrated how effective such a forum can be, in which nations have to justify their actions in public. But the first step is to get GATT to endorse new rules to suit the developing countries.

INVESTMENT RESOURCES

Turning to the problem of investment resources, we must recognise that there is a cleavage in outlook between the industrial West, in which, as a whole, the prestige of private enterprise continues steadily to rise, and the developing countries, particularly of Asia, in which the Socialist pattern remains predominant. This does have some effect in cooling the West's ardour to aid and to invest. On this, the Socialist Mr. Shonfield offers a valuable comment. He stresses how large-scale public investment in India stimulates private investment, which would not otherwise have occurred. It is, moreover, a commonplace in the industrialised countries that when a state enterprise goes in for a long-term programme of expansion, e.g., on the railways or on electrical power, this has repercussions on the profit expectations and investment of capital in the privately owned firms supplying state enterprises. And that, in turn, helps to stimulate more private investment elsewhere. "A clear and generous policy towards the un-

derdeveloped world, publicly undertaken, would," Mr. Shonfield rightly argues, "itself reduce the demands that have to be made on the public purse for carrying it out."

Mr. Shonfield next tackles the problems that arise when a developing country finds that the cost of paying the interest on its international loans is rising faster than its present export earnings. Is the solution the proposed Special United Nations Fund for Economic Development (SUNFED)? It has been suggested that SUNFED should be run by the 80 odd members of the UNO on the principle of equal votes. Many developing countries regard this as splendid because they believe that they would generally be able to swing a majority of the 80 votes. The basic difficulty is that the UN Assembly is a talking shop for letting off pent-up international steam. It has no executive organ capable of controlling a world development programme in the midst of rival national interests. Then, what about the World Bank? Mr. Shonfield argues that the World Bank is handicapped because, following Western experience, it holds sacred the principle that loans are legitimate only for capital investment and not for current consumption, which, it is argued, would amount to a loan to meet a balance of payments crisis caused by internal expansion. If this were conceded it would be impossible to resist unreasonable demands from wasteful governments.

The Bank's fears are understandable but Mr. Shonfield suggests that rigid insistence that loans can only be used to buy foreign capital goods must defeat development programmes. After all, particularly in Asia, the problem is how to find useful work for millions of under employed. Surely the solution is to put these millions to work on capital projects. That is, of course, what the Communist countries do. If you can use

forced labour, you can build new factories without foreign loans. Because India, and other free countries, reject forced labour, it is wrong, Mr. Shonfield plausibly asserts, to drive them to the opposite extreme in which they have incentives to use large amounts of foreign labour-saving equipment—since this is something on which World Bank loans can be spent—and so limit employment of the surplus of local workers. Nobody adds up the waste of keeping millions idle, producing nothing.

Mr. Shonfield urges the World Bank to get away from its preoccupation with machines. Except for big dam projects, agricultural investment in the developing countries barely figures in World Bank lending. Yet there is vast scope to increase the output of food if a small addition to the resources of peasants were applied in millions of agricultural holdings. The trouble is that what the peasant needs is not conventionally called "capital". Thus, it is all right to lend capital to India to finance fertilizer factories which will eventually raise agricultural output. But if it is suggested that, in the interval before the fertilizer plants are in action, New Delhi should borrow cash to buy fertilizer abroad, that is current consumption and does not qualify for a World Bank loan.

The planning authorities in the free Asian countries shrink from putting masses of peasants on to land drainage schemes during the agricultural off-season, because the workers have to be paid something extra, and that increases the demand for consumer goods, especially food. The planners fear to invest money in this way without additional supplies of consumer goods lest they upset the balance of supply and demand. Is not the solution for the World Bank to revise its vocabulary? A loan allocated to buy the extra consumer goods might be classified as "investment in people".

IT DAGGER BRAND REAMERS FOR LASTING PRECISION PERFORMANCE

BACKED BY YEARS OF TRADITION and rigid control at every stage of production
DAGGER BRAND REAMERS (available in inch and metric sizes)
assure precision performance. They are made of superior quality steel,
specially heat-treated to ensure long life and manufactured in
India's biggest and most modern factory for small tools.

*The European Scene***CONSUMER MARKET RESEARCH IN EUROPE—I**

From Our Special West European Correspondent

PARIS, February 13.

THE derivation of predictions from consumer market research is most advanced in certain Western countries that practise national planning. These countries are industrialised, which means that the economic problem is not dominated by the need to build up, virtually out of nothing, immensely expensive basic industries like steel and transport. They are substantially free economies, which means that the preferences of consumers play a part in determining the nature of economic activity. Yet they have a national plan, which means that forecasters of future demand have at their disposal an essential piece of information, missing in totally unplanned economies: an idea of the growth of the economy, and of the distribution of GNP increments between investment and consumption. One can see how important market research and consumption predictions are to them if one contrasts their situation with other economic systems.

In Russia, for instance, or any totally planned, un-free economy, nothing is less interesting than the present or future preferences of consumers. It is supremely indifferent to the Gosplan authorities whether Russians want private cars or might want them in five years' time, because it has already been decided that they are not going to get them. The only consumer demand that might concern the authorities would be one that could lead to political dissatisfaction, e.g., a shortage of necessities, or a vague general desire for a better standard of living, such as now exists in Russia; but one does not need market research to find out those things. On the contrary, consumer market research is absolutely vital in a totally free-enterprise economy, such as the USA, because consumer preference there is sovereign, and even determines the volume of investment. So almost every firm practises, more or less thoroughly, some sort of market study. Yet this is bound to be inefficient because, in the absence of any central control of the economy, essential information is lacking, and this makes consumption predictions extremely hazardous. There is no central decision about a desirable rate of growth, and no effective intervention with the relative volumes of consumption and investment. Thus, for all their market study at the level of the individual enterprise, the Americans today have a million unsold cars and steel mills working at 50 per cent capacity—which suggests that something went wrong with industry's predictions of demand.

This is no judgment on the US system of course. Most Americans would say they prefer to make huge errors about the likely evolution of demand, and retain a system that allows them to repair those errors at the cost of a mild recession. The present point is simply that consumer market study (whose main purpose is prediction) is better practised in mixed economies where there is some planning, but where planning is undertaken in the light of consumer preferences and their future evolution. Would India fall into that class? At first glance, one would say not. Increase and diversification of consumption are indeed the aims of the Indian plans (by contrast with Chinese plans, where harebrained ideas about "perfect communism," and military or foreign policy considerations have been at least as powerful). Yet, because of widespread poverty and naked want, the nature of consumption needs is thought to be too obvious to require any study. Clearly, say the planners, India needs more steel, and if a mar-

ket study shows that people are demanding other things, that is because they are making a mistake: they do not realise that supplies of those other things cannot be assured unless we have more Indian steel first. So it is assumed (sometimes too optimistically) that no likely increase in capacity will be left unused because consumer preferences have been neglected.

Yet the contrast is less marked than might appear between India's case and that of countries, such as Italy, France and some of their neighbours, where explicit market research is the foundation of national planning. Let us see how consumer study enters into their plans. It comes in at the very beginning, because private consumption absorbs about two-thirds of the national product, and that two-thirds largely (though not entirely) determines what happens to the rest: investments, foreign trade and public consumption. Moreover, private consumption takes place on the so-called free market (with all the qualifications about monopolies, taxes, etc., that "free" needs here). Finally, consumption is well above the subsistence level, so planners cannot decree that the nation "obviously" has to have this and that. In those circumstances, the planners—just to know what they are doing—have to start by appealing to market study to see how consumption is constituted and how it is tending if left to itself, i.e., what consumers would want if there were no plan. They accept this information, from the hands of the market analysts, as their data, what is "given."

Then, precisely because they are planners and not heads of free enterprises, they take certain political decisions which do NOT come from market study. These decisions concern the desirable and possible rate of growth; they are taken in concert with the chiefs of private industry and of State undertakings. The consumer is not consulted, once he has suggested, through market analysis, the general direction of economic growth. To attain the rate of growth considered optimal, the planners then decide the level of investment necessary. This part of the art is still pretty shaky, despite some learned bluff: no one can calculate exactly the volume of capital formation needed to produce a given percentage expansion, but fair approximations have been seen. At all events, this determination of the level and direction of investment is the crux of the plan; consumption appears in the plan as the residue.

In other words, the consumer fixes the drift of economic development by revealing to market analysts what he is likely to want more and less of in a few years. But how much he gets of what he wants is decided by the planners for whom consumption is just what is left over when the other parts of the national product have been put to the uses required to maintain a politically fixed rate of growth. Yet at that point, the planners have to call the market analysts back again because their plan has changed the data of the whole problem. The first time, they asked the market analysts what consumption was likely to do if left to itself. Once the plan is launched, consumption is not being left to itself, and in particular it will be revolutionised by the one purely political decision the planners took: the fixing of a desirable rate of growth. This means increased revenues, and that can cause significant changes in the nature of demand, which in turn require changes in the structure of the economy. How big each of those changes will be, will depend on what rate of growth is

Steady Progress since 1923

Started as a Pioneer Charcoal Pig Iron Plant in India in the year 1923, the Mysore Iron & Steel Works Factory at Bhadravati has steadily progressed all these years. Now equipped with Modern Electric Pig Iron Furnaces and Casting Plants, the Bhadravati Factory produces quality steel castings and other products.

Range of Products:

Cast Iron Mortar Mills, Charcoal Pig Iron, Cast Iron vertical and Spun pipes to B.S.S., Mild Steel Sections-Rounds, Flats, Squares and Angles, Grey Iron and Chilled Iron Castings, Cast Iron Railway Sleepers, Steel Castings, Railway and General Baling Hoops for Cotton and Jute, Ferro Alloys, Special Steels etc.

THE MYSORE IRON & STEEL WORKS,
(Government of Mysore)
BHADRAVATI (Mysore State)

chosen and on how much that growth-rate leaves for consumption: a rate of 2 per cent can cause totally different consequences to a rate of 4.5 per cent.

At this point, it seems to me, the role of the Indian market analyst is just as important as that of the West European. Both are concerned with adjusting the economy to demand, unlike their Communist counterparts; and both have in hand data about the planned rate of expansion and about the share-out between investment and consumption, unlike their North American colleagues. The Indian market analyst indeed finds that some of the biggest decisions (such as how much steel, cement and fertiliser to produce) have been taken without consulting him, on "common-sense" grounds so called. Yet that puts him in no different a position to the West European analyst who is called in a second time to say what will happen to demand in its details, given the general size and direction of the plan.

The techniques that West European students of consumption trends use to answer that question will be outlined in a following article. What should be noticed first is that, in answering it, they can reveal political problems that the planners would not have thought of, and which in turn necessitate alterations in the plan. For example, the market studies on the Fourth French Plan, which like the Indian Third is to be started this year, were based on the assumption of an annual increase of 4.5 per cent in the domestic national pro-

duct. Using the methods to be described later, the market analysts calculated that this would lead, by 1965, to gross consumer demand 60 per cent higher than in 1954. Taking into account the concurrent rise in population, that meant a 52 per cent rise in living standards. But analysis of trends in consumption suggested that a 52 per cent rise in private consumption would cause only a 39 per cent rise in consumption of foodstuffs. Not only that, but the type of food demanded would change: less straight-from-the-farm products and more processed, tinned, bottled and prepared food. Consumers might spend 39 per cent more on food, but they would consume only 20 per cent more in volume. The payments to producers of raw foodstuffs would increase only by 30 per cent.

Now, those figures conceal a political problem that could become serious. They say that average French private spending will increase by 52 per cent, but farmers' gross revenues will rise by only 30 per cent. Obviously, the discrepancy between city-dwellers' incomes and peasants' incomes (or between their respective outlays) will be much greater still, so that unless the peasant population is drastically reduced (so that smaller farm revenues are shared among fewer farmers) the plan would lead straight to a jacquerie, a peasants' revolt. All the figures quoted might turn out to be wrong by 10 per cent, but the political warning of the market analysts would still be correct. There is more in market research than the figures.

LUFTHANSA'S BIG JET IS HERE!

TWICE-WEEKLY FLIGHTS* FROM CALCUTTA—
FASTEST ROUTE TO FRANKFURT AND TOKYO

From to-day LUFTHANSA'S giant jet-liners will speed you to Europe and Far East in supreme comfort and luxury. The Far Eastern route is at the same time being extended to Hong Kong and Tokyo to forge another link in LUFTHANSA'S world-wide network of routes. The ultra modern jet-liners coupled with LUFTHANSA'S fabulous service on board will make the Far Eastern route the last word in luxury and efficiency. Best food, choicest drinks, alert stewards and charming hostesses (both European and Oriental) will all add up to make your trip the most memorable ever!

Consult your travel agent to-day for your next trip to Europe or the Far East.

Economic Report from the U.S.

BALANCE OF PAYMENTS PROBLEM

By GUY SIMS FITCH

WASHINGTON, Feb. 1.

PRESIDENT Kennedy's message to Congress on the U.S. balance of payments is in keeping with the general tenor of his approach to the nation's economic problems. The position of the United States is essentially sound, but important improvements can and should be made. Thus, the President has gone to some lengths to convey assurances that his administration will make every effort to overcome the U.S. balance of payments problem, and that the problem can be handled without resort to drastic action. In substance, this means a continued adherence to liberal trade, aid and investment policies, and emphasis on expanding exports and keeping open the channels of commerce rather than on restricting imports and resorting to protectionism or exchange controls. This basic approach is important not only to the United States, but clearly to all free nations. Moreover, since the U.S. dollar remains the chief support for world commerce and economic growth, it becomes especially important to take steps to strengthen the international position of the dollar. In so doing, the administration will in effect be supplementing its policies for strengthening the domestic US economy. For a dynamic US economy, with a flowing technology and productivity, will be able to turn out goods competitively priced in world markets, and perforce will help maintain the dollar's necessary strength. Emphasizing the soundness of the US position, the President has pointed out that throughout the post-war period the United States has run a substantial surplus on its trade account—that is, an excess of exports over imports. Last year's trade surplus, including both goods and services, reached a huge \$5,800 million.

But this trade surplus was more than counter balanced, as it has been generally during the past decade, by the continued large outflow of US funds to support the government's foreign economic and military programmes, and private industry's capital investments abroad. Last year, this outflow totalled some \$7,300 million. This difference of \$1,500 million, in the President's view, represents the basic deficit in the US balance of payments. To this was added last year, however, an outflow of about \$2,300 million of private funds, largely in response to higher interest rates and speculative inducements abroad. This brought the over-all 1960 payments deficit to \$3,800 million. Despite the speculative outburst in foreign markets, other countries kept the larger portion of this in dollars, while converting \$1,700 million into gold—underscoring, perhaps, continued confidence in the US economic and financial position. Movements of short-term funds, particularly of a speculative nature, come and go. To help bring potentially disruptive movements under better control, the President has instructed the State and Treasury Departments to co-operate with other nations in investigating ways of avoiding excessive short-term money flows in or out of the United States. It is to reducing and eliminating the basic deficit of \$1,500 million, then, that Mr. Kennedy has addressed the major burden of his balance of payments message. It is important to recognize, with the President, that his proposals are put forward against a background of basic strength rather than weakness. Not only is the US trade position strong, but US gold and monetary reserves are large, and so are the physical and monetary assets held by Americans throughout the world. For example, the US government now holds gold stocks of some \$17,500 million—about 2/5th of the entire free world reserves. It also has drawing rights as yet unused, of \$4,100 million in foreign exchange from the International Monetary Fund. Moreover, private US short-term assets abroad are estimated at \$4,500 million, while long-term foreign investments total about \$44,000

million. In addition, other countries still owe the United States some \$2,900 million long-term debt. From this recognition of basic US strength comes the conclusion that there is no need to change the price the US officially pays for gold, and the President has gone out of his way in his message to re-emphasize that the price will be maintained at \$35 an ounce. Nor is there a need to invoke exchange controls, nor to resort to trade protectionism, nor to diminish foreign economic assistance or security programme.

The maximum emphasis, therefore, is being placed on other, more constructive and more responsible, remedies. In this vein, the President has proposed a two-part programme, one short-term and one long-term to correct the basic balance of payments deficit. For the short-term, the President is suggesting such moves as international co-operation for strengthening international monetary institutions, drawings from the IMF in convertible currencies other than dollars, and special tax and interest rate measures to attract and hold dollar balances which might otherwise be converted to gold. He also means to continue the order forbidding the holding of gold abroad by Americans. For the long-term, the President has put forward a truly comprehensive programme, which has at its core three main elements: a further expansion of US exports, an increase in economic assistance to developing lands by other industrialized countries and a "harmonizing" of financial and economic policies of those industrialized countries that significantly influence world economic and payment trends.

In regard to exports, the President proposes that the US Export Bank widen its credit facilities to American exporters, that ways be considered for private institutions to take similar action, that the US government's commercial representatives and facilities abroad be increased, and that special attention be given the expansion of farm exports. He also has indicated that the United States will continue to press for removal of foreign restrictions that still exist against American exports, and will seek further tariff cuts by foreign countries. With regard to aid to developing lands, the President is not only proposing that other industrialized nations step up their assistance efforts, but also that the Senate approve USA membership in the Organization for Economic Co-operation and Development (OECD), through which Canada and Western European nations will join the United States in assisting developing countries. In other fields, the President recommends such steps as a reduction in the amount of goods returning American tourists may bring into the United States free of duty, review of US tax laws governing private investments, promotion of foreign travel to the United States, limitation on spending abroad by US military personnel, continuing emphasis on procurement of US goods under US aid programmes, encouragement of foreign capital exports to and investments in the United States, and a review of foreign spending by US government agencies to ascertain their impact on the balance of payments.

No one can say at this time what the effect of these Kennedy recommendations will be. It is noteworthy that the gold flow from the United States already seems to be subsiding, and both government and private groups are estimating that the 1961 balance of payments deficit, even under present conditions, will be cut from last year's \$3,800 million to \$2,000 million or less. To the extent that the Kennedy programme will contribute to a further reduction and an eventual elimination of this deficit, it will help correct what has been in recent years one of the world's persistent and disturbing problems—the balance of payments position of the United States.

WORLDGRAM

India

Atomic Energy: Since the formal inauguration of the Atomic Energy Establishment by the Prime Minister on January 20, 1957, a number of new facilities have been constructed and were formally inaugurated by the Prime Minister on January 16, 1961. These facilities are: (a) Uranium Metal Plant; (b) Fuel Element Fabrication Facility; (c) Zerlina—a zero energy reactor for lattice investigations and new assemblies for carrying out experiments on the physical properties of new reactor system using liquid moderators; and (d) Heavy Water Processing Plant, intended for reconcentrating down-graded heavy water used as moderator in CIR, Zerlina and any other heavy water reactor. In addition to this the Canada-India Reactor is one of the largest research and isotope producing reactors in the world.

Head Wrightson India Limited: To handle Head Wrightson's expanding interests in India, a new Company, Head Wrightson India Limited has been registered. With its administrative headquarters in Calcutta, this Company will be wholly-owned Subsidiary of Head Wrightson & Company Limited of Thornaby-on-Tees, England. It will act as a contracting company for the supply as far as possible from Indian sources, of various types of plant to the designs of the Parent Company. The fullest use will be made by the new Company of the rapidly growing manufacturing facilities in India, for the class of work concerned, both in the public and in the private sector.

This is a first step in strengthening Head Wrightson's participation in India's development; as a further move, it is hoped to incorporate a rupee Company within the next three years. Head Wrightson has maintained a close link with India for many years, and has been responsible for supplying much of the specialist equipment used in India's basic industries. The Company is at present playing a major part in the Durgapur Steelworks project, and are supplying all the ironmaking plant together with much ancillary equipment. The first Blast Furnace was blown-in in December, 1959, and the second of the three is now complete. The Chairman of Head Wrightson India Limited will be Mr. Peter Wrightson, who is also Vice-Chairman of Head Wrightson & Co. Ltd., and Mr. Vaughan Pendred has been appointed Managing Director.

India's Bauxite for Australia: The Australia Aluminium Production Commission has signed a long-term contract with the Bombay Mineral Supply Company (Private) Ltd. for the supply of bauxite to Bell Bay, Tasmania. The contract was negotiated through the State Trading Corporation of India and involves many thousands of tons of Saurashtra bauxite. Shipments under the contract are now going regularly to Australia. The Australian Aluminium Production Commission is the only producer of aluminium in Australia. The Commission imports bauxite for use in the combined alumina and reduction works at Bell Bay, which has an annual capacity of about 13,000 tons of aluminium metal.

U.S.S.R.

A New Maize Hybrid: Ukrainian selectionists have developed a new maize hybrid which they call "Odessa-27". The hybrid can yield 27 centners of

grain per hectare—eight to eleven centners more than other hybrids. It has been developed by crossing the plain sterile hybrid "Slava" with the "Voronezhskaya-76" variety. The new hybrid is resistant to spring temperature fluctuations. In the forest-steppe zone of the Republic it ripens approximately a week earlier than hybrids "Bukovinsky-3" and "V.I.R.-25" cultivated here earlier. The pollen of the female forms of the hybrid is sterile (it can be fertilized only with the pollen of the male forms), which obviates the work of removing tassels usually involved in the production of hybrid seeds.

Yugoslavia

Industrial Output: Yugoslav industrial enterprises increased last month output by over 12 per cent. According to preliminary figures, the greatest increase was achieved in the generation of electric power, in the production of oil, metallurgical and chemical products. Thermal power and hydro-electric power plants, which entered the new year with the record reserve of electricity, attained a high level of output in January. One of the biggest Yugoslav hydro-electric power plants—Jablatica—generated nearly 100 million Kwhs during last month alone, or one-sixth of the total planned output this year. By beginning exploitation at the biggest Yugoslav oil field, at Sustruzec, oil production in Croatia, where the biggest oil deposits in the country are located, has increased by 76 per cent.

Progress of Agriculture in Yugoslavia: Socialist farms in Yugoslavia, as reported, have so far made almost all the necessary preparations for spring sowing. They will have in the spring sowing campaign nearly 35,000 tractors, which is by about 5,000 more than at the beginning of 1960. In this connection it is pointed out that by the end of the Five-Year Plan agriculture is to produce annually about 5 million tons of wheat and rye, about 10 million tons of maize, as well as about 4 million tons of sugar beet and over 1 million tons of wheat. Thus the production of wheat would reach the level which fully meets the actual Yugoslav needs, while maize production would grow by 3.3 million tons as against the situation in 1959, sugar beet by 2 million tons, while wheat production will be doubled. This great increase in agricultural production would be chiefly realised thanks to the dominant influence of social production in agriculture in the course of the present Five-Year Plan. Thus it is expected that socialist farms and peasants in co-operation with them will produce about 70 per cent of the envisaged quantities of wheat, 75 per cent of maize, about 70 per cent of meat and over 50 per cent of milk. It is reckoned in this connection that public owned farms and various forms of co-operation will participate, in the overall value of agricultural production in 1965, with about 70 per cent, and in the market surpluses with as such as 90 per cent.

France

Economic Perspectives of Gabon: Of all the countries in the French Community, Gabon, along with the Ivory Coast, is the one with the best economic future. Despite its small population of 4 lakh inhabitants in an area of 2,80,000 sq. kilometers, it continues to prosper regularly. The output of Okoume, the principal resource

of the country was 7 lakh tons in 1960, which is the same as in 1959 and 12 per cent more than in 1958. The agricultural outlook is equally favourable. The cocoa and coffee harvest were good, and the pepper crop is being expanded. In addition, mining prospects for the country are excellent.

Norway

Exceptional Increase in Norway's Production: Norway had an exceptionally big increase in her productivity in 1960, for the second consecutive year. It was 6.5 per cent over the previous year, according to tentative figures issued by the Statistical Bureau, which means an increase of 11 per cent in the gross national product during the last two years. This constitutes an annual average of 5.5 per cent compared with an annual increase of 3.4 per cent for the period 1950-58. An "Economic Survey" issued by the Statistical Bureau mentions two possible reasons for the extraordinary increase: the more favourable international economic trend, which secured a capacity production for most of the export industries, and a gradual but distinct change in the financial policy easing the brakes on demand. It is further assumed that the growth of hire-purchase transactions and the preparations made by business firms in expectation of the E.F.T.A., have contributed. On the other hand, consumption increased roughly as much as production, the figure for 1960 being 6%. This can only partly be explained by the increase in income which was a result of higher exports; it is thought that the altered financial policy is a contributing factor. Also, the fact that television services were officially opened in Norway in 1960, and the sale of motor vehicles was liberalised and finally completely derestricted during the year have probably helped to create higher consumption. H.P. credits went up by as much as £3,600,000 during the first 9 months compared with £2,400,000 in 1959. Investment increased by 10 per cent while export was 9 per cent up on the previous year.

Poland

7-million tons of steel in 1961: The metallurgical industry in Poland will produce more than 7 million tons of steel in 1961, six per cent higher than the production of the preceding year, according to the evaluation of the iron and steel industry in Poland. The production of the iron and steel industry in Poland. The production of coke will reach 11.5 million tons and rolled products 4.5 million tons. Nearly 4.7 thousand million zlotys have been earmarked for investments in this sector of industry.

Austria

Foreign Trade: The high level of Austria's export trade in 1960 was due largely to the vigorous upswing between the fall of 1959 and the spring of 1960. Although July-October exports were up by 15 per cent by value over the year before, expansion of foreign trade was not in line with the general strong upward trend of the economy during much of 1960.

Asia

Progress on Asian Highway Network: In 13 countries of the Continent plans are going forward, with the help of United Nations technical assistance experts and the United Nations Economic Commission for Asia and the Far East, for the eventual opening of an all-weather road linking Asia from one extreme of its vast expanse to the other. When completed, overland travel would be possible from Saigon and from Singapore to

Ankara and Istanbul and then westward to Europe. The project, which would reopen the ancient Caravan routes, will create in ECAFE region an overall international highway network of more than 3,000 miles. Besides stimulating trade the highway is expected to promote general travel and tourism. This is expected to further cultural and social contacts, and promote the economic advancement of the area. Recommended by the Commission's highway Sub-Committee in 1958, endorsed by the Commission itself in 1959, the project is being actively worked out by zonal meeting of expert working groups under ECAFE auspices.

IMF

Argentina's New Stand-by Arrangements with the IMF: The Government of Argentina has entered into a new stand-by arrangement with the International Monetary Fund which authorizes drawings up to \$100 million, over the next twelve months, in currencies held by the Fund. The Argentine Government also has arranged a re-scheduling of payments to the Fund of previous drawings amounting to \$142.5 million. Under the new schedule, repayments of drawings amounting to \$42.5 million, which were authorised by a stand-by agreement approved in December 1958, will be made by March 31, 1963, shortly after the three-year period initially agreed upon. All outstanding commitments under the stand-by arrangement approved in December 1959 are to be discharged by the beginning of November 1965, that is, five years from each purchase. A comprehensive stabilization programme was introduced in December 1958 and with the progress made, prices have now been stable for six months and the exchange rate for over a year. At the same time the country's gross monetary reserves have been built up again from about \$130 million at the outset of the programme to almost \$700 million today. Progress has been made in reducing the Government deficit and there will be no need to have resort to any inflationary methods of financing. Neither will the Government seek to obtain any balance of payments credits apart from the present stand-by arrangement with the Fund. This new arrangement is intended to assist the Argentine Government in continuing its stabilisation efforts, by providing currencies that may be used for the maintenance of an orderly exchange market. Drawings under the arrangement may prove unnecessary in view of the strong reserve position already attained and such further efforts as are being made.

World Bank

Loan for Costa Rica: The World Bank has made a loan equivalent to \$8.8 million for the expansion of electric generating and transmission facilities in Costa Rica. The loan will help to finance the construction of a 30,000 kw. hydroelectric plant on the Rio Macho, the installation of 9,000 kwts. of diesel generating capacity at Colima and Limon and the extension of the central transmission network. The new facilities will provide a 40 per cent increase in power generating capacity in the Central Zone, which contains a capital city of San Jose and is the area of greatest economic activity and of highest population density. The Bank of America and Grace National Bank of New York participated in the loan without the World Bank's guarantee, to the extent of \$1,20,000 representing the first maturity and part of the second maturity which fall due in May and November 1964. The loan is for a term of 25 years and bears an interest of 5½ per cent per annum, including the one per cent commission which is allocated to the Bank's special reserve. Amortization will begin May 1, 1964. The loan is guaranteed by the Republic of Costa Rica. Including the present loan, the Bank has totally lent \$17.3 million in Costa Rica.

NEWS IN BRIEF

INDIAN

As a measure of export promotion, the Government of India have decided to allow drawback of customs and central excise duty paid on raw materials used in the manufacture of zip fasteners, water coolers, laminated safety glass, mirrors, round spikes and all other types of spikes.

According to a report, the promotional activities of the Central Small Industries Organization were considerably stepped up in 1960. During the year, an intensive campaign for the development of small scale industries in backward areas of the countries was launched in all States.

The Union Ministry of Finance have accepted all the recommendations of the Pay Commission in regard to casual labour including that on payment of remuneration.

The Government of India had fixed October 31, 1960, as the last date by which applications could be filed by displaced persons for payment of their compensation in the form of U.P. Zamindari Abolition Bonds and U.P. Zamindari Abolition Rehabilitation Grant Bonds.

A total number of 95,744 houses for industrial workers was completed till September 30, 1960, since the inception of the subsidized industrial housing scheme in September, 1958. The number of houses sanctioned during the period was 132,512.

The Government of India have reconstituted the Advisory Boards for Harijan and Tribal Welfare, which advise the Centre on all matters relating to the Welfare of scheduled tribes and scheduled castes and development of tribal areas.

Total earnings of all railway, including non-Government railways amounted to Rs. 424.06 crores during the 1959-60. Of this, goods traffic accounted for Rs. 256.12 crores or 60.4 per cent, passenger traffic for Rs. 126.5 crores or 29.83 per cent and parcels, luggage and other miscellaneous sources of revenue for Rs. 41.44 crores or 9.77 per cent.

The unabated sharp rise in prices of raw jute and jute goods during the past two weeks is causing considerable concern to the authorities and it is reported the Government might take early steps to curb the upward trend.

The World Bank is understood to have agreed to provide the foreign exchange necessary for undertaking further studies about the Haldia river and the estuary in connection with the development of Haldia as a subsidiary port.

Investigation of important minerals like coal, copper, gypsum, limestone, chromite, magnesite and lead-zinc and renewed emphasis on systematic mapping of several areas in the country were some of the important features of the work done by the Geological Survey of India during 1959-60.

As on November 1, 1960, as many as 61,044 registered foreigners were reported to be resident in India. On December 1, 1959, their number was 55,653.

FOREIGN

Actual production of raw steel in the U.S. during the week ended February 6 totalled 1,492,000 net tons, according to the American Iron and Steel Institute. This was a 1.8 per cent increase over the 1,466,000 tons produced in the preceding week.

World cocoa production for the 1960-61 season may reach 1,166,000 long tons, according to the latest report by Gill and Duffus. This figure revises the Company's previous estimate upwards by 57,000 tons, and compares with a figure of 1,017,000 tons for the previous season and 889,000 tons for 1958-59.

The Chemical industry in Western Europe is increasing its share of the product of the manufacturing industries, which now exceeds 10 per cent. With a turnover in the chemical industry in 1959 of \$16,900m, the increase over 1958 was 11.5 per cent, the highest since 1954. Investment during 1959 remained at about same level as 1958—\$1,200m and \$1,300m.

Tanganyika has the beginnings of a sound infrastructure with good roads, air, communications, railways, telephones, declared M. Erich Missmer, leader of the Swiss Government's fact finding mission to Tanganyika.

The wool textile industry exports to more countries—150—than any other British industry. Mr. David G. Price, Secretary of the Wool Textile Export Corporation said recently that 1,200 firms, large and small exported all over the world—including Bulgaria, Tobago and Bahrain.

Australian wool export earnings during the first half of this financial year were £A153m. a drop of more than £A36m which reflected decline in exports to almost all the major wool buying countries.

Leading European tobacco manufacturers are to visit Southern Rhodesia soon to examine tobacco production and marketing. The Federal Information Department says the visits are being arranged by the Tobacco Export Promotion Council of Rhodesia and Nyasaland.

West Germany has published its \$999m. proposal to help the U.S. balance of payments. The sum consists almost entirely of money which the U.S. would get sooner or later in any case, although part of it would not normally be due before 1987.

The Banca Commerciale Italiana has announced that its business in Egypt will be taken over by the National Bank of Egypt and by agreement with the authorities its £E500,000 capital will subsequently be transferred to Italy.

In a report on rice published recently, the Food and Agriculture Organization of the United Nations reveals that production in the non-Communist world reached a new record level of 134m. tons in 1959-60, 4m. tons more than in the previous season.

After considering a number of other sites, notably in Norway, Shell has now decided to build its first Scandinavian refinery in Denmark, at the town of Frederica in Jutland. Work on the refinery, which will cost about £11m. and have an annual capacity of 2m. tons, will start late next year and refining would begin in 1965.

TODAY SUGAR MUST DISCOVER EXPORT MARKETS!

India is the home of sugar-cane. At the turn of this century, paradoxically, it was one of the poorest producers of sugar and among the largest importers of the commodity. As late as 1925-26 the country imported Rs. 15,83,36,000 worth of sugar. Today the country produces all the sugar it needs and more!

Behind this phenomenal achievement lies the massive effort of the sugar industry. Given the proper climate of operation, enough sugar can be produced to earn vitally-needed foreign exchange. To compete in the world market, it is necessary to produce cheap sugar which in turn depends on the price of sugar-cane. Today the cost of sugar-cane alone is more than the international price of sugar. Production of cheap cane is therefore a categorical imperative.

tion of cheap cane is therefore a categorical imperative.

Maharashtra Sugar Industry leads the way here. Its emerald green carpet of lush sugar-cane as if level cut by a master gardener is a feast to the eye. On the lands where surrounding agriculturists produce on an average 27 to 45 tons of sugar-cane per acre, 64.1 tons and 62.5 tons are average yields on the entire Godavari and Maharashtra sugar plantations. This is a heartening occurrence, with results on individual plots going above 90 tons. The results are phenomenal, particularly as they are achieved with maximum economy in the use of manures and water, ensuring the cheapness of the cane for world competition in export to earn foreign exchange for India.

PATTERNS FOR BETTER PLANT UTILIZATION

By MORRIS J. SOLOMON*

AN important limiting factor in Indian development is the paucity of capital and foreign exchange. To the extent that a given fixed plant can be made to yield greater output, India will be able to produce a larger total output without additional fixed assets and, perhaps, with a major contribution to employment. There is no doubt that borrowing technology from the more developed countries can hasten India's development, but because of a radical difference in the structure of costs, in many cases the optimum operating patterns for India are quite different than for countries like the United States, United Kingdom or Germany. This article outlines some approaches to obtain better plant utilization with a view to stimulating action.

The most straightforward method for increasing production with fixed plant is the use of more than one shift. Where overhead is large as it is typically under Indian conditions, multi-shift operation can be spectacularly profitable. This is illustrated in a "breakeven graph" projected on the basis of "realistic dimensions." The area between the revenue line and the cost line denotes the profits (screened area). Even where the productivity per man or machine is lower and (or) the price has to be reduced, the gain can be substantial. Multi-shift operation also can overcome a power shortage since in the odd hours the overall loads are lower. A further extension of the same operation is "staffing" so that the plant is operated seven days a week.

NEED FOR A NEW ASSESSMENT

In any complex process involving machines, material and men, one cannot hope to balance each factor perfectly. In actual practice, the Manager must choose between men waiting for machines or machines waiting for men. A very early treatment of one aspect of this problem was applied in Swedish Industry in connection with the optimum number of repairmen to service automatic machines. This treatment has become a classic solution in operations research. Analogous choices often exist with respect to other types of personnel. With Indian costs being what they are, far more waiting of personnel is justified and far less waiting by machines than in the more developed countries. India can afford to be "wasteful" of men, provided in doing

THE RATE OF RISE IN PROFITS AS AN ELEMENT OF TIME WORKED

so it utilizes more fully the resources limiting total production, namely foreign exchange and capital.

A good starting point in any investigation is the determination of the distribution of various "states of a system". The work sampling technique otherwise known as "snap readings" is an inexpensive and thorough means of determining how the time of men or machines is spent. Many Indian businessmen would be amazed to learn that one observer per shift can in two weeks' time tell them things about their operation that they could otherwise not dare to hope for. A snap reading survey of an operation can easily be carried out by the personnel attached to a plant under the guidance of any qualified statistician. Such guidance is readily available from various local Statistical Control Units of the Indian Statistical Institute. An actual example of a comprehensive analysis of machine time obtained from snap readings is given in Table I.

REDUCTION OF MACHING WAITING

It can be seen that the first four categories of time which involve actual work with or by the machine, involves about 60 per cent of the time. All the other categories are a form of waiting. The machine waits for feed, for the allocation of a job, for an operator, for material, for a setter, for a tool, for grinding, for inspection, for repairmen, for repair spares and for demand. Each type of waiting has its own remedies. Some remedies require a mere reorganisation, some require increased expense and still others require increased investment. Plant conditions described in Table I are such as to justify a substantial effort to capture a large part of the 41.1 per cent waiting of various kinds. With the analysis of Table I, Management can evaluate alternative remedial measures.

TABLE I
UTILIZATION AND CAUSES OF NON-UTILIZATION
OF 35 AUTOMATIC MACHINES

Status	Percentage of Total Time		Average of Both Shifts
	1st Shift	2nd Shift	
Machine Working	45.7	40.6	43.4
Actual Setting	6.0	3.7	4.4
Actual Resetting	5.3	12.3	8.6
Actual Repair & Maintenance	0.7	4.5	2.3
Total Actual Work on Machine	57.7	61.1	58.7
Waiting to be Loaded	3.2	0.4	1.9
Waiting for Job	1.1	2.5	1.9
Waiting for the Operator	1.4	3.3	2.3

Waiting for Demand	2.8	12.7	7.6
Total Waiting	42.0	38.8	41.1
	99.7	99.9	99.8

* Abbreviated from an address delivered by Morris J. Solomon to a group of Calcutta industrialists recently. Mr. Solomon is a TCM adviser at the Indian Statistical Institute.

STAGGERED LUNCH PERIODS AND USE OF RELIEF MEN

The world over, a man cannot work 8 hours a day without stopping. There is the inevitable lunch period of at least 40 minutes (defacto), and there is personal time. In addition, the demands of modern machinery are seldom in line with human capabilities. Industrial workers, therefore, do take "unofficial" rest periods.

The estimated distribution of time of an Indian machine shop given in Table II is felt to be quite typical of conditions in Indian Industrial enterprises. Categories 8A to 8H (40.7 per cent) represent time in which the machine is waiting for the operator. The approach that is taken in the more developed countries is to try to cut down on such time by pressures of various kinds with only moderate success. In India it is quite economical to eliminate such waiting by resort to more intensive staffing. Instead of one man per machine one can have 3 men assigned to two machines with a mandate for (and payment contingent on) keeping the machine going without any stopping for personal reasons. In the case of the Indian machine shop analysed in Table II, if 30 per cent out of 40.7 per cent were to be used for production, the resulting output would represent a 50 per cent increase in total output. It is very likely that such an increase could be obtained through a 50 per cent increase in men.

TABLE II.

UTILIZATION AND CAUSES OF NON-UTILIZATION OF INDIAN MACHINE SHOP EXPRESSED IN PERCENTAGES OF TOTAL TIME OF SHIFT

No.	Status	Percentage of Time
1.	Machine Working	39.5
2.	Setting	11.9
3.	Breakdown Repair	.8
4.	Gauging the Product	2.5
5.	Planned to be Idle	.4
6.	Waiting for Instructions	.7
7.	Taking Instructions	.9
7A.	Worker gone for Tool Grinding	.8
7B.	Worker gone to Bring Material	.6

An obstacle to the successful implementation of more intensive staffing is the common condition of over-staffing in Indian enterprises that yield no benefit whatsoever. Needless to say, where such a condition exists, the first step is to attempt to convert that part of the staff which is not being used, to a utilization which permits the enterprise to increase production.

The process of intensive staffing does pose some problems which require recognition and suitable action. Where it is not possible to keep each person's output separate, one still wants to be able to maintain res-

pensibility for results. In that case machine responsibility for quality and volume of output must be extended to a wider group. This implies that responsibility and incentives must be on a group basis. In actual practice it will be advantageous to form teams of say 3 men for 2 machines rather than larger groups. Even for small groups where machines are different, personnel should be able to handle more than one of the machines. In many situations this is hardly a problem. In other situations special arrangements will be necessary.

In any particular situation, one can expect difficulties and hurdles to be overcome. Such hurdles can be overcome by adopting suitable organisational changes and incentives. The profitable use of more intensive staffing is a challenge to the skill of management. One thing is certain. The most difficult hurdles are not technical; they are social and psychological which are most difficult to overcome.

The gain from increased "staffing" per machine becomes especially profitable if it can be combined with a speed up of pace of labour with provision of for rest periods.

SPEED-UP OF PACE OF LABOUR AND REST PERIODS

Particularly for machine processes that have a close dependence on operator action (especially hand feeding) the pace of an operator can vary considerably, depending on the physical condition of the operator and the length of time the operator is expected to work without a break. In general, just as a person can run at a faster rate if he is permitted to rest at frequent intervals, so it is often possible for an operator to work at a faster pace if he has a rest period. This suggests that if the more intensive staffing for staggered lunch periods and relief for personal time can be combined with speedup of pace, with provision for suitable rest periods, then gains can be especially worthwhile. For example, if a 20 per cent gain in working time achieved by working in lunch periods and personal time is combined with a 20 per cent increase in pace, the net gain in production would be 44 per cent.

MORE INTENSIVE USE OF MACHINES

Conversations with industrial executives indicate that where the imports of machine tools are limited there is a tendency to run at speeds which minimize tool wear per unit of product. Such a tendency can obviously lead to a situation where to save the import of one per cent of the import value of the machine, one is forced to permit the import of the full value of machine. This is clearly wasteful. How widespread such a phenomenon is can only be determined by an empirical study.

There is a common complaint that Indian manufacturers cannot obtain specialized services that are usually available in the more developed countries. Often the solution adopted by the individual enterprise is to gear up to provide the service for itself despite the fact that its own demand can keep the equipment only partially occupied. Once having obtained the equipment, the enterprise loses interest in the lack of availability of service. A starting point to remedy this would be a census of equipment by availability for some important geographic centres. Based on the per cent utilization and the disposition of the individual firms, resort can be had to the promotion of subcontracting in lieu of obtaining more machines or of spinning equipment to satellite enterprises. It would be desirable to try such an approach in a restricted locality. In the long run the government should be in the position to foster subcontracting through its licensing powers.

THE BUSINESS WORLD

The Investment Centre in New Delhi

FORMAL inauguration of the Indian Investment Centre took place at Sapru House in New Delhi on Thursday. Mr. G. L. Mehta, Chairman of the Governing Body of the Centre, explained in detail the basic reasons for setting up the Centre. Tracing the history of foreign private capital investment in India during 1956-58, he came to the conclusion that the Indian Union had not succeeded in attracting a sufficiently large quantum of private capital from abroad.

He said, "In the private sector, during the three calendar years 1956-58, the gross inflow of private capital amounted to Rs. 83 crores; this was composed of Rs. 38.8 crores of retained earnings of foreign firms already operating in India, Rs. 31.4 crores of non-cash inflow and Rs. 12.8 crores of cash inflow. The loans from the World Bank amounted to Rs. 69.4 crores. Gross inflow in the private sector during this period, therefore, amounted to Rs. 152.4 crores, i.e. an average annual rate of Rs. 51 crores. If the outflow of Rs. 39.8 crores on account of repatriation of capital is excluded, the net inflow in the private sector amounted to Rs. 112.6 crores roughly showing an annual rate of Rs. 38 crores. This is comparable to the net inflow of private capital of Rs. 16 crores during the biennial period of 1954-55 though the increase in the latter period was to a large extent due to increased World Bank loans. There is no doubt that in the two subsequent years 1959-60, there would be a significant increase in the net inflow of private capital. It would, however, appear that compared to the substantial amounts of borrowings from foreign governments and international institutions in the past three or four years, the volume of foreign private investment in this country has been small."

The fault lay with this country because India's rapid industrial advancement during the last decade had not been sufficiently publicised abroad. While India's political and financial stability was widely recognised in foreign countries, there was very little knowledge about opportunities of profitable investment in this country. The Indian Investment Centre was coming into being at a time when India's ambitious Third Plan, leaning heavily on projects which could not be completed without foreign collaboration, was under great stress due to the paucity of foreign exchange.

Mr. Mehta laid special stress on the fact that the Indian Union offered considerable advantages as compared to many other countries in Asia or Latin America.

There was a great urgency about making this fact widely known. Because of the pressure, political and otherwise, from many countries on the available capital from the advanced countries, India's case was likely to go by default if corrective action was not taken in time. The Investment Centre is expected to act as a catalytic agent between the Indian entrepreneurs and the foreign investors. In addition to promoting wider knowledge and understanding in the capital exporting centres of the world pertaining to conditions, laws, policies and procedures regarding investment and investment opportunities in this country, the Centre would also assist the industrialists on all matters relating to the participation of foreign private capital.

The foreign investor is interested, to a very large degree, in information on the following subjects:

- governmental, fiscal and industrial policies;
- general economic conditions with particular reference to industrial growth and profitability; and
- trends in money and capital market.

The Centre proposes to provide all this information and to assist the industrialists on specific investment projects in such a way that all the essential details leading to the "prospectus stage" are made available. The Indian Industrialist stands to benefit to a very large extent because he is very much handicapped in the presentation of necessary facts and figures in a manner which will interest the foreign collaborator. The Centre proposes to have on its staff technical and qualified personnel for the processing of the project reports. The Technical Co-operation Mission of the United States has promised all technical help for this purpose. An agreement has already been entered into between the Governments of the United States and the Indian Union under which the US technical co-operation has agreed to make available 7,80,000 dollars to cover the foreign exchange expenditure on contract services, training facilities and equipment. Another sum of Rs. 22 lakhs has been provided out of the PL 480 funds to meet the local expenses during the first two years of the Centre's operations. It is hoped that under the able guidance of Mr. G. L. Mehta, the Chairman of the Governing Body, and Mr. R. S. Bhatt, the Executive Director, (who was till recently a member of the Tariff Commission), the Investment Centre will fill a major gap in India's outfit for encouraging the inflow of foreign capital.

What Form Public Enterprise?

By CROESUS

IT was a brilliant idea, once again, of the trustees of the Sir Dorabji Tata Foundation to have invited Lord Morrison (more widely known as Mr. Herbert Morrison of British Labour Party) to deliver the second series of the Dorab Tata Memorial Lectures. Lord Morrison gave three lectures, but two of them covered nearly the same ground, more or less. In a way, this was just as well, because the points made were better understood, and, in any case, at a time when there is such a glaring absence of clear thinking, if not utter confusion of thought, on the subject-matter of these two lectures, the public could afford to bear a little repetition of at least the more im-

portant of these points. One of these that simply fascinated me was a sort of 'obiter dictum' which emanated from the distinguished Labour Peer on possible alternatives to socialisation—economic planning or economic controls. It was clear from what he said that, although he did not rule them out altogether, he was in favour of them only as remedies to an abnormal situation, in the sense that he regarded it possible to do with very little of them or even without them. To quote his own words, "So economic planning and control is legitimate, but we should not engage in these things merely for the fun of it. There is no need to apply controls to

everything. Otherwise, they can become irritants instead of a help to the economy. If overdone, they could choke desirable initiative and constitute an improper interference with freedom, including that of the small businesses. Economic direction for the mere sake of it is a mistake and is liable to represent an irritant and to encourage excessive bureaucracy." It is not that others, more especially, our own leaders, have not said this before, but we suffer from the strange complex of listening to, or accepting, the advice of eminent outsiders sooner than we are prepared to do so in the case of our own countrymen, however eminent, experienced or elderly.

Public corporations is obviously the answer that the practical Britishers have hit upon, after their customary muddling through with more than one form of public or social ownership, such as post-office, municipal trading, voluntary consumers co-operatives, etc. As Lord Morrison observed, the earlier socialist conception of public ownership assumed that all socialised industry would or could be run by State departments, but as the Labour Party began to enter more complicated services and more commercial businesses and came to be confronted with difficulties, doubts arose as to whether civil service administration was the straight and only available answer. The genesis of public corporations perhaps lies in the resolution of such doubts by combining the principle of public ownership with business management. Obviously, the long-familiar system of running certain government departments on the lines of commercial undertakings in our own country must have preceded the public corporations in Britain also.

Now for something about how public corporations are worked, according to Lord Morrison. "The ownership of the undertakings decided upon is vested in the boards of public corporations—boards appointed by the appropriate Minister on grounds of capacity and ability in a number of directions. The board is, so to speak, responsible to the nation. It is responsible for the day-to-day management, though, on matters of wider policy, it is competent for the Minister to give a decision by a general direction. It is, of course, natural for the Minister and the board to keep in touch with each other for discussions from time to time."

More important than their functioning, I feel, is the degree and nature of accountability to Parliament of these public corporations, an aspect which figured prominently in our own country at the time of the Mundhra enquiry or the LIC episode. This aspect has evoked considerable controversy in the UK also and

the eminent Labour Lord did not lose the opportunity of having a dig at the apparent inconsistency of the Conservative attitude to this question, by recalling the discussions on his Parliamentary Bill for London Transport—"The Conservative Party stated that there was too much 'Minister' in the Bill and painted an alarming, though unfair, picture of interference in this business undertaking by a politician," he complained, and went on to point out that, when the Labour Government's public corporations started to function, the Conservatives were themselves persuading their Government to interfere with the public corporations by means of questions in Parliament. Hence the insoluble argument—Lord Morrison rightly described it as "the Parliamentary Dilemma"—that, if you make a board responsible for the day-to-day management of any undertaking, you cannot have Ministers constantly trying to interfere with the undertaking, though they have certain powers of general direction. In this connection, the Labour Lord referred to "one amusing and sometimes annoying feature of all parliaments, namely, that they do not feel themselves obliged to be logical. They want to have the best of both worlds. Parliament, indeed, has tended to underestimate the opportunities for questions and debates which it has. Everything a Minister does or can do about public corporations are matters for parliamentary questioning and debate. So the parliamentary opportunities as to the boards and the constitution of their councils are considerable. There is the appointment of the boards, raising of capital, and a large number of other things. These matters can be raised by means of parliamentary questions. The opportunities for debate are quite extensive. For example, on the Queen's speech, on motions for the adjournment, on supply days, on bills promoted by public corporations relating to their work and on the annual reports and accounts which the corporations must send to the Minister for presentation to Parliament. Later, there was established a House of Commons Select Committee on nationalised industries—which the Trade Union Congress and I feared would be a nuisance—but it has done better than might have been anticipated."

Lord Morrison's summing up was admirable. He said: "As a whole, the public corporations have been worthwhile.... These enterprises are great and, I hope, successful experiments in public ownership, but we must all have minds which are adaptable about their structure and management. We must not get into a state of mental fixation." Wise words these, words which our politicians will do well to bear in mind.

more correctly, that politicians should leave the trade unions severely alone.

The success or failure of unions, as Lord Morrison said, depends upon the factor of employment and unemployment. "If employment is high, it is easier for the unions to win some concessions. If unemployment is high, it is not only hard for the unions to earn concessions; the reverse may happen and they tend to lose members. So the unions have their ups and downs." The earlier unions tended to be unions of skilled workers or craft unions, but, subsequently—in the 1880's—unions began to enlist un-skilled workers also. Indeed, separate unions of these came to be established, as, for example, the Dock Wharf, Riverside and General Workers' Union and the Gas Workers' Union and so on.

Lord Morrison felt that the idea of a general strike had been talked about in the Labour movement for years and had to be tried out before its effectiveness could be demonstrated. It was significant to know from him that, in reality, when the Trade Union Congress had got the idea of a general strike, it did not know what to do with it! More or less an identical situation

Business Notes

Trade Unionism

THE BANE OF POLITICS

IN ADDITION to the three lectures that the Rt. Hon. Lord Morrison of Lambeth delivered in the second series of the Dorab Tata Memorial Lectures, he also spoke of the "British Trade Unionism" under the auspices of the Tata Institute of Social Sciences, in Bombay, last week. There was much in what this distinguished Labour Peer said to provide food for thought to our labour leaders. Tracing the long story of British Trade Unionism from its inception to the present day, Lord Morrison observed, for instance, that a general strike with political implications was questionable and the government of the day was almost bound to resist it. There were striking points of similarity between the British general strike of 1926, which he recalled, and the Government Employees' so-called General Strike in our country last year, and the severe loss of face the latter occasioned to the political party supporting it. It is high time that political parties in India recognised that trade unions should eschew politics or, perhaps, to put it

may be said to have developed in India last year, when the second line of leadership of the political party that started the strike was called upon to take a decision whether to call off the strike or to continue it. But, whereas the labour leaders in the UK came to regard it as a mistake eventually and are today frankly doubtful as to whether such a thing would be allowed to happen again, unless it were against a "coup d'etat" by a possible military or other dictatorship when it would be justified, no such sobering thought would appear to have received any serious attention by our labour leaders here.

Speaking specifically on trade unions vis-a-vis politics, Lord Morrison said the bulk of the British trade unions were associated with the Labour Party in politics and casting important votes at its annual conferences. Even so, he went on to say, the trade unions were still independent and made separate pronouncements both on industrial and public policies. Also, what is perhaps no less important, the Labour Party in the U.K. too does not seek to interfere in the day-to-day activities of these unions, as our politicians are only too apt to do, even on the slightest pretext. In this respect, our trade unions seem to have derived their inspiration more from the Communist trade unions in Britain, who unabashedly endeavour to impose their own political domination over the unions and their industrial policy. Lord Morrison left no doubt in the mind of any of his large audience that political leadership of the unions of this kind was most undesirable and usually undemocratic. He firmly maintained that trade unions should be run by the trade unionists themselves.

Steel**DURGAPUR'S SECOND BLAST FURNACE**

THE COMMISSIONING on February 2, of the second blast furnace of the Durgapur Steelworks by Sardar Swaran Singh, marks an important landmark in the Indian steel industry. Now, in addition to two blast furnaces (the first having been commissioned at the end of 1959), two coke oven batteries, three open hearth furnaces and the blooming and billet mills are in operation. The Durgapur Steel Plant with its three blast furnaces, eight steel-making open hearth furnaces and rolling mills, when fully in operation, is expected to produce 7.9 lakh tons of finished steel products. In terms of ingot steel the annual production would be around 1 million tons a year. During the Third Five-Year Plan period the production

capacity is proposed to be raised to 1.6 million tons.

The work on the third blast furnace of the plant has already been taken in hand. The Union Minister was hopeful that the whole project would be completed according to schedule. This, indeed, is not an easy matter, considering the number of difficulties the project had to face. The appreciation, the Union Minister expressed, for the full co-operation offered by the British associates of the project, appears quite appropriate. The Durgapur Steel Works, in a way, is the symbol of foreign assistance in the form of capital goods and know-how that advanced nations are advancing to the developing countries.

NIEMAN FOUNDATION FOR JOURNALISM

THE NIEMAN FOUNDATION for Journalism at Harvard University, USA, is again giving a Fellowship this year to an Indian journalist who has the following qualifications: (1) a minimum of three years' experience as a working journalist; (2) the written consent of his employer for leave of absence for the college year, namely September 1961 to June 1962; (3) fluency in English, both speaking and writing and (4) a maximum age of 40 years.

Since 1955 the Asia Foundation in the USA has co-operated with the Nieman Foundation in offering Associate Fellowships to journalists from Asian countries. All departments of Harvard University will be open to the Fellows who may select their own studies and pursue them through courses or in more informal ways. A selected candidate will receive an allowance of \$100 a week during the 43 weeks he will reside at the University, in addition to a round trip air tourist fare and some additional allowances for incidental expenses. As Associates, the Asian Fellows will have all the privileges that are granted to regular Fellows.

The University offers no courses in journalism, but Nieman Fellows will be encouraged to study subjects that will form the background of public affairs, such as history, government, economics and foreign policy, or work in such special fields as science and labour.

Applications for the Associate Fellowship, which will commence in September this year, should be sent to the Chairman, Nieman Committee for India, c/o the Indian International Centre, 16, Hailey Road, New Delhi-1. Application forms may be obtained from the office of the Committee at the above address and must reach the office not later than 31st March, 1961.

FROM THE CAPITAL'S CORRIDORS

ECAFE SESSION

PROBLEMS of economic development of Asia and the Far-East and the possibilities of fostering intra-regional co-operation, particularly in trade, transport and industrial matters, are likely to highlight the discussions at the next session of the Economic Commission for Asia and the Far-East. The session starts here on March 8 and will continue for two weeks; it will be inaugurated by Prime Minister Nehru.

The most important item on the agenda, it is understood, is the exploring of possibilities to establish some sort of common market for Asia. The Commission's Secretariat, it is learnt, is in touch with various Governments in this region ascertaining their views on the scope for greater co-operation in trade matters. The Commission at its forthcoming meeting is expected to discuss specific measures which can be undertaken to bring about greater regional or sub-regional trade integration. Some of the measures proposed are co-operation in enforcement of customs regulations, agreements on transit facilities, drawing up of an ECAFE Code for customs practices, promotion of exchanges and training of staff, development of commercial arbitration facilities and organisation of international trade fairs.

The second important topic for discussion would be the development of transport facilities in this area. Special attention is likely to be drawn to the problem of co-ordination of road, rail and water transport in order to make effective use of the limited resources for full economic development of the region. Proposals will be sought on appropriate methods of financing highway projects, ensuring of highway safety, dredging of inland waterways and designing of prototype coasting vessels. In regard to railway transport, discussions will revolve around economic and operational aspects of railway signalling in relation to speed safety and increase in line capacity, welding of rails, maintenance and laying of long welded track, provision of research facilities, training of railway personnel, possibilities of introducing container transport and development of international railway traffic.

Possibilities and problems of international and regional co-operation in embarking upon joint industrial ventures will also be discussed. Among other subjects that may be dealt with are promotion of tourist traffic in this region, contribution of rural community development programmes to the national economic development, agricultural planning in various countries and provision of technical and financial assistance.

The Indian delegation to the ECAFE session will be led by Mr Nityanand Kanungo, the Union Minister for Commerce.

BARBARA WARD ON INDIA'S THIRD PLAN

Not a little interest has been created in Delhi by Barbara Ward Jackson's article on "India on the Eve of Its Third Plan" in the January (1961) issue of 'Foreign Affairs.' Barbara Ward is an agreeable commentator, because she is known to possess not merely deep knowledge, but also because of her friendliness towards India, but also because of her objective, fearless, and direct manner of both appreciating successes and criticising Indian failures. The fact that she is looked upon as an equally objective critic in both Europe and North America makes her analysis, assessment both powerful and helpful. Her analysis, which is to the effect that India at the present time greatly resembles Western Europe in 1947, is one which needs to be accepted abroad. Barbara Ward makes the vital point that like Europe in 1947, India today has not the capacity to produce in the short period enough to sustain her balance of payments; the essential features of the present-day Indian economy and Western Europe of 1947 are the same—lack of control over raw materials and capital needed for further advance. In other words, that potential development tends to be arrested

ed in India when a payments shortage presides over all other shortages. More precisely Barbara Ward's views have been presented in two paragraphs which are reproduced below:

"In short, India in 1961 resembles in some measure the nations of Western Europe in 1947. At that time, most of them had made a most strenuous attempt to drag themselves up from the pit of wartime destruction. Their farmers, their workers, their managers had accomplished a vast effort to convert war industry back to peacetime uses and to restore war-ravaged agriculture to full production. But over one factor they had no control. The raw materials, the food, the capital they needed for further advance were available only in North America; but their dollar reserves had been run down to almost nothing and they still lacked the goods to export to North America in return for its supplies. Such was the deadlock from which they were rescued only by the vision and foresight of the Marshall Plan.

"Today, in its relation to the whole Atlantic world, India stands caught in something of the same contradiction. Years of effort have set its economy in motion as never before, but for further expansion the essential component of foreign exchange is simply not available. It neither can be earned by exports nor imported by means of normal commercial loans. The whole momentum of the first thrust of growth is thus at stake and turns upon an obstacle which cannot be hurdled from the Indian side. Only the Western powers have the means at this stage to see to it that the obstacle does not force the Indian experiment to full stop."

UTILISATION OF YUGOSLAV CREDIT

Talks have started between the 32-member Yugoslav Delegation, which arrived here last week, and the representatives of the Government of India on utilization of the 40 million dollar credit offered by Yugoslavia for India's economic development under the Third Five-Year Plan. After a general discussion on the sectors in which the two countries could collaborate, various joint committees were set up to make a detailed examination of the proposals put forth by the Government of India for utilisation of this credit. Some of these committees will examine Yugoslav participation in power projects (to be executed both in the public and the private sectors), shipping, fisheries, setting up of food processing units, manufacture of equipment for steel industry and provision of machinery for oil prospecting and exploitation. One of the joint committees will consider the possibilities of Yugoslav collaboration with Indian private sector industries, especially soda ash, caustic soda, coal washing, foundry/forging equipment making and copper processing industries. A sum of Rs. 5 crores out of this loan is likely to be earmarked for development of shipping.

There is also a proposal to utilize part of the Yugoslav credit for setting up three training institutes—one to train technicians for the leather industry and the other two to train workers for food and metal processing industries.

Side by side with the talks on utilization of Yugoslav credit, negotiations have started to increase the trade between the two countries. Two committees have been set up to study the possibilities of expansion of trade between India and Yugoslavia and the allied subject of banking.

Talks will be resumed after March 8 when the Yugoslav delegation, which leaves New Delhi on Saturday on a tour of the important industrial centres in the country, including Bombay, Bangalore, Madras and Calcutta, reassembles here.

This is the hallmark of
QUALITY

This is the certification mark of the Indian Standards Institution. It is given to many consumer and industrial articles manufactured or processed according to relevant Indian standards.

The ISI mark has many advantages. To the manufacturer it means increased demand through customer satisfaction, and protection from unfair competition. To the consumer it offers an assurance of quality of goods and services purchased, and better value for the money spent. The granting of the licence to use the ISI mark is a trust placed with the manufacturer. ISI maintains a constant vigil to see that it is not misused in any way, for the interest of the consumer has to be safeguarded.

INDIAN STANDARDS INSTITUTION

last. The team's visit to India is part of its plan to study the economic conditions in South-East Asia, with a view to look into the climate for Japanese investment in these countries.

Mr. Yasuhara Takaki of the Fuji Bank, an important member of the team, has observed that his bank is particularly interested in joint economic enterprises, especially in the field of mineral development. Collaboration in this field is preferred because Japan imports large quantities of iron ore and other mineral products from India.

Mr. Takaki is of the opinion that in view of the tremendous rate of economic progress attained by India during the last few years, Japanese entrepreneurs ought to invest more in this country. They are quite likely to find in India a congenial climate for investment. The Government of India, he said, should also provide some more facilities to foreign investors.

MOVEMENT OF COAL

Mr. Karnail Singh, Chairman of the Railway Board, said at a Press Conference last week that the railways are at present moving coal, outside the steel sector, at the rate of 42 million tons per annum. The movement of coal to the steel plants is at the rate of 7.5 million tons per year.

The railways, he said, had fulfilled their Second Plan target in regard to coal movement which was fixed at 41 million tons outside the steel sector. The target fixed for movement of coal to steel plants was 10 million tons. The capacity released due to shortfall in coal supplies to steel plants, consequent upon the delay in their completion, has been utilised for movement of coal for other uses. This explains movement of extra one million tons of coal in the non-steel sector. The railways, Mr. Karnail Singh observed, had achieved this target despite many difficulties such as loss of movement capacity during the Central Government employees' strike and unprecedented floods in the last monsoon season in various parts of the country, especially in Orissa, West Bengal, Punjab and Uttar Pradesh.

The accumulation of coal stocks at pitheads in some collieries, particularly in the Singareni coalfields, had been due to the fact that at some of these places a round-the-clock loading on all the seven days in a week, as urged by the railways, had not been resorted to.

COAL DUMPS

Four States—Uttar Pradesh, Punjab, Bihar and Orissa—are understood to have accepted the principle of establishing coal dumps in their areas as a means of relieving coal movement bottlenecks. Proposals from some other States have also been received by the Railway Board. They are said to be under consideration. The Government of India, it is understood, is also considering the possibility of increasing coal movement by sea though shipment of coal by sea costs about Rs. 25 per ton more than by railways. Railways are already moving about one million tons of coal by sea for their requirements in the South.

INCREASED ALLOCATION FOR LAYING RAILWAY LINES LIKELY

The possibility of increased allocation for construction of new railway lines, particularly in the South, during the Third Five-Year Plan period was hinted at by the Railway Minister, Mr. Jagjivan Ram, in his Budget speech on Wednesday.

Giving broad indications of the Railways' Third Plan, he told the Lok Sabha that the tentative allotment for new lines was Rs. 120 crores which would provide for approximately 1160 miles. Out of this, about 200 miles would be required for development of

new coalfields and industries. Another 50 miles would be needed to serve the proposed port at Haldia in the Eastern region. The balance would relate mostly to constructions essential for railways' operational needs. The tentative provision, Mr. Jagjivan Ram said, was being reviewed by the Railway Ministry in consultation with the Planning Commission.

ELECTRIFICATION OF RAILWAYS

The Railway Minister also disclosed that tenders had been invited for erection of overhead equipment needed for electrification of Sealdah-Ranaghat and Dum Dum-Bongaon sections of the Eastern Railway. Civil engineering work, he added, was in progress on Sealdah South sections. On the Igatpuri-Bhusaval section, this work had been completed. The work on Madras-Tambaram-Villupuram section, he stated, would be speeded up now that the decision had been taken to electrify this section on the 25 K.V. A.C. system, for which technical details were being finalised.

Mr. Jagjivan Ram further said that against an electrification programme of over 1400 miles, about 500 miles in the Eastern region on routes serving the coal and steel belts, would be substantially completed in the Second Plan. The sections Rajkharswar-Dangoopogi and Asansol-Gomoh had already been commissioned. The sections Durgapur-Asansol, Gomoh-Gaya and Asansol-Sini-Tatanagar-Rourkela were expected to be energised in stages by June next. Works on electrification of the sections Gaya-Moghulserai and Tatanagar-Kharagpur were also progressing, the Minister observed.

SURATGARH FARM

The Central Mechanised Farm at Suratgarh, established in 1956 with Russian aid, has made substantial progress during the past 2½ years. Total yield from this 30,670 acre farm was 1,47,084 maunds in 1958-59. It increased to 2,04,726 maunds in 1959-60 and is likely to go up further to about 3,16,710 maunds during the current agriculture year. Area under cultivation has gone up from 14,154 acres in 1958-59 to 25,017 acres in the current crop year.

A more encouraging fact about the operations at this farm, however, is that the yield per acre has shown considerable rise. The increase in unit area yield of kharif crops is spectacular indeed; against an output of 3.84 maunds per acre in 1957-58, the yield of kharif crops during the current year has been of the order of 18.95 maunds. The yield of rabi crop has nearly doubled as is evident from the following table:

SURATGARH FARM OUTPUT

Crop/Year	Area Sown (Acres)	Total Yield (Maunds)	Yield Per Acre (In maunds)
Kharif			
1956-57	..	..	..
1957-58	..	1,864	7,157
1958-59	..	2,923	20,249
1959-60	..	6,990	66,249
1960-61	..	6,054	114,710*
Rabi			
1956-57	..	2,993	20,790
1957-58	..	2,483	10,928
1958-59	..	11,231	126,835
1959-60	..	15,843	138,477
1960-61	..	18,963	202,000*
Total Harvest			
1956-57	..	2,993	20,790
1957-58	..	4,347	18,085
1958-59	..	14,154	147,084
1959-60	..	22,833	204,726
1960-61	..	25,017	316,710*

* Estimated.

The unit area yields at Suratgarh today compare very favourably with the all-India figures which are 5.09 maunds and 6.45 maunds per acre for the kharif and rabi food crops (excluding rice) respectively.

It is gratifying to note that a modern workshop is now ready at the farm to undertake all kinds of machinery overhaul and repair jobs; arrangements, it is understood, have been completed for obtaining regular supplies of spare parts for the machinery from the Soviet Union. Manufacture of some spares at the workshop has also been started.

To inculcate in the workers employed on the farm a feeling of partnership in the project, an incentive awards scheme has been introduced since the last kharif season. Tentative norms for different operations, both manual and mechanical, have been laid down and brought to the notice of the workers. With the availability of perennial water supplies from the Rajasthan Canal in the near future, Suratgarh farm, thus, can be expected to make further strides in the years to come.

The total investment on the farm till now has been approximately Rs. 1.45 crores. After allowing for depreciation of machinery and interest on capital employed, in accordance with the accounting principles laid down in consultation with the Director of Commercial Audit, Accountant General, Rajasthan, and the Union Ministry of Finance, the farm is understood to have shown profit all along except in 1957-58.

INDUSTRIAL HOUSING

Nearly 95,744 houses for industrial workers had been completed during the eight years to September 30, 1960, under the Industrial Housing Scheme, against 1,32,512 sanctioned. About 42,181 houses were completed during the First Plan period and the remaining during the first

four years of the Second Plan. The bulk of the houses (79,833) were constructed in the State sector. Private employers built 14,485 houses and co-operative societies 1,426 houses.

The Central Government disbursed Rs. 29.48 crores as aid to State Governments and other constructing agencies between September, 1952, and March, 1960. For the current financial year, a provision of Rs. 8.82 crores has been made for Central assistance in this regard.

RURAL HOUSING

According to the latest information available here, over 9,300 houses have been completed or are under construction under the Village Housing Scheme. In addition, the selection and survey of villages, drawing up of lay-out plans and preparation of model designs and specifications for rural houses have been taken in hand. Of the 3,560 villages selected out of 5,000 scheduled to be covered during the Second Five-Year Plan, socio-economic surveys have been completed in 1,770 and physical surveys in 1,630. Lay-out plans have been drawn up for 1,400 villages.

Rural housing cells, with necessary engineering personnel, have been set up in Andhra Pradesh, Bihar, Kerala, Madras, Maharashtra, Mysore, Madhya Pradesh, Orissa, Punjab, Rajasthan, Uttar Pradesh, West Bengal and Assam.

The Central allocation for the rural housing programme during the Second Five-Year Plan amounts to Rs. 48.5 million, of which about Rs. 46 million are likely to be spent by the States by March, 1961.

The Village Housing Scheme provides for grant of house-building loans to villagers up to 66-2/3 per cent of the cost of the house, subject to a minimum of Rs. 2,000 per house. The loan is repayable over a period not exceeding 20 years.

STEEL manufacture at MUKAND

In 1940, Mukand employed 694 men; in June 1960—2,187. Over the past seven years, production figures have soared—18,234 tons in 1952/53; 49,787 tons in 1959/60. This increase is a reflection of a good management of finances:—

	1957/58	1958/59	1959/60	
	(Rs. in lacs)			
Capital	51	51	71	Mukand manufacture high-grade steel products—bars, rods and castings. Presently an expansion programme is under way. It will cope with the growing influx of big orders—like the one placed by the Railways with Mukand on 16th July 1960 for 4,035 sets of Centre Buffer Couplers valued at 84 lacs.
Depreciation provided up to date	32	36	41	
Profits retained in business to date	25	35	45	
Profit for the year	19	30	32	
Dividend for the year	5	5	8	

Mukand provides India's new and growing industries with the quality steel components they must have.

NEARING ACHIEVEMENT

India's ambitious Durgapur Steelworks project is well on the way to completion. ISCON, the consortium of famous British engineering and electrical manufacturing companies, has been most successful and the end of the job is in sight.

Rolling mills, melting shop, blast furnaces, coke oven batteries and cooling towers have transformed the skyline. The birth of this new industry has already brought new employment to West Bengal. A steel city has been carved from paddy fields and jungle by people of two different nationalities and background, but working as a team with a single purpose. The result is a triumph for British industry and a better tomorrow for the people of India.

COMPANY AFFAIRS

BHARAT SUGAR: HIGHER PROFITS

Certain incentives were announced by the Government of India to encourage increased production of sugar. These incentives to the sugar factories were in the shape of a concession of 31 nP per maund of cane crushed up to November 21, 1959, if crushing was started on or before November 10, 1959 and a rebate of 50 per cent of the basic excise duty on production during the season 1959-60 in excess of the average production of the season 1957-58 and 1958-59. The Directors of Bharat Sugar Mills Ltd. have indicated in the annual report of the Company for the year to June 30, 1960 that a rebate of Rs 55,896 was granted for early start of crushing. The excess production amounted to about 70,600 maunds. The company was allotted an export quota of about 190 tons of sugar from the production of the season 1959-60 against a quota of about 46 tons from the production of the previous season.

During the year under review the factory worked for 163 days and crushed 24.99 lakh maunds of sugar cane against working of 125 days and crushing of 18.75 lakh maunds in the previous year. The recovery was, however, lower at 9.93 per cent against 10.15 per cent in the previous year. The lower recovery which was in common with the other sugar mills in Bihar was due to early start of crushing and longer duration of the season. During the current season a crushing of about 27.50 lakh maunds of sugar cane is expected. The Company's farms yielded 58,102 maunds of sugar cane as against 47,123 maunds of sugar cane during the previous year. The average yield of sugar cane per acre was better.

The working results for the year under review show a higher profit of Rs 8.42 lakhs, as compared to Rs 6.74 lakh last year. Provisions have been made for depreciation and taxation to the extent of Rs. 1.05 lakhs and Rs. 4.85 lakhs respectively. The Directors have recommended the payment of dividend, subject to deduction of tax under Income-tax Act, on ordinary shares of Rs. 10 each at the rate of Rs. 1.50 per share. The Directors have reported that in view of the recent changes brought about by the Finance Acts, 1959 and 1960 in the matter of deduction of tax on dividends the Company declared and paid dividend for the year ended June 30, 1959 on 5,000 five per cent Taxable Preference Shares at the rate of 5 per cent without deduction of tax paid by the Company on its profits. Since then, the Preference Shares (Regulation of Dividend) Act, 1960 has been passed. The Directors, however have recommended that the rights attached to 5,000 five per cent Taxable Preference Shares should be so modified as to entitle them for a dividend of 5 per cent without deduction of tax on Company's account but subject to deduction of tax at rates prescribed under the Income-tax Act.

LAXMI STARCH PLANS FOR EXPANSION

The Laxmi Starch Factory Ltd. worked regularly all the shifts during the year to March 31, 1960, but it recorded a fall in the turnover from Rs. 65.32 lakhs during 1958-59 to Rs. 51.33 lakhs during the year under review. This adverse record is mainly attributed to the unfavourable market conditions that prevailed abroad with the result that the off-take by way of exports was maintained by the Company at a lower level. The Company, however, made quite promising efforts for internal trade. The gross profits during the year were recorded at Rs. 5.27 lakhs. After making appropriations for depreciation and taxation there remained a net profit of Rs. 2.23 lakhs. The Directors have recommended the payment of a dividend at the rate of 13 per cent subject to deduction of tax on ordinary shares of Rs. 100 each which will absorb Rs. 1.63 lakhs. A sum of Rs. 1 lakh is being transferred to general reserve. The autho-

rised capital of the company was increased from Rs. 35 lakhs to Rs. 50 lakhs vide special resolution. This step was considered necessary by the directors to meet the company's requirements of funds for the expansion programme. The company also secured a sanction for the scheme to amalgamate Narayan Silk Mills Ltd. with the Company. After the expansion programme has been carried through the Company is likely to record better results.

WAVERLEY JUTE

Waverley Jute Mills Co. Ltd., which was closed down in June 1957, sold its loom hours to other mills within the McLeod Group during the year to May 31, 1960, has shown a net profit of Rs. 2.52 lakhs after providing Rs. 50,000 for deteriorated stores, Rs. 1.05 lakhs for depreciation and Rs. 2.50 lakhs for taxation. The Directors have proposed the payment of dividend for the year, subject to deduction of tax on ordinary shares at the rate of 30 nP. per share which absorbs Rs. 75,000. After paying dividend on preference shares a sum of Rs. 1.94 lakhs is carried forward.

COMMODITY NEWS AND NOTES

RICE PRODUCTION - COMMONWEALTH ECONOMIC COMMITTEE REPORT

Rice (paddy) production in India in 1960-61 is estimated at about 45,500,000 tons—substantially higher than the previous record output in 1958-59—according to the Commonwealth Economic Committee's Rice Bulletin issued in London on January 31. Preliminary production estimates for Thailand and Formosa also show increases over last season's crop, while in Burma a slight fall is indicated. Thailand expects a crop of more than 7,340,000 tons—some 200,000 tons more than in 1959-60, with improved quality. Burma's crop is estimated at 6,770,000 tons. Dealing with exports, the report says: "Trade in rice in 1960, so far reported, has been substantially greater than a year earlier. Shipments from Thailand and Burma in January-November were considerably higher than in 1959, although the level of exports from both countries has fallen in recent months. Cambodian exports in the first 10 months of the year were two-thirds higher than a year earlier, despite a sharp fall in October, while those from South Viet-Nam in January-September were nearly double those in the first nine months of 1959." Burma's exports in October fell to 81,000 tons, the lowest monthly figure for 1960. No shipments were made to India, and there was a sharp drop in those to Indonesia. For the January-October period, India had imported 325,000 tons of rice from Burma, while the Ceylon figure was 213,000 tons. The United States, says the report, also has a larger harvest, with a final crop estimate of 2,430,000 tons. Exports showed a marked recovery in October, rising to 83,900 tons.

ARECANUT DEVELOPMENT

The Twelfth Annual General Meeting of the Indian Central Arecanut Committee was held at Madras on 21st January, 1961, under the Chairmanship of Mr. V. Shanker, Special Secretary to the Government of India, Ministry of Food and Agriculture. The Committee reviewed the progress achieved towards arecanut development during the Second Five-Year Plan and noted that most of the major arecanut growing States had achieved the target of production of quality seedlings for revitalising the existing gardens and extending the area under arecanut. It felt that there was more urgent need for intensifying measures to step up production and suggested that the Central Supervisory Body constituted for reviewing the progress of developmental schemes should critically examine the facilities required for increasing production. It also felt that there was further need for accelerating the development programme in some of the States and also reiterated that special allocation of fertilizers would augment production. The Committee laid primary emphasis on intensive cultivation but extensive cultivation could be resorted to wherever it was necessary to achieve the target of additional production. The Committee also decided that the Arecanut Journal which was being published in English, Malayalam and Kannada languages could in future be released in Bengali, Assamese and Marathi languages also.

The progress reports of the Central and Regional Arecanut Research Stations were considered by the Committee and while recording the reports it reiterated the urgent need of intensifying researches on agronomical and disease problems. For providing some immediate relief from diseases, the Committee suggested that suitable exploratory demonstration plots, where package treatments consisting of liming, spraying, manuring and irrigation be laid out in Kerala and Mysore regions. As there was urgent need to intensify fundamental researches on some of the diseases of arecanut and coconut the Committee proposed development of a National Palm Disease Investigation Institute with financial assistance from National and International organisations to control the diseases of arecanut, coconut and other allied crops. The Committee

also urged upon the State Governments to stock large quantities of fungicides at suitable centres for effecting supplies in proper time. The Committee noted with satisfaction the progress achieved in preservation and storage of nuts and decided to undertake field trials. It also decided that the lending manufacturers of hard board and wrapper paper should be contracted to undertake trials on utilisation of husk individually and in combination with other materials for production of hard boards and wrapper paper. Since the Marketing Survey conducted by the Agricultural Marketing Adviser to the Government of India contained many useful information, the Committee desired that the report be circulated to the States for their critical study. The Committee had sanctioned financial assistance to number of co-operative marketing societies in the States of Kerala, Mysore, Maharashtra and Madras and the progress recorded in these societies was found to be satisfactory. The Committee urged upon the State Government of Assam that similar work could be intensified in the State of Assam and it approved the scheme sponsored by the Assam Government for the establishment of co-operative marketing societies dealing in arecanut. It also reiterated that co-operative marketing societies could take up the supply of fertilizers, fungicides and sprayers required for arecanut growers in a more intensive manner. The Committee reviewed the progress achieved in the Pilot Survey scheme for assessing the area under and production of arecanut in the States of Kerala, Mysore, Assam, Madras, Maharashtra, Andhra Pradesh and Orissa and approved their extension for 3 years during the Third Plan period.

MR. AL FOIL OBSERVES THE FORMALITIES

Foil's the name, Al Foil, alumnus of aluminium and many titles besides. But you can call me Al. Being a tidy sort of chap and very hygiene conscious, I like to wrap up things for you in shiny aluminium foil—in fact, been so 'wrapped up' in the 'wrapping business' that I haven't had the chance of meeting you wonderful people. Not for the last 57 years which is when I entered the 'foiling fray'. And that puts me in a reminiscing mood. A long time... 57 years at Kamarhati... must have wrapped thousands of tons of tea for export, and now chocolates, biscuits and such toothsome confectionary. But that's only the 'sweet side' of my job... there's the bitter too, for the medicine men like to keep their pills fresh and efficacious by using 'foil protection'. Fact of the matter is that I have had to supply almost the entire requirement of foils for the confectionary, pharmaceutical, tea and cigarette industries in the country. Long and wide experience you'll agree... might even call me an expert. So whenever, in packaging, you have a 'foiling problem', remember I am here to serve you—no 'foiling problem' is difficult enough to foil Al Foil, alumnus of aluminium.

BOOK REVIEWS

GOVERNMENT ACCOUNTS AND AUDIT

Indian Governmental System of Accounts and Audit:
By P. C. Das Gupta, M.A., F.C.A. (England),
Indian Audit and Accounts Service (Retd.),
Chartered Accountant. Published by the In-
dian Institute of Public Opinion Ltd., Leslie
House, 19-A, Chowringhee Road, Calcutta-13.
Price Rs. 7.25. Pp. 171.

MR. P. C. Das Gupta speaks as one having authority. He was Deputy Auditor-General of the Government of India and one of the country's most distinguished public accountants. He is also a Chartered Accountant and was head of the Cost Accounts Section of the Ministry of Finance fifteen years ago. The book is written "for the students, not for the scholars" so that the manner of writing is descriptive, but the analysis covers the entire field of Government accounting, from the Budget to the accounts of Government commercial undertakings.

The work is a brief narration of the origin of Governmental accounts in India and an analysis of the powers and duties of the authorities specified in the Constitution. Considerable space is given to the Budget, its framing and the checks on expenditure. The manner in which allocations are made from the Contingency Fund, demands for grants, supplementary grants, votes on account, votes of credit are all described in detail. A separate chapter has been allotted to the Comptroller and Auditor General and an analysis has been made of the full scope of his powers vis-a-vis the powers of the Accountants-General of the Central Revenue and Post and Telegraphs, and the Accountants-General of the States.

Most of the subsequent analysis is devoted to the accounts of individual organisations. The Reserve Bank's role has been discussed right from its constitution to the manner in which it acts as a banker to the Government with specific reference to the arrange-

ments between the Reserve Bank and the Union and State Governments. Railway Reserve Funds are discussed at length with a detailed and interesting analytical description of Railway accounts. Mention is made of the manner in which Railway stores and workshops are treated as "capital suspense." The consolidation of accounts of the various Railway units comes in for particular discussion. A separate chapter is devoted to Public Works Department accounts and two chapters set out separately the accounting procedures evolved in the Defence services and in Government commercial undertakings.

This book has been written for the student, but the valuable material it contains will prove of use and interest even to those who are well-acquainted with the accounting profession. Mr. Das Gupta has filled a very real gap in accounting literature.

STATISTICAL TABLES

Kapoor's Interest Calculator: By L. Hari Das Kapoor.
Published by Messrs. H. P. J. Kapoor, Delhi: Pp.
190: Price Rs. 8.

THIS interest calculator has run into its 16th edition and has been well-known throughout northern India for more than five decades. The first issue was published at Lahore in 1906. Since then, considerable improvements have been made and the present publication has already become widely popular in banking, insurance, factories, mills and other commercial circles because of its intrinsic merits. In addition to the usual tables for calculating interest on products valued at Rs. 1 lakh to Rs. 99 lakhs and at rates rising gradually by $\frac{1}{4}$ per cent, the present volume also includes tables on metric weights and measures, seven new rates including $3\frac{1}{4}$ per cent and $3\frac{3}{4}$ per cent per annum, valuable information about Stamp Duty, current yield on Government securities and stocks and regular range of calculation for 1 day to 29 days.

The Home Minister

IF a true measure of the importance of domestic, as against international, events were to be sought it could not have been better answered than in the spotlight of interest this week. Notwithstanding the fact that a major shift has taken place in the United Nations' views on the character of its responsibilities in the Congo—and an important Afro-Asian resolution in which India played a prominent part in its formulation—interest in Delhi at least has been centred elsewhere. It is at this moment tensely contained in the house on Maulana Azad Road where Pandit Gobind Ballabh Pant, the Home Minister, lies critically ill. A great sense of proportion has thus been exercised both by the people and the entire administration. He is admittedly a central figure in the Indian political scene at the present critical time and throughout he has played a great role.

An appreciation of Pandit Govind Ballabh Pant appears elsewhere in 'A Delhi Diary' in this issue. All that is necessary to say will probably be said again and again. This is the time for history to record that a great son of India has given far beyond his strength outside the range of his immediate responsibilities. Uttar Pradesh and the Punjab have been his anxious concern over the last four months, and it is no secret that crises in both States have undermined his resistance bringing about the serious setback experienced on Monday night. It is not without

significance that his last act, even before he was visited by this reverse, was to call in the Law Minister to give him instructions as to the line on which the debate on the President's address in the Rajya Sabha was to be answered. It is not without significance that, under these instructions, the Law Minister made the most effective speech he has made since he was called to the high office.

There will be speculation as to the time it will take for Pandit Pant to recover. In any case it would be impossible for him to discharge fully his duties as Home Minister with all the ramifications of political responsibility which have come upon him as a great hero of the Indian Revolution and as the seniormost adviser to the Prime Minister. A great gap is thus left in India's body-politic which, in the short period, it will be impossible to fill. Thus we are brought again face to face with that gap in India's top leadership, against which contingency Providence has given us no protection and which we, in our complacency, have tended to ignore. It is vital that the warnings that are coming to us through the ravages of time should now be heeded and the Congress Party should recognise that its middle leadership must be pushed forward if it cannot itself rise equal to the demands that this nation makes upon leadership at the topmost rungs of the democratic State.

The State of the Sino-Indian Border

THE first phase in the settlement of the dispute over the Sino-Indian border has ended in a total deadlock and there are no indications at the present time how it can be broken. The fact-finding conferences between officials nominated by the governments of the two countries have demonstrated beyond the shadow of any doubt that China is in no mood to explore the possibilities of an early settlement on the basis of a reasonable approach to the issue. This is unquestionably the central moral to be drawn from the report of the talks laid on the table of the Lok Sabha on February 14.

China's designs on the frontier between the two countries were vaguely revealed when she started the seemingly innocent cartographic invasions. But in the wake of the Tibetan tragedy and India's fearless stand in granting asylum to the Dalai Lama, she threw off the mask of respect for India's territorial integrity and launched an open campaign of aggression. Having imposed her military control on the territory she needed for a strategic link between Sinkiang and Tibet, she advanced the preposterous theory of "actuality," implying recognition of aggression. The report on the talks of the official teams brings the painful realization that China has advanced further. Actuality stands on a sandy foundation and China has little qualms in shifting her claims.

Throughout the negotiations the Chinese have betrayed an attitude of duplicity. Tibetan negotiations on some segments of the traditional alignment in the Western and Middle Sectors were quoted by them with approval obviously because they suited their conception of the frontier in those areas. The real bone of contention, however, is the Eastern Sector. But confronted with the straight implications of endorsing the negotiations concluded by Tibet in their application to the Eastern Sector, they had not the least hesitation in repudiating Tibet's right to confirm the boundary in this sector. One shift in the position led to still more shifts and ultimately the Chinese asserted that Tibet had no treaty-making powers whatsoever. The incongruity in the positions adopted by China was laid bare when she asserted that the Convention of 1904 between Britain and Tibet was invalid, although it was approvingly quoted by her in another Convention concluded with Britain in 1906. To cap all, she concluded with Britain how, if Tibet had no China could not explain how, if Tibet had no right of making treaties with foreign Powers, she accepted Tibet's plenipotentiary status of complete equality with her at the Tripartite Simla Conference of 1914.

These blatant shifts and new claims to territory advanced to suit expediency cannot be dismissed as minor modifications. They follow a calculated strategy. China's original claim to 25,000 sq. miles of territory within India's border has now been magnified into 50,000 sq. miles which gives a measure of the extent to which the shifts can be pushed. China is certainly in no hurry to settle the issue. She has thrown out clear indications that new issues could be raised and the dispute prolonged. Her refusal to discuss the segment of the boundary lying to the west of the Karokorum Pass is not casual, but it has a deeper implication, questioning, tacitly, the legality of the accession of the State of Jammu and Kashmir to the Indian Union. In April last year, Mr. Chou En-lai explained that his Government accepted the relationship between India and Bhutan as well as Sikkim. There is now a sinister shift with regard to this relationship. That is the only meaning of China's latest evasive stand on this part of the frontier.

In this first phase of exploratory talks China has adopted an attitude of intransigence in demanding complete delimitation on the basis of a joint survey of the entire boundary running into 2,400 miles. Delimitation of an artificial boundary as between the USA and Canada or between India and Pakistan is comprehensible. But where the water-shed principle is clearly applicable in parts and the Himalayas demarcate the limits of the two countries, to insist on survey and delimitation is to block negotiations.

The outcome of the talks lays bare in its ugly form China's expansionist ambition now that Tibet has been fully sucked within her orbit. It should be crystal clear that our frontier in the North, demarcated by Nature, treaty and usage, is reduced to a state of flux and the danger of shifting "actuality" lurks as a constant threat to our security. The talks between the officials and the voluminous evidence of something like 600 documents produced by India need not go totally in vain. They will serve to put India's case in perspective before the world which is as essential as pressing it in the bilateral talks. There could be room for adjustments in some segments of the frontier. But this is hardly what China wants. India's intense desire for peaceful settlement notwithstanding, pious hope that good sense will prevail on her neighbour to the North can be no substitute for military sanction behind her policy. In this matter she has no choice but to strengthen her strategic communications first and to build up her defensive potential. It means a draft on her industrial resources.

A Draft Revenue Budget for 1961-62

WILL the Finance Minister spring on the business world some unpleasant surprises on February 28, 1961, when he presents the budget for the first year of the Third Plan? Unfortunately, the budget for 1961-62 lies in the shadow of general elections next year. This is undoubtedly a factor which may curb the obligations of

a Finance Minister to raise additional revenue by taxation required by the Third Plan. But at the same time it needs to be underlined that the Third Five-Year Plan is much more ambitious than the Second and a slow tempo of development in the first year may not convince anyone that we are in earnest.

The Research Section of the *Eastern Economist* has attempted estimates for the probable revenue and expenditure for the current year as well as for the next year, and the results are summarised in the table below. It will be seen from this table that in terms of revenue, the Union excise duties are expected to pass the estimates made in the budget by as much as Rs. 35 crores. Credit for this buoyancy goes largely to sugar and cloth; the former had a spectacular rise in production—much beyond the installed capacity—and the latter for its remarkable recovery after three bad years. A sizeable increase has also been contributed by petroleum products because of a steady rise in consumption. The corporation tax and the tax on income, on present indications, are not likely to deviate much from the estimates made in the budget. In overall terms, the budget may record an increase of about Rs. 28 crores with the deficit on the revenue account (because of the happy windfall in excise duties) slashed by half from Rs. 60 crores to Rs. 30 crores. Defence expenditure continues to rise, and according to current indications, the total expenditure under this head is likely to be about 13 crores of rupees higher than stipulated in the budget. Similarly, on civil administration, the increase in the emoluments of the Central

Government employees is likely to result in an increase of Rs. 12 crores.

The shape of the 1961-62 budget indicates a rise of expenditure of nearly 82 crores of rupees with the deficit on revenue account by around Rs. 50 crores. In line with the trend witnessed since 1959-60, it is estimated that the Union excise duties will be nearly Rs. 30 crores above 1960-61. The output of all commodities which come under the purview of excise duties has increased from 10 to 15 per cent per annum and this is likely to increase the yield at existing rates by Rs. 30 crores. Additional Rs. 50 crores are anticipated to be as a result of fresh duties on such items as paper, cloth and rayon and—if the Finance Minister has courage—on salt and kerosene. No increase under corporation tax and income-tax is provided; the nominal increase indicated may be all due to the natural growth in incomes. Equally no concessions are expected. It is unwise to leave any gap on revenue account uncovered; therefore, taxation of the order of Rs. 50 crores should not come as a surprise. There are serious problems on capital account with loan figures more difficult to attain with the stagnation in bank deposits. Deficit financing is also to be curtailed; all deficit financing may be well committed to meet shortfalls on the capital account.

A DELHI DIARY

GOBIND BALLABH PANT

THERE has been only one subject of discussion in New Delhi since Monday; that has been Pandit Gobind Ballabh Pant. The news of his stroke late on Monday night spread throughout Delhi on Tuesday morning and left the capital in gloom. Frantic efforts were being made to collect India's best physicians and in particular, Dr. B. C. Roy (without whose final diagnosis no senior Congressman is believed to have received India's best). On Tuesday night to Pressmen who eagerly awaited a piece of hopeful news, Dr. B. C. Roy's comment was, 'We must wait, watch and, perhaps, pray.' Most of us had a sinking of the heart at the suggestion of prayer, though I suppose, for religious people this is precisely what men should do on the frontier of a crisis beyond the skill of most doctors. One of the causes of anxiety is the fact that, in cases such as these, treatment depends primarily on the strength of the patient to withstand the first stroke. Pandit Pant has, for years, not been known to be in the best of health and fears that his reserves might be inadequate have added cause for concern. Nevertheless, as in his whole life, his courage and fighting power is, more or less, spontaneous. It rises to the surface through the bitterest of crises, and gravity has never terrified his mind or shaken his heart.

I have more than once in this Diary referred to the Home Minister's dedication to duty. Over the last two years his devotion, under great risk to his own health, has been beyond description. I recall when he had his first heart attack in April, 1959, it occurred after he had undertaken, unwisely, a road journey of over a hundred miles. The road journey at that time did not seem to be very important and the Home Minister had had a back pain. To the suggestion that he might avoid the journey, part of which was on a bad road, he returned the reply that the people who had invited him would be disappointed. He persisted on his course through pain, and through some premonitory symptoms of a heart attack — a heavy back pain and slight difficulty in breathing. It was only two days later that he agreed to call in the doctor just before the real heart attack came on. Many of us who have seen him in Delhi have been quite amazed at his capacity in sickness to perform a round of official duties such as would never be undertaken by "normal" persons in a state of "normal" health. His day starts at 6 a.m. and goes on till late at night. He has made it a point of honour to be accessible to all; the ununderstanding people refer to Pantji's Durbar, where "all and sundry" can appear. People come to see him and have a word or two. When he gives an undertaking, his mind retains it with a grasp, which to us, newspapermen, is always nearly a miracle. Some Secretaries to the Government have told me that they have gone in to see him on technical matters and they have found that while, apparently, a file passed through the Home Ministry in its desultory fashion moving round the corners of the Cabinet polygon, it has nevertheless been deeply studied. Pandit Pant can lay his hand on a particular paper inside the file to explain a point which he feels needs modification. Throughout his poor health in the last two years his mind has been crystal clear; his assessments are calm and in a miraculous way, untouched by the physical disabilities which he has suffered. There are few persons in Delhi who have not succumbed to the wonderful capacity and courage which has marked not merely his work in the Home Ministry but in every Ministry of the Government of India. He has been known to be the Prime Minister's main adviser; if he ceases to be Home Minister for a long period, there will be a major gap which would be almost impossible for the Prime Minister to fill. This

is largely because his advice has been disinterested; almost insular in its capacity to concentrate on the main political objectives of the Government with due weight to financial matters; self-interest, notwithstanding Mr. C. D. Deshmukh, has always been negligible.

HIGH FINANCE

One of the marks of his many-sidedness is the range of his experience. A lawyer by profession, his administration of revenue and financial matters has been so profound that he has been known for long as the leading financial authority in the Government. No Budget of the Indian Union is considered by the Prime Minister in isolation with the Finance Minister. Ever since Pandit Pant came to Delhi it has been a ritual that the Finance Minister should always consult him first. There are some who feel that, if he were the Finance Minister, things might have been even better because his intrinsic loyalty to his colleague lies in the fact that he does not correct fundamentals but only minor matters deemed by him to be in error. Nevertheless, it is fair to say that so long as the ritual is carried out, there is an assurance in the counsels of the Government of India that errors made will not be major. People tell me — I do not know with how much truth — that he opposed the taxation measures of the May (1957) Budget, recognizing their evil effects. He did not on that occasion prevail—worse luck!

AS A PARLIAMENTARIAN

With all his disabilities, he remains India's foremost parliamentarian. In giving information to the House he recognises the right of Parliament to probe, and even to criticise. On the other hand, he does not, in an Americanism, "stick his neck out" and provide pegs for the Opposition. In defence he is dignified and convincing, wasting no words on undignified criticism or personal references. He has brought a kind of senior statesmanship into the House, elevating standards of debates wherever he has participated. I am reminded of a comment by a Pressman to the effect that he represented in a great sense the sure movement of the caravan of India — "the dogs bark, the caravan moves on."

As a public figure he has responded not merely to official requests to open important functions or to appear at seminars (and other rituals of scholarship). He has a warm feeling for his friends and any of them can call him at any time of the day and night to a festive occasion. I believe he is more frequently seen at marriages than any other Minister of the Centre, for he knows with deep instinct that the paths to human relations are largely through the simple family occasions on which men's minds so frequently dwell. I have heard it said, again by a Pressman, that he is the greatest public relations expert of them all.

TO THE PRESS

Because he has such a deep understanding of the value of public relations, and because he senses instinctively the growing influence of the Press — even when its advice is constantly rejected — he has been an understanding friend of Pressmen. The National Affairs Committee of the All-India Newspapers Editors' Conference always looked forward to meeting him for a word of appreciation, encouragement and advice. The advice always has been deep and profound, the encouragement sincere. Thus it is that one can look upon this week with sadness and some longing. Not the least of those who are keeping an all-day vigil are Pandit Pant's journalist friends. I am proud to count myself one of these.

ARGUS.

The Flying Sherpa

AIR-INDIA's own cargo service, The Flying Sherpa.

between India and U.K. via the Middle East and Europe.

The Flying Sherpa is a specially designed Super Constellation freighter aircraft with a total capacity of 12 tons. It has double doors and reinforced flooring for the uplift of heavy and bulk cargo.

Pressurized and heated cabin for livestock, with trained attendants on board.

Ideal for imports of heavy machinery and spare parts at attractive charter rates. Please apply.

Shipping

STILL IN THE DOLDRUMS

ONE THING which is crystal clear from chairmen's speeches at the annual general meetings of shipping companies is that Indian shipping, like its counterpart in other maritime countries, is still caught up in the doldrums. Mr. Khatau's presidential address to the recent annual meeting of the Scindia Steam Navigation Company is the latest corroboration of this fact. This premier shipping company in India could manage to raise its gross freight earnings by Rs. 1.75 crores in its accounting year ended June 30, 1960, above the previous year by carrying higher cargo but at the cost of net earnings. The net earnings declined mainly because increased calls had to be made at different ports in a desperate attempt to capture cargo, even if at low freight rates, owing to the fierce competition of the entrenched shipping companies of the advanced countries.

The analysis which Mr. Khatau has made of the persistence of low freight rates is as revealing as it is objective. He has stressed the fact that the continued recession in the freight market is no doubt a major cause of the decline in freight rates. But tramp shipping, which has freedom to operate at any competitive rates, has pushed the level of freight rates to a low point and, to make matters worse, the foreign regular liner cargo ships, which are firmly established in international trades, pick up considerable volume of cargo at Indian ports en route. There is a tinge of irony in the arrivals of foreign ships which are otherwise most welcome inasmuch as they bring to us valuable quantities of foodgrains and fertilizers. These vessels have a choice between offering low rates absolutely unrelated to the cost of transport on their return trips and going back in ballast. It needs no particular mentioning that they prefer the first course. Thus it is that Indian ships engaged in international trades find themselves confronted with cut-throat rate-war even in the matter of cargo going out from Indian ports.

FACTS ABOUT OVER-EXPANSION

Against this background it is certainly amazing to find responsible organizations like the General Council of British Shipping levelling charges against under-developed countries for the fault of expanding their tonnage. Certainly it is unique logic to hold under-developed maritime countries responsible for the current difficulties of international shipping and arguing that the rate-war arises primarily from their expansion of tonnage at a time when the world freight market is not in a position to sustain it. Mr. Khatau has provided chapter and verse that the over-expansion, to the extent that it can be legitimately called as such, emanates from the advanced and established maritime nations. The figures of comparative growth of tonnage between 1948 and 1960 in respect of different countries have been tabulated in the summary of his speech which appears elsewhere in this issue. It is not necessary to repeat them here. Over-expansion has come, as the table speaks for itself, from countries of Europe (excluding the UK and Scandinavia) the Scandinavian countries as a single group, Greece, Liberia and Panama. Japan cannot be bracketed with them because her tonnage was destroyed during the war and whatever little she was permitted to rebuild in 1948 is no real basis for comparison of her tonnage in 1960.

Mr. Khatau has uttered a word of caution that no inference can be drawn to the effect that the imbalance

between the world tonnage and the demand of world trade for its services has been corrected from the fact that the laid-up tonnage has been reduced from 8.7 million GRT in October 1959 to 3.3 million GRT in January 1961. Freight rates still remain at a low level and so long as they are not lifted from their depressed points the imbalance cannot be said to have been corrected. Shipping will be able to move out of the present phase of doldrums in course of time, but it is high time real content was given to the professions of advanced countries to accommodate the growth of backward countries. In the sphere of shipping that spirit of accommodation is tragically lacking.

Indo-Soviet Trade

NEW BARTER DEAL IN THE OFFING?

THE FIRST Deputy Prime Minister of the U.S.S.R., Mr. A. N. Kosygin, who arrived in New Delhi on Monday on Prime Minister Nehru's invitation in connection with the signing of the agreement on utilization of the 112.5 million rouble (approximately Rs. 60 crores) credit made available by his country for India's economic development during the Third Five-Year Plan, is understood to have made an offer to the Government of India for a new barter deal involving exchange of Russian petroleum products for Indian textiles.

Russia's anxiety to find outlets for her petroleum products is not in the least surprising for she is now said to have appreciable exportable surplus of both crude oil and oil products. During the past two or three years, Russia has been supplying crude oil and oil products not only to some of the neighbouring Communist countries, but also to Japan, Great Britain, and Cuba. India bought kerosene from her only last year. But what is intriguing indeed is her desire to link these exports with imports of cotton textiles from here. Not that India had not exported cotton piece-goods to Russia before. But they until now have been one of the many export items from here to the Soviet Union and the volume of trade between the two countries in this commodity has been only small.

This new barter deal offer is perhaps another piece of evidence of growing estrangement between the Soviet Union and the People's Republic of China. China, according to her own claims, has big exportable surplus of cotton textiles; her export offensive in South-East Asia, of which textiles trade formed the spearhead, only a couple of years ago is adequate testimony to this fact. India, of course, will welcome the opportunity to step up her exports of cotton cloth to the Soviet Union; her textiles exports to the other countries, especially in South-East Africa, West Asia and Africa, are facing stiff competition not only from the indigenous industry that is coming up in these countries, but also from her eastern competitors — Japan and China.

In the meantime, the agreement on utilisation of the 112.5 million rouble credit has been signed. This credit, which brings the total assistance authorised by the Soviet Union to this country since 1955 to Rs. 385.41 crores, will be utilised for financing the following Third Plan projects: (1) Hydro-electric power station on the right bank of Bhakra; (2) Gujarat Oil Refinery with a thermal power plant attached to it; (3) Coking coal washery at Kathara, in Bihar; (4) refractories plant near Bhilai; (5) Exploration, development and production of oil and gas by O.N.G.C. in Cambay, Ankleshwar and other areas; and (6) preparation of techno-economic report for a pumps and compressors manufacturing unit.

The comforts of life are spreading

Rising standards of living are finding their way into the remotest village and are coming within the reach of people with quite modest means. Consider Kerosine, for instance, which by bringing illumination to the humblest home is playing a part in this welcome development. By the end of the Third Plan, Burmah-Shell estimates

that demand for Kerosine will be around 2.9 million tons, or well over 800 million gallons a year. There can be no question that the first priority should be the exploration and production of indigenous crude oil; the second priority must be to expand refining capacity in India. Oil is essential to economic growth and Burmah-Shell believes that

for tomorrow's needs we must act today

NEARING ACHIEVEMENT

India's ambitious Durgapur Steelworks project is well on the way to completion. ISCON, the consortium of famous British engineering and electrical manufacturing companies, has been most successful and the end of the job is in sight.

Rolling mills, melting shop, blast furnaces, coke oven batteries and cooling towers have transformed the skyline. The birth of this new industry has already brought new employment to West Bengal. A steel city has been carved from paddy fields and jungle by people of two different nationalities and background, but working as a team with a single purpose. The result is a triumph for British industry and a better tomorrow for the people of India.

HOW TO SPEED UP ECONOMIC GROWTH

By ODYSSEUS

IN "INDUSTRIAL DEVELOPMENT: A Guide for Accelerating Economic Growth" (McGraw Hill, London, 1960, 58 sh.), Mr Murray D. Bryce, a Canadian economist and industrial research consultant, offers a practical, "Do-It-Yourself" text book for business men and government officials, called upon to prepare industrial projects in developing countries, but who lack the experience of how to collect and analyse the necessary facts, how to assess the potential returns of a project, whether big or small, and how to find the finance.

My Bryce covers such practical problems as the technical and financial investigation of a project, the analysis of its domestic and foreign market prospects, its comparative costs and threats of competition, capital-cost estimates, measuring working capital requirements, sales revenues, operating costs, and estimating the cash flow; the preparation of designs and specifications, tenders and contracts, the work of engineering consultants; the essentials of good management, the employment of foreign experts; how to seek local finance; the advantages of foreign participation, and how to attract foreign capital, particularly from the World Bank, the International Finance Corporation, and other U.S. sources. There is a major gap here in that Mr Bryce seems unaware that London finance houses have more experience in overseas investment than any other centre in the world. As Mr A. R. Conan says in his "Capital Imports Into Sterling Countries" (Macmillan, 1960), London has since World War II exported no less than £4,000 m. of private capital, and he observes that New York is not equipped to provide a flow of capital, at any rate to sterling countries, and has not, in fact, done so. World Bank loans are not market transactions and are therefore unpredictable because whether they are granted or not may depend on non-financial considerations. Nor is there any assurance that maturing loans can be financed by further borrowing. In 1955, for example, Australia had to redeem \$50 m. of a maturing loan because it was not practicable to re-finance it. Further, if dollar loans are secured, it is then necessary to provide for the annual interest due and for eventual repayment. The relatively short terms of many World Bank loans and the need to provide for early repayment are apt to make such loans troublesome. In business investment, problems soon arise over the transfer of dollar profits. It may not be easy to meet these commitments because of the special conditions attaching to dollar payments. Here there is a contrast with British capital. It is true that debtor countries have not always been able to find the exchange needed to service sterling debt, but in such cases there was usually only some temporary balance of payments difficulty. Some countries may be unable to service dollar loans even when their overall balance of payments is satisfactory.

NO WORLD CAPITAL SHORTAGE?

That the world is suffering from a shortage of capital is a truism, but Mr Bryce says that, provided a project has been realistically prepared, it has good chances of finding backers. Mr Bryce's point is a variation of the proposition that most professions are overcrowded with second-rate practitioners at the bottom, but that there is always a scarcity of outstanding men at the top. The overwhelming majority of local projects fail to secure foreign finance because they are ill-conceived, or rendered unattractive by conditions inspired by nationalistic feelings rather than by purely economic re-

quirements. It therefore seems arguable, paradoxically, that a real world shortage of capital will only emerge if all projects are prepared in accordance with strictly economic principles.

That Mr Bryce is sympathetic to the developing countries should dispose them to heed his warning of the errors made by many. The question that planners should ask is "How can the national income be most increased at the least cost?" Instead, they usually assume that wealth comes from industrialisation of itself, so they create uneconomic industries bolstered by tariff protection. They think that national safety requires self-sufficiency, so they build up defence and automobile industries, expensive to run because their output is limited by a small market. They consider that handicrafts are socially valuable, so they preserve them by subsidies. In order to protect their balance of payments, they invest in national shipping companies at uneconomic rates. Political pressures often prevent them from locating industries on the most economical sites and induce them to spread schemes evenly over the country. As Mr Maurice Zinken says in his "Development of Free Asia" (Chatto & Windus), "The list of errors into which the ignoring of profits leads is long. Separately, they can each be justified by some non-economic consideration, from defence to human charity. Together they are keeping the people of Asia in poverty and squalor and ignorance for longer than is necessary."

Mr Bryce also warns that unless a developing country has some unusual resource, such as oil, it would do better to build what it wants—industry—on the strength of what it already has—agriculture. Historically, agriculture has been the ore big paying activity from which industrialisation had been financed, and has provided the mass of consumers who constitute the market for new industrial goods. Agricultural development lacks the glamour of a steel plant, but it may be the sounder priority. The greatest improvement in the well-being of many countries would come from raising agricultural productivity. This does not mean that there is a conflict between agriculture and industry, but that their development is intermeshed. Unless agriculture modernises itself, industrial expansion is cut short by lack of markets because the masses cannot afford to buy industrial products.

Some argue that the base for all development is heavy industry and that this must be created first, even at sacrifice. For the world as a whole, heavy industry is essential to support other industries, but for an individual country, this is not necessarily so, and for many small developing countries, it is misleading. It is generally cheaper to import heavy products from countries that can make them economically for a world market. A developing country can build industry when, as in India, it has natural advantages in raw materials, such as good iron ore and coal for steel, but it will then be successful not because the project is heavy industry, but because it is sound in itself.

The way to industrial development is to look first for projects which will further, and thereby increase the value of, agricultural, mining, and timber goods already produced for export, and then to seek others which can produce economically goods already being imported in large quantities.

Mr Bryce concedes that where an industry is economically sound for a country, i.e., when in normal

ration it can produce at costs fully competitive with other countries, it is right to grant moderate protection to enable it to establish itself. But he warns that an industry started behind a substantial tariff does not experience the competition needed to make it efficient, and if it can only survive by protection it does not add to, but actually decreases, the national income.

WEAK STATE ENTERPRISES

Mr Bryce reports that although most developing countries claim that their state enterprises are run commercially, they are in fact usually run like government departments—and this from the highest motives: pay scales should be uniform throughout government services; central purchasing should lead to economies; accounting methods should fit government auditing rules; budgets should be centrally administered to ensure control; the policies of all government departments should be co-ordinated. The result is that state enterprises lack the speed, efficiency, and flexibility essential to economic success; they lumber along with the meticulous routine essential in government service.

To say that civil servants usually make poor directors of state enterprises is no reflection on their ability or intentions, for in many countries the civil service has attracted the best available talent. Government service needs men who are careful, thorough, and respectful of official regulations. Commercial enterprise needs men who are enterprising, cost-and-profit-conscious, calculating, yet bold and, above all ever ready to try out new ways, new ideas, and to take risks.

It is not difficult for a civil servant to run a factory below capacity. A good factory almost runs itself, if mediocre performance is acceptable. But the difference between this and full capacity production at high efficiency is usually the difference between substantial losses and high profits. It is easy to criticise managers of government factories for not taking risks or constantly experimenting with new ideas, and for not being more cost-conscious, but usually they gain nothing personally if, by great effort, they succeed in increasing

production or reducing costs. To do this involves risks, and they will incur official censure, perhaps jeopardise their future, if mistakes are listed against them. Even if governments wish to appoint non-civil servants as directors it is often difficult to secure the best talent, because most top level executives shrink from risking their business reputations by becoming mixed up with political projects. Too often governments get second rate business men who can't hope to attain the top flight in private enterprise.

A government enterprise almost always has trouble with labour. Most politicians have to watch the trades union vote and the inevitable result is concessions which raise costs far above those in other plants at home or abroad.

But what about the "excessive profits" of private enterprise? To investors, the "excessive profits" that come from new ventures are rewards for allowing their savings to be used for capital equipment instead of consumer goods. "Excessive profits" are payments by consumers to the entrepreneur for establishing and maintaining good management; they are insurance premia paid by society to the entrepreneur against the risk of loss inherent in all industrial investments. Under any ownership, someone must pay for the enterprises which fail. The difference between failure in state and private enterprise is that the latter faces disaster realistically, minimises losses, and salvages as much capital as possible, either by going bankrupt or by selling out to a more efficient management; whereas, since there is no such word as bankruptcy in the Socialist's vocabulary, a state enterprise is kept on, securing an uneconomic return on its capital, year after year, at the expense of taxpayers and consumers.

Mr Bryce concludes that in trying to secure industrial development through state enterprise, governments in Asia and South America have inflicted much greater losses on their economies than the price in dividends that would have had to be paid for private industrial development.

Bank vaults are always made of steel ...
because steel is so dependable!

symbol of security!

THE UNITED STEEL COS. (INDIA) PRIVATE LTD.

Bombay • Calcutta • Madras

Through the years Steel has come to be considered the symbol of security ... not merely physical security, but economic security as well! The larger the amount of steel a country produces, the higher the rung she occupies on the ladder of economically stable countries ... the greater her credit in the international market. And that is why India today is striving so hard to raise her output of steel — Steel that will endorse her claim to economic stability ... Steel that she can hold up to the world as a symbol of her security.

The European Scene

CONSUMER MARKET RESEARCH IN EUROPE—II

From Our Special West European Correspondent

PARIS, February 19.

THE main use of consumer market research is to predict the evolution of demand, given certain assumptions which the market analyst accepts as data because they come from political decisions (e.g. the growth-rate fixed in a national plan) or from natural factors (population growth). It should be noticed that such predictions include no assumptions or guesses about prices or production. This might seem totally unrealistic: how can anyone presume to foretell how much X will be consumed in five years if he does not know the price and the supply of X? The answer is that the market analyst is not pretending to read the whole future, but to bring out trends in one factor, demand, which in reality largely determines the other two, supply and price. A forecast of future demand may be made on the assumption that relative prices will be stable, and although this is often false it expresses the main fact about free-market economies: that supply adjusts to demand, and only where it cannot, because supply is inelastic, do prices rise. The fluctuations of industrialised economies since the war show that demand is the deciding factor in free countries where private consumption absorbs about two-thirds of the national product.

Thus no separate forecasts of prices and production are needed. We are already as well informed about the future as we can hope to be when we are told that demand for a product will increase by so much, and that if the supply is there to meet it relative price will be stable; if not price will rise. Careful market study makes it possible to predict some such price rises very easily. Take the case of meat in the French market. Higher revenues lead to increased demand for meat, and to lower demand for bread, potatoes and rice. However, since it takes about five years for herds to grow, there must be a lag in the expansion of meat supply, with a consequent if temporary rise in the relative price of beef. More than that, market studies show that a 10 per cent rise in revenues leads to a 12 per cent rise in the demand for roasts and only a 1 per cent rise in the demand for stewing steak. Since anatomists assure us that cattle are completely inelastic, that they can provide only so much roasting meat for so much stewing meat, it follows that a rise in the price of roasts will be inevitable and permanent. This will be partly mitigated by the ingenuity of retail butchers who will label stewing steak "roast", but the trend is clear.

Or take the case of personal services, such as hairdressing and house help. Productivity is rising much slowly in these fields than elsewhere, so if we predict a general rise in personal revenues and increased demand for services of that kind, we can be sure of much higher prices for them; this is in fact one of the most striking features of American life today. However, meat and personal services are exceptions (among others); most of the things that Europeans demand more of when their revenues rise—durable goods, travel, health services and cultural equipment—can be produced in readily increased quantities given the demand. So the assumption of stable relative prices in consumption forecasts is not absurd.

If any separate predictions are required on the production side, they will concern research and development. For the medium term, of about five years, that is fairly easy, because there is usually a gap of about that length between scientific and technological

discoveries and their commercial exploitation. Thus the research people and the scientists can tell us pretty accurately today what new things industry will be offering in five years. Beyond that period, we are in the domain of science fiction. More surprisingly, perhaps, for shorter periods such as 12 months production is very difficult to forecast. But then so is consumption. Consumer market predictions for next year no doubt have their use, but they are less reliable than predictions for three or five years hence. To sum up: the market analyst needs to make no special forecasts of price and supply, because he knows that producers will produce what is demanded (that is what consumption forecasts tell us) if they can produce it (that is what research tells us); and if they do not or cannot, prices will rise.

That brings us back to forecasting demand, which is now established as the autonomous factor. How is this done? Naturally, there is only one way of predicting anything, and that is to extrapolate from a trend that we find in the present and recent past. The hazards of the operation are evident, and that is why market analysts prefer to speak of "perspectives" rather than predictions; they take the word from the demographers who provide "perspectives" of population growth on the explicit assumption that marriage, fertility and death rates remain stable, or at most vary in a foreseeable way. What will happen if there are notable changes in the circumstances that we expect to be stable, neither the demographer nor the market analyst pretend to know, and occasional use of the term "prediction" should not be taken as concealing such pretence.

Yet, naturally, if the market analyst were only saying "demand for X has increased by 5 per cent annually over the last decade, so I guess it will continue to do so in the next five years", this extrapolation would not be very informative—and it would probably be wrong. Before he makes any forecast, he analyses very thoroughly the causes of that 5 per cent rise during the last decade, paying particular attention to the role played by those variables about which he has information for the next five years to come. That information, we have said, he gets from the planners who have fixed a target figure for the growth of incomes, and from the demographers. So he is singling out the effects on consumption in the recent past of (a) increases in incomes, broken down for classes and regions, and (b) variations in population, especially the age distribution and geographical distribution. The last-named is vital in consumer studies, since the move from rural areas to cities causes changes in consumption perhaps as important as an increase in personal revenues.

Therefore consumption predictions such as are provided by the CREDOC institute in France are much more than extensions of known curves. Industrialists, who know well enough how production has grown in their industry in recent years, would have no need to call in market analysts if that were all there was to it. A gradually rising curve of demand for fresh fruit, for example, would permit only the most hazardous forecasts until detailed market study had shown the connection between it and urbanisation: demand for fruit is greater, steadier and less sensitive to variations in revenue, in the towns than in rural areas. It is only when those facts about the past are combined with the planners' predictions about urbanisation and revenue-changes, that a real perspective of fruit demand is obtained. The point will be even more evident

for goods that are, like clothing and household equipment, extremely sensitive at one and the same time to revenue, social class and region.

Although it is much more complicated than just extrapolating from an unanalysed curve, the technique remains fundamentally that of projecting present trends into the future. European consumption forecasters operate with numerous, mutually-interacting trends, and so their calculations are extremely intricate, but the essence of the method is always the same: extending a curve into the unknown. Only an analyst who wanted to be taken for a fortune-teller would pretend that there is anything else in his predictions. Yet there exists—for consumption forecasters in every country except the USA!—an excellent check on such predictions: the response of demand to higher incomes in other countries where those higher incomes have already been attained. That is why the history of recent evolutions of demand in the USA is one of the main guides of European analysts today, when European living standards are approaching US standards more and more each year.

The method of international comparisons has given some quite extraordinarily accurate results (e.g. for motor cars, synthetic textiles, etc.) but it has dangers of its own. There are some national differences that are truly irreducible no matter how much revenues rise—or, if you like to put it this way, some points on which a richer Europe stubbornly resists Americanisation. According to Engels' law and every other indication of market study, French food outlays ought to have fallen to the 30 per cent of family budgets that is normal in industrialised countries, yet they stick at 40 per cent, and in almost all classes at that. Similarly, French consumption of tobacco and cigarettes lags behind even that of poorer Italy, let alone any question of approaching British or US levels. These examples are simple and suggest the caution with which international comparisons should be used in India—where, moreover, comparison should be with countries not too far ahead in the living-standard scale, such as Japan and Algeria.

One could go into further detail about the different methods now in use in Europe for estimating demand

for durables as opposed to non-durables, about the volume and destination of savings (most of which are ultimately consumed some time, but in special ways), etc. But none of that perhaps, would convince the industrialist who thinks that consumption study cannot interest him because he doesn't make consumer goods. This is the merest illusion, of course. All industrialists, with the possible exception of the pharaohs who built the pyramids, work ultimately for consumption. A steel manufacturer is as much interested in consumption changes as a shopkeeper; it is just that he wants to know about changes in a year or two rather than next week. What the objection often means is that there is some powerful agent standing between the manufacturer and the ultimate consumer; as the doctor stands between the pharmaceuticals manufacturer and the patient, or the architect between the building goods industry and the home-buyer. The doctor and the architect decide which drugs and fittings will be consumed, and the consumer meekly obeys—so where is the use of consumer research?

This objection, that it is intermediate users rather than ultimate consumers who govern much production, might have some force in India where so much effort is devoted to building the infrastructure of industrialism—though even there it is evident that intermediate users' demand can be studied by market research techniques. In West Europe, it has been found to have no force at all. Demand for investor goods, pharmaceuticals and specialised equipment—things which the lay consumer seldom buys personally—cannot be forecast without study of ultimate-consumer preferences, and they can, indeed, be treated as, to all intents and purposes, ordinary consumer goods because they follow the same pattern. A survey by the Economic Commission for Europe has shown that, for this region at least, all the variations in production in the 1950's can be entirely explained in terms of two variables: ultimate consumer demand and the equipment of consumer-goods industries. In fact, the major part of industrial investment here has been in equipment for industries processing food, manufacturing furniture and electrical appliances, and for the retail trade—for reasons that can only be understood by means of consumer market analysis.

initiative from the shop floor

The manufacture of crowbars in Tata Steel's Agrico factory in Jamshedpur involved a number of time-consuming and uneconomic manual operations. Ratan Singh, a foreman, decided to do something to improve matters. Carefully studying the problem, he designed a die which cut down work, improved the product and substantially increased turnover at reduced cost. For his brilliant work, Ratan Singh received an award of Rs. 3,000.

In the ten years up to 1960, Tata Steel employees have put forward a total of 10,165 major and minor suggestions—an average of three a day. In the latest year, 445 suggestions were received, 54 of which have merited rewards.

Thus, initiative from the shop floor is helping to improve productivity at Jamshedpur, where industry is not merely a source of livelihood but a way of life.

Economic Report from the U.S.

LIBERAL AID AND TRADE POLICIES

BY GUY SIMS FITCH

WASHINGTON, February 16.

IN virtually every major utterance since taking office, President Kennedy has affirmed his dedication to liberal aid and trade policies. And whenever the occasion has required, he has backed up his statements with appropriate action. At the heart of the Kennedy administration's foreign economic policies seems to be the assurance that the United States will not reduce its international obligations to fit its troublesome balance of payments situation. From one point of view, this may be interpreted as signifying that contributions to the economic advancement and the security of the United States and other free nations are taking precedence over the defence of the dollar. Taking issue with this viewpoint are those who believe that the dollar must be defended at all costs—even at the risk of curtailing U.S. economic and defence commitments and deviating from traditionally liberal trade programmes.

The fact is, however, that neither of these extreme and seemingly conflicting viewpoints need be dominant. Once it is conceded that a strong dollar remains the keystone of a strong international economic and financial system, it becomes clear that the welfare of both—the dollar and the system—go hand in hand. Thus, the Kennedy administration appears to be seeking a solution of the much-publicized deficit in the U.S. balance of payments against a background of economic and trade expansion, at home and around the world. In this context, it becomes easier to understand the strong emphasis Mr. Kennedy has put on domestic economic growth and the expansion of U.S. exports, and his rejection of import curtailment or exchange controls as meaningful facets of national policy. In fact, Mr. Kennedy has gone even further in several public statements, to stress the value of imports to the U.S. economy. As the arguments goes, other nations must sell to the United States if they are to have the resources with which to buy from the United States—a "quid pro quo" that works the other way around as well. Moreover, the evidence is that Mr. Kennedy and his advisers tend to look on imports as a positive economic "good." Through purchases from other countries, for instance, the United States obtains many raw and semi-raw materials it does not produce in sufficient quantity to feed its huge industrial complex, as well as other products that add to the living standards of the American people.

Just last week, the President had his first opportunity to apply on a practical level these basic ideas of liberal trade and an expanding U.S. and world market. The case involved was not particularly imposing in itself—the import of binder twine and cordage, mostly from Canada and Mexico. The U.S. Tariff Commission, in reviewing previous U.S. duty concessions on these items, had split on the question of whether the duties should be raised to protect the American industry from alleged harmful effects of import competition. Significantly, in this first major test of administration trade policies, the President put himself clearly on the side of liberalism, deciding against increased import duties for the two products. This does not mean that Mr. Kennedy necessarily will make the same kind of a decision in every subsequent ruling. Economic circumstances, after all, differ from case to case. Nor does it mean that the issue of trade policy has been settled

once and for all to the complete satisfaction of all the people of the United States. Discussion of trade policy, whatever the viewpoints involved, is a legitimate element in the democratic process, and it is to be expected that complaints about imports will continue to be heard from various sources in various industries in various parts of the country. These complaints tend to take on a particularly aggrieved tone during periods of economic recession, such as the present, when imports often are blamed, rightly or wrongly, for the nation's temporary business ills. Yet the evidence seems clear enough that the President and members of his administration are firmly wedded to the liberal approach in foreign economic policies—an approach that is being translated into specific actions, recommendations and programmes. This is seen in the espousal of export expansion and the rejection of import restriction. It is seen in the continued support for economic assistance to developing lands. It is seen in the endorsement of the projected Organisation for Economic Co-operation and Development (OECD), through which the United States would join Canada and 18 nations of Western Europe to help stimulate world economic growth by increasing and making more effective the flow of development assistance, particularly from those industrial nations—notably in Europe—which have now reached the economic position of being able to enlarge their share of the total aid effort. As one expert has put it, President Kennedy has indicated that "policies that build rather than restrict seem most likely to benefit all countries."

Fourth Open Hearth Furnace at Durgapur Commissioned: One more furnace in the steel melting shop of the Durgapur Steel Works went into commission on February 13. This is the fourth open hearth furnace out of the eight to be constructed in the steelworks. The first open hearth furnace was commissioned on April 25, 1960. The capacity of seven furnaces will be 200 tons each while the last one will have a capacity of 100 tons of special steel. The open hearth furnace will process pig iron from the blast furnaces into steel. Durgapur steelworks is designed to produce one million tons of ingot steel when all the furnaces go into commission.

Indo-Afghan Trade: The review of the working of the Indo-Afghan trade arrangements concluded in New Delhi recently and agreement was reached on the steps for further development of trade during the remainder part of the current Trade Agreement period, which expires in July 1961. The two governments have reaffirmed their desire to promote trade agreement between India and Afghanistan and take such special steps as might be found necessary. As a result of the talks held in Delhi during the last few days, it is expected that there will be further exchange of goods between the two countries. The main imports from Afghanistan into India will consist of dry and fresh fruits, asafoetida, cuminsseeds and hides and skins. Exports from India will consist of cotton and woollen textiles, tea, coffee, vegetable products, agricultural products chemical products, engineering goods, household and building requirements, hardware, rubber manufactures and leather manufactures. It may be recalled that an Indian trade delegation visited Kabul in October 1960 for finalising trade arrangements for the current Trade Agreement period beginning July 21, 1960 for a period of one year. The arrangements agreed upon in Kabul provided for a review of the trade which has not been completed.

Third Prize Bonds' Draw at 12 Centres: The following series of Prize Bonds will be eligible, in accordance with the terms of the notification for the issue of Five-Year interest-free Prize Bonds, 1965, for participation in the Third Quarterly Draw to be held on March 1, 1961:

Rs. 100/- denomination: Series A, B, C, D, E, F, G, H, J, K, L, M, N, Q, U, & V.

Rs. 5/- denomination: Series AA, AB, AC, AD, AE, AF, AG, AH, AJ, AK, AL, AM, AN, AP, AQ, AR, AS, AT, & AU.

The draws will be held at twelve places, namely, Bombay, Calcutta, New Delhi, Madras, Bangalore, Nagpur, Lucknow, Patna, Hyderabad, Ahmedabad, Jaipur and Trivandrum. They will be conducted, at each place, under the supervision of a committee consisting of prominent non-officials and representatives of the Central and State Governments and the Reserve Bank or the State Bank of India. The composition of the committees and the particular series for the draw at each station will be announced later.

Simplified Income-Tax Assessment Procedure: The Central Board of Revenue has clarified that the newly introduced simplified procedure for determining the income-tax payable by persons who derive small income from business is applicable also to persons de-

riving income from a profession or vocation. The essence of the new procedure which was initiated in November 1960, consists in doing away, in the case of small assesseees, with the examination of the accounts at the income-tax Office. It is designed to cut short the time spent in the assessment of cases which produce very little revenue. The scheme will not apply to cases where losses are declared, or where the income includes profits from speculation.

U.S.S.R.

Giant Earth-Digging Machine: A giant earth-digging machine which will move up to 3,000 cubic metres of earth per hour, is on the drawing boards at the Institute of Hydro-Engineering Design. This will be a dredge which will be capable of digging long canals up to 300 metres wide (surface width) and up to 18 metres deep. At the same time it will sluice up the embankments. As different from similar units, the new giant earth-mover will operate under its own power, for which purpose it will carry a 6,000 H.P. power plant. It will also have a 110 metre long slurry pipeline which will do away with the need for pipe communications with the shore. Mounted on hydraulic stilts the earth digger will be able to move independently in any direction during operation. The self-contained giant unit which will be automated to the utmost is well adapted for use in scarcely populated areas remote from sources of power.

World's Biggest Excavator: A rotor excavator, the largest of its kind in the world, capable of scooping up 11,200 cubic metres of loose ground an hour—enough to fill 340 railway dump cars—has been designed at the Novo-Kramatorsk Engineering Works, the Ukraine. It will be able to remove a 50-metre thick layer of earth in strip mining of minerals. This is the world's first powerful excavator to be fitted with combined walking and rail-supported drive gear in stead of caterpillar drive. In spite of its great weight of 4,800 tons the specific ground pressure of this earth-digging giant is less than that of a human foot.

Industrial Projects in Uzbekistan: The Uzbek Minister of Building Construction stated recently at a Republican Builders Conference that 80 major industrial projects will be completed in the Republic in 1961. New production capacities will be commissioned in the chemical, oil processing, ore mining cement and engineering industries. The volume of construction in Uzbekistan would grow 20 per cent this year as against 1960. The construction of five more large panel house-building combines will be started in the Republic to develop further housing construction and that the Tashkent house-building combine was being reconstructed.

Yugoslavia

"Geomasina" Factory now Producing for Export: The Yugoslav factory "Geomasina" has sold to Egypt 10 complete drilling sets with equipment for geological and mining prospecting and for work in quarries. Apart from this, negotiations to sell 12 more sets to the United Arab Republic are to end soon. The total value of the goods exported is some 5 lakh dollars. Geomasina has fully satisfied home requirements and is now exporting to other countries. Apart from Greece, who is already buying these machines, they will soon appear on the markets of India, Pakistan, Ethiopia the Syrian region of the U.A.R., Cyprus and a number of other countries.

COMPLETE SHIP REPAIRS

FOR OVER HALF A CENTURY

The site of Garden Reach Workshops covers an area of 64 acres with half a mile of river frontage, slipway and dry-dock facilities suitable for inland water craft up to 2,000 tons and building berths for shallow-draft vessels up to 1,200 tons launching weight.

SHIPBUILDING

Garden Reach Workshops have provided complete ship repair facilities at Calcutta for over fifty years. The Workshops are fully equipped to handle major and minor repairs to vessels in the River Hooghly, in the stream and in wet-docks, dry-docks and lay-up berths allotted by the Calcutta Port authorities. Stocks of components and spare parts for M.A.N. Marine Diesel Engines are maintained in Bond and complete servicing facilities are readily available.

FACILITIES

Garden Reach Workshops handle a daily average of 25 to 35 ocean-going vessels and during the two years ended 30th September 1959, the Workshops have conserved foreign exchange to the extent of Rs. 48 lakhs being the value of repairs carried out to Indian-owned deep-sea vessels; foreign exchange earned during the period by way of repairs to foreign-owned vessels amounted to Rs. 1.44 crores. Garden Reach Workshops are capable of handling twice this volume.

FOREIGN EXCHANGE : SAVING AND EARNING

Shallow-Draft vessels consisting mainly of Harbour Tugs, Launches, Water-Boats, Barges, Dredgers and Pontoons are wholly constructed at Garden Reach Workshops and during the past four years the value of those vessels amounted to almost Rs. 2 crores,—a valuable contribution to the saving of foreign exchange. Plant and experience combined with expert craftsmanship and supervision enable competitive rates to be quoted for all General Engineering Work.

PMBC 17

The Yugoslav machine manufacturing industry, which was almost non-existent before the war, has advanced the production of most complicated machine equipments and electric motors. Last year's production of machines and transformers in Yugoslavia amounted to about 60,000 tons. In 1965, the closing year of the five-year Plan, it will be raised by 1,50,000 tons.

Yugoslavia's Purchasing Power on the Increase: According to latest official data, the monthly earning of the Yugoslav population reached a record figure of 179 million dinars last December. At the beginning of this year, because salaries of public officials were increased by 10 per cent and earning in the economy were greater, total monthly earning in Yugoslavia continues to grow. Although there was moderate rise in the price of some items and service last year, earnings are much greater than expenditures. This is also borne out by the particular fact that savings deposits last year reached the record figure 92,000 million dinars or 24,500 m. dinars more than in 1959. Owing to the greater purchasing power of the population, commerce was much greater, which acted as an incentive also towards greater output of consumers' goods, which grew at a rate of 17 per cent quicker than the rate of the industrial output as a whole.

Japan

World's two Largest Oil Tankers Planned to be built: It is reported that the Idemitsu Kosan Co. of Tokyo issued orders on December 23, for construction of a pair of 1,30,000 DWT class super-tankers, the largest of their kind ever built. The two ships will be used for hauling Persian Gulf Oil to Japan. According to the Company's report to the Transportation Ministry, Idemitsu placed the orders with two Japanese shipbuilders, Sasebo Ship Industry Co., and Ishikawajima-Harima Heavy Industry Company. Idemitsu will pay for both the ships, each estimated at Y 5,300 m. with its own reserve funds without any borrowing. Each tanker is to measure 291 metres from bow to stern, 43 metres in width and 22.2 in draft and to be powered with a 28,000 H.P. engine, capable of developing a cruising speed of 60 knots. The new super-tankers are expected to shuttle between Tokuyama, Japan and the Persian Gulf an average of 8.5 times a year, carrying 1 million kilolitres of crude oil.

Norway

Subsidies for Norwegian Fishing Industry: The Norwegian Storting (Parliament) recently appropriated 59.7 million kroner for subsidies for cod and herring fisheries in 1961. The amount was arrived at after long consultations between the Ministry of Fisheries and the various organisations of the fishing industry, and was unanimously approved by the Finance Committee of the Parliament. The amount will be divided with 22 million kroner to the herring industry and 37.7 m. kroner to the cod industry.

Australia

Factory Production: The All-group Index (excluding power) of Australian factory production in October 1960 rose 2.0 per cent above the September 1960 level while the non-durable goods section of the index rose 3 per cent and the durables goods section only 1 per cent. For some important sections of the durable goods industries, the rate of monthly increase during the July-October period of 1960, is significantly below that of a year earlier. This applies particularly to the index groups, basic metals, motor vehicles and radio, gramophone, TV etc.

United Kingdom

Medium Term Credit for British Exports: To promote the availability of medium term credit for British export business, the Bank of England announced on February 6, that new arrangements have been made. The announcement was made after discussions between the bank and a committee of London clearing banks and representatives of banking organisations in Scotland and Northern Ireland. "Where members of these bodies have been given credit for a term of 3 years or more repayable by instalments, and covered by Export Credits Guarantee Department, the Bank of England will stand ready to re-finance those instalments of such credits which are within 18 months of maturity," the statement added. Because of this facility, the banks concerned will be able to transfer the portion of their export credits which it covers to their liquid assets. The banks consider that this arrangement will be of considerable help to them in maintaining the flow of finance for exports on medium credit terms. In so far as other banks give medium-term finance for exports on similar lines as a normal part of their business, the Bank of England will be ready to discuss the extension to them of similar re-financing facilities.

Rise in U.K. Exports: United Kingdom exports in January were valued at £330,100,000 imports at £404,700,000 and re-exports at £12,400,000, it was announced by the Board of Trade in London on February 14, giving provisional figures of Britain's overseas trade last month.

It is noted in London that there was an encouraging rise in British exports in January, when they increased by some £24,000,000 (comparing recorded values) over December. After allowing for the normal seasonal variation, exports in January were valued to £319,000,000 (a rise of £17,000,000 over the seasonally adjusted figure for December). Seasonally adjusted imports were valued at £401,000,000 in January, and re-exports at £12,000,000.

Paper Making Machinery: Three Scottish firms have formed a Rs. 10 lakh consortium to establish in Calcutta a factory to produce paper-making machinery. Mr John Kidd, Managing Director of Bertrams, Ltd., of Edinburgh, is visiting India shortly to settle arrangements on behalf of the consortium with the Indian Government. The three firms are Bertrams Ltd., Ernest Scot & Co., and James Bertram and Son Ltd., Edinburgh. Already, negotiations with the Indian Government are well advanced. Work on the conversion of a former jute mill in Calcutta into the consortium's plants is nearly complete, and paper-making machinery is expected to be produced there within the next few months. Mr Kidd told a reporter; "Our three firms have joined forces to start up in India because that is the satisfactory way of doing business there. Machinery and technical men have already been sent out. When the factory is in full production it will employ 500 local workers. Initially, a staff of Scottish technicians will be used to train them."

France

French Automobile Production in 1960: In 1960 French plants manufactured 1,369,263 vehicles, including 1,135,650 pleasure vehicles, compared with 1,283,304 vehicles including 1,085,177 pleasure vehicles in 1959. In December 1960 production decreased to a lower level than during December 1959. It totalled 105,666 vehicles (including 84,586 pleasure vehicles) compared with 110,068 (including 89,777 pleasure vehicles) in November 1960 and compared with 125,692 (including 104,327 pleasure vehicles) in December 1959.

NEWS IN BRIEF

INDIAN

Government contracts valued at over Rs. 2.5 crores were awarded in favour of the small scale industrial units during the 9 months ending December, 1960. Since April, 1957, when the scheme was introduced, the National Small Industries Corporation has assisted the small scale units to the extent of over 8.3 crores in this respect.

The Minister of Industry revealed in the Lok Sabha recently that production in H.M.T. had increased from 402 machines in 1957-58 to 552 and 702 machines in 1958-59 and 1959-60.

The Indian Standards Institution has recently published specifications covering a number of consumer goods. Among these are specifications for electric ceiling fans and regulators, electric table type fans and regulators, optical glass, automobile lamps, milk bottle crates, floating dairy thermometers, aviation turbine fuels, handloom silk dhoties, handloom silk cloth, dyed woollen blanket, distilled water and cigarettes.

The Union Deputy Minister of Works, Housing and Supply, stated in the Lok Sabha recently that the Government of Orissa had so far selected 239 villages, as against 200 villages allotted to them for development under the Village Housing Projects Scheme during the Second Five-Year Plan period.

The Textile Commissioner has decided not to entertain any fresh transfer applications regarding authorised powerlooms up to June 30, 1961, to enable his office to dispose of all pending applications expeditiously, according to a Press note issued by the office of the Textile Commissioner, Bombay.

Production of jute goods of all kinds during January declined sharply to 86,196 tons from 90,680 tons, in the previous month, according to figures compiled by the Indian Jute Mills Association.

It is reported welfare programme will receive priority in the tribal areas of Rajasthan during the Third Plan period. Of the 35 tribal development blocks to be set up in the State, seven will be initiated before the end of the current year.

Walnut stumps which exceed nine feet in length and contain more than 48 inches of clean trunk are not allowed for export, says a Press note issued by the Joint Chief Controller of Exports, Bombay.

The nine-man committee set up by the Planning Commission under the Chairmanship of Professor Mahalanobis to enquire into the pattern of distribution of the increase in national income is expected to submit its interim recommendations before the final draft of the Third Plan is ready.

A 25 acre agriculture-cum-horticulture farm is being set up in the remote Nabura valley area in the 12,000 ft. high Ladakh district of Kashmir. The setting of this farm is an example of the State Government's efforts to develop agriculture in the mountain-girded Ladakh district.

FOREIGN

Exports of Britain's chemical industry reached the record figure of £316 m. last year, an increase of £23 m. on 1959, the Association of Chemical Manufacturers announced recently. The latest total represented 10.5 per cent of the value of all U.K. manufactured exports, the Association added.

The U.K. companies, Maurice Lambot and Co., glass plant engineers and British Hartford Fairmont, are to help in the setting up of a £565,000 factory in Jamaica for the newly formed West Indies Glass Company.

World gold production, excluding Russia's rose for the seventh consecutive year in 1960, climbing 5 per cent above 1959 to some 34.3 m. fine ounces, according to the Engineering and Mining Journal, New York. This is 13.2 m. ounces above 1945, the post-war low, but still 2.4 m. ounces short of the record total of 1940.

Canada is the only one of the four major wheat exporting countries to record a decline in wheat exports during the August-November period, the first four months of current crop year. Canadian exports totalled 108.5 m. bushels, compared with 109.2 m. bushels a year earlier.

The Krupp concern has secured a contract valued at close on £1.7 m. for a complete power producing plant in Budapest. Competitors are known to have included a British Consortium, Rustyfa, whose tender is believed to have been about 30 per cent higher than that submitted by Krupp's.

The Federal Reserve return for the week ended February 8 shows that foreign deposits dropped \$30 m. to \$195 m. while foreign investments rose \$59 m. to \$5,866 m.

The Pakistan Government will shortly invite tenders for a steel plant with an annual capacity of 100,000 tons to be set up at Chittagong in East Pakistan. The Government has already invited tenders for another steel plant to be set up at Karachi in West Pakistan with a capacity of 250,000 tons a year.

The Bundesbank has cut its rates for money market paper across the board by 1/8 of one per cent as part of its drive to bring down German interest rates.

Under an agreement signed recently, a package design and information service for the European market is now available for British manufacturers.

A major programme for the expansion of the Russian paper industry has been drawn up in view of the very backward state into which the industry is officially admitted to have fallen.

A series of bond loans is to be issued this year and next in various countries by the Societe du Pipe-Line Sud-European, the Consortium set up by 19 oil companies in the U.S., Britain, Holland, Belgium, France and Germany, to build an oil pipeline from Marseilles to Karlsruhe via Strasbourg.

PLEASE MAKE YOUR TRUCK TYRES LAST LONGER!

The present maximum output of the Tyre Industry in India is not enough to ensure sufficient truck and bus tyres for the country's needs.

It is not a matter of distribution. Adequate steps have been taken by Tyre Dealers to arrange that such supplies as are available are strictly allocated at our recommended retail prices to those who need them most.

New tyre factories are in the course of construction, and existing units have expansion programs, but it will be some time before supply catches up with demand.

In the meantime, what-?

We believe that this scarcity—which is a source of continuous anxiety to all of us—can be eased to some degree by every truck tyre user taking all possible steps to get the MAXIMUM SERVICE from the tyres he already has. There are many ways that MILEAGE—and, therefore, LIFE of the tyres can be INCREASED. Here is ONE WAY.

MAINTAIN CORRECT INFLATION PRESSURES AND DON'T OVERLOAD YOUR TYRES

LOOK AT THIS CHART

It shows you how overloading and/or under-inflation destroy mileage—kill tyres—and make the tyre scarcity even more acute.

THE BUSINESS WORLD

Bonus and the Bonus Commission

(SPECIALLY CONTRIBUTED)

THERE has been much hue and cry among employers in this country over the composition of the Bonus Commission as announced by the Union Labour Minister, Mr Gulzarilal Nanda. They have, of course, not objected to the setting up of this Commission.

The employers have taken exception to the composition of the Bonus Commission on three grounds. Firstly, they say, the chairman whose name has been announced is not the high-powered person which the Supreme Court wanted him to be in its judgments in the two famous cases, viz., the Associated Cement Companies Ltd. vs. Their Workmen and the New Manekchaw Spinning and Others vs. The Textile Labour Association. Secondly, the Chairman, who is expected to play a pivotal role in a Commission of this kind, has some pre-conceived ideas on the subject, having given, as Chairman of the Industrial Court, Bombay, decisions in a number of cases dealing with various aspects of bonus. Employers felt, and still feel, that it would be extremely difficult, if not impossible, for him to appraise the problem in a dispassionate manner. Thirdly, the Commission appeared to partake of the character of a Tribunal and not of a tripartite Board inasmuch as both employers' and workers' representatives had been excluded from membership.

As a result of the strong stand taken by employers, the Union Labour Minister has now offered to enlarge the composition of the Bonus Commission by including in it representatives of both employers and workers. He has also agreed to discuss the "terms of reference" at a tripartite Committee. He has, however, refused to change the Chairman-designate. One can understand and appreciate Government's stand on this last issue: having made the announcement, Mr Nanda cannot yield to pressure, particularly when the pressure comes from the quarter of employers.

It is not yet known if the employers' organisations would now associate themselves with the work of the Commission (they have taken six weeks' time to consult their constituents and re-examine their attitude in the light of the "concessions" announced by Mr Nanda), but it would be useful at this stage to consider why the setting up of a Bonus Commission is considered so essential, not merely by the Government but also by all responsible employers and trade unions.

"Bonus" has had a long history spread over nearly 40 years. During this period various types and quantities of bonus have been paid to workmen, either as a result of agreements or as per awards given by Industrial Tribunals. There has been considerable confusion regarding the nature of bonus and the circumstances in which it should become payable. Sometimes, it has been paid as a deferred wage, sometimes as a share in the profits and sometimes as a profit bonus to bridge the gap between the existing wage and an undefined "living wage." It has been awarded not merely when a company made huge profits, but also when it made a modest profit or even suffered a loss.

In 1950, an attempt was made by the Labour Appellate Tribunal (since abolished) to formulate the principles on which bonus should be paid. The L.A.T. formula (also known as the Full Bench Formula) was based on the theory that workers contributed to the profits made by an undertaking and were entitled to a share of it, so that they could improve their standard of living and bring it nearer to a "living wage." For this purpose, profits were to be calculated after allowing certain prior charges in respect of taxation, fair return on capital, statutory depreciation, provision for rehabilitation and fair return on reserves employed as working capital. A share of the profits so calculated would then be paid to workmen as bonus.

The L.A.T. formula was amplified and elaborated by the Supreme Court in several judgments which it had to give in the cases that came before it. It generally upheld the formula as the best available method for determining bonus, but gave its own interpretation of what constituted the "prior charges" and what did not. In recent years, there has been an appreciable shift from the concept of "bonus" as a bridge between actual wages and a "living wage": where an undertaking has made substantial profits, "bonus" has been awarded to workmen even though they were enjoying a living or near-living wage. The theory of labour's title to a share of the profits made by an undertaking has prevailed over other considerations.

In spite of the various norms laid down by judicial decisions in amplification of the L.A.T. formula, disputes regarding bonus have become a perennial source of friction between employers and employees; neither employers nor workers appear to be happy over the present situation. Some employers would like bonus to be substituted by suitable incentive wage schemes, while others would prefer a re-examination of the entire formula, particularly in view of the vast changes that have taken place during the past decade in the economic and fiscal position of industry. Workers' representatives, on the other hand, argue that, after the prior charges have been met, a major share of the profits should accrue to them on grounds of social justice.

There is no unanimity of opinion even as regards "prior charges." Employers complain that the present formula allows only normal depreciation, but not initial or additional depreciation, that the rehabilitation requirements of industry are not assessed on a uniform basis, that the return allowed on paid up capital and reserves is far too low and that no allowance is made for such taxes as wealth tax. They also point to the anomaly of Industrial Tribunals granting bonus to workmen in different undertakings at different rates—varying from nil to 9 months or more of basic wages—and urge that a ceiling should be imposed on the quantum of bonus to be paid to workers. Workers' representatives, on the other hand, find the L.A.T. formula too rigid and heavily weighted against workmen: they also dispute the right of shareholders to a further share of the distributable surplus.

Akbarallys DEPARTMENT STORE IN BOMBAY

LIGHTING BY PHILIPS

In a city of bright, modern shops Akbarallys department store in Bombay stands out as a favourite rendezvous of smart shoppers.

And naturally, the lighting at Akbarallys is by Philips.

A scientific combination of Philips fluorescent and incandescent lamps with Philips' exclusive fittings produces lighting that helps to display the merchandise in the most attractive manner possible.

Philips' exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy by providing the maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience as well as research and development aimed to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible plus of Philips' international experience and know-how.

FREE: For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.

Any Commission would find it extremely difficult to reconcile such widely divergent views. The L.A.T. formula, if rigidly applied to all industries, may lead to highly anomalous results. In the case of non-manufacturing (i.e. trading) concerns, for example, the formula is obviously defective inasmuch as there can be no charge for rehabilitation or depreciation and the return on capital would be insignificant as the capital invested is small. The prevailing formula does not also take into consideration other forms of bonus payments made to workers, such as production bonus, attendance bonus etc. Furthermore, in many undertakings, the management agreed to a high rate of production bonus on the distinct understanding that no annual bonus would be claimed by workers.

It may as well be mentioned that the type of "bonus" which is claimed by industrial workers in this country is virtually unknown in other countries (both developed and under-developed) of the world; it is not always conducive to efficiency or increased productivity.

Besides, the position of undertakings in the public sector has also to be considered. At present, no bonus of the type paid to workmen in private sector undertakings is given to workmen in public sector enterprises. There is no apparent justification for this discriminatory treatment.

It is for these reasons that the composition of the Bonus Commission is so important. The Commission would be expected to work out not just a new formula or even a set of formulae, but to view the problem in its totality. Whatever recommendations it makes, these will have far-reaching repercussions on industrial development and enterprise, and ultimately on the flow of investment. It is, therefore, imperative that on it should sit men who have no pre-conceived notions on the subject and who are able to take a broad, dispassionate and objective view of the entire problem. It is also a moot point whether the country does not need today a Price Commission rather than a Bonus Commission.

Business Notes

Tariff Inquiry

TARDY TITANIUM

BY REASON of its various uses in the paint, rubber and textile industries of the country, the importance of the titanium dioxide industry is almost taken for granted. Yet Mr K. R. P. Aiyangar, Chairman, Tariff Commission, felt it necessary to underline it whilst opening the public enquiry into the question of extension of protection to this industry for a further period beyond 31st December, 1961, last week.

The history of the Tariff protection for this industry since protection was first granted to it in 1953 is common knowledge. In fact, there has been only one manufacturer of titanium dioxide in India all these years, viz. Travancore Titanium Products Limited, Trivandrum. At the last tariff enquiry in 1957, the rated capacity of this single unit was assumed as 1829 tonnes per annum of anatase—the only grade that is being produced in the country. Generally, speaking, titanium dioxide is produced in two grades, anatase and rutile. The latter also is used for industrial purpose, but there is still another variety, namely brookite, which is less commonly used.

The total production of Travancore Titanium products, Ltd. was 1,701 tonnes (against a rated capacity of 1,829 tonnes) in 1957, 1,743 tonnes in 1958, 1,972 tonnes in 1959 and 2,503 tonnes in the first eleven months of 1960 (against the present capacity of about 2,947 tonnes per year with plans to raise it to 3,650 tonnes per year). The Company has further large expansion programmes. On the basis of the developmental plans envisaged at present, it desires to step up the existing capacity to 6,604 tonnes within the next two or three years. It has also set up a 50-ton sulphuric acid plant of its own.

Another new unit has been licensed—but the factory is expected to go into production only in 1963—in Maharashtra State, to produce 4,471 tonnes of titanium dioxide per annum, of which one-third would be of the rutile grade. The aggregate production capacity of both the units thereafter would be of the order of 11,075 tonnes per year, it is expected.

The demand for titanium dioxide has been steadily increasing, but, as in respect of so many other industries, the estimates of demand vary from source to source. For instance, at the time of the last enquiry by the Tariff Commission, it was estimated that the annual domestic demand would be about 2,642 tonnes in 1957 and that it would go up to 4,877 tonnes by the end of 1960. The Development Wing estimates show that the demand would be about 5,080 tonnes, 6,096

tonnes, 8,128 tonnes and 9,144 tonnes for the years 1961, 1962, 1963 and 1964, respectively. The sole producer, Travancore Titanium Products, Limited, on the other hand, estimates the current demand somewhat higher at 5,588 tonnes and also expects that the demand would go up to a slightly greater extent, that is to 6,706 tonnes in 1962 and 8,738 in 1963. If, however, sales and imports are taken as the basis for calculating the domestic demand, it was 2,253 tonnes in 1957, 2,538 tonnes in 1958, 3,279 tonnes in 1959 and about 4,500 tonnes in 1960, all lower, be it noted, than any of the three estimates as above, including even the Tariff Commission's. By the way, the figures as above are also inclusive of the rutile grade imports—360 tonnes in 1958, 786 tonnes in 1959 and 797 tonnes in 1960. The question of ascertaining the precise projected figure of demand, therefore, confronts the Tariff Commission again.

Meanwhile, the quality of the indigenous product is said to be satisfactory, but there is certainly room for further improvement. Fortunately for the industry, all the basic raw materials, such as scrap iron, ilmenite sand, sulphuric acid and other auxiliary chemicals, are available within the country itself; only a few items like antimony oxide and zinc dusts have to be imported from abroad.

Curiously enough, in spite of not issuing fresh licences even to established importers since 1957, the Tariff Commission chief pointed out, the imports of titanium dioxide have shown a rising trend. Thus, the imports were 552 tonnes valued at Rs. 14.75 lakhs in 1957, 810 tonnes valued at Rs. 19.72 lakhs in 1958, 1,480 tonnes valued at Rs. 34.25 lakhs in 1959, and 1,375 tonnes valued at Rs. 33.43 lakhs in the first nine months of 1960. The bulk of these imports during the last two years came from the U.K., Japan, and Germany.

Capital Goods

JAPAN MACHINERY CENTRE

A "JAPAN MACHINERY CENTRE" has been newly established in Bombay for the purpose of expanding the markets for Japanese machinery. This has been sponsored by the Japan Export Trade Promotion Agency—JETRO—which is stated to be the sole organisation for promoting Japan's foreign trade with government support. The abbreviation, which, for some reason, is JETRO (and not JETRA as the initial letters of the name of the organisation would seem to suggest) has at least one merit, namely that of reminding one of BETRO, set up by the U.K. after World War II. Obviously the objectives are the same and Japan now feels she is in a position to make a bid again to recap-

ture her lost markets and, if possible, to expand them further. Indicative of this ambition was the exhibition of Measuring Instruments in Metric System, organised jointly by the Japan Machinery Centre and Japan Federation of Measure Instruments Industry Association, Japan, in Bombay, last week. The great salesmen that the Japanese are, they later presented these exhibits to the people of Maharashtra, and the Chief Minister, Mr Y. B. Chavan, accepted the gifts on behalf of the Government and the people of Maharashtra.

Speaking on the occasion, Mr Tadashi Oki, President of Taisho Balance Manufacturing Company Ltd., who specially came down to Bombay at the head of a delegation of manufacturers of these instruments, said that, since India had adopted the metric system, the manufactures of Japan, backed by the considerable experience of the manufacturers of instruments based on this system for the past two decades, would prove useful not only to Government authorities but also to Indian manufacturers and actual users. He also opined that the relations between India and Japan had been getting closer year after year in the economic, cultural and other fields. Thanking the Japanese donors for their gift, Mr. Chavan said that there was a lot that the Indian people had to learn from the industrial development of Japan. He also added that he looked forward to the day when India would make a similar presentation to Japan.

Industry

DISPERSAL

ALTHOUGH THE State of Maharashtra is one of the highly industrialised States, the industrial development so far achieved is concentrated, in the main, in a few urban areas. As a result, the areas which are either under-developed or comparatively under-developed continue to remain as they were, which is neither desirable, politically, nor profitable from the point of view of the balanced economic development of the State. This position is by no means peculiar to Maharashtra; it applies to other States also, and the considered comments on this subject of the President of the Indian Merchants' Chamber, Bombay, Mr Pratapsinh Mathuradas during his speech at the 53rd Annual General Meeting of the Chamber last week, are, therefore, of interest not only to the people of Maharashtra but to those of other States as well.

As Mr Mathuradas observed, it has become imperative to think in terms of dispersal of industries from a few urban areas to other areas which are either totally undeveloped or under-developed, and the only way by which this can be achieved is for the State Governments themselves to take the initiative in providing the necessary economic overheads in the various regions, such as making available suitably developed land, electric power, water, roads, communications, etc. The State Governments could, for example, provide electricity and water to the industries in these new regions at concessional rates, at least in the initial period. It is only thus that Governments can hope to attract industries, both big and small, to the newly developed regions. Accordingly, whilst shifting the industries from the city limits to new (rural) regions, Mr Mathuradas urged that the Government should adopt a positive approach and offer adequate facilities. In this connection, he said, the question of local levies like town duties, octroi, etc. deserved consideration. There is certainly need for a re-orientation in the attitude of the different local authorities in the matter of taxation to ensure that no impediments are created, at least on this account, in the way of the spread and dispersal of industries in the interior regions. In this connection, the I.M.C. President welcomed the State Government's keen awareness of all these problems and its setting up a special agency—Board of Industrial Development—for establishing and managing indus-

dustrial estates. How this new agency will function remains to be seen.

Referring to the immediate need for raising the levels of productivity in different branches of industry by ensuring the maximum utilisation of capacity, Mr. Mathuradas could not but stress the need for provision of sufficient supplies of materials, fuels, etc. on a continuous basis, whether by way of imports or from indigenous sources of supply. This means, as he rightly urged, that, in the matter of allocation of foreign exchange resources, the requirements of industries on 'maintenance' account should be fully taken care of.

Transport difficulties also figured prominently in IMC Chief's speech as a serious impediment to industrial production. The innumerable difficulties faced by industries in regard to movement of adequate and regular supplies of coal and other essential raw materials, leading to interruptions and dislocations in their production schedules, are too well known to need reiteration. Periodic shortage of coals have affected not only the working of important industries, including thermal power stations, but also national output, as well as valuable foreign-exchange-earners when the industries affected happen to be export industries. The IMC President sought no special favour, therefore, when he appealed to the Government for adequate transport facilities and also stressed the need for co-ordination in regard to the work of all the authorities concerned.

ICICI

PROGRESS DURING 1960

DETAILS OF the progress in the business operations of the Industrial Credit and Investment Corporation of India in its sixth year ended December 31, 1960, will be found narrated in the speech of the Chairman, Mr G. L. Mehta, at the last annual meeting, which appears elsewhere in this issue. Two broad financial indicators may be mentioned here, namely, the increase in the Corporation's profits before tax to Rs. 62.60 lakhs in 1960 as against Rs. 50.66 lakhs in the previous year and restoration of the dividend to the shareholders which works out at the net rate of 4 per cent.

The year 1960 was a year of expansion in the share and loan capital of business concerns in India and some of it was obtained by them from industrial finance institutions. The Corporation has met substantial contribution in the field of provision of industrial finance when assessed in qualitative terms. Its total assistance sanctioned last year was Rs. 13.43 crores out of which Rs. 7.62 crores were in the form of foreign exchange assistance and the minor share of Rs. 5.81 crores was in the form of rupee assistance. Mr. Mehta has rightly emphasized that the implications of this assistance go much deeper than what they appear on the surface. The catalytic effect of assistance extended by an industrial finance institution is to be seen in the direct stimulation of investment in industry. In the case of the Corporation, last year's assistance of Rs. 13.43 crores was granted to 39 companies to finance new projects. These companies raised for their requirements an aggregate investment amount of Rs. 55.22 crores. Undoubtedly the Corporation's assistance gave a decisive acceleration to the tempo with which the aggregate investment resources were found.

The Corporation has completely committed the second loan of \$10m received from the World Bank and it has obtained a third loan from the Bank which is of the impressive order of \$20m. It is also negotiating in the current year a loan of \$5m. from the Development Loan Fund. The prospect of the Corporation strengthening its activity of granting assistance in foreign currency, which is so sorely needed, has brightened.

Save with the simplicity of HONEYWELL TEL-O-SET* Miniature Instruments

- Tel-O-Set Features**
- Quick-connect mounting
 - Unit construction
 - Versatile operation
 - Wide range of reset rates
 - Low air consumption
 - High precision
 - Exceptional compactness
 - Chart re-roll

NEW and improved *Tel-O-Set* miniature pneumatic instruments are low in cost, easily installed, compact and require minimum maintenance. They can handle a broad range of temperature, pressure, flow and liquid level applications...

With all their simplicity, these instruments are highly sensitive and respond instantly to change. They operate on a pneumatic-balance principle which eliminates lost motion and friction.

Honeywell *Tel-O-Set* indicators, recorders and controllers are today's most advanced miniature instruments.

*Trademark of Minneapolis-Honeywell Regulator Co.

FROM THE CAPITAL'S CORRIDORS

STEPPING UP COAL OUTPUT

THE four-man team of foreign coal mining experts, consisting of Mr. R. E. Salvati, President, Island Creek Coal Company, Mr. H. E. Jones, Junior President, Amherst Coal Company, Mr. E. R. Phelps, President, Pittsburg and Midway Coal Mining Company, and Mr. B. C. Saunders, Technical Assistant to Mr. Salvati, which visited India last year to suggest measures to step up coal production during the Third Plan period has made some useful recommendations which, if accepted by the Government, can go a long way in raising output of coal to the target level of 97 million tons by 1965-66.

The various recommendations of this team are as follows:

(1) There are adequate proven reserves to support the growth and development programmed for India's coal industry during the Third Plan period (April, 1961-March, 1966). Their aggressive exploratory programme should be continued and expanded, if possible, in order to provide verification of present planning and additional proven reserves for future use.

(2) Transportation shortages are impairing productive output of present-day operating mines, and unless corrected promptly will seriously impair the attainment of the Third Plan growth objectives. Serious consideration should be given to the necessity for additional and larger rail-road cars, locomotive power, etc., and a full car supply for their coal operations. This single item could in itself increase the output from present-day operation by as much as 20 per cent, and at the same time reduce considerably the present-day cost of putting coal in storage at the mines and then loading from storage to rail-road cars—a costly operation at best.

(3) Much of the present-day mining equipment is from time to time made idle by the need for repair parts. This situation will become more critical as more rail-road cars are available and the mines are called upon to produce to capacity. Efforts should be made to simplify parts procurement, enlarge inventories and expedite deliveries from parts depots to points of need.

(4) While great strides have been made in training manpower and obtaining trained personnel for their operations, the coal industry, both public and private, faces a shortage of trained personnel, skilled in the maintenance and repair of mining equipment. A gigantic effort should be made to alleviate this situation and it is believed this can best be accomplished by the use of training programmes on a specialised rather than a general over-all basis.

(5) India is to be congratulated upon its planning for the use of coal washeries. It is believed that despite the excellence of planning to date, additional washeries will be needed over those already contemplated. In order to justify the use of washeries, their cost should be offset through increased prices paid by consumers. The improved quality of the washed products at point of consumption will more than repay the consumer for the increase in cost per ton.

(6) To attain higher coal production, the various Government bureaus having control of various aspects of coal output should be consolidated.

PRIVATE SECTOR'S ROLE

(7) Of fundamental importance to the Third Five-Year Plan coal target is the output of the private sector

mines. They must be given every incentive to carry out their part of the programme. The measures suggested in this regard are: (a) A reappraisal should be made of the coal reserves to allow the private sector mines a greater share of the undeveloped coal reserves of the nation; (b) The private sector should be allowed sufficient financial incentive to develop new mines. One such incentive would be a depletion allowance to permit the private miner to charge off his reserves and accumulate a sum of money for acquisition of new reserves; (c) The simplification and easing of import licences so that the private sector mines can more promptly obtain necessary spare machine parts is of fundamental importance; (d) Some credit assistance will be needed by the private sector mines. This should be made available on the same terms as offered to the National Coal Development Council mines.

(8) Of equal importance to the deep and strip operations in both the private and public sectors of the industry is the matter of employee relations. Safety pays dividends in both production and employee morale. There is ample opportunity for substantial gains through expanded safety programmes, use of protective clothing such as hard-toed shoes, hard hats, etc., safeguarding of equipment and the use of electric cap lamps in underground mining. Also, it is believed that production can benefit from the improved employee relations that would ensue if the workers in the major coal-producing communities had available to them good merchandise at reasonable prices, through company-operated stores. Today's facilities are meagre. This one suggestion could do much toward relieving employee absenteeism, which appears unnecessarily high.

(9) The "strip mines" of the National Coal Development Council are excellently equipped and management is to be congratulated on the degree to which standardisation has been accomplished through the selection of equipment.

(10) India's "deep mines," unlike her strip mines, lack the advantages that result from standardisation of equipment within a given operation. It is believed important that this matter be carefully reviewed before any additional equipment is purchased for the projected or operating NCDC deep mines. It is not suggested that all mines need to have the same equipment, but there are numerous advantages in having all equipment in a given mine produced by the same manufacturer.

NCDC PLANS

(11) The management of NCDC should be complemented upon their underground electrical system and as rapidly as improved transportation is provided for moving coal to points of consumption, they should continue their programme of mechanisation. This applies equally to both the private and public mines.

(12) Present NCDC plans call for reactivating the old Jarandih Mine. This mine operated in the Kargali seam which was very gassy, had bad roof conditions, and was interspersed with numerous faults. The seam is a high quality metallurgical coal for which there is great demand. Adjacent to the old Jarandih Mine is a mine working in the Jarandih seam. Below this seam is reported to be a deposit of the Kargali seam.

(13) A new mine at the location of the present Jarandih Mine in the Kargali or 12-foot seam would seem much better than re-opening the old mine with the faults, gas, and bad roof. This location has the further advantage of offering ample room for a washer and

a good supply of sand from the nearby river. The present management of the mine is perfectly capable of handling the problems incident to the development of a new high-capacity mine in this body of metallurgical coal. Additional diamond drilling should be done to substantiate this recommendation.

(14) National Coal Development Council plans to open a large mechanised mine called the Bisanpur Mine that will be operated with loading machines and shuttle cars dumping directly into mine cars which will be pulled to the surface by locomotives. This mine appears to be very well planned, and it is highly recommended that plans be pushed to rapid completion so that construction can be started promptly in order for the tonnage to be available during the Third Five-Year Plan.

(15) The Sudamdih Mine will be in the Jharia coalfield and it is tentatively forecast that it will produce 1.5 million tons of metallurgical coal through a shaft 2,000 feet deep. This project is one of the major problems of the NCDC plans for the Third Five-Year Plan, and the Team is doubtful whether the NCDC has the technical know-how to embark on a project of this magnitude. The sinking of the shafts alone will be a tremendous problem. Similar mines have already been developed in the private sector. In the opinion of the Coal Team, incentives should be offered to private operators through improved market yields, financial assistance, etc., to develop this particular mine either individually or jointly.

(16) The Korba Mine is under planning and subsequent construction by the U.S.S.R. It appears to the Coal Team that the Russian plans for this mine were very highly developed. However, if the information given to the Team regarding the cost is correct (reported to be 500 million rupees), the Coal Team is of the opinion that this cost for a mine of 2.5 million ton capacity is too high. It is believed that such a mine should be opened for not more than 100 million rupees, and it is suggested that the cost of this installation be subjected to review.

The team's report concludes: "The problems confronting India's coal industry, if it is to attain the production targets set for the Third Five-Year Plan, are numerous and challenging. Errors will be costly in time, money, and the over-all economic growth of the nation. Even utilising the best of planning, engineering, and technical advice available, the attainment of 37½ to 40 million tons of additional coal production during the period 1961 to 1966 will be a most difficult task and, having done so, India will have solved only her coal supply problem for the present and will continue to face a supply problem for the future. India's continued dependence upon coal for her economic growth and improvement makes it all the more important—in fact compelling—that all growth and expansion planned for her coal industry during the Third Five-Year Plan be of the very best possible order and that to the extent possible, within the limits of financial and physical availability, the United States of America provides every possible aid."

TECHNO-ECONOMIC SURVEY OF MADRAS STATE

The key to an effective solution of the problems of poverty and unemployment in Madras State lies in rapid industrialisation, says the Techno-Economic Survey of Madras, prepared by the National Council of Applied Economic Research. But as Madras is deficient in physical resources, industrialisation in this State, the survey adds, can advance only if recourse is taken to establishment of industries in which skills play a greater part than material resources.

The survey suggests two types of large-scale industries which are specially suitable for Madras State: (1) chemical industries based on marine resources and Neyveli lignite deposits; (2) Engineering industries based on Salem iron ore deposits. The survey envisages

the emergence of three new nuclei of industrial growth in Madras—the Neyveli (fuel-cum-chemical) complex, the Salem (iron and aluminium) complex and the Tuticorin marine (chemical) complex. These three complexes would be the new spear-heads for accelerating industrial growth in this State.

For the fullest development of these industrial possibilities, the survey says, there are two important over-head investments that should be given priority. They relate to the development of power and transport links with sources of coal and steel. In both these respects, the survey points out, Madras faces serious, though not insurmountable, problems. By the end of the Third Plan, this State would have utilized practically all its hydro-electric resources; the addition to power supply from the exploitation of hydro resources and from Neyveli will not be sufficient to meet the requirements over the next 10 years. It is, therefore, necessary that resort should be taken to greater zonal co-operation for development of power supply. Alternatively, there will be need to set up in the near future an atomic power station in the State to make available the requisite amount of energy for industrial purposes.

The power resources (both hydro and thermal) of the entire Southern region, according to the survey, are also not likely to be sufficient for any long period of time. It is, therefore, recommended that possibility of generating atomic power should be examined sometime during the Fourth Plan period.

As regards the transport problem, the survey says that although Madras has a good network of internal transport, the railway bottleneck at Vijayawada is one of the most serious hinderances to rapid industrialisation of the State. Heavy investment is required to remove this bottleneck. In addition, the existing port facilities, both at Madras and Tuticorin, need to be developed so as to provide better and cheaper transport.

For increasing agricultural output in the State, the survey suggests greater use of irrigation, fertilizers and improved seeds. As a good portion of Madras is in the rain-shadow, the survey points out that development of irrigation facilities is crucial to increase agricultural production in this State. Irrigation resources of Madras—both major and medium—are likely to be exhausted by the middle of the next decade. So, the survey suggests, there is need for greater zonal co-operation with the adjoining States of Kerala and Andhra Pradesh which have substantial water resources to meet their own requirements and leave sufficient surplus for Madras. Apart from striving to get the co-operation of these States for a zonal irrigation system, the survey recommends that Madras must explore its ground water resources through improvement of tanks and wells, location of underground water sources and adjustment of cropping pattern to the supply of water.

To relieve unemployment in urban areas, which is likely to continue despite agricultural and industrial development in the next few years, the survey recommends initiation of a public works programme.

WHEAT UTILIZATION MISSION'S REPORT

The Wheat Utilisation Mission, which visited India last year under the "Food for Peace" programme, has expressed the opinion that under average climatic conditions, India would have to import for the next two years four to five million tons of cereals and pulses annually if the present level of consumption is to be maintained. Similar quantities of foodgrains, it says, will have to be imported for another three years if any improvement in diet is to be achieved. Wheat imports, it opines, can go a long way to meet these food deficits. The Mission, therefore, has recommended that the aid-giving countries should give serious consideration to make available to India for the next five years adequate quantities of wheat at concessional rates.

The Mission further recommends that friendly countries should consider establishment of a wheat reserve in India, subject to the provision of satisfactory facilities for the handling and long-term storage of such wheat.

The Mission has also expressed an opinion on utilisation of the rupee proceeds from the sale of wheat supplied at concessional rates. It recognises the great importance of relating the use of these rupees to the total money supply, to the maintenance of internal financial stability and to the planning process for economic development. The Indian Government can sell the wheat supplied on concessional terms and may thus provide an excellent offset to the inflationary pressures of deficit financing by absorbing excess purchasing power.

Donor countries, the Mission says in its report, are, however, understandably anxious to know the "specific projects" to be financed from wheat sales funds. This anxiety, it points out, arises out of the donors' desire to demonstrate that they are "directly" and not only "indirectly" assisting specific development projects.

The dilemma of balancing the donor's desire to assist a specific development project and the recipient's wish to fight inflationary spiral of rising costs and prices by withholding rupee expenditure, the Mission opines, can only be resolved by proper understanding and co-operation between the parties concerned. One useful solution, according to the Mission, might well be that both the donor and recipient countries begin planning for the use of rupee sales fund as early as possible, based on estimates of the amounts which will be derived from sales rather than on the basis of sale proceeds actually accrued. "Thus, in India's case, donor Governments may well wish to consider the desirability of having mutually agreed rupee expenditure proposals ready sufficiently in advance, so that they can be included in the annual readjustment of the Five-Year Plans characteristic of the present Indian procedure."

INDO-U.A.R. RICE DEAL

The Government of India has signed an agreement with the United Arab Republic for the import of 50,000 tons of Egyptian rice worth about Rs. 2 crores. The sale proceeds of this rice will be utilized by the U.A.R. for the purchase of Indian tea, jute and some non-traditional items like sewing machines, diesel engines, motor pumps, dry batteries and pharmaceuticals; 30 per cent of the proceeds have been earmarked for import of tea, 20 per cent for import of jute goods, 25 per cent for the purchase of non-traditional items for which no tenders will be required and the remaining 25 per cent for the purchase of non-traditional items for which Indian firms will be required to submit tenders to be accepted by the U.A.R. Government.

In the event of the purchase of non-traditional items falling under the latter category not materialising within six months of the date of signing of this agreement (February 18, 1961), the U.A.R. authorities will have the option to transfer the whole or part of this portion of the sale proceeds to increase by 5 per cent the provision for non-traditional items for which no tenders will be required. The balance will be utilized for increased purchases of tea and jute goods in the ratio of 3:2.

The purchase of all goods by the United Arab Republic under this agreement will be additional to the normal purchases made by the Egyptian region of the U.A.R. The goods purchased will be utilized for consumption in the Egyptian region and shall not be re-exported.

DEFERRED PAYMENTS LIABILITY

Details are now available of the deferred payments liability incurred by India up to October 1, 1960. The payment falling due in the second half of the current

financial year is of the order of Rs. 13.64 crores. The payment liability for the Third Plan period aggregates to Rs. 104.99 crores. The following is the break-up year by year:

Year	(Rs. crores)
1961-62	24.96
1962-63	29.76
1963-64	22.15
1964-65	16.70
1965-66	11.42
Total	104.99

As interest in most of the cases is included in the total cost of the goods imported, the figures given above relate to the gross payments that have to be made.

U.S. INVESTMENTS IN INDIA

During the period July, 1948, to December 31, 1958, U.S. investments in India increased by 435.8 per cent from Rs. 11.17 crores to Rs. 59.85 crores. British investments during this period increased by 93.2 per cent from Rs. 206.02 crores to Rs. 398.03 crores.

At the end of 1958, U.S. investments in India were spread over the following industries:

Industry	Amount (Rs. lakhs)
Petroleum	41.18
Manufacturing	14.88
Trading	2.52
Utilities and Transport	5
Mining	9
Financial	40
Plantations	6
Miscellaneous	67
Total	59.85
